    - For modified-release capsules, manufacturer advises dose reduction to 2 mg once daily.

- Renal impairment

  - Avoid modified-release preparations if eGFR less than 30 mL/minute/1.73 m².

    - Dose adjustments

      - Reduce dose to 1 mg twice daily if eGFR less than 30 mL/minute/1.73 m².

- Prescribing and dispensing information

  - The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder.

- Rare or very rare: Angioedema, eyelid oedema, increased risk of infection, nausea

**INTERACTIONS** → Appendix 1: mirabegron

**SIDE-EFFECTS**

- Common or very common: Arrhythmias, constipation, diarrhoea, dizziness, headache, increased risk of infection, nausea
- Uncommon: Cystitis, dyspepsia, gastritis, joint swelling, palpitations, skin reactions, vulvovaginal pruritus
- Rare or very rare: Angioedema, eyelid oedema, hypersensitivity vasculitis, hypertensive crisis, joint swelling, urinary retention

**FREQUENCY not known**

- Insomnia

**CONCEPTION AND CONTRACEPTION**

Contraception advised in women of child-bearing potential.

**PREGNANCY**

Avoid—toxicity in animal studies.

**BREAST FEEDING**

Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate to severe impairment (risk of increased exposure); avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**

Use with caution. Avoid Regurin®-XL.

Dose adjustments

- Reduce dose to 20 mg once daily or 20 mg on alternate days if eGFR 10–30 mL/minute/1.73 m².
- Avoid in severe impairment (no information available).

**PRESCRIBING AND DISPENSING INFORMATION**

The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution
- Modified-release capsule

**CAUTIONARY AND ADVISORY LABELS 23, 25**

**BETA-3-ADRENOCEPTOR AGONISTS**

**Mirabegron**

**INDICATIONS AND DOSE**

**Urinary frequency, urgency, and urge incontinence**

- Adult: 50 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises reduce dose to 25 mg once daily in patients with mild hepatic impairment with concurrent use of potent inhibitors of CYP3A4; avoid in moderate impairment.
- Manufacturer advises reduce dose to 25 mg once daily if eGFR 30–89 mL/minute/1.73 m² with concurrent use of potent inhibitors of CYP3A4; avoid if eGFR less than 30 mL/minute/1.73 m².

**CONTRA-INDICATIONS**

- Severe uncontrolled hypertension (systolic blood pressure ≥180 mmHg or diastolic blood pressure ≥110 mmHg).

**CAUTIONS**

- History of QT-interval prolongation—stage 2 hypertension.

**INTERACTIONS** → Appendix 1: mirabegron

**SIDE-EFFECTS**

- Common or very common: Arrhythmias, constipation, diarrhoea, dizziness, headache, increased risk of infection, nausea
- Uncommon: Cystitis, dyspepsia, gastritis, joint swelling, palpitations, skin reactions, vulvovaginal pruritus
- Rare or very rare: Angioedema, eyelid oedema, hypersensitivity vasculitis, hypertensive crisis, joint swelling, urinary retention

**FREQUENCY not known**

- Insomnia

**CONCEPTION AND CONTRACEPTION**

Contraception advised in women of child-bearing potential.

**PREGNANCY**

Avoid—toxicity in animal studies.

**BREAST FEEDING**

Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate to severe impairment (risk of increased exposure); avoid in severe impairment (no information available).

**DOSE ADJUSTMENTS**

Manufacturer advises dose reduction to 25 mg once daily in moderate impairment.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 15 mL/minute/1.73 m²—no information available.

**DOSE ADJUSTMENTS**

Dose adjustments: Reduce dose to 25 mg once daily if eGFR 15–29 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

Blood pressure should be monitored before starting treatment and regularly during treatment, especially in patients with pre-existing hypertension.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- Mirabegron for treating symptoms of overactive bladder (June 2013) NICE TA290

Mirabegron is recommended as an option only for patients in whom antimuscarinic drugs are ineffective, contra-indicated, or not tolerated; patients currently receiving mirabegron who do not meet these criteria should have the option to continue until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA290

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

- CAUTIONARY AND ADVISORY LABELS 25

  - Betmiga (Astellas Pharma Ltd)
    - Mirabegron 25 mg
      - Betmiga 25mg modified-release tablets
        - 30 tablet (P.M.) £29.00 DT + £29.00
    - Mirabegron 50 mg
      - Betmiga 50mg modified-release tablets
        - 30 tablet (P.M.) £29.00 DT + £29.00

**1.2 Urinary retention**

**Urinary retention**

**Description of condition**

Urinary retention is the inability to voluntarily urinate. It may be secondary to urethral blockage, drug treatment (such as use of antimuscarinic drugs, sympathomimetics, tricyclic antidepressants), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, neurogenic causes, or it may occur postpartum or postoperatively.
Acute urinary retention is a medical emergency characterised by the abrupt development of the inability to pass urine (over a period of hours). Chronic urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by a residual volume greater than one litre or associated with the presence of a distended or palpable bladder.

Urinary retention due to benign prostatic hyperplasia
The most common cause of urinary retention in men is benign prostatic hyperplasia. Men with an enlarged prostate can have lower urinary tract symptoms associated with obstruction, such as urinary retention (acute or chronic), frequency, urgency or nocturia.

Treatment
Treatment of urinary retention depends on the underlying condition. Catheterisation is used to relieve acute painful urinary retention or when no cause can be found. Surgical procedures or dilatation are often used to correct mechanical outflow obstructions.

Acute urinary retention
Acute retention is painful and requires immediate treatment by catheterisation. Before the catheter is removed an alpha-adrenoceptor blocker (such as alfuzosin hydrochloride, doxazosin p. 783, tamsulosin hydrochloride p. 785, prazosin p. 784, indoramin p. 784 or terazosin p. 786) should be given for at least two days to manage acute urinary retention.

Chronic urinary retention
In patients with chronic urinary retention, intermittent bladder catheterisation should be offered before an indwelling catheter. Catheters may be used as a long-term solution where persistent urinary retention is causing incontinence, infection, or renal dysfunction and a surgical solution is not feasible. Their use is associated with an increased risk of adverse events including recurrent urinary infections, trauma to the urethra, pain, and stone formation.

In men who have symptoms that are bothersome, drug treatment should only be offered when other conservative management options have failed. Men with moderate- to severe symptoms should be offered an alpha-adrenoceptor blocker (alfuzosin hydrochloride, doxazosin, tamsulosin hydrochloride or terazosin). Treatment should initially be reviewed after 4–6 weeks and then every 6–12 months.

The parasympathomimetic bethanechol chloride p. 786 increases detrusor muscle contraction. It is licensed for acute postoperative, postpartum and neurogenic urinary retention.

Urinary retention due to benign prostatic hyperplasia
In patients with benign prostatic hyperplasia, treatment is influenced by the severity of symptoms and their effect on the patient’s quality of life. Watchful waiting is suitable for men with symptoms that are not troublesome and in those who have not yet developed complications of benign prostatic hyperplasia such as renal impairment, urinary retention or recurrent infection.

The recommended treatment of benign prostatic hyperplasia is usually an alpha-adrenoceptor blocker. The alpha1-selective adrenoceptor blockers relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

In patients with an enlarged prostate, a raised prostate specific antigen concentration, and who are considered to be at high risk of progression (such as the elderly), a 5α-reductase inhibitor (such as finasteride p. 787 or dutasteride p. 787) should be used. A combination of an alpha-adrenoceptor blocker and a 5α-reductase inhibitor can be offered if symptoms remain a problem.

Surgery is recommended for men with more severe symptoms that do not respond to drug therapy, or who have complications such as acute urinary retention, haematuria, renal failure, bladder calculi or recurrent urinary-tract infection.

Related drugs
Other drugs used for urinary retention: neostigmine p. 1125, pyridostigmine bromide p. 1126.

Doxazosin

INDICATIONS AND DOSE

Hypertension

Adult: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily; maximum 16 mg per day

Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

Benign prostatic hyperplasia

Adult: Initially 1 mg daily, dose may be doubled at intervals of 1–2 weeks according to response; usual maintenance 2–4 mg daily; maximum 8 mg per day

Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

DOSE EQUIVALENS AND CONVERSION

Tablet

Alfuzosin hydrochloride 10 mg | 30 tablet | £12.51 + £12.51

Alfuzosin hydrochloride 10 mg | 30 tablet | £12.51 + £12.51
Alfuzosin hydrochloride 10 mg | 30 tablet | £14.35 + £14.35

CONTRA-INDICATIONS

History of micturition syncope (in patients with benign prostatic hypertrophy) - history of postural hypotension - monotherapy in patients with overactive bladder or anuria

CAUTIONS

Care with initial dose (postural hypotension) - cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - heart failure - pulmonary oedema due to aortic or mitral stenosis

INTERACTIONS

Common or very common Arrhythmias - asthenia - chest pain - cough - cystitis - dizziness - drowsiness - dry mouth - dyspnoea - gastrointestinal discomfort - headache - hypotension - increased risk of infection - influenza like illness - muscle complaints - nausea - oedema - pain - palpitations - skin reactions - urinary disorders - vertigo

Uncommon Angina pectoris - anxiety - appetite abnormal - arthralgia - constipation - depression - diarrhoea - gastrointestinal disorders - gout - haemorrhage - insomnia - myocardial infarction - sensation abnormal - sexual dysfunction - stroke - syncope - tinnitus - tremor - vomiting - weight increased

Rare or very rare Alopecia - bronchospasm - flushing - gynaecomastia - hepatic disorders - leucopenia - malaise - muscle weakness - thrombocytopenia - vision blurred

Frequency not known Floppy iris syndrome

SIDE-EFFECTS

PREGNANCY

No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

BREAST FEEDING

Accumulates in milk in animal studies—manufacturer advises avoid.

HEPATIC IMPAIRMENT

Manufacturer advises caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).

PATIENT AND CARER ADVICE

Patient counselling is advised for doxazosin tablets (initial dose).

Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Modiﬁed-release tablet

CAUTIONARY AND ADVISORY LABELS

21, 25

Benign prostatic hyperplasia

Patient should be counselled

Driving and skilled tasks

INDICATIONS AND DOSE

- Doxazosin
- Alfuzosin hydrochloride
- Alfuzosin hydrochloride 2.5 mg Tablet
- Doxazosin (as Doxazosin mesilate) 2 mg Tablet
Indoramin

30-Mar-2017

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 25 mg twice daily, increased in steps of 25–50 mg every 2 weeks, maximum daily dose should be given in divided doses; maximum 200 mg per day

**Benign prostatic hyperplasia**

- **BY MOUTH**
  - Adult: 20 mg twice daily, increased in steps of 20 mg every 2 weeks if required, increased if necessary up to 100 mg daily in divided doses
  - Elderly: 20 mg daily may be adequate, dose to be taken at night

**SIDE-EFFECTS**

- Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

**CONTRA-INDICATIONS**

- Established heart failure - history micturition syncope (when used for benign prostatic hyperplasia) - history of postural hypotension (when used for benign prostatic hyperplasia)

**CAUTIONS**

- Cataract surgery (risk of intra-operative floppy iris syndrome) - control incipient heart failure before initiating indoramin - elderly - epilepsy (convulsions in animal studies) - history of depression - Parkinson’s disease (extrapyramidal disorders reported)

**INTERACTIONS** → Appendix 1: alpha blockers

**SIDE-EFFECTS**

- Rare or very rare Parkinson’s disease exacerbated
- Frequency not known Depression - dizziness - drowsiness - dry mouth - ejaculation failure - fatigue - headache - nasal congestion - weight increased
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

**MEDIcINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2**

- **Indoramin (non-proprietary)**
  - Indoramin (as Indoramin hydrochloride) 20 mg | Indoramin 20mg tablets | 60 tablet (P6) £61.00 DT = £7.96
  - Indoramin (as Indoramin hydrochloride) 25 mg | Indoramin 25mg tablets | 84 tablet (P6) £60.26 DT = £60.26
  - Doralese Tiltab (Chemix Pharma Ltd)
    - Indoramin (as Indoramin hydrochloride) 20 mg | Doralese Tiltab 20mg tablets | 60 tablet (P6) £11.44 DT = £7.96

**Prazosin**

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 500 micrograms 2–3 times a day for 3–7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses

**Congestive heart failure (rarely used)**

- **BY MOUTH**
  - Adult: 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

**Raynaud’s syndrome (but efficacy not established)**

- **BY MOUTH**
  - Adult: Initially 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3–7 days, then increased if necessary to 1–2 mg twice daily

**Benign prostatic hyperplasia**

- **BY MOUTH**
  - Adult: Initially 500 micrograms twice daily for 3–7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients

**SIDE-EFFECTS**

- Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

**CONTRA-INDICATIONS**

- History of micturition syncope - history of postural hypotension - not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

**CAUTIONS**

- Cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - first dose hypotension

**INTERACTIONS** → Appendix 1: alpha blockers

**SIDE-EFFECTS**

- Common or very common Asthenia - constipation - depression - diarrhoea - dizziness - dry mouth - dyspnoea - headache - nasal congestion - nausea - nervousness - oedema - palpitations - postural hypotension - sexual dysfunction - skin reactions - syncope - urinary disorders - vertigo - vision blurred - vomiting
- Uncommon Angina pectoris - arrhythmias - arthralgia - cataract surgery (risk of intra-operative floppy iris syndrome) - dizziness - epistaxis - eye pain - eye redness - gastrointestinal discomfort - hyperhidrosis - paraesthesia - sleep disorders - tinnitus
- Rare or very rare Alopecia - fever - flushing - gynaecomastia - hallucination - hepatic function abnormal - pain - pancreatitis - vasculitis
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution (no information available).

**RENAL IMPAIRMENT**

- Manufacturer advises initial dose reduction to 500 micrograms daily; increased with caution.

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- History of micturition syncope - postural hypotension - not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

**DADE**

- Established heart failure - history micturition syncope (when used for benign prostatic hyperplasia) - history of postural hypotension (when used for benign prostatic hyperplasia)

**SIDE-EFFECTS**

- Common or very common Dizziness · sexual dysfunction
  - Uncommon Asthenia · constipation · diarrhea · headache · nausea · palpitations · postural hypotension · rhinitis · skin reactions · vomiting
  - Rare or very rare Angioedema · Stevens-Johnson syndrome · syncope
  - Frequency not known Dry mouth · epistaxis · vision disorders

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid in severe impairment.

**RENAL IMPAIRMENT**

Use with caution if eGFR less than 10 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

**EXCEPTIONS TO LEGAL CATEGORY**

Tamsulosin hydrochloride 400 microgram capsules can be sold to the public for the treatment of functional symptoms of benign prostatic hyperplasia in men aged 45–75 years to be taken for up to 6 weeks before clinical assessment by a doctor.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS 25**

- **Cositam XL** (Consilient Health Ltd)
  - Tamsulosin hydrochloride 400 microgram
    - Cositam XL 400 microgram tablets | 30 tablet [P] £8.89 DT = £10.47
  - **Faramsil** (Sanofi)
    - Tamsulosin hydrochloride 400 microgram
      - Faramsil 400 microgram modified-release tablets | 30 tablet [P] £8.89 DT = £10.47
  - **Flectone XL** (Teva UK Ltd)
    - Tamsulosin hydrochloride 400 microgram
      - Flectone XL 400 microgram tablets | 30 tablet [P] £9.95 DT = £10.37
  - **Flomaxtra XL** (Astellas Pharma Ltd)
    - Tamsulosin hydrochloride 400 microgram
      - Flomaxtra XL 400 microgram tablets | 30 tablet [P] £10.47 DT = £10.47

www.getintopharma.com
Tamsulosin with solifenacin

The properties listed below are those particular to the combination only. For the properties of the components please consider, tamsulosin hydrochloride p. 785, solifenacin succinate p. 779.

**INDICATIONS AND DOSE**

Moderate to severe urinary frequency, urgency, and obstructive symptoms associated with benign prostate hyperplasia when monotherapy ineffective

- **BY MOUTH**
- Adult (male): 1 tablet daily.

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises max. 1 Vesomni® tablet daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have moderate hepatic impairment, severe renal impairment, are poor metabolisers of CYP2D6, or in patients also taking a potent inhibitor of CYP2D6.

**INTERACTIONS**

- Appendix 1: alpha blockers - solifenacin
- Appendix 1: cholinesterase inhibitors - solifenacin

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate impairment; avoid in severe impairment (no information available).

**DOSE ADJUSTMENTS**

Manufacturer advises max. 1 Vesomni® tablet daily in moderate impairment.

**RENAI IMPAIRMENT**

Dose adjustments Max. 1 Vesomni® tablet daily if eGFR less than 30 ml/minute/1.73 m².

**MEDIACIAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

- Vesomni (Astellas Pharma Ltd)
- Tamsulosin hydrochloride 400 microgram, Solifenacin succinate 6 mg Vesomni 6mg/0.4mg modified-release tablets | 30 tablet (Pos) £27.62 DT = £27.62

**Terazosin**

**INDICATIONS AND DOSE**

Mild to moderate hypertension

- **BY MOUTH**
- Adult: 1 mg daily for 7 days, then increased if necessary to 2 mg daily, dose should be taken at bedtime; maintenance 2–10 mg once daily, doses above 20 mg rarely improve efficacy.

Benign prostatic hyperplasia

- **BY MOUTH**
- Adult: Initially 1 mg daily, dose should be taken at bedtime, if necessary dose may be doubled at intervals of 1–2 weeks according to response; maintenance 5–10 mg daily; maximum 10 mg per day

**CONTRA-INDICATIONS**

History of micturition syncope (in benign prostatic hyperplasia) - history of postural hypotension (in benign prostatic hyperplasia)

**CAUTIONS**

Cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - first dose

**CAUTIONS, FURTHER INFORMATION**

First dose First dose may cause collapse due to hypotension within 30–90 minutes, therefore should be taken on retiring to bed; may also occur with rapid dose increase.

**INTERACTIONS**

Appendix 1: alpha blockers

**SIDE-EFFECTS**

**PREGNANCY**

No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

**BREAST FEEDING**

No information available.

**PATIENT AND CARER ADVICE**

Patient counselling is advised for terazosin tablets (initial dose).

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

**Driving and skilled tasks**

May affect performance of skilled tasks e.g. driving.

**CHOLINE ESTERS**

**Bethanechol chloride**

**INDICATIONS AND DOSE**

Urinary retention

- **BY MOUTH**
- Adult: 10–25 mg 3–4 times a day, to be taken 30 minutes before food

**CONTRA-INDICATIONS**

Bradyxemia - cardiovascular disorders - conditions where increased motility of the gastro-intestinal tract could be harmful - conditions where increased motility of the urinary tract could be harmful - epilepsy - heart block - hyperthyroidism - hypotension - intestinal obstruction - obstructive airways disease - parkinsonism - peptic ulcer - recent myocardial infarction - urinary obstruction

**CAUTIONS**

Autonomic neuropathy (use lower initial dose)

**SIDE-EFFECTS**

Abdominal discomfort - hyperhidrosis - nausea - vomiting

**PREGNANCY**

Manufacturer advises avoid—no information available.

**BREAST FEEDING**

Manufacturer advises avoid; gastrointestinal disturbances in infant reported.

**LESS SUITABLE FOR PRESCRIBING**

Less suitable for prescribing.

www.getintopharma.com
Finasteride

**DRUG ACTION** A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

**INDICATIONS AND DOSE**

- **Benign prostatic hyperplasia**
  - **BY MOUTH**
  - Adult: 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

**SIDE-EFFECTS**

- **Adult:**
  - **Obstructive uropathy**
  - **Common or very common** Sexual dysfunction
  - **Uncommon** Breast abnormality
  - **Frequency not known** Angioedema; depressed mood; hypersensitivity; localised oedema; skin reactions; testicular disorders

**CONCEPT AND CONTRACEPTION**

- Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
- Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.

**IMPORTANT SAFETY INFORMATION**

- **MHRA/CHM ADVICE: RARE REPORTS OF DEPRESSION AND SUICIDAL THOUGHTS (MAY 2017)**
  - The MHRA has received reports of depression and, in rare cases, suicidal thoughts in men taking finasteride (Propecia®) for male pattern hair loss; depression is also associated with Proscar® for benign prostatic hyperplasia. Patients should be advised to stop finasteride immediately and inform a healthcare professional if they develop depression.

**CAUTIONS**

- Obstructive uropathy
- **SIDE-EFFECTS**
  - **Adult:**
  - **Common or very common** Sexual dysfunction
  - **Uncommon** Breast abnormalities
  - **Frequency not known** Angioedema; depression; infertility

**HANDLING AND STORAGE**

- Women of childbearing potential should avoid handling crushed or broken tablets of finasteride.

**NATIONAL FUNDING/ACCESS DECISIONS**

- Finasteride is not prescribable in NHS primary care for the treatment of androgenetic alopecia in men.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Finasteride**
  - **Finasteride 1 mg** Finasteride 1mg tablets | 28 tablet £8.36
  - **Finasteride 5 mg** Finasteride 5mg tablets | 28 tablet £11.85
  - **Aindeem** (Actavis UK Ltd)
  - **Finasteride 1 mg** Aindeem 1mg tablet | 28 tablet £33.68
  - **Finasteride 5 mg** Aindeem 5mg tablet | 84 tablet £88.40
  - **Propecia** (Merck Sharp & Dohme Ltd)
  - **Finasteride 1 mg** Propecia 1mg tablets | 28 tablet £33.68
  - **Finasteride 5 mg** Proscar 5mg tablets | 28 tablet £13.94

**Combination available:** Tamsulosin with dutasteride, p. 785

---

**Mepostrone**

**DRUG ACTION** A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

**INDICATIONS AND DOSE**

- **Prostate hyperplasia**
  - **BY MOUTH**
  - Adult: 0.5 mg daily

**SIDE-EFFECTS**

- **Adult:**
  - **Obstructive uropathy**
  - **Common or very common** Sexual dysfunction
  - **Uncommon** Breast abnormalities

**CONCEPT AND CONTRACEPTION**

- Mepostrone is not prescribed in the UK.

**HANDLING AND STORAGE**

- Women of childbearing potential should avoid handling crushed or broken tablets of mepostrone.

**NATIONAL FUNDING/ACCESS DECISIONS**

- Mepostrone is not prescribable in NHS primary care for the treatment of androgenetic alopecia in men.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Mepostrone**
  - **Mepostrone 0.5 mg** Mepostrone 0.5mg tablets | 28 tablet £22.56

**Combination available:** Tamsulosin with dutasteride, p. 785

---

**Progesterone**

**DRUG ACTION** A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

**INDICATIONS AND DOSE**

- **Breast cancer**
  - **BY MOUTH**
  - Adult: 0.5 mg daily

**SIDE-EFFECTS**

- **Adult:**
  - **Obstructive uropathy**
  - **Common or very common** Sexual dysfunction
  - **Uncommon** Breast abnormalities

**CONCEPT AND CONTRACEPTION**

- Progesterone is not prescribed in the UK.

**HANDLING AND STORAGE**

- Women of childbearing potential should avoid handling crushed or broken tablets of progesterone.

**NATIONAL FUNDING/ACCESS DECISIONS**

- Progesterone is not prescribable in NHS primary care for the treatment of androgenetic alopecia in men.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Progesterone**
  - **Progesterone 0.5 mg** Progesterone 0.5mg tablets | 28 tablet £22.56

**Combination available:** Tamsulosin with dutasteride, p. 785
1.3 Urolithiasis

Renal and ureteric stones 03-Apr-2019

Description of condition
Renal and ureteric stones are crystalline calculi that may form anywhere in the upper urinary tract. They are often asymptomatic but may cause pain when they move or obstruct the flow of urine. Most stones are composed of calcium salts (calcium oxalate, calcium phosphate or both). The rest are composed of struvite, uric acid, cystine and other substances. Patients are susceptible to stone formation when there is a decrease in urine volume and/or an excess of stone forming substances in the urine.

The following are risk factors that have been associated with stone formation: dehydration, change in urine pH, males aged between 40–60 years, positive family history, obesity, urinary anatomical abnormalities, and excessive dietary intake of oxalate, urate, sodium, and animal protein. Certain diseases which alter urinary volume, pH, and concentrations of certain ions (such as calcium, phosphate, oxalate, sodium, and uric acid) may also increase the risk of stone formation. Certain drugs such as calcium or vitamin D supplements, protease inhibitors, or diuretics may also increase the risk of stone formation.

Symptoms of acute renal or ureteric stones can include an abrupt onset of severe unilateral abdominal pain radiating to the groin (known as renal colic) that may be accompanied with nausea, vomiting, haematuria, increased urinary frequency, dysuria and fever (if concomitant urinary infection is present).

Stones can pass spontaneously and will depend on a number of factors, including the size of the stone (stones greater than 6 mm have a very low chance of spontaneous passage), the location (distal ureteral stones are more likely to pass than proximal ureteral stones), and the degree of obstruction.

Aims of treatment
- The aim of treatment is to improve the detection, clearance and prevention of renal and ureteric stones thereby reducing pain and improving quality of life.

Non-drug treatment
- Consider watchful waiting for asymptomatic renal stones if they are less than 5mm in diameter. If they are larger; the risk and benefit of this option should be discussed with the patient.
- Options for surgical stone removal should be discussed by the specialist hospital team depending on severity of obstruction, patient factors, size and site of stone. Options include shockwave lithotripsy, percutaneous nephrolithotomy and ureteroscopy.
- Consider stone analysis and measure serum calcium in patients with recurring renal or ureteric stones.
- Along with maintaining a healthy lifestyle, advise patients to drink 2.5–3 litres of water a day with the addition of fresh lemon juice and to avoid carbonated drinks. Maintain a normal daily calcium intake of 700–1200mg and salt intake of no more than 6g a day. For patients with recurrent calcium stones avoid excessive intake of oxalate-rich products, such as rhubarb, spinach, cocoa, tea, nuts, soy products, strawberries, and wheat bran. For patients with recurrent uric acid stones, avoid excessive dietary intake of urate rich products, such as liver, kidney, calf thymus, poultry skin, and certain fish (herring with skin, sardines and anchovies).

Pain Management
- Offer NSAIDs as first line treatment for the management of pain associated with suspected renal colic or renal and ureteric stones. If NSAIDs are contra-indicated or not sufficiently controlling the pain, consider intravenous paracetamol. Subsequently, opioids can be used if both paracetamol and NSAIDs are contra-indicated or not sufficiently controlling the pain. Do not offer antispasmodics to patients with suspected renal colic.

Medical Expulsive Therapy
- Consider alpha-adrenoceptor blockers for patients with distal ureteric stones less than 10mm in diameter. Alpha-adrenoceptor blockers may also be considered as adjunctive therapy for patients having shockwave lithotripsy for ureteric stones less than 10mm.

Prevention of recurrence of stones
- Alongside lifestyle advice, consider potassium citrate [unlicensed] in patients with recurrent stones composed of at least 50% calcium oxalate. Thiazides [unlicensed] may be given if patients also have hypercalciuria after restricting their sodium intake to no more than 6g a day.

1.4 Urological pain

Urological pain 03-Apr-2019

Treatment
- Lidocaine hydrochloride gel is a useful topical application in urethral pain or to relieve the discomfort of catheterisation.
- For information on the management of pain in renal and ureteric stones, see Renal and ureteric stones above.

Alkalisation of urine
- Alkalisation of urine can be undertaken with potassium citrate. The alkalising action may relieve the discomfort of cystitis caused by lower urinary tract infections. Sodium bicarbonate p. 1038 is used as a urinary alkalising agent in some metabolic and renal disorders.

ALKALISING DRUGS

<table>
<thead>
<tr>
<th>Citric acid with potassium citrate</th>
</tr>
</thead>
</table>

### INDICATIONS AND DOSE
- **Relief of discomfort in mild urinary-tract infections**
- **Alkalisation of urine**
  - **By mouth using oral solution**
    - Adult: 10 mL 3 times a day, diluted well with water

### CAUTIONS
- Cardiac disease – elderly

### INTERACTIONS
- Appendix 1: potassium citrate

### SIDE EFFECTS
- Hyperkalaemia - nausea, vomiting

### RENAL IMPAIRMENT
- Avoid in severe impairment.

Monitoring
- Close monitoring required in renal impairment—high risk of hyperkalaemia.

### PRESCRIBING AND DISPENSING INFORMATION
- When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K+/10 mL

### EXCEPTIONS TO LEGAL CATEGORY
- Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.
Sodium citrate

**INDICATIONS AND DOSE**

**Bladder washouts**
- Adult: (consult product literature)

**Relief of discomfort in mild urinary-tract infections**
- **BY MOUTH**
  - Adult: 6 ml for 1 dose

**Microlax®**

**Constipation**
- **BY RECTUM**
  - Child 3–7 years: 5–10 ml for 1 dose
  - Adult: 5–10 ml for 1 dose

**Relaxit®**

**Constipation**
- **BY RECTUM**
  - Child 3–7 years: 5 ml for 1 dose
  - Adult: 5 ml for 1 dose

**CONTRA-INDICATIONS**
- With rectal use: Acute gastro-intestinal conditions

**CAUTIONS**
- With oral use: Cardiac disease (in adults) · elderly · hypertension (in adults) · patients on a sodium-restricted diet (in adults)
- With rectal use: Debilitated patients (in adults) · sodium and water retention in susceptible individuals

**INTERACTIONS**
- Appendix 1: sodium citrate

**SIDE-EFFECTS**
- Polypuria

**PREGNANCY**
- With oral use in adults: Use with caution.

**RENAL IMPAIRMENT**
- With oral use: In patients with fluid retention, avoid antacids containing large amounts of sodium.

**PRESCRIBING AND DISPENSING INFORMATION**
- Sodium citrate 300 mmol/litre (88.2 mg/ml) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

**EXCEPTIONS TO LEGAL CATEGORY**
- Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

Oral solution

**CAUTIONARY AND ADVISORY LABELS**
- Note: Sodium citrate may cause fluid and sodium retention in susceptible individuals.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Granules**
- **Sodium citrate (Non-proprietary)**
  - Sodium citrate 4 gram
  - Sodium citrate 4g oral granules sachets
  - 6 sachet (£1.28)
- Brands may include CanesOasis, Cymalon (sodium citrate), Cystocalm

**Oral solution**
- **Sodium citrate (Non-proprietary)**
  - Sodium citrate 8.23 mg per ml
  - Sodium citrate 0.3M oral solution
  - 30 ml (£1.50) 4.50 DT = £4.50

---

**Powder**
- **Sodium citrate (Non-proprietary)**
  - Sodium citrate 4 gram
  - Sodium citrate 4g oral powder sachets
  - 6 sachet (£1.65) 1.65 DT = £1.65

**Irrigation solution**
- **Sodium citrate (Non-proprietary)**
  - Sodium citrate 3% irrigation solution
  - 1 litre bags

**Enema**
- **Micolette Micro-enema** (Pinewood Healthcare)
  - Sodium citrate 90 mg per ml
  - Micolette Micro-enema 5ml
  - 12 enema (£1.45)
- **Micralax Micro-enema** (RPH Pharmaceuticals AB)
  - Sodium citrate 90 mg per ml
  - Micralax Micro-enema 5ml
  - 12 enema (£1.87)

**HEPARINOID**

Pentosan polysulfate sodium

**INDICATIONS AND DOSE**

**Bladder pain syndrome**
- **BY MOUTH**
  - Adult: 100 mg 3 times a day, review treatment after 6 months and discontinue if no response

**CONTRA-INDICATIONS**
- Active bleeding

**CAUTIONS**
- Patients at increased risk of bleeding

**SIDE-EFFECTS**
- Common or very common: Anemia · asthenia · back pain · diarrhoea · dizziness · gastrointestinal discomfort · haemorrhage · headache · increased risk of infection · nausea · pelvic pain · peripheral oedema·
- Uncommon: Amylobia · anemia · appetite decreased · arthralgia · constipation · depression · dyspnoea · emotional lability · excessive tearing · flatulence · hyperhidrosis · hyperkinesia · insomnina · leucopenia · melanoctytic naevus size increased · myalgia · oral ulceration · paraesthesia · photosensitivity reaction · skin reactions · thrombocytopenia · tinnitus · vomiting · weight changes
- Frequency not known: Coagulation disorder · hepatic function abnormal

**PREGNANCY**
- Manufacturer advises avoid—no information available.

**BREAST FEEDING**
- Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution—evidence of hepatic involvement in elimination.

**RENAL IMPAIRMENT**
- Manufacturer advises caution—evidence of renal involvement in elimination.

**MONITORING REQUIREMENTS**
- Manufacturer advises careful monitoring in patients with history of heparin or pentosan polysulfate sodium induced thrombocytopenia.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**
- Note: Pentosan polysulfate sodium may cause fluid and sodium retention in susceptible individuals.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Anethol with borneol, camphene, cineole, fenchone and pinene**

**INDICATIONS AND DOSE**

**Urolithiasis for the expulsion of calculi**
- **BY MOUTH**
  - Adult: 1–2 capsules 3–4 times a day, to be taken before food

---

www.getintopharma.com
Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts. Aqueous chlorhexidine p. 1211 can be used in the management of common infections of the bladder but it is ineffective against most Pseudomonas spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% p. 1040 (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with amphotericin 50 micrograms/mL p. 593 may be of value in mycotic infections in adults.

Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% p. 789 may also be helpful.

Bladder cancer

Bladder instillations of doxorubicin hydrochloride p. 901 and mitomycin p. 919 are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin hydrochloride p. 902 is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin hydrochloride is also used for some papillary tumours.

Instillation of BCG (Bacillus Calmette-Guérin p. 958), a live attenuated strain derived from Mycobacterium bovis is licensed for the treatment of primary or recurrent bladder carcinoma in-situ and for the prevention of recurrence following transurethral resection.

Urological surgery

Glycine below irrigation solution 1.5% is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

ANTISEPTICS AND DISINFECTANTS

Chlorhexidine with lidocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1211, lidocaine hydrochloride p. 103.

INDICATIONS AND DOSE

Urethral sounding and catheterisation

BY URETHRAL APPLICATION

Adult: 6–11 mL

Cystoscopy

BY URETHRAL APPLICATION

Adult: 11 mL, then 6–11 mL if required

INTERACTIONS

Appendix 1: antiarrhythmics

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCipients: May contain Hydroxybenzoates (parabens)

Instillagel (CliniMed Ltd)

Chlorhexidine gluconate 500 microgram per 1 mL, Lidocaine hydrochloride 20 mg per 1 mL Instillagel gel | 60 mL £14.05 DT + £14.05 | 110 mL £15.76 DT + £15.76

IRRIGATING SOLUTIONS

Glycine

INDICATIONS AND DOSE

Bladder irrigation during urological surgery | Irrigation for transurethral resection of the prostate gland and bladder tumours

Adult: (consult product literature)

CAUTIONs

Urological surgery There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract.

SIDE-EFFECTS

Cardiovascular disorder - electrolyte depletion - fluid overload - pulmonary disorder - seizure - vision blurred

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Irrigation solution

Glycine (Non-proprietary)

Glycine 1.5% irrigation solution 3 litre Flowfusor bottles | 1 bag £0.05

Glycine 1.5% irrigation solution 1 litre Easyflow bags | 1 bag £0.05

Glycine 1.5% irrigation solution 2 litre Flowfusor bottles | 1 bottle

Catheter maintenance solutions

3 Contraception

Contraceptives, hormonal

Overview
The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg) should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a spermicide. Occasionally sensitivity reactions occur. A female condom (Femidom®) is also available; it is pre-lubricated but does not contain a spermicide.

Combined hormonal contraceptives
Oral contraceptives containing an oestrogen and a progestogen (‘combined oral contraceptives’) are effective preparations for general use. Advantages of combined oral contraceptives include:
- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed ‘monophasic’; those with varying amounts of the two hormones are termed ‘phasic’. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Genito-urinary system

The content of combined oral contraceptives ranges from 30 to 40 micrograms. Generally a preparation with the lowest ethinylestradiol is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- Low strength preparations (containing ethinylestradiol 30 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- Standard strength preparations (containing ethinylestradiol 40 micrograms) are appropriate for standard use. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 798, ethinylestradiol with drospirenone p. 798, and ethinylestradiol with gestodene p. 799 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 797 is in the combined oral contraceptive Qlaira®. Nomegestrol is the progestogen contained in the combined oral contraceptive Zoely®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (Evra®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (NavarRing®).

Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives.
contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 55 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives
Medroxyprogesterone acetate p. 810 (Depo-Provera®, SAYANA PRESS®) is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (Noristerat®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An etonogestrel-releasing implant (Neplanon®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood–etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device
The progestogen-only intra-uterine systems Mirena®, Jaydess® and Levovsert® release levonorgestrel p. 806 directly into the uterine cavity. Mirena® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. Jaydess® and Levovsert® are licensed for contraception, and Levovsert® is additionally licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery
All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Contraceptives, non-hormonal
Spermicidal contraceptives
Spermicidal contraceptives are useful additional safeguards but do not give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol ‘9’ p. 811 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Contraceptive devices
Intra-uterine devices
The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (Gyne Fi®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

Caution with oil-based lubricants
Products such as petroleum jelly (Vaseline®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).
Emergency contraception

Overview
Emergency contraception is intended for occasional use, to reduce the risk of pregnancy after unprotected sexual intercourse. It does not replace effective regular contraception.

Women who do not wish to conceive should be offered emergency contraception after unprotected sexual intercourse that has taken place on any day of a natural menstrual cycle. Emergency contraception should also be offered after unprotected intercourse from day 21 after childbirth (unless criteria for lactational amenorrhea are met), and from day 5 after abortion, miscarriage, ectopic pregnancy or uterine evacuation for gestational trophoblastic disease.

Emergency contraception should also be offered to women if their regular contraception has been compromised or has been used incorrectly.

Emergency contraceptive methods
Copper intra-uterine devices

Insertion of a copper intra-uterine device (see intra-uterine contraceptive devices (copper) p. 802) is the most effective form of emergency contraception and should be offered (if appropriate) to all women who have had unprotected sexual intercourse and do not want to conceive. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse or up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle. Antibacterial cover should be considered for copper intra-uterine contraceptive device insertion if there is a significant risk of sexually transmitted infection that could be associated with ascending pelvic infection.

A copper intra-uterine device is not known to be affected by body mass index (BMI) or body-weight or by other drugs.

Hormonal methods

Hormonal emergency contraception (includes levonorgestrel p. 806 and ulipristal acetate p. 804) should be offered as soon as possible after unprotected intercourse if a copper intra-uterine device is not appropriate or is not acceptable to the patient; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy. Hormonal emergency contraception administered after ovulation is ineffective.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse (unlicensed use), but efficacy decreases with time. Ulipristal acetate is effective if taken within 120 hours (5 days) of unprotected intercourse. Ulipristal acetate has been demonstrated to be more effective than levonorgestrel for emergency contraception. It is possible that a higher body-weight or BMI could reduce the effectiveness of oral emergency contraception, particularly levonorgestrel; if BMI is greater than 26 kg/m² or body-weight is greater than 70 kg, it is recommended that either ulipristal acetate or a double dose of levonorgestrel [unlicensed indication] (see Emergency contraception under levonorgestrel) is given. It is unknown which is more effective.

Ulipristal acetate should be considered as the first-line hormonal emergency contraceptive for a woman who has had unprotected intercourse 96–120 hours ago (even if she has also had unprotected intercourse within the last 96 hours). It should also be considered first line for a woman who has had unprotected sexual intercourse within the last 5 days if it is likely to have taken place during the 5 days before the estimated day of ovulation.

Hormonal emergency contraception interactions
See Contraceptives, interactions below.

Starting hormonal contraception after emergency hormonal contraception

Emergency hormonal contraception methods do not provide ongoing contraception. After taking levonorgestrel, women should start suitable hormonal contraception immediately. They must use condoms reliably or abstain from intercourse until contraception becomes effective.

Women should wait 5 days after taking ulipristal acetate before starting suitable hormonal contraception. Women must use condoms reliably or abstain from intercourse during the 5 day waiting period and also until their contraceptive method is effective.

The copper intra-uterine device immediately provides effective ongoing contraception.

Useful Resources

Contraceptives, interactions

Overview
The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 311, eslicarbazepine acetate, nevirapine p. 645, oxcarbazepine p. 321, phenytoin p. 323, phenobarbital p. 335, primidone p. 336, rifonavir p. 659, St John’s Wort, topiramate p. 331, and, above all, rifabutin p. 578 and rifampicin p. 582), and possibly also griseofulvin p. 601. A condom together with a long-acting method (such as an injectable contraceptive) may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Combined hormonal contraceptive interactions

Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progesteron-only contraceptives (medroxyprogesterone acetate p. 810 and norethisterone p. 764) or intra-uterine devices (levonorgestrel p. 806; see also Contraceptives, non-hormonal p. 793). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

Short course (2 months or less) of an enzyme-inducing drug

Containing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

Long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin) or a course of griseofulvin

Use a monophasic combined oral contraceptive at a dose of ethinylestradiol p. 759 50 micrograms or more daily [unlicensed use] and use either an extended or a “tricycling” regime (i.e. taking three packets of monophasic tablets without a break followed by a shortened tablet-free interval of four days [unlicensed use]); continue for the duration of
treatment with the interacting drug and for four weeks after stopping. If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use] on specialist advice, or to use additional precautions, or to change to a method unaffected by the interacting drugs.

Use of contraceptive patches and vaginal rings (including concurrent use of two patches or two vaginal rings) is not recommended for women taking enzyme-inducing drugs over a long period.

**Long-term contraception (over 2 months) of rifampicin or rifabutin**

An alternative method of contraception (such as an IUD) is always recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for four weeks after stopping the enzyme-inducing drug.

**Antibacterials that do not induce liver enzymes**

It is recommended that no additional contraceptive precautions are required when combined oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman.

There had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 550, doxycycline p. 564) reduce the efficacy of combined oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

**Oral progestogen-only contraceptives interactions**

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

**Parenteral progestogen-only contraceptives interactions**

Effectiveness of parenteral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

Effectiveness of the etonogestrel-releasing implant p. 809 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug.

**Hormonal emergency contraception interactions**

The effectiveness of levonorgestrel and ulipristal acetate p. 804 is reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See *Dose adjustments due to interactions* under levonorgestrel). There is no need to increase the dose for emergency contraception if the patient is taking antibiotics that are not enzyme inducers.

The effectiveness of ulipristal acetate for emergency contraception in women using drugs that increase gastric pH has not been studied. Levonorgestrel or a copper intra-uterine device should be considered as alternatives.

**Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception**—the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended. Ulipristal acetate can be used as emergency hormonal contraception more than once in the same cycle. Conversely, manufacturer advises that use of levonorgestrel as emergency contraception more than once in the same cycle is not advisable due to increased risk of side-effects (such as menstrual irregularities).

**Useful Resources**

### 3.1 Contraception, combined

**OESTROGENS COMBINED WITH PROGESTOGENS**

**Combined hormonal contraceptives**

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058 - gallstones - heart disease associated with pulmonary hypertension or risk of embolus - history during pregnancy of cholestatic jaundice - history during pregnancy of choledocholithiasis - history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) - history of haemolytic jaundice syndrome - migraine with aura - personal history of venous or arterial thrombosis - sclerosing treatment for varicose veins - severe or multiple risk factors for arterial disease - severe or multiple risk factors for venous thromboembolism - systemic lupus erythematosus with (or unknown) antiphospholipid antibodies - transient ischaemic attacks without headaches - undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) — seek specialist advice - Crohn’s disease - gene mutations associated with breast cancer (e.g. BRCA 1) - history of severe depression especially if induced by hormonal contraceptive - hyperprolactinaemia (seek specialist advice) - inflammatory bowel disease - migraine - personal or family history of hypertriglyceridaemia
Risk factors for venous thromboembolism

There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100,000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

Risk factors for venous thromboembolism

Use with caution if any of the following factors present but avoid if two or more factors present:

- family history of venous thromboembolism in first-degree relative aged under 45 years (avoid if atherogenic lipid profile);
- diabetes mellitus (avoid if diabetes complications present);
- hypertension; blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (in adolescents, avoid if blood pressure very high);
- smoking (avoid if smoking 40 or more cigarettes daily);
- age over 35 years (avoid if over 50 years);
- obesity (avoid if body mass index \( \geq 35 \text{ kg/m}^2 \) unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dizziness or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

SIDE-EFFECTS

- Common or very common Acne, fluid retention, headaches, metrorrhagia, nausea, weight increased
- Uncommon Alopecia, hypertension
- Rare or very rare Venous thromboembolism

Combination hormone contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dizziness or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

SIDE-EFFECTS

Common or very common Acne, fluid retention, headaches, metrorrhagia, nausea, weight increased

Uncommon Alopecia, hypertension

Rare or very rare Venous thromboembolism
reasonably certain woman is not pregnant, first course can be
started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. Every day (ED) combined preparations, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations. Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for Qlaira ®). After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira ®). After abortion or miscarriage Start same day.

■ PATIENT AND CARER ADVICE

Travel Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery. Diarrhoea and vomiting Vomiting and severe diarrhoea can interfere with the absorption of combined oral contraceptives. The FSRH advises following the instructions for missed pills if vomiting occurs within 3 hours of taking a combined oral contraceptive or severe diarrhoea occurs for more than 24 hours. Use of non-oral contraception should be considered if diarrhoea or vomiting persist.

Missed doses The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary. If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets).

Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Dienogest with estradiol valerate

■ INDICATIONS AND DOSE

Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations

■ BY MOUTH

• Females of childbearing potential: 1 active tablet daily for 26 days, followed by 1 inactive tablet daily for 2 days, to be started on day 1 of cycle with first active tablet (withdrawal bleeding may occur during the 2-day interval of inactive tablets); subsequent courses repeated without interval

■ INTERACTIONS ➔ Appendix 1: combined hormonal contraceptives

■ SIDE-EFFECTS

→ Common or very common Breast abnormalities • gastrointestinal discomfort • increased risk of infection • menstrual cycle irregularities

→ Uncommon Appetite increased • cervical abnormalities • crying • depression • diaphragm • dizziness • fatigue • haemorrhage • hot flush • hyperhidrosis • mood altered • muscle spasms • neoplasms • oedema • ovarian and fallopian tube disorders • painful sexual intercourse • pelvic disorders • sexual dysfunction • skin reactions • sleep disorders • uterine cramps • vomiting • vulvovaginal disorders • weight decreased

→ Rare or very rare Aggression • anxiety • arterial thrombocytopenia • asthma • chest pain • cholecystitis • chronic • concentration impaired • constipation • contact lens intolerance • dry eye • dry mouth • dyspnoea • eye swelling • fever • galactorrhoea • gastrointestinal reflux disease • genital discharge • hair changes • hypertriglyceridaemia • hypotension • lymphadenopathy • malaise • myocardial infarction • pain • palpitations • paraesthesia • seborrhoea • sensation of pressure • urinary tract pain • vascular disorders • vertigo

■ DIRECTIONS FOR ADMINISTRATION

Changing to Qlaira ® Start the first active Qlaira ® tablet on the day after taking the last active tablet of the previous brand.

■ PATIENT AND CARER ADVICE

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking Qlaira ®, refer to product literature. Missed doses A missed pill for a patient taking Qlaira ® can be taken if started no later than 12 hours of the end of the packet, or repeated without interval on the previous cycle.

www.getintopharma.com
**Ethinylestradiol with etonogestrel**

**INDICATIONS AND DOSE**

**Contraception** | Menstrual symptoms
- **BY VAGINA**
- Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs).
- **INTERACTIONS** | Appendix 1: combined hormonal contraceptives

**DIRECTIONS FOR ADMINISTRATION**

Changing method of contraception to vaginal ring
Changing from combined hormonal contraception: Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.
Changing from progestogen-only method: From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how to administer vaginal ring. Counselling: The presence of the ring should be checked regularly.

**Missed doses**
Expulsion, delayed insertion or removal, or broken vaginal ring
If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.
If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:
- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.
If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.
If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

**INTERACTIONS** | Appendix 1: combined hormonal contraceptives

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, breast abnormalities, depression, dizziness, increased risk of infection, menstrual cycle irregularities, mood swings, nervousness, vaginal discharge
- **Uncommon** Appetite abnormal, diarrhoea, hirsutism, hypertri glycaemia, sexual dysfunction, skin reactions, vomiting
- **Rare or very rare** Angioedema, chorea exacerbated, ear disorders, embolism and thrombosis, erythema nodosum, eye irritation, gallbladder disorders, gastrointestinal disorders, haemolytic uraemic syndrome, hepatic disorders, hypersensitivity, inflammatory bowel disease, neonatal depression, optic neuritis, pancreatitis, systemic lupus erythematosus exacerbated, varicose veins exacerbated, weight decreased

INTERACTIONS
- Appendix 1: combined hormonal contraceptives

SIDE-EFFECTS
- Common or very common: Anxiety, breast abnormalities, diarrhoea, dizziness, fatigue, gastrointestinal discomfort, increased risk of infection, malaise, menstrual cycle irregularities, mood altered, muscle spasms, skin reactions, uterine cramps, vaginal haemorrhage, vomiting, vulvovaginal disorders.
- Uncommon: Appetite increased, dyslipidaemia, insomnia, lactation disorders, oedema, photosensitivity reaction, sexual dysfunction.
- Rare or very rare: Embolism and thrombosis, gallbladder disorders, genital discharge, neoplasms, stroke, swelling.
- Frequency not known: Anger, angioedema, cervical dysplasia, colitis, contact lens intolerance, erythema nodosum, hepatic disorders, hyperglycaemia, intracranial haemorrhage, myocardial infarction, pulmonary artery thrombosis, taste altered.

www.getintopharma.com
**DIRECTIONS FOR ADMINISTRATION**

Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.

**Changing to a transdermal combined hormonal contraceptive**

**Changing from combined oral contraception**

Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

**Changing from progestogen-only method**

- from an implant, apply first patch on the day implant is removed
- from an injection, apply first patch when next injection is due
- from oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

**After childbirth (not breast-feeding)**

Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

**After abortion or miscarriage**

Before 20 weeks’ gestation start immediately; no additional contraception required if started immediately. After 20 weeks’ gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

**PATIENT AND CARER ADVICE**

Patients and carers should be given advice on how to administer patches. Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

**Missed doses**

**Delayed application or detached patch**

If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual ‘change day’. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch ‘change day’ remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new ‘Day 1’; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual ‘change day’, the day after day 28; no additional contraception is required.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 48/03

The Scottish Medicines Consortium has advised (September 2003) that Evra™ patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

3.2 Contraception, devices

Other drugs used for Contraception, devices

Levonorgestrel, p. 806

CONTRACEPTIVE DEVICES

**Intra-uterine contraceptive devices (copper)**

- **INDICATIONS AND DOSE**
  - Contraception
    - **By intra-uterine administration**
      - Females of childbearing potential: (consult product literature)
  - **IMPORTANT SAFETY INFORMATION**
    - MHRA/CHM advice (June 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS
      - Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and symptoms include:
        - severe pelvic pain after insertion (worse than period cramps);
        - pain or increased bleeding after insertion which continues for more than a few weeks;
        - sudden changes in periods;
        - pain during intercourse;
        - unable to feel the threads.
      - Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

- **CONTRA-INDICATIONS** Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · distorted uterine cavity · established or marked immunosuppression · genital malignancy · medical diathesis · pelvic inflammatory disease · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding · Wilson’s disease
- **CAUTIONS** Anaemia · anticoagulant therapy (avoid if possible) · diabetes · disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age

---

**Contraception, devices**

Levonorgestrel, p. 806
and the intra-uterine device is removed after day 3 of the menstrual cycle.

- **Risk of infection** The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
  - they are under 25 years old or
  - they are over 25 years old and
    - have a new partner or
    - have had more than one partner in the past year or
    - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

- **SIDE-EFFECTS** Device complications - epilepsy (on insertion) - haemorrhage (on insertion) - hypersensitivity - menstrual cycle irregularities - pain (on insertion) - pelvic infection exacerbated - pre-sycope (on insertion) - uterine injuries

**SIDE-EFFECTS, FURTHER INFORMATION** Advise the patient to seek medical attention promptly in case of significant symptoms—very small risk of uterine perforation, ectopic pregnancy and pelvic inflammatory disease.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a copper allergy.

- **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.

- **BREAST FEEDING** Not known to be harmful.

- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.

- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **TT380® SLIMLINE** For uterine length 6.5–9 cm; replacement every 10 years.
  - **LOAD® 375** For uterine length over 7 cm; replacement every 5 years.
  - **NOVAPLUS T 380® AG ‘Mini’** size for minimum uterine length 5 cm; ‘Normal’ size for uterine length 6.5–9 cm; replacement every 5 years.
  - **MULTILOAD® CU375** For uterine length 6–9 cm; replacement every 5 years.
  - **GYNEFLEX®** Suitable for all uterine sizes; replacement every 5 years.
  - **UT380 STANDARD®** For uterine length 6.5–9 cm; replacement every 5 years.
  - **UT380 SHORT®** For uterine length 5–7 cm; replacement every 5 years.
  - **MULTI-SAFE® 375** For uterine length 6–9 cm; replacement every 5 years.
  - **ANCORA® 375 CU** For uterine length over 6.5 cm; replacement every 5 years.

PROGESTERONE RECEPTOR MODULATORS

Ulipristal acetate

**DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

**INDICATIONS AND DOSE**
- Pre-operative treatment of moderate to severe symptoms of uterine fibroids (initiated by a specialist)
  - **BY MOUTH**
  - Adult: 5 mg once daily for up to 3 months starting during the first week of menstruation
- Intermittent treatment of moderate to severe symptoms of uterine fibroids if surgery not appropriate (initiated by a specialist)
  - **BY MOUTH**
  - Adult: 5 mg once daily for up to 3 months starting during the first week of menstruation, treatment course may be repeated if necessary; re-treatment should start no sooner than during the first week of the second menstruation following completion of the previous course; maximum 4 courses

**EMERGENCY CONTRACEPTION**
- **BY MOUTH**
- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: ESMYA® (ULIPRISTAL ACETATE) FOR SYMPTOMS OF UTERINE FIBROIDS: RESTRICTIONS TO USE AND REQUIREMENT TO CHECK LIVER FUNCTION BEFORE, DURING AND AFTER TREATMENT (AUGUST 2018)

Rare but serious cases of liver injury, including cases of hepatic failure requiring liver transplantation, have been reported worldwide in women treated with **Esmya**® for the symptoms of uterine fibroids. An EU review of the available data concluded that **Esmya**® may have contributed to the onset of some of the cases of serious liver injury and has now finalised with a number of measures to minimise this risk. In particular, more than one treatment course is now authorised only in women who are not eligible for surgery, and liver function monitoring is to be carried out in all women treated with **Esmya**®. See Monitoring requirements for further information.

**CONTRA-INDICATIONS**
- When used for uterine fibroids Breast cancer - cervical cancer - ovarian cancer - undiagnosed vaginal bleeding - uterine cancer - vaginal bleeding not caused by uterine fibroids

**CAUTIONS**
- Uncontrolled severe asthma

**INTERACTIONS** → Appendix 1: ulipristal

**SIDE-EFFECTS**
- Common or very common Back pain; breast tenderness; dizziness; fatigue; gastrointestinal discomfort; headaches; menstrual cycle irregularities; mood altered; myalgia; nausea; pelvic pain; vomiting
- Uncommon Anxiety; appetite disorder; chills; concentration impaired; diarrhoea; drowsiness; dry mouth; fever; flatulence; hot flush; increased risk of infection; insomnia; libido disorder; malaise; skin reactions; vision disorders; vulvovaginal disorders
- Rare or very rare Abnormal sensation in eye; disorientation; dry throat; eye erythema; genital pruritus; ovarian cyst ruptured; painful sexual intercourse; syncope; taste altered; thirst; tremor; vertigo
- Frequency not known Hepatic disorders

**CONCEPTION AND CONTRACEPTION** When ulipristal is given for uterine fibroids non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used both during treatment and for 12 days after stopping, if required.

**PREGNANCY**
- When used for Emergency contraception Limited information available—if pregnancy occurs, manufacturer advises report to the ellaOne® pregnancy registry.
- When used for Uterine fibroids Manufacturer advises avoid—limited information available.

**BREAST FEEDING**
- When used for Emergency contraception Manufacturer advises avoid for 1 week after administration—present in milk.
- When used for Uterine fibroids Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
- When used for Emergency contraception Manufacturer advises avoid in severe impairment (no information available).
- When used for Uterine fibroids Manufacturer advises avoid (no information available).

**RENAI IMPAIRMENT**
- When used for Uterine fibroids Manufacturer advises avoid in severe impairment unless patient is closely monitored—no information available.

**MONITORING REQUIREMENTS**
- When used for Uterine fibroids Manufacturer advises perform liver function tests before treatment initiation—do not initiate if transaminases exceed 2 times the upper limit of normal. During the first 2 treatment courses, monitor liver function monthly; for further treatment courses, perform liver function tests once before each new treatment course and when clinically indicated. At the end of each treatment course, perform liver function tests after 2–4 weeks. Discontinue treatment if serum transaminases exceed 3 times the upper limit of normal and closely monitor patient. Manufacturer advises periodic monitoring of the endometrium following repeated intermittent treatment.

**PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of **Esmya**® has provided a Physician’s Guide to Prescribing **Esmya**®.

**PATIENT AND CARER ADVICE**
- When used for Emergency contraception When prescribing or supplying hormonal emergency contraception, manufacturer advises women should be told:
  - if vomiting occurs within 3 hours of taking a dose, a replacement dose should be taken;
  - that their next period may be early or late;
  - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.
- The Faculty of Sexual and Reproductive Healthcare also advises women should be told:
  - that a barrier method of contraception needs to be used—see Emergency contraception p. 794 for further information;
  - that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman’s usual dysmenorrhoea;
  - that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.
- When used for Uterine fibroids Before initiation of **Esmya**®, the MHRA advises that women are informed of the rare risk of liver damage and the need for liver function testing. Women should also be advised to seek urgent medical attention if they develop any symptoms or signs of liver injury (such as unusual tiredness, yellowing of the skin, darkening of the urine, nausea and vomiting).
3.4 Contraception, oral progestogen-only

Other drugs used for Contraception, oral progestogen-only
Norethisterone, p. 764

PROGESTOGENS
Desogestrel

INDICATIONS AND DOSE
Contraception
BY MOUTH
Females of childbearing potential: 75 micrograms daily, dose to be taken at the same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a 'missed pill'.

CONTRA-INDICATIONS
Acute porphyrias p. 1058, history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable, severe arterial disease, undiagnosed vaginal bleeding

CAUTIONS
Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice, arterial disease, functional ovarian cysts, history of jaundice in pregnancy—malabsorption syndromes, past ectopic pregnancy, sex-steroid dependent cancer, systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

CAUTIONS, FURTHER INFORMATION
Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

INTERACTIONS
Appendix 1: desogestrel

SIDE-EFFECTS
Common or very common
Breast abnormalities—depressed mood—headache—libido decreased—menstrual cycle irregularities—mood altered—nausea—skin reactions—weight increased

Uncommon
Allopia—contact lens intolerance—fatigue—ovarian cyst—vomiting—vulvovaginal infection

Rare or very rare
Erythema nodosum

Frequency not known
Angioedema—embolism and thrombosis—neoplasms

SIDE-EFFECTS, FURTHER INFORMATION
The benefits of using progestogen-only contraceptives (POCs), such as desogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

Available evidence does not support an association between the use of a progestogen-only contraceptive pill and breast cancer. Any increased risk is likely to be small and reduces gradually during the 10 years after stopping; there is no excess risk 10 years after stopping. The older age at which the contraceptive is stopped appears to have a greater influence on increased risk rather than the duration of use.

PREGNANCY
Not known to be harmful.

BREAST FEEDING
Progestogen-only contraceptives do not affect lactation.

HEPATIC IMPAIRMENT
Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

PATIENT AND CARER ADVICE
Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine
One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth
Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Diarrhoea and vomiting
Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Missed doses
The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days’.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.
Levonorgestrel

29-Oct-2018

INDICATIONS AND DOSE

Emergency contraception

BY MOUTH

- Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time), alternatively 3 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours and no later than after 72 hours (may also be used between 72–96 hours after coitus but efficacy decreases with time). Higher dose should be considered for patients with body-weight over 70 kg or BMI over 26 kg/m².

Contraception

BY MOUTH

- Females of childbearing potential: 30 micrograms daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’.

BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks’ gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years.

BY INTRA-UTERINE DEVICES

BY INTRA-UTERINE DEVICE

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks’ gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years.

PREVENTION OF ENDOMETRIAL HYPERPLASIA DURING OESTROGEN REPLACEMENT THERAPY

- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years.

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs.
- There is no need to increase the dose for emergency contraception if the patient is taking antibiotics that are not enzyme inducers.
- With the progesterone-only intra-uterine device, levonorgestrel is released close to the site of the main

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SNC No. 36/03

The Scottish Medicines Consortium has advised (September 2003) that Cerazette® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Desogestrel (Non-proprietary)
  - Desogestrel 75 microgram: Desogestrel 75microgram tablets, 84 tablet [PPI] £3.50 DT = £2.44

  - Moonia (Stragen UK Ltd)
  - Desogestrel 75 microgram: Moonia 75microgram tablets, 84 tablet [PPI] £6.50 DT = £2.44 (Hospital only)
  - Zellera (Morningside Healthcare Ltd)
  - Desogestrel 75 microgram: Zellera 75microgram tablets, 84 tablet [PPI] £2.98 DT = £2.44

Contraception

BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks’ gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years.

BY INTRA-UTERINE DEVICES

KYLEENA® 19.5MG INTRA-UTERINE DEVICE

Contraception

- BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks’ gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years.

LEVOSERT® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception

- BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement (additional precautions (e.g. barrier methods) advised for at least 7 days before), or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately following termination of pregnancy below 24 weeks’ gestation; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 4 years.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception

- BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years.

PREVENTION OF ENDOMETRIAL HYPERPLASIA DURING OESTROGEN REPLACEMENT THERAPY

- BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years.

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs.

- There is no need to increase the dose for emergency contraception if the patient is taking antibiotics that are not enzyme inducers.

- With the progesterone-only intra-uterine device, levonorgestrel is released close to the site of the main

www.getintopharma.com
contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen–only intra-uterine system and additional contraceptive precautions are not required.

- **UNLICENSED USE**
  - With intra-uterine use The Faculty of Sexual and Reproductive Healthcare (FSRH) advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
    - Insertion at any time if reasonably certain the woman is not pregnant or at risk of pregnancy;
    - Additional precautions (e.g. barrier methods) for at least 7 days before replacement even if immediate replacement is intended;
    - Insertion immediately following termination of pregnancy below 24 weeks’ gestation;
    - Postpartum insertions 4 weeks after delivery.
  - With oral use The FSRH advises levonorgestrel is used as detailed below, although these situations are considered unlicensed:
    - Higher dose option for emergency contraception in patients with body-weight over 70 kg or BMI over 26 kg/m²;
    - Use for emergency contraception between 72–96 hours after coitus.
  - With intra-uterine use or oral use in children Consult product literature for licensing status of individual preparations.

- **IMPORTANT SAFETY INFORMATION**
  **MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS**
  Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:
  - Severe pelvic pain after insertion (worse than period cramps);
  - Pain or increased bleeding after insertion which continues for more than a few weeks;
  - Sudden changes in periods;
  - Pain during intercourse;
  - Unable to feel the threads.
  Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

- **CONTRA-INDICATIONS**
  - With intra-uterine use Active porphyrias p. 1058
  - When used for contraception with oral use for contraception history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

- **CAUTIONS**
  **GENERAL CAUTIONS** Risk factors for ectopic pregnancy (including previous ectopic pregnancy, tubal surgery or pelvic infection)
  **SPECIFIC CAUTIONS**
  - With intra-uterine use Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) - acute venous thromboembolism (consider removal) - anemia - anticoagulant therapy (avoid if possible) - diabetes - drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) - endometriosis - epilepsy - risk of seizure at time of insertion) - fertility problems - history of pelvic inflammatory disease - increased risk of expulsion if inserted before uterine involution - jaundice (consider removal) - marked increase of blood pressure (consider removal) - migraine (consider removal) - nulliparity - severe arterial disease (consider removal) - severe cervical stenosis - severe headache (consider removal) - severe primary dysmenorrhea - severely scarred uterus (including after endometrial resection) - young age
  - When used for contraception with oral use for contraception active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - functional ovarian cysts - history of jaundice in pregnancy - malabsorption syndromes - past ectopic pregnancy - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
  - When used for emergency contraception with oral use for emergency contraception active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - functional ovarian cysts - history of jaundice in pregnancy - malabsorption syndromes - past ectopic pregnancy - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

- **CAUTIONS, FURTHER INFORMATION**
  - With intra-uterine use The Faculty of Sexual and Reproductive Healthcare advises intercourse should be avoided or another method of contraception used for at least 7 days before removal of intra-uterine device—emergency contraception may need to be considered if recent intercourse has occurred and the intra-uterine device is removed.
  - Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
    - They are under 25 years old or
    - They are over 25 years old and
    - Have a new partner or
    - Have had more than one partner in the past year or
    - Their regular partner has other partners.
  In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.
  - Use as a contraceptive in co-morbidities
  - With oral use The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE
Advanced uterine atrophy

INTERACTIONS
Appendix 1: levonorgestrel

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Common or very common: Gastrointestinal discomfort, headaches, menstrual cycle irregularities, nausea, skin reactions.

SPECIFIC SIDE-EFFECTS
- Common or very common:
  - With intra-uterine use: Back pain, breast abnormalities, depression, device expulsion, hirsutism, increased risk of infection, libido decreased, nervousness, ovarian cyst, pelvic disorders, uterine haemorrhage (on insertion), vaginal haemorrhage (on insertion), vulvovaginal disorders, weight increased.
  - With oral use: Breast tenderness, diarrhoea, dizziness, fatigue, haemorrhage, vomiting.
- Uncommon:
  - With intra-uterine use: Alopecia, endometritis, oedema, uterine rupture.
- Rare or very rare:
  - With oral use: Face oedema, pelvic pain.
- Frequency not known:
  - With oral use: Cerebrovascular insufficiency, depressed mood, diabetes mellitus, embolism and thrombosis, neoplasms, sexual dysfunction, weight changes.

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer: There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 6 months.

With intra-uterine use: There is no evidence of an association between the levonorgestrel intra-uterine system and breast cancer. The levonorgestrel intra-uterine system should be avoided in patients with a history of breast cancer; any consideration of its use should be by a specialist in contraception and in consultation with the patients cancer specialist.

Patients should be informed about the device that has been inserted and when it should be removed or replaced (including referring them to a patient information leaflet and other sources of information).

Patients may experience irregular, prolonged or infrequent menstrual bleeding in the 3–6 months following insertion; bleeding pattern improves with time but persists in some patients.

Progestogenic side-effects resolve with time (after the first few months).

PREGNANCY
- With oral use: Not known to be harmful.
- With intra-uterine use: If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

BREAST FEEDING
Progestogen-only contraceptives do not affect lactation.

HEPATIC IMPAIRMENT
- With intra-uterine use or oral use for Contraception in adults: Manufacturer advises avoid in liver tumour.
- With oral use for Contraception or Emergency contraception: Manufacturer advises avoid in severe impairment.
- With intra-uterine use: Manufacturer advises avoid in severe impairment—no information available; avoid in acute hepatic disease.

MONITORING REQUIREMENTS
- With intra-uterine use: Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

DIRECTIONS FOR ADMINISTRATION
- With intra-uterine use: The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

PRESCRIBING AND DISPENSING INFORMATION
- With intra-uterine use: Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

PATIENT AND CARER ADVICE

Diarrhoea and vomiting with use as an oral contraceptive: Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine:
- With oral use for Contraception: One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive: Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth: Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

With oral use for Emergency contraception: When prescribing or supplying hormonal emergency contraception, manufacturer advises women should be told:
- if vomiting occurs within 3 hours, a replacement dose should be taken;
- that their next period may be early or late;
- to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy.

The Faculty of Sexual and Reproductive Healthcare also advises women should be told:
- that a barrier method of contraception needs to be used—see Emergency contraception p. 794 for further information;
- that a pregnancy test should be performed if the next menstrual period is delayed by more than 7 days, is lighter than usual, or is associated with abdominal pain that is not typical of the woman’s usual dysmenorrhoea;
- that a pregnancy test should be performed if hormonal contraception is started soon after use of emergency contraception even if they have bleeding; bleeding associated with the contraceptive method may not represent menstruation.
- With intra-uterine use: Counsel women on the signs, symptoms and risks of perforation and ectopic pregnancy.

www.getintopharma.com
Missed doses When used as an oral contraceptive, the following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days’.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

- NATIONAL FUNDING/ACCESS DECISIONS
  - Scottish Medicines Consortium (SMC) decisions
    - SMC No. 1299/18
      - The Scottish Medicines Consortium has advised (February 2018) that levonorgestrel (Kyleena\textsuperscript{®}) is accepted for use within NHS Scotland as a contraceptive device for up to 5 years.
    - All Wales Medicines Strategy Group (AWMSG) decisions
      - AWMSG No. 3582
      - The All Wales Medicines Strategy Group has advised (September 2018) that levonorgestrel (Kyleena\textsuperscript{®}) is recommended as an option for use within NHS Wales for contraception for up to five years.

- EXCEPTIONS TO LEGAL CATEGORY
  - Levonelle\textsuperscript{®} One Step can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Intra-uterine device
    - Jaydess (Bayer Plc)
      - Levonorgestrel 15.5 mg
      - Kyleena (Bayer Plc)
        - Levonorgestrel 19.5 mg
      - Levonorgestrel 20 microgram per 24 hour
        - Levonorgestrel 20 microgram per 24 hour
          - Mirena (Bayer Plc)

- Tablet
  - Levonorgestrel (Non-proprietary)
    - Levonorgestrel 1.5 mg
      - Levonorgestrel 1.5mg tablets
      - Emeress (Morningside Healthcare Ltd)
        - Levonorgestrel 1.5 mg
          - Ezinelle (Mylan)
            - Ezinelle 1.5mg tablets

- PROGESTOGENS
  - Etonogestrel
    - INDICATIONS AND DOSE
      - Contraception (no hormonal contraceptive use in previous month)
        - BY SUBDERMAL IMPLANTATION
          - Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion
      - Contraception (postpartum)
        - BY SUBDERMAL IMPLANTATION
          - Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery (delay until 28 days postpartum if breast-feeding), implant should be removed within 3 years of insertion
      - Contraception following abortion or miscarriage in the second trimester
        - BY SUBDERMAL IMPLANTATION
          - Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion
      - Contraception following abortion or miscarriage in the first trimester
        - BY SUBDERMAL IMPLANTATION
          - Females of childbearing potential: 1 implant to be inserted within 5 days after abortion or miscarriage, implant should be removed within 3 years of insertion
      - Contraception (changing from other hormonal contraceptive)
        - BY SUBDERMAL IMPLANTATION
          - Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

- UNLICENSED USE
  - Nexplanon\textsuperscript{®} not licensed for use in females outside of the age range 18–40 years.

- IMPORTANT SAFETY INFORMATION
  - MHRA/CHM ADVICE (JUNE 2016): NEXPLANON\textsuperscript{®} (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: REPORTS OF DEVICE IN VASCULATURE AND LUNG
    - There have been rare reports of Nexplanon\textsuperscript{®} implants reaching the lung via the pulmonary artery. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Correct subdermal insertion reduces the risk of these events.

- CONTRA-INDICATIONS
  - Acute porphyrias p. 1058 - history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

- CAUTIONS
  - Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - disturbances of lipid metabolism - history during pregnancy of deterioration of otosclerosis - history during pregnancy of pruritus - history of jaundice in pregnancy

www.getintopharma.com
malabsorption syndromes - possible risk of breast cancer - sex-steroi dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

- **INTERACTIONS** → Appendix 1: etonogestrel
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - alopecia - anxiety - appetite increased - breast abnormalities - depressed mood - dizziness - emotional lability - fatigue - flatulence - headaches - hot flush - increased risk of infection - influenza like illness - libido decreased - menstrual cycle irregularities - nausea - ovarian cyst - pain - skin reactions - weight changes
  - Uncommon Arthralgia - constipation - diarrhoea - drowsiness - dysuria - fever - galactorrhoea - genital abnormalities - hypertrichosis - insomnia - myalgia - oedema - vomiting - vulvovaginal discomfort
  - Frequency not known Abscess - angioedema - embolism and thrombosis - haemorrhage - insulin resistance - neoplasms - paraesthesia - seborrhoea

**SIDE EFFECTS, FURTHER INFORMATION**
The benefits of using progestogen-only contraceptives (POCs), such as etonogestrel, should be weighed against the possible risks for each individual woman.

There is a small increase in the risk of having breast cancer diagnosed in women using a combined oral contraceptive pill (COC); this relative risk may be due to an earlier diagnosis, biological effects of the pill or a combination of both. This increased risk is related to the age of the woman using the COC rather than the duration of use and disappears gradually within 10 years after discontinuation.

The risk of breast cancer in users of POCs is possibly of similar magnitude as that associated with COCs, however the evidence is less conclusive.

- **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Implant**
- Nexplanon (Merck Sharp & Dohme Ltd)
  - Etonogestrel 68 mg Nexplanon 68mg implant | 1 device
  - £83.43 DT = £83.43

**Medroxyprogesterone acetate**

- **INDICATIONS AND DOSE**
  - **Dysfunctional uterine bleeding**
    - **BY MOUTH**
    - Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle
  - **Secondary amenorrhoea**
    - **BY MOUTH**
    - Adult: 2.5–10 mg daily for 5–10 days, repeated for 3 cycles, begin treatment on day 16–21 of cycle
  - **Mild to moderate endometriosis**
    - **BY MOUTH**
    - Adult: 10 mg 3 times a day for 90 consecutive days, begin treatment on day 1 of cycle

- **Progestogenic opposition of oestrogen HRT**
  - **BY MOUTH**
  - Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

- **Endometrial cancer | Renal cell cancer**
  - **BY MOUTH**
  - Adult: 200–600 mg daily

- **Breast cancer**
  - **BY MOUTH**
  - Adult: 0.4–1.5 g daily

- **Contraception**
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
  - **BY SUBCUTANEOUS INJECTION**
    - Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

- **Long-term contraception**
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
  - **BY SUBCUTANEOUS INJECTION**
    - Females of childbearing potential: 104 mg every 13 weeks, first dose to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

- **Contraception (when patient changing from other hormonal contraceptive)**
  - **BY SUBCUTANEOUS INJECTION**
    - Females of childbearing potential: (consult product literature)

- **Hot flushes caused by long-term androgen suppression in women with prostate cancer**
  - **BY MOUTH**
  - Adult: 20 mg once daily initially for 10 weeks, evaluate effect at the end of the treatment period

**UNLICENSED USE**

- Medroxyprogesterone acetate is used for the treatment of hot flushes caused by long-term androgen suppression in men, but it is not licensed for this indication.

**CONTRA-INDICATIONS**

- **GENERAL CONTRA-INDICATIONS**
  - Acute porphyrias p. 1058 - severe arterial disease - undiagnosed vaginal bleeding

- **SPECIFIC CONTRA-INDICATIONS**
  - With intramuscular use or subcutaneous use history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable
  - With oral use breast cancer (unless progestogens are being used in the management of this condition) - genital cancer (unless progestogens are being used in the management of this condition) - history of liver tumours

**CAUTIONS**

- **GENERAL CAUTIONS** Possible risk of breast cancer

- **SPECIFIC CAUTIONS** With intramuscular use or subcutaneous use history during pregnancy in disturbances of lipid metabolism - history

---

**BNF 78**

www.getintopharma.com
during pregnancy of deterioration of otosclerosis - history during pregnancy of pruritus

- With oral use: Asthma, cardiac dysfunction, conditions that may worsen with fluid retention: diabetes (progestogens can decrease glucose tolerance—monitor patient closely), epilepsy, history of depression, hypertension, migraine, susceptibility to thromboembolism (particular caution with high dose)

- INTERACTIONS → Appendix 1: medroxyprogesterone

- SIDE-EFFECTS

  GENERAL SIDE-EFFECTS

  - Common or very common: Alopecia, breast abnormalities, depression, dizziness, fluid retention, insomnia, menstrual cycle irregularities, nausea, sexual dysfunction, skin reactions, weight changes.

  SPECIFIC SIDE-EFFECTS

  - Common or very common: With oral use, Appetite increased, cervical abnormalities, constipation, fatigue, headache, hyperhidrosis, hypersensitivity, nervousness, oedema, tremor, vomiting.

  - With parenteral use: Anxiety, asthena, gastrointestinal discomfort, headaches, mood altered, pain, vulvovaginal infection.

  - Uncommon: With oral use, Congestive heart failure, corticoid-like effects, diabetes mellitus exacerbated, diarrhoea, dry mouth, euphoric mood, hypercalcaemia.

  - With parenteral use: Appetite abnormal, arthralgia, hot flush, hypertension, ovarian cyst, painful sexual intercourse, uterine haemorrhage, varicose veins, vertigo, vulvovaginal disorders.

  - Rare or very rare: With oral use, Cerebral infarction, jaundice, malaise, myocardial infarction.

  - With parenteral use: Breast cancer, lipodystrophy.

  - Frequency not known: With oral use, Adrenergic-like effects, cataract diabetic, concentration impaired, confusion, glycosuria, palpitations, visual impairment (discontinue if papilloedema or retinal vascular lesions).

  - With parenteral use: Hepatic disorders, osteoporosis, osteoporotic fractures, seizure.

  SIDE-EFFECTS, FURTHER INFORMATION

  - With oral use: In general, side effects may be more common with high doses such as those used in malignant disease.

  - With parenteral use: Reduction in bone mineral density is greater with increasing duration of use. The loss is mostly recovered on discontinuation.

- CONCEPTION AND CONTRACEPTION

  - With intramuscular use: If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.

  - With subcutaneous use: If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

- PREGNANCY

  - With oral use: Avoid—genital malformations and cardiac defects reported.

  - With intramuscular use or subcutaneous use: Not known to be harmful.

- BREAST FEEDING

  - Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation.

  - With intramuscular use or subcutaneous use: The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

- HEPATIC IMPAIRMENT

  - Avoid in liver tumour.

  - With oral use: Avoid in hepatic impairment.

  - With intramuscular use or subcutaneous use: Caution in severe liver disease and recurrent cholestatic jaundice.

- RENAL IMPAIRMENT

  - When used for mild to moderate endometriosis or Progestogen opposition of oestrogen HRT or Dysfunctional uterine bleeding or Secondary amenorrhea: Use with caution.

- PATIENT AND CARER ADVICE

  - With intramuscular use or subcutaneous use: Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

- MEDICINAL FORMS

  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

## 3.6 Contraception, spermicidal

### SPERMICIDALS

#### Nonoxinol

- **INDICATIONS AND DOSE**

  Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps

  - **BY VAGINA**

    - Females of childbearing potential: (consult product literature)

  - **SIDE-EFFECTS**

    Genital erosion, increased risk of HIV infection, pain - paraesthesia - skin reactions - vaginal redness

  **SIDE-EFFECTS, FURTHER INFORMATION**

  High frequency use of the spermicide nonoxinol-9 has been associated with genital lesions, which may increase the risk of acquiring sexually transmitted infections.
4 Erectile and ejaculatory conditions

4.1 Erectile dysfunction

Description of condition
Erectile dysfunction (impotence) is the persistent inability to attain and maintain an erection that is sufficient to permit satisfactory sexual performance. It can have physical or psychological causes. Erectile dysfunction can also be a side-effect of drugs such as antihypertensives, antidepressants, antipsychotics, cytotoxic drugs and recreational drugs (including alcohol).

Risk factors for erectile dysfunction include sedentary lifestyle, obesity, smoking, hypercholesterolaemia and metabolic syndrome. Erectile dysfunction increases the risk of cardiovascular disease. All men with unexplained erectile dysfunction should be evaluated for the presence of cardiovascular risk factors and any identified risk should be addressed.

Drug treatment

The recommended approach for the management of erectile dysfunction is a combination of drug treatment and lifestyle changes (including regular exercise, reduction in body mass index, Smoking cessation p. 497, and reduced alcohol consumption).

An oral phosphodiesterase type-5 inhibitor is the first-line drug treatment for erectile dysfunction, regardless of the cause. These drugs act by increasing the blood flow to the penis. They do not initiate an erection—sexual stimulation is required.

The choice of oral phosphodiesterase type-5 inhibitor depends on the frequency of intercourse and response to treatment. Avanafil below, sildenafil p. 813 and vardenafil p. 816 are short-acting drugs and are suitable for occasional use as required. Tadalafil p. 814 is a longer-acting drug. It can be used as required, but can also be used as a regular lower daily dose to allow for spontaneous (rather than scheduled) sexual activity or in those who have frequent sexual activity. A patient with erectile dysfunction should receive six doses of an individual phosphodiesterase type-5 inhibitor at the maximum dose (with sexual stimulation) before being classified as a non-responder. Patients who fail to respond to the maximum dose of at least two different phosphodiesterase type-5 inhibitors should be referred to a specialist.

Intracavernosal, intraurethral or topical application of alprostadil (prostaglandin E1) p. 816 is recommended as second-line therapy under careful medical supervision. Intracavernosal or intraurethral preparations can also be used to aid diagnosis.

Priapism associated with alprostadil
Manufacturers advise that patients should seek medical help if a prolonged erection lasting four hours or more occurs; application of an ice pack to the upper-inner thigh (alternating between the left and right thighs every two minutes for up to ten minutes) may result in reflex opening of the venous valves. If priapism has lasted more than six hours, treatment should not be delayed; manufacturer advises management as follows:

- Initial therapy by penile aspiration: using aseptic technique, 20–50 mL of blood should be aspirated using a 19–21 gauge butterfly needle inserted into the corpus cavernosum; if necessary the procedure may be repeated on the opposite side;
- Lavage: if initial aspiration is unsuccessful, a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum; sterile physiological saline can be injected through the first needle and drained through the second;
- If aspiration and lavage of are unsuccessful, intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors can be given, with continuous monitoring of blood pressure and pulse—see phentolamine mesilate p. 819 [unlicensed indication], adrenaline/epinephrine p. 818 [unlicensed indication], and metaraminol p. 187 [unlicensed indication]. Extreme caution is required in patients with coronary heart disease, hypertension, cerebral ischaemia and in patients taking a monoamine–oxidase inhibitor (facilities for managing hypertensive crisis should be available when administered to patients taking MAOIs);
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle;
- If administration of a sympathomimetic drug is unsuccessful, urgent referral for surgical management is required.

Prescribing on the NHS
Some drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances; for details see the criteria listed in part XVIII of the Drug Tariff (Part XIB of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/drug-tariff
Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Related drugs
Other drugs used for Erectile dysfunction: aviptadil with phenolamine mesilate p. 820.

PHOSPHODIESTERASE TYPE-5 INHIBITORS

Avanafil

- INDICATIONS AND DOSE
  - Erectile dysfunction
    - BY MOUTH
      - Adult: Initially 100 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

www.getintopharma.com
Erectile dysfunction in patients on alpha-blocker therapy

- **BY MOUTH**
- Adult: Initially 50 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

**Dose Adjustments due to Interactions**
- Manufacturer advises max. 100 mg once every 48 hours with concurrent use of moderate inhibitors of CYP3A4.

**Contra-Indications**
- Avoid if systolic blood pressure below 90 mmHg (no information available) - blood pressure >170/100 mmHg - hereditary degenerative retinal disorders - history of non-arteritic anterior ischaemic optic neuropathy - life-threatening arrhythmia in previous 6 months - mild to severe heart failure - patients in whom vasodilatation or sexual activity are inadvisable - recent history of myocardial infarction - recent history of stroke - recent unstable angina

**Caution**
- Active peptic ulceration - anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - bleeding disorders - cardiovascular disease - left ventricular outflow obstruction - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

**Interactions**
- Appendix 1: phosphodiesterase type-5 inhibitors

**Side-Effects**
- Common or very common
  - Headaches
  - Nasal complaints
  - Vasodilation
- Uncommon
  - Asthenia
  - Dizziness
  - Drowsiness
  - Dyspnoea
  - Exertional angina
  - Headaches
  - Hypotension
  - Migraine
  - Muscle cramps

**Hepatic Impairment**
- Manufacturer advises avoid in severe impairment.

Dose Adjustments
- Manufacturer advises use lowest effective initial dose in mild to moderate impairment and adjust according to tolerance.

**Renal Impairment**
- Avoid if eGFR less than 30 ml/minute/1.73 m².

**Patient and Carer Advice**
- Onset of effect may be delayed if taken with food.

**National Funding/Access Decisions**

Scottish Medicines Consortium (SMC) decisions
- SMC No. 980/14
  - The Scottish Medicines Consortium has advised (September 2015) that avanafil (Spedra®) is not recommended for use within NHS Scotland, for treatment of erectile dysfunction in men as the clinical and economic analysis presented was not sufficiently robust.

All Wales Medicines Strategy Group (AWMSG) decisions
- AWMSG No. 1261
  - The All Wales Medicines Strategy Group has advised (July 2015) that avanafil (Spedra®) is recommended as an option for use within NHS Wales for the treatment of erectile dysfunction in men.

NHS Restrictions
- Spedra® is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIIB of the Drug Tariff. The prescription must be endorsed ‘SLS’.

---

**Sildenafil**

- **Indications and Dose**
  - Pulmonary arterial hypertension (initiated under specialist supervision)
    - **By Mouth**
      - Adult: 20 mg 3 times a day
    - **By Intravenous Injection**
      - Adult: 10 mg 3 times a day, use intravenous route when the oral route is not appropriate
  - Erectile dysfunction
    - **By Mouth**
      - Adult: Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25–100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

**Digital Ulcers [Associated with Systemic Sclerosis]**
- **By Mouth**
  - Adult: 25 mg 3 times a day, increased to 50 mg 3 times a day

**Dose Adjustments due to Interactions**
- When used for Erectile dysfunction
  - Manufacturer advises a starting dose of 25 mg with concurrent use of moderate and potent inhibitors of CYP3A4. Manufacturer advises if concurrent use of ritonavir is unavoidable, the max. dose should not exceed 25 mg within 48 hours.
  - With oral use for Pulmonary arterial hypertension
    - Manufacturer advises reduce dose to 20 mg twice daily with concurrent use of moderate inhibitors of CYP3A4.
    - Manufacturer advises reduce dose to 20 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).
  - With intravenous use for Pulmonary arterial hypertension
    - Manufacturer advises reduce dose to 10 mg twice daily with concurrent use of moderate inhibitors of CYP3A4.
    - Manufacturer advises reduce dose to 10 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).

**Unlicensed Use**
- Sildenafil is used for the treatment of digital ulcer, but is not licensed for this indication.

**Contra-Indications**
- General Contra-Indications
  - Hereditary degenerative retinal disorders - history of non-arteritic anterior ischaemic optic neuropathy - recent history of myocardial infarction - recent history of stroke

**Specific Contra-Indications**
- When used for erectile dysfunction
  - Avoid if systolic blood pressure below 90 mmHg (no information available) - patients in whom vasodilatation or sexual activity are inadvisable - recent unstable angina

**Caution**
- General Caution
  - Active peptic ulceration - bleeding disorders - cardiovascular disease - left ventricular outflow obstruction
814 Erectile and ejaculatory conditions

SPECIFIC CAUTIONS
- When used for erectile dysfunction: Anatomical deformation of the penis (e.g., angulation, cavernosal fibrosis, Peyronie’s disease) - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukemia)
- When used for pulmonary arterial hypertension: Anatomical deformation of the penis - autonomic dysfunction - hypotension (avoid if systolic blood pressure below 90 mmHg) - intravascular volume depletion - predisposition to priapism - pulmonary veno-occlusive disease

INTERACTIONS
- Appendix A: phosphodiesterase type-5 inhibitors

SIDE-EFFECTS
- When used for pulmonary arterial hypertension
- When used for erectile dysfunction

RARE OR VERY RARE
- Acute coronary syndrome - arteriosclerotic retinopathy - cerebrovascular insufficiency - glaucoma - haematoxylin - hearing impairment - irritability - optic neuropathy (discontinue if sudden visual impairment occurs) - oral hypoaesthesia - priapism - retinal occlusion - scleral discoloration - seizure - severe cutaneous adverse reactions (SCARs) - sudden cardiac death - syncope - throat tightness

PREGNANCY
- Use only if potential benefit outweighs risk—no evidence of harm in animal studies.

BREAST FEEDING
- Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
- Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

Dose adjustments
- With intravenous use for Pulmonary arterial hypertension: Manufacturer advises if usual dose not tolerated, consider dose reduction to 10 mg twice daily in mild to moderate impairment.
- With oral use for Pulmonary arterial hypertension: Manufacturer advises if usual dose not tolerated, consider dose reduction to 20 mg twice daily in mild to moderate impairment.
- When used for Erectile dysfunction: Manufacturer advises consider initial dose reduction to 25 mg in mild to moderate impairment; adjust according to response.

RENAL IMPAIRMENT
- Dose adjustments: Use initial dose of 25 mg in erectile dysfunction if eGFR less than 30 mL/minute/1.73 m².
- In pulmonary hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily and intravenous dose to 10 mg twice daily.

TREATMENT CESSATION
- When used for Pulmonary arterial hypertension: Consider gradual withdrawal.

PATIENT AND CARER ADVICE
- When used for Erectile dysfunction: Onset of effect may be delayed if taken with food.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (February 2010) that sildenafil tablets (Revatio®) is accepted for restricted use within NHS Scotland and should be initiated for patients with pulmonary arterial hypertension only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

The Scottish Medicines Consortium has advised (March 2011) that sildenafil injection (Revatio®) is accepted for restricted use within NHS Scotland for patients with pulmonary arterial hypertension who are currently prescribed oral sildenafil and are temporarily unable to take oral medicine, and should be prescribed only on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

NHS restrictions
- Viagra® is not prescribable in NHS primary care for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII of the Drug Tariff (Part XIB of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use the BNF.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
- Sildenafil (Non-proprietary)
  - Sildenafil (as Sildenafil citrate) 20 mg: Sildenafil 20 mg tablets | 90 tablet (P) £46.33 DT = £46.33
  - Sildenafil (as Sildenafil citrate) 25 mg: Sildenafil 25 mg tablets | 4 tablet (P) £16.59 DT = £10.72 | 8 tablet (P) £69.96-£33.19
  - Sildenafil (as Sildenafil citrate) 50 mg: Sildenafil 50 mg tablets | 4 tablet (P) £21.27 DT = £10.71 | 8 tablet (P) £110.64–£42.54
  - Sildenafil (as Sildenafil citrate) 100 mg: Sildenafil 100 mg tablets | 4 tablet (P) £23.50 DT = £10.80 | 8 tablet (P) £144.69–£46.39
  - 12 tablet (P) £39
- Granipiram (Accord Healthcare Ltd)
  - Sildenafil (as Sildenafil citrate) 20 mg: Granipiram 20 mg tablets | 90 tablet (P) £424.01 DT = £464.33

Sildenafil (as Sildenafil citrate) 100 mg: Sildenafil 100 mg tablets | 12 tablet (P) £39
- Myslecard (Mylan)
  - Sildenafil (as Sildenafil citrate) 20 mg: Myslecard 20 mg tablets | 90 tablet (P) £379.38 DT = £464.33

- Revatio (Pfizer Ltd)
  - Sildenafil (as Sildenafil citrate) 20 mg: Revatio 20 mg tablets | 90 tablet (P) £46.33 DT = £46.33
  - Viagia (Pfizer Ltd, Pfizer Consumer Healthcare Ltd)
  - Sildenafil (as Sildenafil citrate) 25 mg: Viagia 25 mg tablets | 4 tablet (P) £16.59 DT = £10.72 | 8 tablet (P) £69.96–£33.19
  - Sildenafil (as Sildenafil citrate) 50 mg: Viagia 50 mg tablets | 4 tablet (P) £21.27 DT = £10.71 | 8 tablet (P) £110.64–£42.54
  - Sildenafil (as Sildenafil citrate) 100 mg: Viagia 100 mg tablets | 4 tablet (P) £23.50 DT = £10.80 | 8 tablet (P) £144.69
  - Vizarsin (Consilient Health Ltd)
  - Sildenafil (as Sildenafil citrate) 25 mg: Vizarsin 25 mg tablets | 4 tablet (P) £13.10 DT = £10.72
  - Sildenafil (as Sildenafil citrate) 50 mg: Vizarsin 50 mg tablets | 4 tablet (P) £18.07 DT = £10.71
  - Sildenafil (as Sildenafil citrate) 100 mg: Vizarsin 100 mg tablets | 4 tablet (P) £19.97 DT = £10.80

Solution for injection
- Revatio (Pfizer Ltd)
  - Sildenafil (as Sildenafil citrate).8 mg per 1 mL: Revatio 10mg/12.5ml solution for injection vials | 1 vial (P) £45.28 (Hospital only)

Oral suspension
- Revatio (Pfizer Ltd)
  - Sildenafil (as Sildenafil citrate) 10 mg per 1 mL: Revatio 10 mg/ml oral suspension sugar-free | 112 ml (P) £186.75 DT = £186.75

Tadalafil

INDICATIONS AND DOSE
- Pulmonary arterial hypertension (initiated under specialist supervision)
  - BY MOUTH
  - Adult: 40 mg once daily

www.getintopharma.com
Erectile dysfunction

BY MOUTH
Adult: Initially 10 mg (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, continuous daily use not recommended; maximum 1 dose per day.

Erectile dysfunction: for patients who anticipate sexual activity at least twice a week
BY MOUTH
Adult: 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response.

Benign prostatic hyperplasia
BY MOUTH
Adult: 5 mg once daily.

CONTRA-INDICATIONS
GENERAL CONTRA-INDICATIONS
History of non-arteritic anterior ischaemic optic neuropathy
SPECIFIC CONTRA-INDICATIONS
When used for benign prostatic hyperplasia hypotension (avoid if systolic blood pressure below 90 mmHg) - mild to severe heart failure - myocardial infarction - patients in whom vasodilatation or sexual activity are inadvisable - recent stroke - uncontrolled arrhythmias - uncontrolled hypertension - unstable angina
When used for erectile dysfunction hypotension (avoid if systolic blood pressure below 90 mmHg) - mild to severe heart failure - myocardial infarction - patients in whom vasodilatation or sexual activity are inadvisable - recent stroke - uncontrolled arrhythmias - uncontrolled hypertension - unstable angina
When used for pulmonary arterial hypertension acute myocardial infarction in past 90 days

CAUTIONS
When used for benign prostatic hyperplasia anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - cardiovascular disease - left ventricular outflow obstruction - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
When used for erectile dysfunction anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - cardiovascular disease - left ventricular outflow obstruction - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
When used for pulmonary arterial hypertension Anatomical deformation of the penis - aortic and mitral valve disease - congestive cardiomyopathy - coronary artery disease - hereditary degenerative retinal disorders - hypotension (avoid if systolic blood pressure below 90 mmHg) - left ventricular dysfunction - life-threatening arrhythmias - pericardial constriction - predisposition to priapism - pulmonary veno-occlusive disease - uncontrolled hypertension

INTERACTIONS → Appendix 1: phosphodiesterase type-5 inhibitors

SIDE-EFFECTS
Common or very common: Flushing - gastrointestinal discomfort - headache - myalgia - nasal congestion - pain
Rare or very rare: Acute coronary syndrome - angioedema - cerebrovascular insufficiency - eye erythema - eye swelling - haematoma/permia - hyperhidrosis - memory loss - optic neuropathy (discontinue if sudden visual impairment occurs) - priapism - retinal occlusion - seizure - Stevens-Johnson syndrome - sudden cardiac death - sudden hearing loss (discontinue drug and seek medical advice) - syncope

PREGNANCY Manufacturer advises avoid.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
When used for Pulmonary arterial hypertension Manufacturer advises caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).
When used for Benign prostatic hyperplasia or Erectile dysfunction Manufacturer advises caution for regular once-daily dosing (no information available), and in severe impairment for intermittent use (limited information available).

Dose adjustments
When used for Pulmonary arterial hypertension Manufacturer advises consider initial dose reduction to 20 mg once daily in mild to moderate impairment.
When used for Erectile dysfunction Manufacturer advises dose of 10 mg for intermittent use (no information available for higher doses).

RENAL IMPAIRMENT
When used for Pulmonary arterial hypertension Manufacturer advises avoid in severe impairment.
When used for Erectile dysfunction or Benign prostatic hyperplasia Manufacturer advises avoid regular once-daily dosing in severe impairment.

Dose adjustments
When used for Pulmonary arterial hypertension Manufacturer advises initial dose of 20 mg once daily in mild-to-moderate impairment; dose may be increased to 40 mg once daily if tolerated.
When used for Erectile dysfunction Manufacturer advises maximum dose of 10 mg for intermittent use in severe impairment.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (July 2012) that tadalafil (Adcirca®) is accepted for restricted use within NHS Scotland for adults with pulmonary arterial hypertension and should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland.
NHS restrictions Clinals® is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIb of the Drug Tariff (Part Xib of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use the BNF.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
Tadalafil (Non-proprietary)
Tadalafil 2.5 mg 28 tablet £54.99 DT = £54.99
Tadalafil 5 mg 28 tablet £54.99 DT = £23.99
Tadalafil 10 mg 28 tablet £28.88 DT = £1.93
Tadalafil 20 mg 28 tablet £1.95 | 8 tablet £3.90-£109.98 | 56 tablet £375.11-£466.66
Adcirca (Eli Lilly and Company Ltd)
Tadalafil 20 mg 28 tablet £491.22
Clinals (Eli Lilly and Company Ltd)
Tadalafil 2.5 mg 28 tablet £54.99 DT = £54.99
Vardenafil

20-Jul-2017

INDICATIONS AND DOSE

Erectile dysfunction

By mouth using tablets

Adult: Initially 10 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day.

By mouth using orodispersible tablet

Adult: 10 mg, to be taken approximately 25–60 minutes before sexual activity; maximum 10 mg per day.

Erectile dysfunction (patients on alpha-blocker therapy)

By mouth using tablets

Adult: Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day.

DOSE EQUIVALENCE AND CONVERSION

Levi® 10 mg orodispersible tablets and Levitra® 10 mg film-coated tablets are not bioequivalent.

CONTRA-INDICATIONS

Avoid if systolic blood pressure below 90 mmHg - hereditary degenerative renal disorders - myocardial infarction - patients in whom vasodilation or sexual activity is inadvisable - previous history of non-arteritic anterior ischaemic optic neuropathy - recent stroke - unstable angina.

CAUTIONS

Active peptic ulceration - anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - bleeding disorders - cardiovascular disease - elderly - left ventricular outflow obstruction - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia) - susceptibility to prolongation of QT interval.

INTERACTIONS

Appendix 1: phosphodiesterase type-5 inhibitors.

SIDE-EFFECTS

Common or very common

Dizziness - flushing - gastrointestinal discomfort - headache - nasal congestion.

Uncommon

Rare or very rare

Frequency not known

Haematopsia - optic neuropathy (discontinue if sudden visual impairment occurs) - QT interval prolongation - sudden hearing loss.

HEPATIC IMPAIRMENT

For film-coated tablets, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

For orodispersible tablets, manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

Dose adjustments

Film-coated tablets, manufacturer advises initial dose reduction to 5 mg in mild to moderate impairment, increase according to response; max. 10 mg in moderate impairment.

For orodispersible tablets, manufacturer advises initial dose reduction to 5 mg using film-coated tablets in mild impairment, increase according to response.

RENAL IMPAIRMENT

Orodispersible tablets not suitable if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments

Initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m².

PRESCRIBING AND DISPENSING INFORMATION

Orodispersible tablets not suitable for initiation of therapy in patients taking alpha-blockers.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (October 2011) that vardenafil orodispersible tablets (Levitra®) are accepted for restricted use within NHS Scotland for treatment of erectile dysfunction in men for whom an orodispersible tablet is an appropriate formulation.

NHS restrictions

Levitra® is not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIb of the Drug Tariff (Part XIII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SL’. For more information see Prices in the BNF, under How to use the BNF.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Orodispersible tablet

EXCIPIENTS: May contain Aspartame

Levitra® (Bayer Plc)

Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg Levitra® 10 mg orodispersible tablets sugar-free 4 tablet pack £13.67 DT = £13.67

Tablet

Vardenafil (as Vardenafil hydrochloride trihydrate) 5 mg Levitra® 5 mg tablets 4 tablet pack £6.24–£12.04 DT = £8.31 | 8 tablet pack £14.97–£24.08

Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg Levitra® 10 mg tablets 4 tablet pack £11.09–£21.41 DT = £14.77 | 8 tablet pack £26.61–£42.82

Vardenafil (as Vardenafil hydrochloride trihydrate) 20 mg Levitra® 20 mg tablets 4 tablet pack £18.23–£35.20 DT = £24.29 | 8 tablet pack £42.52–£70.40

Levitra® (Bayer Plc)

Vardenafil (as Vardenafil hydrochloride trihydrate) 5 mg Levitra® 5 mg tablets | 4 tablet pack £8.32 DT = £8.31

Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg Levitra® 10 mg tablets | 4 tablet pack £14.78 DT = £14.77 | 8 tablet pack £29.57

Vardenafil (as Vardenafil hydrochloride trihydrate) 20 mg Levitra® 20 mg tablets | 4 tablet pack £24.30 DT = £24.29 | 8 tablet pack £48.60

PROSTAGLANDINS AND PROSTAMIDIES

Alprostadil

20-Jul-2017

INDICATIONS AND DOSE

Erectile dysfunction (initiated under specialist supervision)

By urethral application

Adult: Initially 250 micrograms, adjusted according to response; usual dose 0.125–1 mg; maximum 2 doses per day; maximum 7 doses per week.
Erectile dysfunction

Erectile dysfunction associated with neurological dysfunction

➤ By intracavernosal injection
- Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis
- By intracavernosal injection
- Adult: 10–20 micrograms for 1 dose (consult product literature)

Virdal ® Duo

Neurogenic erectile dysfunction

➤ By intracavernosal injection
- Adult: Initially 1.25 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Erectile dysfunction

➤ By intracavernosal injection
- Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Contra-indications

General Contra-indications
Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope) · not for use with other agents for erectile dysfunction · predisposition to prolonged erection (as in thrombocytopenia, polycythemia, sickle cell anemia, multiple myeloma or leukaemia) · urethral application contra-indicated in balanitis · urethral application contra-indicated in severe curvature · urethral application contra-indicated in severe hypospadias · urethral application contra-indicated in urethral stricture · urethral application contra-indicated in urethritis

Specific Contra-indications
- With topical use Balanitis · severe curvature · severe hypospadias · urethral stricture · urethritis

Caution
- Anatomical deformations of penis (painful erection more likely) — follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie’s disease develop) · priapism (patients should be instructed to report any erection lasting 4 hours or longer)

Interactions
- Appendix 1: alprostadil
Erectile and ejaculatory conditions

**SIDE-EFFECTS**

- **Common or very common**
  - With intracavernosal use: Haemorrhage, muscle spasms, penile disorders, sexual dysfunction, skin reactions
  - With topical use: Balanoposthitis, genital abnormalities, penile disorders, rash, sexual dysfunction, urinary tract pain
  - With urethral use: Dizziness, haemorrhage, headache, hypotension, muscle spasms, penile disorders, sexual dysfunction, urinary burning

- **Uncommon**
  - With intracavernosal use: Asthenia, balanoposthitis, dry mouth, extrasystole, hyperhidrosis, hypotension, increased risk of infection, inflammation, mydriasis, nausea, oedema, pelvic pain, peripheral vascular disease, presyncope, scrotal disorders, sensation abnormal, spermatocele, testicular disorders, urinary disorders, vascular disorders, vasodilation

- With topical use: Dizziness, hyperaesthesia, hypotension, pain in extremity, scrotal pain, syncope, urinary tract disorders

- With urethral use: Balanoposthitis, hyperhidrosis, increased risk of infection, leg pain, nausea, pelvic pain, perineal pain, peripheral vascular disease, scrotal disorders, sensation abnormal, skin reactions, spermatocele, syncope, testicular disorders, urinary disorders, vascular disorders, vasodilation

- **Frequency not known**
  - With intracavernosal use: Myocardial ischaemia, stroke
  - With intravenous use: Periurethral oedema

**CONCEPTION AND CONTRACEPTION**

- With urethral use: If partner is pregnant, barrier contraception should be used. No evidence of harm to latex condoms and diaphragms.
- With topical use: Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latex condoms.

**DIRECTIONS FOR ADMINISTRATION**

- With intracavernosal use: The first dose of the intracavernosal injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.
- With urethral use: During initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.

**PATIENT AND CARER ADVICE**

Patients should be instructed to report any erection lasting 4 hours or longer.

- With topical use: Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women of childbearing age, pregnant, or lactating women.

**NATIONAL FUNDING/ACCESS DECISIONS**

Caverject®, Viridal® Duo, Vitaros® and MUSE® are not prescribable in NHS primary care for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use BNF publications.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Stick**
  - Muse (Meda Pharmaceuticals Ltd)
  - Alprostadil 250 microgram: Muse 250microgram urethral sticks 1 applicator (PBD) £11.30 DT = £11.30 6 applicator (PBD) £67.79
  - Alprostadil 500 microgram: Muse 500microgram urethral sticks 1 applicator (PBD) £11.30 DT = £11.30 6 applicator (PBD) £67.79
  - Alprostadil 1 mg: Muse 1000microgram urethral sticks 1 applicator (PBD) £11.56 DT = £11.56 6 applicator (PBD) £65.67

- **Cream**
  - Vitaros® (Ferring Pharmaceuticals Ltd)
  - Alprostadil 3 mg per 1 gram: Vitaros 3mg/g cream 4 applicator (PBD) £40.00 DT = £40.00

**Powder and solvent for solution for injection**

- **Caverject® (Pfizer Ltd)**
  - Alprostadil 10 microgram: Caverject 10microgram powder and solvent for solution for injection vials 1 vial (PBD) £9.24 DT = £9.24
  - Caverject Dual Chamber 10microgram powder and solvent for solution for injection 2 pre-filled disposable injection (PBD) £14.70

- **Alprostadil 20 microgram**
  - Caverject Dual Chamber 20microgram powder and solvent for solution for injection 2 pre-filled disposable injection (PBD) £19.00
  - Caverject 20microgram powder and solvent for solution for injection vials 1 vial (PBD) £11.94 DT = £11.94

- **Alprostadil 40 microgram**
  - Caverject 40microgram powder and solvent for solution for injection vials 1 vial (PBD) £21.58 DT = £21.58

- **Viridal® (UCB Pharma Ltd)**
  - Alprostadil 10 microgram: Viridal Duo Starter Pack 10microgram powder and solvent for solution for injection cartridges with device 2 cartridge (PBD) £20.13 (Hospital only)
  - Viridal Duo Continuation Pack 10microgram powder and solvent for solution for injection cartridges 2 cartridge (PBD) £16.55

- **Alprostadil 20 microgram**
  - Viridal Duo Pack 20microgram powder and solvent for solution for injection cartridges with device 2 cartridge (PBD) £24.54 (Hospital only)
  - Viridal Duo Continuation Pack 20microgram powder and solvent for solution for injection cartridges 2 cartridge (PBD) £21.39

- **Alprostadil 40 microgram**
  - Viridal Duo Starter Pack 40microgram powder and solvent for solution for injection cartridges with device 2 cartridge (PBD) £29.83 (Hospital only)
  - Viridal Duo Continuation Pack 40microgram powder and solvent for solution for injection cartridges 2 cartridge (PBD) £27.22

**SYMPATHOMIMETICS > VASOCONSTRICTOR**

**Adrenaline/epinephrine**

- **DRUG ACTION**
  - Acts on both alpha and beta receptors and increases both heart rate and contractility (beta, effects); it can cause peripheral vasodilation (a beta1 effect) or vasoconstriction (an alpha effect).

- **INDICATIONS AND DOSE**
  - Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol)

- **BY INTRACavernosal INJECTION**
  - Adult: 10–20 micrograms every 5–10 minutes, using a 20 microgram/mL solution. Important: If suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse; maximum 100 micrograms per course

**UNLICENSED USE**

The use of adrenaline for the treatment of priapism is an unlicensed indication.

- **CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

Cautions listed are only for non-life-threatening situations.

- **INTERACTIONS**
  - Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS**
  - Rare or very rare: Cardiomyopathy.
mouth - dyspnoea - headache - hepatic necrosis - hyperglycaemia - hyperhidrosis - hypertensation (increased risk of cerebral haemorrhage) - hypokalaemia - injection site necrosis - insomnia - intestinal necrosis - metabolic acidosis - mydriasis - myocardial infarction - nausea - pallor - palpitations - peripheral coldness - psychosis - pulmonary oedema (on excessive dosage or extreme sensitivity) - renal necrosis - soft tissue necrosis - tremor - urinary disorders - vomiting

**RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

**MONITORING REQUIREMENTS** Monitor blood pressure and ECG.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

### Solution for injection

**EXCIPIENTS:** May contain Sulphites

- **Adrenaline/epinephrine (Non-proprietary)**
  - Adrenaline 100 microgram per 1 mL Adrenaline (base) 100 micrograms/mL (1 in 10,000) dilute solution for injection ampoules | 10 ampoule (POM) £76.34
  - Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £6.87 | 1 pre-filled disposable injection (POM) £18.00 (Hospital only) | 10 pre-filled disposable injection (POM) £180.00 (Hospital only)
  - Adrenaline (as Adrenaline acid tartrate) 100 microgram per 1 mL Adrenaline (base) 100 micrograms/mL (1 in 10,000) dilute solution for injection ampoules | 10 ampoule (POM) £88.48
  - Adrenaline (base) 500 micrograms/5 mL (1 in 10,000) dilute solution for injection ampoules | 10 ampoule (POM) £81.33
  - Adrenaline 1 mg per 1 mL Adrenaline (base) 10 mg/10 mL (1 in 1,000) solution for injection ampoules | 10 ampoule (POM) £96.38
  - Adrenaline (base) for anaesthesia 1 mg/1 mL (1 in 1,000) solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £11.88 DT + £11.71
  - Adrenaline (base) 1 mg/1 mL (1 in 1,000) solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £11.88 DT + £11.71
  - Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 mL Adrenaline (base) 5 mg/5 mL (1 in 1,000) solution for injection ampoules | 10 ampoule (POM) £33.58
  - Adrenaline (base) 500 micrograms/0.5 mL (1 in 1,000) solution for injection ampoules | 10 ampoule (POM) £6.95 DT + £6.01

- **Phenylephrine hydrochloride 100 microgram per 1 mL Phenylephrine hydrochloride 100 micrograms/10 mL solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £15.00 | 10 pre-filled disposable injection (POM) £150.00

### Phentolamine hydrochloride

- **BY INTRACAVERNOSAL INJECTION**
  - Phenylephrine hydrochloride (Non-proprietary) Phenylephrine (as Phenylephrine hydrochloride) 1 mg per 1 mL Phenylephrine hydrochloride 10 mg per 1 mL Phenylephrine hydrochloride 1 mg/1 mL solution for injection ampoules | 10 ampoule (POM) £40.00 Phenylephrine hydrochloride 10 mg per 1 mL Phenylephrine hydrochloride 10 mg/1 mL solution for injection ampoules | 10 ampoule (POM) £99.12

### Metaraminol

- **INDICATIONS AND DOSE**
  - Priapism (alternative to intracavernosal injections of phenylephrine and adrenaline)
    - Adult: 1 mg every 15 minutes

- **UNLICENSED USE** Use for priapism is an unlicensed indication.

- **CONTRA-INDICATIONS** Hypertension

- **CAUTIONS** Associated with fatal hypertensive crises - cirrhosis - coronary vascular thrombosis - diabetes mellitus - elderly - extravasation at injection site may cause necrosis - following myocardial infarction - hypercapnia - hyperthyroidism - hypoxia - mesenteric vascular thrombosis - peripheral vascular thrombosis - Prinzmetal’s variant angina - uncorrected hypovolaemia

- **INTERACTIONS** Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS**
  - Common or very common Headache - hypertension
  - Rare or very rare Skin exfoliation - soft tissue necrosis
  - Frequency not known Abscess - arrhythmias - nausea - palpitations - peripheral ischaemia

**MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.

**DIRECTIONS FOR ADMINISTRATION** For intracavernosal injection, dilute 1 mg (0.1 mL of 10 mg/mL) metaraminol injection to 50 mL with Sodium chloride injection 0.9% and give carefully by slow injection into the corpora in 5 mL injections.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

### Solution for injection

- Metaraminol (Non-proprietary) Metaraminol (as Metaraminol tartrate) 10 mg per 1 mL Metaraminol 10 mg/1 mL solution for injection ampoules | 10 ampoule (POM) £43.90

**INDICATIONS AND DOSE**

- Priapism associated with alprostadil, if aspiration and lavage of the corpora are unsuccessful (alternative to adrenaline or metaraminol)
  - By intracavernosal injection
    - Adult: 100–200 micrograms every 5–10 minutes, dose to be administered using a 200 micrograms/mL solution; maximum 1 mg per course

**UNLICENSED USE** Use of phenylephrine hydrochloride injection in priapism is an unlicensed indication.

**CONTRA-INDICATIONS** Hypertension

**SIDE-EFFECTS** Angle closure glaucoma - anxiety - appetite decreased - arrhythmias - asthenia - confusion - dyspnoea - headache - hypertension - hypoxia - insomnia - nausea - palpitations - peripheral ischaemia - psychosis - tremor - urinary retention - vomiting

**DIRECTIONS FOR ADMINISTRATION** For intracavernosal injection, if suitable strength of phenylephrine injection is not available, it may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection to 5 mL with sodium chloride 0.9%.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

### Solution for injection

- Phenylephrine hydrochloride (Non-proprietary) Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 mL Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 mL Phenylephrine 500 micrograms/10 mL solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £15.00 | 10 pre-filled disposable injection (POM) £150.00

- Phenylephrine hydrochloride 100 microgram per 1 mL Phenylephrine hydrochloride 100 microgram per 1 mL Phenylephrine 1 mg/10 mL solution for injection ampoules | 10 ampoule (POM) £40.00 Phenylephrine hydrochloride 10 mg per 1 mL Phenylephrine hydrochloride 10 mg/1 mL solution for injection ampoules | 10 ampoule (POM) £99.12
**4.2 Premature ejaculation**

**Description of condition**

Premature ejaculation is a common male sexual disorder characterised by brief ejaculatory latency, loss of control, and psychological distress.

**Treatment**

Non-drug treatment (including psychosexual counselling, education, and behavioural treatments) are recommended in patients for whom premature ejaculation causes few (if any) problems or in patients who prefer not to take drug treatment. These techniques can also be used in addition to a drug treatment.

For patients with life-long premature ejaculation, drug treatment is the recommended approach. Dapoxetine p. 821, a short-acting selective serotonin re-uptake inhibitor, is licensed to be used when required for this condition (not continuous daily use).

Other selective serotonin re-uptake inhibitors (citalopram p. 364, fluoxetine p. 369, fluvoxamine maleate p. 366, escitalopram p. 365, paroxetine p. 366, sertraline p. 367 [unlicensed indications]) and the tricyclic antidepressant clomipramine [unlicensed indication] have been widely used as regular, daily treatment. Caution is suggested in prescribing selective serotonin re-uptake inhibitors for young adolescents with premature ejaculation, and to men who also have a depressive disorder, particularly when associated with suicidal ideation. Ejaculation delay may start a few days after the start of treatment, but it is more evident after 1 to 2 weeks, since receptor desensitisation requires time to occur.

If premature ejaculation is secondary to erectile dysfunction p. 812, the erectile dysfunction should be treated first.

Topical anaesthetic preparations for the management of premature ejaculation are available without prescription.

---

**Other drugs used for Premature ejaculation**

- Lidocaine with prilocaine, p. 1354

---

**Scottish Medicines Consortium (SMC) decisions**

The **Scottish Medicines Consortium** has advised (December 2017) that aviptadil with phentolamine (Invicorp®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of erectile dysfunction due to neurogenic, vasculogenic, psychogenic, or mixed aetiology in adult males who have failed on oral therapies (oral phosphodiesterase type-5 inhibitors) and other non-injectable formulations of erectile dysfunction medications.
selective serotonin re-uptake inhibitors

Dapoxetine

- **drug action** Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

- **indications and dose** Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes
  - **by mouth**
  - **adult:** Initially 30 mg, to be taken approximately 1–3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day; maximum 60 mg per day

- **dose adjustments due to interactions**
  - **manufacturer advises max. dose 30 mg with concurrent use of moderate inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 60 mg.**
  - **manufacturer advises avoid with concurrent use of potent inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 30 mg.**

- **contra-indications** History of bipolar disorder • history of mania • history of severe depression • history of syncope • significant cardiac disease • uncontrolled epilepsy

- **cautions** Bleeding disorders • epilepsy (discontinue if convulsions develop) • susceptibility to angle-closure glaucoma

- **interactions** → Appendix 1: SSRIs

- **side-effects**
  - **common or very common** Anxiety • asthenia • concentration impaired • constipation • diarrhoea • dizziness • drowsiness • dry mouth • gastrointestinal discomfort • gastrointestinal disorders • headache • hypotension • mood altered • nausea • paraesthesia • sexual dysfunction • sinus congestion • sleep disorders • sweat changes • syncope • tinnitus • tremor • vasodilation • vision blurred • vomiting • yawning
  - **uncommon** Akathisia • arrhythmias • behaviour abnormal • confusion • depression • eye pain • feeling abnormal • feeling hot • hypertension • level of consciousness decreased • mydriasis • pruritus • taste altered • thinking abnormal • vertigo

- **side-effects, further information** Discontinue if psychiatric disorder develops.

- **hepatic impairment** Manufacturer advises avoid in moderate to severe impairment.

- **renal impairment** Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

- **pre-treatment screening** Test for postural hypotension before starting treatment.

- **treatment cessation** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

- **patient and carer advice** Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

- **medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**tablet**

**cautionary and advisory labels** 2, 25

- **priligy (A. Menarini Farmaceutica Internazionale SRL)**
  - **dapoxetine 30 mg** Priligy 30mg tablets | 3 tablet DT = £14.71 | 6 tablet DT = £26.48
  - **dapoxetine 60 mg** Priligy 60mg tablets | 3 tablet DT = £19.12 | 6 tablet DT = £34.42

5 Obstetrics

Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin p. 823, carbetocin p. 824, ergometrine maleate p. 824, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

**induction of abortion**

Gemeprost p. 826, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravids. The prostaglandin misoprostol p. 827 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic dinoprostone is rarely used nowadays.

Pre-treatment with mifepristone p. 825 can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

**induction and augmentation of labour**

Dinoprostone is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin (Syntocinon®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Misoprostol is given orally [unlicensed route] or vaginally for the induction of labour.

**prevention and treatment of haemorrhage**

Bleeding due to incomplete miscarriage or abortion can be controlled with ergometrine maleate and oxytocin (Syntometrine®) given intramuscularly; the dose is adjusted according to the patient’s condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine maleate combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine maleate with oxytocin (Syntometrine®) can be given by intramuscular injection.
injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin by slow intravenous injection, followed in severe cases by intravenous infusion of oxytocin at a rate that controls uterine atony or
gestures to prevent atony — risk of hypertension) or
- ergometrine with oxytocin (Syntometrine®) by intra muscular injection

Carboprost p. 824 has an important role in severe postpartum haemorrhage unresponsive to ergometrine maleate and oxytocin.

Misoprostol [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine maleate, and carboprost are not available or are inappropriate.

**Mifepristone**

For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]).

Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include [unlicensed] regimens for inducing medical abortion.

**Indications and Dose**

**Premature labour**

Oxytocin 0.5–1 ml 12-hourly or as directed. Ergometrine 0.5 ml 8-hourly or as directed. If tolerated, repeat at 4-hourly intervals. If the oxytocin dose is increased at 4-hourly intervals, the ergometrine dose should also be increased.

**Oxytocin**

**Premature labour**

By intravenous infusion grade 1 or 2, 0.1–0.5 ml/hour or as directed. By slow intravenous injection 0.5 ml 6-hourly or as directed. If tolerated, repeat at intervals of 1–2 hours and titrate dose to effect.

**Ergometrine**

**Premature labour**

By intravenous infusion 0.1–0.25 ml/hour or as directed. By slow intravenous injection 0.5 ml 6-hourly or as directed. If tolerated, repeat at intervals of 1–2 hours and titrate dose to effect.

**Dose equivalence and conversion**

**Oxytocin**

To convert from U to IU, multiply by 1.45.

**Ergometrine**

To convert from mg to ml, multiply by 4.

**5.1 Induction of labour**

Other drugs used for Induction of labour Misoprostol, p. 827
Oxytocin

**INDICATIONS AND DOSE**

**Induction of labour for medical reasons** | **Stimulation of labour in hypotonic uterine inertia**
---|---
| **By intravenous infusion** | • Adult: Initially 0.001–0.004 unit/minute, not to be started for at least 6 hours after administration of vaginal prostaglandin, dose increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute, if regular contractions not established after a total 5 units, stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

**Caesarean section**
---
| **By slow intravenous infusion** | Adult: 5 units immediately after delivery

**Prevention of postpartum haemorrhage after delivery of placenta**
---
| **By slow intravenous infusion** | Adult: 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours

**By intramuscular injection**
---
| Adult: 10 units, can be used instead of oxytocin with ergometrine (Syntometrine	extsuperscript{®}).

**Treatment of postpartum haemorrhage**
---
| **By intravenous infusion** | Adult: 5 units, repeated if necessary

**Treatment of severe cases of postpartum haemorrhage (following intravenous injection)**
---
| **By intravenous infusion** | Adult: 40 units, given in 500 mL infusion fluid given at a rate sufficient to control uterine atony

**Incomplete, inevitable, or missed miscarriage**
---
| **Initially by slow intravenous injection** | Adult: 5 units, followed by (by intravenous infusion) 0.02–0.04 unit/minute if required, the rate of infusion can be faster if necessary

**UNLICENSED USE** Oxytocin doses in the BNF may differ from those in the product literature. Administration by intramuscular injection is an unlicensed use.

**IMPORTANT SAFETY INFORMATION**

Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth, monitor fluid and electrolytes.

**CONTRA-INDICATIONS** Any condition where spontaneous labour is advisable - any condition where vaginal delivery is advisable - avoid intravenous injection during labour - avoid prolonged administration in oxytocin-resistant uterine inertia - avoid rapid intravenous injection (may transiently reduce blood pressure) - fetal distress (discontinue immediately if this occurs) - hypertonic uterine contractions (discontinue immediately if this occurs) - severe cardiovascular disease - severe pre-eclamptic toxemia.

**CAUTIONS** Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) - enhancement of labour - presence of borderline cephalopelvic disproportion (avoid if significant) - history of lower-uterine segment caesarean section - induction of labour - presence of borderline cephalopelvic disproportion (avoid if significant) - mild pregnancy-induced cardiac disease - mild pregnancy-induced hypertension - moderate pregnancy-induced cardiac disease - moderate pregnancy-induced hypertension - risk factors for disseminated intravascular coagulation - secondary uterine inertia - women over 35 years.

**SIDE-EFFECTS**
---
| Common or very common | Arrhythmias - headache - nausea - vomiting

| Rare or very rare | Dyspnoea - hypotension - rash

| Frequency not known | Angioedema - disseminated intravascular coagulation - electrolyte imbalance - flushing - haemorrhage - myocardial ischaemia - pulmonary oedema - QT interval prolongation - uterine rupture - water intoxication

**SIDE-EFFECTS, FURTHER INFORMATION** Avoid rapid intravenous injection (may transiently reduce blood pressure).

**UTERINE HYPERSTIMULATION -** usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture.

**Overdose** Placental abruption and amniotic fluid embolism reported on overdose.

**MONITORING REQUIREMENTS**
---
| Careful monitoring of fetal heart rate and uterine motility essential for dose titration.

**Monitor for disseminated intravascular coagulation after parturition.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Syntocinon	extsuperscript{®}), give continuously in Glucose 5% or Sodium Chloride 0.9%. Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for induction or enhancement of labour, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL; for treatment of postpartum uterine haemorrhage dilute 40 units in 500 mL; if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher

---

**www.getintopharma.com**
concentration than for induction or enhancement of labour; close attention to patient’s fluid and electrolyte status essential.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Solution for injection**
- **Oxytocin (non-proprietary)**
  - Oxytocin 5 unit per 1 ml Oxytocin 5 units/1ml solution for injection ampoules | 5 ampoule £0.55 | 10 ampoule £2.00
  - Oxytocin 10 unit per 1 ml Oxytocin 10 units/1ml solution for infusion ampoules | 5 ampoule £0.45 | 10 ampoule £0.90
  - Oxytocin 10 units/1ml solution for infusion ampoules | 5 ampoule £0.45 | 10 ampoule £0.90
- **Syntocinon (Mylan)**
  - Syntocinon 5 unit per 1 ml Syntocinon 5 units/1ml solution for injection ampoules | 5 ampoule £4.01 (Hospital only)
  - Syntocinon 10 unit per 1 ml Syntocinon 10 units/1ml solution for injection ampoules | 5 ampoule £4.53 (Hospital only)

5.2 Postpartum haemorrhage

Other drugs used for Postpartum haemorrhage Oxytocin, p. 823

### Carboprost

**INDICATIONS AND DOSE**

Postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 250 micrograms, repeated if necessary, to be given at intervals of not less than 15 minutes. Total dose should not exceed 2 mg (8 doses)

**CONTRA-INDICATIONS** Cardiac disease - pulmonary disease - untreated pelvic infection

**CAUTIONS** Excessive dosage may cause uterine rupture - history of anaemia - history of asthma - history of diabetes - history of epilepsy - history of glaucoma - history of hypertension - history of hypotension - history of jaundice - history of raised intra-ocular pressure - uterine scars

**SIDE-EFFECTS**
- Common or very common Chills - cough - diarrhoea - headache - nausea - uterine disorders - vasodilatation - vomiting
- Frequency not known Anxiety - asthenia - blepharospasm - choking sensation - palpitations - rash - thirst - throat complaints - thyrotoxic crisis

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in active hepatic disease.

**RENAI IMPAIRMENT** Manufacturer advises avoid.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Hemabate (Pfizer Ltd)**
  - Carboprost (as Carboprost trometamol) 250 microgram per 1 ml Hemabate 250 micrograms/1ml solution for injection ampoules | 10 ampoule £182.01 (Hospital only)

### Ergometrine maleate

**INDICATIONS AND DOSE**

Postpartum haemorrhage caused by uterine atony
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Adult: 250–500 micrograms

**CONTRA-INDICATIONS** Eclampsia - first stage of labour - induction of labour - second stage of labour - sepsis - severe cardiac disease - severe hypertension - vascular disease

**CAUTIONS** Acute porphyrias p. 1058. cardiac disease - hypertension - multiple pregnancy - risk of hypertension associated with intravenous administration

**INTERACTIONS**
- Appendix 1: ergometrine

**SIDE-EFFECTS** Abdominal pain - arrhythmias - chest pain - coronary vasospasm - dizziness - dyspnoea - headache - hypertension - myocardial infarction - nausea - palpitations - pulmonary oedema - rash - tinnitus - vasoconstriction - vomiting

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**RENAI IMPAIRMENT** Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.
Ergometrine with oxytocin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate p. 824, oxytocin p. 823.

- **INDICATIONS AND DOSE**
  - **Active management of the third stage of labour** | **Postpartum haemorrhage caused by uterine atony**
  - **BY INTRAMUSCULAR INJECTION**
  - **Adult:** 1 mL for one dose
  - **BY INTRAVENOUS INJECTION**
  - **Adult:** No longer recommended

- **Bleeding due to incomplete miscarriage or abortion**
  - **BY INTRAMUSCULAR INJECTION**
  - **Adult:** Adjusted according to response to, the patient’s condition and blood loss

- **INTERACTIONS** → Appendix 1: ergometrine

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Ergometrine maleate (Non-proprietary)**
      - Ergometrine maleate 500 microgram per 1 mL
      - 10 ampoule (£/unit) £15.00

- **Contraception**
  - **Premature labour**
  - **5.3 Premature labour**

### Other drugs used for Premature labour
- Indomethacin, p. 1143
- Nifedipine, p. 162
- Salbutamol, p. 252
- Terbutaline, p. 255

### OXYTOCIN RECEPTOR ANTAGONISTS

#### Atosiban

- **INDICATIONS AND DOSE**
  - **Uncomplicated premature labour between 24 and 33 weeks of gestation**
  - **INITIALLY BY INTRAVENOUS INJECTION**
  - **Adult:** Initially 6.75 mg over 1 minute, then (by intravenous infusion) 18 mg/hour for 3 hours, then (by intravenous infusion) reduced to 6 mg/hour for up to 45 hours. Maximum duration of treatment is 48 hours

- **CONTRA-INDICATIONS**
  - Abruptio placenta • antepartum haemorrhage (requiring immediate delivery) • eclampsia • intra-uterine fetal death • intra-uterine infection • intra-uterine growth restriction with abnormal fetal heart rate • placenta praevia • premature rupture of membranes after 30 weeks’ gestation • severe pre-eclampsia

- **CAUTIONS**
  - Abnormal placental site • intra-uterine growth restriction

- **SIDE-EFFECTS**
  - **Common or very common**
    - Dizziness • headache • hot flush • hyperglycaemia • hypotension • nausea • tachycardia • vomiting
  - **Uncommon**
    - Fever • insomnia • skin reactions
  - **Rare or very rare**
    - Uterine atony • uterine haemorrhage
  - **Frequency not known**
    - Dyspnoea • pulmonary oedema

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Atosiban 6.75 mg/0.9 mL solution for injection vials**
      - 1 vial (£) £18.41 (Hospital only)
    - **Atosiban 6.75 mg/0.9 mL solution for injection vials**
      - 1 vial (£) £18.41 (Hospital only)
  - **Solution for infusion**
    - **Atosiban 6.75 mg/0.9 mL solution for infusion vials**
      - 1 vial (£) £50.18–£52.82 (Hospital only)

#### Mifepristone

- **DRUG ACTION**
  - Mifepristone, an antiprogestogenic steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix.

- **INDICATIONS AND DOSE**
  - **Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation**
    - **BY MOUTH**
    - **Adult:** 200 mg for 1 dose, to be taken 36–48 hours before procedure
  - **Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate**
    - **BY MOUTH**
    - **Adult:** 600 mg once daily for 2 days, if labour not started within 72 hours of first dose, another method should be used

### 5.4 Termination of pregnancy

#### PROGESTERONE RECEPTOR MODULATORS

- **Mifepristone**

  - **Drug action**
    - Mifepristone, an antiprogestogenic steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix.

  - **Indications and dose**
    - **Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation**
      - **By mouth**
      - **Adult:** 200 mg for 1 dose, to be taken 36–48 hours before procedure
    - **Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate**
      - **By mouth**
      - **Adult:** 600 mg once daily for 2 days, if labour not started within 72 hours of first dose, another method should be used

### Medical termination of intra-uterine pregnancy of up to 49 days gestation

- **By mouth**
- **Adult:** 600 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding continued →
Medical termination of intra-uterine pregnancy of 50–63 days gestation (under close medical supervision)

- **BY MOUTH**
  - Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow–up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)

- **BY MOUTH**
  - Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol; if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058 - chronic adrenal failure - suspected ectopic pregnancy (use other specific means of termination) - uncontrolled severe asthma

- **CAUTIONS** Adrenal suppression (may require corticosteroid) - anti-coagulant therapy - asthma (avoid if severe and uncontrolled) - existing cardiovascular disease - haemorrhagic disorders - history of endocarditis - prosthetic heart valve - risk factors for cardiovascular disease

- **INTERACTIONS** & Appendix 1: mifepristone

- **SIDE-EFFECTS**
  - Common or very common Abdominal cramps - diarrhoea - infection - nausea - pelvic inflammatory disease - uterine disorders - vaginal haemorrhage (sometimes severe) - vomiting
  - Uncommon Hypotension
  - Rare or very rare Angioedema - chills - dizziness - erythema nodosum - fever - headache - hot flush - malaise - skin reactions - toxic epidermal necrolysis - toxic shock syndrome - uterine rupture

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in hepatic failure (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

- **MONITORING REQUIREMENTS** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension).

- **PRESCRIBING AND DISPENSING INFORMATION** Supplied to NHS hospitals and premises approved under Abortion Act 1967.

- **PATIENT AND CARER ADVICE** Patient information leaflet to be provided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 10
  - Mifepristone (Non-proprietary)
  - Mifepristone 200 mg Mifepristone 200mg tablets | 1 tablet [POM] £9.48
  - Mifepristone 200 mg Mifepristone 200mg tablets | 3 tablet [POM] £52.66 (Hospital only)

**PROSTAGLANDINS AND OXYTOCICS**

### Gemeprost

- **INDICATIONS AND DOSE**
  - Cervical ripening prior to first trimester surgical abortion
    - **BY VAGINA**
    - Adult: 1 mg, dose to be inserted into posterior fornix 3 hours before surgery
  - Second trimester abortion
    - **BY VAGINA**
    - Adult: 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix, second course may begin 24 hours after start of treatment (if treatment fails, pregnancy should be terminated by another method)
  - Second trimester intra-uterine death
    - **BY VAGINA**
    - Adult: 1 mg
  - **T**ermination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) following mifepristone
    - **BY VAGINA**
    - Adult: 1 mg
  - Medical termination of intra-uterine pregnancy of up to 49 days gestation following mifepristone
    - **BY VAGINA**
    - Adult: 1 mg every 3 hours, if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended, careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension); maximum 5 mg per course

- **CONTRA-INDICATIONS** Placenta praevia - unexplained vaginal bleeding - uterine scarring

- **CAUTIONS** Cardiovascular insufficiency - cervicitis - obstructive airways disease - raised intra-ocular pressure - vaginitis

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

- **MONITORING REQUIREMENTS**
  - If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours.
  - When used for second trimester intra-uterine death, monitor for coagulopathy during treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

www.getintopharma.com
Misoprostol

**DRUG ACTION** Misoprostol is a synthetic prostaglandin analogue that acts as a potent uterine stimulant.

**INDICATIONS AND DOSE**

- **Termination of pregnancy following mifepristone**
  - (gestation up to 49 days)
  - **By mouth**
  - Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone

- **Termination of pregnancy following mifepristone**
  - (gestation 50 to 63 days)
  - **INITIALLY BY VAGINA**
  - Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, if abortion has not occurred 4 hours after first misoprostol dose a further dose may be given, (by mouth or by vagina) 400 micrograms for 1 dose

- **Termination of pregnancy following mifepristone**
  - (gestation of 9 to 13 weeks)
  - **INITIALLY BY VAGINA**
  - Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses

- **Termination of pregnancy following mifepristone**
  - (gestation of 13 to 24 weeks)
  - **INITIALLY BY VAGINA**
  - Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, followed by (by vagina or by mouth) 200 micrograms every 3 hours if required for a maximum of 4 doses, if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommenced 12 hours later

**MYSODELLE® VAGINAL DELIVERY SYSTEM**

- **Induction of labour (specialist supervision in hospital)**
  - **By Vagina**
  - Adult: 200 micrograms for 1 dose, to be inserted (in vaginal delivery system) high into posterior fornix; if oxytocin required, remove at least 30 minutes before oxytocin administration, for information on when to remove the delivery system—consult product literature

**UNLICENSED USE** Misoprostol doses for termination of pregnancy may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVISE: MISOPOROSTOL VAGINAL DELIVERY SYSTEM (MYSODELLE®). REPORTS OF EXCESSIVE UTERINE CONTRACTIONS (TACHYSYSTOLE) UNRESPONSIVE TO TOCOLYTIC TREATMENT (FEBRUARY 2018)

*Mysodelle (MYSODELLE®) can cause excessive uterine tachysystole that may not respond to tocolytic treatment. Monitor patients closely and remove the vaginal delivery system at the onset of labour, or if there is clinical concern for mother or baby.

Be prepared to administer tocolytic therapy—if needed, it can be administered immediately after removal of *Mysodelle®*.

**CONTRA-INDICATIONS**

- **MYSODELLE® VAGINAL DELIVERY SYSTEM** Before 36 weeks’ gestation - chorioamnionitis (unless adequate prior treatment initiated) - fetal malpresentation - placenta previa - suspicion or evidence of fetal compromise - unexplained vaginal bleeding after 24 weeks gestation - uterine abnormality - uterine scar

**CAUTIONS**

- When used for termination of pregnancy Cardiovascular disease - risk factors for cardiovascular disease

**MYSODELLE® VAGINAL DELIVERY SYSTEM** Modified Bishop score greater than 4

**SIDE-EFFECTS**

- **Common or very common**
  - Nausea - neonatal respiratory depression - rash - transient tachypnoea of the newborn - vomiting

- **Uncommon**
  - Genital pruritus - hypoxic–ischaemic encephalopathy - uterine rupture

**BREAST FEEDING**

- Manufacturer advises avoid—present in milk, and may cause diarrhoea in nursing infants.

**Tertiary sources state present in milk but amount probably too small to be harmful; to further reduce risk following termination of pregnancy, consider interrupting breastfeeding for 5 hours after a dose.

**HANDLING AND STORAGE**

- MYSODELLE® VAGINAL DELIVERY SYSTEM Manufacturer advises store in a freezer (-10 to -25°C); no thawing required prior to use.

**PATIENT AND CARER ADVICE**

- **Driving and skilled tasks** Manufacturer advises patients should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**

**MYSODELLE® VAGINAL DELIVERY SYSTEM**

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3627

The All Wales Medicines Strategy Group has advised (March 2018) that misoprostol (*Mysodelle®*) is recommended as an option for use within NHS Wales for the induction of labour in women with an unfavourable cervix, from 36 weeks gestation, in whom induction is clinically indicated.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 21**
  - Misoprostol (Non-proprietary)

  - Misoprostol 200 microgram Misoprostol 200microgram vaginal tablets | 4 tablet (£245.00 (Hospital only))

  - Topogyn (Nordic Pharma Ltd)

  - Misoprostol 400 microgram Topogyn 400microgram tablets | 16 tablet (£128.00 (Hospital only))

**Vaginal delivery system**

- *Mysodelle* (Ferring Pharmaceuticals Ltd)

- Misoprostol 7 microgram per 1 hour Mysodelle 200micrograms vaginal delivery system | 5 unit (£465.00)

---

**6 Vaginal and vulval conditions**

**Vaginal and vulval conditions**

**Management**

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure.

*Aqueous medicated douches* may disturb normal vaginal acidity and bacterial flora.

*Topical anaesthetic agents* give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.
Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis.

Vaginal and vulval changes

Topical HRT for vaginal atrophy
A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in menopausal atrophic vaginitis. It is important to bear in mind that topical oestrogens should be used in the smallest effective amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are also available.

The risk of endometrial hyperplasia and carcinoma is increased when systemic oestrogens are administered alone for prolonged periods. The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

Non-hormonal preparations for vaginal atrophy
Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff).

Vaginal and vulval infections
Effective specific treatments are available for the common vaginal infections.

Fungal infections
*Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

*Imidazole* drugs ( clotrimazole p. 829, econazole nitrate p. 830, miconazole nitrate p. 830, and miconazole p. 830) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 595 or itraconazole p. 597 is also effective.

*Vulvovaginal candidiasis in pregnancy*
Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

*Recurrent vulvovaginal candidiasis*
Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of reinfection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections
*Trichomonal infections* commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 542 or tinidazole p. 544. *Bacterial infections* with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin below cream and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir p. 633, famciclovir p. 635, and valaciclovir p. 636 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

6.1 Vaginal and vulval infections

6.1a Vaginal and vulval bacterial infections

Other drugs used for Vaginal and vulval bacterial infections Metronidazole, p. 542

**ANTIBACTERIALS** > LINCOSAMIDES

Clindamycin

- **INDICATIONS AND DOSE**
  - **DALACIN® 2% CREAM**
    - **Bacterial vaginosis**
      - **BY VAGINA**
        - **Adult:** 1 applicatorful daily for 3–7 nights, dose to be administered at night
    - **DOSE EQUIVALENCE AND CONVERSION**
      - 1 applicatorful delivers a 5 g dose of clindamycin 2%.

  - **INTERACTIONS** > Appendix 1: clindamycin
  - **SIDE-EFFECTS**
    - **Common or very common** Skin reactions
    - **Frequency not known** Constipation; diarrhoea (discontinue); dizziness; gastrointestinal discomfort; headache; increased risk of infection; nausea; vertigo; vomiting; vulvovaginal irritation
  - **SIDE-EFFECTS, FURTHER INFORMATION** Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

- **CONCEPTION AND CONTRACEPTION**
  - **DALACIN® 2% CREAM** Damages latex condoms and diaphragms.

  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Cream EXCipients:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol
  - **Dalacin® (Pfizer Ltd)**
    - Clindamycin (as Clindamycin phosphate) 20 mg per 1 gram Dalacin 2% cream | 40 gram pack £10.86 DT + £10.86

Vaginal and vulval fungal infections

Dequalinium chloride

**Dequalinium chloride**

- **Drug action** Dequalinium chloride is a bactericidal anti-infective which causes bacterial cell death by increasing cell permeability and reducing enzyme activity.

**Indications and dose**

**Bacterial vaginosis**
- **BY VAGINA**
  - Adult 18–55 years: 10 mg once daily for 6 days, inserted at night

**Contra-indications** Vaginal ulceration

**Side-effects**
- Common or very common Increased risk of infection - vulvovaginal disorders
- Uncommon Haemorrhage, headache, nausea
- Frequency not known Cystitis, fever

**Conception and contraception** Does not affect efficacy of latex condoms; however, manufacturer advises avoid use of non-latex condoms and intravaginal devices — no information available.

**Pregnancy** Manufacturer advises avoid unless essential — limited information available.

**National funding/access decisions**

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (November 2016) that dequalinium chloride (Fluomizin®) is accepted for restricted use within NHS Scotland for treatment of bacterial vaginosis in patients for whom the initial treatment is not effective or well tolerated.

All Wales Medicines Strategy Group (AWMSG) decisions
The All Wales Medicines Strategy Group has advised (November 2016) that dequalinium chloride (Fluomizin®) is recommended as an option for restricted use within NHS Wales for the treatment of bacterial vaginosis only after initial treatment is ineffective or not tolerated, as an alternative option to clindamycin vaginal cream.

**Medicinal forms**

  - Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis - Dubin-Johnson syndrome (or monitor closely) - history of breast cancer - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - Rotor syndrome (or monitor closely) - thrombophlebitic disorder - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism

- **CAUTIONS**
  - Acute porphyrias p. 1058 - diabetes (increased risk of heart disease) - history of breast nodules - closely monitor breast status (risk of breast cancer) - history of endometrial hyperplasia - factors predisposing to thromboembolism - history of fibrocystic disease - closely monitor breast status (risk of breast cancer) - hypophysial tumours - increased risk of gall-bladder disease - interrupt treatment periodically to assess need for continued treatment - migraine (or migraine-like headaches) - presence of antiphospholipid antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size

- **INTERACTIONS**
  - Appendix 1: hormone replacement therapy

- **SIDE-EFFECTS**
  - **Common or very common**
    - Abdominal pain - headaches - nausea - skin reactions - vaginal haemorrhage - vulvovaginal disorders
  - **Uncommon**
    - Hypertension - vulvovaginal fungal infection - weight increased
  - **Rare or very rare**
    - Diarrhoea - embolism and thrombosis - endometrial hyperplasia - fluid retention - genital pruritus - increased risk of ischaemic stroke - insomnia - neoplasm malignant - neoplasms - vaginismus

**SIDE-EFFECTS, FURTHER INFORMATION**

Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- Risk of endometrial cancer
  - The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.
  - In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously.
  - However, this should be weighed against the increased risk of breast cancer.

- Risk of ovarian cancer
  - Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

- Risk of venous thromboembolism
  - Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.
  - In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

- Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- Risk of stroke
  - Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke.
  - Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

- Risk of coronary heart disease
  - HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

- **Other conditions**
  - The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.
after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

- **CONCEPTION AND CONTRACEPTION** HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant. VAGIFEM® No evidence of damage to latex condoms and diaphragms.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

- **MONITORING REQUIREMENTS**
  - History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
  - The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Pessary**
  - **Vagifem** (Novo Nordisk Ltd)
    - Estradiol 10 microgram Vagifem 10microgram vaginal tablets
    - 24 pessary
  - **Vagifem** (Novo Nordisk Ltd)
  - **Estring** (Pfizer Ltd)
    - Estradiol (as Estradiol hemihydrate) 7.5 microgram/24 hour
    - Vaginal delivery system
  - **Estring** (Pfizer Ltd)

- **Estring** (Pfizer Ltd)
  - Estradiol (as Estradiol hemihydrate) 7.5 microgram per 24 hour
  - Estring 7.5micrograms/24hours vaginal delivery system
  - 1 device

  **Benefits**
  - **INDICATIONS AND DOSE**
    - **OVESTIN**®
    - Improve the vaginal epithelium in menopausal atrophic vaginitis (short-term use)
    - BY VAGINA
      - Adult: Apply 1 applicatorful daily for 2–3 weeks, then reduced to 1 applicatorful twice weekly, discontinue every 2–3 months for 4 weeks to assess need for further treatment
    - Vaginal surgery for prolapse when there is epithelial atrophy in postmenopausal women (before surgery)
      - BY VAGINA
        - Adult: Apply 1 applicatorful daily for 2 weeks before surgery, resume 2 weeks after surgery

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · Rotor syndrome (or monitor closely) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

- **CAUTIONS** Acute porphyrias p. 1058 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · interrupt treatment periodically to assess need for continued treatment · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

  **CAUTIONS, FURTHER INFORMATION**
  - Risk of breast cancer It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.
  - Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.
  - Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.
    - In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously.
    - However, this should be weighed against the increased risk of breast cancer.
  - Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
  - Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.
  - In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.
  - Travel Involving prolonged immobility further increases the risk of deep vein thrombosis.
  - Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
  - Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
  - Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, rectal or colorectal disease.
otitis media, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy
- **SIDE EFFECTS**
  - Breast abnormalities - cervical mucus increase, headache, increased risk of coronary artery disease, increased risk of ischaemic stroke, increased risk of venous thromboembolism, nausea, neoplasms, skin reactions, vaginal haemorrhage, vaginal spotting, vomiting
- **CONCEPTION AND CONTRACEPTION**
  - Effect on latex condoms and diaphragms not yet known.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT**
  - Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
- **RENA L IMPAIRMENT** Manufacturer advises caution in renal disease. Evidence for caution is unsatisfactory and many women with these conditions may stand to benefit from HRT.
- **MONITORING REQUIREMENTS**
  - Closely monitor breast status if history of breast nodules or fibrocystic disease (risk of breast cancer).
  - The endometrial safety of long-term or repeated use of oestrogen products for vaginal application, where systemic exposure to oestrogen remains within the normal postmenopausal range, it is not recommended to add a progestogen.
  - Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
  - Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.
  - In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, major surgery or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.
  - Travel involving prolonged immobility further increases the risk of deep vein thrombosis.
  - Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke.
  - Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
- **OTHER CONDITIONS**
  - The product literature advises caution in other conditions including hypertension, asthma, epilepsy, otosclerosis, and systemic lupus erythematosus.
  - Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
    - Ovestin (Aspen Pharma Trading Ltd)
    - Estradiol 1 mg per 1 gram Ovestin 1mg cream 15 gram £4.45 DT = £4.45

### Prasterone

**Drug action** Prasterone is biochemically and biologically identical to endogenous dehydroepiandrosterone (DHEA), and is converted to oestrogens and androgens.

- **INDICATIONS AND DOSE**
  - Vulvar and vaginal atrophy [in postmenopausal women with moderate to severe symptoms]
    - Adults: 6.5 mg once daily, at bedtime. Treatment should be reassessed at least every 6 months

- **CONTRA-INDICATIONS**
  - Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction). acute liver disease, acute porphyrias, history of breast cancer, history of liver disease (where liver function tests have failed to return to normal), oestrogen-dependent cancer, thrombophilic disorder, undiagnosed vaginal bleeding, untreated endometrial hyperplasia, venous thromboembolism

- **CAUTIONS**
  - Assess need for continued treatment at least every 6 months: cholestasis, diabetes mellitus, factors predisposing to thromboembolism, history of endometrial hyperplasia, hypertriglyceridaemia, liver disorders (discontinue if jaundice or deterioration in liver function occurs during treatment)
  - migraine (or migraine-like headaches) prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size

- **CAUTIONS, FURTHER INFORMATION**
  - Risk of breast cancer It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.
  - Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.
  - Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.
  - Bleeding or spotting occurring during treatment should be investigated.
  - For oestrogen products for vaginal application, where systemic exposure to oestrogen remains within the normal postmenopausal range, it is not recommended to add a progestogen.

### Ovestin

**Expiry Date**

- May 2019

**Interactions**

- **Anticoagulants** Risk of bleeding increases (use lower dose and monitor closely). Risk of venous thromboembolism (e.g. angina or myocardial infarction) increases. Risk of peptic ulcer increases (may require increase in dose of omeprazole). Risk of deep vein thrombosis increases (may require reduction in dose of dabigatran, rivaroxaban or apixaban).

**Effects of other drugs**

- **Selective oestrogen receptor modulators** Risk of endometrial cancer increases (increase monitoring frequency). Risk of thromboembolism increases (some need for dose adjustment)

**Pharmacokinetics**

- **Absorption** Almost complete. Absorption is increased by food and antacids.
- **Distribution** Varies with dose and duration of HRT use. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

**Indications and Dose**

- **Vulvar and vaginal atrophy** [in postmenopausal women with moderate to severe symptoms]
  - Adults: 6.5 mg once daily, at bedtime. Treatment should be reassessed at least every 6 months.
SELECTIVE OESTROGEN RECEPTOR MODULATORS

Ospemifene

18-Oct-2018

DRUG ACTION Ospemifene is a selective oestrogen receptor modulator that has an oestrogen-like effect in the vagina, increasing the cellular maturation and mucusification of the vaginal epithelium.

INDICATIONS AND DOSE

Moderate to severe symptomatic vulvar and vaginal atrophy [in post-menopausal women who are not candidates for local vaginal oestrogen therapy]

BY MOUTH

Adult: 60 mg once daily

CONTRA-INDICATIONS

Breast cancer (suspected or actively treated) • endometrial hyperplasia • history of venous thromboembolism • sex-hormone dependent malignancy (suspected or active) • unexplained vaginal bleeding

CAUTIONS

Risk factors for stroke • risk factors for venous thromboembolism (discontinue if prolonged immobilisation)

INTERACTIONS

→ Appendix 1: ospemifene

SIDE-EFFECTS

Common or very common Genital discharge • hot flush • increased risk of infection • muscle spasms • skin reactions • vaginal discharge

Uncommon Endometrial thickening • hypersensitivity • tongue swelling

PREGNANCY

Manufacturer advises avoid—toxicity in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises avoid in severe impairment—no information available.

PATIENT AND CARER ADVICE

Manufacturer advises patients and their carers should be advised to seek immediate medical attention if they experience symptoms of thromboembolism (such as sudden chest pain, dyspnoea or swelling of a leg).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Immune system

1 Immune system disorders and transplantation

Immune response

Inflammatory bowel disease
Azathioprine p. 836, ciclosporin p. 838, mercaptopurine p. 912, and methotrexate p. 913 have a role in the treatment of inflammatory bowel disease.
Folic acid p. 1025 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Immunosuppressant therapy
Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 846), calcineurin inhibitors (ciclosporin or tacrolimus p. 841), corticosteroids, or sirolimus p. 840. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness
Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised—important: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella–zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants
Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 1121 is given concurrently.
Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.
There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.
Cyclophosphamide p. 894 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants
Prednisolone p. 678 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin’s disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being.
The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.
Ciclosporin a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.
Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.
Sirolimus is a non–calcineurin inhibiting immunosuppressant licensed for renal transplantation. Basiliximab p. 844 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.
Belatacept p. 847 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein–Barr virus. It is used with interleukin-2 receptor antagonist induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) below is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

Other drugs used for immune system disorders and transplantation

**Antithymocyte immunoglobulin (rabbit)**

28-Nov-2017

- **INDICATIONS AND DOSE**
  - **Prophylaxis of organ rejection in heart allograft recipients**
    - Adult: 1–2.5 mg/kg daily for 3–5 days, to be given over at least 6 hours
  - **Prophylaxis of organ rejection in renal allograft recipients**
    - Adult: 1–1.5 mg/kg daily for 3–9 days, to be given over at least 6 hours
  - **Treatment of corticosteroid-resistant allograft rejection in renal transplantation**
    - Adult: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

- **DOSES AT EXTREMES OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

- **CONTRA-INDICATIONS**
- Infection

- **INTERACTIONS** → Appendix 1: immunoglobulins

- **SIDE-EFFECTS**
  - **Common or very common**
    - Chills · diarrhea · dysphagia · dyspnæa · fever · hypotension · infection · lymphopenia · myalgia · nausea · neoplasms · neutropenia · reactivation of infection · secondary malignancy · sepsis · skin reactions · thrombocytopenia · vomiting
  - **Uncommon**
    - Cytokine release syndrome · hepatic disorders · hypersensitivity · infusion related reaction

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor blood count.

- **DIRECTIONS FOR ADMINISTRATION**
  - For continuous intravenous infusion (Thymoglobulin®) in Glucose 5% or Sodium chloride 0.9%; reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractonated heparin and hydrocortisone in glucose infusion—precipitation reported.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **MEPYRAMINES**
  - Available.

- **IMMUNOCORES**
  - Antithymocyte immunoglobulin (rabbit) is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

  www.nice.org.uk/guidance/TA481

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder and solvent for solution for infusion**
    - Thymoglobulin (Sanofi)
      - Antithymocyte immunoglobulin (rabbit) 25 mg
      - Thymoglobuline 25 mg powder and solvent for solution for infusion vials | 1 vial | £158.77 (Hospital only)

**IMMUNOSUPPRESSANTS › ANTIMETABOLITES**

**Azathioprine**

13-Jun-2018

- **DRUG ACTION**
  - Azathioprine is metabolised to mercaptopurine.

- **INDICATIONS AND DOSE**
  - Severe acute Crohn’s disease | Maintenance of remission of Crohn’s disease | Maintenance of remission of acute ulcerative colitis
    - **BY MOUTH**
      - Adult: 2–2.5 mg/kg daily, some patients may respond to lower doses

  - Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders | Polymyositis in cases of corticosteroid resistance
    - **BY MOUTH**
      - Adult: Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months

  - Autoimmune conditions
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Adult: 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

  - Suppression of transplant rejection
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Adult: 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

  - Severe refractory eczema, normal or high TPMT activity
    - **BY MOUTH**
      - Adult: 1–3 mg/kg daily
## Immune system disorders and transplantation

### Severe refractory eczema, intermediate TPMT activity
- **BY MOUTH**
  - Adult: 0.5–1.5 mg/kg daily

### Generalised myasthenia gravis
- **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

#### Dose adjustments due to interactions
- Monitor dose and reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

### Contra-indications
- Hypersensitivity to mercaptopurine.

### Interactions
- Reduce dose in elderly.

### Side-effects
- **General side-effects**
  - Common or very common: Bone marrow depression (dose-related), increased risk of infection, leucopenia, thrombocytopenia.
  - Uncommon: Anaemia, hepatic disorders, hypersensitivity, pancreatitis.
  - Rare or very rare: Agranulocytosis, alopecia, bone marrow suppression, gastrointestinal disorders, neoplasms, photosensitivity reaction, pneumonia.
  - Severe cutaneous adverse reactions (SCARs).
  - Frequency not known: Nodular regenerative hyperplasia, sinusoidal obstruction syndrome.

### Specific side-effects
- With oral use: Nausea.

### Further information
- Side-effects may require drug withdrawal.

### Hypersensitivity reactions
- Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and renal dysfunction) call for immediate withdrawal.

### Neutropenia and thrombocytopenia
- Neutropenia is dose-dependent. Management of neutropenia and thrombocytopenia requires careful monitoring and dose adjustment.

### Nausea
- Nausea is common early in the course of treatment and usually resolves after a few weeks without an alteration in dose. Moderate nausea can be managed by using divided daily doses, taking doses after food, prescribing concurrent antiemetics or temporarily reducing the dose.

### Allergy and cross-sensitivity
- Contra-indicated in hypersensitivity to mercaptopurine.

### Pregnancy
- Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

### Breast feeding
- Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

### Hepatic impairment
- Manufacturer advises caution (impaired metabolism)—monitor liver function and complete blood count more frequently in those with severe impairment.

### Dose adjustments
- Manufacturer advises use doses at lower end of the dose range in hepatic failure; reduce dose if hepatic or haematological toxicity occur.

### Renal impairment
- Dose adjustments: Reduce dose.

### Pre-treatment screening
- Thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

### Monitoring requirements
- Monitor for toxicity throughout treatment.
- Monitor full blood count weekly (more frequently with higher doses or if severe renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.

### Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

### Directions for administration
- With intravenous use: For intravenous injection, give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For intravenous infusion (Imuran®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid. Intravenous injection is alkaline and very irritant, intravenous route should therefore be used only if oral route not feasible.

### Patient and carer advice
- Bone marrow suppression. Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

### Medicinal forms
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution.

## Table

### Azathioprine (Non-proprietary)
- **Azathioprine 25 mg** (Azathioprine 25mg tablets) | 28 tablet pack
- **Azathioprine 50 mg** (Azathioprine 50mg tablets) | 56 tablet pack
- **Azathioprine 100 mg** (Azathioprine 100mg tablets) | 56 tablet pack
- **Azathioprine 250 mg** (Azathioprine 250mg tablets) | 56 tablet pack
- **Azathioprine 500 mg** (Azathioprine 500mg tablets) | 56 tablet pack

### Azapress (Emmgen Pharma Ltd)
- **Azathioprine 25 mg** (Azapress 25mg tablets) | 100 tablet pack
- **Azathioprine 50 mg** (Azapress 50mg tablets) | 100 tablet pack
- **Azathioprine 100 mg** (Azapress 100mg tablets) | 100 tablet pack

### Imuran (Aspen Pharma Trading Ltd)
- **Azathioprine 25 mg** (Imuran 25mg tablets) | 100 tablet pack
- **Azathioprine 50 mg** (Imuran 50mg tablets) | 100 tablet pack
- **Azathioprine 100 mg** (Imuran 100mg tablets) | 100 tablet pack

---

**www.getintopharma.com**
Ciclosporin

(Cyclosporin)

**IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS**

**Drug Action**
Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

**Indications and Dose**

- **Severe acute ulcerative colitis refractory to corticosteroid treatment**
  - **By mouth**
  - Adult: Initially 1.5 mg/kg twice daily, increased if necessary up to 2.5 mg/kg twice daily after 6 weeks, dose increases should be made gradually, for maintenance treatment, titrate dose individually to the lowest effective dose according to tolerability, treatment may be required for up to 12 weeks.

- **Severe active rheumatoid arthritis (administered on expert advice)**
  - **By mouth**
  - Adult: Initially 2 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response.

- **Severe active rheumatoid arthritis (in combination with low-dose methotrexate, when methotrexate monotherapy has been ineffective) (administered on expert advice)**
  - **By mouth**
  - Adult: Initially 1.25 mg/kg twice daily, increased if necessary up to 2.5 mg/kg twice daily after 6 weeks, dose increases should be made gradually, for maintenance treatment, titrate dose individually to the lowest effective dose according to tolerability, treatment may be required for up to 12 weeks.

- **Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)**
  - **By mouth**
  - Adult: 25 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum.

- **Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)**
  - **By mouth**
  - Adult: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision.

- **Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)**
  - **By mouth**
  - Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision.

**Indications and Dose**

- **Bone-marrow transplantation**
  - **Initially by intravenous infusion**
    - Adult: 3–5 mg/kg daily, to be administered over 2–6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) initially 12.5–15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3–6 months and then tailed off (may take up to a year after transplantation).

- **Nephrotic syndrome**
  - **By mouth**
  - Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis).

**Interactions due to interactions**

- With oral use. Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide.

**Unlicensed Use**
Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment.

**Contra-indications**

**Caution**

- Elderly - monitor renal function.
- Hyperuricaemia - in atopic dermatitis, active herpes simplex infections — allow infection to clear before starting (if they occur during treatment withdraw if severe) - in atopic dermatitis, *Staphylococcus aureus* skin infections — not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) - in psoriasis treat, patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) - in uveitis, Behçet’s syndrome (monitor neurological status) - lymphoproliferative disorders (discontinue treatment) - malignancy.

**Important Safety Information**

MHRA/CHM Advice: Ciclosporin must be prescribed and dispensed by brand name (December 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

**Interactions**

- Appendix 1: ciclosporin
**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common: Eye inflammation

**SPECIFIC SIDE-EFFECTS**
- Common or very common: Appetite decreased, diarrhoea, electrolyte imbalance, fatigue, fever, flushing, gastrointestinal discomfort, gingival hyperplasia, hair changes, headaches, hepatic disorders, hyperglycaemia, hyperlipidaemia, hypertension, hyperuricaemia, leucopenia, muscle complaints, nausea, paraesthesia, peptic ulcer, renal impairment (renal structural changes on long-term administration), seizure, skin reactions, tremor, vomiting
- Uncommon: Anaemia, encephalopathy, oedema, thrombocytopenia, weight increased
- Rare or very rare: Gynaecomastia, haemolytic anaemia, idiopathic intracranial hypertension, menstrual disorder, multifocal motor neuropathy, muscle weakness, myopathy, pancreatitis
- Frequency not known: Pain in extremity, thrombotic microangiopathy

**PREGNANCY**
- Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies

**BREAST FEEDING**
- Manufacturer advises avoid—present in milk.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in severe impairment (risk of increased exposure).

**Dose adjustments**
- Manufacturer advises consider dose reduction in severe impairment to maintain blood-cyclosporin concentration in target range—monitor until concentration stable.

**RENAL IMPAIRMENT**
- Dose adjustments
  - In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid. In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. *During treatment* for non-transplant indications, manufacturer recommends if eGFR decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the eGFR decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.

**MONITORING REQUIREMENTS**
- Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).
- Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis.
- Monitor liver function.
- Monitor serum potassium, especially in renal dysfunction (risk of hyperkalaemia).
- Monitor serum magnesium.
- Measure blood lipids before treatment and after the first month of treatment.
- In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month.
- Investigate lymphadenopathy that persists despite improvement in atopic dermatitis.
- Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients.
- Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives.
- In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals.
- In rheumatoid arthritis measure serum creatinine at least twice before treatment. During treatment, monitor serum creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased).
- Monitor hepatic function if concomitant NSAIDs given.

**DIRECTIONS FOR ADMINISTRATION**
- With oral use: Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.
- With intravenous use: For *intravenous infusion* (*Sandimmun*®), give intermittently or continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20–100 ml; give intermittent infusion over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

**PRESCRIBING AND DISPENSING INFORMATION**
- Brand name prescribing: Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-cyclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications). *Sandimmun*® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

**PATIENT AND CARER ADVICE**
- Patients and carers should be counselled on the administration of different formulations of ciclosporin. Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

**CAUTIONARY AND ADVISORY LABELS**

**EXCIPIENTS:** May contain Alcohol, poloxyl castor oils
- *Sandimmun* (Novartis Pharmaceuticals UK Ltd)
  - Ciclosporin 50 mg per 1 ml
  - Ciclosporin 100 mg per 1 ml

**Neoral** (Novartis Pharmaceuticals UK Ltd)
- Ciclosporin 100 mg per 1 ml

**Ciclosporin 100 mg per 1 ml**
- Concentrate for infusion ampoules

**Sandimmun 50 mg/ml oral solution**
- Concentrate for infusion ampoules

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS**

**EXCIPIENTS:** May contain Alcohol, propylene glycol
- *Capsorin* (Morningside Healthcare Ltd)
  - Ciclosporin 100 mg/ml oral solution sugar-free
  - Ciclosporin 1000 mg/ml oral solution sugar-free

**Neoral** (Novartis Pharmaceuticals UK Ltd)
- Ciclosporin 100 mg/ml oral solution sugar-free
- Ciclosporin 1000 mg/ml oral solution sugar-free

**Sandimmun** (Novartis Pharmaceuticals UK Ltd)
- Ciclosporin 100 mg/ml oral solution sugar-free

### Capsule

**CAUTIONARY AND ADVISORY LABELS**

**EXCIPIENTS:** May contain Ethanol, ethyl lactate, propylene glycol
- *Ciclosporin* (Non-proprietary)
  - Capsules

**Ciclosporin 25 mg**
- Capsules

**Ciclosporin 50 mg**
- Capsules
Immune system disorders and transplantation

Sirolimus

**DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

**INDICATIONS AND DOSE**

Prophylaxis of organ rejection in kidney allograft recipients

**BY MOUTH**

- Adult: Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily; to be given in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus doses should be given 4 hours after ciclosporin), ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration

**DOSE EQUIVALENCE AND CONVERSION**

- The 500 mg microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths.

**CAUTIONS** Hyperlipidaemia - increased susceptibility to infection (especially urinary-tract infection) - increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

**INTERACTIONS** → Appendix 1: sirolimus

**SIDE-EFFECTS**

- **Hyperlipidaemia**

- **Uncommon** Antibiotic associated colitis - focal segmental glomerulosclerosis - headache - nephrotic syndrome - pancytopenia - post-transplant lymphoproliferative disorder

**Frequency not known** Posterior reversible encephalopathy syndrome (PRES)

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

**PREGNANCY** Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

**Dose adjustments** Manufacturer advises maintenance dose reduction of approx. 50% in severe impairment—monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration.

**MONITORING REQUIREMENTS**

- Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).

- Manufacturer advises pre-dose (‘trough’) whole blood-sirolimus concentration (using chromatographic assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ).

- Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.

- When changing between oral solution and tablets, measurement of whole blood ‘trough’ sirolimus concentration after 1–2 weeks is recommended.

- Therapeutic drug monitoring assays Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range.

- Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.

**DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.

Ciclosporin 100 mg

Ciclosporin 100 mg capsules

- Adult: 840 micrograms/day + 30 capsule

- **Capimmune** (Mylan)
  - Ciclosporin 25 mg: 2 capsules/day 840 micrograms/day + 30 capsule
  - Ciclosporin 50 mg: 4 capsules/day 840 micrograms/day + 30 capsule

- **Ciclosporin** (Novartis Pharmaceuticals UK Ltd)
  - Ciclosporin 100 mg: 3 capsules/day 840 micrograms/day + 30 capsule

- **Neoral** (Teva UK Ltd)
  - Ciclosporin 25 mg: 1 capsule/day 840 micrograms/day + 30 capsule

- **Sandimmune** (Morningside Healthcare Ltd)
  - Ciclosporin 50 mg: 1 capsule/day 840 micrograms/day + 30 capsule

- **Sandimmune** (Mylan)
  - Ciclosporin 100 mg: 1 capsule/day 840 micrograms/day + 30 capsule

- **Vanquoral** (Afro-Caribbean patients may require higher doses)
  - Ciclosporin 100 mg: 1 capsule/day 840 micrograms/day + 30 capsule
  - Ciclosporin 25 mg: 1 capsule/day 840 micrograms/day + 30 capsule

- **Mycophenolate** 1000 mg

- **Mycophenolate** 1000 capsules

- **Mycophenolate** 1000 micrograms/litre

- **Mycophenolate** 117500 micrograms/litre
Immune system disorders and transplantation

Tacrolimus

**DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

**INDICATIONS AND DOSE**

**ADOPORT®**

**Prophylaxis of graft rejection following liver transplantation, starting 12–18 hours after transplantation**

- **BY MOUTH**
  - Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation**

- **BY MOUTH**
  - Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

- **BY MOUTH**
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

- **BY MOUTH**
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

**Allograft rejection resistant to conventional immunosuppressive therapy**

- **BY MOUTH**
  - Adult: Seek specialist advice

**MODIGRAF®**

**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

- **BY MOUTH**
  - Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation**

- **BY MOUTH**
  - Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

- **BY MOUTH**
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

- **BY MOUTH**
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

**Rejection therapy**

- **BY MOUTH**
  - Adult: Seek specialist advice

**PROGRAF® CAPSULES**

**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

- **BY MOUTH**
  - Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

---

www.getintopharma.com
Immune system and malignant disease

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- BY MOUTH
  - Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- BY MOUTH
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- BY MOUTH
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy

- BY INTRAVENOUS INFUSION
  - Adult: Seek specialist advice

PROgraf® INFUSION

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation when oral route not appropriate

- BY INTRAVENOUS INFUSION
  - Adult: Initially 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation when oral route not appropriate

- BY INTRAVENOUS INFUSION
  - Adult: Initially 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- BY INTRAVENOUS INFUSION
  - Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- BY INTRAVENOUS INFUSION
  - Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Allograft rejection resistant to conventional immunosuppressive therapy

- BY CONTINUOUS INTRAVENOUS INFUSION
  - Adult: Seek specialist advice (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE and DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- Adoport®, Prograf® and Capexion® are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- Modigraf® granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- Advagraf® is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: Envarsus® is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

**CAUTIONS**
- Increased risk of infections – lymphoproliferative disorders – malignancies – neurotoxicity – QT-interval prolongation – UV light (avoid excessive exposure to sunlight and sunlamps)

**INTERACTIONS**

- Appendix 1: tacrolimus

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common

- Uncommon

- Rare or very rare

- Frequency not known

**SPECIFIC SIDE-EFFECTS**

- Frequency not known
- With intravenous use
- Anaphylactoid reaction (due to excipient) – hypersensitivity
SIDE-EFFECTS, FURTHER INFORMATION  Cardiomyopathy has been reported to occur primarily in children with tacrolimus blood trough concentrations much higher than the recommended maximum levels. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.

- ALLERGY AND CROSS-SENSITIVITY  Contra-indicated if history of hypersensitivity to macrolides.
- CONCEPTION AND CONTRACEPTION  Exclude pregnancy before treatment.
- PREGNANCY  Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- BREAST FEEDING  Avoid—present in breast milk (following systemic administration).
- HEPATIC IMPAIRMENT  Manufacturer advises caution in severe impairment.

Dose adjustments  Manufacturer advises consider dose reduction in severe impairment.

- MONITORING REQUIREMENTS
  - After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
  - Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.

- DIRECTIONS FOR ADMINISTRATION
  - With intravenous use  For intravenous infusion (Prograf®); give continuously in Glucose 5% or Sodium Chloride 0.9%.
  - Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.
- PATIENT AND CARER ADVICE  Avoid excessive exposure to UV light including sunlight.

Driving and skilled tasks  May affect performance of skilled tasks (e.g. driving).

- NATIONAL FUNDING/ACCESS DECISIONS
  - NICEdgments
    - Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE T4A81
    - Immediate-release tacrolimus, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in adults having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. Tacrolimus granules for oral suspension (Modigraft®) should be used only if the manufacturer provides it at the same price or lower than that agreed with the Commercial Medicines Unit. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/T4A81

- Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE T4A81
  - Prolonged-release tacrolimus is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/T4A81

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (December 2010) that tacrolimus granules for suspension (Modigraft®) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

The Scottish Medicines Consortium has advised (April 2015) that tacrolimus (Envarsus®) is accepted for use in NHS Scotland for prophylaxis of graft rejection and treatment of rejection resistant to treatment with other immunosuppressive medicinal products in adults.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

- Envarsus® (Chiesi Ltd) Tacrolimus (as Tacrolimus monohydrate) 750 microgram Envarsus 750 microgram modified-release tablets | 30 tablet (Pst) £44.33 DT = £44.33
- Tacrolimus (as Tacrolimus monohydrate) 1 mg Tacrolimus 1 mg modified-release tablets | 30 tablet (Pst) £59.10 DT = £59.10
- Tacrolimus (as Tacrolimus monohydrate) 4 mg Tacrolimus 4 mg modified-release tablets | 30 tablet (Pst) £236.40 DT = £236.40

Granules

CAUTIONARY AND ADVISORY LABELS 13, 23

- Modigraf® (Astellas Pharma Ltd) Tacrolimus (as Tacrolimus monohydrate) 200 microgram Tacrolimus 0.2mg granules sachets sugar-free | 50 sachet (Pst) £17.30 DT = £17.30

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Canakinumab

- **DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

- **INDICATIONS AND DOSE**
  - **Gouty arthritis [in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or in those with concomitant drug intolerances or to them, and in whom repeated courses of corticosteroids are inappropriate]**
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: 150 mg for 1 dose, in patients who respond, dose may be repeated after at least 12 weeks if symptoms recur, to be administered to the upper thigh, abdomen, upper arm or buttocks
  - **Gouty arthritis associated periodic syndromes [specialist use only]**
    - **BY SUBCUTANEOUS INJECTION**
      - Adult (body-weight 41 kg and above): 150 mg every 8 weeks, to be administered to the upper thigh, abdomen, upper arm or buttocks, additional doses may be considered if clinical response not achieved within 7 days—consult product literature
  - **Tumour necrosis factor receptor associated periodic syndrome [specialist use only]**
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: 150 mg per 1 ml Ilaris 150mg/1ml solution for injection vials | 1 vial (POT £9,927.80)
  - **Still's disease [specialist use only]**
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: 4 mg/kg every 4 weeks (max. per dose 300 mg), to be administered to the upper thigh, abdomen, upper arm or buttocks

- **CONTRA-INDICATIONS** Active infection · leucopenia · neutropenia
- **CAUTIONS** History of recurrent infection · latent and active tuberculosis · predisposition to infection

- **VACCINATIONS** Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain upper · arthralgia · asthenia · dizziness · increased risk of infection · leucopenia · neutropenia · pain · proteinuria · vertigo
  - **Uncommon** Gastrooesophageal reflux disease
  - **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.
  - **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
  - **BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.
  - **RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.

- **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.
  - Manufacturer advises monitor for signs and symptoms of infection (including tuberculosis) during and after treatment.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C).

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Manufacturer advises patients and carers should be instructed to seek medical advice if signs or symptoms suggestive of tuberculosis (including persistent cough, weight loss and subfebrile temperature) occur.
  - **Consult product literature**—there can be variation in the licensing of different medicines containing the same drug.

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

Basiliximab

- **DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

- **INDICATIONS AND DOSE**
  - **Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens [specialist use only]**
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Adult: Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs.

- **CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS** Anaemia · capillary leak syndrome · constipation · cytokine release syndrome · diarrhoea · dyspnoea · electrolyte imbalance · headache · heart failure · hypercholesterolaemia · hypersensitivity · hypertension · hypotension · increased risk of infection · myocardial infarction · nausea · pain · peripheral oedema · post procedural wound complication · pulmonary oedema · respiratory disorders · skin reactions · sneezing · tachycardia · weight increased
- **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Simulect ®) give intermittently in Glucose 5% or Sodium...
chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20-30 minutes.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481
    - Basiliximab, when used as part of an immunosuppressive regimen that includes a calcineurin inhibitor, is recommended as an initial option to prevent organ rejection in adults having a kidney transplant. The use of basiliximab with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
    - **www.nice.org.uk/guidance/TA481**

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - Powder and solvent for solution for injection
    - Simulect® (Novartis Pharmaceuticals UK Ltd)
    - Basiliximab 10 mg Simulect 10mg powder and solvent for solution for injection vials | 1 vial (£358.69 Hospital only)
    - Basiliximab 20 mg Simulect 20mg powder and solvent for solution for injection vials | 1 vial (£842.38 Hospital only)

---

**Belimumab**

- **INDICATIONS AND DOSE**
  - Adjuvant therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy
    - **BY INTRAVENOUS INFUSION**
    - Adult: 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months

---

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: BELIMUMAB (BELNLYSTA®): INCREASED RISK OF SERIOUS PSYCHIATRIC EVENTS SEEN IN CLINICAL TRIALS (APRIL 2019)

Clinical trials show an increased risk of depression, suicidal ideation or behaviour, or self-injury in patients with systemic lupus erythematosus on belimumab. Healthcare professionals should assess patients for these risks before starting treatment, monitor for new or worsening signs of these risks during treatment, and advise patients to seek immediate medical attention if new or worsening symptoms occur.

- **CAUTIONS** Do not initiate until active infections controlled • history or development of malignancy • predisposition to infection
- **INTERACTIONS** • Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - Common or very common Cystitis • depression • diarrhoea • fever • hypersensitivity • increased risk of infection • infusion related reaction • insomnia • leucopenia • migraine • nausea • pain in extremity
  - Uncommon Angioedema • skin reactions
  - Frequency not known Progressive multifocal leukoencephalopathy (PML) • self-injurious behaviour • suicidal tendencies • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an antipyretic may be considered.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.
- **PREGNANCY** Avoid unless essential.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Belnlysta®), give intermittently in Sodium chloride 0.9%; reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Belimumab for treating active autoantibody-positive systemic lupus erythematosus (June 2016) NICE TA397
    - Belimumab (Benlysta®) is recommended as an add-on treatment option in adults with active autoantibody-positive systemic lupus erythematosus, only if all of the following criteria apply:
      - there is evidence for serological disease activity (defined as positive anti-double-stranded DNA and low complement) and a Safety of Estrogen in Lupus National Assessment – Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of greater than or equal to 10 despite standard therapy;
      - treatment with belimumab is continued after 24 weeks only if the SELENA-SLEDAI score has improved by 4 points or more;
      - the manufacturer provides belimumab with the discount agreed in the patient access scheme; and
      - under the conditions specified in the NICE managed access agreement documentation.

Patients whose treatment was started before this guidance was published should continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

- **www.nice.org.uk/guidance/ta397**

Scottish Medicines Consortium (SMC) decisions

SMC No. 775/12

The Scottish Medicines Consortium has advised (May 2017) that belimumab (Benlysta®) is accepted for restricted use within NHS Scotland as adjuvant therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy, and who have evidence of serological disease activity and a Safety of Estrogens in Lupus Erythematosus National Assessment-Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of 10 or greater. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

**IMMUNOSUPPRESSANTS** > PURINE SYNTHESIS INHIBITORS

**Mycophenolate mofetil**

**INDICATIONS AND DOSE**

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)
- **BY MOUTH**
  - Adult: 1 g twice daily, to be started within 72 hours of transplantation
  - **BY INTRAVENOUS INFUSION**
    - Adult: 1 g twice daily for maximum 14 days, then transfer to oral therapy, to be started within 24 hours of transplantation

Prophylaxis of acute rejection in cardic transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)
- **BY MOUTH**
  - Adult: 1.5 g twice daily, to be started within 5 days of transplantation

Prophylaxis of acute rejection in hepatic transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)
- **INITIALLY BY INTRAVENOUS INFUSION**
  - Adult: 1 g twice daily for 4 days, up to a maximum of 14 days, to be started within 24 hours of transplantation, then (by mouth) 1.5 g twice daily, the dose route should be changed as soon as is tolerated.

**CEPTAVA®**

Renal transplantation (specialist use only)
- **BY MOUTH**
  - Adult: 720 mg twice daily, to be started within 72 hours of transplantation

**DOSE EQUIVALENCE AND CONVERSION**
- For Ceptava®: Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

**MYFORTIC®**

Renal transplantation (specialist use only)
- **BY MOUTH**
  - Adult: 720 mg twice daily, to be started within 72 hours of transplantation

**DOSE EQUIVALENCE AND CONVERSION**
- For Myfortic®: Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: MYCOPHENOLATE MOFETIL, MYCOPHENOLIC ACID: UPDATED CONTRACEPTION ADVICE FOR MALE PATIENTS (FEBRUARY 2018)**

Available clinical evidence does not indicate an increased risk of malformations or miscarriage in pregnancies where the father was taking mycophenolate medicines, however mycophenolate mofetil and mycophenolic acid are genotoxic and a risk cannot be fully excluded; for further information, see Conception and contraception and Patient and carer advice.

**CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) - children (higher incidence of side-effects may call for temporary reduction of dose or interruption) - delayed graft function - elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema) - increased susceptibility to skin cancer (avoid exposure to strong sunlight) - risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants.

**INTERACTIONS** → Appendix 1: mycophenolate

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common
  - Acne
  - Alopecia
  - Anaemia
  - Appetite decreased
  - Arthralgia
  - Asthenia
  - Bone marrow disorders
  - Chills
  - Constipation
  - Cough
  - Depression
  - Diarrhoea
  - Drowsiness
  - Dyslipidaemia
  - Dysphonia
  - Electrolyte imbalance
  - Fever
  - Gastrointestinal discomfort
  - Gastrointestinal disorders
  - Gastrointestinal haemorrhage
  - Headache
  - Hyperglycaemia
  - Hypertension
  - Hypotension
  - Increased risk of infection
  - Insomnia
  - Leucocytosis
  - Leucopenia
  - Malaise
  - Nausea
  - Neoplasms
  - Oedema
  - Oral disorders
  - Pain
  - Pancreatitis
  - Paraesthesia
  - Renal impairment
  - Respiratory disorders
  - Seizure
  - Sepsis
  - Skin reactions
  - Tachycardia
  - Thinking abnormal
  - Thrombocytopenia
  - Tremor
  - Vomiting
  - Weight decreased

- Uncommon
  - Agranulocytosis

- Frequency not known
  - Endocarditis
  - Hypogammaglobulinaemia
  - Malignancy
  - Meningitis
  - Neuropathy
  - Neutropenia
  - Pancreatitis
  - Paraesthesia
  - Progressive multifocal leukoencephalopathy
  - Renal impairment
  - Respiratory disorders
  - Seizure
  - Sepsis
  - Skin reactions
  - Tachycardia
  - Thinking abnormal

**SPECIFIC SIDE-EFFECTS**
- Common or very common
  - With intravenous use
    - Hepatitis
    - Muscle tone increased
  - With oral use
    - Anxiety
    - Burping
    - Confusion
    - Dizziness
    - Gout
    - Hepatic disorders
    - Hyperbilirubinaemia
    - Hyperuricaemia
    - Neuromuscular dysfunction
    - Taste altered
    - Vasodilation

**SIDE-EFFECTS, FURTHER INFORMATION**
Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

**CONCEPTION AND CONTRACEPTION**

Pregnancy prevention. The MHRA advises to exclude pregnancy in females of child-bearing potential before treatment. After 2 months of treatment— 2 pregnancy tests 8–10 days apart are recommended. Women should use at least 1 method of effective contraception before and during treatment, and for 6 weeks after discontinuation—2 methods of effective contraception are preferred. Male patients or their female partner should use effective contraception during treatment and for 90 days after discontinuation.

**PREGNANCY** Avoid unless no suitable alternative—will be required for infusion.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**RENAL IMPAIRMENT** No data available in cardiac or hepatic transplantation patients with renal impairment.

**MONITORING REQUIREMENTS** Monitor full blood count every week for 4 weeks then twice a month for 2 months.
then every month in the first year (consider interrupting treatment if neutropenia develops).

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use: For intravenous infusion (CellCept®), give intermittently in Glucose 5%; reconstitute each 500–mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours.

**PATIENT AND CARER ADVICE**
- Pregnancy prevention advice: The MHRA advises that prescribers should ensure that female patients understand the implications of both immunosuppression and the effect of the prescribed medications on the pregnancy. Bone marrow suppression. Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexpressible bruising or bleeding.

**NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE decisions**
  - Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481
  - Mycophenolate mofetil, when used as part of an immunosuppressive regimen, is recommended as an initial option to prevent organ rejection in adults having a kidney transplant. Treatment should be started with the least expensive product, but if this is not suitable, an alternative dosage form may be given. The use of mycophenolate mofetil with tacrolimus is outside the terms of the marketing authorisation. If this combination is prescribed, the prescriber should follow relevant professional guidance, taking full responsibility for the decision. Informed consent should be obtained and documented.
  - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop. 

  www.nice.org.uk/guidance/TA481

- Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481

  Mycophenolate sodium (Ceptava®, Myfortic®) is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

Multiple sclerosis

Description of condition

Multiple sclerosis is a chronic, immune-mediated, demyelinating inflammatory condition of the central nervous system, which affects the brain, optic nerves and spinal cord, and leads to progressive severe disability.

Relapsing-remitting multiple sclerosis is the most common pattern of the disease. It is characterised by periods of exacerbation of symptoms (relapses) followed by unpredictable periods of stability (remission). The severity and frequency of relapses varies greatly between patients, but on average occur once or twice per year. This clinical pattern often develops into secondary-progressive multiple sclerosis, with progressive disability unrelated to relapses. Most patients develop secondary progressive disease 6–10 years after onset.

Primary-progressive multiple sclerosis follows a gradual course, with the development of symptoms that worsen over time, without relapses and remissions.

Progressive-relapsing multiple sclerosis follows a course of steadily worsening neurological function from onset, in addition to acute relapses.

Disease activity in relapsing-remitting multiple sclerosis

Active disease is defined as at least two clinically significant relapses occurring within the last 2 years. Highly active disease is characterised by an unchanged/increased relapse rate or by ongoing severe relapses compared with the previous year, despite treatment with interferon beta p. 850. Rapidly-evolving severe relapsing-remitting multiple sclerosis is defined by two or more disabling relapses in 1 year, and one or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

Aims of treatment

There is no cure for multiple sclerosis. The overall aims of treatment are to modify the course of the disease and manage symptoms, in order to improve quality of life. Treatment is aimed at reducing the frequency and duration of relapses and at preventing or slowing disability.

Drug treatment

Shared decision-making between the patient and their clinicians is particularly important in the treatment of multiple sclerosis, due to the unpredictability of the condition and the lack of evidence of long-term benefit of treatments. A discussion about treatment options, disease activity, risk, and benefit should take place to ensure that treatment choices are right for the patient and their circumstances. The choice of drug also depends on the patient’s disability status, individual tolerance, disease severity and disease activity (see Disease activity in relapsing-remitting multiple sclerosis above). Treatment should be initiated as early as possible, under the supervision of a specialist.

Note: NHS England (May 2014) has provided guidance on the use of interferon beta, glatiramer acetate p. 852, fingolimod p. 854 and natalizumab p. 857 for the treatment of multiple sclerosis in England, see Useful resources below. This Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing these treatment options. See also National funding/access decisions, under individual monographs for teriflunomide p. 859, dimethyl fumarate p. 853 and alemtuzumab p. 857.

1.1 Multiple sclerosis

Multiple sclerosis

Description of condition

Multiple sclerosis is a chronic, immune-mediated, demyelinating inflammatory condition of the central nervous system, which affects the brain, optic nerves and spinal cord, and leads to progressive severe disability.

Relapsing-remitting multiple sclerosis is the most common pattern of the disease. It is characterised by periods of exacerbation of symptoms (relapses) followed by unpredictable periods of stability (remission). The severity and frequency of relapses varies greatly between patients, but on average occur once or twice per year. This clinical pattern often develops into secondary-progressive multiple sclerosis, with progressive disability unrelated to relapses. Most patients develop secondary progressive disease 6–10 years after onset.

Primary-progressive multiple sclerosis follows a gradual course, with the development of symptoms that worsen over time, without relapses and remissions.

Progressive-relapsing multiple sclerosis follows a course of steadily worsening neurological function from onset, in addition to acute relapses.

Disease activity in relapsing-remitting multiple sclerosis

Active disease is defined as at least two clinically significant relapses occurring within the last 2 years. Highly active disease is characterised by an unchanged/increased relapse rate or by ongoing severe relapses compared with the previous year, despite treatment with interferon beta p. 850. Rapidly-evolving severe relapsing-remitting multiple sclerosis is defined by two or more disabling relapses in 1 year, and one or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

Aims of treatment

There is no cure for multiple sclerosis. The overall aims of treatment are to modify the course of the disease and manage symptoms, in order to improve quality of life. Treatment is aimed at reducing the frequency and duration of relapses and at preventing or slowing disability.

Drug treatment

Shared decision-making between the patient and their clinicians is particularly important in the treatment of multiple sclerosis, due to the unpredictability of the condition and the lack of evidence of long-term benefit of treatments. A discussion about treatment options, disease activity, risk, and benefit should take place to ensure that treatment choices are right for the patient and their circumstances. The choice of drug also depends on the patient’s disability status, individual tolerance, disease severity and disease activity (see Disease activity in relapsing-remitting multiple sclerosis above). Treatment should be initiated as early as possible, under the supervision of a specialist.

Note: NHS England (May 2014) has provided guidance on the use of interferon beta, glatiramer acetate p. 852, fingolimod p. 854 and natalizumab p. 857 for the treatment of multiple sclerosis in England, see Useful resources below. This Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing these treatment options. See also National funding/access decisions, under individual monographs for teriflunomide p. 859, dimethyl fumarate p. 853 and alemtuzumab p. 857.

www.getintopharma.com
Low levels of vitamin D are believed to be a risk factor for developing multiple sclerosis. Patients with diagnosed multiple sclerosis are usually given regular vitamin D after assessment of their serum levels of vitamin D, but there is insufficient evidence to support its use as a treatment for multiple sclerosis. Patients should not be offered vitamin D solely for the purpose of treating multiple sclerosis.

Relapsing-remitting multiple sclerosis

Disease-modifying drugs are the recommended treatment for patients presenting with active relapsing-remitting multiple sclerosis. Interferon beta and glatiramer acetate may be the preferred choice for some patients, due to their established safety profile, and the long term clinical experience associated with their use. Peginterferon beta-1a p. 852 requires less frequent administration and is available as an alternative to the non-pegylated interferon beta therapies.

Teriflunomide and dimethyl fumarate are treatment options for patients with active disease. They may be preferred due to their oral route of administration. There is insufficient evidence for the use of either drug to treat highly active or rapidly-evolving severe relapsing-remitting multiple sclerosis.

More active disease may be treated with natalizumab or alemtuzumab. Natalizumab may be preferred due to the complex safety profile associated with alemtuzumab. Natalizumab is only recommended for the treatment of rapidly-evolving severe relapsing-remitting multiple sclerosis. Although licensed as a treatment option in all patients with active disease, alemtuzumab may be used more frequently in patients for whom other disease-modifying treatments have not been effective, due to the risk of serious side effects associated with its use.

Fingolimod is also taken by the oral route and is the recommended treatment for patients with highly active disease. The NHS England Clinical Commissioning Policy (see Useful resources below) advises that fingolimod is a suitable alternative for patients receiving natalizumab who are at high risk of developing progressive multifocal leukoencephalopathy (defined as patients previously exposed to the JC virus or who are receiving immunosuppressants or who have been receiving treatment with natalizumab for more than 2 years).

Secondary progressive multiple sclerosis

Currently, only interferon beta 1b is licensed for use in secondary progressive multiple sclerosis. Interferon beta 1b reduces the risk of relapse and of short-term relapse-related disability, but does not prevent the development of permanent physical disability or retard progression once it is established. Therefore its role in secondary progressive disease is limited.

Primary progressive multiple sclerosis

Currently there are no effective disease-modifying treatments licensed for primary progressive multiple sclerosis. Interferon beta [unlicensed indication] has been used, but there is limited evidence to support its use due to the lack of a significant reduction in disability progression.

Progressive-relapsing multiple sclerosis

There are no specific treatment options for this type of multiple sclerosis. None of the currently licensed disease-modifying drugs are recommended in non-relapsing progressive disease.

Management of symptoms

Other than episodes of neurological dysfunction, chronic symptoms (such as fatigue, spasticity, visual problems, and emotional lability) produce much of the disability in multiple sclerosis. Smoking may increase the progression of disability in multiple sclerosis, and Smoking cessation p. 497 should be encouraged.

Relapses

Suspected relapses should be referred to a specialist for diagnosis and treatment. Corticosteroids are recommended for reducing inflammation and accelerating recovery in acute relapses of relapsing-remitting multiple sclerosis. Oral methylprednisolone p. 678 is recommended as the first-line option. Intravenous methylprednisolone should be considered as an alternative if oral methylprednisolone has failed or is not tolerated or if hospitalisation is required.

Fatigue and impaired mobility

Regular exercise may have beneficial effects on mobility and fatigue in patients with multiple sclerosis, and should be encouraged. Cognitive behavioural techniques for fatigue should also be considered in combination with exercise. Amantadine hydrochloride p. 418 [unlicensed indication] may be used to treat fatigue related to multiple sclerosis. Vitamin B12 injections are not recommended as a treatment for fatigue in patients with multiple sclerosis. NICE do not consider it to be a cost-effective treatment and do not recommend its use.

Spasticity

Many factors may aggravate spasticity in multiple sclerosis, including constipation, infection, poor mobility aids, pressure ulcers, posture and pain. These should be managed appropriately. The first-line options for managing spasticity in multiple sclerosis are baclofen p. 1128 or gabapentin p. 315 [unlicensed indication]. They may be used cautiously in combination if the individual drugs are ineffective or if side effects prevent an increase in the dose of either drug. Tizanidine p. 1129 or dantrolene sodium p. 1346 are second-line options; benzodiazepines may be used as third-line therapy and may also be effective in treating nocturnal spasms. A cannabis extract p. 1127 containing dronabinol and cannabidiol is licensed as an adjunct treatment for moderate-to-severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. NICE do not consider it to be a cost-effective treatment and do not recommend its use.

Oscillopsia

Gabapentin [unlicensed indication] is the first-line treatment for oscillopsia; memantine hydrochloride p. 304 [unlicensed indication] is the second-line option.

Emotional lability

Amitriptyline hydrochloride p. 372 [unlicensed indication] may be used to treat emotional lability in patients with multiple sclerosis.

CHOLINERGIC RECEPTOR STIMULATING DRUGS

Fampridine

**INDICATIONS AND DOSE**

*Improvement of walking disability in multiple sclerosis (specialist use only)*

- **BY MOUTH**
  - Adult: 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks

**CONTRA-INDICATIONS**

- History of seizures (discontinue treatment if seizures occur)

**CAUTIONS**

- Atrioventricular conduction disorders - predisposition to seizures - sinoatrial conduction disorders - symptomatic cardiac rhythm disorders

**INTERACTIONS**

> Appendix 1: fampridine

**SIDE-EFFECTS**

- Common or very common
  - Anxiety - asthenia - balance impaired - constipation - dizziness - dyspepsia - dysphonia - headache - insomnia - laryngeal pain - nausea - pain - palpitations - paraesthesia - tremor - uriitary tract infection - vomiting

- Uncommon
  - Seizure - skin reactions - tachycardia

**PREGNANCY**

- Avoid—toxicity in animal studies.

**BREAST FEEDING**

- Avoid—no information available.

**RENAL IMPAIRMENT**

- Avoid if eGFR less than 80 mL/minute/1.73 m².

**PRESCRIBING AND DISPENSING INFORMATION**

- Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2107

The Scottish Medicines Consortium has advised (November 2018) that fampridine (Fampyra®) is not recommended for use within NHS Scotland for the improvement of walking in adult patients with multiple sclerosis (MS) with walking disability (EDSS [expanded disability status scale] 4 to 7) as the economic case was not demonstrated.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule Modified-release tablet

  **CAUTIONARY AND ADVISORY LABELS**

  23, 25

  - **Fampyra** (Biogen Idec Ltd)
    - Fampridine 10 mg
      - 28 tablet £21.00 | 56 tablet £36.00

IMMUNOSTIMULANTS

**INTERFERONS**

AVONEX® VIAL

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided. For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- **BY INTRAMUSCULAR INJECTION**
  - Adult: (consult product literature)

BETAFERON® INJECTION

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided. For secondary progressive multiple sclerosis with active disease. For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: (consult product literature)

REBIF® CARTRIDGE

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided. For secondary progressive multiple sclerosis with active disease. For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: (consult product literature)

REBIF® PRE-FILLED PEN AND SYRINGE

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided. For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS**

- Decompensated liver disease - severe depressive illness

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Consult product literature for further information on contra-indications.

**CAUTIONS**

- History of cardiac disorders - history of depressive disorders (avoid in severe depression or in those with suicidal ideation) - history of seizures - history of severe myelosuppression

**CAUTIONS, FURTHER INFORMATION**

Consult product literature for further information on cautions.
Monitor for signs of hepatic injury

Peginterferon beta-1a

**DRUG ACTION** Peginterferon beta-1a is a polyethylene glycol-conjugated (‘pegylated’) derivative of interferon beta; pegylation increases the persistence of interferon in blood.

**INDICATIONS AND DOSE**

- **Treatment of relapsing, remitting multiple sclerosis**
  - By subcutaneous injection
  - Adult: consult product literature

**CONTRA-INDICATIONS** Severe depression - suicidal ideation

**CAUTIONS** History of cardiac disorders - history of depressive disorders (avoid in severe depression or those with suicidal ideation) - history of seizures - history of severe myelosuppression

**CAUTIONS, FURTHER INFORMATION** Consult product literature for further information about cautions.

**INTERACTIONS** → Appendix 1: peginterferon beta-1a

**SIDE-EFFECTS**

- **Common or very common** Arthralgia - asthenia - chills - depression - fever - headache - hyperthermia - influenza like illness - myalgia - nausea - pain - skin reactions - vomiting
- **Uncommon** Seizure - thrombocytopenia
- **Rare or very rare** Glomerulonephritis - haemolytic uraemic syndrome - injection site necrosis - nephrotic syndrome - thrombotic microangiopathy
- **Frequency not known** Pulmonary arterial hypertension

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

**PREGNANCY** Do not initiate during pregnancy. Avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment.

**RENAL IMPAIRMENT** Caution in severe renal impairment.

**MONITORING REQUIREMENTS**

- Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
- Thrombotic microangiopathy. Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
- Nephrotic syndrome. Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Plergyrid (Biogen Idec Ltd)
  - Peginterferon beta-1a 126 microgram per 1 ml Plergyrid 63 micrograms/0.5 ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PFS) £596.63
  - Peginterferon beta-1a 188 microgram per 1 ml Plergyrid 94 micrograms/0.5 ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PFS) £654.00
  - Peginterferon beta-1a 250 microgram per 1 ml Plergyrid 125 micrograms/0.5 ml solution for injection pre-filled pen | 2 pre-filled disposable injection (PFS) £1,962.00

**IMMUNOSTIMULANTS > OTHER**

Glatiramer acetate

**DRUG ACTION** Glatiramer is an immunomodulating drug comprising synthetic polypeptides.

**INDICATIONS AND DOSE**

- **Multiple sclerosis [relapsing-remitting] (initiated under specialist supervision)**
  - By subcutaneous injection
  - Adult: 20 mg once daily, alternatively 40 mg 3 times a week, doses to be separated by an interval of at least 48 hours

**CAUTIONS** Cardiac disorders

**SIDE-EFFECTS**

- **Common or very common** Anxiety - appetite decreased - arrhythmia - asthenia - chest pain - chills - constipation - cough - depression - dyspepsia - dysphagia - dyspnoea (may occur within minutes of injection) - ear disorder - eye disorders - fever - gastrointestinal disorders - headache - hyperhidrosis - hypersensitivity - increased risk of infection - joint disorders - local reaction - lymphadenopathy - nausea - neoplasms - neuromuscular dysfunction - oedema - oral disorders - pain - palpitations - rhinitis - skin reactions - speech disorder - syncope - taste altered - tremor - urinary disorders - vasodilation - vision disorders - vomiting - weight increased
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE decisions
  - Beta interferons and glatiramer acetate for treating multiple sclerosis (June 2018) NICE TAS57
  - Glatiramer acetate (Copaxone®) is recommended as an option for treating multiple sclerosis, only if:
the patient has relapsing-remitting multiple sclerosis, and
the manufacturer provides it according to the
commercial arrangement. Patients whose treatment was
started within the NHS before this guidance was published
should have the option to continue treatment, without
change to their funding arrangements, until they and their
NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta527

Scottish Medicines Consortium (SMC) decisions
SMC No. 1108/15
The Scottish Medicines Consortium has advised (December 2015) that glatiramer acetate (Copaxone®) is accepted for
use within NHS Scotland for the treatment of relapsing
forms of multiple sclerosis.

NHS restrictions
NHS England Clinical Commissioning Policy
An NHS England Clinical Commissioning Policy outlines
the funding arrangements and the criteria for initiating
and discontinuing this treatment option, see www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04.

Medicinal forms
There can be variation in the licensing of

Solution for injection
• Brablo (Mylan)
Glatiramer acetate 20 mg per 1 ml Brablo 20mg/1ml solution for injection pre-filled syringes £462.56
Glatiramer acetate 40 mg per 1 ml Brablo 40mg/1ml solution for injection pre-filled syringes £462.56
• Copaxone (Teva UK Ltd)
Glatiramer acetate 20 mg per 1 ml Copaxone 20mg/1ml solution for injection pre-filled syringes £513.95
Glatiramer acetate 40 mg per 1 ml Copaxone 40mg/1ml solution for injection pre-filled syringes £513.95

IMMUNOSUPPRESSANTS
IMMUNOMODULATING DRUGS

Dimethyl fumarate

Drug action
Dimethyl fumarate has immunomodulatory and anti-inflammatory properties.

Indications and dose

**SKILARENCE®**

**Plaque psoriasis [moderate-to-severe] (under expert supervision)**

• **BY MOUTH**
• Adult: Initially 30 mg once daily for 1 week, dose to be
taken in the evening, then increased in steps of 30 mg
every week for 3 weeks, then increased in steps of 120 mg every week for 5 weeks, for further information
on the dose titration and administration schedule, advice on establishing a maintenance dose, and for
dose adjustments due to side-effects, consult product literature; maximum 720 mg per day

**TECFIDERA®**

**Multiple sclerosis [relapsing-remitting] (initiated by a specialist)**

• **BY MOUTH**
• Adult: Initially 120 mg twice daily for 7 days, then
increased to 240 mg twice daily, for dose adjustments
due to side-effects—consult product literature

**Contra-indications**

SKILARENCE®
Do not initiate if leucocyte count below
3 x 10⁹/litre - do not initiate if lymphocyte count below
1 x 10⁹/litre - do not initiate if pathological haematological
abnormalities identified - severe gastro-intestinal disorders

Cautions
Reduced lymphocyte count

TECFIDERA®
Serious infection (do not initiate until
infection resolved; consider suspending treatment if
infection develops) - severe active gastro-intestinal disease

SKILARENCE®
Significant infection (consider avoiding
initiation until infection resolved and suspending
treatment if infection develops)

**Interactions** → Appendix 1: dimethyl fumarate

**Side-effects**

• Common or very common
  • Appetite decreased - asthenia
  • Constipation - decreased leucocytes - diarrhoea
  • Eosinophilia - feeling hot - flattulence - gastrointestinal discomfort - headache - leucocytosis - nausea - paraesthesia
  • Skin reactions - vasodilation - vomiting
• Uncommon
  • Dizziness - proteinuria
• Rare or very rare
  • Acute lymphocytic leukaemia - pancytopenia
• Frequency not known
  • Progressive multifocal leukoencephalopathy (PML) - renal failure

**Side-effects, further information**
Severe prolonged lymphopenia reported, and patients are exposed to a potential risk of PML. Treatment should be stopped immediately if PML is suspected.

**Pregnancy**

TECFIDERA®
Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in animal studies.

SKILARENCE®
Manufacturer advises avoid—toxicity in animal studies.

**Breast feeding**
Manufacturer advises avoid.

**Hepatic impairment**

TECFIDERA®
Manufacturer advises caution in severe
impairment (no information available).

SKILARENCE®
Manufacturer advises avoid in severe
impairment (no information available).

**Renal impairment**

TECFIDERA®
Manufacturer advises caution in severe
impairment—no information available.

SKILARENCE®
Manufacturer advises avoid in severe
impairment—no information available.

**Monitoring requirements**

• Manufacturer advises monitor full blood count before
treatment initiation then every 3 months thereafter—
consult product information for further information.

• Manufacturer advises monitor patient closely for features of
progressive multifocal leukoencephalopathy (PML) (e.g.
signs and symptoms of neurological dysfunction) and
other opportunistic infections.

• Manufacturer advises monitor renal and hepatic function
before treatment initiation and during treatment—consult
product literature for further information.

• Manufacturer of Tecfidera® advises perform a baseline MRI as a reference and repeat as required during treatment.

**Prescribing and dispensing information**

SKILARENCE®
The manufacturer of Skilarence® has
provided a Healthcare Professional Guideline, which
includes important safety information on the risk of serious infections.

**Patient and carer advice**
Manufacturer advises patients and their carers should be informed of the possibility of experiencing symptoms of flushing; they
should also be advised to report symptoms of infection to
their doctor. The MHRA recommends that patients and their carers should be counselled on the risk of progressive multifocal leuкоencephalopathy and advised to seek immediate medical attention if symptoms develop.

- NATIONAL FUNDING/ACCESS DECISIONS

TECFIDERA®

NICE decisions

- Dimethyl fumarate (Tecfidera®) for treating relapsing-remitting multiple sclerosis (August 2014) NICE TA320

Dimethyl fumarate (Tecfidera®) is recommended for the treatment of active relapsing-remitting multiple sclerosis, only if:

- the patient does not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
- the manufacturer provides dimethyl fumarate with the discount agreed in the patient access scheme

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (April 2014) that dimethyl fumarate (Tecfidera®) is accepted for use within NHS Scotland for the treatment of patients with relapsing remitting multiple sclerosis. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

SKILARENCE®

NICE decisions

- Dimethyl fumarate for treating moderate-to-severe plaque psoriasis (September 2017) NICE TA475

Dimethyl fumarate is recommended as an option for treating plaque psoriasis in adults, only if the disease:

- is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10, and
- has not responded to other systemic therapies, including, ciclosporin, methotrexate and PUVA (psoralen and long-wave ultraviolet A radiation), or these options are contra-indicated or not tolerated. Stop dimethyl fumarate treatment at 16 weeks if the psoriasis has not responded adequately. An adequate response is defined as:
  - a 75% reduction in the PASI score (PASI 75) from when treatment started, or
  - a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

Scottish Medicines Consortium (SMC) decisions

SMC No. 1313/18

The Scottish Medicines Consortium has advised (April 2018) that dimethyl fumarate (Skilarence®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe plaque psoriasis in adults in need of systemic medicinal therapy, whom other non-biologic systemic treatments (methotrexate, ciclosporin and acitretin) are not appropriate or have failed and who are considered unsuitable for biologic therapy given their current disease state or personal preference.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

Fingolimod

- DRUG ACTION

Fingolimod is an immunomodulating drug.

- INDICATIONS AND DOSE

Treatment of highly active relapsing-remitting multiple sclerosis in patients who have high disease activity despite treatment with at least one disease modifying therapy or in those with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- BY MOUTH
  - Adult: 500 micrograms once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MULTIPLE SCLEROSIS THERAPIES: SIGNAL OF REBOUND EFFECT AFTER STOPPING OR SWITCHING THERAPY (APRIL 2017)

A signal of rebound syndrome in multiple sclerosis patients whose treatment with fingolimod was stopped or switched to other treatments has been reported in two recently published articles. The MHRA advise to be vigilant for such events and report any suspected adverse effects relating to fingolimod, or other treatments for multiple sclerosis, via the Yellow Card Scheme, while this report is under investigation.

MHRA/CHM ADVICE: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS. ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT BRADYCARDIA OR HEART BLOCK AFTER THE FIRST DOSE AND FOLLOWING TREATMENT INTERRUPTION (JANUARY 2013)

Fingolimod is known to cause transient bradycardias and heart block after the first dose—see Cautions, Contra-indications and Monitoring for further information.

MHRA/CHM ADVICE: FINGOLIMOD: NEW CONTRA-INDICATIONS IN RELATION TO CARDIAC RISK (DECEMBER 2017)

Fingolimod can cause persistent bradycardia, which can increase the risk of serious cardiac arrhythmias. New contra-indications have been introduced for patients with pre-existing cardiac disorders—see Contra-indications for further information.

MHRA/CHM ADVICE: FINGOLIMOD: UPDATED ADVICE ABOUT RISK OF CANCERS AND SERIOUS INFECTIONS (DECEMBER 2017)

Fingolimod has an immunosuppressive effect and can increase the risk of skin cancers and lymphoma. Following a recent EU review, the MHRA has recommended the following strengthened warnings:

- re-assess the benefit-risk balance of fingolimod therapy in individual patients, particularly those with additional risk factors for malignancy—either closely monitor for skin cancers or consider discontinuation on a case-by-case basis
- examine all patients for skin lesions before they start fingolimod and then re-examine at least every 6 to 12 months

www.getintopharma.com
Multiple sclerosis

Progressive multifocal leukoencephalopathy (PML) and other opportunistic infections Patients should be advised to seek medical attention if they have any signs of PML or any other infections. Suspension of treatment should be considered if a patient develops a severe infection, taking into consideration the risk-benefit.

CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment. Ensure effective contraception during and for at least 2 months after treatment.

PREGNANCY Avoid (toxicity in animal studies).

BREAST FEEDING Avoid.

HEPATIC IMPAIRMENT Manufacturer advises caution when initiating treatment in mild to moderate impairment; avoid in severe impairment.

MONITORING REQUIREMENTS
- All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring—before, during and after dose), and after treatment interruption (see note below); monitoring should include:
  - Pre-treatment
    - an ECG and blood pressure measurement before starting
  - During the first 6 hours of treatment
    - continuous ECG monitoring for 6 hours
    - blood pressure and heart rate measurement every hour
  - After 6 hours of treatment
    - a further ECG and blood pressure measurement
  - If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases
  - If post-dose bradycardia-related symptoms occur, appropriate clinical management should be initiated and monitoring should be continued until the symptoms have resolved. If pharmacological intervention is required during the first-dose monitoring, overnight monitoring should follow, and the first-dose monitoring should then be repeated after the second dose.
  - If after 6 hours, the heart rate is less than 45 beats per minute, or the ECG shows new onset second degree, higher grade AV block, or a QTc interval of 500 milliseconds or greater, or if third degree AV block occurs, monitoring should be extended (at least overnight, until side-effect resolution).
  - The occurrence at any time of third degree AV block requires extended monitoring (at least overnight, until side-effect resolution).
  - In case of T-wave inversion, ensure there are no associated signs or symptoms of myocardial ischaemia—if suspected seek advice from a cardiologist.

Note First dose monitoring as above should be repeated in all patients whose treatment is interrupted for:
- 1 day or more during the first 2 weeks of treatment
- more than 7 days during weeks 3 and 4 of treatment
- more than 2 weeks after one month of treatment
- If the treatment interruption is of shorter duration than the above, treatment should be continued with the next dose as planned
- Manufacturer advises eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).
- Manufacturer advises skin examination for skin lesions before starting treatment and then every 6 to 12 months thereafter or as clinically indicated
- Monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter.
- Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection (interrupt treatment if lymphocyte count reduced)—consult product literature.
Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepato-splenomegaly and adenopathy)—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaeemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately.

Manufacturer advises to monitor routine MRI for lesions suggestive of progressive multifocal leukoencephalopathy (PML), particularly in patients considered at increased risk; monitor for signs and symptoms of new neurological dysfunction.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012) NICE TA254

Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:

- they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, and
- the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme

Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta254

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (September 2012) that fingolimod (Gilenya®) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland.

The Scottish Medicines Consortium has advised (October 2014) that fingolimod (Gilenya®) is accepted for restricted use within NHS Scotland as a single disease modifying therapy in highly active relapsing-remitting multiple sclerosis for adults with rapidly evolving severe relapsing remitting multiple sclerosis. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

The Scottish Medicines Consortium has advised (April 2015) that fingolimod (Gilenya®) is accepted for use within NHS Scotland as a single disease modifying therapy in highly active relapsing remitting multiple sclerosis for adults with high disease activity despite treatment with at least one disease modifying therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

The All Wales Medicines Strategy Group has advised (January 2017) that fingolimod (Gilenya®) is recommended as an option for use within NHS Wales as a single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous recent MRI, only if the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme or where the list price is equivalent or lower.

NHS restrictions

MEDIUM FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- Gilenya (Novartis Pharmaceuticals UK Ltd)
- Fingolimod (as Fingolimod hydrochloride)

500 microgram Gilenya 0.5mg capsules | 7 capsule £67.50
(Hospital only) | 28 capsule £230 1,470.00 (Hospital only)

IMMUNOSUPPRESSANTS > MONOCOVAL ANTIBODIES > ANTI-LYMPHOCYTE

Anti-lymphocyte monoclonal antibodies

DRUG ACTION

The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

IMPORTANT SAFETY INFORMATION

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

SIDE-EFFECTS

- Common or very common Alopecia - anaemia - arthralgia - asthenia - back pain - constipation - depression - diarrhoea - fever - headache - hypersensitivity (discontinue permanently) - hypertension - increased risk of infection - infusion related reaction - leucopenia - myocardial infarction - neutropenia - night sweats - thrombocytopenia - vomiting
- Uncommon Progressive multifocal leukoencephalopathy (PML)
- Frequency not known Anaphylactic reaction

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side-effects In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Cytokine release syndrome Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

PRE-TREATMENT SCREENING

All patients should be screened for hepatitis B before treatment.

MONITORING REQUIREMENTS

Patients should also be monitored for cytopenias—consult product literature for specific recommendations.
Alemtuzumab

INDICATIONS AND DOSE
Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features

BY INTRAVENOUS INFUSION

Adults: (consult product literature)

- BY INTRAVENOUS INFUSION
- Adults: (consult product literature)

UNLICENSED USE

Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

IMPRESSA

Alemtuzumab should be given under the care of a specialist with facilities for the management of hypersensitivity and anaphylactic reactions.

MHRA/CHM ADVICE: ALEMTUZUMAB (LEMTRADA®): RESTRICTION OF USE DUE TO SERIOUS SAFETY CONCERNS (APRIL 2019)

There have been reports of severe cardiovascular reactions, autoimmune hepatitis, and haemophagocytic lymphohistiocytosis with the use of Lemtrada®. Whilst a review by the European Medicines Agency is ongoing, healthcare professionals are advised to only initiate treatment in new patients with relapsing-remitting multiple sclerosis (RRMS) that is highly active despite a full and adequate course of treatment with at least two other disease-modifying treatments, or in patients with highly active RRMS where all other disease-modifying treatments are contra-indicated or unsuitable.

Healthcare professionals should monitor liver function and vital signs, including blood pressure before and during treatment. Stop infusions if clinically significant changes in vital functions are observed and consider additional monitoring, including ECG. Re-administration should be carefully considered if symptoms of hepatic injury or other serious immune-mediated reactions occur. Patients should be advised to seek immediate medical attention if they experience symptoms within a few days of the infusion or if symptoms of hepatic injury occur.

CONTRA-INDICATIONS

Human immunodeficiency virus

CAUTIONS

Hepatitis B carriers • hepatitis C carriers • in patients with active infection, a delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled • not recommended for inactive disease • not recommended for stable disease • patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course • patients with previous autoimmune conditions other than multiple sclerosis • pretreatment before administration is required (consult product literature)

CAUTIONS, FURTHER INFORMATION

For full details of cautions, consult product literature.

Autoimmune mediated conditions

The risk of autoimmune-mediated reactions occur. Patients should be advised to seek immediate medical attention if they experience symptoms within a few days of the infusion or if symptoms of hepatic injury occur.

INTERACTIONS

Appendix 1: monoclonal antibodies

SIDE-EFFECTS

Common or very common

Abdominal pain • anxiety • autoimmune thyroiditis • cough • cytokine release syndrome • goitre • haemorrhage • hyperhidrosis • hyperthyroidism • hypothyroidism • influenza-like illness • lymphadenopathy • lymphopenia • malaise • menstrual cycle irregularities • multiple sclerosis exacerbated • muscle complaints • muscle weakness • oropharyngeal pain • pain • palpitations • peripheral oedema • proteinuria • sensation abnormal • skin reactions • stomatitis • tremor • vertigo • vision blurred

Uncommon

Cervical dysplasia • conjunctivitis • dysphagia • gastroesophageal reflux disease • hiccups • throat complaints • weight decreased

Rare or very rare

Haemophagocytic lymphohistiocytosis

Frequency not known

Artery dissection • cerebrovascular insufficiency • Goodpasture’s syndrome • hepatitis autoimmune (including fatal cases) • liver injury • meningitis listeria • nephropathy

CONCEPTION AND CONTRACEPTION

Women of childbearing potential should use effective contraception during and for 4 months after treatment.

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk — toxicity in animal studies.

Autoimmune thyroid disease during treatment may affect fetus (consult product literature).

BREAST FEEDING

Manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk.

PRE-TREATMENT SCREENING

Screening patients at high risk of hepatitis B or C is recommended before treatment. All patients should be evaluated for active or latent tuberculosis before starting treatment.

MONITORING REQUIREMENTS

For further information on monitoring, see Important safety information.

HPV screening should be carried out annually in female patients.

PRESCRIBING AND DISPENSING INFORMATION

All patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course.

PATIENT AND CARER ADVICE

Patients should be provided with a patient alert card and patient guide.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Alemterol for treating relapsing-remitting multiple sclerosis (May 2014) NICE TA312
- Alemterol (Lemtrada®) is recommended as an option, within its marketing authorisation, for treating adults with active relapsing-remitting multiple sclerosis.

www.nice.org.uk/guidance/ta312

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- Lemtrada (Genzyme Therapeutics Ltd)
  - Alemterol 10 mg per 1 ml (Hospital only)
  - Alemterol 30 mg per 1 ml (Hospital only)
  - Alemterol 30 mg per 1 ml

- MabCampath (Genzyme Therapeutics Ltd)
  - Alemterol 30 mg per 1 ml

- MabCampath 30 mg per 1 ml

- MabCampath 30 mg per 1 ml

Natalizumab

INDICATIONS AND DOSE

Highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or glatiramer acetate, or those patients with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- BY INTRAVENOUS INFUSION
- Adult 18–65 years: 300 mg every 4 weeks, treatment should be discontinued if no response after 6 months

CONTRA-INDICATIONS

Active infection • active malignancies (except cutaneous basal cell carcinoma) •
Progressive Multifocal Leucoencephalopathy  Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML.  
Lever toxicity  Advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop.  
Alert card  A patient alert card should be provided.

- NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions  
Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)  
NICE TA127

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

Scottish Medicines Consortium (SMC) decisions  
The Scottish Medicines Consortium has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

NHS restrictions

NHS England Clinical Commissioning Policy  

- MEDICINAL FORMS  
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion  
ELECTROLYTES: May contain Sodium

- Tysabri (Biogen Idec Ltd)  
Natalizumab 20 mg per 1 ml  
Tysabri 300mg/15ml concentrate for solution for infusion via 1 vial (Product) £1,120.00 (Hospital only)

Ocrelizumab

- INDICATIONS AND DOSE

Multiple sclerosis (specialist use only)  

- BY INTRAVENOUS INFUSION

- Adult: Initially 300 mg, then 300 mg after 2 weeks; maintenance 600 mg every 6 months, the first maintenance dose should be given 6 months after the first initial dose; a minimum interval of 5 months should be maintained between each maintenance dose, for dose interruption, adjustment of infusion rate or discontinuation of treatment due to infusion-related reactions or side-effects—consult product literature

- CONTRA-INDICATIONS  
Active infection - active malignancies - severely immunocompromised patients

- CAUTIONS

Complete required vaccinations at least 6 weeks before treatment initiation - hepatitis B reactivation

- INTERACTIONS

Appendix 1: monoclonal antibodies

- CONCEPTION AND CONTRACEPTION

Manufacturer advises women of childbearing potential should use contraception during treatment and for 12 months after the last dose.

www.getintopharma.com
Teriflunomide

**Drug Action** Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties.

### Indications and Dose

#### Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- **By mouth**
- **Adult:** 14 mg once daily

#### Contra-Indications

- Anaemia
- Leucopenia
- Neutropenia
- Serious infection
- Severe hypoproteinaemia
- Severe immunodefi ciency
- Significantly impaired bone-marrow function
- Thrombocytopenia

#### Caution

- Adult over 65 years
- Anaemia
- Dyspnée—assess for interstitial lung disease and consider suspending treatment;
- Hypoproteinaemia (avoid if severe)
- Impaired bone-marrow function (avoid if severe)
- Latent tuberculosis
- Leucopenia
- Persistent cough—assess for interstitial lung disease and consider suspending treatment;
- Severe infection—delay or suspend treatment until resolved
- Significant alcohol consumption—signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment—switching between other immunomodulating drugs
- Thrombocytopenia

#### Interactions

- Appendix 1: teriflunomide

#### Side-effects

- **Common or very common**
  - Abdominal pain upper
  - Alopecia
  - Anaemia
  - Anxiety
  - Arthralgia
  - Cystitis
  - Diarrhoea
  - Headache
  - Hypersensitivity
  - Hypertension
  - Increased risk of infection
  - Menorrhagia
  - Myalgia
  - Nausea
  - Nerve disorders
  - Neutropenia
  - Oral disorders
  - Pain
  - Palpitations
  - Sensation abnormal—skin reactions
  - Urinary frequency increased
  - Vomiting
  - Weight decreased

- **Uncommon**
  - Thrombocytopenia

- **Frequency not known**
  - Asthenia
  - Hepatitis acute
  - Interstitial lung disease
  - Nail disorder
  - Pancreatitis
  - Sepsis

**Side-effects, Further Information** Hepatic injury

Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

**Important**: accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).

#### Conception and Contraception

Effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment. In patients undergoing treatment with teriflunomide that are planning to conceive, the accelerated elimination procedure should be used prior to conception. Use of non-oral contraception is recommended during the accelerated elimination procedure—consult product literature.

#### Pregnancy

Avoid—toxicity in animal studies.

#### Breast Feeding

Present in milk in animal studies—manufacturer advises avoid.

#### Hepatic Impairment

Manufacturer advises avoid in severe impairment.

#### Monitoring Requirements

- Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.
- Monitor blood pressure before treatment and periodically thereafter.

- Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.
- Monitor blood pressure before treatment and periodically thereafter.
Malignant disease

1 Antibody responsive malignancy

ANTINEOPLASTIC DRUGS > MONOCLONAL ANTIBODIES

Atezolizumab

- **Drug action** Atezolizumab is a monoclonal antibody, which binds to the programmed death-ligand 1 (PD-L1), thereby reactivating the immune response to tumour cells.

- **Indications and dose**
  - **Urothelial carcinoma [as monotherapy] (specialist use only)**
  - **By intravenous infusion**
  - **Adult:** 1200 mg every 3 weeks, for dose interruption, adjustment of infusion rate or discontinuation of treatment due to side-effects or infusion-related reactions—consult product literature

- **Treatment cessation**
  - Accelerated elimination procedures To aid drug elimination in case of serious adverse effect or before conception, stop treatment and give either colestyramine p. 197 or charcoal, activated p. 1366. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception.

- **National funding/access decisions**
  - **Nice decisions**
    - Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014) NICE TA303
      - Teriflunomide is recommended for the treatment of adults with active relapsing-remitting multiple sclerosis (normally defined as 2 clinically significant relapses in the previous 2 years), in adults who:
        - do not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
        - the manufacturer provides teriflunomide with the discount agreed in the patient access scheme www.nice.org.uk/TA303
  - Scottish Medicines Consortium (SMC) decisions
    - The Scottish Medicines Consortium has advised (February 2014) that the use of teriflunomide (Aubagio)® in NHS Scotland is restricted to use in patients with relapsing-remitting multiple sclerosis who do not have highly active disease, and only as an alternative to treatment with interferon beta or glatiramer acetate.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **Aubagio** (Genzyme Therapeutics Ltd)
      - Teriflunomide 14 mg Aubagio 14mg tablets | 28 tablet (POM)
      - £1.037.84

Non-small cell lung cancer [as combination therapy] (specialist use only)

- **By intravenous infusion**
- **Adult:** (consult product literature)

- **Caution** Abnormal thyroid function—manufacturer advises to consider appropriate treatment—patients may need pre-medication to minimise the development of infusion-related reactions—consult product literature

- **Interactions** Appendix 1: monoclonal antibodies

- **Side-effects**
  - Common or very common Abdominal pain, appetite decreased, arthralgia, asthenia, chills, colitis, diarrhoea, dysphagia, dyspnoea, electrolyte imbalance, fever, hyperthyroidism, hypotension, hypothyroidism, hypoxia, influenza like illness, infusion related reaction, musculoskeletal pain, nasal congestion, nausea, pneumonia, skin reactions, thrombocytopenia, vomiting
  - Uncommon Adrenal insufficiency, diabetes mellitus, Guillain-Barre syndrome, hepatitis, meningitis, non-infective, pancreatitis
  - Rare or very rare Encephalitis non-infective, hypophysitis

- **Infusion-related reactions** Manufacturer advises permanently discontinue treatment in patients with severe infusion reactions.

- **Conception and contraception**
  - Manufacturer advises effective contraception in women of childbearing potential, during treatment and for 5 months after stopping treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **Pregnancy**
  - Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **Breast feeding**
  - Manufacturer advises avoid—no information available.

- **Monitoring requirements**
  - Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions—consult product literature.

- **Prescribing and dispensing information**
  - Manufacturer advises to record the brand name and batch number after each administration.
  - All prescribers should be familiar with the Physician Information and Management Guidelines provided by the manufacturer.

- **Handling and storage**
  - Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after dilution.

- **Patient and carer advice**
  - An alert card should be provided.

- **Missed doses**
  - Manufacturer advises if a dose is missed, it should be administered as soon as possible—administration schedule should be adjusted to maintain a 3-week interval between doses.

- **Driving and skilled tasks**
  - Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of drowsiness.

- **National funding/access decisions**

- **Nice decisions**
  - Atezolizumab for untreated PD-L1-positive locally advanced or metastatic urothelial cancer when cisplatin is unsuitable (updated July 2018) NICE TA492
  - Atezolizumab (Tecentriq)® is recommended for use within the Cancer Drugs Fund as an option for untreated locally advanced or metastatic urothelial carcinoma in adults, for whom cisplatin-based chemotherapy is unsuitable, only if:
Atezolizumab for treating locally advanced or metastatic non-small-cell lung cancer after platinum-containing chemotherapy (June 2018) NICE TA520

Atezolizumab is recommended as an option for treating locally advanced or metastatic urothelial carcinoma in adults who have had platinum-containing chemotherapy, only if:

- atezolizumab is stopped at 2 years of uninterrupted treatment or earlier if the disease progresses, and
- the company provides aetuzolizumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta492

- Atezolizumab for treating locally advanced or metastatic urothelial carcinoma after platinum-containing chemotherapy (June 2018) NICE TA525

Atezolizumab is recommended as an option for treating locally advanced or metastatic urothelial carcinoma in adults who have had platinum-containing chemotherapy, only if:

- aetuzolizumab is stopped at 2 years of uninterrupted treatment or earlier if the disease progresses, and
- the company provides aetuzolizumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta525

Scottish Medicines Consortium (SMC) decisions

SME No. 1336/18

The Scottish Medicines Consortium has advised (July 2018) that aetuzolizumab (Tecentriq) is accepted for restricted use within NHS Scotland for the treatment of adults with locally advanced or metastatic non-small-cell lung cancer after prior chemotherapy, subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower. SMC No. SME2103

The Scottish Medicines Consortium has advised (November 2018) that aetuzolizumab (Tecentriq) is not recommended for use within NHS Scotland as monotherapy for the treatment of adults with locally advanced or metastatic urothelial carcinoma after prior platinum-containing chemotherapy, or who are considered cisplatin ineligible, as the clinical and economic case was not demonstrated.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- Tecentriq (Roche Products Ltd)
- Atezolizumab 60 mg per 1 ml Tecentriq 1200mg/20ml concentrate for solution for infusion vials | 1 vial | £807.69

Atezolizumab is recommended as an option for treating metastatic Merkel cell carcinoma in adults, only if they

- their tumours express PD-L1 at a level of 5% or more, and
- the conditions of the managed access agreement for aetuzolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

NICE TA517

The Scottish Medicines Consortium has advised (July 2018) that aetuzolizumab (Tecentriq) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of adults with locally advanced or metastatic urothelial carcinoma after prior chemotherapy, subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

NICE TA525

Atezolizumab is recommended as an option for treating locally advanced or metastatic non-small-cell lung cancer after platinum-containing chemotherapy (May 2018)

NICE TA520

Atezolizumab is recommended as an option for treating locally advanced or metastatic non-small-cell lung cancer (NSCLC) in adults who have had chemotherapy (and targeted treatment if they have an EGFR- or ALK-positive tumour), only if:

- aetuzolizumab is stopped at 2 years of uninterrupted treatment or earlier if the disease progresses, and
- the company provides aetuzolizumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta492

- Atezolizumab for treating locally advanced or metastatic non-small-cell lung cancer after chemotherapy (May 2018)

Antibody responsive malignancy

Avelumab

- DRUG ACTION

Avelumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

- INDICATIONS AND DOSE

Metastatic Merkel cell carcinoma (specialist use only)

- BY INTRAVENOUS INFUSION

- Adult: 10 mg/kg every 2 weeks, for information on dose delay or interruption due to side-effects and infusion-related reactions—consult product literature

- CAUTIONS

Patients should receive pre-medication to minimise the development of adverse reactions (consult product literature)

- INTERACTIONS

Appendix 1: monoclonal antibodies

- SIDE-EFFECTS

Common or very common Abdominal pain - anaemia - appetite decreased - arthralgia - asthenia - chills - constipation - cough - diarrhoea - diziness - dry mouth - dyspnoea - endocrine disorders - fever - headache - hypertension - hypotension - influenza like illness - infusion related reaction - lymphopenia - myalgia - myositis - nephritis - neuropathies - peripheral oedema - pneumonitis - skin reactions - vomiting - weight decreased

Rare or very rare Myocarditis

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related reactions

For treatment modifications in patients with grade 1 or 2 infusion-related reactions, consult product literature. Manufacturer advises permanently discontinue treatment in patients with grade 3 or 4 infusion-related reaction.

Immune-related reactions

Most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.

CONCEPTION AND CONTRACEPTION

Manufacturer advises women of child-bearing potential should use effective contraception during treatment and for at least 1 month after stopping treatment.

PREGNANCY

Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Manufacturer advises avoid during treatment and for at least 1 month after stopping treatment—no information available.

MONITORING REQUIREMENTS

Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions.

DIRECTIONS FOR ADMINISTRATION

Manufacturer advises for intermittent intravenous infusion (Bavencio®), dilute requisite dose with Sodium Chloride 0.9%; give over 60 minutes via a separate line using a low-protein binding 0.2 micron filter.

HANDLING AND STORAGE

Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage conditions after preparation of the infusion.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Avelumab for treating metastatic Merkel cell carcinoma (April 2018) NICE TA517

Avelumab is recommended as an option for treating metastatic Merkel cell carcinoma in adults, only if they

18-May-2018

www.getintopharma.com
have had 1 or more lines of chemotherapy for metastatic disease. Avelumab is recommended for use within the Cancer Drugs Fund as an option for treating metastatic Merkel cell carcinoma in adults, only if:

- they have not had chemotherapy for metastatic disease, and
- the conditions in the managed access agreement for avelumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta517

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (May 2018) that avelumab (Bavencio®) is accepted for use within NHS Scotland as monotherapy for treating adults with metastatic Merkel cell carcinoma.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- Bavencio (Merck Serono Ltd)
  - Avelumab 20 mg per 1 ml Bavencio 200mg/10ml concentrate for solution for infusion vials | 1 vial (£768.00)

Bevacizumab

DRUG ACTION Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

INDICATIONS AND DOSE Treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy | First-line treatment of metastatic breast cancer in combination with paclitaxel when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate | First-line treatment of metastatic breast cancer in combination with capetitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate (patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capetitabine) | Advanced or metastatic renal cell carcinoma in combination with interferon alpha-2a | First-line treatment of unsectarectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology (in combination with platinum-based chemotherapy) | First-line treatment of advanced (FIGO stages IIIB, IIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with carboplatin and paclitaxel) | First recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor (in combination with carboplatin and gencitabine)

- BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

CAUTIONS Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) - history of arterial thromboembolism - history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) - history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) - increased risk of fistulas (discontinue permanently if tachleo-oesophageal or grade 4 fistula develops) - increased risk of haemorrhage - increased risk of tumour-associated haemorrhage - intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation - uncontrolled hypertension - untreatmet CNS metastases

INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-EFFECTS
- Rare or very rare Encephalopathy - necrotising fasciitis (discontinue and initiate treatment promptly)
- Frequency not known Chest pain - chills - flushing - gallbladder perforation - hyperglycaemia - hypotension - nasal septum perforation - osteonecrosis of jaw - pulmonary hypertension - renal thrombotic microangiopathy

CONCEPTION AND CONTRACEPTION Effective contraception required during and for at least 6 months after treatment in women.

PREGNANCY Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING Manufacturer advises avoid breast-feeding during and for at least 6 months after treatment.

MONITORING REQUIREMENTS
- Monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly.
- Monitor blood pressure.
- Monitor for congestive heart failure.
- Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).
- Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).
• **NICE decisions**

  **Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007)** NICE TA118  
  Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is not recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy.  
  [www.nice.org.uk/guidance/TA118](http://www.nice.org.uk/guidance/TA118)

  **Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010)** NICE TA212  
  Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer.  
  [www.nice.org.uk/guidance/TA212](http://www.nice.org.uk/guidance/TA212)

  **Bevacizumab, cetuximab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012)** NICE TA242  
  Bevacizumab in combination with non-oxaliplatin (fluoropyrimidine-based) chemotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy; see also NICE guidance Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007).  
  [www.nice.org.uk/guidance/TA242](http://www.nice.org.uk/guidance/TA242)

  **Bevacizumab (first-line), sorafenib (first and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced and/or metastatic renal cell carcinoma (August 2009)** NICE TA178  
  Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced and/or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced and/or metastatic renal cell carcinoma.  
  [www.nice.org.uk/guidance/TA178](http://www.nice.org.uk/guidance/TA178)

  **Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011)** NICE TA214  
  Bevacizumab in combination with a taxane is not recommended for the first-line treatment of metastatic breast cancer.  
  [www.nice.org.uk/guidance/TA214](http://www.nice.org.uk/guidance/TA214)

  **Bevacizumab in combination with capcitabine for the first-line treatment of metastatic breast cancer (August 2012)** NICE TA263  
  Bevacizumab in combinations with capcitabine is not recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months.  
  [www.nice.org.uk/guidance/TA263](http://www.nice.org.uk/guidance/TA263)

  **Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)** NICE TA284  
  Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).  
  [www.nice.org.uk/guidance/TA284](http://www.nice.org.uk/guidance/TA284)

  **Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013)** NICE TA285  
  Bevacizumab in combination with gemcitabine and carboplatin is not recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.  

  **Scottish Medicines Consortium (SMC) decisions**

  The Scottish Medicines Consortium has advised (May 2012) that bevacizumab (Avastin®) is not recommended for use within NHS Scotland for the first line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate.  
  The Scottish Medicines Consortium has advised (September 2015) that bevacizumab (Avastin®) is accepted for restricted use within NHS Scotland in combination with paclitaxel for the treatment of advanced FIGO stage IV epithelial ovarian, fallopian tube, or primary peritoneal cancer.  
  [www.nice.org.uk/guidance/TA212](http://www.nice.org.uk/guidance/TA212)

  **All Wales Medicines Strategy Group (AWMSG) decisions**

  The All Wales Medicines Strategy Group has advised (September 2015) that bevacizumab (Avastin®) is not recommended for use within NHS Wales in combination with paclitaxel and cisplatin, or alternatively, paclitaxel and topotecan in patients who cannot receive platinum therapy, for the treatment of adults with persistent, recurrent, or metastatic carcinoma of the cervix. The case for cost-effectiveness has not been proven.  
  [www.nice.org.uk/guidance/TA212](http://www.nice.org.uk/guidance/TA212)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Avastin (Roche Products Ltd)**  
  Bevacizumab 25 mg per 1 ml Avastin 400mg/16ml solution for infusion vials | 1 vial | £242.66  
  (Hospital only)

**Blinatumomab**

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

### INDICATIONS AND DOSE

**Relapsed or refractory Philadelphia chromosome-negative acute lymphoblastic leukaemia (initiated by a specialist)**

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - **Adult**: (consult product literature)
  - **Philadelphia chromosome-negative acute lymphoblastic leukaemia in complete remission with minimal residual disease (initiated by a specialist)**
    - **BY CONTINUOUS INTRAVENOUS INFUSION**
    - **Adult (body-weight 45 kg and above)**: (consult product literature)
Brentuximab vedotin

08-May-2019

- **INDICATIONS AND DOSE**
  - CD30 positive Hodgkin lymphoma (specialist use only)
  - Systemic anaplastic large cell lymphoma (specialist use only)

- **CAUTIONS**
  - Elevated BMI—risk of hyperglycaemia - high tumour burden—risk of tumour lysis syndrome - rapidly proliferating tumours—risk of tumour lysis syndrome

- **SIDE-EFFECTS**
  - Common or very common
  - Abdominal pain - alopecia - anaemia - arthralgia - back pain - chill - constipation - cough - diarrhoea - dizziness - dyspnoea - fatigue - fever - hyperglycaemia - increased risk of infection - infusion related reaction - myalgia - nausea - nerve disorders - neutropenia - sepsis - skin reactions - thrombocytopenia - vomiting - weight decreased
  - Uncommon
  - Cytomegalovirus infection reactivation - pancreatitis acute - tumour lysis syndrome
  - Rare or very rare
  - Severe cutaneous adverse reactions (SCARs)
  - Frequency not known

- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception required during treatment and for 6 months after treatment in men and women
  - PRENANCY
  - Avoid unless potential benefit outweighs risk (toxicity in animal studies)
  - BREAST FEEDING
  - Avoid—no information available
**Brentuximab vedotin for treating CD13**

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Brentuximab vedotin for treating relapsed or refractory systemic anaplastic large cell lymphoma (October 2017) NICE TA478
- Brentuximab vedotin is recommended as an option for treating relapsed or refractory systemic anaplastic large cell lymphoma in adults, only if:
  - they have an Eastern Cooperative Oncology Group performance status of 0 or 1, and
  - the manufacturer provides brentuximab vedotin according to the commercial access agreement with NHS England.

These recommendations are not intended to affect treatment that was started in the NHS before this guidance was published. Adults having treatment outside these recommendations may continue without change to the funding arrangements in place before this guidance was published, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta478

- Brentuximab vedotin for treating CD30-positive Hodgkin lymphoma (June 2018) NICE TA524
- Brentuximab vedotin is recommended as an option for treating CD30-positive Hodgkin lymphoma in adults with relapsed or refractory disease, only if:
  - they have already had autologous stem cell transplant, or
  - they have already had at least 2 previous therapies when autologous stem cell transplant or multi-agent chemotherapy are not suitable, and
  - the manufacturer provides brentuximab vedotin according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta524

- Brentuximab vedotin for treating CD30-positive cutaneous T-cell lymphoma (April 2019) NICE TA577

Brentuximab vedotin (Adcetris®) is recommended as an option for treating CD30-positive cutaneous T-cell lymphoma (CTCL) after at least one systemic therapy in adults, only if:

- they have mycosis fungoides stage IIB or over, primary cutaneous anaplastic large cell lymphoma or Sézary syndrome, and
- the manufacturer provides brentuximab vedotin according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta577

**Cetuximab**

**INDICATIONS AND DOSE**

Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated |

Treatment of locally advanced squamous cell cancer of the head and neck (in combination with radiotherapy) |

Treatment of recurrent or metastatic squamous cell cancer of the head and neck (in combination with platinum-based chemotherapy) |

- BY INTRAVENOUS INFUSION
  - Adult (initiated by a specialist): (consult product literature or local protocols)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness.

Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

**CONTRA-INDICATIONS**

Combination of cetuximab with oxaliplatin-containing chemotherapy is contra-indicated in patients with metastatic colorectal cancer who have mutant or unknown RAS status. RAS mutated colorectal tumours (or if RAS tumour status unknown)

**CAUTIONS**

Cardiopulmonary disease · cardiovascular disease · history of keratitis · pulmonary disease—discontinue if interstitial lung disease · risk factors for keratitis · severe dry eye · ulcerative keratitis (including contact lens use)

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- **Common or very common** Appetite decreased · cytokine release syndrome · dehydration · diarrhoea · electrolyte imbalance · eye inflammation · fatigue · headache · infusion related reaction · mucositis · nausea · skin eruption · vomiting

- **Uncommon** Embolism and thrombosis · interstitial lung disease

- **Rare or very rare** Severe cutaneous adverse reactions (SCARs)

- **Frequency not known** Meningitis aseptic · superinfection of skin lesions

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

- Adcetris (Takeda UK Ltd)

**Brentuximab vedotin 50 mg** Adcetris 50mg powder for concentrate for solution for infusion vials | 1 vial [POD] £2,500.00
Daratumumab

**DRUG ACTION** Daratumumab is a monoclonal antibody that binds to CD38, a cell-surface protein, resulting in tumour cell death by immune-mediated actions and apoptosis.

**INDICATIONS AND DOSE**

Multiple myeloma (as monotherapy after failure of a proteasome inhibitor and an immunomodulatory agent) (specialist use only)

Multiple myeloma (in combination with lenalidomide and dexamethasone in patients who have received at least one prior therapy) (specialist use only)

**By intravenous infusion**

Adult: 16 mg/kg once weekly for weeks 1 to 9, for week 1, dose can alternatively be divided over 2 consecutive days, then 16 mg/kg every 3 weeks for weeks 10 to 24, then 16 mg/kg every 4 weeks for week 25 onwards until disease progression, for dose interruption or infusion rate reduction due to infusion-related reactions or side-effects—consult product literature

**Newly diagnosed multiple myeloma (in combination with bortezomib, melphalan and prednisone) (specialist use only)**

**By intravenous infusion**

Adult: 16 mg/kg once weekly for weeks 1 to 9, for week 1, dose can alternatively be divided over 2 consecutive days, then 16 mg/kg every 3 weeks for weeks 10 to 24, then 16 mg/kg every 4 weeks for week 25 onwards until disease progression, for dose interruption or infusion rate reduction due to infusion-related reactions or side-effects—consult product literature

**CAUTIONS**

History of obstructive pulmonary disorder (consider additional post-medication—consult product literature) - patients may need pre-medication to minimise adverse reactions - risk of herpes zoster reactivation (consider antiviral prophylaxis)

**CAUTIONS, FURTHER INFORMATION**

Infusion-related reactions Serious infusion-related reactions can occur and daratumumab should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with a corticosteroid, an antihistamine and an anti- pyretic and post-medication with oral corticosteroids—consult product literature. Manufacturer advises patients should be closely monitored for signs of infusion-related reactions during and after administration; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

Common or very common Anae mia - atrial fibrillation - chills - cough - diarrhoea - dyspnoea - fatigue - fever - headache - hypertension - hypoxia - increased risk of infection - infusion related reaction - lymphopenia - muscle spasms - nasal congestion - nausea - neutropenia - peripheral neuropathy - peripheral oedema - pulmonary

---

866 Antibody responsive malignancy

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **PREGNANCY** Use only if potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **BREAST FEEDING** Avoid breast-feeding during and for 2 months after treatment—no information available.

- **PRE-TREATMENT SCREENING** Evidence of non-mutated (wild-type) RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be determined by an experienced laboratory using a validated test method.

- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **DIRECTIVE FOR ADMINISTRATION**

  - **PRE-TREATMENT SCREENING**

  - **PREGNANCY**

  - **CONCEPTION AND CONTRACEPTION**

  - **Cetuximab for treating recurrent or metastatic squamous cell cancer of the head and neck (June 2008) NICE TA145** Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.

  - [www.nice.org.uk/guidance/TA145](www.nice.org.uk/guidance/TA145)

  - **Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242** Cetuximab monotherapy or combination therapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.

  - [www.nice.org.uk/guidance/TA242](www.nice.org.uk/guidance/TA242)

  - **Cetuximab and panitumumab for previously untreated metastatic colorectal cancer (updated September 2017) NICE TA439** Cetuximab is recommended, within its marketing authorisation, as an option for previously untreated epidermal growth factor receptor-expressing, RAS wild-type metastatic colorectal cancer in patients in combination with:

    - 5-fluorouracil, folinic acid and oxaliplatin (FOLFOX), or
    - 5-fluorouracil, folinic acid and irinotecan (FOLFIRI).

    This advice is contingent upon the manufacturer providing cetuximab with the discount agreed in the commercial access agreement.

    - [www.nice.org.uk/guidance/TA439](www.nice.org.uk/guidance/TA439)

  - **Cetuximab for treating recurrent or metastatic squamous cell cancer of the head and neck (August 2017) NICE TA473** Cetuximab in combination with platinum-based chemotherapy is recommended as an option for treating recurrent or metastatic squamous cell cancer of the head and neck in patients only:

    - if the cancer started in the oral cavity, and
    - when the company provides the drug in line with the commercial access agreement with NHS England.

    Patients currently receiving cetuximab whose disease does not meet the above criteria may continue treatment until they and their clinician consider it appropriate to stop.

    - [www.nice.org.uk/guidance/TA473](www.nice.org.uk/guidance/TA473)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Solution for infusion**

  - **Erbitux** (Merck Serono Ltd)

    - **Cetuximab 5 mg per 1 ml** Erbitux 100mg/20ml solution for infusion vials | 1 vial (P38) £178.10 (Hospital only)
    - Erbitux 500mg/100ml solution for infusion vials | 1 vial (P38) £890.50 (Hospital only)

    - Daratumumab 20 mg per ml Darzalex 400mg/20ml concentrate for solution for infusion vials | 1 vial | £1,440.00
    - Darzalex 100mg/5ml concentrate for solution for infusion vials | 1 vial | £360.00

**Dinutuximab beta**

- **DRUG ACTION** Dinutuximab beta is a chimeric monoclonal antibody; it specifically targets the carbohydrate moiety of disialoganglioside 2, which is overexpressed on neuroblastoma cells.

- **INDICATIONS AND DOSE**
  - High-risk neuroblastoma (specialist use only)
    - By intravenous infusion
    - Adult: (consult product literature)

- **CONTRA-INDICATIONS** Acute grade 3 or 4, or extensive chronic graft-versus-host disease

- **CAUTIONS** Avoid vaccinations during and for at least 10 weeks after treatment cessation (increased risk of immune stimulation and neurological toxicity) - ensure absence of systemic infection — any other infection should be controlled before treatment initiation - pre-medication must be administered to minimise the risk of infusion-related reactions and neuropathic pain

- **CAUTIONS, FURTHER INFORMATION**
  - Pre-medication Severe infusion-related reactions can occur and dinutuximab beta should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with an antihistamine, and to monitor closely, particularly during the first and second treatment course; discontinue immediately if reaction occurs and treat as indicated—consult product literature.

  - Manufacturer advises pre-medication with non-opioid analgesics, gabapentin and opioids—consult product literature.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**
  - Common or very common
  - Uncommon
    - Disseminated intravascular coagulation - eosinophilia - hepatocellular injury - hypovolaemic shock - intracranial pressure increased - peripheral vascular disease - posterior reversible encephalopathy syndrome (PRES)

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises women of childbearing potential should use contraception during and for 6 months after stopping treatment. See also

---

oedema - respiratory disorders - throat irritation - thrombocytopenia - vomiting

- **Frequency not known**
  - Allergic rhinitis - chest discomfort - hypotension - pruritus

**SIDE-EFFECTS, FURTHER INFORMATION**

- Manufacturer advises effective contraception in women of childbearing potential during treatment and for 3 months after stopping treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk — no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **BREAST FEEDING**
  - Manufacturer advises avoid — no information available.

- **EFFECT ON LABORATORY TESTS**
  - Positive possible indirect Coombs test (may affect antibody screening).

- **HANDLING AND STORAGE**
  - Manufacturer advises store in a refrigerator at 2–8°C; consult product literature for storage advice following dilution.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Daratumumab monotherapy for treating relapsed and refractory multiple myeloma (March 2018) NICE TA510 Daratumumab monotherapy is recommended for use within the Cancer Drugs Fund as an option for treating relapsed and refractory multiple myeloma in adults whose previous therapy included a proteasome inhibitor and an immunomodulator, and whose disease progressed on the last therapy, only if:
      - they have daratumumab after 3 previous therapies, and
      - the conditions in the managed access agreement are followed.

  - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

  - Daratumumab with bortezomib and dexethasone for previously treated multiple myeloma (April 2019) NICE TA573 Daratumumab (Darzalex®) plus bortezomib plus dexethasone is recommended for use within the Cancer Drugs Fund as an option for treating relapsed multiple myeloma in people who have had one previous treatment. It is recommended only if the conditions in the managed access agreement for daratumumab plus bortezomib plus dexethasone are followed.

  - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

**Scottish Medicines Consortium (SMC) decisions**

- SMC No. 1205/17
  - The Scottish Medicines Consortium has advised (October 2017) that daratumumab (Darzalex®) is accepted for restricted use within NHS Scotland as monotherapy for use as a fourth-line treatment option for adults with relapsed and refractory multiple myeloma, only if a proteasome inhibitor and an immunomodulatory agent have been used as prior therapy and disease demonstrated progression on the last therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

www.getintopharma.com
Dinutuximab beta for treating neuroblastoma (August 2018)

**National Funding/Access Decisions**

- **Patient and Carer Advice**
  - Handling and storage: Manufacturer advises monitor circulatory and respiratory function — risk of capillary leak syndrome.
  - Handling and storage: Manufacturer advises monitor liver function and electrolytes regularly.
  - Handling and storage: Manufacturer advises store in a refrigerator (2–8°C) — consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.
  - Patient and carer advice: Driving and skilled tasks: Manufacturer advises patients should not use or drive machines during treatment.
  - National funding/access decisions: NICE decisions

**NICE decisions**

- Dinutuximab beta for treating neuroblastoma (August 2018)
  - NICE TS38

  Dinutuximab beta (Qarziba®) is recommended as an option for treating high-risk neuroblastoma in people aged 12 months and over whose disease has at least partially responded to induction chemotherapy, followed by myeloablative therapy and stem cell transplant, only if:
  - they have not already had anti-GD2 immunotherapy; and
  - the manufacturer provides dinutuximab beta according to the commercial arrangement.

  Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

  www.nice.org.uk/guidance/ts38

Scottish Medicines Consortium (SMC) decisions

- SMC No. SMC2105

The Scottish Medicines Consortium has advised (November 2018) that dinutuximab beta (Qarziba®) is accepted for use within NHS Scotland for the treatment of high-risk neuroblastoma in patients aged 12 months and over whose disease has at least partially responded to induction chemotherapy, followed by myeloablative therapy and stem cell transplantation, as well as patients with a history of relapsed or refractory neuroblastoma, with or without residual disease.

In patients with a history of relapsed or refractory disease and in patients who have not achieved a complete response after first line therapy, dinutuximab beta should be combined with interleukin-2.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**Pregnancy and Reproductive Function** in Cytotoxic drugs p. 888.

- **Pregnancy** Manufacturer advises avoid — no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- **Breast Feeding** Manufacturer advises avoid during treatment and for 6 months after the last dose — no information available.

**Monitoring Requirements**

- Manufacturer advises pre-treatment evaluation of pulse oximetry, bone marrow function, liver function and renal function — consult product literature for values required for treatment initiation.
- Manufacturer advises monitor circulatory and respiratory function — risk of capillary leak syndrome.
- Manufacturer advises monitor liver function and electrolytes regularly.

**Handling and Storage**

- Manufacturer advises store in a refrigerator (2–8°C) — consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

**Patient and Carer Advice**

- Driving and skilled tasks: Manufacturer advises patients should not use or drive machines during treatment.

**National Funding/Access Decisions**

- NICE decisions

**NICE decisions**

- Dinutuximab beta for treating neuroblastoma (August 2018)
  - NICE TS38

  Dinutuximab beta (Qarziba®) is recommended as an option for treating high-risk neuroblastoma in people aged 12 months and over whose disease has at least partially responded to induction chemotherapy, followed by myeloablative therapy and stem cell transplant, only if:
  - they have not already had anti-GD2 immunotherapy, and
  - the manufacturer provides dinutuximab beta according to the commercial arrangement.

  Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

  www.nice.org.uk/guidance/ts38

Scottish Medicines Consortium (SMC) decisions

- SMC No. SMC2105

The Scottish Medicines Consortium has advised (November 2018) that dinutuximab beta (Qarziba®) is accepted for use within NHS Scotland for the treatment of high-risk neuroblastoma in patients aged 12 months and over whose disease has at least partially responded to induction chemotherapy, followed by myeloablative therapy and stem cell transplantation, as well as patients with a history of relapsed or refractory neuroblastoma, with or without residual disease.

In patients with a history of relapsed or refractory disease and in patients who have not achieved a complete response after first line therapy, dinutuximab beta should be combined with interleukin-2.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Qarziba (EUSA Pharma Ltd)
  - Dinutuximab beta 4.5 mg per 1 ml Qarziba 20mg/4.5ml concentrate for solution for infusion vials | 1 vial £7,610.00 (Hospital only)

**Durvalumab**

- **Drug Action** Durvalumab is a human monoclonal antibody that selectively binds to programmed cell death ligand-1 (PD-L1), blocking its interaction with the programmed death-1 (PD-1) receptor and with CD80, and thereby potentiating an immune response to tumour cells.

- **Indications and Dose**
  - Non-small cell lung cancer (initiated by a specialist)
    - Adult: 10 mg/kg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability.

- **Interactions** → Appendix 1: monoclonal antibodies

- **Side-effects**
  - Common or very common: Cough, diarrhoea, dysphonia, dysuria, fever, flank pain, gastrointestinal discomfort, gastrointestinal disorders, hyperthyroidism, hypothyroidism, increased risk of infection, infusion related reaction, myalgia, night sweats, peripheral oedema, respiratory disorders, skin reactions — thyroditis
  - Uncommon: Adrenal insufficiency, glomerulonephritis, hepatic disorders, myopathy, nephritis — type 1 diabetes mellitus
  - Rare or very rare: Diabetes insipidus, hypopituitarism, hypopituitarism — myocardiits

**Side-effects, further information**

**Immune-related reactions**

- Manufacturer advises that most immune-related adverse reactions resolved with appropriate management, including initiation of immunosuppressive treatment and treatment modifications — consult product literature.

**Infusion-related reactions**

- Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions.

- **Conception and Contraception**
  - Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 3 months after stopping treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **Pregnancy**
  - Manufacturer advises avoid — no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **Breast Feeding**
  - Manufacturer advises avoid — no information available.

- **Monitoring Requirements**
  - Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions — consult product literature.

- **Directions for Administration**
  - Manufacturer advises for intravenous infusion, dilute to a concentration between 1 mg/mL and 15 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 60 minutes through a low-protein binding in-line filter (pore size 0.2 or 0.22 micron).

- **Handling and Storage**
  - Manufacturer advises store in a refrigerator (2–8°C) and protect from light — consult product literature for storage conditions after preparation of the infusion.

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- EXCipients: May contain Polysorbates
  - Imfinzi (AstraZeneca UK Ltd)

  **Imfinzi 50 mg per 1 ml** Imfinzi 220mg/2.4ml concentrate for solution for infusion vials | 1 vial £592.00
  - Imfinzi 500mg/10ml concentrate for solution for infusion vials | 1 vial £2,466.00

www.getintopharma.com
Elotuzumab

12-Apr-2019

DRUG ACTION Elotuzumab is a monoclonal antibody that targets the signalling lymphocytic activation molecule family member 7 (SLAMF7) protein, thereby activating natural killer cells and mediating myeloma cell death.

INDICATIONS AND DOSE

Multiple myeloma in patients who have received at least one prior therapy (in combination with lenalidomide and dexamethasone) (specialist use only)

- BY INTRAVENOUS INFUSION
  - Adult: 10 mg/kg every week, on days 1, 8, 15 and 22 of cycles 1 and 2, then 10 mg/kg every 2 weeks, on days 1 and 15 of subsequent cycles

CAUTIONS

Pre-medication must be administered to minimise the development of infusion-related reactions—consult product literature—secondary primary malignancies

CAUTIONS, FURTHER INFORMATION

Secondary primary malignancies Manufacturer advises to monitor for the development of secondary primary malignancy before and during treatment with elotuzumab.

INTERACTIONS

Appendix 1: monoclonal antibodies

SIDE-EFFECTS

- Common or very common Chest pain · cough · deep vein thrombosis · diarrhoea · fatigue · fever · headache · hypersensitivity · increased risk of infection · infusion related reaction · lymphopenia · mood altered · night sweats · numbness · oropharyngeal pain · weight decreased

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects reported when used in combination with lenalidomide and dexamethasone or bortezomib and dexamethasone.

Infusion-related reactions Manufacturer advises for mild-to-moderate infusion reactions interrupt treatment or reduce infusion rate, and monitor closely (consult product literature); permanently discontinue therapy in severe infusion reactions.

CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception in men and women of childbearing potential; male patients should continue effective contraception during treatment and for at least one month after the last dose if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

PREGNANCY

Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

HANDLING AND STORAGE

Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of the infusion.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCipients: May contain Polysorbates, sucrose

- Empliciti (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Elotuzumab 300 mg Empliciti 300mg powder for concentrate for solution for infusion vials | 1 vial | £3,085.00
  - Elotuzumab 400 mg Empliciti 400mg powder for concentrate for solution for infusion vials | 1 vial | £3,446.00

Gemtuzumab ozogamicin

17-Oct-2018

DRUG ACTION Gemtuzumab ozogamicin is a monoclonal antibody that binds to CD33-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

INDICATIONS AND DOSE

CD33-positive acute myeloid leukaemia (specialist use only)

- BY INTRAVENOUS INFUSION

- Adult: (consult product literature)

CAUTIONS

Adverse-risk cytogenetics (consider benefits and risks of treatment, consult product literature) · haematopoietic stem cell transplantation (increased risk of hepatotoxicity) · pre-medication recommended to minimise adverse reactions

CAUTIONS, FURTHER INFORMATION

Pre-medication Serious infusion-related reactions can occur and gemtuzumab ozogamicin should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with a corticosteroid, paracetamol and antihistamine 1 hour prior to dosing, and to take appropriate measures to help prevent the development of tumour lysis-related hyperuricaemia—consult product literature.

SIDE-EFFECTS

- Common or very common Anaemia · appetite decreased · ascites · chills · constipation · decreased leucocytes · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hypotension · infection · infusion related reaction (including fatal cases) · multi organ failure · nausea · neutropenia · oedema · pancytopenia · sinusoidal obstruction syndrome · skin reactions · stomatitis · tachycardia · thrombocytopenia · tumour lysis syndrome (including fatal cases) · vomiting

Frequency not known Interstitial pneumonia

SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related reactions (including fatal cases) can occur during the first 24 hours after administration. Manufacturer advises interrupt treatment immediately and treat as clinically indicated (consult product literature); permanent discontinuation should be strongly considered in patients who develop signs and symptoms of anaphylaxis.

CONCEPTION AND CONTRACEPTION

Manufacturer advises women of childbearing potential should use 2 methods of effective contraception during treatment and for at least 7 months after the last dose; male patients should use 2 methods of effective contraception during treatment and for at least 4 months after the last dose if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Manufacturer advises avoid during treatment and for at least one month after the last dose—no information available.

HEPATIC IMPAIRMENT

Manufacturer advises caution in moderate-to-severe impairment—increased risk of developing hepatotoxicity; postpone treatment if serum transaminases (ALT or AST) greater than 2.5 times the upper limit of normal or total bilirubin greater than 2 times the upper limit of normal.

MONITORING REQUIREMENTS

Manufacturer advises monitor complete blood counts prior to each dose as well as signs and symptoms of infection.

www.getintopharma.com
bleeding and other effects of myelosuppression during treatment; dose interruption or discontinuation of treatment may be required—consult product literature.

- Manufacturer advises monitor for signs and symptoms of infusion-related reactions—close clinical monitoring, including pulse, blood pressure and temperature, should be performed during infusion; monitor for signs and symptoms of tumour lysis syndrome.
- Manufacturer advises monitor for signs and symptoms of hepatotoxicity (including hepatic veno-occlusive disease); liver tests should be monitored prior to each dose—consult product literature.

### Prescribing and dispensing information

Gemtuzumab ozogamicin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

### Handling and storage

Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.

### Patient and carer advice

- **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and headache.

### National funding/access decisions

**NICE decisions**
- Gemtuzumab ozogamicin for untreated acute myeloid leukaemia (November 2018) NICE TAs545
  - Gemtuzumab ozogamicin (Mylotarg® 5), with daunorubicin and cytarabine, is recommended as an option for untreated de novo CD33-positive acute myeloid leukaemia (AML), except acute promyelocytic leukaemia, in people 15 years and over, only if:
    - they start induction therapy when either the cytogenetic test confirms that the disease has favourable, intermediate or unknown cytogenetics (that is, because the test was unsuccessful) or when their cytogenetic test results are not yet available, and
    - they start consolidation therapy when their cytogenetic test confirms that the disease has favourable, intermediate or unknown cytogenetics (because the test was unsuccessful), and
  - the manufacturer provides gemtuzumab ozogamicin according to the commercial arrangement.

  Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

  [Website link](https://www.nice.org.uk/guidance/ta545)

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (October 2018) that gemtuzumab ozogamicin (Mylotarg® 5) is accepted for restricted use within NHS Scotland as combination therapy with daunorubicin and cytarabine for the treatment of previously untreated, de novo CD33-positive acute myeloid leukaemia in patients aged 15 years and above with a favourable, intermediate or unknown cytogenetic profile.

### Medicinal forms

- **Medication costs** There can be variation in the licensing of different medicines containing the same drug.
- **Powder for solution for infusion**
  - Mylotarg® (Pfizer Ltd) ▶

  Gemtuzumab ozogamicin 5 mg Mylotarg 5mg powder for concentrate for solution for infusion vials | 1 vial [GDP] £6,300.00 (Hospital only)

### Inotuzumab ozogamicin

#### Drug action

Inotuzumab ozogamicin is a monoclonal antibody that binds to CD22-expressing tumour cells to induce cell cycle arrest and apoptotic cell death.

#### Indications and dose

Monotherapy for relapsed or refractory CD22-positive B cell precursor acute lymphoblastic leukaemia (under expert supervision)
- By intravenous infusion
- Adult: (consult product literature)

#### Contra-indications

- Prior confirmed severe or ongoing sinusoidal obstruction syndrome

#### Caution

- History of, or predisposition to QT-interval prolongation (e.g. electrolyte disturbances, concomitant use of drugs that prolong the QT interval); patients may need pre-medication to minimise adverse reactions—patients undergoing haematopoietic stem cell transplantation (increased risk of hepatotoxicity)

#### Further information

- Pre-medication Manufacturer advises pre-medication with a corticosteroid, antipyretic and antihistamine prior to dosing in all patients and pre-medication to reduce uric acid levels and hydration in patients with a high tumour burden (increased risk of tumour lysis syndrome)—consult product literature.

#### Interactions

- Appendix 1: monoclonal antibodies

#### Side-effects

- Common or very common

#### Further information

Manufacturer advises interrupt treatment if an infusion related reaction occurs; depending on the severity, discontinuation of the infusion or administration of steroids and antihistamines should be considered (consult product literature); permanently discontinue treatment in severe or life-threatening infusion reactions.

#### Conception and contraception

Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 8 months after the last dose; male patients should use effective contraception during treatment and for at least 5 months after the last dose if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

#### Pregnancy

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

#### Breast feeding

Manufacturer advises avoid during treatment and for at least two months after the last dose—no information available.

#### Hepatic impairment

Manufacturer advises caution if bilirubin and transaminase levels are raised (limited information available); avoid in serious ongoing impairment.

#### Dose adjustments

Manufacturer advises dose interruption or discontinuation according to bilirubin and transaminase levels.

#### Pre-treatment screening

Manufacturer advises baseline CD22 positivity of greater than 0% is required prior to initiating treatment.
Inotuzumab ozogamicin is recommended only if the Scottish Medicines Consortium (SMC) decisions (2018) have advised (June 2018) that inotuzumab ozogamicin (Besponsa®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of adults with relapsed or refractory CD22-positive B cell precursor acute lymphoblastic leukaemia (ALL) for whom the intent is to proceed to stem cell transplantation. Adults with Philadelphia chromosome positive relapsed or refractory B cell precursor ALL should have failed treatment with at least one tyrosine kinase inhibitor. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**DRUG ACTION**

Iplimumab is a monoclonal antibody which causes T-cell activation resulting in tumour cell death.

**INDICATIONS AND DOSE**

- **Melanoma (as monotherapy) (specialist use only)**
  - *By Intravenous infusion*
  - Adult: 3 mg/kg every 4 weeks for 4 doses, for dose interruption or discontinuation of treatment due to immune-related side-effects—consult product literature
- **Melanoma (in combination with nivolumab) (specialist use only)** Advanced renal cell carcinoma (in combination with nivolumab) (specialist use only)
  - *By Intravenous infusion*
  - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: IPILIMUMAB (YERVOY®): REPORTS OF CYTOMEGALOVIRUS (CMV) GASTROINTESTINAL INFECTION OR REACTIVATION (JANUARY 2019)

There have been post-marketing cases of gastrointestinal CMV infection or reactivation in iplimumab-treated patients reported to have corticosteroid-refractory immune-related colitis, including fatal cases.

Patients should be advised to contact their healthcare professional immediately at the onset of symptoms of colitis. Possible causes, including infections, should be investigated; a stool infection work-up should be performed and patients screened for CMV. For patients with corticosteroid-refractory immune-related colitis, use of an additional immunosuppressive agent should only be considered if other causes are excluded using viral PCR on biopsy, and eliminating other viral, bacterial, and parasitic causes.

**SIDE-EFFECTS**

- **Common or very common** Alopecia - anaemia - appetite decreased - arthralgia - asthma - cancer pain - chills - confusion - constipation - cough - dehydration - diarrhoea - dizziness - dyspnoea - electrolyte imbalance - eye discomfort - fever - gastrointestinal discomfort - gastrointestinal disorders - haemorrhage - headache - hepatic disorders - hypophysitis - hypopituitarism - hypotension - hypothyroidism - influenza like illness - lethargy - lymphopenia - mucositis - muscle complaints - nausea - nerve disorders - night sweats - oedema - pain - skin reactions - vasodilation - vision disorders - vomiting - weight decreased
- **Uncommon** Adrenal hypofunction - alkalosis - allergic rhinitis - amenorrhoea - arthrythmias - arthritis - brain oedema - depression - dysarthria - eosinophilia - eye inflammation - glomerulonephritis - haemolytic anaemia - hair colour changes - hyperthyroidism - hypogonadism - increased risk of infection - infusion related reaction - libido decreased - meningitis - movement disorders - multi organ failure - muscle weakness - myopathy - nephritis - autoimmunity - neutropenia - pancreatitis - paraneoplastic

**INTERACTIONS**

→ Appendix 1: monoclonal antibodies
**872 Antibody responsive malignancy**

**Immune system and malignant disease**

- Ipilimumab for previously treated advanced (unresectable or metastatic) melanoma (December 2012) NICE TA268
  - Ipilimumab (Yervoy®) is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy.

**Necitumumab**

- Necitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

**Indications and Dose**

- Necitumumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

**Scottish Medicines Consortium (SMC) decisions**

- The Scottish Medicines Consortium has advised (April 2013) that ipilimumab (Yervoy®) is accepted for use within NHS Scotland for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- The Scottish Medicines Consortium has advised (November 2014) that ipilimumab (Yervoy®) is accepted for use within NHS Scotland for the first-line treatment of advanced (unresectable or metastatic) melanoma in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**Side-effects**

- Common or very common: Conjunctivitis, dysuria, electrolyte imbalance, embolism and thrombosis, fever, haemorrhage, headache, hypomagnesaemia (severe), increased risk of infection, infusion related reaction, muscle spasms, oral disorders, skin reactions, taste altered, vomiting, weight decreased.
Antibody responsive malignancy 873

Melanoma (as monotherapy) (specialist use only) | Advanced renal cell carcinoma (as monotherapy) (specialist use only)

- **BY INTRAVENOUS INFUSION**
  - **Adult:** 400 mg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability.

**Important Safety Information**

**MHRA/CHM Advice: Nivolumab (Opdivo®): Reports of Organ Transplant Rejection (July 2017)**

A European review of worldwide data concluded that nivolumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with nivolumab versus the risk of possible organ transplant rejection for each patient.

- **Caution** May increase risk of severe graft-versus-host reaction in patients who have had prior haematopoietic stem cell transplant (particularly in those with a prior history). patients may need pre-medication to minimise the development of infusion-related reactions.

**Interactions**

- **Common or very common** Abdominal pain - alopecia - anaemia - appetite decreased - arthralgia - constipation - cough - decreased leucocytes - diarrhoea - dizziness - dry mouth - dyspnoea - electrolyte imbalance - fatigue - fever - headache - hyperglycaemia - hypersensitivity - hypertension - hyperthyroidism - hypothyroidism - increased risk of infection - infusion related reaction - nausea - nerve disorders - neutropenia - oedema - pain - respiratory disorders - skin reactions - stomatitis - thrombocytopenia - vomiting - weight decreased

- **Rare or very rare** Dermatitis - diabetes mellitus - diabetic ketoacidosis - histiocytic necrotising lymphadenitis - myasthenic syndrome - myocardiitis - myopathy - severe cutaneous adverse reactions (SCARs) - vasculitis

- **Frequency not known** Solid organ transplant rejection

**Side-effects, Further Information**

**Immune-related reactions**

Manufacturer advises that most immune-related adverse reactions improved or resolved with appropriate management, including initiation of corticosteroids and treatment modifications—consult product literature for further information.

### Nivolumab

**Drug Action**

Nivolumab is a human immunoglobulin G4 monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

**Indications and Dose**

Melanoma (in combination with ipilimumab) (specialist use only): Advanced renal cell carcinoma (in combination with ipilimumab) (specialist use only)

- **By Intravenous Infusion**
  - **Adult:** consult product literature

**Dosing Information**

**Solution for infusion**

- **ELECTROLYTES:** May contain Sodium
- **Portrazza (Eli Lilly and Company Ltd)**
  - **Necitumumab 16 mg per 1 ml** Portrazza 800mg/50ml concentrate for solution for infusion vials | 1 vial | £1,450.00 (Hospital only)

**BNF 78**

8

Immune system and malignant disease

www.getintopharma.com
Infusion-related reactions  Manufacturer advises that patients with mild or moderate infusion reactions may continue treatment with close monitoring and use of premedication according to local guidelines; discontinue treatment if severe infusion reactions occur.

- CONCEPTION AND CONTRACEPTION  Manufacturer advises effective contraception required during treatment and for at least 5 months after treatment in women of childbearing potential.
- PREGNANCY  Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- BREAST FEEDING  Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT  Manufacturer advises moderate to severe impairment (limited information available).
- MONITORING REQUIREMENTS  Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions, cardiac and pulmonary reactions, and electrolyte disturbances before and periodically during treatment. Patients should be monitored for adverse reactions for at least 5 months after the last dose.
- DIRECTIONS FOR ADMINISTRATION  Manufacturer advises for intermittent intravenous infusion, give undiluted or dilute to a concentration of not less than 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 or 60 minutes (depending on dose—consult product literature) through an in-line filter (pore size 0.2–1.2 micron).
- HANDLING AND STORAGE  Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.
- PATIENT AND CARER ADVICE  Patients should be provided with a patient alert card with each prescription.
- NATIONAL FUNDING/ACCESS DECISIONS  

NICE decisions

- Nivolumab for treating advanced (unresectable or metastatic) melanoma (February 2016) NICE TA384
Nivolumab (Opdivo®) as monotherapy is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults.

www.nice.org.uk/guidance/ta384

- Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016) NICE TA400
Nivolumab (Opdivo®) in combination with ipilimumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta400

- Nivolumab for adjuvant treatment of completely resected melanoma with lymph node involvement or metastatic disease (January 2019) NICE TA558
Nivolumab (Opdivo®) is recommended for use within the Cancer Drugs Fund as an option for the adjuvant treatment of completely resected melanoma in adults with lymph node involvement or metastatic disease. It is recommended only if the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta558

- Nivolumab for previously treated advanced renal cell carcinoma (updated November 2017) NICE TA417
Nivolumab (Opdivo®) is recommended, within its marketing authorisation, as an option for previously treated advanced renal cell carcinoma in adults, when the manufacturer provides nivolumab in line with the commercial access agreement with NHS England.

www.nice.org.uk/guidance/ta417

- Nivolumab for treating relapsed or refractory classical Hodgkin lymphoma (updated November 2017) NICE TA462
Nivolumab (Opdivo®) is recommended, within its marketing authorisation, as an option for treating relapsed or refractory classical Hodgkin lymphoma in adults after autologous stem cell transplant and treatment with brentuximab vedotin, when the manufacturer provides nivolumab in line with the commercial access agreement with NHS England.

www.nice.org.uk/guidance/ta462

- Nivolumab for previously treated squamous non-small-cell lung cancer (November 2017) NICE TA483
Nivolumab (Opdivo®) is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced or metastatic squamous non-small-cell lung cancer in adults after chemotherapy, only if:

- nivolumab is stopped at 2 years of uninterrupted treatment, or earlier in the event of disease progression, and
- the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta483

- Nivolumab for previously treated non-squamous non-small-cell lung cancer (November 2017) NICE TA484
Nivolumab (Opdivo®) is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced or metastatic non-squamous non-small-cell lung cancer in adults after chemotherapy, only if:

- their tumours are PD-L1 positive, and
- nivolumab is stopped at 2 years of uninterrupted treatment, or earlier in the event of disease progression, and
- the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta484

- Nivolumab for treating squamous cell carcinoma of the head and neck after platinum-based chemotherapy (November 2017) NICE TA490
Nivolumab (Opdivo®) is recommended for use within the Cancer Drugs Fund as an option for treating squamous cell carcinoma of the head and neck in adults whose disease has progressed on platinum-based chemotherapy, only if:

- the disease has progressed within 6 months of having chemotherapy, and
- nivolumab is stopped at 2 years of uninterrupted treatment, or earlier in the event of disease progression, and
- the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta490
arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta490

- Nivolumab for treating locally advanced unresectable or metastatic urothelial cancer after platinum-containing chemotherapy (July 2018) NICE TA530

Nivolumab (Opdivo®) is not recommended, within its marketing authorisation, for treating locally advanced unresectable or metastatic urothelial carcinoma in adults who have had platinum-containing therapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta530

Scottish Medicines Consortium (SMC) decisions

SMC No. 1144/16
The Scottish Medicines Consortium has advised (July 2016) that nivolumab (Opdivo®) is accepted for use within NHS Scotland for the treatment of locally advanced or metastatic squamous non-small cell lung cancer after prior chemotherapy in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1180/16
The Scottish Medicines Consortium has advised (October 2016) that nivolumab (Opdivo®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic squamous non-small cell lung cancer after prior chemotherapy in adults, subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1120/16
The Scottish Medicines Consortium has advised (August 2016) that nivolumab (Opdivo®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1187/16
The Scottish Medicines Consortium has advised (November 2016) that nivolumab (Opdivo®) is accepted for restricted use within NHS Scotland in combination with ipilimumab for the first-line treatment of advanced (unresectable or metastatic) melanoma in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2112
The Scottish Medicines Consortium has advised (December 2018) that nivolumab (Opdivo®) is accepted for use within NHS Scotland as monotherapy for the adjuvant treatment of adults with melanoma with involvement of lymph nodes or metastatic disease who have undergone complete resection. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1188/16
The Scottish Medicines Consortium has advised (June 2017) that nivolumab (Opdivo®) is accepted for use within NHS Scotland as monotherapy for treating adults with advanced uveal melanoma progressing after prior therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1240/17
The Scottish Medicines Consortium has advised (July 2017) that nivolumab (Opdivo®) is accepted for use within NHS Scotland for the treatment of patients with relapsed or refractory classical Hodgkin lymphoma after autologous stem cell transplant and treatment with brentuximab vedotin. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1261/17
The Scottish Medicines Consortium has advised (September 2017) that nivolumab (Opdivo®) is accepted for restricted use within NHS Scotland as monotherapy, for the treatment of squamous cell cancer of the head and neck in adults progressing on or after platinum-based therapy. Treatment with nivolumab is subject to a two year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1285/18
The Scottish Medicines Consortium has advised (January 2018) that nivolumab (Opdivo®) is not recommended for use within NHS Scotland as monotherapy for the treatment of locally advanced unresectable or metastatic urothelial carcinoma in adults after failure of prior platinum-containing therapy, as the economic case was not demonstrated.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

CAUTIONARY AND ADVISORY LABELS

3 ELECTROLYTES: May contain Sodium

Opdivo (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼

Nivolumab 10 mg per 1 ml

Opdivo 40mg/4ml concentrate for solution for infusion vials | 1 vial (£633.00 (Hospital only)

Opdivo 100mg/10ml concentrate for solution for infusion vials | 1 vial (£11.097.00 (Hospital only)

Opdivo 240mg/24ml concentrate for solution for infusion vials | 1 vial (£32.633.00 (Hospital only)

Obinutuzumab

- INDICATIONS AND DOSE

Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuccessful due to co-morbidities

Treatment of previously untreated advanced follicular lymphoma | Treatment of follicular lymphoma in patients who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen

- BY INTRAVENOUS INFUSION

Adult: (consult product literature or local protocols)

- CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

For obinutuzumab contra-indications, consult product literature.

- CAUTIONS

CAUTIONS, FURTHER INFORMATION

For full details on the cautions of obinutuzumab, consult product literature.

- Hepatitis B infection and reactivation

Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking obinutuzumab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and
Immune system and malignant disease

Obinutuzumab for untreated advanced follicular lymphoma

Obinutuzumab with bendamustine for treating follicular lymphoma

Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015) NICE TA343

Olaratumab

**Drug action**

Olaratumab is a monoclonal antibody that binds to platelet-derived growth factor receptor alpha to inhibit tumour growth.

**Indications and dose**

Advanced soft tissue sarcoma (in combination with doxorubicin) in patients that are not amenable to curative treatment with surgery or radiotherapy, and who have not been previously treated with doxorubicin (specialist use only)

- By intravenous infusion

- Adult: 15 mg/kg once daily on days 1 and 8 of a 3-week cycle, for up to 8 cycles, patients whose disease has not progressed after combination therapy may continue with olaratumab monotherapy, for dose adjustments due to side-effects and infusion-related reactions—consult product literature

**Important safety information**

MHRA/CHM advice: Lartruvo® (Olaratumab): No new patients to be prescribed due to study showing no clinical benefit (February 2019)

Results from the clinical trial (ANNOUNCE) of olaratumab with doxorubicin in patients with advanced or metastatic soft tissue sarcoma showed no survival benefit compared with doxorubicin. No new patients should be prescribed Lartruvo®, but treatment may be continued in patients who experience clinical benefit while further assessment of study results is ongoing.

**Caution**

Patients should receive pre-medication to minimise the development of adverse reactions (consult product literature)

**Interactions**

- Appendix 1: monoclonal antibodies

**Side-effects**

- Common or very common

Arthralgia, diarrhoea, headache, infusion related reaction, lymphopenia, mucositis, muscle complaints, nausea, neutropenia, pain, vomiting
Panitumumab

02-Aug-2017

**Drug action** Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

**Indications and dose** Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy): Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens)

- By intravenous infusion
  - Adult: consult product literature

**Important safety information**

**MHRA/CHM advice: Severe skin reactions**

Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

**MHRA/CHM advice: Epidermal growth factor receptor (EGFR) inhibitors: serious cases of keratitis and ulcerative keratitis (May 2012)**

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib, and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

**Contra-indications** Interstitial pulmonary disease - the combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant RAS metastatic colorectal cancer or for whom RAS status is unknown.

**Caution** History of keratitis - history of severe dry eye - history of ulcerative keratitis - pulmonary disease - discontinue if interstitial lung disease develops - risk factors for keratitis - risk factors for severe dry eye - risk factors for ulcerative keratitis (including contact lens use).

**Interactions** → Appendix I: monoclonal antibodies
Antibody responsive malignancy

- **SIDE-EFFECTS**
  - **Common or very common** Alopecia - anaemia - anxiety - appetite decreased - asthenia - chest pain - chills - constipation - cough - dehydration - diarrhoea - dizziness - dry eye - dry mouth - dyspnoea - electrolyte imbalance - embolism and thrombosis - eye discomfort - eye disorders - eye inflammation - fever - flushing - gastrointestinal discomfort - gastrooesophageal reflux disease - haemorrhage - hair changes - headache - hyperglycaemia - hyperhidrosis - hypersensitivity (may be delayed) - hypertension - hypotension - increased risk of infection - insomnia - leucopenia - mucositis - nail disorders - nausea - oral disorders - pain - peripheral oedema - skin reactions - skin ulcer - tachycardia - vomiting - weight decreased
  - **Uncommon** Angioedema - cyanosis - infusion related reaction - nasal dryness - onycholysis - respiratory disorders
  - **Rare or very rare** Anaphylactic reaction - severe cutaneous adverse reactions (SCARs)
  - **INTERACTIONS**
    - Pembrolizumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with pembrolizumab versus the risk of possible organ transplant rejection for each patient.

- **PRE-TREATMENT SCREENING**
  - Evidence of non-mutated RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.

- **MONITORING REQUIREMENTS**
  - Monitor for hypomagnesaemia.
  - Monitor for hypocalcaemia.
  - Monitor for hypomagnesaemia.
  - Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Cetuximab, bevazcizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242
    - Panitumumab monotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.
    - www.nice.org.uk/guidance/TA242
  - **Cetuximab and panitumumab for previously untreated metastatic colorectal cancer (updated September 2017) NICE TA439
    - Panitumumab is recommended, within its marketing authorisation, as an option for previously untreated RAS wild-type metastatic colorectal cancer in adults in combination with:
      - 5-fluorouracil, folinic acid and oxaliplatin (FOLFOX), or
      - 5-fluorouracil, folinic acid and irinotecan (FOLFIRI).
    - This advice is contingent upon the manufacturer providing panitumumab with the discount agreed in the patient access scheme.
    - www.nice.org.uk/guidance/TA439

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for infusion**
  - **ELECTROLYTES**: May contain Sodium
    - **Vectibix (Amgen Ltd)**
      - **Panitumumab 20 mg per 1 ml** Vectibix 400mg/20ml concentrate for solution for infusion vials | 1 vial | £1,517.16 (Hospital only)
      - Vectibix 100mg/5ml concentrate for solution for infusion vials | 1 vial | £370.23 (Hospital only)

- **Pembrolizumab**
  - **DRUG ACTION** Pembrolizumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.
  - **INDICATIONS AND DOSE**
    - Melanoma (specialist use only) | Non-small cell lung cancer (specialist use only) | Urothelial carcinoma (specialist use only) | Classical Hodgkin lymphoma (specialist use only) | Head and neck squamous cell carcinoma (specialist use only)
      - By intravenous infusion
        - Adult: 200 mg every 3 weeks, for dose adjustments due to side-effects or infusion-related reactions—consult product literature

- **IMPORTANT SAFETY INFORMATION**
  - **MHRA/CHM ADVICE: PEMBROLIZUMAB (KEYTRUDA®): REPORTS OF ORGAN TRANSPLANT REJECTION (JULY 2017)**
    - A European review of worldwide data concluded that pembrolizumab may increase the risk of rejection in organ transplant recipients. The MHRA recommends considering the benefit of treatment with pembrolizumab versus the risk of possible organ transplant rejection for each patient.

  **CAUTIONS**
  - Patients may need pretreatment to minimise the development of adverse reactions (consult product literature)

  **INTERACTIONS**
  - Appendix 1: monoclonal antibodies

  **SIDE-EFFECTS**

  **Uncommon**

  **Rare or very rare**
  - Erythema nodosum - haemolytic anaemia - myasthenic syndrome - sarcoidosis

  **Frequency not known**
  - Solid organ transplant rejection

  **SIDE-EFFECTS, FURTHER INFORMATION**
  - Immune-related reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.

  **Infusion-related reactions**
  - Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions.

  **CONCEPTION AND CONTRACEPTION**
  - Manufacturer recommends effective contraception during treatment and for at least 4 months after treatment in women of childbearing potential.

  **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—no information available

  **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

  **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions.
Pembrolizumab for treating advanced melanoma after disease progression with ipilimumab (updated September 2017) NICE TA357

Pembrolizumab (Keytruda®) is recommended as an option for treating advanced (unresectable or metastatic) melanoma in adults only:

- after the disease has progressed with ipilimumab and, for BRAF V600 mutation-positive disease, a BRAF or MEK inhibitor, and
- the manufacturer provides pembrolizumab in line with the commercial access agreement with NHS England.

www.nice.org.uk/guidance/ta357

Pembrolizumab for advanced melanoma not previously treated with ipilimumab (updated September 2017) NICE TA356

Pembrolizumab (Keytruda®) is recommended as an option for treating advanced (unresectable or metastatic) melanoma that has not been previously treated with ipilimumab, in adults, only when the manufacturer provides pembrolizumab in line with the commercial access agreement with NHS England.

www.nice.org.uk/guidance/ta356

Pembrolizumab for adjuvant treatment of resected melanoma with high risk of recurrence (December 2018) NICE TA553

Pembrolizumab (Keytruda®) is recommended for use within the Cancer Drugs Fund as an option for the adjuvant treatment of stage III melanoma with lymph node involvement in adults who have had complete resection. It is recommended only if the conditions in the managed access agreement for pembrolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta553

Pembrolizumab for treating PD-L1-positive non-small-cell lung cancer after chemotherapy (updated September 2017) NICE TA428

Pembrolizumab (Keytruda®) is recommended as an option for treating locally advanced or metastatic PD-L1-positive non-small-cell lung cancer in adults who have had at least one chemotherapy (and targeted treatment if they have an epidermal growth factor receptor (EGFR)- or anaplastic lymphoma kinase (ALK)-positive tumour), only if:

- pembrolizumab is stopped at 2 years of uninterrupted treatment and no documented disease progression, and
- the manufacturer provides pembrolizumab in line with the commercial access agreement with NHS England. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they or their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta428

Pembrolizumab for untreated PD-L1-positive metastatic non-small-cell lung cancer (July 2018) NICE TA531

Pembrolizumab (Keytruda®) is recommended as an option for untreated PD-L1-positive metastatic non-small-cell lung cancer in adults whose tumours express PD-L1 (with at least a 50% tumour proportion score) and have no epidermal growth factor receptor- or anaplastic lymphoma kinase-positive mutations, only if:

- pembrolizumab is stopped at 2 years of uninterrupted treatment or earlier in the event of disease progression, and
- the manufacturer provides pembrolizumab according to the commercial access agreement.

www.nice.org.uk/guidance/ta531

Pembrolizumab with pemetrexed and platinum chemotherapy for untreated, metastatic, non-squamous non-small-cell lung cancer (January 2019) NICE TA557

Pembrolizumab (Keytruda®), with pemetrexed and platinum chemotherapy is recommended for use within the Cancer Drugs Fund, as an option for untreated, metastatic, non-squamous non-small-cell lung cancer in adults whose tumours have no epidermal growth factor receptor- or anaplastic lymphoma kinase-positive mutations. It is only recommended if:

- pembrolizumab is stopped at 2 years of uninterrupted treatment or earlier if disease progresses, and
- the manufacturer provides pembrolizumab according to the managed access agreement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta557

Pembrolizumab for treating locally advanced or metastatic urothelial carcinoma after platinum-containing chemotherapy (April 2018) NICE TA519

Pembrolizumab (Keytruda®) is recommended for use within the Cancer Drugs Fund as an option for treating locally advanced or metastatic urothelial carcinoma in adults who have had platinum-containing chemotherapy, only if:

- pembrolizumab is stopped at 2 years of uninterrupted treatment or earlier in the event of disease progression, and
- the conditions in the managed access agreement for pembrolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta519

Pembrolizumab for untreated PD-L1-positive locally advanced or metastatic urothelial cancer when cisplatin is unsuitable (updated July 2018) NICE TA522

Pembrolizumab (Keytruda®) is recommended for use within the Cancer Drugs Fund as an option for untreated locally advanced or metastatic urothelial carcinoma in adults when cisplatin-containing chemotherapy is unsuitable, only if:

- their tumours express PD-L1 with a combined positive score of 10 or more, and
- pembrolizumab is stopped at 2 years of uninterrupted treatment or earlier if the disease progresses, and
- the conditions of the managed access agreement for pembrolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta522

Pembrolizumab for treating relapsed or refractory classical Hodgkin lymphoma (September 2018) NICE TA540

Pembrolizumab (Keytruda®) is not recommended for treating relapsed or refractory classical Hodgkin lymphoma in adults who have had autologous stem cell transplant and brentuximab vedotin.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

Pembrolizumab for treating relapsed or refractory classical Hodgkin lymphoma (September 2018) NICE TA540
Pembrolizumab (Keytruda®) is recommended for use within the Cancer Drugs Fund as an option for treating relapsed or refractory classical Hodgkin lymphoma in adults who have not received at least one prior chemotherapy regimen, subject to:
- pembrolizumab is stopped after 2 years of treatment or earlier if the person has a stem cell transplant or the disease progresses, and
- the conditions in the managed access agreement for pembrolizumab are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

The Scottish Medicines Consortium (SMC) has advised (December 2016) that pembrolizumab (Keytruda®) is not recommended for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1087/15

Scottish Medicines Consortium (SMC) decisions
SMC No. 1086/15
The Scottish Medicines Consortium has advised (November 2015) that pembrolizumab (Keytruda®) is accepted for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1087/15
The Scottish Medicines Consortium has advised (January 2017) that pembrolizumab (Keytruda®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung carcinoma (NSCLC) in adults whose tumours express programmed death ligand 1 (PD-L1) and who have received at least one prior chemotherapy regimen, subject to a two-year clinical stopping rule. The advice is contingent upon the continuing availability of pembrolizumab at the price agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1239/17
The Scottish Medicines Consortium has advised (July 2017) that pembrolizumab (Keytruda®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of metastatic non-small cell lung carcinoma (NSCLC) in adults whose tumours express programmed death ligand 1 (PD-L1) with a ≥50% tumour proportion score with no epidermal growth factor receptor or anaplastic lymphoma kinase positive tumour mutations, subject to a two-year clinical stopping rule. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMCM217
The Scottish Medicines Consortium has advised (February 2019) that pembrolizumab (Keytruda®) is not recommended for use within NHS Scotland when used in combination with pemetrexed and platinum chemotherapy, for the first-line treatment of metastatic non-squamous non-small cell lung carcinoma in adults whose tumours have no epidermal growth factor receptor- or anaplastic lymphoma kinase-positive mutations, as the economic case was not demonstrated.

SMC No. 1291/18
The Scottish Medicines Consortium has advised (February 2018) that pembrolizumab (Keytruda®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of locally advanced or metastatic urothelial carcinoma in adults who have received prior platinum-containing chemotherapy. Treatment with pembrolizumab is subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1339/18
The Scottish Medicines Consortium has advised (September 2018) that pembrolizumab (Keytruda®) is not recommended for use within NHS Scotland as monotherapy, for the treatment of locally advanced or metastatic urothelial carcinoma in adults who are not eligible for cisplatin-containing chemotherapy and whose tumours express PD-L1 with a combined positive score (CPS) ≥10, as the economic case was not demonstrated.

SMC No. 1296/18
The Scottish Medicines Consortium has advised (March 2018) that pembrolizumab (Keytruda®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of adults with relapsed or refractory classical Hodgkin lymphoma who have failed autologous stem cell transplant and brentuximab vedotin, or who are transplant-ineligible and have failed brentuximab vedotin. Treatment with pembrolizumab is subject to a two-year clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

Medications should be stored in a cool, dry place or a refrigerator, as instructed by the manufacturer. The patient should be advised to store their medications in a way that is childproof. Where applicable, the information should be presented in a concise and consistent manner, with clear instructions for use and storage.

Keytruda® is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation.

Pertuzumab

Indications and dose
HER2-positive early stage breast cancer (in combination with trastuzumab and chemotherapy) | HER2-positive metastatic or locally recurrent unresectable breast cancer (in combination with trastuzumab and docetaxel) (specialist use only)
- by intravenous infusion
- Adult: consult product literature or local protocols

Caution
Conditions that could impair left ventricular function - history of congestive heart failure - impaired left ventricular function - prior anthracycline exposure - radiotherapy to the chest area - recent myocardial infarction - serious cardiac arrhythmia - uncontrolled hypertension

www.getintopharma.com
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta569

Scottish Medicines Consortium (SMC) decisions

SMC No. 897/13

The Scottish Medicines Consortium has advised (June 2017) that pertuzumab (Perjeta®) is not recommended for use within NHS Scotland for the treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in adults who have not received previous anti-HER2 therapy or chemotherapy as the economic case was not sufficient to gain acceptance.

SMC No. SMC2119

The Scottish Medicines Consortium has advised (December 2018) that pertuzumab (Perjeta®) is accepted for use within NHS Scotland in combination with trastuzumab and chemotherapy for the neoadjuvant treatment of adults with HER2-positive, locally advanced, inflammatory, or early stage breast cancer at high risk of recurrence. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2120

The Scottish Medicines Consortium has advised (January 2019) that pertuzumab (Perjeta®) is accepted for use within NHS Scotland in combination with trastuzumab and docetaxel, in adults with HER2-positive metastatic or locally recurrent unresectable breast cancer, who have not received previous anti-HER2 therapy or chemotherapy for their metastatic disease. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Perjeta (Roche Products Ltd)

Pertuzumab 30 mg per 1 ml

Perjeta 420mg/14ml concentrate for solution for infusion vials 1 vial £2,395.00 (Hospital only)

Ramucirumab

31-May-2016

Drug action

Ramucirumab is a human monoclonal antibody that binds to the vascular endothelial growth factor receptor-2 (VEGFR-2), inhibiting VEGF–induced angiogenesis.

Indications and dose

Treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma, in combination with paclitaxel, in patients with disease progression after prior platinum and fluoropyrimidine chemotherapy

By intravenous infusion

Adult: 8 mg/kg on days 1 and 15 of a 28 day cycle, dose to be administered prior to paclitaxel infusion, consult product literature for dose adjustments due to side-effects and infusion–related reactions continued
Treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma, as monotherapy, in patients with disease progression after prior platinum or fluoropyrimidine chemotherapy, and for whom treatment in combination with paclitaxel is not appropriate

- **BY INTRAVENOUS INFUSION**
  - Adult: 8 mg/kg every 2 weeks, consult product literature for dose adjustments due to side-effects and infusion-related reactions

Treatment of metastatic colorectal cancer, in combination with FOLFIRI (irinotecan, fluorouracil and folinic acid), in patients with disease progression on, or after, prior therapy with bevacizumab, oxaliplatin and a fluoropyrimidine

- **BY INTRAVENOUS INFUSION**
  - Adult: 8 mg/kg every 2 weeks, dose to be administered prior to FOLFIRI administration, consult product literature for dose adjustments due to side-effects and infusion-related reactions

Treatment of locally advanced or metastatic non-small cell lung cancer, in combination with docetaxel, in patients with disease progression after platinum-based chemotherapy

- **BY INTRAVENOUS INFUSION**
  - Adult: 10 mg/kg on day 1 of a 21 day cycle, dose to be administered prior to docetaxel infusion, consult product literature for dose adjustments due to side-effects and infusion-related reactions

- **CAUTIONS**
  - Elective surgery—discontinue treatment for at least 4 weeks prior to surgery.
  - Hypertension—must be controlled before initiation.
  - Impaired wound healing—discontinue treatment until wound fully healed.
  - Pretreatment is recommended to minimise the development of adverse reactions (consult product literature) - risk of bleeding

- **INTERACTIONS**
  - Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**
  - Common or very common
    - Asthenia
    - Diarrhoea
    - Electrolyte imbalance
    - Gastrointestinal discomfort
    - Gastrointestinal perforation
    - Haemorrhage
    - Hand and foot syndrome
    - Headache
    - Hepatic pain
    - Hypertension
    - Hypoalbuminaemia
    - Leucopenia
    - Mucositis
    - Neutropenia
    - Peripheral oedema
    - Proteinuria
    - Seizure
    - Stomatitis
    - Thrombocytopenia
  - Frequency not known
    - Arterial thrombosis
    - Back pain
    - Back spasms
    - Cardiac arrest
    - Cerebrovascular insufficiency
    - Chest discomfort
    - Chills
    - Dyspnoea
    - Flushing
    - Hypersensitivity
    - Hypotension
    - Hypoxia
    - Infusion related reaction
    - Myocardial infarction
    - Parasthesia
    - Respiratory disorders
    - Supraventricular tachycardia
  - Rare or individual
    - Cardiac arrest
    - Cerebrovascular insufficiency
    - Chills
    - Diaphoresis
    - Hypertension
    - Hypotension
    - Infusion related reaction
    - Hypertension
    - Hypoxia
    - Proteinuria
    - Seizure
    - Stomatitis

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Infusion-related hypersensitivity reactions have been reported with ramucirumab, particularly during or following the first or second infusion; if the patient experiences a grade 1 or 2 infusion-related reaction, the manufacturer advises to reduce rate of infusion by 50% and give premedication for all subsequent infusions—consult product literature. Manufacturer advises to permanently discontinue treatment in the event of a grade 3 or 4 infusion-related reaction.

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises effective contraception during treatment and for up to 3 months after treatment in women of childbearing potential.

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Manufacturer advises discontinue breast-feeding during treatment and for at least 3 months after treatment—no information available.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in severe cirrhosis, cirrhosis with hepatic encephalopathy, cirrhosis with clinically significant ascites, or hepatorenal syndrome (risk of progressive hepatic failure, no information available).

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor for signs of infusion-related hypersensitivity reactions; monitor blood pressure prior to each infusion; monitor for development or worsening of proteinuria during treatment—consult product literature; monitor blood counts and coagulation parameters in patients at risk of bleeding.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Cyramza®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and invert gently to mix. Do not exceed a rate of 25 mg/minute, and give over approximately 60 minutes via an infusion pump using a separate infusion line with a protein sparing 0.22 micron filter.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - For Cyramza®, each 10 mL vial contains sodium 17 mg (equivalent to Na+ 0.74 mmol).

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Ramucirumab for treating advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy (January 2016) NICE TA378
    - Ramucirumab alone or in combination with paclitaxel is not recommended for the treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy.
    - Patients whose treatment was started before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.
    - NICE decisions for locally advanced or metastatic non-small cell lung cancer (August 2016) NICE TA403
    - Ramucirumab for previously treated locally advanced or metastatic non-small-cell lung cancer

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **ELECTROLYTES**: May contain Sodium
  - **Cyramza®** (Eli Lilly and Company Ltd)
    - Ramucirumab 10 mg per 1 mL
      - Cyramza® 100mg/10ml concentrate for solution for infusion vials | 1 vial (£89.50 | Hospital only)
      - Cyramza® 500mg/50ml concentrate for solution for infusion vials | 1 vial (£9.50 | Hospital only)

**Rituximab**

- **INDICATIONS AND DOSE**
  - Rheumatoid arthritis (specialist use only)
  - **BY INTRAVENOUS INFUSION**
    - Adult: 1 g, then 1 g after 2 weeks, consult product literature for information on retreatment

www.getintopharma.com
Antibody responsive malignancy 883

Non-Hodgkin’s lymphoma (specialist use only) | Chronic lymphocytic leukaemia (specialist use only) | Granulomatosis with polyangiitis and microscopic polyangiitis (specialist use only)

- **BY INTRAVENOUS INFUSION**
- **Adult:** consult product literature.

Non-Hodgkin’s lymphoma (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
- **Adult:** consult product literature.

Pemphigus vulgaris (specialist use only)

- **BY INTRAVENOUS INFUSION**
- **Adult:** 1 g then 1 g after 2 weeks; maintenance 0.5 g at months 12 and 18, and then every 6 months thereafter if needed, consult product literature for the treatment of relapse.

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**
Severe infection

**SPECIFIC CONTRA-INDICATIONS**
- When used for pemphigus vulgaris, rheumatoid arthritis and granulomatosis with polyangiitis and microscopic polyangiitis: Severe heart failure, severe, uncontrolled heart disease.

**CONTRA-INDICATIONS, FURTHER INFORMATION**
For full details on contra-indications, consult product literature.

**CAUTIONS**

**GENERAL CAUTIONS**
History of cardiovascular disease; exacerbation of angina, arrhythmia, and heart failure have been reported - patients receiving cardiotoxic chemotherapy; exacerbation of angina, arrhythmia, and heart failure have been reported - pre-medication recommended to minimise adverse reactions (consult product literature) - predisposition to infection - transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion).

**SPECIFIC CAUTIONS**
- When used for pemphigus vulgaris, granulomatosis with polyangiitis and microscopic polyangiitis: Pneumocystis jirovecii pneumonia - consult product literature for prophylaxis requirements.

**CAUTIONS, FURTHER INFORMATION**
For full details on cautions, consult product literature or local treatment protocol.

Hepatitis B infection and reactivation
- Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking rituximab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

**INTERACTIONS**
- Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**
- **Common or very common**
  - Angioedema
  - Anxiety
  - Appetite decreased
  - Arrhythmias
  - Bone marrow disorders
  - Bursitis
  - Cancer pain
  - Cardiac disorder
  - Chest pain
  - Chills
  - Conjunctivitis
  - Cough aggravated
  - Dizziness
  - Dysphagia
  - Dyspnoea
  - Ear pain
  - Gastrointestinal discomfort
  - Gastrointestinal disorders
  - Hepatitis B
  - Hypercholesterolaemia
  - Hypglycaemia
  - Hyperhidrosis
  - Hypocalcaemia
  - Hypotension
  - Insomnia
  - Lacrimation disorder
  - Malaise
  - Migraine
  - Multi organ failure
  - Muscle tone increased
  - Myalgia
  - Nausea
  - Nerve disorders
  - Oedema
  - Oral disorders
  - Oropharyngeal pain
  - Osteoarthritis
  - Pain
  - Respiratory disorders
  - Sensation abnormal
  - Sepsis
  - Skin reactions
  - Throat irritation
  - Tinnitus
  - Vasodilation
  - Weight decreased

- **Uncommon**
  - Asthma
  - Coagulation disorder
  - Haemolytic anaemia
  - Heart failure
  - Hypoxia
  - Ischaemic heart disease
  - Lymphadenopathy
  - Taste altered

- **Rare or very rare**
  - Cytokine release syndrome
  - Facial paralysis
  - Hepatitis B reactivation
  - Renal failure
  - Stevens-Johnson syndrome
  - Toxic epidermal necrolysis
  - Transient hypertension
  - Vasculitis
  - Vision disorders

- **Frequency not known**
  - Hearing loss
  - Hypogammaglobulinaemia
  - Infective thrombosis
  - Irritability
  - Posterior reversible encephalopathy syndrome (PRES)
  - Psychiatric disorder
  - Seizure
  - Skin papilloma

**SIDE-EFFECTS, FURTHER INFORMATION**
Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

Progressive multifocal leuкоencephalopathy has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leuкоencephalopathy is suspected, suspend treatment if this has been excluded.

**CONCEPTION AND CONTRACEPTION**
Effective contraception (in both sexes) required during and for 12 months after treatment.

**PREGNANCY**
Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.

**BREAST FEEDING**
Avoid breast-feeding during and for 12 months after treatment.

**MONITORING REQUIREMENTS**
For full details on monitoring requirements consult product literature.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use: For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to 1–4 mg/mL and gently invert bag to avoid foaming; for further information, consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION**
Rituximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

**PATIENT AND CARER ADVICE**
Alert card Patients should be provided with a patient alert card with each infusion.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- **Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis** (March 2014) NICE TA308
- With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener’s] and microscopic polyangiitis), only if:
  - further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, or
  - cyclophosphamide is contra-indicated or not tolerated, or
  - the patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, or
  - the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months or
  - the patient has had uroepithelial malignancy.
Immune system and malignant disease

Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (August 2010) NICE TA195

With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with methotrexate, is recommended as an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.

www.nice.org.uk/guidance/ta195

Rituximab for the first-line treatment of stage III-IV follicular lymphoma (January 2012) NICE TA243

With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with:
- cyclophosphamide, vincristine and prednisolone (CVP);
- cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
- mitoxantrone, chlorambucil and prednisolone (MCP);
- cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon-alfa (CHVPi); or
- chlorambucil is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.

www.nice.org.uk/guidance/ta243

Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma (February 2008) NICE TA137

With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with chemotherapy, is recommended as an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma. Rituximab monotherapy, as maintenance therapy, is recommended as an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma in remission induced with chemotherapy (with or without rituximab). Rituximab monotherapy is recommended as an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma, when all alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy).

www.nice.org.uk/guidance/ta137

Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010) NICE TA193

With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for patients with relapsed or refractory chronic lymphocytic leukaemia except when the condition:
- is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), or
- has previously been treated with rituximab, unless it was in the context of a clinical trial, at a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide.

Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukaemia that has previously been treated with rituximab, unless rituximab has been given as specified above.

www.nice.org.uk/guidance/ta193

Rituximab for the first-line maintenance treatment of follicular non-Hodgkin’s lymphoma (June 2011) NICE TA226

With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab maintenance therapy is recommended as an option for the treatment of patients with follicular non-Hodgkin’s lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy.

www.nice.org.uk/guidance/ta226

Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009) NICE TA174

With intravenous use This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia.

www.nice.org.uk/guidance/ta174

Idelalisib for treating chronic lymphocytic leukaemia (October 2015) NICE TA359

Rituximab, in combination with idelalisib, is recommended as an option for treatment in adults:
- who have untreated chronic lymphocytic leukaemia or
- who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months and
- if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement.

Patients who are already receiving idelalisib should continue treatment until they or their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta359

Venetoclax with rituximab for previously treated chronic lymphocytic leukaemia (February 2019) NICE TA561

Venetoclax (Venclyxto®) with rituximab is recommended, within its marketing authorisation, as an option for treating chronic lymphocytic leukaemia in adults who have had at least 1 previous therapy. It is recommended only if the manufacturer provides it according to the commercial arrangement.

www.nice.org.uk/guidance/ta561

Scottish Medicines Consortium (SMC) decisions

SMC No. 894/13

With intravenous use The Scottish Medicines Consortium has advised (August 2013) that Rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide.

SMC No. 975/14

With subcutaneous use The Scottish Medicines Consortium has advised (June 2014) that subcutaneous rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in accordance with UK licensing, except in the maintenance setting, where use is restricted to patients who have responded to induction therapy with rituximab plus chemotherapy.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- MabThera (Roche Products Ltd)

Rituximab 119.66 mg per 1 ml MabThera 1400mg/11.7ml solution for injection vials | 1 vial (with SMC No. 894/13 agreement) 11,344.65 (Hospital only)
Solution for infusion

**EXCIPIENTS:** May contain Polysorbates  
**ELECTROLYTES:** May contain Sodium

- **Rituximab** (Roche Products Ltd)
  - **Rituximab 100 mg per 1 ml** MabThera 100mg/10ml concentrate for solution for infusion vials | 2 vial (£349.25)  
  - **Rituximab 500 mg/50ml** concentrate for solution for infusion vials | 1 vial (£873.15)  

- **Rixathon** (Sandoz Ltd) ▼
  - **Rituximab 10 mg per 1 ml** Rituxan 100mg/10ml concentrate for solution for infusion vials | 2 vial (£314.33, Hospital only)  
  - **Rituximab 500mg/50ml** concentrate for solution for infusion vials | 1 vial (£785.84, Hospital only)  
  - **Rituximab 100 mg per 1 ml** Truxima 100mg/10ml concentrate for solution for infusion vials | 2 vial (£314.33)  
  - **Truxima 500mg/50ml** concentrate for solution for infusion vials | 1 vial (£785.84)

**Siltuximab**

- **DRUG ACTION** Siltuximab is a monoclonal antibody that inhibits interleukin-6 receptor binding.

**INDICATIONS AND DOSE**

**Treatment of multicentric Castleman’s disease (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative**

- **BY INTRAVENOUS INFUSION**
  - Adult: 11 mg/kg every 3 weeks

**CAUTIONS**

- Patients at increased risk of gastrointestinal perforation—promptly investigate those presenting with symptoms suggestive of gastrointestinal perforation - severe infection—withdraw treatment until resolved - treat infection prior to treatment

- **CAUTIONS, FURTHER INFORMATION**

Consult product literature for further information about siltuximab cautions.

- **Hypersensitivity reactions** Infusion-related side-effects are reported commonly with siltuximab; resuscitation facilities should be available during treatment.

**INTERACTIONS** ▶ Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - hypersensitivity - hypertension - hypertriglyceridaemia - increased risk of infection - infusion related reaction - localised oedema - neutropenia - renal impairment - skin reactions - thrombocytopenia - weight increased

**SIDE-EFFECTS, FURTHER INFORMATION** Siltuximab therapy should be discontinued permanently in the event of a severe infusion-related reaction, anaphylaxis, a severe allergic reaction, or the occurrence of cytokine-release syndrome. Mild to moderate infusion-related reactions may improve by temporarily reducing the rate or stopping the infusion. When restarting treatment, a reduced infusion rate and the administration of antihistamines, paracetamol, and corticosteroids may be considered. Consider discontinuation of siltuximab if more than 2 doses are delayed due to treatment-related toxicities during the first 48 weeks—for full details consult product literature.

**CONCEPTION AND CONTRAINDICATIONS**

- **Women** of childbearing potential should use effective contraception during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information).

**MONITORING REQUIREMENTS**

- Monitor neutrophil and platelet count, and haemoglobin levels prior to each dose of siltuximab treatment for the first 12 months and thereafter prior to every third dosing cycle. Consider delaying treatment if required neutrophil, platelet, and haemoglobin levels not achieved—consult product literature for details.

- **Monitor for infection during treatment.**

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Sylvant®), give intermittently in Glucose 5%. Allow vials to reach room temperature over approximately 30 minutes, then reconstitute each 100 mg vial with 5.2 mL of water for injection, and each 400 mg vial with 20 mL of water for injection, to produce a 20 mg/mL solution. Gently swirl without shaking to dissolve. Further dilute to 250 mL with glucose 5% and gently mix. Use within 6 hours of dilution and give over 60 minutes using an administration set lined with polyvinyl chloride or polyurethane, through a low-protein binding in-line 0.2 micron filter.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
- **Powder for solution for infusion**
  - **Sylvant** (Janssen-Cilag Ltd) ▼
    - **Siltuximab 100 mg** Sylvant 100mg powder for concentrate for solution for infusion vials | 1 vial (£415.00, Hospital only)  
    - **Siltuximab 400 mg** Sylvant 400mg powder for concentrate for solution for infusion vials | 1 vial (£1,661.00, Hospital only)

---

**Trastuzumab**

**INDICATIONS AND DOSE**

**Treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (initiated by a specialist)** Treatment of metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate (in combination with paclitaxel) or docetaxel (initiated by a specialist) Treatment of metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab (in combination with an aromatase inhibitor) (initiated by a specialist)

- **BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**
  - **Adult:** (consult product literature) or local protocols

Monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an aromatase inhibitor and a taxane (initiated by a specialist)

- **BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**
  - **Adult:** (consult product literature or local protocols)

Treatment of metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer (in combination with capecitabine or fluorouracil and cisplatin) (initiated by a specialist)

- **BY INTRAVENOUS INFUSION**
  - **Adult:** (consult product literature or local protocols)

**CONTRA-INDICATIONS**

- Severe dyspnoea at rest

**CAUTIONS**

- Coronary artery disease - history of hypertension - symptomatic heart failure - uncontrolled arrhythmias

**INTERACTIONS** ▶ Appendix 1: monoclonal antibodies

---

www.getintopharma.com
**SIDE-EFFECTS**

- **Common or very common** Alopecia, anaemia, angioedema, anxiety, appetite decreased, arrhythmias, arthralgia, arthritis, asthenia, asthma, ataxia, breast abnormalities, cardiomyopathy, chest pain, chill, constipation, cough, cystitis, depression, diarrhoea, diziness, drowsiness, dry eye, dry mouth, dyspnoea, excessive tearing, eye inflammation, fever, gastrointestinal discomfort, haemorrhage, haemorrhoids, headache, heart failure, hepatic disorders, hyperhidrosis, hypersensitivity, hypotension, increased risk of infection, influenza like illness, infusion related reaction (may be delayed), insomnia, leucopenia, malaise, mucositis, muscle complaints, muscle tone increased, nail disorders, nausea, neutropenia, oedema, oral disorders, pain, palpitations, pancreatitis, paraesthesia, peripheral neuropathy, renal disorder, respiratory disorders, rhinorrhoea, sedation, skin reactions, speech altered, thinking abnormal, thrombocytopenia, tremor, vasodilation, vomiting, weight decreased
- **Uncommon** Deafness, pericardial effusion
- **Rare or very rare** Paresis
- **Frequency not known** Brain oedema, cancer progression, cardiogenic shock, glomerulonephritis, hyperkalaemia, hypoprotrombinaemia, hypothyroidism, pulmonary fibrosis (may be delayed), pulmonary oedema (may be delayed) - renal failure

**CONCEPTION AND CONCEPTION**

Manufacturer advises effective contraception in women of childbearing potential during and for 7 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**

Manufacturer advises avoid—

- oligohydramnios reported. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**

Avoid breast-feeding during treatment and for 7 months afterwards.

**MONITORING REQUIREMENTS**

- Cardiotoxicity Monitor cardiac function before and during treatment for details of monitoring and managing cardiotoxicity, consult product literature.

**DIRECTIONS FOR ADMINISTRATION**

- Resuscitation facilities should be available during administration of trastuzumab.

**PRESCRIBING AND DISPENSING INFORMATION**

When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab is not interchangeable with trastuzumab emtansine. Trastuzumab is a biosimilar medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002) NICE TA34

Trastuzumab in combination with paacltaxel is recommended as an alternative for patients who have received prior chemotherapy for HER2-positive metastatic breast cancer, in whom anthracycline treatment is inappropriate.

Trastuzumab monotherapy is recommended as an alternative for patients who have received prior chemotherapy for HER2-positive metastatic breast cancer, in whom anthracycline treatment is inappropriate. Trastuzumab monotherapy is recommended as an alternative for patients with tumours expressing HER2 scored at levels of 3+ who have received prior anthracycline treatment.

**Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006) NICE TA107**

Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable).

www.nice.org.uk/guidance/ta107

- Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257

Lapatinib or trastuzumab in combination with an aromatase inhibitor is not recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2). Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta257

- Pertuzumab with trastuzumab and docetaxel for treating HER2-positive breast cancer (March 2018) NICE TA509

Pertuzumab, in combination with trastuzumab and docetaxel, is recommended, within its marketing authorisation, for treating HER2-positive metastatic or locally recurrent unresectable breast cancer, in adults who have not had previous anti-HER2 therapy or chemotherapy for their metastatic disease, only if the manufacturer provides pertuzumab within the agreed commercial access arrangement.

www.nice.org.uk/guidance/ta509

- Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010) NICE TA208

Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2 positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:

- have not received treatment for metastatic disease and
- have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3.

www.nice.org.uk/guidance/ta208

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 928/13

The Scottish Medicines Consortium has advised (January 2014) that subcutaneous trastuzumab injection (Herceptin®) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab.

SMC No. 623/10

The Scottish Medicines Consortium has advised (October 2015) that trastuzumab solution for infusion (Herceptin®) is accepted for restricted use within NHS Scotland in combination with capecitabine or fluorouracil and cisplatin for the treatment of patients with HER2 positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction, who have not received prior anticaner treatment for their metastatic disease. It is restricted to patients with metastatic gastric cancer whose tumours have HER2 over-expression, as determined by an accurate and validated assay.

www.getintopharma.com
Trastuzumab emtansine

02-Aug-2017

DRUG ACTION

Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination (initiated by a specialist) Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have developed disease recurrence during or within 6 months of completing adjuvant therapy (initiated by a specialist)

BY INTRAVENOUS INFUSION

Adult: (consult product literature or local protocols)

CAUTIONS

Dyspnoea at rest—increased risk of pulmonary events - history of congestive heart failure - patients over 75 years - peripheral neuropathy (temporarily discontinue treatment—consult product literature) - recent history of myocardial infarction - recent history of unstable angina - risk of left ventricular dysfunction—consult product literature for specific risks with trastuzumab treatment - serious arrhythmias

INTERACTIONS

Appendix 1: monoclonal antibodies

SIDE-EFFECTS

Common or very common

Uncommon
Hepatic disorders - nodular regenerative hyperplasia - pneumonitis

CONCEPTION AND CONTRACEPTION

Effective contraception must be used during and for 6 months after stopping treatment in women and men.

PREGNANCY

Manufacturer advises avoid—oligohydramnios reported with trastuzumab. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Manufacturer advises avoid breast-feeding during and for 6 months after treatment.

HEPATIC IMPAIRMENT

Consult product literature for initiating treatment and discontinuation in cases of abnormal liver function tests.

Dose adjustments

Consult product literature for dose modification in cases of abnormal liver function tests.

RENAL IMPAIRMENT

No information available—manufacturer advises caution in severe impairment.

MONITORING REQUIREMENTS

Monitor hepatic function before each dose.

Monitor for signs and symptoms of neurotoxicity.

Monitor closely for infusion-related and hypersensitivity reactions.

Monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia).

Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction.

Monitor for dyspnoea, cough, fatigue and pulmonary infiltrates—discontinue if interstitial lung disease or pneumonitis confirmed (fatal cases reported).

DIRECTIONS FOR ADMINISTRATION

Resuscitation facilities should be available during administration of trastuzumab emtansine.

PRESCRIBING AND DISPENSING INFORMATION

When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are not interchangeable.

NATIONAL FUNDING/ACCESS DECISIONS

Trastuzumab emtansine for treating HER2-positive advanced breast cancer after trastuzumab and a taxane (updated November 2017) NICE TA458

Trastuzumab emtansine is recommended, within its marketing authorisation, as an option for treating human epidermal growth factor receptor 2 (HER2)-positive, unresectable, locally advanced or metastatic breast cancer in adults who previously received trastuzumab and a taxane, separately or in combination. Patients should have either received prior therapy for locally advanced or metastatic disease or developed disease recurrence during or within 6 months of completing adjuvant therapy.

Trastuzumab emtansine is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (April 2017) that trastuzumab emtansine (Kadcyla®) is accepted for use within NHS Scotland as monotherapy for the treatment of patients with human epidermal growth factor type 2 (HER2)-positive, unresectable locally advanced or metastatic breast cancer who previously received trastuzumab and a taxane, separately or in combination, and have either received prior therapy for locally advanced or metastatic disease or developed disease recurrence during or within six months of completing adjuvant therapy. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

www.getintopharma.com
2 Carcinoid syndrome

**ENZYME INHIBITORS**

**Telotristat ethyl**

**DRUG ACTION** Telotristat ethyl and its active metabolite inhibit L-tryptophan hydroxylases TPH-1 and TPH-2 which reduces the production of serotonin, thereby alleviating symptoms associated with carcinoid syndrome.

**INDICATIONS AND DOSE**

**Carcinoid syndrome diarrhoea (specialist use only)**

- **BY MOUTH**
  - Adult: 250 mg 3 times a day, review treatment if no response after 12 weeks

**SIDE-EFFECTS**

- Common or very common: Appetite decreased - constipation - fatigue - fever - flatulence - gastrointestinal discomfort - headache - peripheral oedema

**PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

**RENAL IMPAIRMENT** Manufacturer advises caution in mild-to-moderate impairment; avoid in severe impairment—no information available.

**MONITORING REQUIREMENTS** Manufacturer advises monitor liver function at initiation and during treatment as clinically indicated—discontinue if liver injury suspected.

**PATIENT AND CARER ADVICE** Manufacturer advises inform patients to report any symptoms of depression or decreased interest.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1237/18

The Scottish Medicines Consortium has advised (June 2018) that telotristat ethyl (Xermelo®) is accepted for restricted use within NHS Scotland for the treatment of carcinoid syndrome diarrhoea in adults who experience an average of four or more bowel movements a day. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

**MEDIUM FORMS**

- **Powder for solution for infusion**
  - **Kadcyla** (Roche Products Ltd)
    - Trastuzumab emtansine 100 mg Kadcyla 100mg powder for concentrate for solution for infusion vials | 1 vial £641.01
    - Trastuzumab emtansine 160 mg Kadcyla 160mg powder for concentrate for solution for infusion vials | 1 vial £2,625.62

**3 Cytotoxic responsive malignancy**

**Cytotoxic drugs**

**Overview**

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

**Cytotoxic drug handling guidelines**

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored
Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from: Department of Health PO Box 777 London SE1 6XH Fax: 01623 724524

It is also available from the Department of Health website (www.dh.gov.uk).

Safe systems for cytotoxic medicines

NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment.

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

Cytotoxic drugs: important safety information

Risk of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy.

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Cytotoxic drug doses

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should not be repeated except on the instructions of a specialist.

Cytotoxic drug side-effects

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers’ product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimes.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

Extravasation of intravenous drugs

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. See information on the prevention and management of extravasation injury.

Oral mucositis

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil p. 910, methotrexate p. 913, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil p. 910, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin’s lymphoma (especially if high grade and bulky disease), Burkitt’s lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 1121 should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine p. 912 or azathioprine p. 836 should be reduced if allopurinol needs to be given concomitantly. Febuxostat p. 1121 may also be used and should be started 2 days before cytotoxic therapy is initiated. Rasburicase p. 542, a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy. It rapidly reduces plasma-uric acid.
Cytotoxic responsive malignancy

Concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

**Bone-marrow suppression**

All cytotoxic drugs except vincristine sulfate p. 929 and bleomycin p. 919 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine p. 893, lomustine p. 897, and melphalan p. 897. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than 1.06 x 10^9/litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible.

Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice and NICE guidance.

**Alopecia**

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

**Thromboembolism**

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

**Cytotoxic drugs: effect on pregnancy and reproductive function**

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given before cytotoxic therapy begins; women of childbearing age should use effective contraception during and after treatment.

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency).

Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

**Cytotoxic drugs: nausea and vomiting**

Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to the individual's susceptibility to emetogenic stimuli.

- **Mildly emetogenic treatment**—fluorouracil, etoposide p. 923, methotrexate p. 913 (less than 100 mg/m^2, low dose in children), the vinca alkaloids, and abdominal radiotherapy.

- **Moderately emetogenic treatment**—the taxanes, doxorubicin hydrochloride p. 901, intermediate doses of cyclophosphamide p. 894, mitoxantrone p. 963, and high doses of methotrexate (0.1 – 1.2 g/m^2).

- **Highly emetogenic treatment**—cisplatin p. 921, dacarbazine p. 895, and high doses of cyclophosphamide.

**Prevention of acute symptoms**

For patients at low risk of emesis, pretreatment with dexamethasone p. 675 or lorazepam p. 339 may be used.

For patients at high risk of emesis, a 5HT3-receptor antagonist, usually given by mouth in combination with dexamethasone and the neurokinin receptor antagonist aprepitant p. 433 is effective.

**Prevention of delayed symptoms**

For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and 5HT3-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Rolapitant p. 434 and metoclopramide hydrochloride p. 432 are also licensed for delayed chemotherapy-induced nausea and vomiting.

**Prevention of anticipatory symptoms**

Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

**Treatment of cytotoxic-induced side-effects**

**Anthracycline side-effects**

**Anthracycline-induced cardiotoxicity**

The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

**Anthracycline extravasation**

Local guidelines for the management of extravasation should be followed or specialist advice sought.

See further information on the prevention and management of extravasation injury.

**Chemotherapy-induced mucositis and myelosuppression**

Folinic acid p. 941 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate p. 913 and thus speed recovery from methotrexate-induced mucositis or myelosuppression ("folinic acid rescue").

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim p. 574.

When folinic acid and fluorouracil p. 910 are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid p. 919 is used to increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.
The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

**Urothelial toxicity**

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 894 and ifosfamide p. 896; it is caused by the metabolite acrolein. Mesna p. 940 reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

**Anthracyclines and other cytotoxic antibiotics**

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be avoided because it may markedly increase toxicity. Daunorubicin p. 900, doxorubicin hydrochloride p. 901, epirubicin hydrochloride p. 902 and idarubicin hydrochloride p. 903 are anthracycline antibiotics. Mitoxantrone p. 903 is an anthracycline derivative.

Doxorubicin hydrochloride is available as both conventional and liposomal formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Conventional doxorubicin hydrochloride is used to treat the acute leukaemias, Hodgkin’s and non-Hodgkin’s lymphomas, paediatric malignancies, and some solid tumours including breast cancer.

Epirubicin hydrochloride is structurally related to doxorubicin hydrochloride and can be used to treat breast cancer.

Idarubicin hydrochloride has general properties similar to those of doxorubicin hydrochloride; it is mostly used in the treatment of haematological malignancies.

Daunorubicin also has general properties similar to those of doxorubicin hydrochloride.

Mitoxantrone is structurally related to doxorubicin hydrochloride.

Pimonidazole p. 904 is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established.

Bleomycin p. 919 is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin’s lymphoma.

Daunomycin is principally used to treat paediatric cancers. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin p. 919 can be given intravenously to treat gastro-intestinal and breast cancers, and by bladder instillation for superficial bladder tumours. It causes delayed bone marrow toxicity.

**Vinca alkaloids**

The vinca alkaloids, vinblastine sulfate p. 929, vincristine sulfate p. 929, and vindesine sulfate p. 930, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours. Vinorelbine p. 931 is a semi-synthetic vinca alkaloid. See also, role of vinorelbine in the treatment of breast cancer.

**Antimetabolites**

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

---

**Alkylating drugs**

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication.

Cyclophosphamide is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver.

Ifosfamide is related to cyclophosphamide and is given intravenously.

Melphanal p. 897 is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphanal is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphanal is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities.

Lomustine p. 897 is a lipid-soluble nitrosourea and the drug is given at intervals of 4 to 6 weeks.

Carmustine p. 893 has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin’s lymphomas, and brain tumours. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

Estramustine phosphate p. 896 is a combination of an oestrogen and chlorimethine used predominantly in prostate cancer. It is given by mouth and has both an antimitotic effect and (by reducing testosterone concentration) a hormonal effect.

Mitobronitol is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies.

**ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS**

**Bendamustine hydrochloride**

**INDICATIONS AND DOSE**

Treatment of chronic lymphocytic leukaemia | Treatment of non-Hodgkin’s lymphoma | Treatment of multiple myeloma

- By intravenous infusion
- Adult: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

Recent clinical trials have shown increased mortality when bendamustine was used in combination treatments outside its approved indications. In addition, a recent European review of post-marketing data has suggested that the risk of opportunistic infections for all patients receiving bendamustine treatment may be greater than previously recognised.

The MHRA recommends monitoring patients for opportunistic infections as well as cardiac, neurological, and respiratory adverse events; known carriers of hepatitis B virus (HBV) should be monitored for signs and symptoms of active HBV infection. Patients should be advised to report promptly new signs of infection; consider discontinuing bendamustine if there are signs of opportunistic infections.
**CONTRA-INDICATIONS** Jaundice • low leucocyte count • low platelet count • major surgery less than 30 days before start of treatment • severe bone marrow suppression

**CAUTIONS** Cardiac disorders—monitor serum potassium and ECG

**INTERACTIONS** → Appendix 3: alkylating agents

**SIDE-EFFECTS**
- Common or very common  Alopecia • amenorrhoea • anaemia • anorexia • appetite decreased • arrhythmias • cardiac disorder • chills • constipation • decreased leucocytes • dehydration • diarrhoea • dizziness • fatigue • fever • haemorrhage • headache • hepatitis B reaction • hypersensitivity • hypertension • hypokalaemia • hypotension • increased risk of infection • insomnia • mucusitis • nausea • neutropenia • pain • palpitations • respiratory disorders • skin reactions • stomatitis • thrombocytopenia • tumour lysis syndrome • vomiting
- Uncommon  Bone marrow disorders • heart failure • myocardial infarction • neoplasms • pericardial effusion
- Rare or very rare  Anticholinergic syndrome • ataxia • circulatory collapse • drowsiness • haemorrhage • hyperhidrosis • infertility • multi organ failure • nervous system disorder • paraesthesia • peripheral neuropathy • sepsis • taste altered
- Frequency not known  Extravasation necrosis • hepatic failure • necrosis • renal failure • severe cutaneous adverse reactions (SCARs)

**SIDE-EFFECTS, FURTHER INFORMATION**

**Secondary malignancy** Use of bendamustine is associated with an increased incidence of acute leukaemias. **Infections** Serious and fatal infections are reported, including opportunistic infections such as Pneumocystis jiroveci pneumonia (PIP), varicella zoster virus (VZV) and cytomegalovirus (CMV)—manufacturer advises monitoring for respiratory signs and symptoms throughout treatment; patients should be advised to report new signs of infection, including fever or respiratory symptoms, promptly. Reactivation of hepatitis B is reported in patients who are chronic carriers of the virus—manufacturer advises monitoring for signs and symptoms of active hepatitis B during treatment and for several months after stopping treatment.

**CONCEPTION AND CONTRACEPTION** Effective contraception is required during treatment in men or women, and for 6 months after treatment in men. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY** Avoid (teratogenic and mutagenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

**Dose adjustments** Manufacturer advises reduce dose by 30% in moderate impairment.

**RENAL IMPAIRMENT** No information available on use in patients with creatinine clearance less than 10 mL/minute.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- *Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011)* NICE TA216  Bendamustine is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia (Binet stage B or C) in patients for whom fludarabine combination chemotherapy is not appropriate. www.nice.org.uk/guidance/TA216
- *Obinutuzumab with bendamustine for treating follicular lymphoma refractory to rituximab (August 2017)* NICE TA472  Bendamustine in combination with obinutuzumab followed by obinutuzumab maintenance, is recommended for use within the Cancer Drugs Fund as an option for treating adults with follicular lymphoma that did not respond or progressed during or up to 6 months after treatment with rituximab or a rituximab-containing regimen, only if the conditions in the managed access agreement for obinutuzumab are followed. www.nice.org.uk/guidance/TA472

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (April 2011) that bendamustine (Levact®) is accepted for use within NHS Scotland for first-line treatment of chronic lymphocytic leukaemia (Binet stage B or C) in patients for whom fludarabine combination chemotherapy is not appropriate.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- *Bendamustine hydrochloride (Non-proprietary)*
  - Bendamustine hydrochloride 25 mg Bendamustine 25mg powder for concentrate for solution for infusion vials | 1 vial £6.85–£65.98 | 5 vial Painter £312.53–£347.26 (Hospital only) | 20 vial Painter £1,241.14 (Hospital only)
  - Bendamustine hydrochloride 100 mg Bendamustine 100mg powder for concentrate for solution for infusion vials | 1 vial Painter £262.02 | 5 vial Painter £1,241.14–£1,379.04 (Hospital only)
  - Levact  (Napp Pharmaceuticals Ltd)  Bendamustine hydrochloride 25 mg Levact 25mg powder for concentrate for solution for infusion vials | 5 vial Painter £347.26 (Hospital only)
  - Levact 100mg powder for concentrate for solution for infusion vials | 5 vial Painter £1,379.04 (Hospital only)

**Busulfan** *(Busulphan)*

**INDICATIONS AND DOSE**

Chronic myeloid leukaemia, induction of remission
- **BY MOUTH**
  - Adult: 60 micrograms/kg daily (max. per dose 4 mg); maintenance 0.5–2 mg daily

**Conditioning treatment before haematopoietic progenitor cell transplantation**
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Adult: (consult local protocol)

**Conditioning treatment before haematopoietic progenitor cell transplantation in patients who are candidates for a reduced-intensity conditioning (RIC) regimen**
- **BY INTRAVENOUS INFUSION**
  - Adult: (consult local protocol)

**DOSES AT EXTREMES OF BODY-WEIGHT**
- Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 888.

**CAUTIONS** Avoid in Acute porphyrias p. 1058; high dose (antiepileptic prophylaxis required) • history of seizures (antiepileptic prophylaxis required) • ineffective once in blast crisis phase • previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) • previous radiation therapy (increased risk of hepatic veno-occlusive disease) • risk of second malignancy • three or
**INTERACTIONS** → Appendix 1: alkylating agents

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Alopecia, diarrhoea, hepatic disorders, nausea, respiratory disorders, sinusoidal obstruction syndrome, skin reactions, thrombocytopenia, vomiting
- **Uncommon** Seizure
- **Rare or very rare** Cataract, eye disorders

**SPECIFIC SIDE-EFFECTS**

- **Common or very common** With intravenous use: Anaemia, anxiety, appetite decreased, arrhythmia, arthralgia, ascites, asthenia, asthma, cardiomegaly, chest pain, chills, confusion, constipation, cough, depression, dizziness, dysphoria, dysuria, electrolyte imbalance, embolism and thrombosis, fever, gastrointestinal discomfort, gastrointestinal disorders, haemorrhage, headache, hiccups, hyperglycaemia, hypersensitivity, hypertension, hypoalbuninaemia, hypotension, increased risk of infection, insomnia, mucositis, myalgia, nervous system disorder, neutropenia, oedema, pain, pancytopenia, pericardial effusion, pericarditis, reactivation of infections, renal disorder, renal impairment, stomatitis, vasodilatation, weight increased
- **Uncommon** With oral use: Amenorrhoea (may be reversible), azoospermia, bone marrow disorders, cardiac tamponade, delayed puberty, hyperbilirubinaemia, infertility male, leucopenia, leukaemia, menopausal symptoms, oral disorders, ovarian and fallopian tube disorders, testicular atrophy
- **Rare or very rare** With oral use: Dry mouth, erythema nodosum, gynaecomastia, myasthenia gravis, radiation injury, Sjögren’s syndrome
- **Frequency not known** With intravenous use: Hypogonadism, ovarian failure, premature menopause, sepsis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Lung toxicity** Discontinue if lung toxicity develops.

**Secondary malignancy** Use of busulfan is associated with an increased incidence of secondary malignancy.

**CONCEPTION AND CONTRACEPTION** Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

**PREGNANCY** Avoid (teratogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**Monitoring** In patients with hepatic impairment, manufacturer advises regular liver function tests → consult product literature.

**MONITORING REQUIREMENTS**
- Monitor cardiac and liver function.
- Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia.

---

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**CAUTIONS** Avoid in Acute porphyrias p. 1058

**INTERACTIONS** → Appendix 1: alkylating agents

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Alopecia, anaemia, ataxia, constipation, diarrhoea, dizziness, headache, nausea, seizures, vomiting

**SPECIFIC SIDE-EFFECTS**

- **Common or very common** With intravenous use: Abdominal pain, abscess, anxiety, asthenia, chest pain, coma, confusion, conjunctival oedema, depression, diabetes mellitus, drowsiness, dysphagia, electrolyte imbalance, embolism and thrombosis, eye pain, faecal incontinence, fever, gait abnormal, haemorrhage, hallucination, healing impaired, hydrocephalus, hyperglycaemia, hypersensitivity, hypertension, hypotension, increased risk of infection, injury, insomnia, intracranial pressure increased, leucocytosis, memory loss, meningitis, oedema, pain, paralysis, paraesthesia, peripheral neuropathy, personality disorder, rash, sensation abnormal, sepsis, speech impairment, stupor, thinking abnormal, thrombocytopenia, tremor, urinary incontinence, vision disorders
- **Uncommon** With intravenous use: Acute leukaemia, appetite decreased, bone marrow depression, encephalopathy (with high doses), hepatotoxicity, myelodysplastic syndrome (following long term use) — ocular toxicity, respiratory disorders, retinal haemorrhage, stomatitis
- **Rare or very rare** With intravenous use: Gynaecomastia, nephrotoxicity (cumulative), peripheral vascular disease (with high doses)
- **Frequency not known** With intravenous use: Infertility, myalgia

**SIDE-EFFECTS, FURTHER INFORMATION**

**Pulmonary toxicity** Lung infiltration, pulmonary fibrosis, pneumonitis, and interstitial lung disease have been
reported, some of which have been fatal. These appear to be dose-related, cumulative, and may be delayed.

**Hepatotoxicity** Hepatotoxicity has been reported to occur with high doses, and may be delayed up to 60 days after administration; usually reversible.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**NATIONAL FUNDING/ACCESS DECISIONS**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

**IMPORTANT SAFETY INFORMATION**

**SIDE-EFFECTS, FURTHER INFORMATION** Secondary malignancy Use of chlorambucil is associated with an increased incidence of acute leukaemia, particularly with prolonged use.

**Skin reactions** Manufacturer advises assessing continued use if rash occurs—has been reported to progress to Stevens-Johnson syndrome and toxic epidermal necrolysis.

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor for signs and symptoms of toxicity.

**Dose adjustments** Manufacturer advises consider dose reduction in severe impairment—limited information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015) NICE TA343**

Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:

- bendamustine-based therapy is not suitable, and
- the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.

Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

**Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015) NICE TA344**

Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:

- the patient is ineligible for fludarabine-based therapy, and
- bendamustine is not suitable, and
- the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.

Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Implant**

- Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121

Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma only for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres.

[www.nice.org.uk/guidance/ta121](http://www.nice.org.uk/guidance/ta121)

**INDICATIONS AND DOSE**

**Some lymphomas and chronic leukaemias (used either alone or in combination therapy)**

- **BY MOUTH**
- **Adult:** (consult local protocol)

**IMMUNE SYSTEM AND MALIGNANT DISEASE**

**Chlorambucil**

**INDICATIONS AND DOSE**

**Some lymphomas and chronic leukaemias (used either alone or in combination therapy)**

- **BY MOUTH**
- **Adult:** (consult local protocol)

**IMPORANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

**CAUTIONS** Children with nephrotic syndrome (increased seizure risk) - history of epilepsy (increased seizure risk)

**INTERACTIONS**

- Appendix 1: alkylating agents

**SIDE-EFFECTS**

- **Common or very common** Anaemia - bone marrow disorders - diarrhoea - gastrointestinal disorder - leucopenia - nausea - neoplasms - neutropenia - oral ulceration - seizures - thrombocytopenia - vomiting

- **Uncommon** Skin reactions

- **Rare or very rare** Cystitis - fever - hepatic disorders - movement disorders - muscle twitching - peripheral neuropathy - respiratory disorders - severe cutaneous adverse reactions (SCARs) - tremor

- **Frequency not known** Amenorrhoea - azoospermia

**SIDE-EFFECTS, FURTHER INFORMATION** Secondary malignancy Use of chlorambucil is associated with an increased incidence of acute leukaemia, particularly with prolonged use.

**Skin reactions** Manufacturer advises assessing continued use if rash occurs—has been reported to progress to Stevens-Johnson syndrome and toxic epidermal necrolysis.

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**Cyclophosphamide**

**INDICATIONS AND DOSE**

**Rheumatoid arthritis with severe systemic manifestations**

- **BY MOUTH**
- **Adult:** 1–1.5 mg/kg daily

**Severe systemic rheumatoid arthritis Other connective tissue diseases (especially with active vasculitis)**

- **BY INTRAVENOUS INJECTION**
- **Adult:** 0.5–1 g every 2 weeks, then reduced to 0.5–1 g every month, frequency adjusted according to clinical response and haematological monitoring. To be given with prophylactic mesna

**Used, mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours**

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
- **Adult:** (consult local protocol)
Cytotoxic responsive malignancy

**BREAST FEEDING** Discontinue breast-feeding during and for 36 hours after stopping treatment.

**HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of decreased cyclophosphamide activation and increased risk of veno-occlusive liver disease).

**Dose adjustments** Manufacturer advises consider dose adjustment in severe impairment—consult product literature.

**RENAL IMPAIRMENT**

Dose adjustments Reduce dose if serum creatinine concentration greater than 120 micromol/litre.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (cyclophosphamide injection; Baxter) give via drip tubing in Glucose 5% or Sodium chloride 0.9%; reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion.

**Tablet**

- **Cyclophosphamide (Non-proprietary)**
  - Cyclophosphamide (as Cyclophosphamide monohydrate) 500 mg Cyclophosphamide 50mg tablets 100 tablet £39.00  
    - **Cytoxan** (Imported (United States))
      - Cyclophosphamide 25 mg Cytoxan 25mg tablets | 100 tablet £66.99

**Powder for solution for injection**

- **Cyclophosphamide (Non-proprietary)**
  - Cyclophosphamide (as Cyclophosphamide monohydrate) 500 mg Cyclophosphamide 50mg powder for solution for injection vials | 1 vial £34.12
    - **Cytoxan** (Imported (United States))
      - Cyclophosphamide 25 mg Cytoxan 25mg powder for solution for injection vials | 1 vial £34.12

Dacarbazine

- **INDICATIONS AND DOSE**
  - Metastatic melanoma | Soft-tissue sarcomas (combination therapy) | Hodgkin's disease (combination therapy)
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Adult: (consult local protocol)

**SIDE-EFFECTS**

- **Common or very common** Anaemia - appetite decreased - leucopenia - nausea - thrombocytopenia - vomiting
- **Uncommon** Alopecia - infection - influenza like illness - photosensitivity reaction - skin reactions
- **Rare or very rare** Agranulocytosis - confusion - diaphoresis - flushing - headache - hepatic disorders - lethargy - pancytopenia - paraesthesia - renal impairment - seizure - visual impairment

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY** Avoid (carcinogenic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Avoid in severe impairment.
Cytotoxic responsive malignancy

**Dose adjustments**
Dose reduction may be required in combined renal and hepatic impairment.

**RENAL IMPAIRMENT**
Avoid in severe impairment.

**Dose adjustments**
Dose reduction may be required in combined renal and hepatic impairment.

**PRESCRIBING AND DISPENSING INFORMATION**
Dacarbazine is a component of a commonly used combination for Hodgkin’s disease (ABVD—doxorubicin previously *Adriamycin*), bleomycin, vinblastine, and dacarbazine.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
CAUTIONARY AND ADVISORY LABELS 5, 23

- Estracyt (Pfizer Ltd)
- Estramustine phosphate (as Estramustine sodium phosphate) 140 mg Estracyt 140mg capsules | 100 capsule £171.28

**Ifosfamide**

**INDICATIONS AND DOSE**

- Malignant disease
  - BY INTRAVENOUS INFUSION
  - Adult: (consult local protocol)

**CONTRA-INDICATIONS**
Acute infection - urinary-tract infection - urinary-tract obstruction - urothelial damage

**CAUTIONS**
Avoid in Acute porphyrias p. 1058 - diabetes mellitus

**INTERACTIONS**
→ Appendix 1: alkylating agents

**SIDE-EFFECTS**
- Common or very common
  - Alopecia - appetite decreased - bone marrow disorders - haemorrhage - hepatic disorders - infection - leucopenia - nausea - reactivation of infection - renal impairment - thrombocytopenia - vomiting
- Uncommon
  - Cardiotoxicity - diarrhoea - hypertension - oral disorders
- Rare or very rare
  - Skin reactions
- Frequency not known

**SIDE-EFFECTS, FURTHER INFORMATION**
Urothelial toxicity
Mesna is routinely given with ifosfamide to reduce urothelial toxicity.

**Secondary malignancy**
Use of ifosfamide is associated with an increased incidence of acute leukaemia.

**Conception and Contraception**
Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**Pregnancy**
Avoid (teratogenic and carcinogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**Breast Feeding**
Discontinue breast-feeding.

---

**Estramustine phosphate**

**INDICATIONS AND DOSE**

- Prostate cancer
  - BY MOUTH
  - Adult: Initially 560–840 mg daily in divided doses; maintenance 140–1400 mg daily in divided doses

**CONTRA-INDICATIONS**
Peptic ulceration - severe cardiovascular disease - thromboembolic disorders

**CAUTIONS**
Cardiovascular disease - cerebrovascular disease - conditions which might be aggravated by fluid retention (such as epilepsy or migraine) - congestive heart failure - diabetes - hypercalcemia - hypertension

**INTERACTIONS**
→ Appendix 1: alkylating agents

**SIDE-EFFECTS**
- Common or very common
- Frequency not known
  - Allergic dermatitis - angioedema - confusion - depression - erectile dysfunction - hypertension - muscle weakness - myocardiopathy
- **CONCEPTION AND CONTRACEPTION**
  - Men should use effective contraceptive methods during treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution—monitor hepatic function; avoid in severe impairment.
- **RENAI IMPAIRMENT**
  - Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION**
  - Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication.
- **PATIENT AND CARER ADVICE**
  - Patients should be given advice on how to administer estramustine capsules.

---

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- Estracyt (Pfizer Ltd)
- Estramustine phosphate (as Estramustine sodium phosphate) 140 mg Estracyt 140mg capsules | 100 capsule £171.28

---

**Immune system and malignant disease**

**RENAL IMPAIRMENT**
Frequency not known

**SIDE-EFFECTS**

**INTERACTIONS**

**CAUTIONS**

**MEDICINAL FORMS**

- Adriamycin
  - Dose adjustments
  - Manufacturer advises caution
  - Men should use
  - confusion
  - thrombocytopenia
- **diabetes**
- **Cardiovascular disease**
- **Prostate cancer**
- **Hodgkin disease (ABVD)**
- **Secondary malignancy**
- **Urothelial toxicity**
- **Cytotoxic drugs**
**HEPATIC IMPAIRMENT**  Manufacturer advises avoid.

**RENAL IMPAIRMENT**  Avoid if serum creatinine concentration greater than 120 micromol/litre.

**MONITORING REQUIREMENTS**  Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi’s syndrome or diabetes insipidus if renal toxicity not treated promptly).

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Ifosfamide (Non-proprietary)
  - Ifosfamide 1 gram: £115.79-
  - Ifosfamide 2 gram: £228.09-

**SIDE-EFFECTS**

**CONTRA-INDICATIONS**

**Monitoring Requirements**

**Renal Impairment**

**Contraception and Contraception**

**Breast Feeding**

**Pregnancy**

**Conception and Contraception**

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- Melphalan (Non-proprietary)
  - Melphalan (as Melphalan hydrochloride) 50 mg: £137.37
- Melphalan 100 mg: £234.94
- Melphalan 500 mg: £228.09-

**Tablet**
- Melphalan (Non-proprietary)
  - Melphalan 2 mg: £45.38
- Melphalan 100 mg: £228.09-

**IMPORTANT SAFETY INFORMATION**

**Risks of Incorrect Dosing of Oral Anti-Cancer Medicines**

See Cytotoxic drugs p. 888.

**INTERACTIONS**

- Appendix 1: alkylating agents

**SIDE-EFFECTS**

**General Side-Effects**

- Common or very common
  - Alopecia
  - Anaemia
  - Bone marrow depression (delayed)
  - Diarrhoea
  - Nausea
  - Stomatitis
  - Thrombocytopenia
  - Vomiting

- Rare or very rare
  - Haemolytic anaemia
  - Hepatic disorders
  - Respiratory disorders
  - Skin reactions

**Specific Side-Effects**

- Common or very common
  - With oral use
    - Leucopenia
  - With parental use
    - Feeling hot
    - Myalgia
    - Myopathy
    - Paraesthesia

- Rare or very rare
  - Peripheral vascular disease

**Side-Effects, Further Information**

Secondary malignancy

Use of melphalan is associated with an increased incidence of acute leukaemias.

**Conception and Contraception**

Manufacturer advises adequate contraception during treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**Pregnancy**

Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**Breast Feeding**

Discontinues breast-feeding.

**Renal Impairment**

Dose adjustments

Reduce dose initially (consult product literature).

**Monitoring Requirements**

Monitor full blood count before and throughout treatment.

**Melphalan**

**Indications and Dose**

- Multiple myeloma
  - Adult: 150 micrograms/kg daily for 4 days, dose to be repeated every 6 weeks, dose may vary according to regimen
  - By intravenous injection, or by intravenous infusion
  - Adult: (consult product literature)

**Polycythaemia Vera**

- Adult: Initially 6–10 mg daily for 5–7 days, then reduced to 2–4 mg daily until satisfactory response, then reduced to 2–6 mg once weekly

**Localised malignant melanoma of the extremities**

**Localised soft-tissue sarcoma of the extremities**

- By regional arterial perfusion
  - Adult: (consult local protocol)

**Drug Action**

Lomustine is a lipid-soluble nitrosourea.

**Indications and Dose**

Hodgkin’s disease resistant to conventional therapy

- Malignant melanoma
  - Certain solid tumours

- By Mouth
  - Adult: 120–130 mg/m² every 6–8 weeks, dose is for when lomustine is used alone

**Hepatic Impairment**

Manufacturer advises avoid.

**Renal Impairment**

Avoid if serum creatinine concentration greater than 120 micromol/litre.

**Monitoring Requirements**

Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi’s syndrome or diabetes insipidus if renal toxicity not treated promptly).

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Ifosfamide (Non-proprietary)
  - Ifosfamide 1 gram: £115.79-
  - Ifosfamide 2 gram: £228.09-

**Side-Effects**

**Contra-Indications**

**Monitoring Requirements**

**Renal Impairment**

**Conception and Contraception**

**Breast Feeding**

**Pregnancy**

**Conception and Contraception**

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- Melphalan (Non-proprietary)
  - Melphalan (as Melphalan hydrochloride) 50 mg: £137.37
  - Melphalan powder and solvent for solution for injection vials: £228.09-

**Tablet**
- Melphalan (Non-proprietary)
  - Melphalan 2 mg: £45.38
  - Melphalan 100 mg: £228.09-
**Streptozocin**

**DRUG ACTION** Streptozocin is an antibiotic antineoplastic nitrosoare.

**INDICATIONS AND DOSE**
- Neuroendocrine tumours of pancreatic origin (specialist use only)
  - By intravenous infusion
  - Adult: (consult product literature)

**CAUTIONS**
- Antiemetic pre-medication recommended—avoid extravasation (risk of tissue necrosis) elderly—hyperhydration required (consult product literature)

**INTERACTIONS** → Appendix 1: streptozocin

**SIDE-EFFECTS**
- Common or very common: Acute kidney injury—diarrhoea—nausea—nephropathy—renal tubular injury—urinary disorder—urine abnormalities—vomiting
- Frequency not known: Confusion—depression—extravasation necrosis—fever—glucose tolerance impaired—hepatotoxicity—hypoalbuminaemia—lacthary

**CONCEPTION AND CONTRACEPTION**
- Manufacturer advises caution in women of childbearing potential that they are of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**
- Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**
- Manufacturer advises caution.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution.

**Dose adjustments**
- Manufacturer advises consider dose reduction.

**RENAL IMPAIRMENT**
- Manufacturer advises caution: evaluate benefit/risk ratio if eGFR 30—45 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

**Dose adjustments**
- Manufacturer advises reduce dose if eGFR 46—60 mL/minute/1.73 m²—consult product literature.

**MONITORING REQUIREMENTS**
- Manufacturer advises monitor renal function (plasma creatinine and eGFR derived from the MDRD formula) immediately before treatment initiation and 2 weeks after each course of therapy; proteinuria and serum electrolytes should also be monitored before treatment initiation and 2—4 weeks after the last cycle of treatment.

**HANDLING AND STORAGE**
- Manufacturer advises store in a refrigerator (2—8°C) and protect from light—consult product literature for storage conditions after reconstitution and dilution.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- Zanosar (intrapharm Laboratories Ltd)

| Streptozocin 1 gram | Zanosar 1g powder for concentrate for solution for infusion vials | 1 vial | £570.00 |

---

**Temozolomide**

**DRUG ACTION** Temozolomide is structurally related to dacarbazine.

**INDICATIONS AND DOSE**
- Newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy | Second-line treatment of malignant glioma in adults
  - BY MOUTH
  - Adult: (consult product literature)

**CAUTIONS**
- Pneumocystis jiroveci pneumonia—consult product literature for monitoring and prophylaxis requirements

**INTERACTIONS** → Appendix 1: alkylating agents

**SIDE-EFFECTS**

**Uncommon**

**Rare or very rare**
- Neoplasms—respiratory disorders—secondary malignancy—severe cutaneous adverse reactions (SCARs)

**CONCEPTION AND CONTRACEPTION**
- Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**
- Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**
- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in severe impairment (no information available).

**RENAL IMPAIRMENT**
- Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS**
- Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
Monitor for myelodysplastic syndrome.

Monitor for secondary malignancies.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    Temozolomide may be considered for the treatment of recurrent malignant glioma, which has not responded to first-line chemotherapy.  
    www.nice.org.uk/TA23
  - Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121
    Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1.  
    www.nice.org.uk/TA121

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Capsule**

    - Temozolomide 250 mg: Temozolomide 250mg capsules | 5 capsule (PO) £529.43 (Hospital only)

### Thiotepa

- **INDICATIONS AND DOSE**
  - Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy
    - **BY INTRAVENOUS INFUSION**
    - **Adults:** (consult local protocol)

- **CAUTIONS**
  - Avoid in Acute porphyrias p. 1058

- **INTERACTIONS**
  - Appendix 1: alkylating agents

- **SIDE-EFFECTS**
  - **Common or very common**
    - Alopecia
    - anaemia
    - anxiety
    - appetite decreased
    - arthralgia
    - asthenia
    - azoospermia
    - cataract
    - chills
    - cognitive disorder
    - confusion
    - conjunctivitis
    - constipation
    - cough
    - cystitis
    - delirium
    - diarrhoea
    - dizziness
    - dysuria
    - embolism
    - eunuchoidism
    - extrapyramidal symptoms
    - fever
    - gastrointestinal discomfort
    - gastrointestinal disorders
    - generalised oedema
    - graft versus host disease
    - haemorrhage
    - headache
    - hearing impairment
    - heart failure
    - hepatic disorders
    - hyperglycaemia
    - hypersensitivity
    - hypertension
    - hypopituitarism
    - increased risk of infection
    - infertility
    - intracranial aneurysm
    - intracranial haemorrhage
    - leucopenia
    - lymphoedema
    - menopausal symptoms
    - mucositis
    - multi organ failure
    - myalgia
    - nausea
    - neutropenia
    - otoxicity
    - pain
    - pancytopenia
    - paraesthesia
    - psychiatric disorder
    - pulmonary oedema
    - renal impairment
    - respiratory disorders
    - secondary malignancy
    - sepsis
    - sinusal obstruction syndrome
    - skin reactions
    - stomatitis
    - thrombocytopenia
    - toxic shock syndrome
    - vision blurred
    - vomiting
    - weight increased

- **Uncommon**
  - Cardiomyopathy
  - hallucination
  - hypoxia
  - myocarditis

- **Frequency not known**
  - Severe cutaneous adverse reactions (SCARs)

### Conception and Contraception

- Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **PREGNANCY**
  - Avoid (teratogenic and embryotoxic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) decisions**
    - SMC No. 790/12
      - The Scottish Medicines Consortium has advised (June 2012) that thiotepa (Temapina®) is not recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for infusion**
  - **Temapina** (Adienne Pharma & Biotech)
    - Thiotepa 15 mg: Tepadin 15mg powder for concentrate for solution for infusion vials | 1 vial (PO) £
    - Thiotepa 100 mg: Tepadin 100mg powder for concentrate for solution for infusion vials | 1 vial (PO) £

### Treosulfan

- **INDICATIONS AND DOSE**
  - Ovarian cancer
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAPERITONEAL INSTILLATION**
    - **Adult:** (consult product literature)

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

- **CAUTIONS**
  - Avoid in Acute porphyrias p. 1058

- **INTERACTIONS**
  - Appendix 1: alkylating agents

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Common or very common**
      - Alopecia
      - anaemia
      - bone marrow disorders
      - increased risk of infection
      - leucopenia
      - nausea
      - skin reactions
      - thrombocytopenia
      - vomiting
    - **Uncommon**
      - Neoplasms
        - treatment related secondary malignancy
    - **Rare or very rare**
      - Addison’s disease
      - cardiomyopathy
      - cystitis haemorrhagic
      - hypoglycaemia
      - influenza like illness
      - paraesthesia
      - respiratory disorders
      - scleroderma
      - sepsis

- **SPECIFIC SIDE-EFFECTS**
  - **Uncommon**
  - **With oral use** Stomatitis
Daunorubicin with cytarabine

The properties listed below are those particular to the combination only. For the properties of the components please consider, daunorubicin above, cytarabine p. 908.

- **INDICATIONS AND DOSE**
  - **Acute myelogenous leukaemia**
    - **BY INTRAVENOUS INFUSION**
      - Adult: (consult local protocol)
  - **Advanced AIDS-related Kaposis sarcoma (liposomal formulation only)**
    - **BY INTRAVENOUS INFUSION**
      - Adult: (consult product literature)

- **CONTRA-INDICATIONS**
  - Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracyclines · recent myocardial infarction · severe arrhythmia

- **CAUTIONS**
  - Caution in handling · irritant to tissues

- **INTERACTIONS**
  - Appendix 1: anthracyclines

- **SIDE-EFFECTS**
  - Abdominal pain · alopecia · amnorrhoea · anaemia · arrhythmias · ascites · ativoventricular block · azosperma · bone marrow disorders · cardiac inflammation · cardiomyopathy · chills · congestive heart failure · cyanosis · death · dehydration · diarrhoea · dyspnœa · extravasation necrosis · fever · flushing · gastrointestinal disorders · haemorrhage · hepatomegaly · hyperpyrexia · hyperuricaemia · hypoxia · infection · ischaemic heart disease · leucopenia · mucositis · myocardial infarction · nail discolouration · nausea · nephropathy · neutropenia · oedema · pain · paraesthesia · pleural effusion · radiation injuries · shock · skin reactions · stomatitis · thrombocytopenia · thrombophlebitis · urine red · venous sclerosis · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Cardiotoxicity is cumulative and may be irreversible, however responds to treatment if detected early.

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **PREGNANCY**
  - Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - For solution for infusion
  - Manufacturer advises caution. For powder for solution for infusion manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- **Dose adjustments**
  - Manufacturer advises dose reduction according to serum bilirubin concentration—consult product literature.

- **RENAL IMPAIRMENT**
  - Avoid in severe impairment.

- **Dose adjustments**
  - Reduce dose by 25% if serum creatinine 105–265 micromol/litre.
  - Reduce dose by 50% if serum creatinine greater than 265 micromol/litre.

- **MONITORING REQUIREMENTS**
  - Cardiac monitoring essential.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 25

  - **Treosulfan (Non-proprietary)**
    - Treosulfan 250 mg
      - 100 capsule Pack £65.20
  - **Powder for solution for injection**
    - **Treosulfan (Non-proprietary)**
      - Treosulfan 1 gram
        - 5 vial Pack £269.17
      - Treosulfan 5 gram
        - 5 vial Pack £1,040.17

- **ANTINEOPLASTIC DRUGS**

- **Daunorubicin**

  - **INDICATIONS AND DOSE**
    - Acute myelogenous leukaemia · Acute lymphocytic leukaemia
      - **BY INTRAVENOUS INFUSION**
        - Adult: (consult local protocol)
    - **Advanced AIDS-related Kaposis sarcoma (liposomal formulation only)**
      - **BY INTRAVENOUS INFUSION**
        - Adult: (consult product literature)

  - **CONTRA-INDICATIONS**
    - Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracyclines · recent myocardial infarction · severe arrhythmia

  - **CAUTIONS**
    - Caution in handling · irritant to tissues

  - **INTERACTIONS**
    - Appendix 1: anthracyclines

  - **SIDE-EFFECTS**
    - Abdominal pain · alopecia · amnorrhoea · anaemia · arrhythmias · ascites · ativoventricular block · azosperma · bone marrow disorders · cardiac inflammation · cardiomyopathy · chills · congestive heart failure · cyanosis · death · dehydration · diarrhoea · dyspnœa · extravasation necrosis · fever · flushing · gastrointestinal disorders · haemorrhage · hepatomegaly · hyperpyrexia · hyperuricaemia · hypoxia · infection · ischaemic heart disease · leucopenia · mucositis · myocardial infarction · nail discolouration · nausea · nephropathy · neutropenia · oedema · pain · paraesthesia · pleural effusion · radiation injuries · shock · skin reactions · stomatitis · thrombocytopenia · thrombophlebitis · urine red · venous sclerosis · vomiting

  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Cardiotoxicity is cumulative and may be irreversible, however responds to treatment if detected early.

  - **CONCEPTION AND CONTRACEPTION**
    - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

  - **PREGNANCY**
    - Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

  - **BREAST FEEDING**
    - Discontinue breast-feeding.

  - For solution for infusion
  - Manufacturer advises caution. For powder for solution for infusion manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

  - **Dose adjustments**
    - Manufacturer advises dose reduction according to serum bilirubin concentration—consult product literature.

- **RENAL IMPAIRMENT**
  - Avoid in severe impairment.

  - **Dose adjustments**
    - Reduce dose by 25% if serum creatinine 105–265 micromol/litre.
    - Reduce dose by 50% if serum creatinine greater than 265 micromol/litre.

- **MONITORING REQUIREMENTS**
  - Cardiac monitoring essential.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for infusion**
    - DaunoXome (Galen Ltd)
      - Daunorubicin (as Daunorubicin hydrochloride citrate liposomal pegylated) 2 mg per 1 ml
        - DaunoXome 50mg/25ml concentrate for solution for infusion vials | 1 vial (Pack) £250.00
    - **Powder for solution for infusion**
      - Daunorubicin (Non-proprietary)
        - Daunorubicin (as Daunorubicin hydrochloride)
          - 20 mg
            - Daunorubicin 20mg powder for solution for infusion vials | 10 vial (Pack) £715.00 (Hospital only)
Doxorubicin hydrochloride

INDICATIONS AND DOSE

Acute leukaemias | Hodgkin’s lymphoma | Non-Hodgkin’s lymphoma | Some solid tumours including breast cancer | Advanced soft-tissue sarcoma

- BY INTRAVENOUS INJECTION
  - Adults: (consult product literature)

Some papillary bladder tumours (bladder instillation) | Recurrent superficial bladder tumours (bladder instillation) | Transitional cell carcinoma (bladder instillation) | Carcinoma in situ (bladder instillation)

- BY INTRAVESICAL INSTILLATION
  - Adults: (consult product literature)

CAELYX®

For AIDS-related Kaposi’s sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease | Advanced ovarian cancer when platinum-based chemotherapy has failed | Progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation | Monotherapy for metastatic breast cancer in patients with increased cardiac risk

- BY INTRAVENOUS INFUSION
  - Adults: (consult product literature)

MYOCET®

For use with cyclophosphamide for metastatic breast cancer

- Adults: (consult product literature)

CONTRA-INDICATIONS | CAUTIONS | INTERACTIONS | SIDE-EFFECTS

- Common or very common
  - Alopecia | anaemia | anxiety | appetite decreased | arthralgias | asthenia | bone marrow depression | breast pain | cachexia | cardiovascular disorder | chest discomfort | chills | constipation | cough | decreased leucocytes | dehydration | depression | diarrhoea | dizziness | drowsiness | dry mouth | dysphagia | dyspnoea | dysuria | electrolyte imbalance | epistaxis | eye inflammation | fever | gastrointestinal discomfort | gastrointestinal disorders | headache | hyperhidrosis | hypersensitivity | hypertension | hyperthermia | hypotension | increased risk of infection | influenza like illness | infusion related reaction | insomnial | malaise | mucosal abnormalities | muscle complaints | muscle tone increased | muscle weakness | nail disorder | nausea | nerve disorders | neutropenia | oedema | oral disorders | pain | scrotal erythema | sensation abnormal | sepsis | skin reactions | skin ulcer | syncope | taste altered | thrombocytopenia | vasodilation | vision blurred | vomiting | weight decreased

- Uncommon
  - Confusion | embolism and thrombosis

- Rare or very rare
  - Secondary oral neoplasms | severe cutaneous adverse reactions (SCARs)

FURTHER INFORMATION

SIDE-EFFECTS, FURTHER INFORMATION

Extravasation can cause tissue necrosis.

Cardiomyopathy: Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m².

Liposomal formulations: Liposomal formulations of doxorubicin may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear. It may also occur with non-liposomal formulations.

Elevated bilirubin concentrations: Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose.

CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

PREGNANCY

Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

For liposomal formulation, manufacturer advises caution. For solution for injection or infusion, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

Dose adjustments: Manufacturer advises dose reduction according to bilirubin concentration.

RENAL IMPAIRMENT

Consult product literature in severe impairment.

MONITORING REQUIREMENTS

Patients should be assessed before treatment, by echocardiography. Cardiac monitoring during treatment may assist in determining safe dosage.

DIRECTIONS FOR ADMINISTRATION

Conventional doxorubicin is given by injection into a fast-running infusion, commonly at 21-day intervals.

PRESCRIBING AND DISPENSING INFORMATION

Doxorubicin is available as both conventional and liposomal formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389

Pegylated liposomal doxorubicin hydrochloride (PLDH) monotherapy or in combination with platinum, is recommended as an option for treating recurrent ovarian cancer.

PLDH, in combination with trabectedin, is not recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patients currently receiving PLDH in combination with trabectedin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA389

Olaratumab in combination with doxorubicin for treating advanced soft tissue sarcoma (August 2017) NICE TA465

Doxorubicin, in combination with olaratumab, is recommended for use within the Cancer Drugs Fund as an option for advanced soft tissue sarcoma in patients, only if:

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

- Doxorubicin hydrochloride (Non-proprietary)
  - Doxorubicin hydrochloride 2 mg per 1 ml
    - Doxorubicin 10mg/5ml solution for injection vials | 1 vial (POD) £18.54 (Hospital only)
    - Doxorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial (POD) £103.00 (Hospital only)
  - Doxorubicin 10mg/5ml solution for infusion vials | 1 vial (POD) £103.00 (Hospital only)
  - Doxorubicin 10mg/5ml solution for infusion vials | 1 vial (POD) £20.60 (Hospital only)
  - Doxorubicin 10mg/ml concentrate for solution for infusion vials | 1 vial (POD) £13.12 (Hospital only) 1 vial (POD) £13.57
  - Doxorubicin 10mg/5ml solution for infusion vials | 1 vial (POD) £20.60 (Hospital only)
  - Doxorubicin 50mg/25ml solution for infusion vials | 1 vial (POD) £39.10
  - Doxorubicin 50mg/25ml solution for infusion vials | 1 vial (POD) £36.03 Vial

- Caelyx (Janssen-Cilag Ltd)
  - Doxorubicin hydrochloride (as Doxorubicin hydrochloride liposomal pegylated) 2 mg per 1 ml
    - Caelyx 50mg/25ml concentrate for solution for infusion vials | 1 vial (POD) £12.49
  - Caelyx 20mg/10ml concentrate for solution for infusion vials | 1 vial (POD) £36.03 Vial

Powder and solvent for suspension for infusion

Electrolytes: May contain Sodium

- Myocet (Teva UK Ltd)
  - Doxorubicin hydrochloride liposomal pegylated 50 mg
    - Myocet 50mg powder and solvent for suspension for infusion vials | 2 vial (POD) £912.26 (Hospital only)

Solution for infusion

- Doxorubicin hydrochloride (Non-proprietary)
  - Doxorubicin hydrochloride 2 mg per 1 ml
    - Doxorubicin 100mg/100ml solution for infusion vials | 1 vial (POD) £142.00 (Hospital only)
    - Doxorubicin 20mg/10ml concentrate for solution for infusion vials | 1 vial (POD) £142.00 (Hospital only)
    - Doxorubicin 100mg/100ml concentrate for solution for infusion vials | 1 vial (POD) £142.00 (Hospital only)
    - Doxorubicin 200mg/100ml solution for infusion vials | 1 vial (POD) £142.00 (Hospital only)
    - Doxorubicin 200mg/100ml solution for infusion vials | 1 vial (POD) £391.40

- Caelyx (Janssen-Cilag Ltd)
  - Doxorubicin hydrochloride (as Doxorubicin hydrochloride liposomal pegylated) 2 mg per 1 ml
    - Caelyx 50mg/25ml concentrate for solution for infusion vials | 1 vial (POD) £12.49
  - Caelyx 20mg/10ml concentrate for solution for infusion vials | 1 vial (POD) £36.03 Vial

Indications and dose

Treatment of breast cancer | Treatment and prophylaxis of certain forms of superficial bladder cancer

- By intravenous infusion, or by intravesical instillation

Contra-Indications

Bladder inflammation or contraction (when used as a bladder instillation) - catheterisation difficulties (when used as a bladder instillation) - haematuria (when used as a bladder instillation) - invasive tumours penetrating the bladder (when used as a bladder instillation) - myocardopathy - previous treatment with maximum cumulative doses of epirubicin or other anthracycline - recent myocardial infarction - severe arthrythmia - severe myocardial insufficiency - unstable angina - urinary tract infections (when used as a bladder instillation)

Caution

Caution in handling—irritant to tissues

Interactions

Appendix 1: anthracyclines

Side-effects

General side-effects

- Common or very common Paraesthesia, urinary frequency increased

Specific side-effects

- Common or very common
  - With intravesical use Chemical cystitis
  - With parenteral use Alopecia, anaemia, appetite decreased, bone marrow depression, dehydration, diarrhoea - increased risk of infection, leucopenia, mucositis, nausea, neutropenia, oesophagitis, stomatitis, urine red - vasodilation, vomiting
  - Uncommon
  - With parenteral use Embolism and thrombosis - thrombocytopenia
  - Rare or very rare
  - With parenteral use Amenorrhoea, arthrythmias, asites, asthenia, azospermia, cardiac conduction disorders, cardiomyopathy, cardio toxicity, chill, congestive heart failure, dizziness, dyspnoea, fever, hepatomegaly, hyperuricaemia, malaise, neoplasms, oedema, pleural effusion, pulmonary oedema, skin reactions

Frequency not known

- With intravesical use Cystitis bacterial
- With parenteral use Eye inflammation, haemorrhage, hypoxia, nail discoulouration, photosensitivity reaction - radiation injuries - sepsis - shock

Side-effects, further information

Manufacturer advises extreme caution with cumulative doses exceeding 900 mg/m² — risk of congestive heart failure increased.

Conception and contraception

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

Pregnancy

Avoid (carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

Breast feeding

Discontinue breast-feeding.

Hepatic impairment

Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. Dose adjustments

Manufacturer advises dose reduction according to bilirubin level.

Renal impairment

Dose adjustments.

Dose reduction may be necessary in severe impairment.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

- Epirubicin hydrochloride (Non-proprietary)
  - Epirubicin hydrochloride 2 mg per 1 ml
    - Epirubicin 10mg/5ml solution for injection vials | 1 vial (POD) £17.38 - £20.18
    - Epirubicin 50mg/25ml solution for injection vials | 1 vial (POD) £100.88

- Pharmorubicin (Pfizer Ltd)
  - Epirubicin hydrochloride 2 mg per 1 ml
    - Pharmorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial (POD) £106.19 (Hospital only)
    - Pharmorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial (POD) £21.24 (Hospital only)

Solution for infusion

- Epirubicin hydrochloride (Non-proprietary)
  - Epirubicin hydrochloride 2 mg per 1 ml
    - Epirubicin 100mg/100ml solution for infusion vials | 1 vial (POD) £366.85
    - Epirubicin 100mg/50ml solution for infusion vials | 1 vial (POD) £201.76

- Pharmorubicin (Pfizer Ltd)
  - Epirubicin hydrochloride 2 mg per 1 ml
    - Pharmorubicin 200mg/100ml solution for infusion Cytosafe vials | 1 vial (POD) £386.16 (Hospital only)
### Idarubicin hydrochloride

**04-May-2017**

#### INDICATIONS AND DOSE

**Acute non-lymphocytic leukaemias monotherapy**
- **BY MOUTH**
  - Adult: 30 mg/m² daily for 3 days; maximum 400 mg/m² per course

**Acute non-lymphocytic leukaemia in combination therapy**
- **BY MOUTH**
  - Adult: 15–30 mg/m² daily for 3 days; maximum 400 mg/m² per course

**Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)—monotherapy**
- **BY MOUTH**
  - Adult: 45 mg/m² for 1 dose, repeat treatment every 3–4 weeks, alternatively 15 mg/m² daily for 3 consecutive days, repeat treatment every 3–4 weeks; maximum 400 mg/m² per course

**Acute leukaemias: Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)**
- **BY INTRAVENOUS INJECTION**
- Adult: (consult product literature)

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSE**

*See Cytotoxic drugs p. 888.*

- **CONTRA-INDICATIONS**
  - Previous treatment with maximum cumulative dose of idarubicin or other anthracycline
  - Recent myocardial infarction
  - Severe arrhythmias
  - Severe myocardial insufficiency

- **CAUTIONS**
  - Caution in handling—irritant to tissues

- **INTERACTIONS**
  - Appendix 1: anthracyclines

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common
      - Alopecia
      - Anaemia
      - Appetite decreased
      - Arthralgias
      - Cardiomyopathy
      - Chills
      - Congestive heart failure
      - Diarrhoea
      - Embolism and thrombosis
      - Fever
      - Haemorrhage
      - Headache
      - Increased risk of infection
      - Leucopenia
      - Nausea
      - Neutropenia
      - Skin reactions
      - Stomatitis
      - Thrombocytopenia
      - Urine red-vomiting
    - Uncommon
      - Dehydration
      - Gastrointestinal disorders
      - Hyperuricaemia
      - Leukaemia secondary
      - Myocardial infarction
      - Nail discolouration
      - Sepsis
      - Shock
      - Soft tissue necrosis
    - Rare or very rare
      - Cardiac conduction disorders
      - Cardiac inflammation
      - Flushing
      - Intracranial haemorrhage
    - Frequency not known
      - Bone marrow disorders
      - Tumour lysis syndrome

- **SPECIFIC SIDE-EFFECTS**
  - Common or very common
    - With intravenous use
      - Abdominal pain
      - Mucosal abnormalities
      - Parasthesia
      - Radiation injuries
    - With oral use
      - Gastrointestinal discomfort
      - Mucositis
      - Radiation skin sensitivity

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **PREGNANCY**
  - Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- **Dose adjustments**
  - Manufacturer advises consider dose reduction in mild to moderate impairment—consult product literature.

- **MUSCULOSKELETAL**
  - Arthralgias
  - Myalgias

- **RESPIRATORY**
  - Hypostatic pneumonia
  - Pulmonary oedema

- **SKIN**
  - Alopecia
  - Pruritus

- **THERAPEUTIC EFFECT**
  - Decreased

#### MEDICATION FORMS

**Capsule**
- **CAUTIONARY AND ADVISORY LABELS**
  - 25
    - **Zavedos (Pfizer Ltd)**
      - Idarubicin hydrochloride 5 mg Zavedos 5mg capsules | 1 capsule [PO] £1.47
      - Idarubicin hydrochloride 10 mg Zavedos 10mg capsules | 1 capsule [PO] £9.12

**Powder for solution for injection**
- **Zavedos (Pfizer Ltd)**
  - Idarubicin hydrochloride 5 mg Zavedos 5mg powder for solution for injection vials | 1 vial [PO] £87.36 (Hospital only)
  - Idarubicin hydrochloride 10 mg Zavedos 10mg powder for solution for injection vials | 1 vial [PO] £174.72 (Hospital only)

### Mitoxantrone

(Mitoxantrone)

#### INDICATIONS AND DOSE

**Metastatic breast cancer**
- Non-Hodgkin’s lymphoma
- Adult acute non-lymphocytic leukaemia
- Non-resectable primary hepatocellular carcinoma
- **BY INTRAVENOUS INFUSION**
- Adult: (consult local protocol)

#### CAUTIONS

- Intrathecal administration not recommended

#### INTERACTIONS

- Appendix 1: anthracyclines

#### SIDE-EFFECTS

**GENERAL SIDE-EFFECTS**
- Abdominal pain
- Alopecia
- Anxiety
- Appetite decreased
- Arthralgias
- Cardiomyopathy
- Chills
- Congestive heart failure
- Diarrhoea
- Embolism and thrombosis
- Fever
- Haemorrhage
- Headache
- Increased risk of infection
- Leucopenia
- Nausea
- Neutropenia
- Skin reactions
- Stomatitis
- Thrombocytopenia
- Urine red-vomiting

**COMMON OR VERY COMMON SIDE-EFFECTS**
- Alopecia
- Anaemia
- Appetite decreased
- Arthralgias
- Cardiomyopathy
- Chills
- Congestive heart failure
- Diarrhoea
- Embolism and thrombosis
- Fever
- Haemorrhage
- Headache
- Increased risk of infection
- Leucopenia
- Nausea
- Neutropenia
- Skin reactions
- Stomatitis
- Thrombocytopenia
- Urine red-vomiting

**RARE OR VERY RARE SIDE-EFFECTS**
- Cardiac conduction disorders
- Cardiac inflammation
- Flushing
- Intracranial haemorrhage

**FREQUENCY NOT KNOWN SIDE-EFFECTS**
- Bone marrow disorders
- Tumour lysis syndrome

#### MEDICATION FORMS

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- **Mitoxantrone (Non-proprietary)**
  - Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial [PFS] £121.85 (Hospital only) | 1 vial [PFS] £51.43
  - **Onkotrone (Baxter Healthcare Ltd)**
    - Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial [PFS] £103.57
    - Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial [PFS] £129.48

www.getintopharma.com
Pixantrone
07-Feb-2009

**INDICATIONS AND DOSE**
Treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas (monotherapy)

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS**
Active severe infection - risk factors for severe infection

**CAUTIONS**
Active cardiovascular disease - cardiac risk factors - caution in handling—irritant to tissues - concurrent radiotherapy to the mediastinal area - history of cardiovascular disease - previous radiotherapy to the mediastinal area - previous therapy with anthracyclines - previous therapy with anthracyclines

**INTERACTIONS**
Appendix 1: anthracyclines

**SIDE-EFFECTS**
- Common or very common
  - Uncommon
- Rare or very rare

**CONCEPTION AND CONTRACEPTION**
Ensure effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**
Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**
No information available—manufacturer advises caution.

**MONITORING REQUIREMENTS**
Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine.

Full blood count and cardiac function should be monitored throughout treatment.

**PATIENT AND CARER ADVICE**
Photosensitivity Photosensitivity is a theoretical risk and patients should be advised to follow sun protection strategies.

**NATIONAL FUNDING/ACCESS DECISIONS**
NICE decisions
- Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma (February 2014) NICE TA306

Pixantrone (Pixuvri®) monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma in patients:
- who have previously been treated with rituximab, and
- who are receiving third- or fourth-line treatment, and
- if the manufacturer provides pixantrone with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta306

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
ELECTROLYTES: May contain Sodium

- Pixuvri (Servier Laboratories Ltd)

Pixantrone (as Pixantrone dimaleate) 29 mg

| 1 vial | £553.50 |

**ANTINEOPLASTIC DRUGS**
Azacitidine
14-Feb-2019

**INDICATIONS AND DOSE**
Treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haematopoietic stem cell transplantation

- **BY SUBCUTANEOUS INJECTION**
  - Adult: (consult local protocol)

**CONTRA-INDICATIONS**
Advanced malignant hepatic tumour

**CAUTIONS**
History of severe congestive heart failure - unstable cardiac disease (consider cardiopulmonary assessment before and during treatment) - unstable pulmonary disease (consider cardiopulmonary assessment before and during treatment)

**INTERACTIONS**
Appendix 1: azacitidine

**SIDE-EFFECTS**
- Common or very common

- Uncommon
  - Hepatic coma - hepatic failure - pyoderma gangrenosum - renal tubular acidosis

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises effective contraception during and for 3 months after treatment in men or women.

**PREGNANCY**
Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in severe impairment (no information available)—monitor for adverse drug reactions.
Cytotoxic responsive malignancy

Stage III colon cancer, adjuvant following surgery (combination therapy)

- **BY MOUTH**
  - Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Metastatic colorectal cancer (monotherapy)

- **BY MOUTH**
  - Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

Metastatic colorectal cancer (combination therapy)

- **BY MOUTH**
  - Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

Advanced gastric cancer (first-line treatment in combination with a platinum based regimen)

- **BY MOUTH**
  - Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, alternatively 625 mg/m² twice daily given continuously, adjust dose according to tolerability—consult product literature

Locally advanced or metastatic breast cancer (second-line treatment as monotherapy after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated) Locally advanced or metastatic breast cancer (second-line treatment, in combination with docetaxel, where previous therapy included an anthracycline)

- **BY MOUTH**
  - Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 886.

- **CONTRA-INDICATIONS** Dihydropyrimidine dehydrogenase deficiency

- **CAUTIONS** Diabetes mellitus - diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption - electrolyte disturbances -history of angina pectoris - history of arrhythmias - history of significant cardiovascular disease - nervous system disease

- **INTERACTIONS** → Appendix 1: capecitabine

- **SIDE-EFFECTS**

Immune system and malignant disease

Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes’ C) colon cancer (April 2006) NICE TA100
Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes’ C) colon cancer.

www.nice.org.uk/TA100

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Tablet

Capecitabine (Non-proprietary)

- Capecitabine 150 mg tablets | 60 tablet (Roche Products Ltd) £40.02 DT = £30.00
- Capecitabine 300 mg tablets | 60 tablet (Roche Products Ltd) £76.04

- Capecitabine 500 mg tablets | 120 tablet (Roche Products Ltd) £240.00 DT + £225.72 | 120 tablet (Roche Products Ltd) £265.55 DT + £225.72 (Hospital only)

- Xeloda (Roche Products Ltd) £40.02 DT = £30.00
- Xeloda 500 mg tablets | 120 tablet (Roche Products Ltd) £265.55 DT + £225.72

Cladribine

Drug action
Cladribine is a nucleoside analogue that is cytotoxic particularly to lymphocytes and monocytes, inhibiting both DNA synthesis and repair. Its effect on B- and T-lymphocytes is thought to interrupt the cascade of immune events central to multiple sclerosis.

Indications and dose

Hairy cell leukaemia (specialist use only)
- By subcutaneous injection, or by intravenous infusion
  - Adult: (consult product literature or local protocols)

B-cell chronic lymphocytic leukaemia (specialist use only)
- By intravenous infusion
  - Adult: (consult product literature or local protocols)

Highly active relapsing-remitting multiple sclerosis (specialist use only)
- By mouth
  - Adult: (consult product literature or local protocols)

Important safety information

MHRA/ChM advice: Cladribine for leukaemia: reports of progressive multifocal encephalopathy (PML): stop treatment if PML suspected (December 2017)

The MHRA is aware of 3 confirmed cases of progressive multifocal encephalopathy (PML) that developed 6 months to several years after cladribine treatment for haematological conditions. An association between cladribine and prolonged lymphopenia has been reported.

PML should be considered in the differential diagnosis for patients with new or worsening neurological signs or symptoms. Patients should be monitored for signs and symptoms of new neurological dysfunction, and advised to seek urgent medical attention if they experience symptoms—stop treatment immediately if PML is suspected and ensure specialist investigation is received.

Contra-indications
- With oral use Active chronic hepatitis - active chronic tuberculosis - active malignancy - HIV infection - immunocompromised patients

Caution
General cautions
Acute infection - use irradiated blood only (haematology consultation advised)
Cytotoxic responsive malignancy 907

SPECIFIC CAUTIONS
- With intravenous use or subcutaneous use High tumour burden—consult product literature • symptomatic or severe bone marrow depression
- With oral use No prior exposure to varicella zoster virus • prior malignancy (consider if potential benefit outweighs risk)

CAUTIONS, FURTHER INFORMATION
- Immunosuppressive effect of cladribine
- With intravenous use or subcutaneous use Cladribine has potent and prolonged myelosuppressive and immunosuppressive effects. Patients treated with cladribine are more prone to serious bacterial, opportunistic infections, and viral infections, and prophylactic therapy should be considered in those at risk. Acute infections should be treated before initiating cladribine.
To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.
- Varicella zoster virus
- With oral use Manufacturer advises vaccination prior to initiation of therapy in patients who have no history of exposure to varicella zoster virus; delay treatment for 4–6 weeks after vaccination.

INTERACTIONS → Appendix 1: cladribine

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Common or very common Increased risk of infection

SPECIFIC SIDE-EFFECTS
- Common or very common
- With intravenous use Anaemia • anxiety • appetite decreased • arrhythmias • arthralgia • arthritis • ashenha • chest pain • chills • confusion • conjunctivitis • constipation • cough • diarrhoea • dizziness • dyspnoea • fever • flatulence • gastrointestinal discomfort • haemolytic anaemia • headache • hyperhidrosis • hypersensitivity • insomnia • joint disorders • malaise • muscle weakness • myalgia • myocardial ischaemia • nausea • neoplasms • oedema • pain • renal impairment • respiratory disorders • secondary malignancy • septic shock • skin reactions • thrombocytopenia • vomiting
- With oral use Alopecia • lymphopenia • rash
- With subcutaneous use Anaemia • anxiety • appetite decreased • arrhythmias • arthralgia • arthritis • ashenha • bone marrow disorders • chills • constipation • cough • diarrhoea • dizziness • dyspnoea • fever • gastrointestinal disorders • gastrointestinal pain • haemorrhage • headache • hyperhidrosis • hypotension • immunosuppression • insomnia • lymphopenia • malaise • miosis • myalgia • myocardial ischaemia • nausea • neutropenia • oedema • pain • respiratory disorders • secondary malignancy • sepsis • skin reactions • thrombocytopenia • vomiting

Uncommon
- With intravenous use Bone marrow disorders • hypereosinophilia • level of consciousness decreased • nerve disorders • neurotoxicity (with high doses) • paralysis • paraparesis • Stevens-Johnson syndrome • tumour lysis syndrome
- With subcutaneous use Ataxia • cachexia • confusion • drowsiness • eye inflammation • haemolytic anaemia • paraesthesia • polyneuropathy

Rare or very rare
- With intravenous use Heart failure
- With subcutaneous use Amyloidosis • cholelithiasis • depression • dysphagia • epilepsy • graft versus host disease • heart failure • hepatic failure • hypereosinophilia • pulmonary embolism • renal failure • severe cutaneous adverse reactions (SCARs) • speech disorder • tumour lysis syndrome

□ Frequency not known
- With oral use Malignancy

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment and for at least 6 months after the last dose in men and women of childbearing potential.
- With oral use Manufacturer advises exclude pregnancy before each treatment course; if using a hormonal contraceptive, a barrier method should also be used for at least 4 weeks after the last dose of each course.

PREGNANCY Manufacturer advises avoid—teratogenic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

- With intravenous use or subcutaneous use Manufacturer advises avoid during treatment and for 6 months after the last dose—no information available.
- With oral use Manufacturer advises avoid during treatment and for 1 week after the last dose—no information available.

HEPATIC IMPAIRMENT
- With intravenous use Manufacturer advises caution (limited information available).
- With subcutaneous use Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (no information available).
- With oral use Manufacturer advises avoid in moderate to severe impairment (no information available).

RENAL IMPAIRMENT
- With subcutaneous use Manufacturer advises caution in mild impairment; avoid in moderate-to-severe impairment.
- With intravenous use Manufacturer advises avoid in moderate-to-severe impairment—no information available.

PRE-TREATMENT SCREENING
- With oral use Manufacturer advises exclude HIV infection, active or latent tuberculosis and active or latent hepatitis before starting each treatment course—delay treatment until infection adequately treated.

MONITORING REQUIREMENTS
- Manufacturer advises monitor for malignancy—follow routine cancer screening guidelines.
- Manufacturer advises monitor for progressive multifocal leucoencephalopathy—perform a baseline MRI.
- Manufacturer advises monitor for haemolysis in patients who are or who become Coombs’ positive.
- Manufacturer advises haematological monitoring required—consult product literature.
- With intravenous use or subcutaneous use Renal and hepatic function should be monitored periodically as clinically indicated.

DIRECTIONS FOR ADMINISTRATION Litak® for subcutaneous use only—no dilution required; manufacturer advises patients may self-administer, after appropriate training. 
Leustat® for infusion use only.

HANDLING AND STORAGE
- Litak® Manufacturer advises store in a refrigerator (2–8°C).
- Leustat® Manufacturer advises store in a refrigerator (2–8°C).

PATIENT AND CARER ADVICE
Driving and skilled tasks
- With intravenous use or subcutaneous use Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.
Cytotoxic responsive malignancy

- NATIONAL FUNDING/ACCESS DECISIONS
  - NICE decisions
    - Cladribine tablets for treating relapsing–remitting multiple sclerosis (December 2017) NICE TA493
      - Cladribine tablets are recommended as an option for treating highly active multiple sclerosis in adults, only if the person has:
        - rapidly evolving severe relapsing–remitting multiple sclerosis, that is, at least 2 relapses in the previous year and at least 1 T1 gadolinium-enhancing lesion at baseline MRI, or
        - relapsing–remitting multiple sclerosis that has responded inadequately to treatment with disease-modifying therapy, defined as 1 relapse in the previous year and MRI evidence of disease activity.
      - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
      - www.nice.org.uk/guidance/ta493

- Scottish Medicines Consortium (SMC) decisions
  - The Scottish Medicines Consortium has advised (February 2018) that cladribine ([Mavenclad](#)) is accepted for restricted use within NHS Scotland for the treatment of adults with:
    - rapidly evolving severe relapsing–remitting multiple sclerosis: patients with two or more relapses in the prior year whether on treatment or not, and at least one T1 gadolinium-enhancing lesion, or
    - sub-optimal therapy relapsing–remitting multiple sclerosis: patients with one or more relapses in the previous year while on disease modifying therapy, and at least one T1 gadolinium-enhancing lesion or nine T2 lesions.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - Litak (Lipomed GmbH)
      - Cladribine 2 mg per 1 ml Lipak 10mg/5ml solution for injection vials | 1 vial (PO) £165.00 (hospital only)
  - Solution for infusion
    - Leustat (Janssen-Cilag Ltd)
      - Cladribine 1 mg per 1 ml Leustat 10mg/10ml solution for infusion vials | 1 vial (PO) £159.70
    - Tableau
      - Mavenclad (Merck Serono Ltd)
        - Cladribine 10 mg Mavenclad 10mg tablets | 1 tablet (PO) £188.97 | 6 tablet (PO) £1,283.46

- Clofarabine

  - INDICATIONS AND DOSE
    - Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens
      - By intravenous infusion
    - Adult 18-20 years: (consult local protocol)

  - CAUTIONS
    - Cardiac disease

  - INTERACTIONS
    - Appendix 1: clofarabine

  - SIDE-EFFECTS
    - Common or very common
      - Alopecia, anaemia, appetite decreased, consciousness impaired, diarrhoea, dysphagia, eye disorders, eye inflammation, eye stinging, fever, gastrointestinal discomfort, gastritis, haematological disorders, haemorrhagic conjunctivitis (consider prophylactic corticosteroid eye drops), hyperuricaemia, leucopenia, myalgia, oral disorders, renal impairment, skin reactions, thrombocytopenia, urinary retention, vasculitis, visual disorders, vomiting
    - Uncommon
      - Arthralgia, dysphonia, headache, increased risk of infection, myalgia, nerve disorders, pain, paralysis, pericarditis, paresis, skin ulcer, throat pain
    - Rare or very rare
      - Arrhythmias

  - FREQUENCY NOT KNOWN
    - Antibiotic associated colitis, gastrointestinal disorders, hypernatraemia, pancreatitis, severe cutaneous adverse reactions (SCARs)

- CONCEPTION AND CONTRACEPTION
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- PREGNANCY
  - Manufacturer advises avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- BREAST FEEDING
  - Discontinue breast-feeding.

- HEPATIC IMPAIRMENT
  - Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment—no information available.

- RENAL IMPAIRMENT
  - Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for infusion
    - ELECTROLYTES: May contain Sodium
      - Clofarabine (Non-proprietary)
        - Clofarabine 1 mg per 1 ml Clofarabine 20mg/20ml concentrate for solution for infusion vials | 1 vial (PO) £1,259.87–£1,326.18 (Hospital only)
      - Evoltra (Sanofi)
        - Clofarabine 1 mg per 1 ml Evoltra 20mg/20ml concentrate for solution for infusion vials | 1 vial (PO) £1,326.18 (Hospital only)

  - IMPORTANT SAFETY INFORMATION
    - Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

- Cytarabine

  - DRUG ACTION
    - Cytarabine acts by interfering with pyrimidine synthesis.

  - INDICATIONS AND DOSE
    - Induction of remission of acute myeloblastic leukaemia
      - By intravenous infusion, or by intravenous injection, or by subcutaneous injection
      - Adult: (consult local protocol)

  - Lymphomatous meningitis
    - By intrathecal injection
      - Adult: (consult local protocol)

  - INTERACTIONS
    - Appendix 1: cytarabine

  - SIDE-EFFECTS
    - Common or very common
      - Alopecia, anaemia, appetite decreased, consciousness impaired, diarrhoea, dysphagia, eye disorders, eye inflammation, eye stinging, fever, gastrointestinal discomfort, gastrointestinal disorders, haemorrhagic conjunctivitis (consider prophylactic corticosteroid eye drops), hyperuricaemia, leucopenia, myalgia, oral disorders, renal impairment, skin reactions, thrombocytopenia, urinary retention, vasculitis, visual disorders, vomiting
    - Uncommon
      - Arthralgia, dysphonia, headache, increased risk of infection, myalgia, nerve disorders, pain, paralysis, pericarditis, paresis, skin ulcer, throat pain
    - Rare or very rare
      - Arrhythmias
    - Frequency not known
      - Acute respiratory distress syndrome (ARDS), amenorrhea, ataxia, azoospermia, bone marrow disorders, cardiomyopathy, cerebellar dysfunction, chest...

**PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Dose adjustments Reduce dose—consult product literature.

**MONITORING REQUIREMENTS**

Haematological monitoring. Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.

**NATIONAL FUNDING/ACCESS DECISIONS**

**DEPOCYTE ®**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (July 2007) that liposomal cytarabine suspension (DepoCyte®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- **Cytarabine (Non-proprietary)**
  - Cytarabine 20 mg per 1 ml Cytarabine 100mg/5ml solution for injection Cytosafe vials | 5 vial | £20.48 (Hospital only)
  - Cytarabine 50mg/25ml solution for injection Cytosafe vials | 1 vial | £13.50
  - Cytarabine 100mg/5ml solution for injection vials | 5 vial | £30.00 (Hospital only) | 5 vial | £20.98
  - Cytarabine 100mg/5ml solution for injection vials | 1 vial | £13.50 (Hospital only)
  - Cytarabine 100 mg per 1 ml Cytarabine 1g/10ml solution for injection Cytosafe vials | 1 vial | £39.00 (Hospital only)
  - Cytarabine 1g/10ml solution for injection vials | 1 vial | £40.00-£49.78 (Hospital only) | 1 vial | £37.05-£39.00
  - Cytarabine 500mg/5ml solution for injection vials | 5 vial | £100.00 (Hospital only) | 5 vial | £89.78
  - Cytarabine 100mg/1ml solution for injection vials | 5 vial | £26.93
  - Cytarabine 2g/20ml solution for injection Cytosafe vials | 1 vial | £77.50
  - Cytarabine 2g/20ml solution for injection vials | 1 vial | £79.00-£88.92 (Hospital only) | 1 vial | £73.63-£77.50

**Suspension for injection**

- **DepoCyte** (Napp Pharmaceuticals Ltd)
  - Cytarabine liposomal pegylated 10 mg per 1 ml DepoCyte 50mg/5ml suspension for injection vials | 1 vial | £1,123.75 (Hospital only)

**Combinations available:** *Daunorubicin with cytarabine*, p. 900

---

**Decitabine**

**DRUG ACTION** Decitabine is a pyrimidine analogue.

**INDICATIONS AND DOSE**

**Treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years of age who are not candidates for standard induction chemotherapy**

- **BY INTRAVENOUS INFUSION**
  - Elderly: (consult local protocol)

**CAUTIONS** History of severe congestive heart failure - history of unstable cardiac disease

---

**Fludarabine phosphate**

**INDICATIONS AND DOSE**

Initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first line treatment in patients with sufficient bone-marrow reserves

- **BY MOUTH**
  - Adult: 40 mg/m² for 5 days every 28 days, usually given for 6 cycles
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

**CONTRA-INDICATIONS** Haemolytic anaemia

**CAUTIONS** Increased susceptibility to skin cancer - worsening of existing skin cancer

**CAUTIONS, FURTHER INFORMATION**

Immunosuppression Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

Co-trimoxazole is used to prevent pneumocystis infection.

**INTERACTIONS** → Appendix 1: fludarabine

**SIDE-EFFECTS**

**COMMON SIDE-EFFECTS**

- Common or very common Anaemia - diarrhoea - epistaxis - fever - headache - hypersensitivity - increased risk of infection - leucopenia - nausea - neutropenia - sepsis - stomatitis - thrombocytopenia - vomiting

- Uncommon Acute febrile neutrophilic dermatosis - pancytopenia

- Frequency not known Gastrointestinal disorders - interstitial lung disease

**CONCEPTION AND CONTRACEPTION** Men must avoid fathering a child during and for 3 months after treatment.

**PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

**RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

**ELECTROLYTES:** May contain Potassium, sodium

### Fluorouracil

**INDICATIONS AND DOSE**

Treatment of some solid tumours including gastrointestinal tract cancers and breast cancer \(^1\) in combination with folinic acid in advanced colorectal cancer

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION**
- **Adult** (consult product literature)

**CONTRA-INDICATIONS** Bone marrow depression (after treatment with radiotherapy or other antineoplastic agents) - complete or near complete absence of dihydouracil dehydrogenase activity (increased risk of severe, life-threatening, or fatal toxicity)—consult product literature - serious infections

**CAUTIONS** History of heart disease - partial dihydouracil dehydrogenase deficiency—consult product literature

**INTERACTIONS** → Appendix 1: fluorouracil

**SIDE-EFFECTS**

- **Common or very common** Agranulocytosis, alopecia, anaemia, anal inflammation, appetite decreased, asthenia, bone marrow disorders, bronchospasm, diarrhoea, gastrointestinal disorders, haemorrhage, hand and foot syndrome (long term use), healing impaired, immunosuppression, increased risk of infection, ischaemic heart disease, leucopenia, malaise, mucositis, nausea, neutropenia, skin reactions, stomatitis, thrombocytopenia, vomiting
- **Uncommon** Arrhythmias, cardiac inflammation, cardiogenic shock, cardiomyopathy congestive, dehydration, diziness, drowsiness, euphoric mood, eye disorders, eye inflammation, headache, heart failure, hepatic disorders, hypotension, movement disorders, myocardial infarction, nail discoloration, nail disorders, nerve disorders, ovulation disorder, parkinsonism, photosensitivity reaction, seizures, spermatogenesis disorder, vision disorders
- **Rare or very rare** Biliary sclerosis, cardiac arrest, cerebral ischaemia, cholecytitis, coma, confusion, embolism and thrombosis, encephalopathy, fever, muscle weakness, peripheral vascular disease, renal failure, seizure, speech impairment, sudden cardiac death
- **Frequency not known** Vein discolouration

---

**Fludarabine**

- **Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007)** NICE TA119
  - Fludarabine monotherapy is **not** recommended for the first-line treatment of chronic lymphocytic leukaemia.
  - www.nice.org.uk/TA119
- **Fludarabine for the treatment of B-cell chronic lymphocytic leukaemia (September 2001)** NICE TA29
  - Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first line chemotherapy, and who would otherwise have received combined chemotherapy of either:
    - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
    - cyclophosphamide, doxorubicin and prednisolone (CAP)
    - cyclophosphamide, vincristine and prednisolone (CVP)
  - Intraocular fludarabine should only be used when oral fludarabine is contra-indicated.
  - www.nice.org.uk/TA29
- **Scottish Medicines Consortium (SMC) decisions**
  - The Scottish Medicines Consortium has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

**Fludara**

- **Fludara (Sanofi)**
- **Fludara phosphate 10 mg Fludara 10mg tablets | 15 tablet | £302.48 (Hospital only) | 20 tablet | £403.31 (Hospital only)
- **Fludara phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial | £735.34 (Hospital only)
Gemcitabine

23-Jul-2018

● INDICATIONS AND DOSE

First-line treatment for locally advanced or metastatic non-small cell lung cancer (as monotherapy in elderly patients and in palliative treatment; otherwise in combination with cisplatin) | Treatment of locally advanced or metastatic pancreatic cancer | Treatment of advanced or metastatic bladder cancer (in combination with cisplatin) | Treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy (in combination with carboplatin) | Treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (in combination with paclitaxel)

▶ BY INTRAVENOUS INFUSION

▶ Adults: (consult local protocol)

● INTERACTIONS | Appendix 1: gemcitabine

● SIDE-EFFECTS

▶ Common or very common Alopecia - anaemia - appetite decreased - asthenia - back pain - bone marrow depression - chills - constipation - cough - diarrhoea - drowsiness - dyspnoea - fever - haematuria - headache - hyperhidrosis - influenza like illness - insomnia - leucopenia - myalgia - nausea - neutropenia - oedema - oral disorders - proteinuria - rhiinitis - skin reactions - thrombocytopenia - vomiting

▶ Uncommon Respiratory disorders

▶ Rare or very rare Capillary leak syndrome - hypotension - myocardial infarction - posterior reversible encephalopathy syndrome (PRES) - severe cutaneous adverse reactions (SCARs) - skin ulcer - thrombocytopenia

▶ Frequency not known Arrhythmias - coagulopathy - cyanosis - drug reaction with eosinophilia and systemic symptoms (DRESS) - fever - hypotension - infusional reactions - neutropenia - pericarditis - pyrexia - rash - tachycardia - urticaria

SIDE-EFFECTS, FURTHER INFORMATION Gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

● CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

● PREGNANCY Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

● BREAST FEEDING Discontinue breast-feeding.

● HEPATIC IMPAIRMENT Manufacturer advises caution

● RENAL IMPAIRMENT Manufacturer advises caution

● PRE-TREATMENT SCREENING Manufacturer advises caution

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

▶ Fluorouracil (Non-proprietary) Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 500mg/20ml solution for injection vials | 10 vial (PPO) £64.00 (Hospital only) Fluorouracil 250mg/10ml solution for injection vials | 5 vial (PPO) £24.00 (Hospital only) Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 1g/20ml solution for injection vials | 1 vial (PPO) £12.16-£12.80 Fluorouracil 500mg/10ml solution for injection vials | 1 vial (PPO) £6.08-£6.40 | 5 vial (PPO) £32.00 (Hospital only)

Solution for infusion

▶ Fluorouracil (Non-proprietary) Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 2.5g/100ml solution for infusion vials | 1 vial (PPO) £32.00 (Hospital only) | 1 vial (PPO) £32.00 Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 5g/100ml solution for infusion vials | 1 vial (PPO) £64.00 (Hospital only) | 1 vial (PPO) £64.00-£64.00 Fluorouracil 2.5g/50ml solution for infusion vials | 1 vial (PPO) £32.00 (Hospital only) | 1 vial (PPO) £32.00 (Hospital only)

www.getintopharma.com
Patients currently receiving gemcitabine in combination with carboplatin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA476

- Paclitaxel as albumin-bound nanoparticles with gemcitabine for untreated metastatic pancreatic cancer (September 2017)
  NICE TA476

Gemcitabine with paclitaxel as albumin-bound nanoparticles (nab-paclitaxel) is recommended as an option for untreated metastatic adenocarcinoma of the pancreas in adults, only if:
- other combination chemotherapies are unsuitable and they would otherwise have gemcitabine monotherapy, and
- the manufacturer provides nab-paclitaxel with the discount agreed in the patient access scheme.

Patients whose treatment with nab-paclitaxel was started before this guidance was published, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA476

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (December 2006) that gemcitabine (Gemzar®) is accepted for restricted use within NHS Scotland for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

### Mercaptopurine

(6-Mercaptopurine)

#### INDICATIONS AND DOSE

**Severe acute Crohn’s disease** | **Maintenance of remission of Crohn’s disease** | **Ulcerative colitis**

- **BY MOUTH**
  - Adult: 1–1.5 mg/kg daily, some patients may respond to lower doses

**Acute leukaemias** | **Chronic myeloid leukaemia**

- **BY MOUTH USING TABLETS**
  - Adult: Initially 2.5 mg/kg daily, adjusted according to response, alternatively initially 50–75 mg/m² daily, adjusted according to response

- **BY MOUTH USING ORAL SUSPENSION**
  - Adult: Initially 25–75 mg/m² daily, adjusted according to response

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

#### DOSE EQUIVALENT AND CONVERSION

- Mercaptopurine tablets and Xaluprine® oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations.

#### UNLICENSED USE

Not licensed for use in severe ulcerative colitis and Crohn’s disease.

### IMPORTANT SAFETY INFORMATION

#### SAFE PRACTICE

Mercaptopurine has been confused with mercaptamine; care must be taken to ensure the correct drug is prescribed and dispensed.

#### RISKS OF INCORRECT DOING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

#### CONTRA-INDICATIONS

Absent thiopurine methyltransferase activity

#### CAUTIONS

Reduced thiopurine methyltransferase activity

#### CAUTIONS, FURTHER INFORMATION

Thiopurine methyltransferase. The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, thioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

#### INTERACTIONS

→ Appendix 1: mercaptopurine

#### SIDE-EFFECTS

- **Common or very common** Anaemia - appetite decreased - bone marrow depression - diarrhoea - hepatic disorders - hepatotoxicity (more common at high doses) - leucopenia - nausea - oral disorders - thrombocytopenia - vomiting

- **Uncommon** Arthralgia - fever - increased risk of infection - neutropenia - pancreatitis - rash

- **Rare or very rare** Alopecia - face oedema - intestinal ulcer - neoplasms - oligozoospermia

- **Frequency not known** Photosensitivity reaction

#### CONCEPTION AND CONCEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

#### PREGNANCY

Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

#### BREAST FEEDING

Discontinue breast-feeding.
**Methotrexate**

**01-Feb-2019**

**DRUG ACTION** Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

**INDICATIONS AND DOSE**

**Severe Crohn’s disease**
- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 25 mg once weekly until remission induced; maintenance 15 mg once weekly

**Maintenance of remission of severe Crohn’s disease**
- **BY MOUTH**
  - Adult: 10–25 mg once weekly

**Moderate to severe active rheumatoid arthritis**
- **BY MOUTH**
  - Adult: 7.5 mg once weekly, adjusted according to response; maximum 20 mg per week

**Severe active rheumatoid arthritis**
- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 7.5 mg once weekly, then increased in steps of 2.5 mg once weekly, adjusted according to response; maximum 25 mg per week

**Neoplastic diseases**
- **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRATHecal INJECTION**
- Adult: (consult product literature)

**Severe psoriasis unresponsive to conventional therapy (specialist use only)**
- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 2.5–10 mg once weekly, then increased in steps of 2.5–5 mg, adjusted according to response, dose to be adjusted at intervals of at least 1 week; usual dose 7.5–15 mg once weekly, stop treatment if inadequate response after 3 months at the optimum dose; maximum 30 mg per week

**SIDE-EFFECTS**
- **Common or very common**
  - With intrathecal use: Nocrotising demyelinating leukoencephalopathy; neuropathy
  - With oral use: Anaemia; appetite decreased; diarrhoea; drowsiness; fatigue; gastrointestinal discomfort; headache; increased risk of infection; leucopenia; nausea; oral disorders; respiratory disorders; skin reactions; throat ulcer; thrombocytopenia; vomiting
  - With parenteral use: Anaemia; appetite decreased; chest pain; cough; diarrhoea; drowsiness; dyspnoea; fatigue; fever; gastrointestinal discomfort; headache; leucopenia; malaise; nausea; oral disorders; respiratory disorders; skin reactions; throat complaints; thrombocytopenia; vomiting

**UNLICENSED USE** Not licensed for use in severe Crohn’s disease.

**IMPORTANT SAFETY INFORMATION**

Note that the dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

**CONTRA-INDICATIONS** Active infection (in non-malignant conditions); ascites; immunodeficiency syndromes (in non-malignant conditions); significant pleural effusion

**CAUTIONS** Photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported); diarrhoea—extreme caution in blood disorders (avoid if severe); peptic ulceration—risk of accumulation in pleural effusion or ascites—dren before treatment; ulcerative colitis—ulcerative stomatitis

**INTERACTIONS** → Appendix 1: methotrexate

**UNLICENSED USE** Not licensed for use in severe Crohn’s disease.
osteoporosis · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · vasculitis · vertigo · vulvovaginal disorders

- With parenteral use Agranulocytosis · alopecia · arthralgia · bone marrow disorders · confusion · cystitis · depression · diabetes mellitus · drug toxicity · dysuria · gastrointestinal disorders · haemorrhage · healing impaired · hepatic disorders · increased risk of infection · lipatropathy · local reaction · myalgia · neoplasms · osteoporosis · pain · paraesthesia · photosensitivity reaction · rheumatoid arthritis aggravated · seizure · severe cutaneous adverse reactions (SCARs) · sterile abscess · vasculitis · vertigo · vulvovaginal disorders

- Rare or very rare

- With oral use Azotemia · brain oedema · cognitive impairment · conjunctivitis · cough · dyspnoea · eosophagitis · gynaecomastia · hypertension · immune deficiency · infertility · insomnia · lymphadenopathy · meningitis aseptic · menstrual disorder · mood altered · muscle weakness · nail discoulouration · neutropenia · oligozoospermia · pain · pancreatitis · paresis · pericardial disorders · pericarditis · proteinuria · psychosis · radiation injuries · renal impairment · retinopathy · sensation abnormal · sepsis · sexual dysfunction · speech impairment · stress fracture · taste metallic · telangiectasia · tinnitus · visual impairment

- With parenteral use Aproea · asthma-like conditions · azotemia · conjunctivitis · embolism and thrombosis · eosophagitis · gynaecomastia · hypertension · immune deficiency · infertility · influenza like illness · insomnia · lymphadenopathy · meningitis · meningitis aseptic · menstrual disorder · mood altered · muscle weakness · nail discoulouration · necrosis · neutropenia · paralysis · pericardial disorders · pericarditis · proteinuria · reactivation of infection · renal impairment · retinopathy · sepsis · sexual dysfunction · sperm abnormalities · stress fracture · taste altered · telangiectasia · vision disorders

- Frequency not known

- With oral use Encephalopathy

- With parenteral use Aphihasia · chills · cognitive disorder · defective coagulation · dizziness · hangnails · leukemia · leukoencephalopathy · metabolic change · mucositis · nephropathy · pancreatitis · pulmonary oedema · skin ulcer · sudden death · tinnitus

SIDE-EFFECTS, FURTHER INFORMATION

Give folic acid to reduce side-effects. Folic acid decreases mucosal and gastrointestinal side-effects of methotrexate and may prevent hematotoxicity; there is no evidence of a reduction in haematological side-effects.

Withdraw treatment if ulcerative stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception during and for at least 6 months after treatment in men and women.

- PREGNANCY

Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).

- BREAST FEEDING

Discontinue breast-feeding—present in milk.

- HEPATIC IMPAIRMENT

When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.

- RENAL IMPAIRMENT

Risk of nephrotoxicity at high doses. Avoid in severe impairment.

Dose adjustments Reduce dose.

- PRE-TREATMENT SCREENING

Exclude pregnancy before treatment.

Patients should have full blood count and renal and liver function tests before starting treatment.

- MONITORING REQUIREMENTS

- In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:

  - have full blood count and renal and liver function tests repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months.

  - be advised to report all symptoms and signs suggestive of infection, especially sore throat

- Local protocols for frequency of monitoring may vary.

- Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- PRESCRIBING AND DISPENSING INFORMATION

Folic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.

- PATIENT AND CARER ADVICE

Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

Patients should be counselled on the dose, treatment booklet, and the use of NSAIDs.

Methotrexate treatment booklets Methotrexate treatment booklets should be issued where appropriate.

In England, Wales, and Northern Ireland, they are available for purchase from:

- Gorse Street, Chadderton
- Oldham
- OLS 9QH
- Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Hospitals can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

In Scotland, treatment booklets can be obtained by emailing stockholders.dppas@raps.org.uk or by fax on 0131 629 9967.

These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection.

- Tablet

- Solution for injection

- Methotrexate (Non-proprietary)

Methotrexate (as Methotrexate sodium) 2.5 mg per 1 ml Methotrexate 5mg/2ml solution for injection vials | 5 vial | £36.00 (Hospital only) |
Nelarabine

- INDICATIONS AND DOSE
  - T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens
  - BY INTRAVENOUS INFUSION
  - Adult: (consult local protocol)

- CAUTIONS
  - Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) prior or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

- INTERACTIONS
  - Appendix 1: nelarabine

- SIDE-EFFECTS
  - Common or very common
  - Rare or very rare
    - Rhabdomyolysis

- Frequency not known
  - Progressive multifocal leukoencephalopathy (PML)

- SIDE-EFFECTS, FURTHER INFORMATION
  - If neurotoxicity occurs, treatment should be discontinued.

- CONCEPTION AND CONTRACEPTION
  - Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

- PREGNANCY
  - Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- BREAST FEEDING
  - Discontinue breast-feeding.

- MONITORING REQUIREMENTS
  - Neurotoxicity Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.
Pemetrexed for the treatment of non-small cell lung cancer

**INDICATIONS AND DOSE**

Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin). First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin). Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (monotherapy). Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy).

**DRUG ACTION**
Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.

**CAUTIONS**
- Diabetes - history of cardiovascular disease - prophylactic folic acid supplementation required (consult product literature).
- Renal disorder - mucositis - nausea - neuropathy sensory - oedema - pain - renal disorder - skin reactions - stomatitis - vomiting

**SIDE-EFFECTS**
- Common or very common Appetite decreased - fatigue - mucositis - nausea - neuropathy sensory - oedema - pain - renal disorder - skin reactions - stomatitis - vomiting
- Conception and contraception Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.
- Pregnancy Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- Breast feeding Discontinue breast-feeding.
- Renal impairment Manufacturer advises avoid if creatinine clearance less than 45 mL/minute — no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**
The Scottish Medicines Consortium has advised (March 2008) that the use of nelerabine (Atriance®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Electrolytes**: May contain Sodium
- Atriance® (Novartis Pharmaceuticals UK Ltd) ▼
  - NERELABINE 5 mg per 1 ml
  - Atriance 250mg/50mL solution for infusion
  - 6 vial £1,332.00

**Pemetrexed**

**DRUG ACTION**
Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.

**INDICATIONS AND DOSE**

Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin).

First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin).

Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (monotherapy).

Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy).

- by intravenous infusion
- Adult: (consult local protocol)

**CAUTIONS**
- Diabetes - history of cardiovascular disease - prophylactic folic acid supplementation required (consult product literature).
- Renal disorder - mucositis - nausea - neuropathy sensory - oedema - pain - renal disorder - skin reactions - stomatitis - vomiting

**SIDE-EFFECTS**
- Common or very common Appetite decreased - fatigue - mucositis - nausea - neuropathy sensory - oedema - pain - renal disorder - skin reactions - stomatitis - vomiting
- Conception and contraception Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.
- Pregnancy Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- Breast feeding Discontinue breast-feeding.
- Renal impairment Manufacturer advises avoid if creatinine clearance less than 45 mL/minute — no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Pemetrexed for the treatment of non-small cell lung cancer (August 2007) NICE TA124
  - Pemetrexed is not recommended for the treatment of locally advanced or metastatic non-small cell lung cancer which has previously been treated with chemotherapy.
  - www.nice.org.uk/TA124
- Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009) NICE TA181
  - Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma.
  - www.nice.org.uk/TA181
- Pemetrexed for the maintenance treatment of non-small cell lung cancer (updated August 2017) NICE TA190
  - Pemetrexed is recommended as an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology if disease has not progressed immediately following platinum-based chemotherapy in combination with gemcitabine, paclitaxel or docetaxel.
  - www.nice.org.uk/TA190
- Pemetrexed maintenance treatment for non-squamous non-small cell lung cancer after pemetrexed and cisplatin (August 2016) NICE TA402
  - Pemetrexed is recommended as an option for the maintenance treatment of locally advanced or metastatic non-squamous non-small cell lung cancer in patients when:
    - their disease has not progressed immediately after 4 cycles of pemetrexed and cisplatin induction therapy
    - their Eastern Cooperative Oncology Group performance status is 0 or 1 at the start of maintenance treatment, and,
    - the company provides the drug according to the terms of the commercial access agreement as agreed with NHS England.
  - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/TA402
- Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008) NICE TA135
  - Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.
  - www.nice.org.uk/TA135

**Scottish Medicines Consortium (SMC) decisions**
The Scottish Medicines Consortium has advised (September 2008) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology. It is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

The Scottish Medicines Consortium has advised (February 2010) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology. It is restricted to patients in whom histology has been confirmed as adenocarcinoma or large cell carcinoma.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Pemetrexed (Non-proprietary)
  - Pemetrexed (as Pemetrexed ditroremo) 25 mg per 1 mL
  - Pemetrexed 100mg/4mL concentrate for solution for infusion 1 vial £140.00
  - Pemetrexed 500mg/20mL concentrate for solution for infusion 1 vial £700.00
  - Pemetrexed 1000mg/40mL concentrate for solution for infusion 1 vial £1,400.00

www.getintopharma.com
Powder for solution for infusion

**ELECTROLYTES:** May contain Sodium

- **Pemetrexed (Non-proprietary)**
  - Pemetrexed (as Pemetrexed disodium) 100 mg: Pemetrexed 100mg powder for concentrate for solution for infusion vials | 1 vial | £160.00–£245.00 (Hospital only)
  - Pemetrexed (as Pemetrexed disodium) 500 mg: Pemetrexed 500mg powder for concentrate for solution for infusion vials | 1 vial | £800.00–£1310.00 (Hospital only)
  - **Alimta** (Eli Lilly and Company Ltd)
  - Pemetrexed (as Pemetrexed disodium) 100 mg: Alimta 100mg powder for concentrate for solution for infusion vials | 1 vial | £600.00 (Hospital only)
  - Pemetrexed (as Pemetrexed disodium) 500 mg: Alimta 500mg powder for concentrate for solution for infusion vials | 1 vial | £800.00 (Hospital only)

---

**Tegafur with gimeracil and oteracil**

06-Feb-2019

- **DRUG ACTION** Tegafur is a prodrug of fluorouracil. Gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa.

- **INDICATIONS AND DOSE**
  - Treatment of advanced gastric cancer when used in combination with cisplatin
  - **BY MOUTH**
    - Adult: (consult local protocol)

---

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS**
  - Dihydropyrimidine dehydrogenase deficiency
- **INTERACTIONS**
  - Appendix 1: tegafur
- **SIDE-EFFECTS**
  - Common or very common: Anemia, appetite abnormal, asthenia, constipation, cough, decreased leucocytes, dehydration, diarrhoea, dizziness, dry mouth, dysphagia, dyspnoea, electrolyte imbalance, embolism and thrombosis, eye disorders, eye inflammation, gastrointestinal discomfort, gastrointestinal disorders, haemorrhage, headache, hearing impairment, hiccups, hyperbilirubinaemia, hypotension, hypoproteinaemia, hypotension, insomnia, nausea, nerve disorders, neutropenia, oral disorders, taste altered, thrombocytopenia, vision disorders, vomiting
  - Uncommon: Aerophobia, allergic rhinitis, alopecia, angina pectoris, anxiety, aphasia, arrhythmias, ascites, breast abnormalities, burping, cerebrovascular insufficiency, chills, coagulation disorders, confusion, depression, drowsiness, dysphoria, ear discomfort, encephalopathy, eosinophilia, fever, gout, hallucination, heart failure, hemiparesis, hyperaemia, hyperglobulinaemia, hyperglycaemia, hyperlipidaemia, hypertrichosis, hypovolaemic shock, increased leucocytes, increased risk of infection, joint disorders, limb discomfort, loss of consciousness, memory loss, movement disorders, mucositis, muscle complaints, muscle weakness, myocardial infarction, nail disorders, nasal complaints, neoplasm complications, nephrotoxicity, oedema, oesophageal spasm, pain, palpitations, pancytopenia, pericardial effusion, personality disorder, renal impairment, seizure, sensation abnormal, sepsis, sexual dysfunction, skin reactions, smell altered, sweat changes, syncope, throat complaints, thrombocytosis, tremor, urinary frequency increased, vasodilatation, vertigo, weight changes

---

**Tegafur with gimeracil and oteracil**

06-Feb-2019

- **DRUG ACTION** Tegafur is a prodrug of fluorouracil. Gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa.

- **INDICATIONS AND DOSE**
  - Treatment of advanced gastric cancer when used in combination with cisplatin
  - **BY MOUTH**
    - Adult: (consult local protocol)

---

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS**
  - Dihydropyrimidine dehydrogenase deficiency
- **INTERACTIONS**
  - Appendix 1: tegafur
- **SIDE-EFFECTS**
  - Common or very common: Anemia, appetite abnormal, asthenia, constipation, cough, decreased leucocytes, dehydration, diarrhoea, dizziness, dry mouth, dysphagia, dyspnoea, electrolyte imbalance, embolism and thrombosis, eye disorders, eye inflammation, gastrointestinal discomfort, gastrointestinal disorders, haemorrhage, headache, hearing impairment, hiccups, hyperbilirubinaemia, hypotension, hypoproteinaemia, hypotension, insomnia, nausea, nerve disorders, neutropenia, oral disorders, taste altered, thrombocytopenia, vision disorders, vomiting
  - Uncommon: Aerophobia, allergic rhinitis, alopecia, angina pectoris, anxiety, aphasia, arrhythmias, ascites, breast abnormalities, burping, cerebrovascular insufficiency, chills, coagulation disorders, confusion, depression, drowsiness, dysphoria, ear discomfort, encephalopathy, eosinophilia, fever, gout, hallucination, heart failure, hemiparesis, hyperaemia, hyperglobulinaemia, hyperglycaemia, hyperlipidaemia, hypertrichosis, hypovolaemic shock, increased leucocytes, increased risk of infection, joint disorders, limb discomfort, loss of consciousness, memory loss, movement disorders, mucositis, muscle complaints, muscle weakness, myocardial infarction, nail disorders, nasal complaints, neoplasm complications, nephrotoxicity, oedema, oesophageal spasm, pain, palpitations, pancytopenia, pericardial effusion, personality disorder, renal impairment, seizure, sensation abnormal, sepsis, sexual dysfunction, skin reactions, smell altered, sweat changes, syncope, throat complaints, thrombocytosis, tremor, urinary frequency increased, vasodilatation, vertigo, weight changes

---

**Tioguanine**

*(Thioguanine)*

- **INDICATIONS AND DOSE**
  - Acute leukaemia | Chronic myeloid leukaemia
  - **BY MOUTH**
    - Adult: 100–200 mg/m² daily, can be given at various stages of treatment in short-term cycles

---

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS**
  - Absent thiopurine methyltransferase activity
- **CAUTIONS**
  - Thiopurine methyltransferase activity
  - The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
  - Long-term therapy: Long-term therapy is no longer recommended because of the high risk of liver toxicity.
- **INTERACTIONS**
  - Appendix 1: tioguanine

---

**www.getintopharma.com**
Cytotoxic responsive malignancy

SIDE-EFFECTS

- **Common or very common** Bone marrow failure - gastrointestinal disorders - hepatic disorders - hyperbilirubinaemia - hyperuricaemia - hyperuricosuria - nodular regenerative hyperplasia - osseopagal varices - sinusoidal obstruction syndrome - splenomegaly - stomatitis - thrombocytopenia - uric acid nephropathy - weight increased
- **Frequency not known** Photosensitivity reaction

CONCEPTION AND CONTRACEPTION

Ensure effective contraception during treatment in men or women.

PREGNANCY

Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Manufacturer advises caution.

RENAL IMPAIRMENT

Dose adjustments Reduce dose.

PRE-TREATMENT SCREENING

Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.

MONITORING REQUIREMENTS

Monitor liver function weekly—discontinue if liver toxicity develops.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Trifluridine with tipiracil

06-Feb-2019

DRUG ACTION

Trifluridine is an antimetabolite that interferes with cancer cell DNA synthesis and inhibits cell proliferation; tipiracil is a TPase inhibitor that boosts trifluridine concentrations.

INDICATIONS AND DOSE

Metastatic colorectal cancer, in patients previously treated with (or unsuitable for treatment with) available therapies including fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapies, or anti-vascular endothelial growth factor (VEGF) agents, or anti-epidermal growth factor receptor (EGFR) agents (specialist use only)

- **BY MOUTH**
  - Adult: Initially 35 mg/m² twice daily (max. per dose 80 mg), given on days 1 to 5 and days 8 to 12 of each 28-day cycle, consult product literature for further information on dose adjustment

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Trifluridine with tipiracil for previously treated metastatic colorectal cancer (August 2016) NICE TA405

Scottish Medicines Consortium (SMC) decisions

SMC No. 1221/17

The Scottish Medicines Consortium has advised (February 2017) that trifluridine with tipiracil (Lonsurf®) is recommended, within its marketing authorisation, as an option for treating metastatic colorectal cancer in adults, only when provided by the manufacturer with the discount agreed in the patient access scheme.

Scottish Medicines Consortium (SMC) decisions

SMC No. 1221/17

The Scottish Medicines Consortium has advised (February 2017) that trifluridine with tipiracil (Lonsurf®) is accepted for use within NHS Scotland for the treatment of adults with metastatic colorectal cancer who have been previously treated with, or are not considered candidates for, available therapies including fluoropyrimidine-, oxaliplatin- and irinotecan-based chemotherapies, anti-vascular endothelial growth factor agents, and anti-epidermal growth factor receptor agents.

This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

SIDE-EFFECTS

- **Common or very common** Alopecia - anaemia - appetite decreased - asthenia - constipation - cough - decreased leucocytes - diarrhoea - dizziness - dyspnoea - fever - flushing - gastrointestinal discomfort - headache - hyperbilirubinaemia - hypoaalbuminaemia - increased leucocytes - increased risk of infection - insomnia - malaise - mucositis - nausea - neutropenia - oedema - oral disorders - peripheral neuropathy - skin reactions - taste altered - thrombocytopenia - urine abnormalities - vomiting - weight decreased
**Cytotoxic responsive malignancy**

- **Mitomycin**
  - **INDICATIONS AND DOSE**
    - Recurrent superficial bladder tumours (bladder instillation)
      - By intravesical instillation
      - Adult: consult product literature or local protocols
    - Upper gastro-intestinal cancers | Breast cancers
      - By intravenous injection
      - Adult: consult product literature or local protocols
  - **CAUTIONS**
    - Caution in handling—irritant to tissues
  - **INTERACTIONS**
    - Appendix 1: mitomycin
  - **SIDE-EFFECTS**
    - General side-effects
      - Common or very common | Skin reactions
    - Specific side-effects
      - Frequency not known
      - With intravenous use | Neoplasms
        - Bone marrow depression | Haemolysis
        - Bone marrow depression | Heart failure
        - Haemolysis | Hepatic disorders
        - Heart failure | Pulmonary hypertension
        - Hepatic disorders | Sepsis
        - Pulmonary hypertension | Sinusoidal obstruction syndrome
        - Sepsis | Bladder disorders | Urinary tract stenosis
        - Sinusoidal obstruction syndrome | Bladder disorders | Urinary tract stenosis
        - Bladder disorders | Urinary tract stenosis
        - Urinary tract stenosis | Frequency not known
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Tablet**
      - Lonsurf (Seriver Laboratories Ltd)
        - Tipiracil (as Tipiracil hydrochloride) 6.14 mg, Trifluridine 20 mg, Lonsurf 10 mg, Lonsurf 20 mg/8.11 mg tablets | 20 tablet | £66.67
        - Tipiracil (as Tipiracil hydrochloride) 8.19 mg, Trifluridine 20 mg, Lonsurf 10 mg, Lonsurf 20 mg/8.11 mg tablets | 20 tablet | £100.00
  - **Powder for solution for injection**
    - Bleomycin (as Bleomycin sulfate) 15000 unit, Bleomycin 15,000 unit powder for solution for injection vials | 10 vial | £190.60
  - **Bleo-Kyowa**
    - Bleomycin (as Bleomycin sulfate) 15000 unit, Bleo-Kyowa 15,000 unit powder for solution for injection vials | 10 vial | £190.60

---

**Antineoplastic drugs > Cytotoxic anti-biotics and related substances**

**Bleomycin**

- **Indications and dose**
  - Squamous cell carcinoma | Metastatic germ cell cancer | Non-Hodgkin’s lymphoma
    - By intramuscular injection, or by intravenous injection, or by intravenous infusion, or by intrarterial infusion, or by local infiltration
    - Adult: consult product literature or local protocols

- **Cautions**
  - Caution in handling—irritant to tissues

- **Interactions**
  - Appendix 1: bleomycin

- **Side-effects**
  - Common or very common: Alopecia, angular stomatitis, appetite decreased, chills, fever (after administration), haemorrhage, headache, interstitial pneumonia, leucopenia, malaise, nail discoloration, nail disorder, nausea, pain, pulmonary fibrosis, dose-related, scleroderma, skin reactions, stomatitis, vomiting, weight decreased
  - Uncommon: Diarrhoea, dizziness, hepatocellular injury, oliguria, shock, urinary disorders, venin wall hypertrophy, venous stenosis

**Side-effects, Further information**

- Progressive pulmonary fibrosis: Progressive pulmonary fibrosis is dose-related, and may occur at lower doses in the elderly. Suspicious chest X-ray changes are an indication to stop therapy with this drug.
- Pulmonary toxicity: Patients who have received bleomycin may be at risk of developing pulmonary toxicity if exposed to high inspired oxygen concentrations, for example peri-operatively, or during lung function testing.

- **Conception and contraception**
  - Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 888

- **Pregnancy**
  - Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888

- **Breastfeeding**
  - Discontinue breast feeding.

- **Renal impairment**
  - Dose adjustments: Reduce dose by half if serum creatinine 177–354 micromol/litre; reduce dose further if serum creatinine greater than 354 micromol/litre.

- **Prescribing and dispensing information**
  - To conform to the European Pharmacopoeia vials previously labelled as containing ‘15 units’ of bleomycin are now labelled as containing 15,000 units. The amount of bleomycin in the vial has not changed.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for injection**
    - Bleomycin (Non-proprietary)
      - Bleomycin (as Bleomycin sulfate) 15000 unit, Bleomycin 15,000 unit powder for solution for injection vials | 10 vial | £170.00
    - Bleomycin (as Bleomycin sulfate) 15000 unit, Bleomycin (Kyowa Kirin Ltd) 15,000 unit powder for solution for injection vials | 10 vial | £190.60
Pentostatin

**INDICATIONS AND DOSE**

**Hairy cell leukaemia (initiated in specialist centres)**
- Adult: To be given on alternate weeks (consult product literature)

**INTERACTIONS** → Appendix 1: pentostatin

**SIDE-EFFECTS**
- **Common or very common**
  - Agranulocytosis, alopecia, amnorrhea, anaemia, angina pectoris, anxiety, appetite decreased, arrhythmias, arthrosis, asthenia, asthma, atrioventricular block, blood disorder, bone disorder, bone marrow disorders, breast mass, cardiac arrest, chest pain, chill, confusion, constipation, cough, deafness, death, depersonalisation, depression, diarrhoea, dizziness, drowsiness, dry eye, dry mouth, dysarthria, dysphagia, dyspnoea, ear pain, electrolyte imbalance, embolism and thrombosis, emotional lability, eosinophilia, eye disorders, eye inflammation, eye pain, febrile neutropenia, fever, fluid imbalance, flushing, gastrointestinal discomfort, gastrointestinal disorders, gout, graft versus host disease, haemorrhage, hallucination, hangover, headache, heart failure, hostility, hyperbilirubinaemia, hyperglycaemia, hyperhidrosis, hypersensitivity, hyperventilation, hypertension, increased risk of infection, influenza like illness, jaundice, joint disorders, leucopenia, lymphadenopathy, malaise, memory loss, meningism, movement disorders, muscle complaints, nausea, neoplasms, nephrolithiasis, nephropathy, nerve disorders, neurotoxicity (withhold or discontinue), oedema, oral disorders, pain, paralysis, pericardial effusion, photosensitivity reaction, pulmonary oedema, rash (withhold if severe), renal impairment, respiratory disorders, retinopathy, seborrhoea, seizures, sensation abnormal, sepsis, sexual dysfunction, skin reactions, sleep disorders, splenomegaly, syncope, taste altered, thinking abnormal, thrombocytopenia, tinnitus, tremor, urinary disorders, urogenital disorder, vasculitis, vertigo, vision disorders, vomiting, weight changes
- **Uncommon**
  - Angioedema, antibiotic associated colitis, capillary leak syndrome, cardiomyopathy, cystitis, haemolytic anaemia, mucositis, multi organ failure, myocardial infarction, pure red cell aplasia, transplant failure, tumour lysis syndrome
- **Rare or very rare**
  - Dementia, pericarditis, shock, Stevens-Johnson syndrome, systemic inflammatory response syndrome

**SIDE-EFFECTS, FURTHER INFORMATION** Pentostatin can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises that men should not father children during and for 3 months after treatment.

**PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information available).

**RENAL IMPAIRMENT** Avoid if creatinine clearance less than 60 mL/minute.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Nipent (Pfizer Ltd)
  - Pentostatin 10 mg

**ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS**

Trabectedin

**INDICATIONS AND DOSE**

**Treatment of advanced soft-tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated**
- Treatment of relapsed platinum-sensitive ovarian cancer (in combination with pegylated liposomal doxorubicin)

**INTERACTIONS** → Appendix 1: trabectedin

**SIDE-EFFECTS**
- **Common or very common**
  - Alopecia, anaemia, appetite decreased, arthralgia, asthenia, back pain, constipation, cough, dehydration, diarrhoea, dizziness, dyspnoea, fever, flushing, gastrointestinal discomfort, headache, hyperbilirubinaemia, hypereosinophilia, hyperventilation, hypertension, infection, insomnia, leucopenia, mucositis, myalgia, nausea, neutropenia, oedema, paraesthesia, peripheral neuropathy, skin reactions, stomatitis, taste altered, thrombocytopenia, vomiting, weight decreased
- **Uncommon**
  - Capillary leak syndrome, septic shock
- **Rare or very rare**
  - Hepatic failure
- **Frequency not known**
  - Extravasation necrosis
  - Rhabdomyolysis

**SIDE-EFFECTS, FURTHER INFORMATION** A corticosteroid, such as dexamethasone by intravenous infusion, must be given 30 minutes before therapy for its antiemetic and hepatoprotective effects (consult product literature).

**CONCEPTION AND CONTRACEPTION** Effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men.

**PREGNANCY** See Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for 3 months after treatment.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution (risk of increased exposure).
- **Dose adjustments** Manufacturer advises consider dose reduction.

**RENAL IMPAIRMENT** Avoid monotherapy if creatinine clearance less than 30 mL/minute. Avoid combination regimens if creatinine clearance less than 60 mL/minute.

**MONITORING REQUIREMENTS**
- Specific haematological, renal and hepatic parameters must be monitored and within certain ranges prior to starting treatment and repeated weekly during the first 2 cycles and at least once between treatments in subsequent cycles—consult product literature for full details.
- Monitor for signs and symptoms of rhabdomyolysis (including myelotoxicity, severe liver function disorder, renal failure, muscle weakness or pain)–monitor creatine phosphokinase closely and discontinue treatment (consult product literature).
Cytotoxic responsive malignancy

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010) NICE TA185

Trabectedin (Yondelis®) is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer. www.nice.org.uk/guidance/ta185

- Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA399

Trabectedin (Yondelis®) in combination with pegylated liposomal doxorubicin hydrochloride (PLDH) is not recommended for treating the first recurrence of platinum-sensitive ovarian cancer. Patients currently receiving trabectedin in combination with PLDH should have the option to continue their treatment until they or their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/ta399

MEDITICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- Yondelis (Pharma Mar, S.A.)

Trabectedin 250 microgram Yondelis 0.25mg powder for concentrate for solution for infusion vials | 1 vial (£363.00 (Hospital only))

Trabectedin 1 mg Yondelis 1mg powder for concentrate for solution for infusion vials | 1 vial (£1,366.00 (Hospital only))

ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS

Carboplatin

10-Jun-2016

INDICATIONS AND DOSE

Treatment of advanced ovarian cancer and lung cancer (particularly the small cell type)

BY INTRAVENOUS INFUSION

Adult: The dose of carboplatin is determined according to renal function rather than body surface area (consult product literature)

INTERACTIONS

Appendix 1: platinum compounds

SIDE-EFFECTS

- Common or very common Alopecia, anaemia, asthenia, cardiovascular disorder, constipation, diarrhoea, gastrointestinal discomfort, haemorrhage, hypersensitivity, increased risk of infection, leucopenia, mucosal abnormalities, musculoskeletal disorder, nausea, neutropenia, ototoxicity, peripheral neuropathy, reflexes decreased, respiratory disorders, sensation abnormal, skin reactions, taste altered, thrombocytopenia, urogenital disorder, vision disorders, vomiting

- Rare or very rare Cardiac discomfort, dyspnoea

- Frequency not known Appetite decreased, bone marrow failure, chills, dehydration, embolism,encephalopathy, extravasation necrosis, fever, haemolytic uraemic syndrome, heart failure, hypertension, hypopanaesthesia, hypotension, injection site necrosis, malaise, pancreatitis, stomatitis, stroke, treatment related secondary malignancy

CONCEPTION AND CONCEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

PREGNANCY

Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Discontinue breast-feeding.

RENAL IMPAIRMENT

Avoid if creatinine clearance less than 20 mL/minute.

Dose adjustments

Reduce dose.

Monitoring

Monitor haematological parameters in renal impairment.

Monitor renal function in renal impairment.

PRESCRIBING AND DISPENSING INFORMATION

Carboplatin can be given in an outpatient setting.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284

Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).

www.nice.org.uk/TA284

- Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is not recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

www.nice.org.uk/TA285

MEDITICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- Carboplatin (Non-proprietary)

Carboplatin 10 mg per 1 ml Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial (£20.67–£22.04 (Hospital only))

Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial (£153.39–£156.92 (Hospital only)) | 1 vial (£60.59)

Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial (£243.89–£264.53 (Hospital only)) | 1 vial (£232.64)

Carboplatin 600mg/60ml solution for infusion vials | 1 vial (£260.00 (Hospital only)) | 1 vial (£260.00)

Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial (£158.40–£168.85 (Hospital only)) | 1 vial (£181.77)

Carboplatin 450mg/45ml solution for infusion vials | 1 vial (£197.48 (Hospital only)) | 1 vial (£197.48)

Carboplatin 150mg/15ml solution for infusion vials | 1 vial (£65.83 (Hospital only)) | 1 vial (£65.83)

Carboplatin 50mg/5ml solution for infusion vials | 1 vial (£22.86 (Hospital only)) | 1 vial (£22.86)

Cisplatin

INDICATIONS AND DOSE

Treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (alone or in combination)

BY INTRAVENOUS INFUSION

Adult: (consult product literature)

CAUTIONS

FURTHER INFORMATION

Hydration Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting.

INTERACTIONS

Appendix 1: platinum compounds

SIDE-EFFECTS

- Common or very common Anaemia, arrhythmias, bone marrow failure, electrolyte imbalance, extravasation
necrosis - fever - leucopenia - nephrotoxicity (dose-related and potentially cumulative) - sepsis - thombocytopenia
- Uncommon Anaphylactoid reaction - ototoxicity (dose-related and potentially cumulative) - spermatogenesis abnormal
- Rare or very rare Acute leukaemia - cardiac arrest - encephalopathy - myocardial infarction - nerve disorders - seizure - stomatitis
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- PREGNANCY Avoid (teratogenic and toxic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT Avoid if possible—nephotoxic.
- MONITORING REQUIREMENTS
  - Monitor full blood count.
  - Monitor audiometry.
  - Monitor plasma electrolytes.
  - Nephrotoxicity Monitoring of renal function is essential.
- DIRECTIONS FOR ADMINISTRATION Cisplatin is increasingly given in a day care setting.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
  - Solution for infusion
    - Cisplatin (Non-proprietary)
      - Cisplatin 1 mg per 1 ml Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial (£8.25–£10.00) £25.11–£28.11 DT = £26.51 (Hospital only)
        Cisplatin 100mg/100ml solution for infusion vials | 1 vial (£8.25–£10.00) £50.22 DT = £50.88 (Hospital only)
        Cisplatin 10mg/10ml solution for infusion vials | 1 vial (£8.25–£10.00) £5.90 (Hospital only) | 1 vial (£5.90) £5.90
        Cisplatin 50mg/50ml solution for infusion vials | 1 vial (£8.25–£10.00) £25.37–£28.11 DT = £26.51 | 1 vial (£8.25–£10.00) £25.37 DT = £26.51 (Hospital only)
        Cisplatin 10mg/10ml concentrate for solution for infusion vials | 1 vial (£8.25–£10.00) £5.90 (Hospital only)
        Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial (£8.25–£10.00) £50.22–£55.64 DT = £50.88 (Hospital only)

Oxaliplatin

- INDICATIONS AND DOSE
  - Treatment of metastatic colorectal cancer (in combination with fluorouracil and folinic acid) - Treatment of colon cancer after resection of the primary tumour (adjuvant treatment)
    - By intravenous infusion
    - Adult: (consult product literature)

- CONTRA-INDICATIONS Peripheral neuropathy with functional impairment
- INTERACTIONS ➔ Appendix 1: platinum compounds
- SIDE-EFFECTS
  - Uncommon Metabolic acidosis - nervousness - ototoxicity
  - Rare or very rare Acute kidney injury - acute tubular necrosis - antibiotic associated colitis - deafness - disseminated intravascular coagulation - dysarthria - haemolytic anaemia - hepatic disorders - immune-allergic thombocytopenia - nephritis acute interstitial - nodular regenerative hyperplasia - pancreatitis - posterior reversible encephalopathy syndrome (PRES) (with oxaliplatin combination chemotherapy) - respiratory disorders - sinosoidal obstruction syndrome - vision loss (reversible on discontinuation)
  - Frequency not known Autoimmune pancytopenia - chest discomfort - dysphagia - extravasation necrosis - gait abnormal - hypersensitivity vasculitis - movement disorders - muscle complaints - muscle contractions involuntary - QT interval prolongation - rhematomyolysis - throat complaints

SIDE-EFFECTS, FURTHER INFORMATION Neurotoxicity is dose limiting.

Respiratory symptoms
If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.
- CONCEPTION AND CONTRACEPTION Effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- BREAST FEEDING Discontinue breast-feeding.
- RENAL IMPAIRMENT Avoid if creatinine clearance less than 30 ml/minute.
  - Dose adjustments Reduce dose in mild to moderate impairment (consult product literature).
- NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions
- Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes’ C) colon cancer (April 2006) NICE TA100 Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes’ C) colon cancer.
  www.nice.org.uk/TA100

- Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93 A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.
  www.nice.org.uk/TA93

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
  - Solution for infusion
    - Oxaliplatin (Non-proprietary)
      - Oxaliplatin 5 mg per 1 ml Oxaliplatin 50mg/10ml concentrate for solution for infusion vials | 1 vial (£8.25–£10.00) £15.58–£15.83 (Hospital only) | 1 vial (£8.25–£10.00) £14.72–£15.00
      - Oxaliplatin 100mg/20ml concentrate for solution for infusion vials | 1 vial (£8.25–£10.00) £33.37–£33.50 (Hospital only) | 1 vial (£8.25–£10.00) £295.63–£330.00

Cytotoxic responsive malignancy 923

ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES

Etoposide

12-Jul-2018

- INDICATIONS AND DOSE
  - Small cell carcinoma of the bronchus, the lymphomas and testicular cancer
    - BY MOUTH
      - Adult: 120–240 mg/m² daily for 5 days
    - BY INTRAVENOUS INFUSION
      - Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 888.

- INTERACTIONS → Appendix 1: etoposide
- SIDE-EFFECTS
  - GENERAL SIDE-EFFECTS
    - Common or very common
      - Abdominal pain - acute
      - leukaemia - alopecia - anaemia - appetite decreased - arthralgia - bleeding tendency - bone marrow depression - constipation - diarrhoea - dizziness - hepatotoxicity - hypertension - leucopenia - malaise - mucositis - myocardial infarction - nausea - neutropenia - skin reactions - thrombocytopenia - vomiting
    - Uncommon
      - Nerve disorders
      - Rare or very rare
        - Dyshagia - neurotoxicity - radiation recall reaction - respiratory disorders - seizure - severe cutaneous adverse reactions (SCARs) - taste altered - vision loss
  - SPECIFIC SIDE-EFFECTS
    - Common or very common
      - With intravenous use Anaphylactic reaction - hypotension - infection
      - With oral use Oesophagitis - stomatitis - transient systolic hypertension
    - Uncommon
      - With intravenous use Haemorrhage
      - Rare or very rare
        - With intravenous use Fever
    - With oral use Drowsiness
    - Frequency not known
      - With intravenous use Angioedema - extravasation necrosis - infertility - tumour lysis syndrome
  - CONCEPTION AND CONTRACEPTION
    - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.
  - PREGNANCY
    - Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
  - BREAST FEEDING
    - Discontinue breast-feeding.
  - HEPATIC IMPAIRMENT
    - Manufacturer advises caution (increased risk of accumulation).
  - RENAL IMPAIRMENT
    - Dose adjustments: Consider dose reduction—consult local treatment protocol for details.
    - DIRECTIONS FOR ADMINISTRATION
      - Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days.

ANTINEOPLASTIC DRUGS > TAXANES

Cabazitaxel

11-Feb-2019

- INDICATIONS AND DOSE
  - Treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen (in combination with prednisone or prednisolone)
    - BY INTRAVENOUS INFUSION
      - Adult: (consult product literature or local protocols)

- CAUTIONS
  - Avoid in Acute porphyrias p. 1058
  - INTERACTIONS → Appendix 1: taxanes

- SIDE-EFFECTS
  - Common or very common
  - Frequency not known
    - Respiratory disorders
  - CONCEPTION AND CONTRACEPTION
    - Ensure effective contraception during treatment (women) and for up to 6 months after treatment (men).
  - PREGNANCY
    - See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
  - BREAST FEEDING
    - Discontinue breast-feeding.
  - HEPATIC IMPAIRMENT
    - Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
  - Dose adjustments: Manufacturer advises dose reduction in mild to moderate impairment—consult product literature.
  - RENAL IMPAIRMENT
    - Use with caution if creatinine clearance less than 50 mL/minute.
  - MONITORING REQUIREMENTS
    - Monitor electrolytes—correct dehydration.
**Cytotoxic responsive malignancy**

**DIRECTIONS FOR ADMINISTRATION**
Intravenous infusion incompatible with PVC.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Cabazitaxel for hormone-relapsed metastatic prostate cancer treated with docetaxel (updated August 2016) NICE TA391
  - Cabazitaxel (Jevtana®) in combination with prednisone or prednisolone is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients whose disease has progressed during or after docetaxel chemotherapy, only if the following criteria are met:
    - the patient has an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1
    - the patient has had 225 mg/m² or more of docetaxel
    - treatment with cabazitaxel is stopped when the disease progresses or after a maximum of 10 cycles
    - the manufacturer provides cabazitaxel with the discount agreed in the patient access scheme
    - NHS trusts purchase cabazitaxel in accordance with the manufacturer provides cabazitaxel with the discount agreed in the patient access scheme

**Scottish Medicines Consortium (SMC) decisions**
SMC No. 735/11
- The Scottish Medicines Consortium has advised (December 2016) that cabazitaxel (Jevtana®) in combination with prednisone or prednisolone is accepted for restricted use within NHS Scotland for the treatment of patients with hormone refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen (patients who have received at least 225 mg/m² (three cycles) of docetaxel and have an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**EXCIPIENTS:** May contain Ethanol
- Jevtana (Sanofi)
  - Cabazitaxel 40 mg per 1 ml
  - JevTana 60mg/1.5ml concentrate and solvent for solution for infusion vials | 1 vial [R30] £3,696.00
  (Hospital only)

---

**Docetaxel**

**INDICATIONS AND DOSE**

Adjuvant treatment of operable node-positive and operable node-negative breast cancer (in combination with doxorubicin and cyclophosphamide) | Initial chemotherapy of locally advanced or metastatic breast cancer (with doxorubicin) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed (monotherapy) | Locally advanced or metastastic breast cancer where cytotoxic chemotherapy with an anthracycline has failed (with capecitabine) | Initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2 (with trastuzumab) | Locally advanced or metastastic non-small cell lung cancer where previous chemotherapy has failed | Initial chemotherapy of unresectable, locally advanced or metastatic non-small cell lung cancer (with cisplatin) | Hormone-resistant metastatic prostate cancer (in combination with prednisone or prednisolone) | Initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction (with cisplatin and fluorouracil) | Induction treatment of locally advanced squamous cell carcinoma of the head and neck (with cisplatin and fluorouracil)

**BY INTRAVEOUS INFUSION**

- Adult: (consult product literature or local protocols)

**CAUTIONS**
Avoid in Acute porphyrias p. 1058 - consult product literature

**INTERACTIONS**
- Appendix 1: taxanes

**SIDE-EFFECTS**
- Common or very common Abdominal pain · alopecia · anaemia · appetite decreased · arthralgia · asthenia · constipation · diarrhoea · dry mouth · fluid imbalance · haemorrhage · hypersensitivity · hypertension · increased risk of infection · myalgia · nail disorders · nausea · neutropenia · pain · peripheral neuropathy · paresthesia · skin reactions · stomatitis · taste altered · thrombocytopenia · vomiting
- Uncommon Gastrointestinal disorders · heart failure
- Frequency not known Ascites · bone marrow depression · chest tightness · chills · cutaneous lupus erythematosus · disseminated intravascular coagulation · eye disorders · eye inflammation · fever · hearing impairment · hepatitis · hypoaesthesia · loss of consciousness · multi organ failure · myalgia · myocardial infarction · nail discoloration · neurotoxicity · ototoxicity · pericardial effusion · peripheral lymphoedema · peripheral oedema · pulmonary oedema · radiation injuries · renal impairment · respiratory disorders · scleroderma · seizure · sensation abnormal · severe cutaneous adverse reactions (SCARs) · vasodilation · venous thromboembolism · vision disorders · weight increased

**SIDE-EFFECTS, FURTHER INFORMATION**
Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises effective contraception for men and women during treatment, and for at least 6 months after stopping treatment in men.

**PREGNANCY**
Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in mild to moderate and to avoid in severe impairment.

**Dose adjustments**
Manufacturer advises dose reduction according to liver function tests in mild to moderate impairment — consult product literature.

www.getintopharma.com
Cytotoxic responsive malignancy 925

Paclitaxel 17-Jul-2017

- **DRUG ACTION** Paclitaxel is a member of the taxane group of drugs.

- **INDICATIONS AND DOSE**
  - Treatment of ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin (conventional paclitaxel only)
  - Treatment of metastatic ovarian cancer where platinum-containing therapy has failed (conventional paclitaxel only)
  - Treatment of locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate)
    - (conventional paclitaxel only)
    - Adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide (conventional paclitaxel only)
    - Treatment of non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate (conventional paclitaxel only)
    - Treatment of advanced AIDS-related Kaposi’s sarcoma where liposomal anthracylene therapy has failed (conventional paclitaxel only)
    - First-line treatment of metastatic adenocarcinoma of the pancreas (in combination with gemcitabine) (conventional paclitaxel only)
    - Monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated (albumin-bound paclitaxel only)
    - In combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas (albumin-bound paclitaxel only)

- **INFORMATION**
  - **BY INTRAVENOUS INFUSION**
    - Adult: consult product literature or local protocols

- **CAUTIONS** Avoid in Acute porphyrias p. 1058 consult product literature patients aged over 75 years with metastatic adenocarcinoma of the pancreas

- **INTERACTIONS** Appendix 1: taxanes

- **SIDE-EFFECTS**
  - Common or very common
  - Uncommon
  - Rare or very rare
    - Atrioventricular block - cardiac arrest - congestive heart failure - left ventricular dysfunction - radiation injuries - severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION

Manufacturer advises routine premedication with a corticosteroid, an
antihistamine and a histamine H2-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** (Consult product literature)

- **MONITORING REQUIREMENTS**
  - Cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or previous exposure to anthracyclines.
  - Patients should be monitored for signs and symptoms of pneumonitis and sepsis.

- **PRESCRIBING AND DISPENSING INFORMATION** Paclitaxel is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Prescribers should specify the brand to be dispensed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

**EXCIPIENTS:** May contain Polyoxyl castor oils

- **Paclitaxel (Non-proprietary)**
  - Paclitaxel 6 mg per 1 ml Paclitaxel 150mg/25ml concentrate for solution for infusion vials | 1 vial | £504.90–£561.00 (Hospital only) | 1 vial | £300.52
  - Paclitaxel 30mg/5ml concentrate for solution for infusion vials | 1 vial | £112.31–£116.05 (Hospital only) | 1 vial | £66.85
  - Paclitaxel 100mg/16.7ml concentrate for solution for infusion vials | 1 vial | £336.60–£374.00 (Hospital only) | 1 vial | £200.35–£342.59

- **Paclitaxel 300mg/50ml concentrate for solution for infusion vials | 1 vial | £1,009.80–£1,122.00 (Hospital only) | 1 vial | £601.03

### Powder for suspension for infusion

**ELECTROLYTES:** May contain Sodium

- **Abraxane® (Celgene Ltd)**
  - Paclitaxel albumin 100 mg Abraxane 100mg powder for suspension for infusion vials | 1 vial | £246.00 (Hospital only)

### ANTINEOPLASTIC DRUGS > TOPOISOMERASE I INHIBITORS

#### Irinotecan hydrochloride

**DRUG ACTION** Irinotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

**INDICATIONS AND DOSE** Metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed | Treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan (in combination with cetuximab) | First-line treatment of metastatic carcinoma of the colon or rectum (in combination with fluorouracil, folinic acid and bevacizumab) | First-line treatment of metastatic colorectal carcinoma (in combination with capcitabine with or without bevacizumab)

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature or local protocols)

### Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (April 2010) that paclitaxel albumin (Abraxane®) is accepted for restricted use within NHS Scotland for treatment of metastatic breast cancer in patients who have failed first-line treatment for metastatic disease and for whom standard anthracycline containing therapy is not indicated; use is restricted to patients who would otherwise receive docetaxel or 3-weekly solvent-based paclitaxel as second-line treatment for metastatic breast cancer.

The Scottish Medicines Consortium has advised (February 2015) that paclitaxel albumin (Abraxane®) is accepted for use within NHS Scotland in combination with gemcitabine for the first-line treatment of adult patients with metastatic adenocarcinoma of the pancreas.

### NICE decisions

- **Paclitaxel for ovarian cancer (January 2003)**

  Either paclitaxel in combination with a platinum compound (cisplatin or carboplatin) or a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery).

- **Paclitaxel for the adjuvant treatment of early node-positive breast cancer (September 2006)**

  Paclitaxel, within its licensed indication, is not recommended for the adjuvant treatment of women with early node-positive breast cancer.

- **Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)**

  Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).

- **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016)**

  Paclitaxel, in combination with platinum or as monotherapy, is recommended as an option for treating recurrent ovarian cancer.

- **Paclitaxel as albumin-bound nanoparticles with gemcitabine for untreated metastatic pancreatic cancer (September 2017)**

  Paclitaxel as albumin-bound nanoparticles (nab-paclitaxel) with gemcitabine is recommended as an option for untreated metastatic adenocarcinoma of the pancreas in adults, only if:
  - other combination chemotherapies are unsuitable and they would otherwise have gemcitabine monotherapy, and
  - the manufacturer provides nab-paclitaxel with the discount agreed in the patient access scheme.

Patients whose treatment with nab-paclitaxel was started before this guidance was published, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.
Metastatic adenocarcinoma of the pancreas in patients who have progressed following gemcitabine based therapy (in combination with fluorouracil and leucovorin) (specialist use only)

• BY INTRAVENOUS INFUSION USING LIPID FORMULATION

• Adult: (consult product literature or local protocols)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: **Oниvye®** (IRINOTECAN, LIPOSOMAL FORMULATIONS): REPORTS OF SERIOUS AND FATAL THROMBOEMBOLIC EVENTS (MARCH 2019)

Oниvye® has been associated with reports of serious thromboembolic events, such as pulmonary embolism, venous thrombosis, and arterial thromboembolism. Healthcare professionals are advised to obtain a thorough medical history to identify patients with multiple risk factors. Patients should be advised to seek medical advice immediately if signs or symptoms of thromboembolism occur, such as sudden pain and swelling in a leg or an arm, sudden onset of coughing, chest pain or difficulty breathing.

**CONTRA-INDICATIONS** Bowel obstruction • chronic inflammatory bowel disease

**CAUTIONS** Raised plasma-bilirubin concentration • risk factors for cardiac disease • risk factors for pulmonary toxicity • underweight patients—increased risk of adverse events

**INTERACTIONS** Appendix 1: irinotecan

**SIDE-EFFECTS**

• Common or very common Alopecia • anaemia (dose-limiting) • appetite decreased • asthma • cholinergic syndrome • constipation • decreased leucocytes • diarrhoea (delayed diarrhoea requires prompt treatment) • dizziness • dysphonia • dyspnoea • electrolyte imbalance • embolism and thrombosis • febrile neutropenia (dose-limiting) • fever • fluid imbalance • gastrointestinal disorders • gastrointestinal syndrome • hypoglycaemia • hypotension • increased risk of infection • infusion related reaction • insomnia • mucusitis • nausea • neutropenia (dose-limiting) • oedema • renal impairment • sepsis • stomatitis • taste altered • thrombocytopenia (dose-limiting) • vomiting • weight decreased

• Uncommon Hypersensitivity • hypoxia • nail discoloration • skin reactions

• Frequency not known Antibiotic associated colitis • circulatory collapse • gastrointestinal haemorrhage • hiccups • hypertension • interstitial lung disease • muscle cramps • paraesthesia • speech disorder • ulcerative colitis

**CONCEPTION AND CONTRACEPTION** For conventional formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 3 months after treatment in men. For liposomal formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 4 months after treatment in men.

**PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** For conventional formulations, manufacturer advises avoid. For liposomal formulations, manufacturer advises avoid until one month after the last dose—no information available.

**HEPATIC IMPAIRMENT** For conventional formulations, manufacturer advises caution if bilirubin concentration 1.5–3 times the upper limit of normal (risk of decreased clearance)—monitor liver function at baseline and before each cycle; avoid if bilirubin concentration greater than 3 times the upper limit of normal (no information available for combination therapy). For liposomal formulations, manufacturer advises caution; avoid if bilirubin greater than 2 mg/dL, or if transaminases are greater than 2.5 times the upper limit of normal, or greater than 5 times the upper limit of normal if liver metastasis present (limited information available).

**Dose adjustments** For conventional formulations, manufacturer advises dose reduction—consult product literature.

**RENAI IMPAIRMENT** For conventional formulations, manufacturer advises avoid—no information available. For liposomal formulations, manufacturer advises avoid in severe impairment—no information available.

**MONITORING REQUIREMENTS** Manufacturer advises monitor for respiratory symptoms in patients with risk factors for interstitial lung disease before and during treatment; monitor complete blood count weekly during treatment.

**PRESCRIBING AND DISPENSING INFORMATION** Irinotecan is available as both conventional and liposomal formulations. Manufacturers advise that the different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and visual disturbances within 24 hours of administration.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

• Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93

A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or oxaliplatin and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.

www.nice.org.uk/TA93

• Pegylated liposomal irinotecan for treating pancreatic cancer after gemcitabine (April 2017) NICE TA440

Pegylated liposomal irinotecan, in combination with fluorouracil and leucovorin, is not recommended for treating metastatic adenocarcinoma of the pancreas in adults whose disease has progressed after gemcitabine-based therapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA440

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (March 2017) that liposomal irinotecan (Oниvye®) is not recommended for use within NHS Scotland for the treatment of metastatic adenocarcinoma of the pancreas, in combination with fluorouracil and leucovorin (folinic acid), in patients who have progressed following gemcitabine based therapy as there was insufficient evidence submitted.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium

• Irinotecan hydrochloride (Non-proprietary) 500mg/25ml concentrate for solution for infusion vials | 1 vial (Bax) £393.75–£730.82 (Hospital only)
**Topotecan**

**INDICATIONS AND DOSE**
Topotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

**Metastatic ovarian cancer when first-line or subsequent treatment has failed**
- Topotecan (Hycamtin®) is recommended for treating recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease (in combination with cisplatin).
- Oral topotecan is recommended as an option for treatment in patients who have not previously received cisplatin treatment.

**Relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate**
- Oral topotecan is recommended as an option for retreatment with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

**SIDE-EFFECTS**
- **Common or very common**
  - Alopecia
  - Anaemia
  - Appetite decreased
  - Apathy
  - Nausea
  - Vomiting
- **Rare or very rare**
  - Angioedema
  - Interstitial lung disease
- **Frequency not known**
  - Bone marrow depression
  - Neutropenia

**CONCEPTION AND CONCEPTION**
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**
Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREASTFEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Manufacturer advises avoid in severe impairment (limited information available).

**RENAL IMPAIRMENT**
Avoid infusion if creatinine clearance less than 20 mL/minute. Avoid oral route if creatinine clearance less than 60 mL/minute.

**DOSE ADJUSTMENTS**
Reduce dose.

**INTERACTIONS**
Appendix 1: topotecan

**CAUTIONARY AND ADVISORY LABELS**
See Cytotoxic drugs p. 888.

**IMPORTANT SAFETY INFORMATION**
Risks of incorrect dosing of oral anti-cancer medicines

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- **Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183**
  - Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin.
  - [www.nice.org.uk/TA183](http://www.nice.org.uk/TA183)
- **Topotecan for the treatment of relapsed small-cell lung cancer (November 2009) NICE TA184**
  - Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if retreatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated.
  - Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.
  - [www.nice.org.uk/TA184](http://www.nice.org.uk/TA184)
- **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389**
  - Topotecan is not recommended for treating first recurrence of platinum-sensitive ovarian cancer, recurrent platinum-resistant ovarian cancer, or platinum-refractory ovarian cancer.
  - Patients currently receiving topotecan should have the option to continue their treatment until they or their clinician consider it appropriate to stop.
  - [www.nice.org.uk/TA389](http://www.nice.org.uk/TA389)

**Scottish Medicines Consortium (SMC) decisions**
The Scottish Medicines Consortium has advised (November 2007) that topotecan (Hycamtin®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- **Topotecan (Non-proprietary)**
  - Topotecan (as Topotecan hydrochloride) 1 mg per 1 ml
  - Topotecan 4 mg/4 ml concentrate for solution for infusion vials | 5 vial | £1,453.10 (Hospital only)

**Powder for solution for infusion**
- **Hycamtin (Novartis Pharmaceuticals UK Ltd)**
  - Topotecan (as Topotecan hydrochloride) 1 mg
  - Topotecan 1 mg powder for concentrate for solution for infusion vials | 1 vial | £97.65

- **Topotecan (as Topotecan hydrochloride) 4 mg**
  - Topotecan 4 mg powder for concentrate for solution for infusion vials | 1 vial | £348.76

- **Potactasol (Actavis UK Ltd)**
  - Topotecan (as Topotecan hydrochloride) 4 mg
  - Potactasol 4 mg powder for concentrate for solution for infusion vials | 1 vial | £290.00 (Hospital only)

**Capsule**
**CAUTIONARY AND ADVISORY LABELS** 25
- **Hycamtin (Novartis Pharmaceuticals UK Ltd)**
  - Topotecan (as Topotecan hydrochloride) 250 microgram
  - Topotecan (as Topotecan hydrochloride) 1 mg
  - Topotecan 1 mg capsules | 10 capsule | £75.00
  - Topotecan 1 mg capsules | 10 capsule | £360.00
**ANTINEOPLASTIC DRUGS** ▶**VINCA ALKALOIDS**

**Vinblastine sulfate**

<table>

</thead>
<tbody>
<tr>
<td>Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)</td>
</tr>
<tr>
<td>Adult: (consult product literature)</td>
</tr>
</tbody>
</table>

**IMPORTANT SAFETY INFORMATION**

Vinblastine is for **intra**venous administration only. Inadvertent intracranial administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 ml minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**CONTRA-INDICATIONS**

**CONTRA-INDICATIONS**, FURTHER INFORMATION

Intracranial injection contra-indicated.

**CAUTIONS**

Caution in handling—irritant to tissues.

**INTERACTIONS**

▶ Appendix 1: vinca alkaloids

**SIDE-EFFECTS**

▶ Rare or very rare

- Hypersensitivity, rash - SIADH
- Frequency not known

**SIDE-EFFECTS, FURTHER INFORMATION**

**Bronchospasm**

Severe bronchospasm following administration is more common when used in combination with mitomycin-C.

**Neurotoxicity**

Sensory and motor neuropathies are common and are cumulative. Manufacturer advises monitoring patients for symptoms of neuropathy, such as hypoesthesia, hyperesthesia, hyporeflexia, areflexia, neuralgia, jaw pain, decreased vibratory sense, cranial neuropathy, ileus, burning sensation, arthralgia, myalgia, muscle spasm, or weakness, both before and during treatment—requires dose reduction, treatment interruption or discontinuation depending on severity.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

**CONCEPTION AND CONTRACEPTION**

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**

Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in significantly impaired hepatic or biliary function.

**DOSE ADJUSTMENTS**

Manufacturer advises consider initial dose reduction in significantly impaired hepatic or biliary function.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

▶ Vinblastine sulfate (Non-proprietary)

| Vinblastine sulfate 1 mg per 1 ml | 5 vial (PN) £85.00 (Hospital only) |

**IMPORTANT SAFETY INFORMATION**

Vincristine injections are for **intra**venous administration only. Inadvertent intracranial administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 ml minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**CONTRA-INDICATIONS**

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Intrathecal injection contra-indicated.

**CAUTIONS**

Caution in handling—irritant to tissues - neuromuscular disease

**INTERACTIONS**

▶ Appendix 1: vinca alkaloids

**SIDE-EFFECTS**

▶ Rare or very rare

- Hypersensitivity, rash - SIADH
- Frequency not known

**SIDE-EFFECTS, FURTHER INFORMATION**

**Bronchospasm**

Severe bronchospasm following administration is more common when used in combination with mitomycin-C.

**Neurotoxicity**

Sensory and motor neuropathies are common and are cumulative. Manufacturer advises monitoring patients for symptoms of neuropathy, such as hypoesthesia, hyperesthesia, hyporeflexia, areflexia, neuralgia, jaw pain, decreased vibratory sense, cranial neuropathy, ileus, burning sensation, arthralgia, myalgia, muscle spasm, or weakness, both before and during treatment—requires dose reduction, treatment interruption or discontinuation depending on severity.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

**CONCEPTION AND CONTRACEPTION**

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**

Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution.

**DOSE ADJUSTMENTS**

Manufacturer advises dose reduction.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

▶ Vincristine sulfate (Non-proprietary)

| Vincristine sulfate 1 mg per 1 ml | 1 vial (PN) £11.47 (Hospital only) | 5 vial (PN) £67.35 (Hospital only) | 2mg/2ml solution for injection vials | 1 vial (PN) £26.66 (Hospital only) | 5 vial (PN) £113.30 (Hospital only) | 5mg/5ml solution for injection vials | 5 vial (PN) £329.50 (Hospital only) |

www.getintopharma.com
Vindesine sulfate

**INDICATIONS AND DOSE**

- **Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)**
  - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

Vindesine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**CONTRA-INDICATIONS**

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Intrathecal injection contra-indicated.
  - **CAUTIONS**
    - Caution in handling—irritant to tissues - neuromuscular disease
  - **INTERACTIONS**
    - Appendix 1: vinca alkaloids
  - **SIDE-EFFECTS**
    - **Common or very common**
      - Alopecia
    - **Frequency not known**

**SIDE-EFFECTS, FURTHER INFORMATION**

Neurotoxicity, usually as peripheral or autonomic neuropathy; it occurs less often with vindesine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes; and otoxicity has been reported. There have been instances in which neurotoxicity has made it necessary to reduce the dosage or temporarily discontinue use of vindesine.

**CONCEPTION AND CONTRACEPTION**

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**

Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Dose adjustments Dose reduction may be necessary.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for injection**
    - **Eldisine** (Genus Pharmaceuticals Ltd)
      - Vindesine sulfate 5 mg Eldisine 5mg powder for solution for injection vials | 1 vial (P20) £78.30 (Hospital only)

---

Vinflunine

**INDICATIONS AND DOSE**

- **Treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen (monotherapy)**
  - Adult: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

Vinflunine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**CONTRA-INDICATIONS**

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Intrathecal injection contra-indicated.
  - **CAUTIONS**
    - Cardiovascular disease - QT-interval prolongation (avoid hypokalaemia)
  - **INTERACTIONS**
    - Appendix 1: vinca alkaloids
  - **SIDE-EFFECTS**
    - **Common or very common**
    - **Uncommon**
      - Acute respiratory distress syndrome (ARDS) - cancer pain - laryngeal pain - myocardial infarction - myocardial ischaemia - neutropenic sepsis - renal failure - SIADH - tinnitus - vertigo - visual impairment
    - **Rare or very rare**
      - Posterior reversible encephalopathy syndrome (PRES)
  - **CONCEPTION AND CONTRACEPTION**
    - Manufacturer advises effective contraception during and for up to 3 months after treatment.
  - **PREGNANCY**
    - Avoid unless essential—teratogenicity and embryotoxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
  - **BREAST FEEDING**
    - Discontinue breast-feeding.
  - **HEPATIC IMPAIRMENT**
    - Manufacturer advises caution (no information available in severe impairment).
  - **Dose adjustments**
    - Manufacturer advises dose reduction.
  - **RENAL IMPAIRMENT**
    - Dose adjustments Reduce dose if creatinine clearance less than 60 mL/minute—consult product literature.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - **NICE decisions**
      - Vinflunine for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract (January 2013) NICE TA272

Vinflunine (Javelon®) is not recommended for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract that has progressed after treatment with platinum-based chemotherapy.

www.nice.org.uk/guidance/ta272
Vinorelbine is a semi-synthetic vinca alkaloid.

**INDICATIONS AND DOSE**

- **Advanced breast cancer**
  - **By mouth**
    - Adult: 60 mg/m² once weekly for 3 weeks, then increased if tolerated to 80 mg/m² once weekly (max. per dose 160 mg once weekly)
  - **By intravenous injection, or by intravenous infusion**
    - Adult: (consult product literature)

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Bronchospasm**
  - Severe bronchospasm following administration of the vinca alkaloids is more common when used in combination with mitomycin-C.

**Neurotoxicity**

- Neurotoxicity reported in clinical trials, most commonly as constipation, paresthesia, hyperreflexia, and hyporeflexia.

**CONCEPTION AND CONTRACEPTION**

- Manufacturer advises effective contraception during and for at least 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment.

**PREGNANCY**

- Avoid unless essential (teratogenicity, and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**

- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

- With oral use: Manufacturer advises caution in moderate impairment; avoid in severe impairment (no information available).

- With intravenous use: Manufacturer advises caution in severe impairment.

**Dose adjustments**

- With oral use: Manufacturer advises dose reduction in moderate impairment—consult product literature.

- With intravenous use: Manufacturer advises dose reduction in severe impairment.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Javlor** (Pierre Fabre Ltd)
  - Vinflunine (as Vinflunine ditartrate) 25 mg per 1 ml Javlor 250mg/10ml concentrate for solution for infusion vials | 1 vial £1,062.50
  - Javlor 50mg/2ml concentrate for solution for infusion vials | 1 vial £212.50

**Vinorelbine**

- **Capsule** (Pierre Fabre Ltd)
  - Vinorelbine (as Vinorelbine tartrate) 10 mg per 1 ml
  - Vinorelbine (as Vinorelbine tartrate) 30 mg capsules | 1 capsule £39.96 (Hospital only)
  - Vinorelbine (as Vinorelbine tartrate) 50 mg capsules | 1 capsule £65.98 (Hospital only)

- **Solution for infusion**
  - Vinorelbine (as Vinorelbine tartrate) 10 mg per 1 ml
    - Vinorelbine 50mg/5ml concentrate for solution for infusion vials | 1 vial £139.00 | 10 vials £1,339.80
    - Vinorelbine 10mg/1ml concentrate for solution for infusion vials | 1 vial £22.00 | 10 vials £220.00
    - Navelbine (Pierre Fabre Ltd)
    - Vinorelbine (as Vinorelbine tartrate) 10 mg per 1 ml
      - Navelbine 10mg/1ml concentrate for solution for infusion vials | 1 vial £297.45 (Hospital only)
      - Navelbine 50mg/5ml concentrate for solution for infusion vials | 10 vials £1,399.79 (Hospital only)

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS** 21, 25
  - Navelbine (Pierre Fabre Ltd)
    - Vinorelbine (as Vinorelbine tartrate) 20 mg
      - Navelbine 20mg capsules | 1 capsule £43.96 (Hospital only)
    - Vinorelbine (as Vinorelbine tartrate) 30 mg
      - Navelbine 30mg capsules | 1 capsule £65.98 (Hospital only)
    - Vinorelbine (as Vinorelbine tartrate) 80 mg
      - Navelbine 80mg capsules | 1 capsule £175.92 (Hospital only)
**ANTINEOPLASTIC DRUGS > OTHER**

### Amsacrine

**INDICATIONS AND DOSE**

**Acute leukaemia (refractory to anthracycline chemotherapy used alone or in combination with other chemotherapy agents) (specialist use only)**

- By intravenous infusion
- Adult: (consult local protocol)

**CAUTIONS**

- Hypokalaemia—increased risk of ventricular fibrillation (correct hypokalaemia before initiating treatment)
- INTERACTIONS → Appendix 1: amsacrine
- SIDE-EFFECTS

- Common or very common Abdominal pain - alopecia - arrhythmias - bone marrow disorders - cardiotoxicity - congestive heart failure - diarrhoea - dyspepsia - emotional lability - fever - generalised tonic-clonic seizure - haemorrhage - hepatic disorders - hypokalaemia - hypotension - infection - nausea - necrosis - skin reactions - stomatitis - thrombocytopenia - vomiting
- Rare or very rare Anaemia - cardiomyopathy - confusion - dizziness - granulocytopenia - headache - lethargy - leucopenia - numbness - peripheral neuropathy - proteinuria - renal impairment - visual impairment - weight changes
- Frequency not known Cardiac arrest - hyperuricaemia
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for 6 months after treatment in women of child-bearing potential, and during and for 6 months after treatment in men.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution—increased risk of toxicity.
- RENAL IMPAIRMENT Manufacturer advises consider dose reduction (consult product literature).
- Dose adjustments Manufacturer advises consider dose reduction (consult product literature).
- MONITORING REQUIREMENTS

- Manufacturer advises monitor full blood count, liver function and renal function regularly; electrolytes should be re-evaluated prior to each treatment.
- Manufacturer advises monitor for cardiotoxicity during treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Amsidine** (Eurocept International bv)
  - Amsacrine 50 mg per 1 ml
  - Amsidine 75mg/1.5ml solution for infusion ampoules and diluent
  - 6 ampoule (PFS) £1,200.00 (Hospital only)

### Arsenic trioxide

**INDICATIONS AND DOSE**

**Acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy**

- By intravenous infusion
- Adult: (consult local protocol)

**CAUTIONS**

- Hypokalaemia (correct before treatment) - hypomagnesaemia (correct before treatment) - previous treatment with anthracyclines (increased risk of QT interval prolongation)

**INTERACTIONS → Appendix 1: arsenic trioxide

**SIDE-EFFECTS**

- Frequency not known Confusion - decreased leucocytes - fluid imbalance - heart failure - hepatotoxicity - peripheral neuropathy - sepsis

**SIDE-EFFECTS, FURTHER INFORMATION**

Signs and symptoms of differentiation syndrome (leucocyte activation syndrome) include unexplained fever, dyspnoea, weight gain, pulmonary infiltrates, pleural or pericardial effusions, with or without leucocytosis—treat with high dose corticosteroids, consult product literature.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men and women.

**PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises use with caution—no information available.

**RENAL IMPAIRMENT** Manufacturer advises caution—limited information available.

**MONITORING REQUIREMENTS** ECG required before and during treatment—consult product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Arsenic trioxide for treating acute promyelocytic leukaemia (June 2018) NICE TA526

Arsenic trioxide is recommended, within its marketing authorisation, as an option for inducing remission and consolidation in acute promyelocytic leukaemia (characterised by the presence of the t(15;17) translocation or the PML/RAR-alpha gene) in adults with:

- untreated, low-to-intermediate risk disease (defined as a white blood cell count of 10x10⁹ per microlitre or less), when given with all-trans-retinoic acid (ATRA)
- relapsed or refractory disease, after a retinoid and chemotherapy.

[www.nice.org.uk/guidance/ta526](http://www.nice.org.uk/guidance/ta526)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. SMC2025

The Scottish Medicines Consortium (SMC) has advised (January 2019) that arsenic trioxide (Trisenox®) is not recommended for use within NHS Scotland in combination with all-trans-retinoic acid (ATRA [tretinoin]) for the induction of remission, and consolidation in adults with newly diagnosed, low-to-intermediate risk acute promyelocytic leukaemia (characterised by the presence of the t(15;17) translocation and/or the presence of the PML/RAR-alpha gene), as the economic case was not demonstrated.
Cytotoxic responsive malignancy

**Asparaginase**

11-Sep-2018

**DRUG ACTION**
Asparaginase is an enzyme which acts by breaking down L-asparagine to aspartic acid and ammonia, this disrupts proteins synthesis of tumour cells.

**INDICATIONS AND DOSE**

**Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Adults: 5000 units/m² every 3 days

**CONTRA-INDICATIONS**
History of pancreatitis related to asparaginase therapy - history of serious haemorrhage related to asparaginase therapy - history of serious thrombosis related to asparaginase therapy - pancreatitis - pre-existing known coagulopathy

**CAUTIONS**
Diabetes (may raise blood glucose) - hypersensitivity reactions - hypertriglyceridaemia (severe)—increased risk of acute pancreatitis

**SIDE-EFFECTS**
- Uncommon Headache - hyperammonaemia - hyperuricaemia
- Rare or very rare Coma - consciousness impaired - diabetic ketoacidosis - hepatic disorders - hyperparathyroidism - hypoparathyroidism - ischaemic stroke - necrotising pancreatitis - pancreatic pseudocyst - posterior reversible encephalopathy syndrome (PRES) - seizures - tremor

**SIDE-EFFECTS, FURTHER INFORMATION**
There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises effective contraception in men and women of childbearing potential during treatment and for at least 3 months after last dose; asparaginase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**
Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**HEPATIC FEEDING**
Manufacturer advises avoid in severe impairment—no information available.

**MONITORING REQUIREMENTS**
Manufacturer advises monitor trough serum asparaginase levels 3 days after administration; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.

**HANDLING AND STORAGE**
Manufacturer advises store in a refrigerator (2-8°C)—consult product literature for storage conditions after reconstitution and dilution.

**PATIENT AND CARER ADVICE**
Driving and skilled tasks Manufacturer advises asparaginase has moderate influence on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
SMC No. 1319/18
The Scottish Medicines Consortium has advised (April 2018) that asparaginase (Spectria) is accepted for use within NHS Scotland when used as a component of antineoplastic combination therapy for the treatment of acute lymphoblastic leukaemia in paediatric patients from birth to 18 years and adults.

**CRISANTASPASE**

16-Mar-2017

**DRUG ACTION**
Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi.

**INDICATIONS AND DOSE**

**Acute lymphoblastic leukaemia**

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INJECTION**
  - Adult: consult product literature

**CONTRA-INDICATIONS**
History of pancreatitis related to asparaginase therapy

**CAUTIONS**
Diabetes (may raise blood glucose)

**INTERACTIONS**
Appendix 1: crisantaspase

**SIDE-EFFECTS**
- Common or very common Chill s - coagulation disorders - confusion - diarrhoea - dizziness - drowsiness - dyspnoea - face oedema - fever - headache - hepatic disorders - hypersensitivity - limb swelling - lip swelling - neurotoxicity - pain - pallor - pancreatitis - seizures - skin reactions - thrombosis
- Uncommon Hyperglycaemia - hyperlipidaemia - hypoxia - increased risk of infection - respiratory disorders
- Rare or very rare Arthritis reactive - coma - diabetic ketoacidosis - dysphagia - dysphasia - encephalopathy - haemorrhage - level of consciousness decreased - myalgia -
myocardial infarction, necrotising pancreatitis, neutropenia, paresis, sepsis, thrombocytopenia

- Frequency not known: Abdominal pain, flushing, hyperammonaemia, hypertension, hypotension, nausea, pseudocyst, vomiting

- Conception and contraception: Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- Pregnancy: Avoid. See also, Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- Breast feeding: Discontinue breast-feeding.

- Dose adjustments: Manufacturer advises dose reduction—consult product literature.

- Renal impairment: Dose adjustments—Consider dose reduction if creatinine clearance less than 40 mL/minute.

- Monitoring requirements: Monitor for signs of peripheral neuropathy—severe peripheral neurotoxicity requires treatment delay or dose reduction (consult product literature).

- ECG monitoring recommended in patients prescribed concomitant use of drugs that prolong the QT-interval or who are susceptible to QT-interval prolongation.

- Monitor electrolytes periodically.

- National funding/access decisions

- NICE decisions:
  - Eribulin for treating locally advanced or metastatic breast cancer after 2 or more chemotherapy regimens (December 2016) NICE TA423
  - Eribulin (Halaven®) is recommended for the treatment of locally advanced or metastatic breast cancer, only if:
    - the condition has progressed after at least 2 chemotherapy regimens (which may include an anthracycline and a taxane, and capetitabine), and
    - the manufacturer provides eribulin with the discount agreed in the patient access scheme.

- Scottish Medicines Consortium (SMC) decisions

  - SMC No. 1065/15
  - The Scottish Medicines Consortium has advised (March 2016) that eribulin (Halaven®) is accepted for restricted use within NHS Scotland for the treatment of patients with locally advanced or metastatic breast cancer that has progressed after at least two prior chemotherapy regimens for advanced disease, which includes capecitabine if indicated. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- Medicinal forms: There can be variation in the licensing of different medicines containing the same drug.

- Powder for solution for injection:
  - Eribulin (Jazz Pharmaceuticals UK)
    - Crisantaspase 10000 unit
    - Erwinase 10,000 unit powder for solution for injection vials | 5 vials £3,065.00

- Eribulin

  - 08-Feb-2019

- Indications and dose:

  - Treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 1 chemotherapy regimen for advanced disease
    - By intravenous injection
    - Adult: Give on day 1 and day 8 of a 21-day cycle, previous therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting unless the patient is unsuitable for these treatments (consult local protocol)

- Contra-indications: Congenital long QT syndrome

- Caution: Bradyarrhythmias (increased susceptibility to QT-interval prolongation), congestive heart failure (increased susceptibility to QT-interval prolongation), electrolyte disturbances (increased susceptibility to QT-interval prolongation), susceptibility to QT-interval prolongation

- Interactions: Appendix 1: eribulin

- Side-effects:
  - Common or very common: Alopecia, anaemia, appetite decreased, arthralgia, asthenia, chest pain, chills, conjunctivitis, constipation, cough, decreased leucocytes, dehydration, depression, diarrhoea, dizziness, dry mouth, dyspnoea, dysuria, electrolyte imbalance, embolism and thrombosis, excessive tearing, fever, gastrointestinal discomfort, gastroesophageal reflux disease, haemorrhage, headache, hot flush, hyperbilirubinaemia, hypoglycaemia, increased risk of infection, influenza like illness, insomnia, lethargy, mucositis, muscle complaints, muscle weakness, nail disorder, nausia, nerve disorders, neurotoxicity, neutropenia, oral disorders, oropharyngeal pain, pain, peripheral oedema, rhinorrhoea, sensation abnormal, skin reactions, sweat changes, tachycardia, taste altered, thrombocytopenia, tinnitus, vertigo, vomiting, weight decreased

  - Uncommon: Angioedema, hepatotoxicity, interstitial lung disease, pancreatitis, proteinuria, renal failure, sepsis

  - Rare or very rare: Disseminated intravascular coagulation

  - Frequency not known: QT interval prolongation, severe cutaneous adverse reactions (SCARs)

  - Conception and contraception: Ensure effective contraception during and for up to 3 months after treatment in men or women.

  - Pregnancy: Avoid unless essential (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

  - Breast feeding: Discontinue breast-feeding.

  - Hepatic impairment: Manufacturer advises caution (increased risk of neutropenia).

  - Dose adjustments: Manufacturer advises dose reduction—consult product literature.

  - Renal impairment: Dose adjustments: Consider dose reduction if creatinine clearance less than 40 mL/minute.

  - Monitoring requirements: Monitor for signs of peripheral neuropathy—severe peripheral neurotoxicity requires treatment delay or dose reduction (consult product literature).

  - ECG monitoring recommended in patients prescribed concomitant use of drugs that prolong the QT-interval or who are susceptible to QT-interval prolongation.

  - Monitor electrolytes periodically.

  - National funding/access decisions

  - NICE decisions:
    - Eribulin for treating locally advanced or metastatic breast cancer after 2 or more chemotherapy regimens (December 2016) NICE TA423
    - Eribulin (Halaven®) is recommended for the treatment of locally advanced or metastatic breast cancer, only if:
      - the condition has progressed after at least 2 chemotherapy regimens (which may include an anthracycline and a taxane, and capetitabine), and
      - the manufacturer provides eribulin with the discount agreed in the patient access scheme.

      - Erwinase 10,000 unit powder for solution for injection vials | 5 vials £3,065.00

  - Eribulin 44 mg per 1 ml Halaven 0.88mg/2ml solution for injection vials | 1 vial £36.10 (Hospital only)
Hydroxycarbamide (Hydroxyurea)

INDICATIONS AND DOSE

Polycthæmia vera (specialist use only)

- BY MOUTH
  - Adult: Initially 15–20 mg/kg daily, adjusted according to response, for information on dose adjustment based on haematocrit and platelet count—consult product literature; usual dose 500–1000 mg daily, dosage should be based on actual or ideal body weight, whichever is less

Essential thrombocythaemia (specialist use only)

- BY MOUTH
  - Adult: Initially 15 mg/kg daily, adjusted according to response, for information on dose adjustment based on platelet count and white cell count—consult product literature, dosage should be based on actual or ideal body weight, whichever is less

Chronic myeloid leukaemia (specialist use only)

- BY MOUTH
  - Adult: Initially 40 mg/kg daily, then reduced to 20 mg/kg daily, adjusted according to response, for information on dose adjustment based on platelet count and white cell count—consult product literature, dosage should be based on actual or ideal body weight, whichever is less

Chronic myeloid leukaemia (specialist use only) Cancer of the cervix (specialist use only)

- BY MOUTH
  - Adult: 20–30 mg/kg daily, alternatively 80 mg/kg every 3 days, for information on dose adjustment based on platelet count, white cell count and actual or ideal body weight—consult product literature

Sickle-cell disease [prevention of recurrent vaso-occlusive crises] (initiated by a specialist)

- BY MOUTH
  - Adult: Initially 15 mg/kg daily, increased in steps of 2.5–5 mg/kg daily, dose to be increased every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

- CAUTIONS Leg ulcers (review treatment if cutaneous vasculitic ulcers develop)
- INTERACTIONS → Appendix 1: hydroxycarbamide
- SIDE-EFFECTS
  - Rare or very rare Gangrene
- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception before and during treatment.
- PREGNANCY Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

Mitotane

- DRUG ACTION Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

INDICATIONS AND DOSE

Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

- BY MOUTH
  - Adult: Initially 2–3 g daily in 2–3 divided doses adjusted according to plasma-concentration monitoring, in severe illness initial dose can be increased up to 6 g daily, reduce dose or interrupt treatment if signs of toxicity, discontinue if inadequate response after 3 months

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

- CAUTIONS Avoid in Acute porphyrias p. 1058 - risk of accumulation in overweight patients
- INTERACTIONS → Appendix 1: mitotane
- SIDE-EFFECTS
  - Common or very common Adrenal insufficiency - anaemia - appetite decreased - asthenia - cognitive impairment - confusion - diarrhoea - dizziness - drowsiness - dyslipidaemia - gastrointestinal discomfort -
Panobinostat

**DRUG ACTION** Panobinostat is a histone deacetylase inhibitor, which promotes cell-cycle arrest and apoptosis of tumour cells via multiple pathways.

**INDICATIONS AND DOSE** Treatment of relapsed or refractory multiple myeloma (in combination with bortezomib and dexamethasone), in patients who have received at least two prior regimens, including bortezomib and an immunomodulatory agent

- **BY MOUTH**
  - Adult 18-74 years: 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature

- Adult 75 years and over: 15 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature

**SIDE-EFFECTS**

- **Common or very common** Anaemia; antimicrobial associated colitis; appetite decreased; arthralgia; arthritis; asthenia; chemicalitis; chills; cough; decreased leucocytes; diarrhoea; dizziness; dry mouth; dysphagia; electrolyte imbalance; fever; fluid imbalance; gastrointestinal discomfort; gastrointestinal disorders; haemorrhage; headache; hepatocellular injury; hyperbilirubinaemia; hyperglycaemia; hypertension; hyperuricaemia; hypocalcaemia; hypotension; hypothyroidism; increased risk of infection; insomnia; intracranial haemorrhage; joint swelling; malaise; nausea; neutropenia; palpitations; pancreatitis; peripheral oedema; QT interval prolongation; renal failure; respiratory disorders; sepsis; skin reactions; syncope; taste altered; thrombocytopenia; tremor; urinary incontinence; vomiting; weight decreased
- **Uncommon** Haemorrhagic shock; myocardial infarction

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects are reported when used in combination with bortezomib and dexamethasone.

**Gastro-intestinal disorders** Manufacturer advises that patients are treated with anti-diarrhoeals, or any additional treatment, in accordance with local treatment guidelines at the first sign of abdominal cramping or onset of diarrhoea.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before starting treatment in women of child-bearing potential, and ensure highly effective contraception used during treatment and for 3 months after last dose. Women using hormonal contraceptives should also use a barrier method of contraception. Highly effective contraception also required for men and their partners.
female partners during treatment and for 6 months after last dose.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises frequent monitoring of hepatic function in mild and moderate impairment, particularly during the dose escalation phase; avoid in severe impairment—no information available.

**Dose adjustments** Manufacturer advises reduce initial dose to 15 mg during the first treatment cycle in mild impairment—dose may be increased to 20 mg based on patient tolerability; reduce initial dose to 10 mg during the first treatment cycle in moderate impairment—dose may be increased to 15 mg based on patient tolerability.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor full blood count before treatment, then frequently during treatment; reduce dose or interrupt treatment if thrombocytopenia or neutropenia occur—consult product literature.
  - Manufacturer advises monitor ECG before treatment and repeat periodically before each treatment cycle; QTcF should be <480 milliseconds before treatment initiation—consult product literature.
  - Manufacturer advises monitor electrolytes before treatment and periodically as clinically indicated, especially in patients with diarrhoea; monitor thyroid and pituitary function (free T4 and TSH) as clinically indicated; monitor hepatic function before treatment and regularly during treatment as clinically indicated.
  - Manufacturer advises monitor patients over 65 years more frequently, especially for thrombocytopenia and gastrointestinal toxicity.

- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be told to seek medical advice if severe gastro-intestinal toxicity occurs.

- **Missed doses** Manufacturer advises if a dose is missed, it can be taken up to 12 hours after the specified dose time.

- **Driving and skilled tasks** Dizziness may affect performance of skilled tasks (e.g. driving).

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Panobinostat for treating multiple myeloma at least 2 previous treatments (January 2016) NICE TA380 Panobinostat, in combination with bortezomib and dexamethasone, is recommended as an option for treating relapsed or refractory multiple myeloma in patients who have received at least 2 prior regimens including bortezomib and an immunomodulatory agent when the manufacturer provides panobinostat with the discount agreed in the patient access scheme. www.nice.org.uk/TA380

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS** 25
  - Farydak (Novartis Pharmaceuticals UK Ltd) ▼ Panobinostat (as Panobinostat lactate anhydrous) 10 mg: Farydak 10 mg capsules | 6 capsule [PD] £3,492.00 Panobinostat (as Panobinostat lactate anhydrous) 15 mg: Farydak 15 mg capsules | 6 capsule [PD] £3,492.00
  - Panobinostat (as Panobinostat lactate anhydrous) 20 mg: Farydak 20 mg capsules | 6 capsule [PD] £4,056.00

**Pegaspargase**

- **DRUG ACTION** Pegaspargase breaks down the amino acid L-asparagine, thereby interfering with the growth of malignant cells, which are unable to synthesise L-asparagine.

- **INDICATIONS AND DOSE**
  - Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)
    - By intramuscular injection, or by intravenous infusion
      - Adult 18-21 years: 2500 units/m² every 14 days
      - Adult 22 years and over: 2000 units/m² every 14 days

- **CONTRA-INDICATIONS** History of pancreatitis - history of serious haemorrhagic event with previous L-asparaginase therapy - history of serious thrombosis with previous L-asparaginase therapy

- **CAUTIONS** Concomitant use of other hepatotoxic drugs (particularly in pre-existing hepatic impairment)—monitor hepatic function. Diabetes (may raise blood glucose) - hypersensitivity reactions - marked decrease of leukocyte count at start of treatment is possible—may be associated with significant rise in serum uric acid and development of uric acid nephropathy

- **CAUTIONS, FURTHER INFORMATION**
  - Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—pegaspargase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises patients should be closely monitored for signs of hypersensitivity during treatment and for an hour after administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

- **INTERACTIONS** → Appendix 1: pegaspargase

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - bone marrow depression - diarrhoea - hyperglycaemia - hypersensitivity - hypoxia - pain in extremity - pancreatitis (discontinue if suspected and do not restart if confirmed) - peripheral neuropathy - rash - seizure - stomatitis - syncope - thrombosis (discontinue) - vomiting
  - Rare or very rare Acute kidney injury - posterior reversible encephalopathy syndrome (PRES) - tremor

- **Frequency not known** Confusion - diabetic ketoacidosis - drowsiness - hepatobiliary disorder - hyperammonaemia (monitor if symptoms present) - toxic epidermal necrolysis

- **SIDE-EFFECTS, FURTHER INFORMATION** There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome in patients receiving pegaspargase.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 6 months after discontinuing treatment; pegaspargase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **PREGNANCY** Manufacturer advises avoid unless essential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises trough serum asparaginase activity levels may be measured before the next administration of
Pegaspargase for treating acute lymphoblastic leukaemia

- **SIDE-EFFECTS**
  - Common or very common: Appetite decreased
  - Frequency not known: Azosperma, hepatic disorders, infection, lethargy, leucopenia, nausea, neutropenia, ovarian failure, pneumonitis, skin reactions, thrombocytopenia, vomiting

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **PREGNANCY**
  - Avoid (teratogenic in animal studies and isolated reports in humans). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Manufacture advises caution in mild to moderate impairment; avoid in severe impairment.

- **RENAL IMPAIRMENT**
  - Caution in mild to moderate impairment. Avoid in severe impairment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  
  **Capsule**
  
  **CAUTIONARY AND ADVISORY LABELS**
  
  **4**
  
  **Procarbazine (Non-proprietary)**
  
  Procarbazine (as Procarbazine hydrochloride)
  
  - 50 mg
  - Procarbazine 50mg capsules (50 capsule £411.35–£452.48 OT + £431.92

**Raltitrexed**

- **DRUG ACTION**
  - Raltitrexed is a thymidylate synthase inhibitor.

- **INDICATIONS AND DOSE**
  - Palliation of advanced colorectal cancer when fluorouracil and folic acid cannot be used
    - **BY INTRAVENOUS INFUSION**
    - Adult: (consult local protocol)

**Procarbazine**

- **DRUG ACTION**
  - Procarbazine is a mild monoamine-oxidase inhibitor.

- **INDICATIONS AND DOSE**
  - Hodgkin's lymphoma
    - **BY MOUTH**
    - Adult: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS**
  - Pre-existing severe leucopenia, pre-existing severe thrombocytopenia

- **CAUTIONS**
  - Cardiovascular disease, cerebrovascular disease, epilepsy, phaeochromocytoma; procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary).

- **INTERACTIONS**
  - Appendix 1: procarbazine
Cytotoxic responsive malignancy

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93
      Raltitrexed is not recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies. [www.nice.org.uk/TA93](http://www.nice.org.uk/TA93)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for infusion**
    - **Tomudex** (Pfizer Ltd)
      - Raltitrexed 2 mg Tomudex 2mg powder for solution for infusion vials
        - 1 vial (£44.75) 1148.75 (Hospital only)

**RETINOID AND RELATED DRUGS**

**Bexarotene**

- **DRUG ACTION** Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. Bexarotene can cause regression of cutaneous T-cell lymphoma.

- **INDICATIONS AND DOSE**
  - **Skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment**
    - **BY MOUTH**
    - **Adult:** Initially 300 mg/m² once daily, adjusted according to response, to be taken with a meal

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS** History of pancreatitis · hypervitaminosis A · uncontrolled hyperlipidaemia · uncontrolled hypothyroidism
- **CAUTIONS** Avoid in Acute porphyrias p. 1058 · hyperlipidaemia · hypothyroidism
- **INTERACTIONS** → Appendix 1: retinoids
- **SIDE-EFFECTS**
  - **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · chills · constipation · deafness · diarrhoea · dizziness · dry eye · dry mouth · dyslipidaemia · eye disorders · gastrointestinal discomfort · gastrointestinal disorders · headaches · hyperhidrosis · hypersensitivity · hypoproteinaemia · hypothyroidism · increased risk of infection · insomnia · leucopenia · lymphadenopathy · muscle complaints · nausea · oedema · oral disorders · pain · pseudolymphoma · sensation abnormal · skin nodule · skin reactions · skin ulcer · thyroid disorder · vomiting · weight changes
  - **Uncommon** Albuminuria · anxiety · arrhythmias · ataxia · blood disorder · cataract · coagulation disorder · depression · ear disorder · eosinophilia · eye inflammation · fever · gout · haemorrhage · hair disorder · hepatic failure · hyperbilirubinemia · hypertension · hyperthyroidism · increased leucocytes · mucous membrane disorder · muscle weakness · nail disorder · neoplasms · nerve disorders · pancreatitis · renal impairment · serous drainage · thrombocytopenia · thrombocytosis · varicose veins · vasodilation · vertigo · vision disorders
  - **Frequency not known** Burping · chest pain · confusion · cough aggravated · dehydration · drowsiness · dysphagia · dyspnoea · emotional lability · hypercalcaemia · hyperuricaemia · libido decreased · muscle tone increased · pelvic pain · peripheral vascular disease · red blood cell abnormality · taste altered · thirst · tinnitus · white blood cell abnormalities

**ALLERGY AND CROSS-SENSITIVITY** Caution—hypersensitivity to retinoids.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 1 month after treatment in men and women.

**PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in hepatic insufficiency.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 14/02

The Scottish Medicines Consortium has advised (November 2002) that bexarotene (Targretin®) is recommended for restricted use as a second-line treatment for patients with advanced (stages IIb or III) cutaneous T-cell lymphoma who have proved refractory both to local skin directed therapy and to at least one systemic therapy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - **Targretin** (Eisai Ltd)
      - Bexarotene 75 mg Targretin 75mg capsules 100 capsule (£937.50)

**Tretinoin**

- **INDICATIONS AND DOSE**
  - **Induction of remission in acute promyelocytic leukaemia** (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)
    - **BY MOUTH**
    - **Adult:** 45 mg/m² daily in 2 divided doses maximum duration of treatment is 90 days, consult product literature for details of concomitant chemotherapy

**CAUTIONS** Increased risk of thromboembolism during first month of treatment

**INTERACTIONS** → Appendix 1: retinoids

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · alopecia · anxiety · appetite decreased · arrhythmia · asthma · bone pain · chest pain · chills · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · flushing · headache · hearing impairment · hyperhidrosis · insomnia · intracranial pressure increased · malaise · nasal dryness · nausea · pancreatitis · paraesthesia · respiratory disorders · skin reactions · visual impairment · vomiting
- **Frequency not known** Embolism and thrombosis · erythema nodosum · genital ulceration · hepatotoxicity · hypercalcaemia · increased leucocytes · myocardial infarction · myositis · necrotising fasciitis · QT interval prolongation · stroke · thrombocytosis · vasculitis

**SIDE-EFFECTS, FURTHER INFORMATION**

Retinoic acid syndrome

Fever · dyspnoea · acute respiratory distress · pulmonary infiltrates · pleural effusion · hyperleucocytosis · hypotension · oedema · weight gain · hepatic · renal and multi-organ failure requires immediate treatment—consult product literature.

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).

**PREGNANCY** Teratogenic. See Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** Avoid (discontinue breast-feeding).
Cytotoxic responsive malignancy

940

HEPATIC IMPAIRMENT  Manufacturer advises caution.
Dose adjustments  Manufacturer advises dose reduction to 25 mg/m².

RENAL IMPAIRMENT  Manufacturer advises caution.
Dose adjustments  Reduce dose to 25 mg/m².

MONITORING REQUIREMENTS  Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

DESCRIBING AND DISPENSING INFORMATION  Tretinoin is the acid form of vitamin A.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.
Capsule

CAUTIONARY AND ADVISORY LABELS  21, 25
- Tretinoin (Non-proprietary)
  - Tretinoin 10 mg  Tretinoin 10mg capsules  1 100 capsule  

3.1 Cytotoxic drug-induced side effects

ANTIDOTES AND CHELATORS  IRON CHELATORS

Dexrazoxane

- INDICATIONS AND DOSE

CARDIOXANE  
Prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 500 mg/m² of doxorubicin or a prior cumulative dose of 540 mg/m² of epirubicin when further anthracycline treatment is required
  - BY INTRAVENOUS INFUSION
    - Adult: Administer 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose, dose to be given 30 minutes before anthracycline administration

SAVENE  
Anthracycline extravasation
  - BY INTRAVENOUS INFUSION
    - Adult: Initially 1 g/m² daily (max. per dose 2 g) for 2 days, then 500 mg/m² for 1 day, first dose to be given as soon as possible and within 6 hours after injury

CONTRA-INDICATIONS  Children

CAUTIONS  Myelosuppression (effects may be additive to those of chemotherapy)

CARDIOXANE  Manufacturer advises caution in patients with heart failure—no information available - manufacturer advises caution in patients with myocardial infarction in previous 12 months—no information available - manufacturer advises caution in patients with symptomatic valvular heart disease—no information available - manufacturer advises caution in patients with uncontrolled angina—no information available

INTERACTIONS  Appendix 1: iron chelators

SIDE-EFFECTS
  - Common or very common  Alopecia - anaemia - appetite decreased - asthenia - constipation - cough - diarrhea - dizziness - dry mouth - diplopia - embolism and thrombosis - fever - gastrointestinal discomfort - headache - increased risk of infection - leucopenia - myalgia - nail disorder - nausea - neutropaenia - peripheral neuropathy - peripheral oedema - post procedural infection - sensation abnormal - skin reactions - stomatitis - syncope - tachycardia - thrombocytopenia - tremor - vaginal haemorrhage - vomiting - weight decreased - wound complications
  - Uncommon  Acute myeloid leukaemia - lymphoedema - sepsis - thirst - vertigo
  - Frequency not known  Anaphylactic reaction

CONCEPTION AND CONTRACEPTION  Ensure effective contraception during and for at least 3 months after treatment in men and women.

PREGNANCY  Avoid unless essential (toxicity in animal studies).

BREAST FEEDING  Discontinue breast-feeding.

HEPATIC IMPAIRMENT

CARDIOXANE  Manufacturer advises caution (no information available).
Dose adjustments  Manufacturer advises if anthracycline dose is reduced, reduce the Cardioxane® dose by a similar ratio.

SAVENE  Manufacturer advises avoid (no information available).

RENAL IMPAIRMENT

CARDIOXANE  DOSE ADJUSTMENTS  Manufacturer advises reduce dose by 50% if creatinine clearance less than 40 mL/minute.

SAVENE  Manufacturer advises avoid—risk of accumulation.

MONITORING REQUIREMENTS
  - Monitor full blood count.
  - Monitor for cardiac toxicity.
  - Monitor liver function.

DIRECTIONS FOR ADMINISTRATION  Local coolants such as ice packs should be removed at least 15 minutes before administration.

CARDIOXANE  For intravenous infusion, give intermittently in Compound sodium lactate; reconstitute each vial with 25 mL water for injections and dilute each vial with 25–100 mL infusion fluid; give requisite dose over 15 minutes.

SAVENE  For intravenous infusion, give intermittently in diluent; reconstitute each 500-mg vial with 25 mL of diluent; dilute requisite dose further in remaining diluent and give over 1–2 hours into a large vein in an area other than the one affected.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
- Cardoxane (Clinigen Healthcare Ltd)
  - Dexrazoxane 500 mg  Cardoxane 500mg powder for solution for infusion vials  1 1 vial  (£57.51)

Powder and solvent for solution for infusion
- ELECTROLYTES: May contain Potassium, sodium
  - Savene (Clinigen Healthcare Ltd)
    - Dexrazoxane 500 mg  Savene 500mg powder for concentrate and solvent for solution for infusion vials  1 10 vial  (£30.00)

DETOXIFYING DRUGS  UROPROTECTIVE DRUGS

Mesna

- INDICATIONS AND DOSE

Cytotoxic induced urothelial toxicity
  - BY MOUTH, OR BY INTRAVENOUS INJECTION
    - Adult: Dose to be calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment (consult product literature)

SIDE-EFFECTS
  - Common or very common  Appetite decreased - arthralgia - asthenia - chest pain - chills - concentration impaired -
Cytotoxic drug-induced side effects

- **CAUTIONS** Avoid simultaneous administration of methotrexate • not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B12 deficiency
- **INTERACTIONS**  ➔ Appendix 1: folates

### Folates

**Folinic acid**

12-Apr-2019

- **INDICATIONS AND DOSE**
  - **Prevention of methotrexate-induced adverse effects**
    - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** Initial dose equal to or exceeding dose of methotrexate, to be given at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management
  - **Suspected methotrexate overdosage**
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** (consult product literature)
  - **Adjunct to fluorouracil in colorectal cancer**
    - **BY SLOW INTRAVENOUS INJECTION**
    - **Adult:** (consult product literature)
  - **SODIOFOLIN**
    - As an antidote to methotrexate
      - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - **Adult:** (consult product literature)
  - **Adjunct to fluorouracil in colorectal cancer**
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Intrathecal injection

**Cystic fibrosis**

- **CONTRA-INDICATIONS** Intrathecal injection

**VITAMINS AND TRACE ELEMENTS**

**Folinic acid**

**Prevention of methotrexate-induced adverse effects**

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - **Adult:** Initial dose equal to or exceeding dose of methotrexate, to be given at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management
  - **Suspected methotrexate overdosage**
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** (consult product literature)
  - **Adjunct to fluorouracil in colorectal cancer**
    - **BY SLOW INTRAVENOUS INJECTION**
    - **Adult:** (consult product literature)
  - **SODIOFOLIN**
    - As an antidote to methotrexate
      - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - **Adult:** (consult product literature)
  - **Adjunct to fluorouracil in colorectal cancer**
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** (consult product literature)

**CONTRA-INDICATIONS** Intrathecal injection
Levofolinic acid

**DRUG ACTION** Levofolinic acid is an isomer of folic acid.

**INDICATIONS AND DOSE**

- Prevention of methotrexate-induced adverse effects
  - By intramuscular injection, or by intravenous injection, or by intravenous infusion
  - Adult: Usual dose: 7.5 mg every 6 hours for 10 doses, usually started 12–24 hours after beginning of methotrexate infusion

- Suspected methotrexate overdose
  - By intravenous infusion, or by intravenous injection
  - Adult: Initial dose at least 50% of the dose of methotrexate, intravenous infusion to be administered at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

**Adjunct to fluorouracil in colorectal cancer**

- Prevention of methotrexate-induced adverse effects
  - By slow intravenous injection
  - Adult: (consult product literature)

**CONTRA-INDICATIONS** Intrathecal injection

**CAUTIONS** Avoid simultaneous administration of methotrexate - not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B12 deficiency

**INTERACTIONS** → Appendix 1: folates

**SIDE-EFFECTS**

- Common or very common
  - Dehydration - diarrhoea - mucosal toxicity - nausea - vomiting

- Uncommon
  - Fever

- Rare or very rare
  - Agitation (with high doses) - depression (with high doses) - epilepsy exacerbated - gastrointestinal disorder - insomnia (with high doses) - urticaria

**PREGNANCY** Not known to be harmful; benefit outweighs risk.

**BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Levofolinic acid (Non-proprietary)
  - Levofolinic acid (as Disodium levofolate) 50 mg per 1 ml Levofolinic acid 50mg/1ml solution for injection vials | 1 vial (£2.47) £4.70 (Hospital only)
  - Levofolinic acid 200mg/4ml solution for injection vials | 1 vial (£0.80) £0.79 (Hospital only)
  - Isoverin (Pfizer Ltd)
  - Levofolinic acid (as Calcium levofolate) 10 mg per 1 ml Isoverin 175mg/17.5ml solution for injection vials | 1 vial (£1.01) £1.33 (Hospital only)
  - Isoverin 25mg/2.5ml solution for injection vials | 1 vial (£1.11) £1.62 (Hospital only)

3.1a Hyperuricaemia associated with cytotoxic drugs

**Other drugs used for Hyperuricaemia associated with cytotoxic drugs**

- Allopurinol, p. 1121 - Febuxostat, p. 1121

DETOXIFYING DRUGS > URATE OXIDASES

Rasburicase

**INDICATIONS AND DOSE**

- Prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and high tumour burden at risk of rapid lysis
  - By intravenous infusion
  - Adult: 200 micrograms/kg once daily for up to 7 days according to plasma-uric acid concentration

**CONTRA-INDICATIONS** G6PD deficiency

**CAUTIONS** Atopic allergies

**SIDE-EFFECTS**

- Common
  - Diarrhoea - fever - headache - nausea - skin reactions - vomiting

- Uncommon
  - Bronchospasm - haemolysis - haemolytic anaemia - hypersensitivity - hypotension - methaemoglobinemia - seizure

- Rare or very rare
  - Rhinitis

- Frequency not known
  - Muscle contractions involuntary

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS** Monitor closely for hypersensitivity.

**EFFECT ON LABORATORY TESTS** May interfere with test for uric acid—consult product literature.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Fasturtec®), give intermittently in Sodium chloride 0.9%; reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for infusion**

- Fasturtec (Sanofi)
  - Rasburicase 1.5 mg: Fasturtec 1.5mg powder and solvent for solution for infusion vials | 3 vial (£20.83) £60.39 (Hospital only)
  - Rasburicase 7.5 mg: Fasturtec 7.5mg powder and solvent for solution for infusion vials | 1 vial (£34.72) £104.17 (Hospital only)

4 Hormone responsive malignancy

Breast cancer

**Description of condition**

Breast cancer is the most common form of malignancy in women, especially in those aged over 50 years. Established risk factors include age, early onset of menstruation, late menopause, older age at first completed pregnancy, and a family history of breast cancer. The use of oral contraceptives or hormone replacement therapy (HRT) is also associated with an increased risk of breast cancer.

Breast cancer in men is rare. Although risk factors are not fully understood, it may be associated with abnormalities of sex hormone metabolism, including those caused by liver disease or testicular trauma, genetic predisposition, and environmental risk factors such as industrial exposure to chronic heat.

Additional risk factors include obesity and alcohol consumption.
Physical activity and breast-feeding protect against breast cancer. Non-invasive breast cancer, also known as ductal carcinoma in situ, is when the cancer remains localised in the ducts. However, in most cases, the cancer is invasive at the time of diagnosis, which means that malignant cells are liable to spread beyond the immediate area of the tumour. Invasive breast cancer, where malignant cells spread beyond the ducts, can be defined as early breast cancer (stage I/II), locally advanced disease (stage III) and advanced disease (stage IV).

**Aims of treatment**

Reducing mortality, increasing progression-free and disease-free survival and improving quality of life are the main aims of treatment, and are dependent on the stage of the disease.

Surgery and radiotherapy aim to remove the tumour mass, whilst adjuvant drug therapy (drug treatment following surgery) aims to reduce the risk of disease recurrence and the risk of developing invasive disease. Neoadjuvant drug therapy (drug treatment before surgery) aims to reduce the size of the tumour to allow breast-conserving surgery to be possible and to reduce axillary lymph node involvement.

Advanced breast cancer is not curable, and treatment aims to prolong survival, relieve symptoms and improve quality of life.

**Overview**

The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these. The course of the disease and the therapeutic approach vary depending on the characteristics of the cancer. Factors such as patient age, menopausal status, tumour size and grade, involvement of axillary lymph nodes or skin, and the presence of hormone receptors within the tumour, may inform the extent and aggressiveness of the disease. The risks and benefits of each therapy should be discussed with the patient before being started.

**Early and locally advanced breast cancer**

For operable breast cancer, treatment involves surgery to the breast (breast-conserving surgery or mastectomy) and to the axillary lymph nodes, with or without radiotherapy to reduce local recurrence rates. This is often followed by adjuvant drug therapy to eradicate the micro-metastases that cause relapses. In women with invasive breast cancer, radiotherapy is recommended after breast-conserving surgery with clear margins (no cancer cells are found at the edges of the removed tissue), as it reduces local recurrence rates. However, the use of radiotherapy may be omitted if risk of local recurrence is very low and the woman is willing to take adjuvant endocrine therapy for a minimum of 5 years. Radiotherapy is also recommended after mastectomy in patients with node-positive invasive breast cancer or involved resection margins (cancer cells are found at the edges of the removed tissue). It should also be considered in patients with node-negative T3 or T4 invasive breast cancer.

**Adjuvant drug therapy**

Adjuvant drug therapy may include the use of chemotherapy, endocrine therapy, biological therapy, or bisphosphonate therapy. The decision to use adjuvant drug therapy should be based on the risks and benefits of treatment, disease prognosis and predictive factors such as oestrogen receptor (ER), progesterone receptor (PR), and human epidermal growth receptor 2 (HER2) status of the primary tumour.

In women with invasive breast cancer in only one breast who have not received treatment, including the use of neoadjuvant chemotherapy, NICE clinical guideline 101 recommends the use of the PREDICT tool to estimate prognosis and the absolute benefits of adjuvant therapy (www.predict.nhs.uk).

**Chemotherapy**

Adjuvant anthracycline–taxane combination chemotherapy is recommended in patients with invasive breast cancer who are at sufficient risk of disease recurrence to require chemotherapy. The choice of chemotherapy regimen is usually guided by local policy, Cancer Alliances, and the National Cancer Drugs Fund list.

**Biological therapy**

Trastuzumab p. 885 should be offered to patients with tumour size T1c and above HER2-positive invasive breast cancer, in combination with surgery, chemotherapy, or radiotherapy. It should also be considered in patients with a smaller tumour size (T1a or T1b) depending on their comorbidities, prognosis, and possible toxicity with concomitant chemotherapy. Cardiac function should be regularly assessed in patients receiving trastuzumab p. 885, and particular caution should be taken in patients with underlying cardiac disease (consult product literature for further details).

**Endocrine therapy**

Tamoxifen p. 953 should be used as initial adjuvant endocrine therapy in men and premenopausal women with oestrogen-receptor–positive invasive breast cancer. In addition, ovarian function suppression with a gonadotropin-releasing hormone (GnRH) should be considered in premenopausal women, taking into account the risk of temporary or permanent menopause. Ovarian function suppression aims to stop the production of circulating oestrogen, which can stimulate breast cancer progression. It may be most beneficial in women who are at sufficient risk of disease recurrence to have been offered chemotherapy.

In postmenopausal women with oestrogen-receptor positive invasive breast cancer who are at medium or high-risk of disease recurrence, an aromatase inhibitor should be given as first-line therapy. Alternatively, tamoxifen should be given if an aromatase inhibitor is not tolerated or is contra-indicated, or if the risk of disease recurrence is low.

**Extended endocrine therapy**

Extended endocrine therapy (total duration longer than 5 years) with an aromatase inhibitor [unlicensed indication] should be offered to postmenopausal women with oestrogen-receptor–positive invasive breast cancer at medium or high-risk of disease recurrence who have been taking tamoxifen for 2 to 5 years. Extended therapy should also be considered in postmenopausal women at low risk of disease recurrence.

Extended tamoxifen therapy for longer than 5 years can also be considered in both premenopausal and postmenopausal women with oestrogen-receptor–positive invasive breast cancer.

**Endocrine therapy for ductal carcinoma in situ**

Following breast-conserving surgery, endocrine therapy should be offered to women with oestrogen-positive ductal carcinoma in situ, if radiotherapy is recommended but not given. If radiotherapy is not recommended, the use of endocrine therapy should also be considered.

**Bisphosphonate therapy**

Zoledronic acid p. 732 and sodium clodronate p. 731 have been shown to improve disease-free survival and overall survival in postmenopausal women with node-positive invasive breast cancer. However, there is insufficient evidence to recommend their use in premenopausal women.

Intravenous zoledronic acid [unlicensed indication] or oral sodium clodronate [unlicensed indication] should be offered to postmenopausal women with lymph-node-positive invasive breast cancer. Treatment should be considered in those with lymph-node-negative invasive breast cancer who are at high-risk of recurrence.
Bisphosphonate therapy is also recommended in women at high-risk of osteoporosis due to the use of aromatase inhibitors in postmenopausal women, or in women with treatment-induced premature menopause. For further information, see Guidance for the management of breast cancer treatment-induced bone loss: a consensus position statement from a UK expert group, 2008.

**Neoadjuvant drug therapy**

Neoadjuvant drug therapy may involve the use of chemotherapy or endocrine therapy.

**Chemotherapy**

Neoadjuvant chemotherapy should be offered to reduce tumour size in patients with oestrogen-receptor-negative invasive breast cancer. In patients with oestrogen-receptor-positive invasive breast cancer, chemotherapy should be considered. In patients with HER2-positive invasive breast cancer, neoadjuvant chemotherapy should be offered in combination with trastuzumab p. 885 and pertuzumab p. 880.

A chemotherapy regimen containing both a platinum [unlicensed indication] and an anthracycline should be considered in patients with triple-negative invasive breast cancer (oestrogen-receptor-negative, progesterone-receptor negative and HER2-negative).

**Endocrine therapy**

If chemotherapy is not indicated, neoadjuvant endocrine therapy should be considered as an alternative in postmenopausal women with oestrogen-receptor-positive invasive breast cancer. Chemotherapy and endocrine therapy are equally effective in postmenopausal women in terms of breast-conservation and shrinking of the tumour. Although chemotherapy is more effective than endocrine therapy at shrinking the tumour in premenopausal women, some tumours may respond to endocrine treatment.

**Advanced breast cancer**

Treatment of advanced breast cancer depends on the patient’s treatment history, disease severity, and oestrogen receptor and HER2 status.

**Endocrine therapy**

For the majority of patients with oestrogen-receptor-positive advanced breast cancer, endocrine therapy is recommended as first-line treatment. Aromatase inhibitors should be offered to postmenopausal women with no previous history of endocrine treatment, or to those previously treated with tamoxifen p. 953.

Tamoxifen in combination with ovarian function suppression should be offered as first-line treatment to pre- and perimenopausal women with oestrogen-receptor-positive advanced breast cancer not previously treated with tamoxifen.

Ovarian function suppression should be offered to pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen.

Tamoxifen should be offered as first-line treatment to men with oestrogen-receptor-positive advanced breast cancer.

**Chemotherapy**

Chemotherapy should be offered as first-line treatment in patients with oestrogen-receptor-positive advanced breast cancer that is imminently life-threatening or requires early relief of symptoms because of significant visceral organ involvement. Once chemotherapy treatment is completed, endocrine therapy should be offered. The choice of chemotherapy regimen is usually guided by local policy, Cancer Alliances, and the National Cancer Drugs Fund list.

**Biological therapy**

Trastuzumab is recommended for the treatment of HER2-positive advanced breast cancer. It is used in combination with paclitaxel p. 925 in those who have not received chemotherapy for metastatic breast cancer, and as monotherapy for patients who have received at least two chemotherapy regimens for metastatic breast cancer (see trastuzumab National funding/access decisions).

**Bisphosphonate therapy**

The use of bisphosphonates should be considered in patients with metastatic breast cancer to reduce pain and prevent skeletal complications of bone metastases.

**Familial breast cancer**

Chemoprevention should be offered to all women who have been identified as being at high-risk of developing breast cancer. Chemoprevention should also be considered in women at moderate-risk. Other strategies to reduce breast cancer risk should also be considered, for example bilateral mastectomy or bilateral oophorectomy. Women who were at high-risk of breast cancer and have undergone a bilateral mastectomy should not receive chemoprevention.

**Treatment options for chemoprevention**

Chemoprevention should only be continued for 5 years. Tamoxifen [unlicensed indication] is recommended for premenopausal women who do not have a history of, or increased risk of thromboembolic disease or endometrial cancer.

Anastrozole p. 954 [unlicensed indication] is recommended in postmenopausal women who do not have severe osteoporosis, see Osteoporosis p. 725. In women who have severe osteoporosis, or who do not wish to take anastrozole, treatment with tamoxifen can be given, provided there is no history, or increased risk of thromboembolic disease or endometrial cancer. Alternatively, raloxifene hydrochloride p. 754 is an option [unlicensed indication] in postmenopausal women with a uterus who do not wish to take tamoxifen, unless there is a history or increased risk of thromboembolic disease.

**Treatment of menopausal symptoms**

Some treatments used in the management of breast cancer, such as tamoxifen or ovarian function suppression may lead to menopausal symptoms or early menopause, and women should be counselled about these side-effects prior to starting any of these treatments.

Women diagnosed with breast cancer should discontinue their hormone replacement therapy (HRT) because of possible tumour stimulation and interference with adjuvant endocrine therapy. HRT should not be offered routinely to women with menopausal symptoms if they have a history of breast cancer; however, in exceptional circumstances, HRT can be offered to women with severe menopausal symptoms once the associated risks have been discussed.

Selective serotonin re-uptake inhibitor (SSRIs) antidepressants may be offered to relieve menopausal symptoms such as hot flushes in women with breast cancer who are not taking tamoxifen. Clonidine hydrochloride p. 145, venlafaxine p. 368 [unlicensed indication] and gabapentin p. 315 [unlicensed indication] are sometimes used for the treatment of hot flushes in women with breast cancer after discussion with the patient and information given about side effects.

www.nice.org.uk/guidance/cg81

Prostate Cancer

31 May 2016

Description of condition
Prostate cancer is the most common form of cancer affecting men. The main risk factors are age (most cases being diagnosed in men over 65 years of age), ethnicity (more common in black African–Caribbean men), and a familial component. Prostate cancer is usually slow-growing and asymptomatic at diagnosis, however, the presenting symptoms of advanced disease are usually urinary outflow obstruction, or, pelvic or back pain due to bone metastases. Treatment decisions are guided by baseline prostate specific antigen (PSA) levels, tumour grade (Gleason score), the stage of the tumour, the patient’s life expectancy (based on age and comorbid conditions), treatment morbidity, and patient preference.

Aims of treatment
In early or locally advanced prostate cancer, radical treatment aims to eliminate the malignancy. In metastatic disease, drug therapy is aimed at prolonging survival and reducing symptoms.

Drug treatment
Treatment options for patients with prostate cancer include active monitoring, radical prostatectomy, external beam radiotherapy, and brachytherapy. Hormone therapy (androgen deprivation or anti-androgens) is the primary treatment for metastatic prostate cancer, but is also increasingly being used for patients with locally advanced, non-metastatic disease.

In patients with localised prostate cancer, the choice of treatment is guided by whether the disease is considered low, intermediate, or high risk according to the Gleason score, the serum PSA level, and the tumour stage.

Localised or locally advanced prostate cancer
In patients with low-risk localised prostate cancer, and those at intermediate risk who decline radical treatments (prostatectomy or radiotherapy), active monitoring is a suitable option. This involves close monitoring to avoid unnecessary treatment until disease progression occurs (or until the patient requests treatment).

In patients with intermediate-risk or high-risk localised prostate cancer (when there is a realistic prospect of long-term disease control) and in those with locally advanced disease, radical prostatectomy or radical radiotherapy should be offered. Other treatment options include a combination of radical radiotherapy and androgen deprivation therapy, consisting of 6 months of androgen deprivation therapy before, during or after radiotherapy. Pelvic radiotherapy should be considered in those with locally advanced prostate cancer who have a higher than 15% risk of pelvic lymph node involvement and are to receive neoadjuvant hormonal therapy.

Androgen deprivation therapy involves the use of a luteinising hormone-releasing hormone (LHRH) agonist (buserelin p. 738, goserelin p. 739, leuprorelin acetate p. 740, or triptorelin p. 741), or bilateral orchidectomy, which removes the supply of endogenous hormone. Androgen deprivation therapy may be continued for up to 3 years in patients with high-risk localised prostate cancer.

Patients should be informed about the side-effects of treatment, particularly urinary and sexual dysfunction, loss of fertility, radiation-induced enteropathy, and hot flushes. Although there is limited evidence, intermittent therapy may be considered for patients who are having long-term androgen deprivation therapy, to reduce drug toxicity. Tumour flare, due to an initial surge in testosterone concentrations, has been reported in the initial stages of treatment with androgen deprivation therapy and prophylactic anti-androgen therapy (such as cyproterone acetate p. 770) may be added.

Medroxyprogesterone acetate p. 810 [unlicensed indication] can be used, initially for up to 10 weeks, to manage troublesome hot flushes caused by long-term androgen suppression; cyproterone acetate is an alternative if medroxyprogesterone acetate is not effective or not tolerated.

Patients who experience a reduction in libido and loss of sexual function should have access to specialist erectile dysfunction services and be considered for treatment with a phosphodiesterase type-5 inhibitor.

Osteoporosis and fatigue may also be a problem with androgen deprivation therapy. A bisphosphonate can be offered to men who have osteoporosis; denosumab p. 734 is an alternative if bisphosphonates are not appropriate. Gynaecomastia can occur with long-term (longer than 6 months) bicalutamide p. 947 treatment. Prophylactic radiotherapy (within the first month of treatment), or weekly tamoxifen p. 953 [unlicensed indication], if radiotherapy is unsuccessful, can be considered.

Metastatic prostate cancer
Bilateral orchidectomy should be offered to all patients with metastatic prostate cancer as an alternative to continuous LHRH agonist treatment. Anti-androgen monotherapy with bicalutamide [unlicensed indication] can be offered to those who are willing to accept the adverse impact on overall survival and gynaecomastia in the hope of retaining sexual function. However, if satisfactory sexual function is not maintained, stop bicalutamide and start androgen deprivation therapy.

Ablative therapy p. 946 (in combination with prednisone or prednisolone p. 678) and enzalutamide p. 947 are both recommended as options for the treatment of castration-resistant metastatic prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel p. 924-containing chemotherapy regimen.

In patients who develop hormone-relapsed metastatic tumour, chemotherapy with docetaxel can be used. It is recommended to stop the treatment with docetaxel after 10 cycles, or if severe adverse events occurred, or if there is evidence of disease progression.

Ablative therapy p. 946 (in combination with prednisone or prednisolone) is also recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients who have no or mild symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated.

In patients with hormone-relapsed prostate cancer, a corticosteroid, such as dexamethasone p. 675, can be offered as third line therapy, after androgen deprivation therapy and anti-androgen therapy. A

Other drugs used for Hormone responsive malignancy
Ethinyloxadiol, p. 759 - Norethisterone, p. 764
Abiraterone acetate

**INDICATIONS AND DOSE**

Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen (in combination with prednisone or prednisolone) or Metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated (in combination with prednisone or prednisolone)

- **BY MOUTH**

  - Adult: 1 g once daily, for dose of concurrent prednisone or prednisolone—consult product literature

**CAUTIONS**

Diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently) | history of cardiovascular disease

**CAUTIONS, FURTHER INFORMATION**

- Cardiovascular disease: Correct hypertension and hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure, uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring).

**INTERACTIONS**

→ Appendix 1: abiraterone

**SIDE-EFFECTS**

- Common or very common: Angina pectoris, arrhythmias, bone fracture, diarrhoea, dyspepsia, haematuria, heart failure, hepatic disorders, hypertension, hypertriglyceridaemia, hypokalaemia, left ventricular dysfunction, osteoporosis, peripheral oedema, rash, sepsis, urinary tract infection

- Uncommon: Adrenal insufficiency, myopathy

- Rare or very rare: Alveolitis allergic

- Frequency not known: Myocardial infarction, QT interval prolongation

**CONCEPTION AND CONTRACEPTION**

Men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method to avoid in severe impairment.

**HEPATIC IMPAIRMENT**

Manufacturer advises use with caution in moderate impairment and only if benefit clearly outweighs risk; avoid in severe impairment.

**RENAL IMPAIRMENT**

Use with caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for management of hypertension, hypokalaemia and oedema.

- Monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (updated July 2016) NICE TA259

  - Abiraterone in combination with prednisone or prednisolone is recommended as an option for the treatment of castration-resistant metastatic prostate cancer only if:

  - their disease has progressed on or after one docetaxel-containing chemotherapy regimen, and

  - the manufacturer provides abiraterone in accordance with the commercial access arrangement as agreed with NHS England.

  Patients currently receiving abiraterone in combination with prednisone or prednisolone whose disease does not meet the first criteria should be able to continue therapy until they and their clinician consider it appropriate to stop.

  - www.nice.org.uk/guidance/ta259

- Abiraterone for treating metastatic hormone-relapsed prostate cancer before chemotherapy is indicated (updated July 2016) NICE TA387

  - Abiraterone, in combination with prednisone or prednisolone, is recommended, within its marketing authorisation, as an option for treating metastatic hormone-relapsed prostate cancer:

    - in people who have no or mild symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated

    - only when the manufacturer provides abiraterone in accordance with the commercial access arrangement as agreed with NHS England.

  - www.nice.org.uk/guidance/ta387

**Scottish Medicines Consortium (SMC) decisions**

**SMC No. 764/12**

The **Scottish Medicines Consortium** has advised (August 2012) that abiraterone acetate (Zytiga®), in combination with prednisone or prednisolone, is accepted for restricted use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with docetaxel-containing chemotherapy regimen, and have received only one prior chemotherapy regimen. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland.

**SMC No. 873/13**

The **Scottish Medicines Consortium** has advised (October 2015) that abiraterone acetate (Zytiga®) in combination with prednisone or prednisolone, is accepted for use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic, after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDIcINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 23**

  - Zytiga (Janssen-Cilag Ltd)

  - Abiraterone acetate 500 mg Zytiga 500mg tablets 1 56 tablet pack £2,735.00

Apalutamide

**DRUG ACTION**

Apalutamide is an androgen receptor inhibitor that decreases tumour cell proliferation and increases apoptosis.

**INDICATIONS AND DOSE**

Prostate cancer (specialist use only)

- **BY MOUTH**

  - Adult: 240 mg once daily, for dose adjustments due to side-effects—consult product literature

**CONTRA-INDICATIONS**

History or risk of seizures
**Bicalutamide**  07-Jun-2018

- **INDICATIONS AND DOSE**
  Locally advanced prostate cancer at high risk of disease progression either alone or as adjuvant treatment to prostatectomy or radiotherapy / Locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate
  - BY MOUTH
    - Adult: 150 mg once daily
  Advanced prostate cancer, in combination with gonadorelin analogue or surgical castration
  - BY MOUTH
    - Adult: 50 mg once daily, to be started at the same time as surgical castration or at least 3 days before gonadorelin therapy

- **PROSTATE CANCER (METASTATIC) WITH THE AIM OF RETAINING SEXUAL FUNCTION.**
  - BY MOUTH
    - Adult: 150 mg once daily

- **UNLICENSED USE**
  Bicalutamide is used in prostate cancer (metastatic) with the aim of retaining sexual function, but it is not licensed for this indication.

- **CAUTIONS**
  Risk of photosensitivity—avoid excessive exposure to UV light and sunlight

- **INTERACTIONS**
  Appendix 1: bicalutamide

- **SIDE-EFFECTS**
  - Common or very common
    - Alopecia
    - Anaemia
    - Appetite decreased
    - Asthenia
    - Breast tenderness
    - Chest pain
    - Constipation
    - Depression
    - Dizziness
    - Drowsiness
    - Flatulence
    - Gastrointestinal discomfort
    - Gynaecomastia
    - Haematuria
    - Hair changes
    - Hepatic disorders
    - Hot flush
    - Hypertension
    - Memory loss
    - Muscle weakness
    - Nasal congestion
    - Oedema
    - Skin reactions
    - Weight increased
  - Uncommon
    - Angioedema
    - Interstitial lung disease

- **MONITORING REQUIREMENTS**
  Consider periodic liver function tests.

- **PATIENT AND CARER ADVICE**
  Risk of photosensitivity. Patients should be advised to consider the use of sunscreen.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **Erleada** (Janssen-Cilag Ltd)
  - **Aplutamide 60 mg** Erleada 60mg tablets | 122 tablet
  - £2,735.00

---

**Enzalutamide**  14-Jul-2018

- **INDICATIONS AND DOSE**
  Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after docetaxel therapy
  - BY MOUTH
    - Adult: 160 mg once daily, for dose adjustments due to side-effects, consult product literature

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises if concurrent use of potent inhibitors of CYP2C8 is unavoidable, reduce dose to 80 mg daily.

- **CAUTIONS**
  Alcoholism
  Bradycardia
  Brain injury
  Brain metastases
  Brain tumours
  History of QT-interval prolongation
  History or risk of seizure
  Recent cardiovascular disease
  Risk factors for QT-interval prolongation
  Stroke
  Uncontrolled hypertension

- **INTERACTIONS**
  Appendix 1: enzalutamide

- **SIDE-EFFECTS**
  - Common or very common
    - Anxiety
    - Asthenia
    - Bone fracture
    - Concentration impaired
    - Fall
    - Gynaecomastia
    - Headache
    - Hot flush
    - Hypertension
    - Memory loss
    - Muscle weakness
    - Nasal congestion
    - Oral disorders
    - Posterior reversible encephalopathy syndrome
    - QT interval prolongation
    - Throat oedema
    - Thrombocytopenia
    - Vomiting
  - Uncommon
    - Cognitive disorder
    - Leucopenia
    - Neutropenia
    - Seizure
    - Visual hallucinations
  - Frequency not known
    - Back pain
    - Diarrhoea
    - Muscle complaints
    - Muscle weakness
    - Nausea
    - Oral disorders
    - Posterior reversible encephalopathy syndrome
    - Scrotal swelling
  - Hypersensitivity
    - Photosensitivity reaction

- **CONCEPTION AND CONTRACEPTION**
  Men should use condoms during treatment and for 3 months after stopping treatment if their partner is of child-bearing potential—risk of fetal toxicity in animal studies.

- **RENAL IMPAIRMENT**
  Caution in severe impairment—no information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Enzalutamide for treating metastatic hormone-relapsed prostate cancer before chemotherapy is indicated (January 2016) NICE TA377

Enzalutamide is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients who have mild or no symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated,
and only if the manufacturer provides enzalutamide with the discount agreed in the patient access scheme. www.nice.org.uk/TA377

**HEPATIC IMPAIRMENT**

Enzalutamide is recommended, within its marketing authorisation, as an option for treating metastatic hormone-relapsed prostate cancer in adults only if, their disease has progressed during or after docetaxel-containing chemotherapy, and the manufacturer provides enzalutamide with the discount agreed in the patient access scheme. This guidance does not cover the use of enzalutamide for metastatic hormone-relapsed prostate cancer previously treated with abiraterone.

www.nice.org.uk/TA316

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

| CAUTIONARY AND ADVISORY LABELS | 25 |
| Xtandi (Astellas Pharma Ltd) | Enzalutamide 40 mg | 112 capsule | PTX |
| £2,734.67 DT = £2,734.67 |

---

**Flutamide** 28-Mar-2017

**INDICATIONS AND DOSE**

Advanced prostate cancer | Metastatic prostate cancer refractory to gonadorelin analogue therapy (monotherapy)

**CAUTIONS** Avoid excessive alcohol consumption - avoid in Acute porphyrias p. 1058 • cardiac disease (oedema reported).

**SIDE-EFFECTS**

- Common or very common Appetite abnormal • asthma • breast abnormalities • diarrhoea • drowsiness • galactorrhoea • gynaecomastia • hepatic function abnormal (sometimes fatal) • hepatitis (sometimes fatal) • insomnia • nausea • vomiting
- Rare or very rare Alopecia • anxiety • breast neoplasm • cardiovascular disorder • chest pain • constipation • cough • depression • dizziness • dyspepsia • gastrointestinal discomfort • gastrointestinal disorders • hair growth abnormal • headache • herpes zoster • hot flush • hypertension • interstitial pneumonitis • libido decreased • lupus-like syndrome • lymphoedema • malaise • muscle cramps • oedema • photosensitivity reaction • skin reactions • thirst • vision blurred
- Frequency not known QT interval prolongation
- HEPATIC IMPAIRMENT Manufacturer advises caution.

**MONITORING REQUIREMENTS** Liver function tests, monthly for first 4 months, periodically thereafter and at the first sign or symptom of liver disorder (e.g. pruritus, dark urine, persistent anorexia, jaundice, abdominal pain, unexplained influenza-like symptoms).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| Flutamide (Non-proprietary) |
| Flutamide 250 mg | Flutamide 250mg tablets | 84 tablet | POM |
| £106.24 DT = £106.24 |

---

**Diethylstilbestrol** (Stilboestrol) 06-Aug-2018

**INDICATIONS AND DOSE**

**Breast cancer in postmenopausal women**

- **BY MOUTH**
  - Adult: 10–20 mg daily

**Prostate cancer**

- **BY MOUTH**
  - Adult: 1–3 mg daily

**CAUTIONS** Cardiovascular disease

**SIDE-EFFECTS** Bone pain (in breast cancer) • breast abnormalities • cervical mucus increased • cholelithiasis • contact lens intolerance • depression • erectile dysfunction • erythema nodosum • feminisation • fluid retention • gynaecomastia • headaches • hypercalcaemia (in breast cancer) • hypertension • increased risk of thrombosis • jaundice cholestatic • mood altered • nausea • neoplasms • skin reactions • sodium retention • testicular atrophy • uterine disorders • vomiting • weight changes • withdrawal bleed

**PREGNANCY** In first trimester, high doses associated with vaginal carcinoma, urogenital abnormalities, and reduced fertility in female offspring. Increased risk of hypospadias in male offspring.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe or active impairment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| Diethylstilbestrol (Non-proprietary) |
| Diethylstilbestrol 1 mg | Diethylstilbestrol 1mg tablets | 28 tablet | POM |
| £117.85 DT = £117.61 |
| Diethylstilbestrol 5 mg | Diethylstilbestrol 5mg tablets | 28 tablet | POM |
| £185.00–£208.00 DT = £208.00 |

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES** ANTI-GONADOTROPHIN-RELEASING HORMONES

**Degarelix** 08-Feb-2019

**INDICATIONS AND DOSE**

Advanced hormone-dependent prostate cancer

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 240 mg, to be administered as 2 injections of 120 mg, then 80 mg every 28 days, dose to be administered into the abdominal region

**CAUTIONS** Diabetes • susceptibility to QT-interval prolongation

**SIDE-EFFECTS**

- Common or very common Anaemia • chills • diarrhoea • dizziness • fatigue • fever • gynaecomastia • headache • hot flush • influenza like illness • insomnia • musculoskeletal discomfort • musculoskeletal pain • nausea • sexual dysfunction • skin reactions • sweat changes • testicular disorders • weight changes
- Uncommon Alopecia • appetite decreased • arrhythmias • bone disorders • breast pain • cognitive impairment • constipation • depression • diabetes mellitus • dry mouth • dyspepsia • gastrointestinal discomfort • genitai discomfort • hyperglycaemia • hypertension • hypotension • joint disorders • malaise • muscle spasms • muscle weakness • numbness • palpitations • pelvic pain • peripheral oedema

www.getintopharma.com
Hormone responsive malignancy 949

Somatostatin analogues, malignant disease

Overview
Lanreotide, octreotide, and pasireotide are somatostatin analogues used for the treatment of hormone-responsive malignancies. They are indicated for the relief of symptoms associated with neuroendocrine tumours. Octreotide and lanreotide are indicated for the treatment of hormone-responsive malignancies, and pasireotide is indicated for the treatment of acromegaly. They work by inhibiting the release of hormones from tumours.

Indications and dose

Somatuline Autogel®

Acromegaly (if somatostatin analogue not given previously)

- By deep subcutaneous injection
  - Adult: Initially 60 mg every 28 days, adjusted according to response (consult product literature), for patients previously treated with somatostatin analogue, consult product literature for initial dose, dose to be given in the gluteal region.

Neuroendocrine (particularly carcinoid) tumours

- By deep subcutaneous injection
  - Adult: Initially 60–120 mg every 28 days, adjusted according to response, dose to be given in the gluteal region.

Unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded

- By deep subcutaneous injection
  - Adult: 120 mg every 28 days.

Somatuline LA®

Acromegaly and neuroendocrine (particularly carcinoid) tumours

- By intramuscular injection
  - Adult: Initially 30 mg every 14 days, increased to 30 mg every 7–10 days, adjusted according to response.

Thyroid tumours

- By intramuscular injection
  - Adult: Initially 30 mg every 14 days, increased to 30 mg every 10 days, adjusted according to response.

Cautions

- Cardiac disorders (including bradycardia), patients with carcinoid tumours—exclude the presence of an obstructive intestinal tumour before treatment.

Interactions

- Appendix 1: lanreotide

Side effects

- Common or very common: Biliary dilatation, lethargy, muscularkeletal pain, weight decreased.
- Uncommon: Hot flush, insomnia.
- Rare or very rare: Pancreatitis.

Pregnancy

Manufacturer advises use only if potential benefit outweighs risk.

Medicinal forms

- There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- Firmagon® (Ferring Pharmaceuticals Ltd)
  - Degarelix (as Degarelix acetate) 80 mg: Firmagon 80mg powder and solvent for solution for injection vials 1 vial [Pack] £129.37 DT + £129.37.
  - Degarelix (as Degarelix acetate) 120 mg: Firmagon 120mg powder and solvent for solution for injection vials 2 vial [Pack] £260.00 DT + £260.00.

Pituitary and hypothalamic hormones and analogues

Somatostatin analogues

- CAUTIONS: Diabetes mellitus (antidiabetic requirements may be reduced) - insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses) - may cause growth hormone-secreting pituitary tumour expansion during treatment (causing serious complications).

- SIDE-EFFECTS
  - Common or very common: Alopecia - appetite decreased - asthenia - cholecytosis - cholestasis (following long term use) - cholestasis - constipation - diabetes mellitus - diarrhoea - dizziness - gastrointestinal discomfort - gastrointestinal disorders - glucose tolerance impaired (following long term use) - headache - hyperglycaemia (long term use) - hypoglycaemia - myalgia - nausea - pruritus - sinus bradycardia - vomiting.

- CAUTIONS
  - Cardiac disorders (including bradycardia) - patients with carcinoid tumours—exclude the presence of an obstructive intestinal tumour before treatment.

- INTERACTIONS
  - Appendix 1: lanreotide.

- SIDE-EFFECTS
  - Common or very common: Biliary dilatation, lethargy, muscularkeletal pain, weight decreased.
  - Uncommon: Hot flush, insomnia.
  - Frequency not known: Pancreatitis.

- PREGNANCY
  - Manufacturer advises use only if potential benefit outweighs risk.

www.getintopharma.com
**BREAST FEEDING**  Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS**  Monitor for hypothyroidism when clinically indicated.

**NATIONAL FUNDING/ACCESS DECISIONS**

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 1988

The All Wales Medicines Strategy Group has advised (September 2018) that lanreotide (Somatuline® Autogel®) is recommended as an option for use within NHS Wales for the treatment of grade 1 and a subset of grade 2 (Ki67 index up to 10%) gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded, in adults with unresectable locally advanced or metastatic disease.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Somatuline Autogel (Ipsen Ltd)
- Lanreotide (as Lanreotide acetate) 120 mg per 1 ml Somatuline Autogel 60mg/0.5ml solution for injection pre-filled syringes
- Lanreotide (as Lanreotide acetate) 180 mg per 1 ml Somatuline Autogel 90mg/0.5ml solution for injection pre-filled syringes
- Lanreotide (as Lanreotide acetate) 240 mg per 1 ml Somatuline Autogel 120mg/0.5ml solution for injection pre-filled syringes
- Lanreotide (as Lanreotide acetate) 30 mg Somatuline LA 30mg powder and solvent for suspension for injection vials

**Powder and solvent for suspension for injection**

- Somatuline LA (Ipsen Ltd)
- Lanreotide (as Lanreotide acetate) 30 mg Somatuline LA 30mg powder and solvent for suspension for injection vials

**INTERACTIONS**

- Common or very common Arrhythmias, biliary sludge, dyspepsia, hyperbilirubinemia, hypothyroidism, skin reactions, thyroid disorder
- Uncommon Dehydration
- Frequency not known Hepatic disorders, pancreatitis acute (after administration), thrombocytopenia

**SIDE-EFFECTS**

- Effective contraception required during treatment.
- Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.
- Manufacturer advises caution (risk of increased half-life in cirrhosis).
- Manufacturer advises avoid—present in milk in animal studies.
- Manufacturer advises caution (risk of increased half-life in cirrhosis).
- Manufacturer advises consider dose reduction—consult product literature.
- Monitor thyroid function on long-term therapy.
- Monitor liver function.
- With intravenous use ECG monitoring and after dilution.

**Octreotide**

**INDICATIONS AND DOSE**

Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 50 micrograms 1–2 times a day, adjusted according to response; increments to 200 micrograms 3 times a day, higher doses may be required exceptionally; maintenance doses are variable; in carcinoid tumours, discontinue after 1 week if no effect, if rapid response required, initial dose may be given by intravenous injection (with ECG monitoring and after dilution)

**Acromegaly**

Short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 100–200 micrograms 3 times a day, discontinue if no improvement within 3 months

**Prevention of complications following pancreatic surgery**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: (consult product literature)

**Test dose before use of depot preparation**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Test dose 50–100 micrograms for 1 dose, test dose should be given if subcutaneous octreotide not previously given

**Acromegaly**

Neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide

- **BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION**
  - Adult: Initially 20 mg every 4 weeks for 3 months then adjusted according to response, increased if necessary up to 30 mg every 4 weeks, to be administered into the gluteal muscle, for acromegaly, start depot 1 day after the last dose of subcutaneous octreotide, for neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

**Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded**

- **BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION**
  - Adult: 30 mg every 4 weeks

**Reduce intestinal secretions in palliative care**

- Reduce vomiting due to bowel obstruction in palliative care

- **BY CONTINUOUS SUBCUTANEOUS INFUSION**
  - Adult: 0.25–0.5 mg/24 hours (max. per dose 0.75 mg/24 hours), occasionally doses higher than the maximum are sometimes required
Acromegaly [when surgery has failed or is inappropriate, and control with another somatostatin analogue is inadequate]

- By deep intramuscular injection
  - Adult: Initially 40 mg every 4 weeks, increased if necessary up to 60 mg every 4 weeks, dose may be increased if levels of growth hormone and/or insulin-like growth factor-1 are not fully controlled after 3 months of initial dosing, for dose adjustment due to side-effects—consult product literature

CAUTIONS

Cardiac disorders (including bradycardia)—susceptibility to QT-interval prolongation (including electrolyte disturbances)

INTERACTIONS

- Appendix 1: pasireotide

SIDE-EFFECTS

- Common or very common Adrenal insufficiency - arthralgia - hypotension - QT interval prolongation
- Uncommon Anaemia

PREGNANCY

Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises caution in moderate impairment (risk of increased exposure); avoid in severe impairment.

Dose adjustments

- With subcutaneous use for Cushing's disease Manufacturer advises reduce initial dose to 300 micrograms twice daily (max. dose 600 micrograms twice daily) in moderate impairment.
- With intramuscular use for Cushing's disease Manufacturer advises max. dose 20 mg every four weeks in moderate impairment.
- When used for Acromegaly Manufacturer advises reduce initial dose to 20 mg every four weeks (max. dose 40 mg every four weeks) in moderate impairment.

RENAL IMPAIRMENT

Manufacturer advises caution in severe impairment—increased plasma-pasireotide exposure.

MONITORING REQUIREMENTS

- Manufacturer advises consider monitoring pituitary function before treatment initiation and periodically thereafter.
- With subcutaneous use Manufacturer advises monitor liver function before treatment initiation, after 1, 2, 4, 8, and 12 weeks of treatment, and thereafter as clinically indicated. Manufacturer advises assess glycaemic status before treatment initiation, weekly for the first 2–3 months of treatment, over the first 2–4 weeks after any dose increase, periodically thereafter, and 3 months after treatment is complete—if glycaemic control is poor, diabetes management and monitoring should be intensified before and during treatment. Manufacturer advises monitor ECG and electrolytes before treatment initiation, after one week of treatment, and periodically thereafter.
- With intramuscular use Manufacturer advises monitor liver function before treatment initiation, after the first 2–3 weeks of treatment, then monthly for 3 months, and thereafter as clinically indicated. Manufacturer advises assess glycaemic status before treatment initiation, weekly for the first 3 months of treatment, over the first 4–6 weeks after any dose increase, periodically thereafter, and 3 months after treatment is complete—if glycaemic control is poor, diabetes management and monitoring should be intensified before and during treatment. Manufacturer advises monitor ECG and electrolytes before treatment initiation, after 3 weeks of treatment, and periodically thereafter.

Pasireotide

INDICATIONS AND DOSE

Cushing's disease [when surgery has failed or is inappropriate]

- By subcutaneous injection
  - Adult: Initially 600 micrograms twice daily for 2 months, then increased if necessary to 900 micrograms twice daily, consider discontinuation if no response after 2 months of treatment, for dose adjustment due to side-effects—consult product literature

- By deep intramuscular injection
  - Adult: Initially 10 mg every 4 weeks, increased if necessary up to 40 mg every 4 weeks, dose may be titrated every 2–4 months based on response and tolerability, consider discontinuation if no clinical benefit observed, for dose adjustment due to side-effects—consult product literature
PROGESTOGENS

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Signifor (Novartis Pharmaceuticals UK Ltd)
  - Pasireotide (as Pasireotide diaspargate) 300 microgram per 1 ml Signifor 0.3mg/1ml solution for injection ampoules | 60 ampoule (PO) £2,800.00
  - Pasireotide (as Pasireotide diaspargate) 600 microgram per 1 ml Signifor 0.6mg/1ml solution for injection ampoules | 60 ampoule (PO) £3,240.00
  - Pasireotide (as Pasireotide diaspargate) 900 microgram per 1 ml Signifor 0.9mg/1ml solution for injection ampoules | 60 ampoule (PO) £3,240.00

Powder and solvent for suspension for injection
- Signifor (Novartis Pharmaceuticals UK Ltd)
  - Pasireotide (as Pasireotide pamoate) 10 mg Signifor 10mg powder and solvent for suspension for injection vials | 1 vial (PO) £2,300.00
  - Pasireotide (as Pasireotide pamoate) 20 mg Signifor 20mg powder and solvent for suspension for injection vials | 1 vial (PO) £2,300.00
  - Pasireotide (as Pasireotide pamoate) 30 mg Signifor 30mg powder and solvent for suspension for injection vials | 1 vial (PO) £2,300.00
  - Pasireotide (as Pasireotide pamoate) 40 mg Signifor 40mg powder and solvent for suspension for injection vials | 1 vial (PO) £2,300.00
  - Pasireotide (as Pasireotide pamoate) 60 mg Signifor 60mg powder and solvent for suspension for injection vials | 1 vial (PO) £2,300.00

Hormone responsive breast cancer

Antineoplastic Drugs > Anti-oestrogens

Fulvestrant 14-Jul-2018

INDICATIONS AND DOSE
Oestrogen-receptor-positive breast cancer
- By deep intramuscular injection
- Adult: 500 mg every 2 weeks for the first 3 doses, then 500 mg every month, to be administered into the buttock

INTERACTIONS
- Appendix 1: fulvestrant

SIDE-EFFECTS
- Uncommon Hepatic disorders - vaginal discharge
- Frequency not known Myalgia

PREGNANCY
- Manufacturer advises avoid—increased incidence of fetal abnormalities and death in animal studies.

 BREAST FEEDING
- Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
- Manufacturer advises caution in mild to moderate impairment—risk of increased exposure; avoid in severe impairment—no information available.

RENAL IMPAIRMENT
- Manufacturer advises caution if creatinine clearance less than 30 ml/minute—no information available.

DIRECTIONS FOR ADMINISTRATION
- 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock.
Tamoxifen

**DRUG ACTION** An anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct in the treatment of female infertility.

**INDICATIONS AND DOSE**

- **Pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen**
  - BY MOUTH
    - Adult: 20 mg daily
  - **Anovulatory infertility**
    - BY MOUTH
      - Adult: Initially 20 mg daily on days 2, 3, 4 and 5 of cycle, if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs

**Gynaecomastia** (prevention in men undergoing long-term bicalutamide treatment, if radiotherapy unsuccessful)

- BY MOUTH
  - Adult: 20 mg once weekly

**Breast cancer** (chemoprevention in women at moderate-to-high risk)

- BY MOUTH
  - Adult: 20 mg daily for 5 years

**UNLICENSED USE** Tamoxifen may be used as detailed below, although these situations are considered outside the scope of its licence:

- **CONTRA-INDICATIONS** Treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

**CAUTIONS**

- Acute porphyrias p. 1058

**INTERACTIONS**

- **Common or very common**
  - Alopecia, anaemia, cataract, cerebral ischaemia, constipation, diarrhoea, dizziness, embolism and thrombosis, fatigue, fluid retention -

**SIDE-EFFECTS**

- Headache, hepatic disorders, hot flush, hypersensitivity, hypertriglyceridaemia, muscle complaints, nausea, neoplasms, retinopathy, sensation abnormal, skin reactions, taste altered, uterine disorders, vaginal haemorrhage, vomiting, vulvovaginal disorders

- **Uncommon**
  - Hypercalcaemia, interstitial pneumonitis, leucopenia, pancreatitis, thromboembolism, vision disorders

- **Rare or very rare**
  - Agranulocytosis, angioedema, corneal changes, cutaneous lupus erythematosus, cutaneous vasculitis, cystic ovarian swelling, nerve disorders, neutropenia, radiation recall reaction, Stevens-Johnson syndrome, tumour flare

**FURTHER INFORMATION**

- **SIDE-EFFECTS**
  - Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen.

- **Risk of thromboembolism** Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment and initiating anticoagulant measures).

**CONCEPTION AND CONTRACEPTION** Unless being used in the treatment of female infertility, effective contraception must be used during treatment and for 2 months after stopping. Patients being treated for infertility should be warned that there is a risk of multiple pregnancy (rarely more than twins).

**PREGNANCY** Avoid—possible effects on fetal development.

**BREAST FEEDING** Suppresses lactation. Avoid unless potential benefit outweighs risk.

**PATIENT AND CARER ADVICE**

- Endometrial changes Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly.

- Thromboembolism Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Toremifene**

**INDICATIONS AND DOSE**

- Hormone-dependent metastatic breast cancer in postmenopausal women
  - BY MOUTH
    - Adult: 60 mg daily

**CONTRA-INDICATIONS** Bradycardia, electrolyte disturbances (particularly uncorrected hypokalaemia), endometrial hyperplasia, heart failure with reduced left-
HORMONE ANTAGONISTS AND RELATED AGENTS

Anastrozole

28-May-2018

INDICATIONS AND DOSE
Adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women
Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy
Advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen

SIDE-EFFECTS
Frequency not known

CONTRA-INDICATIONS
Not for postmenopausal women

CAUTIONS
Susceptibility to osteoporosis

LICENSED USE
Anastrozole is used for chemoprevention of breast cancer, but it is not licensed for this indication.

CONTRA-INDICATIONS
Not indicated for premenopausal women

CAUTIONS
Avoid in Acute porphyrias p. 1058.

INTERACTIONS
Appendix 1: toremifene

SCOTTISH MEDICINES CONSORTIUM (SMC) decisions
The Scottish Medicines Consortium (SMC) has advised (August 2005 and October 2006) that anastrozole (Arimidex®) is accepted for restricted use within NHS Scotland, within the licensed indications, for early breast cancer and early invasive breast cancer.

NATIONAL FUNDING/ACCESS DECISIONS

ARIMIDEX®

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (August 2005 and October 2006) that anastrozole (Arimidex®) is accepted for restricted use within NHS Scotland, within the licensed indications, for early breast cancer and early invasive breast cancer.

NATIONAL FUNDING/ACCESS DECISIONS

Exemestane

12-Jul-2018

INDICATIONS AND DOSE
Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy
Advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed

SIDE-EFFECTS
Common or very common

CONTRA-INDICATIONS
Not indicated for premenopausal women

INTERACTIONS
Appendix 1: exemestane

CAUTIONS
Avoid in Acute porphyrias p. 1058.

LICENSED USE
Exemestane is used for chemoprevention of breast cancer, but it is not licensed for this indication.

CONTRA-INDICATIONS
Not for postmenopausal women

CAUTIONS
Susceptibility to osteoporosis

SIDE-EFFECTS
Frequency not known

SCOTTISH MEDICINES CONSORTIUM (SMC) decisions
The Scottish Medicines Consortium has advised (October 2005) that exemestane (Aromasin®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

NATIONAL FUNDING/ACCESS DECISIONS
Immunotherapy responsive malignancy

ANTINEOPLASTIC DRUGS

Talimogene laherparepvec

- **DRUG ACTION** Talimogene laherparepvec is an oncolytic immunotherapy derived from herpes simplex virus type-1 which causes tumour lysis and the release of tumour-derived antigens.

- **INDICATIONS AND DOSE**
  - Unresectable metastatic melanoma with no bone, brain, or visceral disease
  - By intraleisional injection
  - Adult: consult product literature

- **CONTRA-INDICATIONS**
  - Severely immunocompromised patients

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Manufacturer advises caution in patients who are severely immunocompromised, for example, those with severe congenital or acquired cellular and/or humoral immune deficiency—may be at increased risk of disseminated herpetic infection.

- **CAUTIONS**
  - Administration of antivirals (may interfere with effectiveness of Imlygic®) - autoimmune disease - immunocompromised patients - multiple myeloma (risk of plasmacytoma at injection site)

- **CAUTIONS, FURTHER INFORMATION**
  - Immunocompromised patients
  - Manufacturer advises caution in patients who are immunocompromised, for example, those with HIV/AIDS, leukaemia, lymphoma, common variable immunodeficiency, or in those who require chronic high-dose steroids or other immunosuppressive agents—risk of disseminated herpetic infection.

- **SIDE-EFFECTS**
  - Common or very common - anaemia, anxiety, arthralgia, chill, confusion, constipation, cough, deep vein thrombosis, dehydration, depression, diarrhoea, dizziness, dyspnoea exertional, ear pain, fatigue, fever, flushing, gastrointestinal discomfort, headache, hypertension, immune-mediated events, increased risk of infection, influenza like illness, insomnia, malaise, myalgia, nausea, neoplasm complications, oropharyngeal pain, pain, peripheral oedema, post procedural infection, respiratory disorders, vasculitis

  - Uncommon - Glomerulonephritis - injection site plasmacytoma - post procedural infection - respiratory disorders - vasculitis

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Necrosis or ulceration of tumour tissue may occur, and impaired healing at the injection site has been reported.
  - Manufacturer advises careful wound care and infection precautions; if persistent infection or delayed healing develops, the risks and benefits of continuing treatment should be considered.
Imlygic
Talimogene laherparepvec is recommended as an option for treating unresectable metastatic melanoma (September 2016)

Talimogene laherparepvec is recommended as an option for treating unresectable, regionally or distantly metastatic (Stage IIIb, IIIc or IV Melanoma) melanoma that has not spread to bone, brain or other internal organs, only if:

- treatment with systemically administered immunotherapies is not suitable and,
- the manufacturer provides talimogene laherparepvec with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA410

- CONCEPTION AND CONTRACEPTION Manufacturer advises use of latex condoms.
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- DIRECTIONS FOR ADMINISTRATION Consult product literature for information on injection technique.
- HANDLING AND STORAGE Manufacturer advises caution in handling—risk of accidental exposure; avoid preparation or administration if immunocompromised or pregnant. For further information, see the Physician’s Brochure provided by the manufacturer. Store and transport frozen at -90°C to -70°C—consult product literature for further information on thawing and storage after thawing.
- PATIENT AND CARER ADVICE Manufacturer advises that patients and carers should be informed about the risks of treatment, advised to avoid touching or scratching injection sites, and to keep these sites covered with occlusive dressings. Close contacts should avoid direct contact with injected lesions or body fluids of treated patients during treatment and for up to 30 days after last treatment—if exposed, clean the affected area and seek medical attention if symptoms of herpetic infection develop; close contacts who are immunocompromised or pregnant should not be exposed to potentially contaminated materials. For further information, see the Information for Patients and Close Contacts provided by the manufacturer.

Provide patient alert card—record batch number for each administration of Imlygic®.

Driving and skilled tasks Manufacturer advises that patients and their carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness and confusion.

- NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Talimogene laherparepvec for treating unresectable metastatic melanoma (September 2016)

Talimogene laherparepvec is recommended as an option for treating unresectable, regionally or distantly metastatic (Stage IIIb, IIIc or IV Melanoma) melanoma that has not spread to bone, brain or other internal organs, only if:

- treatment with systemically administered immunotherapies is not suitable and,
- the manufacturer provides talimogene laherparepvec with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

IMMUNOSTIMULANTS > INTERFERONS

Interferon alfa

- DRUG ACTION Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

- INDICATIONS AND DOSE

INTRA® PEN

Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymphoid or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma

- BY SUBCUTANEOUS INJECTION
  - Adult: (consult local protocol)

INTRA® VIALS

Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymphoid or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma

- BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - Adult: (consult local protocol)

ROFERON-A®

Chronic myelogenous leukaemia | Hairy cell leukaemia | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | AIDS-related Kaposi’s sarcoma | Advanced renal cell carcinoma | Progressive cutaneous T-cell lymphoma | Follicular non-Hodgkin’s lymphoma

- BY SUBCUTANEOUS INJECTION
  - Adult: (consult local protocol)

- CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION For contra-indications consult product literature and local treatment protocol.

- CAUTIONS

CAUTIONS, FURTHER INFORMATION For cautions consult product literature and local treatment protocol.

- INTERACTIONS → Appendix 1: interferons

- SIDE-EFFECTS

  - Common or very common Alopecia | anaemia | anxiety | appetite abnormal | arrhythmias | arthritis | asthma | atioventricular block | breast pain | chest pain | chills | concentration impaired | confusion | constipation | cough | cyanosis | decreased leucocytes | dehydration | depression | diarrhoea | dizziness | drowsiness | dry mouth | dyspnoea | electrolyte imbalance | eye disorders | eye inflammation | eye pain | fever | flushing | gastrointestinal discomfort | haemorrhage | headaches | hepatic disorders | hyperhidrosis | hypertension | hyperthyroidism | hyperuricaemia | hypothyroidism | increased risk of infection | influenza like illness | lymphadenopathy | malaise | menstrual cycle irregularities | mood altered | muscle complaints | nasal complaints | nausea | oedema | oral disorders | pain | palpitations | respiratory disorders | sensation abnormal | sexual dysfunction | skin reactions | sleep disorders | taste altered | thirst | thrombocytopenia | tinnitus | tremor | urinary frequency increased | vaginal disorder | vertigo | vision disorders | vomiting | weight decreased

  - Uncommon Behaviour abnormal | hypotension | memory loss | nerve disorders | pericarditis | proteinuria | psychiatric disorders

  - Rare or very rare Agranulocytosis | angioedema | aplastic anaemia | autoimmune disorder | cardiac arrest |
cardiomyopathy - central nervous system haemorrhage - cerebrovascular insufficiency - coma (more common with high doses in the elderly) - congestive heart failure - consciousness impaired - diabetes mellitus - embolism and thrombosis - encephalopathy - gastrointestinal disorders - haemolytic anaemia - hallucination - hearing impairment - hyperglycaemia - hyperlipidaemia - hypertriglyceridaemia (sometimes severe) - injection site necrosis - mucosal dryness - myocardial infarction - myocardial ischaemia - myopathy - nph reticulocyte syndrome - pancreatitis - peripheral ischaemia - psychosis - pulmonary oedema - renal impairment - retinopathy - sarcoidosis - seizure (more common at high doses) - sepsis - severe cutaneous adverse reactions (SCARs) - suicidal tendencies - systemic lupus erythematosus (SLE) - thyroid disorder - ulcerative colitis - vasculitis

- Frequency not known: Hepatitis B reactivation - neutropenia - pericardial effusion - pulmonary arterial hypertension - pure red cell aplasia - tongue discoloration - transplant rejection

- CONCEPTION AND CONTRACEPTION: Effective contraception required during treatment—consult product literature.

- PREGNANCY: Avoid unless potential benefit outweighs risk (toxicity in animal studies).

- BREAST FEEDING: Unlikely to be harmful.

- HEPATIC IMPAIRMENT: Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. Monitoring Close monitoring required in mild to moderate hepatic impairment.

- RENAL IMPAIRMENT: Avoid in severe renal impairment. Monitoring Close monitoring required in mild to moderate renal impairment.

- MONITORING REQUIREMENTS: Monitoring of lipid concentration is recommended.

- DIRECTIONS FOR ADMINISTRATION
  - INTRONA A® VIALS: IntronaA® injection vials for subcutaneous injection or intravenous infusion.

- NATIONAL FUNDING/ACCESS DECISIONS
  - NICE decisions
    - Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200

  - Interferon alfa-2b 25 mega u per 1 ml Introna 30million units/1.2ml solution for injection multidose pens | 1 pre-filled disposable injection (POD) £124.72
  - Interferon alfa-2b 50 mega u per 1 ml Introna 60million units/1.2ml solution for injection multidose pens | 1 pre-filled disposable injection (POD) £243.45

- Roferon-A (Roche Products Ltd)
  - Interferon alfa-2a 6 mega u per 1 ml Roferon-A 3million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (POD) £14.20 DT = £14.20
  - Interferon alfa-2a 9 mega u per 1 ml Roferon-A 4.5million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (POD) £21.29 DT = £21.29
  - Interferon alfa-2a 12 mega u per 1 ml Roferon-A 6million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (POD) £28.37 DT = £28.37

- CONTRA-INDICATIONS: Simultaneous administration of foreign proteins including immunological products (such as vaccines)—risk of exaggerated immune response

- CAUTIONS: Arrhythmias - cardiac disease - congestive heart failure - ischaemia - seizure disorders (including seizures associated with fever)

- SIDE-EFFECTS
  - Common or very common: Abdominal pain - arthralgia - back pain - chills - depression - diarrhoea - fatigue - fever - headache - nausea - rash - vomiting

- CONCEPTION AND CONTRACEPTION: Effective contraception required during treatment—consult product literature.

- PREGNANCY: Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).

- BREAST FEEDING: Manufacturers advise avoid—no information available.

- HEPATIC IMPAIRMENT: Manufacturer advises caution in severe impairment (increased risk of accumulation).

- RENAL IMPAIRMENT: Manufacturer advises caution in severe impairment—risk of accumulation.

- MONITORING REQUIREMENTS: Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.

- MEDICINAL FORMS: There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ImmuKin (Horizon Pharma Ireland Ltd)
  - Interferon gamma-1b (recombinant human) 200 microgram per 1 ml Immukin 100micrograms/0.5ml solution for injection vials | 6 vial (POD) £450.00
IMMUNOSTIMULANTS > INTERLEUKINS

Aldesleukin

- **Drug Action** Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival.

- **Indications and Dose**
  - Metastatic renal cell carcinoma (specialist use only)
  - By subcutaneous injection, or by intravenous infusion
  - Adult: (consult product literature)

- **Unlicensed Use** Aldesleukin is not licensed for use in patients in whom all three of the following prognostic factors are present: performance status of Eastern Cooperative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment.

- **Contra-Indications** Consult product literature for information about aldesleukin contra-indications.

- **Cautions** Consult product literature for information about aldesleukin cautions.

- **Side-effects**
  - Common or very common
    - Acidity
    - Alopea
    - Anaemia
    - Anxiety
    - Appetite decreased
    - Arrhythmias
    - Arthralgia
    - Ascites
    - Asthenia
    - Cardiovascular disorders
    - Chest pain
    - Chills
    - Coagulation disorders
    - Confusion

IMMUNOSTIMULANTS > OTHER

Bacillus Calmette-Guérin

- **Drug Action** Bacillus Calmette-Guérin is a live attenuated strain derived from Mycobacterium bovis.

- **Indications and Dose**
  - Bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection
  - By Intravesical instillation
  - Adult: (consult product literature)

- **Contra-Indications** Fever of unknown origin - HIV infection - impaired immune response - severe haematuria - tuberculosis - urinary-tract infection

- **Cautions** Bladder injury (delay administration until mucosal damage healed) - traumatic catheterisation (delay administration until mucosal damage healed) - urethral injury (delay administration until mucosal damage healed)

- **Side-effects**
  - Common or very common
    - Appetite decreased
    - Arthritis
    - Bladder cramps
    - Bladder disorders
    - Cardiovascular event
    - Chills
    - Cystitis
    - Diarrhoea
    - Fatigue
    - Fever

    - Interstitial lung disease
    - Nephritis
    - Renal abscess
    - Renal failure

- **Pregnancy** Avoid.

- **Breast Feeding** Avoid.

- **Pre-Treatment Screening** Screen for active tuberculosis (contra-indicated if tuberculosis confirmed).

- **Medicinal Forms** There can be variation in the licensing of different medicines containing the same drug.
  - Powder for reconstitution for instillation
    - OncoTICE (Merck Sharp & Dohme Ltd)
    - TICE strain Bacillus of Calmette-Guérin 12.5 mg OncoTICE 12.5mg powder for reconstitution for instillation vials | 1 vial | £71.61 (Hospital only)

Mifamurtide

- **Indications and Dose**
  - Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)
  - By Intravenous infusion
  - Adult: Infusion to be given over 1 hour (consult product literature or local protocols)

- **Unlicensed Use** Not licensed for use in patients over 30 years of age at initial diagnosis.

- **Cautions** Asthma—consider prophylactic bronchodilator therapy - chronic obstructive pulmonary disease—consider
prophylactic bronchodilator therapy · history of autoimmune disease · history of collagen disease · history of inflammatory disease

- **INTERACTIONS** → Appendix 1: mifamurtide
- **SIDE-EFFECTS**
  - **Common or very common**
    - Alopecia · anaemia · anxiety · appetite decreased · arthralgia · asthenia · cancer pain · chest discomfort · chills · confusion · constipation · cough · cyanosis · dehydration · depression · diarrhoea · dizziness · drowsiness · dysmenorrhoea · dyspnoea · feeling cold · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · hearing loss · hepatic pain · hyperhidrosis · hypertension · hypokalaemia · hypotension · hypothermia · increased risk of infection · insomnia · laryngeal pain · leucopenia · malaise · mucositis · muscle complaints · musculoskeletal stiffness · nasal congestion · nausea · neutropenia · oedema · pain · pallor · palpitations · respiratory disorders · sensation abnormal · sepsis · skin reactions · tachycardia · thrombocytopenia · tinnitus · tremor · urinary disorders · vertigo · vision blurred · vomiting · weight decreased
- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception required.
- **PREGNANCY**
  - Avoid.
- **BREAST FEEDING**
  - Avoid—no information available.
- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in moderate impairment (risk of increased half-life and exposure); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT**
  - Use with caution—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor renal function, hepatic function and clotting parameters.
  - Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

### Mifamurtide decisions

- **Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235**
  - Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.
  - [www.nice.org.uk/TA235](http://www.nice.org.uk/TA235)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Mifamurtide 4 mg**
  - Mepact 4mg powder for suspension for infusion vials | 1 vial | £2.375.00

---

### Immunotherapy responsive malignancy

#### IMMUNOSUPPRESSANTS

- **THALIDOMIDE AND RELATED ANALOGUES**

### Lenalidomide

- **DRUG ACTION**
  - Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties.

#### INDICATIONS AND DOSE

- **Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with dexamethasone until disease progression**
  - **BY MOUTH**
    - Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature.

- **Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with melphalan and prednisone followed by maintenance monotherapy**
  - **BY MOUTH**
    - Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles for up to 9 cycles, for doses of melphalan and prednisone, and dose adjustments due to side-effects, consult product literature.

- **Multiple myeloma in patients who have received at least one prior therapy, given in combination with dexamethasone**
  - **BY MOUTH**
    - Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature.

- **Treatment of transfusion-dependent anaemia due to low-or intermediate-1-risk myelodysplastic syndromes (MDS) associated with an isolated deletion 5q cytogenetic abnormality when other treatment options are insufficient or inadequate**
  - **BY MOUTH**
    - Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature.

#### CAUTIONS

- **High tumour burden—risk of tumour lysis syndrome · patients with risk factors for myocardial infarction**

#### CAUTIONS, FURTHER INFORMATION

- **Thromboembolism**
  - Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors.
- **Second primary malignancy**
  - Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

- **INTERACTIONS** → Appendix 1: lenalidomide
- **SIDE-EFFECTS**
  - **Common or very common**
    - Anaemia · appetite decreased · arthralgia · asthenia · atrial fibrillation · chills · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte imbalance · embolism and thrombosis · fall · fever · gastrointestinal discomfort · haemorrhage · headache · heart failure · hyperglycaemia · hypertension · hyperthyroidism · hypotension · hypothyroidism · increased risk of infection · influenza like illness · insomnia · iron overload · lethargy · mood altered · muscle complaints · muscle weakness · myocardial infarction ·
nauae - neoplasms - neutropenia - night sweats - pain - pancytopenia - paraesthesia - peripheral neuropathy - peripheral oedema - renal failure - rhinorrhoea - sepsis - skin reactions - taste altered - thrombocytopenia - toothache - tumour flare - vertigo - vomiting - weight decreased
▶ Uncommon Angioedema
▶ Rare or very rare Severe cutaneous adverse reactions (SCARs) - tumour lysis syndrome
▶ Frequency not known Acquired haemophilia - gastrointestinal disorders - hepatic disorders - hypersensitivity - hypersensitivity vasculitis - interstitial pneumonitis - pancreatitis - reactivation of infections

SIDE-EFFECTS, FURTHER INFORMATION
If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.
Discontinue permanently if angioedema, exfoliative or bullous rash, or if Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected.

CONCEPTION AND CONTRACEPTION
For women of childbearing potential, pregnancy must be excluded before starting treatment with lenalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

PREGNANCY
Important: teratogenic risk. Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.

BREAST FEEDING
Discontinue breast-feeding—no information available.

RENAL IMPAIRMENT
Dose adjustments Reduce dose in moderate to severe impairment—consult product literature.

MONITORING REQUIREMENTS
Monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature).
Monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard anticoagulation therapy; lenalidomide may be restarted with continued anticoagulation therapy once thromboembolic event resolved—consult product literature).
Monitor thyroid function.
Monitor for signs and symptoms of peripheral neuropathy.
Monitor visual acuity regularly (risk of cataract).

PATIENT AND CARER ADVICE
Thromboembolism Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.
Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Conception and contraception Patient counselling is advised for lenalidomide capsules (pregnancy and contraception).

NATIONAL FUNDING/ACCESS DECISIONS
NICE decisions
▶ Lenalidomide for treating myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality (September 2014) NICE TA322
Lenalidomide is recommended as an option, within its marketing authorisation, for treating transfusion-dependent myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality when other therapeutic options are insufficient or inadequate, with the following condition:
• the drug cost of lenalidomide (excluding any related costs) for people who remain on treatment for more than 26 cycles (each of 28 days; normally a period of 2 years) will be met by the company.
www.nice.org.uk/guidance/ta322
▶ Lenalidomide for the treatment of multiple myeloma (updated April 2014) NICE TA171
Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles.
www.nice.org.uk/guidance/ta171
▶ Ixazomib with lenalidomide and dexamethasone for treating relapsed or refractory multiple myeloma (February 2018) NICE TA505
Ixazomib, with lenalidomide and dexamethasone, is recommended for use within the Cancer Drugs Fund as an option for treating multiple myeloma in adults only if:
• they have already had 2 or 3 lines of therapy, and
• the conditions in the managed access agreement for ixazomib are followed.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
www.nice.org.uk/guidance/ta505

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (May 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior therapies.
The Scottish Medicines Consortium has advised (April 2014) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for treatment of multiple myeloma in adults to use at first relapse in those who have received prior therapy with bortezomib and for whom thalidomide has not been tolerated or is contra-indicated.
The Scottish Medicines Consortium has advised (December 2015) that lenalidomide is accepted for restricted use within NHS Scotland for patients with previously untreated multiple myeloma who are not eligible for transplant and when thalidomide-containing regimens are unsuitable.

www.getintopharma.com
INTERACTIONS
Second primary malignancy

DRUG ACTION
Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-melanoma tumoricidal activity.

INDICATIONS AND DOSE
Treatment of relapsed and refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment (in combination with dexamethasone)

DRUG COMBINATION
- Adult: 4 mg once daily for 21 consecutive days of repeated 28–day cycles, for doses of dexamethasone and dose adjustment due to side effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS
- Manufacturer advises halve dose with concurrent use of potent inhibitors of CYP1A2 and ciprofloxacin.

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B REACTIVATION
An EU wide review has concluded that pomalidomide can cause hepatitis B reactivation; the MHRA recommends to establish hepatitis B virus status in all patients before initiation of treatment.

CAUSATIONS
- Cardiac disease - cardiac risk factors - hepatitis B infection - high tumour burden - risk of tumour lysis syndrome - interstitial lung disease — discontinue if suspected - peripheral neuropathy

CAUTIONS, FURTHER INFORMATION
- Thromboembolism: Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis should be considered, particularly in patients with additional risk factors.
- Second primary malignancy: Patients should be carefully evaluated before and during treatment with pomalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.
- Hepatitis B infection: The MHRA advises that those with a history of hepatitis B infection should be closely monitored for signs and symptoms of active infection throughout treatment; expert advice should be sought for patients who test positive for active infection.

INTERACTIONS
- Appendix 1: pomalidomide

SIDE-EFFECTS
- Uncommon: Hepatitis - hyperbilirubinaemia - neoplasms - stroke - tumour lysis syndrome
- Frequency not known: Hepatitis B reactivation

CONCEPTION AND CONTRACEPTION
For women of childbearing potential, pregnancy must be excluded before starting treatment with pomalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

PREGNANCY
- Important: teratogenic risk.
- Breast feeding: Avoid—present in milk in animal studies.
- Hepatic impairment: Manufacturer advises caution (risk of increased exposure).
- Renal impairment: Manufacturer advises caution—no information available.

MONITORING REQUIREMENTS
- Manufacturer advises monitor full blood count before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).
- Manufacturer advises monitor for arterial or venous thromboembolism.
- Manufacturer advises monitoring for signs and symptoms of cardiac failure.
- Manufacturer advises monitor for acute onset or unexplained worsening of respiratory symptoms.
- Manufacturer advises monitor liver function for 6 months after initiation, then as clinically indicated.

PRESCRIBING AND DISPENSING INFORMATION
- Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

PATIENT AND CARER ADVICE
- Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.
- Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Conception and contraception: Patient counselling is advised for pomalidomide capsules (pregnancy and contraception).

www.getintopharma.com
Thalidomide

07-Feb-2009

Thalidomide has immunomodulatory and anti-inflammatory activity.

**INDICATIONS AND DOSE**
First-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors) in combination with melphalan and prednisolone.

**CAUTIONS**
High tumour burden—risk of tumour lysis syndrome - patients aged 76 years and over—increased risk of serious side-effects

**CONCEPTION AND CONTRACEPTION**
Women of child-bearing potential, pregnancy must be excluded prior to starting treatment with thalidomide (perform pregnancy test on initiation or within 3 days prior to initiation).

**PREGNANCY**
Important: teratogenic risk.

**BREAST FEEDING**
Avoid present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in severe impairment (no information available).

**RENAL IMPAIRMENT**
Caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**
Monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).

**PREScribing AND DISPensing INFORMATION**
Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a complete Prescription Authorisation Form.

**PATIENT AND CARER ADVICE**
Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, increased risk of infection, malaise, movement disorders—neutropenia—peripheral neuropathy—peripheral oedema—respiratory disorders—sensation abnormal—skin reactions—thrombocytopenia—tremor, vomiting—frequency not known—atrioventricular block—gastrointestinal disorders—gastrointestinal haemorrhage—hearing impairment—hypothyroidism—liver disorder—menstrual cycle irregularities—myocardial infarction—neoplasms—pancreatitis—pancytopenia—posterior reversible encephalopathy syndrome (PRES)—pulmonary hypertension—reactivation of infections—renal failure—seizure—sexual dysfunction—toxic epidermal necrolysis—tumour lysis syndrome—SIDE-EFFECTS, FURTHER INFORMATION:

**Rash** If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.

**Peripheral neuropathy** If symptoms suggestive of peripheral neuropathy develop (such as paraesthesia, abnormal coordination, or weakness) dose reduction, dose interruption, or treatment discontinuation may be necessary—consult product literature.

**EFFECTS, FURTHER INFORMATION**

**PATIENTS AND CARERS**

**IMMUNOTHERAPY RESPONSIVE MALIGNANCY**

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Pomalidomide for multiple myeloma previously treated with lenalidomide and bortezomib (January 2017) NICE TA427
- Pomalidomide (Imnovid®), in combination with low-dose dexamethasone, is recommended as an option for treating multiple myeloma in adults at third or subsequent relapse (that is, after three previous treatments including both lenalidomide and bortezomib), only when the manufacturer provides pomalidomide with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta427

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

| CAUTIONARY AND ADVISORY LABELS | 3, 25 |
| EXPERTISES: May contain Propylene glycol |  |
| Pomalidomide |  |
| Pomalidomide 1 mg | Innovid 1mg capsules | 21 capsule | £884.00 |
| Pomalidomide 2 mg | Innovid 2mg capsules | 21 capsule | £884.00 |

**SIDE-EFFECTS**

- Common or very common Anaemia - arrhythmias - asthenia - confusion - constipation - decreased leucocytes - depression - dizziness - dryness - dry mouth - dyspnoea - embolism and thrombosis - fever - heart failure - increased risk of infection - malaise - movement disorders—neutropenia—peripheral neuropathy—peripheral oedema—respiratory disorders—sensation abnormal—skin reactions—thrombocytopenia—tremor—vomiting
- Frequency not known—atrioventricular block—gastrointestinal disorders—gastrointestinal haemorrhage—hearing impairment—hypothyroidism—liver disorder—menstrual cycle irregularities—myocardial infarction—neoplasms—pancreatitis—pancytopenia—posterior reversible encephalopathy syndrome (PRES)—pulmonary hypertension—reactivation of infections—renal failure—seizure—sexual dysfunction—toxic epidermal necrolysis—tumour lysis syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**

**Rash** If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.

**Peripheral neuropathy** If symptoms suggestive of peripheral neuropathy develop (such as paraesthesia, abnormal coordination, or weakness) dose reduction, dose interruption, or treatment discontinuation may be necessary—consult product literature.

**CONCEPTION AND CONTRACEPTION**
For women of child-bearing potential, pregnancy must be excluded before starting treatment with thalidomide (perform pregnancy test on initiation or within 3 days prior to initiation).

Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

**PREGNANCY**
Important: teratogenic risk.

**BREAST FEEDING**
Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in severe impairment (no information available).

**RENAL IMPAIRMENT**
Caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**
Monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).

**Monitor for arterial or venous thromboembolism.**

**Monitor patients for signs and symptoms of peripheral neuropathy.**

**Hepatic disorder**
Liver function should be monitored, particularly when there is history of, or concurrent viral liver infection, or when thalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

**PREScribing AND DISPensing INFORMATION**
Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a complete Prescription Authorisation Form.

**PATIENT AND CARER ADVICE**
Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as
Photodynamic therapy responsive malignancy

PHOTOSENSITISERS

Porfimer sodium

- **DRUG ACTION** Porfimer sodium accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

- **INDICATIONS AND DOSE**
  - Photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer
    - By slow intravenous injection
  - Adult: (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058; concomitant photosensitising treatment; diseases exacerbated by light; elective surgery; ophthalmic slit-lamp examination for 30 days after administration

- **SIDE-EFFECTS** Alopecia; bone marrow depression; constipation; dizziness; dysphagia; haemorrhage; hyperuricaemia; nausea; oedema; pain; photosensitivity reaction (sunscreens ineffective); skin reactions; stomatitis; thromboembolism; tumour lysis syndrome; vomiting

- **PREGNANCY** Manufacturer advises avoid breastfeeding for at least 1 month after treatment—no information available.

- **BREAST FEEDING** No information available—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (may increase duration of photosensitivity); avoid in severe impairment (no information available).

- **PATIENT AND CARER ADVICE** Photosensitivity Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for injection**
    - Photofrin (Axcan Pharma Inc, Pinnacle Biologics BV)
    - Photofrin 15 mg Photofrin 15mg powder for solution for injection vials | 1 vial (£0.31) (Hospital only)
    - Porfimer sodium 75 mg Photofrin 75mg powder for solution for injection vials | 1 vial (£0.31) (Hospital only)

Temoporfin

- **DRUG ACTION** Temoporfin accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

- **INDICATIONS AND DOSE** Photodynamic therapy of advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments
  - By slow intravenous injection
  - Adult: (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058; concomitant photosensitising treatment; diseases exacerbated by light; elective surgery; ophthalmic slit-lamp examination for 30 days after administration

- **SIDE-EFFECTS** Alopecia; bone marrow depression; constipation; dizziness; dysphagia; haemorrhage; hyperuricaemia; nausea; oedema; pain; photosensitivity reaction (sunscreens ineffective); skin reactions; stomatitis; thromboembolism; tumour lysis syndrome; vomiting

- **PREGNANCY** Manufacturer advises avoid pregnancy for at least 3 months after treatment.

- **BREAST FEEDING** No information available—manufacturer advises avoid breastfeeding for at least 1 month after treatment—no information available.

- **PATIENT AND CARER ADVICE** Photosensitivity Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 15 days after administration. Avoid prolonged exposure of injection site arm for 15 days. If extravasation occurs protect area from light for at least 3 months.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - Foscan (Biolitec Pharma Ltd)
      - Temoporfin 1 mg per 1 ml Foscan 3mg/3ml solution for injection vials | 1 vial (£0.00) (Hospital only)
      - Foscan 6mg/6ml solution for injection vials | 1 vial (£0.31) (Hospital only)
      - Foscan 12mg/12ml solution for injection vials | 1 vial (£0.61) (Hospital only)

www.getintopharma.com
7 Targeted therapy responsive malignancy

ANTINEOPLASTIC DRUGS > PROTEASOME INHIBITORS

Bortezomib

- **DRUG ACTION** Bortezomib is a proteasome inhibitor.
- **INDICATIONS AND DOSE** Treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation (either as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone) | Treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with melphalan and prednisolone) | Induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with dexamethasone, or with dexamethasone and thalidomide) | ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION | ▶ Adult: (consult local protocol)

**CONTRA-INDICATIONS** Acute diffuse infiltrative pulmonary disease | pericardial disease

**CAUTIONS** Amyloidosis | cardiovascular disease | consider antiviral prophylaxis for herpes zoster infection | dehydration | diabetes (may affect blood glucose) | history of syncope | pulmonary disease (discontinue if interstitial lung disease develops) | risk factors for seizures | risk of neuropathy—consult product literature

**INTERACTIONS** ▶ Appendix 1: bortezomib

**SIDE-EFFECTS** ▶ Common or very common Anemia | anxiety | appetite abnormal | arrhythmias | asthma | chills | constipation | cough | decreased leucocytes | diabetes mellitus | diarrhoea | dizziness | dysphagia | dyspnoea | electrolyte imbalance | encephalopathy | enzyme abnormality | eye inflammation | fever | fluid imbalance | gastrointestinal discomfort | gastrointestinal disorders | haemorrhage | hair disorder | headaches | hearing impairment | heart failure | hepatic disorder | hiccup | hyperbilirubinaemia | hypersensitivity | hypertension | hypotension | increased risk of infection | ischaemic heart disease | lethargy | loss of consciousness | malaise | mood altered | muscle complaints | muscle weakness | nausea | nerve disorders | neuromuscular dysfunction | neutropenia | oedema | oral disorders | oropharyngeal complaints | pain | renal impairment | sensation abnormal | sepsis | skin reactions | sleep disorder | syncope | taste altered | thrombocytopenia | tinnitus | ventricular dysfunction | vertigo | vision disorders | vomiting | weight changes

▶ Uncommon Altered smell sensation | angioedema | antibiotic associated colitis | arthritis | azotemia | cardiac arrest | cardiomyopathy | cardiovascular disorder | cerebrovascular insufficiency | chest discomfort | circulatory impairment | circulatory collapse | coagulation | disorders | concentration impaired | confusion | Cushing’s syndrome | dry eye | dysphonia | ear discomfort | embolism and thrombosis | eye discomfort | eye disorders | failure to thrive | gait abnormal | gas exchange abnormal | genital pain | haemolytic anaemia | hallucination | hyperthyroidism | increased leucocytes | injury | irritable bowel syndrome | joint disorders | lymphadenopathy | memory loss | movement disorders | mucous membrane disorder | myopathy | neurotoxicity | palpitations | pancreatitis | pancytopenia | pericardial disorders | pericarditis | posterior reversible encephalopathy syndrome (PRES) (discontinue) | proteinuria | psychiatric disorders | psychotic disorder | pulmonary hypertension | pulmonary oedema | reflexes abnormal | respiratory disorders | rhinorrhoea | seizure | sensation of pressure | severe cutaneous adverse reactions (SCARs) | sexual dysfunction | shock | SIADH | skin mass | skin ulcers | speech disorder | sweat changes | temperature sensation altered | thirst change | tremor | tumour lysis syndrome | urinary disorders | urinary tract disorder | vascular disorders | vasculitis | vasodilation

▶ Rare or very rare Acidosis | acute coronary syndrome | alcohol intolerance | amyloidosis | apnoea | ascites | atrioventricular block | bladder irritation | blood disorders | bone disorder | bone fracture | brain oedema | breast disorder | cardiac valve disorder | cholelithiasis | CNS haemorrhage | cognitive disorder | coma | coronary artery insufficiency | delirium | drooling | ear disorder | erythromelalgia | fistula | gout | healing impaired | hypothyroidism | inflammation | lymphoedema | macrophage activation | mass | meningitis | metabolic disorder | multi organ failure | nail disorder | neoplasm malignant | neoplasms | nervous system disorder | paralysis | paresis | pelvic pain | perforation | photosensitivity reaction | platelet abnormalities | procedural complications | prostatitis | radiation injury | seborrhoea | sudden death | suicidal ideation | testicular disorders | throat complaints | ulcer | vaginal ulceration | venous insufficiency | vitamin deficiencies

▶ Frequency not known Herpes zoster reactivation | JC virus infection | progressive multifocal leukoencephalopathy (PML)

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.

**PREGNANCY** Toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—monitor for toxicity.

**Dose adjustments** Manufacturer advises reduce dose in moderate to severe impairment—consult product literature.

**RENAL IMPAIRMENT** No information available for creatinine clearance less than 20 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** ▶ Monitor blood-glucose concentration in patients on oral antidiabetics.

▶ Monitor for symptoms of progressive multifocal leukoencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed.

▶ Chest x-ray recommended before treatment to monitor for pulmonary disease—discontinue if interstitial lung disease develops.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions** ▶ Bortezomib for previously untreated mantle cell lymphoma (December 2015) NICE TA370

Bortezomib is recommended as an option for the treatment of previously untreated mantle cell lymphoma

www.getintopharma.com
in adults for whom haematopoietic stem cell transplantation is unsuitable.

www.nice.org.uk/TA370

- **Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation (April 2014)** NICE TA311

Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

www.nice.org.uk/TA311

- **Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)** NICE TA228

Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:
- high-dose chemotherapy with stem cell transplantation is considered inappropriate and
- the person is unable to tolerate or has contra-indications to thalidomide.

www.nice.org.uk/TA228

- **Bortezomib monotherapy for relapsed multiple myeloma (October 2007)** NICE TA129

Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:
- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) and
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.

www.nice.org.uk/TA129

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium, has advised (December 2013) that bortezomib (Velcade®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Velcade** (Janssen-Cilag Ltd)

  Bortezomib 3.5 mg Velcade 3.5mg powder for solution for injection vials | 1 vial (Hosp) £762.38 (Hospital only)

**Carfilzomib**

08-Feb-2019

- **DRUG ACTION** Carfilzomib is an irreversible selective proteasome inhibitor that disrupts tumour cell turnover and induces apoptosis.

- **INDICATIONS AND DOSE** Treatment of multiple myeloma in patients who have received at least one prior therapy (in combination with dexamethasone, or with dexamethasone and lenalidomide) (specialist use only)

- **BY INTRAVENOUS INFUSION**

- **Adult:** (consult product literature or local protocols)

- **CAUTIONS**

  Elderly (over 75 years)—higher incidence of adverse effects; ensure adequate hydration; infusion-related reactions; recent history of myocardial infarction; risk of cardiac failure; risk of herpes zoster reactivation; uncontrolled angina; uncontrolled arrhythmias

  **CAUTIONS, FURTHER INFORMATION**

  Infusion-related reactions Manufacturer advises premedication with dexamethasone to reduce incidence and severity of infusion-related reactions.

  Risk of herpes zoster reactivation Manufacturer advises consider antiviral prophylaxis for herpes zoster infection.

- **INTERACTIONS** → Appendix 1: carfilzomib

- **SIDE-EFFECTS**

  - **Common or very common** Anaemia; anxiety; appetite decreased; arthralgia; arthrosis; asthma; cataract; chest pain; chills; constipation; cough; decreased leucocytes; dehydration; diarrhoea; dizziness; dysphonia; dyspnoea; electrolyte imbalance; embolism and thrombosis; fever; flushing; gastrointestinal discomfort; haemorrhage; headache; heart failure; hyperbilirubinaemia; hyperglycaemia; hyperhidrosis; hypertension; hyperuricaemia; hypoalbuminaemia; hypotension; increased risk of infection; infusion related reaction; insomnia; muscle complaints; muscle weakness; nausea; neutropenia; opharyngeal pain; pain; palpitations; peripheral neuropathy; peripheral oedema; pulmonary hypertension; pulmonary oedema; renal impairment; respiratory disorders; sensation abnormal; sepsis; skin reactions; thrombocytopenia; tinnitus; toothache; vision blurred; vomiting

  - **Uncommon** Cardiac arrest; gastrointestinal perforation; haemolytic uraemic syndrome; hepatic disorders; intracranial haemorrhage; multi organ failure; myocardial infarction; myocardial ischaemia; pericardial effusion; pericarditis; stroke; tumour lysis syndrome

  - **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES); thrombotic microangiopathy

  **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during and for 1 month after treatment in women of childbearing potential; efficacy of oral contraceptives may be reduced, and hormonal contraceptives associated with a risk of thrombosis should be avoided. Male patients should use effective contraception during and for 3 months after treatment if their partner is pregnant or of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

  **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

  **BREAST FEEDING** Manufacturer advises avoid during and for at least 2 days after treatment—no information available.

  **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of side-effects), particularly in moderate to severe impairment (limited information available).

  **RENAL IMPAIRMENT** Manufacturer advises caution—increased incidence of adverse effects.

  **MONITORING REQUIREMENTS** Manufacturer advises monitoring of the following patient parameters: serum potassium concentration at least monthly; signs and symptoms of fluid overload, especially in those at risk of cardiac failure; renal function at treatment initiation and at least monthly during treatment—consider dose modification; hepatic function at treatment initiation and monthly during treatment—consider dose modification; platelet count and blood pressure. Also monitor for signs and symptoms of thrombotic microangiopathy.
Handing and storage
Manufacturer advises store in a refrigerator at 2–8°C.

Patient and carer advice
Manufacturer advises that patients and carers are warned to report signs and symptoms of thromboembolism (such as dyspnoea, chest pain, arm or leg swelling or pain).

Driving and skilled tasks
Patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness, hypotension and blurred vision.

National funding/access decisions

NICE decisions
- Carfilzomib for previously treated multiple myeloma (July 2017) NICE TA457
  Carfilzomib (Kyprolis®) in combination with lenalidomide and dexamethasone is recommended as an option for treating multiple myeloma in adults, only if:
  - they have had only 1 previous therapy, which did not include bortezomib, and
  - the manufacturer provides carfilzomib with the discount agreed in the patient access scheme.

Scottish Medicines Consortium (SMC) decisions

SMC No. 1171/16
The Scottish Medicines Consortium has advised (January 2017) that carfilzomib (Kyprolis®) in combination with lenalidomide and dexamethasone is not recommended for use within NHS Scotland for the treatment of adults with multiple myeloma who have received at least one prior therapy as the economic case was not demonstrated.

SMC No. 1242/17
The Scottish Medicines Consortium has advised (August 2017) that carfilzomib (Kyprolis®) is accepted for use within NHS Scotland, in combination with dexamethasone alone for the treatment of adults with multiple myeloma who have received at least one prior therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

Electrolytes: May contain Sodium
- Kyprolis (Amgen Ltd) ▼
  Carfilzomib 10 mg  Kyprolis 10mg powder for solution for infusion vials 1 vial £176.00
  Carfilzomib 30 mg  Kyprolis 30mg powder for solution for infusion vials 1 vial £528.00
  Carfilzomib 60 mg  Kyprolis 60mg powder for solution for infusion vials 1 vial £1,056.00

Ixazomib

Drug action
Ixazomib is a proteasome inhibitor.

Indications and dose
Multiple myeloma in patients who have received at least one prior therapy, in combination with lenalidomide and dexamethasone (specialist use only)
- By mouth
- Adult: 4 mg once weekly on days 1, 8, and 15 of a 28-day treatment cycle, for dose adjustments due to side-effects, consult product literature

Important safety information
Risks of incorrect dosing of oral anti-cancer medicines
See Cytotoxic drugs p. 888.

Caution, further information
- Herpes zoster reactivation
- Herpes zoster reactivation
  - Manufacture advises consider concomitant antiviral prophylaxis to decrease the risk of herpes zoster reactivation.
- Interactions
  - Appendix 1: ixazomib
- Side-effects
  - Common or very common
    - Back pain, constipation, diarrhoea, increased risk of infection, nausea, neutropenia, peripheral neuropathy (monitor for symptoms), peripheral oedema, rash, thrombocytopenia, vomiting
  - Frequency not known
    - Posterior reversible encephalopathy syndrome (PRES) (discontinue)
- Conception and contraception
  - Manufacture advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for at least 90 days after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.
- Pregnancy
  - Manufacture advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- Breast feeding
  - Manufacture advises avoid—no information available.
- Hepatic impairment
  - Manufacture advises caution in moderate to severe impairment (risk of increased exposure).
  - Dose adjustments
    - Manufacture advises dose reduction to 3 mg in moderate to severe impairment.
- Renal impairment
  - Manufacture advises dose reduction to 3 mg in severe impairment (creatinine clearance less than 30 mL/min).
- Monitoring requirements
  - Manufacture advises to monitor hepatic function regularly and adjust dose accordingly—consult product literature.
- Patient and carer advice
  - Missed doses
    - Manufacture advises if less than 72 hours remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.
- National funding/access decisions
  - NICE decisions
    - Ixazomib with lenalidomide and dexamethasone for treating relapsed or refractory multiple myeloma (February 2018) NICE TA505
      Ixazomib, with lenalidomide and dexamethasone, is recommended for use within the Cancer Drugs Fund as an option for treating multiple myeloma in adults only if:
      - they have already had 2 or 3 lines of therapy, and
      - the conditions in the managed access agreement for ixazomib are followed.

www.getintopharma.com
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.  
www.nice.org.uk/guidance/ta505

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- **CAUTIONARY AND ADVISORY LABELS 23, 25**
  - Ninlaro (Takeda UK Ltd) ▼
  - Ixazomib (as ixazomib citrate) 2.3 mg Ninlaro 2.3mg capsules | 3 capsule £6,336.00
  - Ixazomib (as ixazomib citrate) 3 mg Ninlaro 3mg capsules | 3 capsule £6,336.00
  - Ixazomib (as ixazomib citrate) 4 mg Ninlaro 4mg capsules | 3 capsule £6,336.00

**TARGETED ANTINEOPLASTIC DRUGS > PROTEIN KINASE INHIBITORS**

**Abemaciclib**
- **INDICATIONS AND DOSE**
  - Locally advanced or metastatic breast cancer (initiated by a specialist)
    - **BY MOUTH**
    - Adult: 150 mg twice daily, for dose adjustments due to side-effects—consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce abemaciclib dose to 100 mg twice daily; in those already taking a reduced dose, consult product literature. If the CYP3A4 inhibitor is stopped, increase the abemaciclib dose (after 3–5 half lives of the inhibitor) to the dose used before starting the CYP3A4 inhibitor.

**IMPORTANT SAFETY INFORMATION**

- **RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
  - See Cytotoxic drugs p. 888.

- **INTERACTIONS**
  - Appendix 1: abemaciclib

- **SIDE-EFFECTS**
  - Common or very common: Alopecia - anaemia - appetite decreased - decreased leucocytes - diarrhoea - dizziness - embolism and thrombosis - excessive tearing - fatigue - fever - infection - muscle weakness - nausea - neutropenia - skin reactions - taste altered - thrombocytopenia - vomiting

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for at least 3 weeks after completing treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **PREGNANCY**
  - Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in severe impairment. Temporary or permanent withdrawal may be needed following increases in aminotransferases—consult product literature.

**DOSE ADJUSTMENTS**
- Manufacturer advises dose reduction to 150 mg once daily in severe impairment.

**Afatinib**
- **INDICATIONS AND DOSE**
  - Treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with EGFR tyrosine kinase inhibitor
    - **BY MOUTH**
    - Adult: 40 mg once daily; increased if tolerated to up to 50 mg once daily, dose increase may be considered after 3 weeks at initial dose; consult product literature for details on dosing and dose adjustment due to side effects

**IMPORTANT SAFETY INFORMATION**

- **RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
  - See Cytotoxic drugs p. 888.

- **CAUTIONS**
  - Cardiac risk factors - conditions which may affect left ventricular ejection fraction—consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment - diarrhoea—proactive management recommended (consult product literature) - exposure to sun (protect skin from exposure to sun) - history of keratitis - new pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded - severe dry eyes - signs and symptoms of keratitis— promptly refer to ophthalmologist for assessment - signs and symptoms of skin reaction—treat promptly and interrupt afatinib treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature) - ulcerative keratitis - use of contact lenses - worsening pulmonary symptoms

www.getintopharma.com
Targeted therapy responsive malignancy

Afatinib (as Afatinib dimaleate) 50 mg Giotrif 50mg tablets  
28 tablet [PO] £2,023.28

Alectinib 15-Aug-2018

DRUG ACTION  Alectinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE  Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only)
▶ BY MOUTH
▶ Adult: 600 mg twice daily, for dose adjustments due to side-effects—consult product literature

PATIENT AND CARER ADVICE

INTERACTIONS  → Appendix 1: afatinib
SIDE-EFFECTS
▶ Common or very common  Appetite decreased - cystitis - dehydration - diarrhoea - dry eye - dyspepsia - epistaxis - eye inflammation - fever - hypokalaemia - muscle spasms - nausea - oral disorders - paronychia - renal impairment - rhinitis - skin reactions - taste altered - vomiting - weight decreased
▶ Uncommon  Interstitial lung disease - pancreatitis
▶ Rare or very rare  Severe cutaneous adverse reactions (SCARs)

CONCEPTION AND CONTRAINDICATIONS  Ensure effective contraception during and for at least one month after treatment in women of childbearing potential.

PREGNANCY  Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING  Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT  Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

Dose adjustments  Manufacturer advises consider dose interruption if hepatic function worsens in mild to moderate impairment—consult product literature.

RENAL IMPAIRMENT  Manufacturer advises avoid in severe renal impairment.

DIRECTIONS FOR ADMINISTRATION  Tablets should be taken whole on an empty stomach. Food should not be consumed for at least 3 hours before and at least 1 hour after each dose.

Giotrif tablets may be dispersed in approximately 100 mL of noncarbonated water by stirring occasionally for 100 hours and at least 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube.

PATIENT AND CARER ADVICE  Patient counselling advised (administration). Driving and skilled tasks  Occular adverse reactions may affect performance of skilled tasks e.g. driving.

NATIONAL FUNDING/ACCESS DECISIONS  NICE decisions
▶ Afatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer (April 2014) NICE TA310
Afatinib is recommended as an option, within its marketing authorisation, for treating locally advanced or metastatic non-small-cell lung cancer in adults:
● whose tumour tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation, and
● who have not previously had an EGFR-TK inhibitor, and
● if the manufacturer provides afatinib with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta310

INTERACTIONS  → Appendix 1: alectinib
SIDE-EFFECTS
▶ Common or very common  Anaemia - arrhythmias - constipation - diarrhoea - eye disorders - eye inflammation - hyperbilirubinaemia - musculoskeletal pain - myalgia - nausea - oedema - photosensitivity reaction - skin reactions - vision disorders - vomiting
▶ Uncommon  Drug-induced liver injury - respiratory disorders

CONCEPTION AND CONTRAINDICATIONS  Manufacturer advises women of child-bearing potential should use effective contraception during and for at least 3 months after stopping treatment.

PREGNANCY  Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING  Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT  Dose adjustments  Manufacturer advises reduce dose to 450 mg twice daily in severe impairment.

MONITORING REQUIREMENTS  Manufacturer advises monitor creatine phosphokinase every 2 weeks for the first month and as clinically indicated thereafter in patients reporting symptoms of myalgia.

Manufacturer advises monitor heart rate and blood pressure as clinically indicated.

Manufacturer advises monitor liver function at baseline then every 2 weeks during the first 3 months of treatment and periodically thereafter as clinically indicated; more frequent monitoring should be performed in patients who develop aminotransferase and bilirubin elevations.

Manufacturer advises monitor for symptoms of interstitial lung disease and pneumonitis.

PATIENT AND CARER ADVICE
Photosensitivity  Manufacturer advises patients should use a broad spectrum sunscreen and lip balm and be advised to avoid prolonged sun exposure during treatment, and for 7 days after discontinuation.

Myalgia  Manufacturer advises patients should be advised to report any unexplained muscle pain, tenderness or weakness.

Vomiting  Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.

Missed doses  Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks  Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of symptomatic bradycardia and vision disorders.

www.getintopharma.com
### NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions
- **Alectinib for untreated ALK-positive advanced non-small-cell lung cancer (August 2018)** NICE TA536
  Alectinib (Alecensa®) is recommended, within its marketing authorisation, as an option for untreated anaplastic lymphoma kinase (ALK)-positive advanced non-small-cell lung cancer in adults. It is recommended only if the manufacturer provides alectinib according to the commercial arrangement.
  www.nice.org.uk/guidance/ta536
- **Scottish Medicines Consortium (SMC) decisions**
  SMC No. SMC2012
  The Scottish Medicines Consortium has advised (August 2018) that alectinib (Alecensa®) is accepted for use within NHS Scotland as monotherapy for the first-line treatment of adults with anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
- **Capsule**
  CAUTIONARY AND ADVISORY LABELS 11, 21
  ELECTROLYTES: May contain Sodium
  - **Alecensa** Roche Products Ltd
  - **Alectinib** as Alectinib hydrochloride 150 mg Alecensa 150mg capsules | 224 capsule £5,032.00

### DRUG ACTION
Alectinib is a tyrosine kinase inhibitor.

### INDICATIONS AND DOSE
**Treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa)**
- **BY MOUTH**
- **Adult:** consult product literature

### IMPORTANT SAFETY INFORMATION
**Risks of incorrect dosing of oral anti-cancer medicines**
See Cytotoxic drugs p. 888.

### CONTRA-INDICATIONS
Recent active gastro-intestinal bleeding, untreated brain metastases

### CAUTIONS
Hypertension (blood pressure should be well-controlled before starting and monitored during treatment)

### INTERACTIONS
- **Appendix 1: alectinib**

### SIDE-EFFECTS
- **Common or very common**

- **Uncommon**
  - Leucopenia
  - Neutropenia
  - Posterior reversible encephalopathy syndrome (PRES)

- **Conception and contraception**
  - Effective contraception required during and for up to 1 week after treatment.

### PREGNANCY
Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

### HEPATIC IMPAIRMENT
Manufacturer advises avoid in severe impairment—no information available.

### Dose adjustments
Manufacturer advises reduce dose in moderate impairment.

### MONITORING REQUIREMENTS
- **Monitor**
  - For thyroid dysfunction.
  - For symptoms of gastro-intestinal perforation.
  - For proteinuria before and during treatment.
  - For liver function before and during treatment.

### NATIONAL FUNDING/ACCESS DECISIONS
- **NICE decisions**
  - **Axitinib for treating advanced renal cell carcinoma after failure of prior systemic treatment (February 2015)**
  NICE TA333
  Axitinib (Inlyta®) is recommended as an option for treating adults with advanced renal cell carcinoma after failure of treatment with a first-line tyrosine kinase inhibitor or a cytokine, only if the manufacturer provides axitinib with the discount agreed in the patient access scheme.
  www.nice.org.uk/guidance/ta333

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
- **Tablet**
  CAUTIONARY AND ADVISORY LABELS 25
  - **Inlyta** (Pfizer Ltd)
    - **Axitinib 1 mg** Inlyta 1mg tablets | 56 tablet £703.40 (Hospital only)
    - **Axitinib 3 mg** Inlyta 3mg tablets | 56 tablet £2,110.20 (Hospital only)
    - **Axitinib 5 mg** Inlyta 5mg tablets | 56 tablet £3,517.00 (Hospital only)
    - **Axitinib 7 mg** Inlyta 7mg tablets | 56 tablet £4,923.80 (Hospital only)

### Binimetinib
- **DRUG ACTION**
  Binimetinib inhibits the mitogen-activated protein kinase (MAPK) pathway, specifically mitogen-activated extracellular kinases MEK 1 and 2, thereby inhibiting BRAF V600 mutation-positive cell growth.

#### INDICATIONS AND DOSE
**Unresectable or metastatic melanoma with a BRAF V600 mutation (in combination with encorafenib)** (specialist use only)
- **BY MOUTH**
- **Adult:** 45 mg twice daily, for dose adjustments due to side-effects, consult product literature

### IMPORTANT SAFETY INFORMATION
**Risks of incorrect dosing of oral anti-cancer medicines**
See Cytotoxic drugs p. 888.

### CONTRA-INDICATIONS
**History of retinal vein occlusion**

### CAUTIONS
Left ventricular dysfunction (ejection fraction below 50%, or below the institutional lower limits of normal) - neuromuscular conditions associated with elevated creatine kinase and rhabdomyolysis - risk factors for retinal vein occlusion - risk factors for venous thromboembolism

www.getintopharma.com
Targeted therapy responsive malignancy

### Bosutinib

**INDICATIONS AND DOSE**

**Previously treated chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia (specialist use only)**

- **BY MOUTH**
  - Adult: 500 mg once daily, consult product literature for dose adjustment due to side-effects, or incomplete haematologic response by week 8, or incomplete cytogenetic response by week 12

**Newly-diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (specialist use only)**

- **BY MOUTH**
  - Adult: 400 mg once daily, consult product literature for dose adjustment due to side-effects, or failure to demonstrate breakpoint cluster region-Abelson (BCR-ABL) transcripts ≤10% by month 3

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

**MHRA/CHM ADVISORY (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that bosutinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS**
  - Cardiac disease - hepatitis B infection - history of pancreatitis — withhold treatment if lipase elevated and abdominal symptoms occur - history of QT prolongation — monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment - recent cardiac event — monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment - risk factors for QT prolongation — monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment - significant gastrointestinal disorder

### CAUTIONS, FURTHER INFORMATION

**Hepatitis B infection**

The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS**  
  - Appendix 1: bosutinib

### SIDE-EFFECTS

- **Common or very common**

- **Uncommon**
  - Facial paralysis - pancreatitis - paresis

- **Frequency not known**
  - Respiratory disorders - retinal occlusion (discontinue permanently)

### MONITORING REQUIREMENTS

- **Manufacturer advises monitor liver function before and during treatment.**

- **Manufacturer advises avoid in renal failure.**

- **Manufacturer advises monitor blood pressure before and during treatment.**

- **Manufacturer advises monitor blood pressure function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.**

- **Manufacturer advises assess left ventricular ejection fraction before treatment, one month after starting treatment, then every 3 months or more frequently as clinically indicated.**

- **Manufacturer advises monitor for visual disturbances.**

- **Manufacturer advises monitor blood pressure before and during treatment.**

- **Manufacturer advises avoid in moderate or severe impairment (increased exposure).**

- **Manufacturer advises monitor liver function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.**

- **Manufacturer advises assess left ventricular ejection fraction before treatment, one month after starting treatment, then every 3 months or more frequently as clinically indicated.**

- **Manufacturer advises monitor blood pressure function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.**

- **Manufacturer advises monitor blood pressure before and during treatment.**

- **Manufacturer advises monitor liver function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.**

- **Manufacturer advises monitor blood pressure before and during treatment.**

- **Manufacturer advises monitor liver function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.**

- **Manufacturer advises monitor blood pressure function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.**

### NATIONAL FUNDING/ACCESS DECISIONS

**NICE decisions**

- **Encorafenib with binimetinib for unresectable or metastatic BRAF V600 mutation-positive melanoma (February 2019)**

  NICE TA562

Encorafenib with binimetinib (Mektovi) is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma in adults. It is recommended only if the manufacturer provides binimetinib according to the commercial arrangements.

www.nice.org.uk/guidance/ta562

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

---

This information is intended for healthcare professionals and should be used in conjunction with the product literature.
**Indications and dose**

Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib (specialist use only)

**By mouth**

- Adult: Initially 90 mg once daily for 7 days, then increased to 180 mg once daily, for dose adjustments due to dose interruption or side-effects—consult product literature.

**Dose adjustments due to interactions**

- Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce brigatinib dose to 90 mg once daily; in those starting treatment or already taking a reduced dose, consult product literature.

**Monitoring requirements**

- Manufacturer advises monitor full blood count weekly for haematological, cytogenetic, or molecular response.
- Manufacturer advises monitor liver function at baseline, then monthly for the first month and then monthly thereafter or as clinically indicated.
- Manufacturer advises monitor blood pressure, heart rate, creatine phosphokinase, amylase, and lipase regularly.
- Manufacturer advises monitor fasting serum glucose at baseline and periodically thereafter.
- Manufacturer advises monitor liver function at baseline, then every 2 weeks during the first 3 months of treatment, and periodically thereafter.
- Manufacturer advises prompt investigation if pneumonitis suspected—consult product literature.
- Manufacturer advises monitor for new or worsening respiratory symptoms, particularly in the first week of treatment—promptly investigate if pneumonitis suspected—consult product literature.
- Manufacturer advises monitor blood pressure, heart rate, creatine phosphokinase, amylase, and lipase regularly.
- Manufacturer advises monitor liver function at baseline, then every 2 weeks during the first 3 months of treatment, and periodically thereafter.
- Manufacturer advises monitor fasting serum glucose at baseline and periodically thereafter.
- Manufacturer advises patients and carers should be told to report symptoms of visual disturbance, or unexplained muscle pain, tenderness, or weakness.

**Monitoring requirements due to interactions**

- Manufacturer advises dose reduction to 40 mg once daily in severe impairment.
- Manufacturer advises dose reduction to 30 mg once daily in moderate impairment. Manufacturer advises reduce dose to 20 mg in mild impairment.

---

**Drug action**

Brigatinib is a tyrosine kinase inhibitor.
Driving and skilled tasks  Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbance, dizziness, or fatigue.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions
- Brigatinib for treating ALK-positive advanced non-small-cell lung cancer after crizotinib (March 2019) NICE TA571
- Brigatinib (Alunbrig®®) is recommended, within its marketing authorisation, for treating anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer in adults who have already had crizotinib. It is recommended only if the manufacturer provides it according to the commercial arrangement.

www.nice.org.uk/guidance/ta571

Cabozantinib

• DRUG ACTION Cabozantinib is an inhibitor of several protein kinases.

• INDICATIONS AND DOSE

Treatment of progressive, unresectable locally advanced or metastatic medullary thyroid carcinoma (initiated by a specialist)
- BY MOUTH USING CAPSULES
- Adult: 140 mg once daily, for dose adjustment or treatment interruption due to side-effects, consult product literature (closely monitor for first 8 weeks of therapy)

Advanced renal cell carcinoma (initiated by a specialist)
- BY MOUTH USING TABLETS
- Adult: 60 mg once daily, for dose adjustment or treatment interruption due to side-effects, consult product literature (closely monitor for first 8 weeks of therapy)

DOSE EQUIVALENCE AND CONVERSION
- Cabozantinib tablets and capsules are not bioequivalent—consult product literature when switching formulations.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 888.

• CONTRA-INDICATIONS Reversible Posterior Leukoencephalopathy Syndrome

CAUTIONS Hypertension—discontinue treatment if uncontrolled despite medical intervention - palmar-plantar erythrodysesthesia syndrome—consider treatment interruption if severe and restart at a lower dose when resolved to grade 1. Patients at increased risk of fistulae—consult product literature - patients at increased risk of gastrointestinal perforation—consult product literature - patients at increased risk of intra-abdominal abscess—consult product literature - patients at risk of haemorrhage (including tumour involvement of the trachea or bronchus)—discontinue if symptoms develop - patients at risk of thromboembolic events including myocardial infarction—discontinue if symptoms develop - risk of osteonecrosis of the jaw—susceptibility to QT-interval prolongation (e.g. cardiac disease, electrolyte disturbances, bradycardia, concomitant use of drugs that prolong the QT interval)—monitor ECG and electrolytes periodically

CAUTIONS, FURTHER INFORMATION

- Elective surgery Withhold treatment for at least 28 days before elective surgery and restart only if adequate wound healing—discontinue in patients with wound healing complications requiring medical intervention.
- Risk of osteonecrosis of the jaw Discontinue treatment at least 28 days before elective invasive dental procedures—monitor for symptoms before and during treatment and discontinue if osteonecrosis develops.

• INTERACTIONS → Appendix 1: cabozantinib

• SIDE-EFFECTS

• CONCEPTION AND CONTRACEPTION Patients and their sexual partners must use effective contraception (in addition to barrier method) during treatment and for at least 4 months after the last dose.

• PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

• BREAST FEEDING Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after the last dose.

• HEPATIC IMPAIRMENT For capsules manufacturer advises caution in mild to moderate impairment (risk of increased exposure); avoid in severe impairment (no information available). For tablets manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).

Dose adjustments For capsules manufacturer advises dose reduction to 60 mg once daily in mild to moderate impairment.

• RENAL IMPAIRMENT Manufacturer advises caution in renal impairment. Avoid in severe impairment.

• MONITORING REQUIREMENTS Monitor urine protein regularly and discontinue if nephrotic syndrome develops.

• PATIENT AND CARER ADVICE Food should not be consumed for at least 2 hours before and at least 1 hour after each dose.

Driving and skilled tasks Fatigue and weakness may affect performance of skilled tasks e.g. driving.
Ceritinib

21-Feb-2019

**DRUG ACTION** Ceritinib is a tyrosine kinase inhibitor, with particular activity against anaplastic lymphoma kinase (ALK).

**INDICATIONS AND DOSE**
First-line treatment of anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only) Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib (specialist use only)

- **BY MOUTH**
  - Adult: 450 mg once daily, dose interruption, dose reduction or discontinuation may be required based on individual safety and tolerability—consult product literature; discontinue treatment if patient unable to tolerate at least 150 mg daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce the dose by one-third (rounded to the nearest multiple of the 150 mg dosage form).

**IMPORTANT SAFETY INFORMATION**
Risks of incorrect dosing of oral anti-cancer medicines

See Cytotoxic drugs p. 888.

**CONTRA-INDICATIONS**
Congenital long QT syndrome

**CAUTIONS**
Diabetes mellitus - history or susceptibility to QT-interval prolongation

**CAUTIONS, FURTHER INFORMATION**
- QT-interval prolongation QT-interval prolongation has been observed in clinical studies, which may lead to an increased risk for ventricular tachyarrhythmias (e.g. torsade de pointes) or sudden death. Risk factors include pre-existing bradycardia, other relevant pre-existing cardiac disease or electrolyte disturbances; manufacturer advises monitor ECG and electrolytes periodically.

**INTERACTIONS**
  - Appendix 1: ceritinib

**SIDE-EFFECTS**
- **Common or very common** Anaemia - appetite decreased; arthralgias - arthralgias; asthma - anaphylaxis; diarrhoea - dysphagia; gastrointestinal discomfort; gastroesophageal reflux disease; hepatic disorders - hyperbilirubinaemia; hyperglycaemia; hypophosphataemia; nausea - oesophageal disorder; pericardial effusion - pericarditis; QT interval prolongation - renal impairment - respiratory disorders - skin reactions - vision disorders - vitreous floaters; vomiting; weight decreased

- **Uncommon** Pancreatitis

**SIDE-EFFECTS, FURTHER INFORMATION**
Gastro-intestinal effects

Manufacturer advises monitor for signs of gastrointestinal toxicity and consider dose reduction or discontinuation of treatment.

**INTERSTITIAL LUNG DISEASE**
Manufacturer advises monitor patients who exhibit pulmonary symptoms and consider dose reduction or discontinuation of treatment.

**CONCEPTION AND CONTRACEPTION**
Manufacturer recommends effective contraception in women of childbearing potential during treatment and for up to 3 months after discontinuation of treatment.

**PREGNANCY**
Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in severe impairment (limited information available).
Ceritinib for untreated ALK-positive non-small cell lung cancer

NATIONAL FUNDING/ACCESS DECISIONS

Manufacturer advises monitor for pulmonary symptoms, then monitor every 2 weeks for the first three months of treatment and monthly thereafter; if transaminases are elevated, more frequent monitoring should be performed as clinically indicated.

Manufacturer advises monitor fasting plasma-glucose levels before treatment initiation and periodically thereafter as clinically indicated.

Manufacturer advises monitor for pulmonary symptoms indicative of interstitial lung disease and pneumonitis—discontinue treatment if diagnosis confirmed; also monitor heart rate and blood pressure regularly.

DIRECTIONS FOR ADMINISTRATION

Manufacturer advises Zykadia® capsules should be taken with food at the same time each day—consult product literature for dosing information if patients are unable to take capsules with food.

PATIENT AND CARER ADVICE

Patients and carers should be counselled on the administration of capsules.

Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks

Manufacturer advises patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of fatigue and vision disorders.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Ceritinib for previously treated anaplastic lymphoma kinase-positive non-small cell lung cancer (June 2016) NICE TA395

Ceritinib (Zykadia®) is recommended, within its marketing authorisation, as an option for treating advanced anaplastic lymphoma kinase-positive non-small cell lung cancer in adults previously treated with crizotinib; only if the manufacturer provides the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta395

Ceritinib for untreated ALK-positive non-small cell lung cancer (January 2018) NICE TA500

Ceritinib (Zykadia®) is recommended, within its marketing authorisation, as an option for untreated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta500

Scottish Medicines Consortium (SMC) decisions

SMC No. 1097/15

The Scottish Medicines Consortium has advised (December 2015) that ceritinib (Zykadia®) is accepted for use within NHS Scotland for the treatment of adults with anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS

EXCIPIENTS: May contain Gelatin, propylene glycol

Zykadia (Novartis Pharmaceuticals UK Ltd)

Ceritinib 150 mg Zykadia 150mg capsules | 150 capsule $8,923.45

DRUG ACTION

Cobimetinib is a mitogen-activated protein kinase (MAPK) inhibitor.

INDICATIONS AND DOSE

Treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma (in combination with vemurafenib) (specialist use only)

BY MOUTH

Adult: 60 mg once daily for 21 days; subsequent cycles repeated after a 7-day interval, for dose adjustment due to side-effects—consult product literature

CAUTIONS

Left ventricular dysfunction - risk factors for bleeding

INTERACTIONS

Appendix 1: cobimetinib

SIDE EFFECTS

Common or very common

Anaemia - basal cell carcinoma - chills - dehydration - diarrhoea - electrolyte imbalance - fever - haemorrhage - hyperglycaemia - hypertension - nausea - photosensitivity reaction - pneumonitis - serous retinopathy - skin reactions - vision disorders - vomiting

Uncommon

Rhabdomyolysis

CONCEPTION AND CONTRACEPTION

Manufacturer advises use of two effective contraceptive methods during treatment and for at least 3 months after stopping treatment.

PREGNANCY

Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

Manufacturer advises caution in severe impairment—limited information available.

MONITORING REQUIREMENTS

Creatine kinase elevation Manufacturer advises baseline creatine kinase and creatinine levels should be measured before starting treatment, and then at monthly intervals during treatment or as clinically indicated—consult product literature if elevated.

Left ventricular function Manufacturer advises ejection fraction should be evaluated before initiation of treatment, then after the first month of treatment and at least every 3 months thereafter (or as clinically indicated) until treatment discontinuation.

Liver function Manufacturer advises liver function should be evaluated before initiation of treatment and monthly thereafter (or more frequently as clinically indicated).

Visual disturbances Manufacturer advises assess for new or worsening visual disturbances at each visit; if symptoms of new or worsening visual disturbances are identified, an ophthalmologic examination is recommended.

PATIENT AND CARER ADVICE

Vomiting

Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.

Missed doses

Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks

Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances.

Important Safety Information

Risks of incorrect dosing of oral anti-cancer medicines

See Cytotoxic drugs p. 888.

www.getintopharma.com
Crizotinib

**DRUG ACTION** Crizotinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only) | ROS1-positive advanced non-small cell lung cancer (specialist use only)

**BY MOUTH**

- Adult: 250 mg twice daily, consult product literature for information on dose adjustments based on individual patient safety and tolerability.

**SIDE-EFFECTS**

- Uncommon Gastrointestinal perforation (including fatal cases) - hepatic failure (including fatal cases) - renal impairment

**RECOMMENDATIONS**

- Reduce dose to 200 mg twice daily after 2 weeks, based on individual assessment of safety and tolerability.

**INTERACTIONS**

- Appendix 1: Crizotinib

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES** See Cytotoxic drugs p. 888.

**MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF CARDIAC FAILURE**

Severe, sometimes fatal cases of cardiac failure have been reported in patients treated with crizotinib. The MHRA has issued the following advice:

- Monitor all patients for signs and symptoms of heart failure (including dyspnoea, oedema, or rapid weight gain from fluid retention).
- Consider reducing the dose, or interrupting or stopping treatment if symptoms of heart failure occur.

**CAUTIONS**

- History of diverticulitis (risk of gastrointestinal perforation)—discontinue treatment if gastrointestinal perforation occurs) - metastases of gastrointestinal tract (risk of gastro-intestinal perforation) - patients with susceptibility to QT-prolongation (including bradycardia, history of cardiac disease, concomitant use of drugs that prolong QT interval, and electrolyte disturbances)—periodic renal monitoring required - risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs - vision disorders reported—consider full ophthalmological evaluation if vision disorder worsens or persists

**CAUTIONS, FURTHER INFORMATION**

- Fatal interstitial lung disease and pneumonitis - Fatal interstitial lung disease and pneumonitis reported (monitor patients with pulmonary symptoms, withdrawal if suspected, and permanently discontinue treatment if diagnosed).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Cotellic (Roche Products Ltd) ▼

Cotellic (as Cotellic hemifumarate) 20 mg tablets 63 tablet (Po) £4,275.67

**SIDE-EFFECTS, FURTHER INFORMATION**

Consider reducing the dose, or interrupting or stopping treatment if symptoms of cardiac failure occur.

**CONCEPTION AND CONTRACEPTION**

Ensure effective contraception during and for at least 90 days after treatment.

**PREGNANCY**

Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**

Avoid — no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises use with caution.

Dose adjustments Manufacturer advises reduce dose in moderate to severe impairment—consult product literature.

**RENAL IMPAIRMENT**

Dose adjustments Reduce dose to 250 mg once daily in severe impairment not requiring peritoneal dialysis or hemodialysis, may be increased to 200 mg twice daily after at least 4 weeks, based on individual assessment of safety and tolerability.

**MONITORING REQUIREMENTS**

Monitor liver function once a week during the first 2 months of treatment, then at least monthly thereafter and as clinically indicated. Monitor ECG and electrolytes (correct if abnormal) in all patients before starting treatment, then periodically and as clinically indicated thereafter. Monitor for signs and symptoms of treatment emergent bradycardia (including syncope, dizziness and hypotension)—monitor blood pressure and heart rate regularly.

**PATIENT AND CARER ADVICE**

Counsel all patients on the early signs and symptoms of gastrointestinal perforation—advise to seek immediate medical attention.

Driving and skilled tasks Symptomatic bradycardia (including syncope, dizziness and hypotension), vision disorder and fatigue may affect performance of skilled tasks (e.g. driving or operating machinery).

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Crizotinib for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer (September 2016) NICE TA406

Crizotinib is recommended, within its marketing authorisation, as an option for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.

- Crizotinib for previously treated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer (December 2016) NICE TA422

Crizotinib is recommended, within its marketing authorisation, as an option for previously treated
anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta422

- Crizotinib for treating ROS1-positive advanced non-small-cell lung cancer (July 2018) NICE TA629

Crizotinib is recommended for use within the Cancer Drugs Fund as an option for treating ROS1-positive advanced non-small-cell lung cancer (NSCLC) in adults, only if the conditions in the managed access agreement are followed. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta529

Scottish Medicines Consortium (SMC) decisions

SMC No. 129/18

The Scottish Medicines Consortium has advised (June 2018) that crizotinib (Xalkori®) is accepted for use within NHS Scotland for the treatment of adults with ROS1-positive advanced non-small cell lung cancer. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- MEDICINAL FORMS

  There can be variation in the licensing of different medicines containing the same drug.

  Capsule

    £4,689.00 (Hospital only)

Dabrafenib

24-Jul-2018

- DRUG ACTION

  Dabrafenib is a BRAF kinase inhibitor, which inhibits BRAF V600 mutation-positive melanoma cell growth.

- INDICATIONS AND DOSE

  Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with trametinib) (specialist use only) Adjuvant treatment of stage III melanoma with a BRAF V600 mutation following complete resection (in combination with trametinib) (specialist use only)

  BY MOUTH

  Adult: 150 mg every 12 hours, for dose adjustments due to side-effects, consult product literature

  Adjuvant treatment of stage III melanoma with a BRAF V600 mutation following complete resection (in combination with trametinib) (specialist use only)

  BY MOUTH

  Adult: 150 mg every 12 hours for 12 months, for dose adjustments due to side-effects, consult product literature

- SIDE-EFFECTS

  • Common or very common Alopecia - appetite decreased - arthralgia - asthenia - chills - constipation - cough - diarrhoea - fever - headache - hyperglycaemia - hypophosphataemia - influenza-like illness - myalgia - nausea - neoplasms - pain in extremity - photosensitivity reaction - skin reactions - vomiting

  • Uncommon Nephritis - pancreatitis - panniculitis - renal impairment - uveitis

- SIDE-EFFECTS, FURTHER INFORMATION

  Additional side-effects reported when used in combination with trametinib include dizziness, hyperhidrosis, hypotension, leukopenia, muscle spams, myocarditis, neutropenia, night sweats, and thrombocytopenia.

- CONCEPTION AND CONTRA-INDICATIONS

  Manufacturer advises women of child-bearing potential should use effective non-hormonal contraception during and for 4 weeks after stopping treatment.

- PREGNANCY

  Manufacturer advises avoid unless potential benefit outweighs risk—incidence in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

- BREAST FEEDING

  Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT

  Manufacturer advises caution in moderate to severe impairment—no information available.

- RENAL IMPAIRMENT

  Manufacturer advises caution in severe impairment—no information available.

- MONITORING REQUIREMENTS

  Manufacturer advises assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment; assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature; monitor full blood count as clinically indicated; monitor for ophthalmologic reactions including uveitis, iridocyclitis and iritis; monitor serum creatinine.

- PATIENT AND CARER ADVICE

  Manufacturer advises patients should be informed to immediately report any skin lesions—risk of cutaneous squamous cell carcinoma and new primary melanoma.

  Missed doses

  Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

  Driving and skilled tasks

  Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of ocular adverse reactions.

- NATIONAL FUNDING/ACCESS DECISIONS

  NICE decisions

  ▶️ Dabrafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2014) NICE TA321

  Dabrafenib (Tafinlar®) is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma only if the manufacturer provides dabrafenib with the discount agreed in the patient access scheme.

  www.nice.org.uk/guidance/ta321

  ▶️ Trametinib in combination with dabrafenib for treating unresectable or metastatic melanoma (June 2016) NICE TA396

  Trametinib (Mekinist®) in combination with dabrafenib (Tafinlar®) is recommended, within its marketing authorisation, as an option for treatment of melanoma only when the manufacturer provides trametinib and dabrafenib with the discounts agreed in the patient access schemes.

  www.nice.org.uk/guidance/ta396

www.getintopharma.com
• Dabrafenib with trametinib for adjuvant treatment of resected BRAF V600 mutation-positive melanoma (October 2018) NICE TA544

Dabrafenib (Tafinlar®) with trametinib (Mekinist®) is recommended, within its marketing authorisation, as an option for the adjuvant treatment of resected stage III BRAF V600 mutation-positive melanoma in adults. It is recommended only if the manufacturer provides dabrafenib and trametinib with the discounts agreed in the commercial arrangements.

www.nice.org.uk/guidance/ta544

Scottish Medicines Consortium (SMC) decisions

SMC No. 1023/15

The Scottish Medicines Consortium has advised (March 2015) that dabrafenib (Tafinlar®) is accepted for restricted use within NHS Scotland, as monotherapy, for the treatment of unresectable or metastatic BRAF V600 mutation-positive melanoma in adults who have received no prior therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2131

The Scottish Medicines Consortium has advised (February 2019) that dabrafenib (Tafinlar®) is accepted for use within NHS Scotland in combination with trametinib for the adjuvant treatment of adults with stage III melanoma with a BRAF V600 mutation, following complete resection. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

Dasatinib

30-Apr-2019

Dasatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Chronic phase chronic myeloid leukaemia (initiated by a specialist)

BY MOUTH USING TABLETS

Adult: 100 mg once daily, then increased if necessary up to 140 mg once daily, for dose adjustment due to side-effects—consult product literature

Accelerated and blast phase chronic myeloid leukaemia [resistant or intolerant to prior therapy] (initiated by a specialist) / Acute lymphoblastic leukaemia [resistant or intolerant to prior therapy] (initiated by a specialist)

BY MOUTH USING TABLETS

Adult: 140 mg once daily, then increased if necessary up to 180 mg once daily, for dose adjustment due to side-effects—consult product literature

CAUTIONS

Hepatitis B infection - risk of cardiac dysfunction (monitor closely) - susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesiaemia before starting treatment)

FURTHER INFORMATION

Hepatitis B infection

The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

INTERACTIONS

Appendix 1: dasatinib

SIDE-EFFECTS

Common or very common

Uncommon

Rare or very rare

Cardiac arrest - dementia - diabetes mellitus - facial paralysis - gait abnormal - hypersensitivity vasculitis - hypothyroidism - pure red cell aplasia - seizure - thyroiditis

Frequency not known

Hepatitis B reactivation

CONCEPTION AND CONCEPTION

Effective contraception required during treatment.

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Manufacturer advises caution.

MONITORING REQUIREMENTS

Manufacturer advises evaluate for signs and symptoms of underlying cardiopulmonary disease before initiation of therapy—echocardiography should be performed at treatment initiation in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease.

www.getintopharma.com
Manufacturer advises monitor patients with risk factors or a history of cardiac disease for signs or symptoms of cardiac dysfunction during treatment.

When used for Accelerated or blast phase chronic myeloid leukaemia or Acute lymphoblastic leukaemia Manufacturer advises monitor full blood count weekly for the first 2 months, then monthly or as clinically indicated thereafter.

When used for Chronic phase chronic myeloid leukaemia Manufacturer advises monitor full blood count every 2 weeks for 3 months, then every 3 months or as clinically indicated thereafter.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016) NICE TA426 Dasatinib is recommended, within its marketing authorisation, as an option for untreated chronic phase Philadelphia-chromosome-positive CML in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.

Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016) NICE TA425 Dasatinib is recommended as an option for treating chronic or accelerated phase Philadelphia-chromosome-positive CML in adults, if they cannot have imatinib, or their disease is imatinib-resistant and the manufacturer provides dasatinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta426

Scottish Medicines Consortium (SMC) decisions

**SMC No. 370/07**

The Scottish Medicines Consortium has advised (September 2016) that dasatinib (Sprycel®) is accepted for use within NHS Scotland for the treatment of adults with chronic, accelerated or blast phase chronic myelogenous leukaemia (CML) with resistance or intolerance to prior therapy including imatinib mesilate, only if the manufacturer provides dasatinib with the discount agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1170/16

The Scottish Medicines Consortium has advised (September 2016) that dasatinib (Sprycel®) is accepted for use within NHS Scotland for the treatment of adults with newly diagnosed Philadelphia chromosome positive (Ph+) chronic myelogenous leukaemia (CML) in the chronic phase, only if the manufacturer provides dasatinib with the discount agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 25**

Sprycel (Bristol-Myers Squibb Pharmaceuticals Ltd)

Dasatinib 20 mg Sprycel 20mg tablets | 60 tablet | POM | £1,252.48 DT | £1,252.48 (Hospital only)

Dasatinib 50 mg Sprycel 50mg tablets | 60 tablet | POM | £2,504.96 DT | £2,504.96 (Hospital only)

Dasatinib 80 mg Sprycel 80mg tablets | 30 tablet | POM | £2,504.96 DT | £2,504.96 (Hospital only)

Dasatinib 100 mg Sprycel 100mg tablets | 30 tablet | POM | £2,504.96 DT | £2,504.96 (Hospital only)

Dasatinib 140 mg Sprycel 140mg tablets | 30 tablet | POM | £2,504.96 DT | £2,504.96 (Hospital only)

Encorafenib

**DRUG ACTION** Encorafenib inhibits the mitogen-activated protein kinase (MAPK) pathway, specifically BRAF kinase, thereby inhibiting BRAF V600 mutation-positive cell growth.

**INDICATIONS AND DOSE** Unresectable or metastatic melanoma with a BRAF V600 mutation (in combination with binimetinib) (specialist use only)

- By mouth
  - Adult: 450 mg once daily, for dose adjustments due to side-effects, consult product literature

**IMPORTANT SAFETY INFORMATION**

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES See Cytotoxic drugs p. 888.

- CONTRA-INDICATIONS BRAF wild-type malignant melanoma
- CAUTIONS Prior or concurrent cancer associated with RAS mutation · risk factors for QT-interval prolongation
- INTERACTIONS Appendix 1: encorafenib
- SIDE-EFFECTS
  - Common or very common Alopecia · anaemia · angioedema · appetite decreased · arthralgia · arthrosis · constipation · detachment of retinal pigment epithelium · diarrhoea · dizziness · embolism and thrombosis · eye inflammation · facial paralysis · fatigue · fever · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · heart failure · hypertension · hypersensitivity · hypersensitivity vasculitis · hypotension · insomnia · intracranial haemorrhage · left ventricular dysfunction · lip squamous cell carcinoma · muscle complaints · muscle weakness · myopathy · nausea · neoplasms · nerve disorders · oedema · pain · panniculitis · paresis · photosensitivity reaction · renal impairment · skin reactions · taste altered · ulcerative colitis · vision disorders · vomiting
  - Uncommon Pancreatitis
  - Frequency not known QT interval prolongation
  - CONCEPTION AND CONTRACEPTION Manufacturer advises women of child-bearing potential should use effective contraception during and for at least one month after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.
  - PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
  - BREAST FEEDING Manufacturer advises avoid—no information available.
  - HEPATIC IMPAIRMENT Manufacturer advises caution in mild impairment (increased exposure); avoid in moderate or severe impairment (no information available).
  - Dose adjustments Manufacturer advises dose reduction to 300 mg once daily in mild impairment.
  - RENAL IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).
  - MONITORING REQUIREMENTS
    - Manufacturer advises assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, every 2 months during treatment, and for up to 6 months after discontinuation; assess for non-cutaneous malignancy and monitor full blood count before, during, and after treatment discontinuation as clinically indicated—consult product literature.
    - Manufacturer advises monitor liver function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.

www.getintopharma.com
Manufacturer advises assess ECG before treatment, one month after starting treatment, then every 3 months or more frequently as clinically indicated.

Manufacturer advises monitor blood creatinine levels as clinically indicated.

Manufacturer advises monitor ophthalmologic reactions including uveitis, iridocyclitis, and iritis.

**PATIENT AND CARER ADVICE** Manufacturer advises patients should be informed to immediately report new skin lesions—risk of cutaneous squamous cell carcinoma and new primary melanoma.

**Missed doses** Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Encorafenib with binimetinib for unresectable or metastatic BRAF V600 mutation-positive melanoma (February 2019) NICE TA562

Encorafenib (Braftovi®) with binimetinib is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma in adults. It is recommended only if the manufacturer provides encorafenib according to the commercial arrangements. [www.nice.org.uk/guidance/ta562](http://www.nice.org.uk/guidance/ta562)

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Braftovi (Pierre Fabre Ltd)**
- Encorafenib 50 mg (Braftovi 50mg capsules) | 28 capsule [Pm](https://www.nice.org.uk/guidance/ta562)

- Encorafenib 280 mg (Braftovi 280mg capsules) | 28 capsule [Pm](https://www.nice.org.uk/guidance/ta562)
- Encorafenib 300 mg (Braftovi 300mg capsules) | 28 capsule [Pm](https://www.nice.org.uk/guidance/ta562)
- Encorafenib 400 mg (Braftovi 400mg capsules) | 28 capsule [Pm](https://www.nice.org.uk/guidance/ta562)
- Encorafenib 500 mg (Braftovi 500mg capsules) | 28 capsule [Pm](https://www.nice.org.uk/guidance/ta562)
- Encorafenib 600 mg (Braftovi 600mg capsules) | 28 capsule [Pm](https://www.nice.org.uk/guidance/ta562)
- Encorafenib 750 mg (Braftovi 750mg capsules) | 28 capsule [Pm](https://www.nice.org.uk/guidance/ta562)
- Encorafenib 900 mg (Braftovi 900mg capsules) | 28 capsule [Pm](https://www.nice.org.uk/guidance/ta562)

**Drug Action**

Erlotinib is a tyrosine kinase inhibitor.

**Indications and Dose**

Treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy | Monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy

- **By mouth**
- Adult: 150 mg once daily

Treatment of metastatic pancreatic cancer (in combination with gemcitabine)

- **By mouth**
- Adult: 100 mg once daily

**Dose Adjustments Due to Interactions**

- Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, increase dose to 300 mg daily, if well tolerated for more than 2 weeks, further increase to 450 mg daily could be considered with close monitoring.

**Important Safety Information**

**Epidermal Growth Factor Receptor (EGFR) Inhibitors: Serious Cases of Keratitis and Ulcerative Keratitis (May 2012)**

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness.

Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

**Risks of Incorrect Dosing of Oral Anti-Cancer Medicines** See Cytotoxic drugs p. 888.

**Cautionary and Advisory Labels**

- **Uncommon** Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness.

**Driving and Skilled Tasks**

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances.

**Conception and Contraception**

Effective contraception required during and for at least 2 weeks after treatment.

**Pregnancy**

Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**Breast Feeding**

Manufacturer advises avoid—breast feeding during treatment and for at least 2 weeks after the last dose.

**Hepatic Impairment**

Manufacturer advises caution in mild to moderate impairment—monitor liver function and interrupt treatment if changes in liver function are severe (increased risk of hepatic failure); avoid in severe impairment—no information available.

**Dose Adjustments**

Manufacturer advises consider dose reduction or interruption if serious adverse effects occur.

**Renal Impairment**

Manufacturer advises avoid in severe impairment.

**National Funding/Access Decisions**

**NICE decisions**

- Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer (June 2011) NICE TA227

Erlotinib (Tarceva®) monotherapy is **not** recommended for maintenance treatment in patients with locally advanced or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy.

Patients currently receiving erlotinib monotherapy for maintenance treatment should have the option to continue treatment until they and their clinician consider it appropriate to stop. [www.nice.org.uk/guidance/ta227](http://www.nice.org.uk/guidance/ta227)

- Erlotinib for the first-line treatment of locally advanced or metastatic EGFR/TK mutation-positive non-small-cell lung cancer (June 2012) NICE TA258

Erlotinib (Tarceva®) is recommended as an option in patients for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if:

- they test positive for the epidermal growth factor tyrosine kinase (EGFR-TK) mutation, and

[www.getintopharma.com](http://www.getintopharma.com)
Immune system and malignant disease

Drug action

Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy (December 2015) NICE TA374

Erlotinib is not recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-negative.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

BNF 78
Targeted therapy responsive malignancy 981

- Rare or very rare  
  Pure red cell aplasia
- Frequency not known  
  Hepatitis B reactivation

SIDE-EFFECTS, FURTHER INFORMATION  
Reduce dose or discontinue if severe side-effects occur—consult product literature.

- CONCEPTION AND CONTRACEPTION  
  Effective contraception must be used during and for up to 8 weeks after treatment.
- PREGNANCY  
  Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- BREAST FEEDING  
  Manufacturer advises avoid.
- HEPATIC IMPAIRMENT  
  Consult product literature.

- MONITORING REQUIREMENTS  
  For Votubia® preparations: manufacturer advises everolimus blood concentration monitoring is required—consult product literature.
  For Certican®: manufacturer advises pre-dose (‘trough’) whole blood everolimus concentration should be 3–8 nanograms/mL; monitoring should be performed every 4–5 days (using chromatographic assay) after initiation or dose adjustment until 2 consecutive stable concentrations; monitor patients with hepatic impairment taking concomitant strong CYP3A4 inducers and inhibitors when switching formulation, and/or if concomitant ciclosporin dose is reduced.
  Manufacturer advises monitor blood-glucose concentration, complete blood count, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.
  Manufacturer advises monitor renal function before treatment and periodically thereafter.
  Manufacturer advises monitor for signs and symptoms of infection before and during treatment.

- DIRECTIONS FOR ADMINISTRATION  
  VOTUBIA® DISPERSIBLE TABLETS  
  Manufacturer advises tablets must be dispersed in water before administration—consult product literature for details.
  Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

- PRESCRIBING AND DISPENSING INFORMATION  
  Votubia® is available as both tablets and dispersible tablets. These formulations vary in their licensed indications and are not interchangeable—consult product literature for information on switching between formulations.

- PATIENT AND CARER ADVICE  
  Pneumonitis  
  Non-infectious pneumonitis reported. Manufacturer advises patients and their carers should be informed to seek urgent medical advice if new or worsening respiratory symptoms occur.
  Infections  
  Manufacturer advises patients and their carers should be informed of the risk of infection.

- NATIONAL FUNDING/ACCESS DECISIONS  
  NICE decisions  
  Everolimus with exemestane for treating advanced breast cancer after endocrine therapy (December 2016) NICE TA421
  Everolimus, in combination with exemestane, is recommended within its market authorisation for treating advanced human epidermal growth factor receptor 2 (HER2)-negative, hormone-receptor-positive breast cancer in postmenopausal women without symptomatic visceral disease that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor. Everolimus is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.
  www.nice.org.uk/TA421

- Everolimus for advanced renal cell carcinoma after previous treatment (February 2017) NICE TA432
  Everolimus is recommended within its marketing authorisation as an option for treating advanced renal cell carcinoma that has progressed during or after treatment with vascular endothelial growth factor targeted therapy. Everolimus is only recommended if the manufacturer provides it with the discount agreed in the patient access scheme.
  www.nice.org.uk/TA432

- Everolimus and sunitinib for treating unresectable or metastatic neuroendocrine tumours in people with progressive disease (June 2017) NICE TA449
  Everolimus and sunitinib are recommended, within their marketing authorisations, as options for treating well- or moderately differentiated unresectable or metastatic neuroendocrine tumours (NETs) of pancreatic origin in adults with progressive disease.
  Everolimus is recommended, within its marketing authorisation, as an option for treating well-differentiated (grade 1 or grade 2) non-functional unresectable or metastatic NETs of gastrointestinal or lung origin in adults with progressive disease.
  Everolimus is recommended only when the company provides it with the discount agreed in the patient access scheme.
  www.nice.org.uk/TA449

VOTUBIA® DISPERSIBLE TABLETS

Scottish Medicines Consortium (SMC) decisions  
SMC No. 1331/18
The Scottish Medicines Consortium has advised (June 2018) that everolimus (Votubia® dispersible tablets) are accepted for use within NHS Scotland for the adjunctive treatment of patients aged two years and older whose refractory partial-onset seizures, with or without secondary generalisation, are associated with tuberous sclerosis complex. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

AFINITOR®

NICE decisions  
Lenvatinib with everolimus for previously treated advanced renal cell carcinoma (January 2018) NICE TA498
Lenvatinib plus everolimus is recommended as an option for treating advanced renal cell carcinoma in adults who have had one previous vascular endothelial growth factor (VEGF)-targeted therapy, only if:  
- their Eastern Cooperative Oncology Group (ECOG) performance status score is 0 or 1, and
- the manufacturer provides lenvatinib with the discount agreed in the patient access scheme.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
  www.nice.org.uk/guidance/TA498

CERTICAN®

NICE decisions  
Everolimus for preventing organ rejection in liver transplantation (July 2015) NICE TA348
Everolimus (Certican®) is not recommended within its marketing authorisation for preventing organ rejection in patients who have undergone a liver transplant. Patients currently receiving everolimus for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.
  www.nice.org.uk/guidance/TA348

www.getintopharma.com
Targeted therapy responsive malignancy

982

IMMUNOSUPPRESSIVE THERAPY FOR KIDNEY TRANSPLANT IN ADULTS (OCTOBER 2017) NICE TA481

Everolimus is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA481

Gefitinib

DRUG ACTION

Gefitinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor

BY MOUTH

- Adult: 250 mg once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

INTERACTIONS

Appendix 1: gefitinib

SIDE-EFFECTS

- Common or very common Alopecia - angioedema - appetite decreased - asthenia - cystitis - dehydration - diarrhoea - dry eye - dry mouth - eye inflammation - fever - haemorrhage - hyperglycaemia - interstitial lung disease - nail disorder - nausea - proteinuria - skin reactions - stomatitis - vomiting
- Uncommon Corneal erosion - gastrointestinal perforation - hepatitis - pancreatitis
- Rare or very rare Cutaneous vasculitis - severe cutaneous adverse reactions (SCARs)

CONCEPTION AND CONCEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

PREGNANCY

Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Manufacturer advises caution in moderate to severe impairment due to cirrhosis—monitor for adverse events (risk of increased drug plasma concentrations).

RENAI IMPAIRMENT

Manufacturer advises caution if creatinine clearance less than 20 mL/minute.

MONITORING REQUIREMENTS

- Monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed.
- Monitor liver function—consider discontinuing if severe changes in liver function occur.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Gefitinib for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010) NICE TA192

Gefitinib (Iressa®) is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if the patient tests positive for the epidermal growth receptor tyrosine kinase (EGFR-TK) mutation and the manufacturer provides gefitinib at the fixed price agreed under the patient access scheme.

www.nice.org.uk/guidance/ta192

Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy (December 2015) NICE TA374

Gefitinib (Iressa®) is not recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-positive.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta374

Scottish Medicines Consortium (SMC) decisions

SMC No. 615/10

The Scottish Medicines Consortium has advised (December 2015) that gefitinib (Iressa®) is accepted for restricted use within NHS Scotland for the treatment of adults with previously untreated locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor tyrosine kinase. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

www.getintopharma.com
Ibrutinib

**DRUG ACTION** Ibrutinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

**Treatment of relapsed or refractory mantle cell lymphoma**
- **BY MOUTH**
  - Adult: 560 mg once daily, for dose adjustments due to side effects consult product literature.

**Treatment of chronic lymphocytic leukaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients with 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy**
- **BY MOUTH**
  - Adult: 420 mg once daily, for dose adjustments due to side effects consult product literature.

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4, amiodarone or ciprofloxacin is unavoidable, reduce dose to 280 mg once daily.
- Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 140 mg once daily, or withhold ibrutinib for up to 7 days.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 888.

**MHRA/CHM ADVICE: IBRUTINIB (IMBRUVICA®): REPORTS OF VENTRICULAR TACHYARRHYTHMIA; RISK OF HEPATITIS B REACTIVATION AND OF OPPORTUNISTIC INFECTIONS (AUGUST 2017)**

Cases of ventricular tachyarrhythmia have been reported with the use of ibrutinib. The MHRA advises that ibrutinib should be temporarily discontinued in patients who develop symptoms suggestive of ventricular arrhythmia and to assess benefit-risk before restarting therapy.

Hepatitis B virus status should be established before initiating therapy—for patients with positive hepatitis B serology, consultation with a liver disease expert is recommended before the start of treatment; monitor and manage patients according to local protocols to minimise the risk of hepatitis B virus reactivation. Prophylaxis should be considered for those at an increased risk of opportunistic infections.

**CAUTIONS**
Family history of congenital short QT syndrome • increased leucocytes—increased risk of infection • interstitial lung disease • muscle spasms • musculoskeletal pain • nausea • neoplasms • neutropenia • peripheral oedema • sepsis • skin reactions • stomatitis • thrombocytopenia • tumour lysis syndrome • vision blurred • vomiting

**SIDE-EFFECTS**
- Common or very common
  - Arrhythmias • arthralgia • broken nails • CNS haemorrhage • constipation • diarrhoea • dizziness • fever • haemorrhage • headache • hypertension • hyperuricaemia • increased leucocytes • increased risk of infection • interstitial lung disease • muscle spasms • musculoskeletal pain • nausea • neoplasms • neutropenia • peripheral oedema • sepsis • skin reactions • stomatitis • thrombocytopenia • tumour lysis syndrome • vision blurred • vomiting

**INTERACTIONS**
- Appendix 1: ibrutinib

**CONCEPTION AND CONTRACEPTION**
Highly effective contraception (must include a non-hormonal method) required during and for 3 months after stopping treatment.

**PREGNANCY**
Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**
Manufacturer advises discontinue breastfeeding—no information available.

**HEPATIC IMPAIRMENT**
Manufacturer advises avoid in severe impairment (risk of increased exposure)—monitor for toxicity.

**Dose adjustments**
Manufacturer advises dose reduction to 280 mg daily in mild impairment and to 140 mg daily in moderate impairment with further adjustments if necessary—consult product literature.

**RENAL IMPAIRMENT**
Use in severe impairment only if benefit outweighs risk and with close monitoring for toxicity.

**Monitoring**
Maintain hydration and monitor serum creatinine periodically in mild to moderate renal impairment.

**MONITORING REQUIREMENTS**
- Monitor full blood count once a month.
- Monitor for atrial fibrillation (increased risk in cardiac risk factors, acute infections and history of atrial fibrillation), monitor all patients periodically and complete ECG if arrhythmic symptoms or dyspnoea develop—consult product literature for treatment options.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Ibrutinib for previously treated chronic lymphocytic leukaemia and untreated chronic lymphocytic leukaemia with 17p deletion or TP53 mutation (January 2017) NICE TA429
  Ibrutinib (Imbruvica®) alone is recommended within its marketing authorisation as an option for treating chronic lymphocytic leukaemia in adults who have had at least one prior therapy or who have a 17p deletion or TP53 mutation, and in whom chemo-immunotherapy is unsuitable, and only when the manufacturer provides ibrutinib with the discount agreed in the patient access scheme.
  www.nice.org.uk/guidance/ta429
- Ibrutinib for treating Waldenstrom’s macroglobulinaemia (November 2017) NICE TA491
  Ibrutinib (Imbruvica®) is recommended for use in the Cancer Drugs Fund as an option for treating Waldenstrom’s macroglobulinaemia in adults who have had at least one prior therapy, only if the conditions in the managed access agreement for ibrutinib are followed.
  Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
  www.nice.org.uk/guidance/ta491
 Immunology

Immune system and malignant disease

INTERACTIONS

CAUTIONS

DRUG ACTION

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS

Indications and advice on minimising the risk of infection

SIDE-EFFECTS

Common or very common Colitis · diarrhoea · fever · infection · neutropenia · pneumonitis · rash

Rare or very rare Severe cutaneous adverse reactions (SCARs)

CONCEPTION AND CONTRAINDICATIONS

Highly effective contraception (in addition to barrier method) required during and for one month after treatment.

PREGNANCY

Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

Manufacturer advises caution (risk of increased exposure—limited information available in severe impairment)—monitor for adverse reactions.

MONITORING REQUIREMENTS

Manufacturer advises monitor liver function—consult product literature.

Monitor for signs and symptoms of infection, including cytomegalovirus infection and respiratory infections; new symptoms should be reported promptly. Neutrophil count should be monitored in all patients every 2 weeks for the first 6 months of treatment; patients with neutrophil count <1000 per mm$^3$ should be monitored weekly.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Idelalisib for treating chronic lymphocytic leukaemia (October 2015) NICE TA359

Idelalisib (Zydelig®), in combination with rituximab, is recommended as an option for treatment in adults:

- who have untreated chronic lymphocytic leukaemia with a 17p deletion or TP53 mutation, or
- who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months, and
- if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta359

Scottish Medicines Consortium (SMC) decisions

SMC No. 1039/15

The Scottish Medicines Consortium has advised (March 2015) that idelalisib (Zydelig®) is accepted for restricted use within NHS Scotland, in combination with rituximab, for the treatment of relapsed chronic lymphocytic leukaemia in patients who are unsuitable for chemotherapy and treatment naïve patients with 17p deletion or TP53 mutation who are unsuitable for chemotherapy and treatment only whilst idelalisib is available at the price agreed in the patient access scheme.

SMC No. 1039/15

The Scottish Medicines Consortium has advised (May 2015) that idelalisib (Zydelig®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of patients with follicular lymphoma that is refractory to two prior lines of treatment. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 2597

The All Wales Medicines Strategy Group has advised (April 2017) that idelalisib (Zydelig®) is recommended as an option for use within NHS Wales as monotherapy for the treatment of patients with follicular lymphoma, that is refractory to two prior lines of treatment.

Idelalisib

DRUG ACTION

Idelalisib is a protein kinase inhibitor.

INDICATIONS AND DOSE

Treatment of chronic lymphocytic leukaemia in patients who have received at least one previous therapy, or as first-line treatment in the presence of 17p deletion or TP53 mutation in patients who are not eligible for any other therapies (in combination with rituximab) | Treatment of follicular lymphoma refractory to two lines of treatment (monotherapy)

BY MOUTH

Adult: 150 mg twice daily, for dose adjustment due to side effects, consult product literature

IMPORTANT SAFETY INFORMATION

Risks of incorrect dosing of ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

MHRA/CHM ADVICE: IDEALALISIB (ZYDELIG®); UPDATED INDICATIONS AND ADVICE ON MINIMISING THE RISK OF INFECTION (SEPTEMBER 2016)

In light of a recent safety review the indications for idelalisib have been updated. Manufacturer recommendations regarding monitoring for infection and prophylaxis of Pneumocystis jirovecii pneumonia have also been updated. Patients should be advised on the risk of serious or fatal infections during treatment, and idelalisib should not be initiated in patients with any evidence of infection.

CAUTIONS

Active hepatitis · diarrhoea—symptomatic management recommended (consult product literature) · pneumonitis—withhold treatment (consult product literature)

Frequency not known

Embolism and thrombosis | hepatitis B reactivation | neoplastic complications | osteonecrosis | pericarditis

CONCEPTION AND CONTRACEPTION

Effective contraception required during treatment.

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Dose adjustments Max. 400 mg daily; reduce dose further if not tolerated.

RENAI IMPAIRMENT

Dose adjustments Maximum starting dose 400 mg daily if creatinine clearance less than 60 mL/minute; reduce dose further if not tolerated.

MONITORING REQUIREMENTS

Monitor for gastrointestinal haemorrhage.

Monitor complete blood counts regularly.

Monitor for fluid retention.

Monitor liver function.

Monitor growth in children (may cause growth retardation).

DIRECTIONS FOR ADMINISTRATION

Tablets may be dispersed in water or apple juice.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer imatinib tablets.

www.getintopharma.com
Dasatinib, nilotinib and imatinib for untreated chronic
Imatinib for the treatment of unresectable and/or metastatic
gastro-intestinal stromal tumours, as defined by the Miettinen 2006 criteria (based on tumour size, location, and mitotic rate), for up to 3 years.

Patients currently receiving treatment initiated within the NHS with imatinib that is not recommended for them by NICE in this guidance should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/TA326

Imatinib for chronic myeloid leukaemia (updated January 2016) NICE TA70
Imatinib is recommended as an option for patients with Philadelphia-chromosome-positive chronic myeloid leukaemia who initially present in the accelerated phase or with blast crisis. Imatinib is also recommended as an option for patients who present in the chronic phase and then progress to the accelerated phase or blast crisis if they have not received imatinib previously.

www.nice.org.uk/TA70

Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004) NICE TA86
Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment (as defined by Southwest Oncology Group criteria available at www.nice.org.uk/TA86) is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond.

www.nice.org.uk/TA86

Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010) NICE TA209
Imatinib 600 mg daily or 800 mg daily is not recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily.

www.nice.org.uk/TA209

Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016) NICE TA425
Imatinib is recommended as an option for untreated chronic phase Philadelphia-chromosome-positive CML in adults.

www.nice.org.uk/TA426

Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016) NICE TA425
High-dose imatinib (600 mg in the chronic phase or 800 mg in the accelerated and blast-crisis phases) is not recommended for treating Philadelphia-chromosome-positive CML in adults whose disease is imatinib-resistant.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA425

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (March 2002) that imatinib (Glivec®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).

The Scottish Medicines Consortium has also advised (February 2012) that nilotinib (Tasigna®) is accepted for restricted use within NHS Scotland for the treatment of adult patients who are at significant risk of relapse following resection of a KIT (CD117)-positive gastrointestinal stromal tumour (GIST) and who are at high risk of recurrence following complete resection (according to the Armed Forces Institute of Pathology (AFIP) risk criteria).

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Lapatinib

INDICATIONS AND DOSE

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2) with hormone-receptor-negative disease who have had previous treatment with trastuzumab in combination with chemotherapy (in combination with trastuzumab)

BY MOUTH
Adult: 1 g once daily

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab (in combination with capecitabine)

BY MOUTH
Adult: 1.25 g once daily

Treatment of advanced or metastatic breast cancer with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for postmenopausal women with hormone-receptor-positive disease (in combination with an aromatase inhibitor)

BY MOUTH
Adult: 1.5 g once daily

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 888.

CAUTIONS Diarrhoea— withhold treatment if severe (consult product literature) - low gastric pH (reduced absorption) - susceptibility to QT-interval prolongation (including electrolyte disturbances)

INTERACTIONS → Appendix 1: lapatinib

SIDE-EFFECTS
Common or very common
Alopecia - appetite decreased - arthralgia - asthenia - constipation - cough - dehydration - diarrhoea (treat promptly) - dysphagia - epistaxis - gastrointestinal discomfort - headache - hepatotoxicity (discontinue permanently if severe) - hot flush - hyperbilirubinaemia - insomnia - mucositis - nail disorder - nausea - pain - paronychia - skin reactions - stomatitis - vomiting

Targeted therapy responsive malignancy 987

LENVIMA®

Differentiated thyroid carcinoma (specialist use only)

• BY MOUTH
  • Adult: 24 mg once daily, dose should be taken at the same time every day, for dose adjustments due to side-effects—consult product literature

Hepatocellular carcinoma (specialist use only)

• BY MOUTH
  • Adult (body-weight up to 60 kg): 8 mg once daily, dose should be taken at the same time every day, for dose adjustments due to side-effects—consult product literature
  • Adult (body-weight 60 kg and above): 12 mg once daily, dose should be taken at the same time every day, for dose adjustments due to side-effects—consult product literature

Important safety information

Risks of incorrect dosing of oral anti-cancer medicines

See Cytotoxic drugs p. 888.

Contra-indications

Fistulae

Caution

Arterial thromboembolism within the previous 6 months—elderly (75 years and over)—reduced tolerability—hypertension—blood pressure should be well-controlled prior to treatment—impaired wound healing—consider temporary interruption of treatment for major surgical procedures

Interactions

Appendix 1: lenvatinib

Side-effects

Common or very common

Uncommon
  • Pancreatitis—pareisis—posterior reversible encephalopathy syndrome (PRES)—spleenic infarction

Frequency not known

Fistula

Side-effects, further information

Manufacturer advises gastrointestinal toxicity should be actively managed—dehydration and/or hypovolaemia caused by gastrointestinal toxicity are identified as primary risk factors for renal impairment or failure.

Conception and contraception

Manufacturer advises women of child-bearing potential should use highly effective contraception during treatment and for 1 month after the last dose, an additional barrier method of contraception should be used in women using oral hormonal contraceptives. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

Pregnancy

Manufacturer advises avoid unless potential benefit outweighs risk—teratogenic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

Breast feeding

Manufacturer advises avoid—present in milk in animal studies.

Hepatic impairment

KISPLYX® Manufacturer advises caution in severe impairment (risk of increased exposure).

BNF 78

Lenvatinib

26-Feb-2019

DRUG ACTION

Lenvatinib is a multireceptor tyrosine kinase inhibitor.

INDICATIONS AND DOSE

KISPLYX®

Advanced renal cell carcinoma following one prior vascular endothelial growth factor-targeted therapy (in combination with everolimus) (specialist use only)

• BY MOUTH
  • Adult: 18 mg once daily, dose should be taken at the same time every day, for dose adjustment due to side-effects—consult product literature

CONCEPTION AND CONTRACEPTION

Contraceptive advice should be used in women using oral contraceptive. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—teratogenic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

KISPLYX® Manufacturer advises caution in severe impairment (risk of increased exposure).

IMMUNE SYSTEM AND MALIGNANT DISEASE

www.getintopharma.com
Dose adjustments Manufacturer advises dose reduction to 10 mg once daily in severe impairment.

LENVIMA® Manufacturer advises caution.
- When used for Hepatocellular carcinoma Manufacturer advises avoid in severe impairment (no information available).

Dose adjustments When used for Differentiated thyroid carcinoma Manufacturer advises dose reduction to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature.

RENAL IMPAIRMENT KISPLYX® Manufacturer advises avoid in end-stage renal disease.
Dose adjustments Manufacturer advises reduce dose to 10 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature.

MONITORING REQUIREMENTS
- Manufacturer advises monitor blood pressure after 1 month and periodically during treatment (calcium levels should be monitored at least monthly), correct electrolyte abnormalities prior to treatment; monitor thyroid function before and regularly during treatment.
- Manufacturer advises monitor liver function before treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor for signs and symptoms of cardiac decompensation (adjust dose as necessary—consult product literature).
- Manufacturer advises monitor liver function before treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor urine protein regularly.

DIRECTIONS FOR ADMINISTRATION Manufacturer advises capsules should be swallowed whole. Alternatively, capsules may be added to a tablespoon of water or apple juice in a small glass (without breaking or crushing), allowed to sit for at least 10 minutes, then stirred for at least 3 minutes to dissolve the capsule shells before swallowing; the same amount of liquid should then be added to the glass, swirled a few times, then swallowed.

PATIENT AND CARER ADVICE Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and dizziness.

NATIONAL FUNDING/ACCESS DECISIONS NICE decisions
- Lenvatinib and sorafenib for treating differentiated thyroid cancer after radioactive iodine (August 2018) NICE TASS
Lenvatinib (Lenvima®) is recommended as an option for treating progressive, locally advanced or metastatic differentiated thyroid cancer (papillary, follicular or Hürthle cell) in adults whose disease does not respond to radioactive iodine, only if:
- they have not had a tyrosine kinase inhibitor before, or
- they have had to stop taking a tyrosine kinase inhibitor within 3 months of starting it because of toxicity specifically, toxicity that cannot be managed by dose delay or dose modification), and
- the manufacturer provides lenvatinib according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta535

- Lenvatinib for untreated advanced hepatocellular carcinoma (December 2018) NICE TAS
Lenvatinib (Lenvima®) is recommended as an option for untreated, advanced, unresectable hepatocellular carcinoma in adults, only if:
- they have Child–Pugh grade A liver impairment and an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1, and
- the manufacturer provides it according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta551

Scottish Medicines Consortium (SMC) decisions
SMC No. SMC2138The Scottish Medicines Consortium has advised (April 2019) that lenvatinib (Lenvima®) is accepted for use within NHS Scotland as monotherapy for the treatment of adults with advanced or unresectable hepatocellular carcinoma who have received no prior systemic therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

KISPLYX® NICE decisions
- Lenvatinib with everolimus for previously treated advanced renal cell carcinoma (January 2018) NICE TA498
Lenvatinib plus everolimus is recommended as an option for treating advanced renal cell carcinoma in adults who have had one previous vascular endothelial growth factor (VEGF)-targeted therapy, only if:
- their Eastern Cooperative Oncology Group (ECOG) performance status score is 0 or 1, and
- the manufacturer provides lenvatinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta498

LENVIMA® Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (October 2016) that lenvatinib (Lenvima®) is accepted for use within NHS Scotland for treatment of adults with progressive, locally advanced or metastatic, differentiated (papillary/follicular/Hürthle cell) thyroid carcinoma, refractory to radioactive iodine. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions
The All Wales Medicines Strategy Group has advised (October 2017) that lenvatinib (Lenvima®) is recommended as an option for restricted use within NHS Wales for the treatment of adults with progressive, locally advanced or metastatic, differentiated
Midostaurin

**DRUG ACTION** Midostaurin is an inhibitor of multiple tyrosine kinases.

**INDICATIONS AND DOSE**

**Acute myeloid leukaemia (specialist use only)**
- **BY MOUTH**
  - Adult: 50 mg twice daily, on days 8–21 of induction and consolidation chemotherapy cycles; for administration following consolidation chemotherapy, and dose adjustment or treatment interruption due to side-effects—consult product literature

**Aggressive systemic mastocytosis (specialist use only)**
- **Systemic mastocytosis with associated haematological neoplasm (specialist use only)**
  - **Mast cell leukaemia (specialist use only)**
  - **BY MOUTH**
  - Adult: 100 mg twice daily, for dose adjustment or treatment interruption due to side-effects—consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 888.

**CAUTIONS** Active severe infection (control before initiation of monotherapy) - elderly (limited experience) - patients at risk of congestive heart failure - risk factors for QT-interval prolongation

**INTERACTIONS** → Appendix 1: midostaurin

**SIDE-EFFECTS**
- **Common or very common**
  - Concentration impaired - constipation - cough - diarrhoea - dizziness - dyspepsia - dysphagia - fatigue - febrile neutropenia - fever - haemorrhage - headache - hypotension - infection - nausea - oropharyngeal pain - peripheral oedema - respiratory disorders - tremor - vertigo - vomiting - weight increased
- **Frequency not known**
  - Congestive heart failure - QT interval prolongation

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises perform pregnancy test in women of childbearing potential within 7 days prior to treatment initiation; effective contraception must be used during treatment and for at least 4 months after stopping treatment—additional barrier method recommended in women using hormonal contraceptives. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**
Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**
Manufacturer advises avoid during treatment and for 4 months after stopping treatment—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in severe impairment and monitor for toxicity—no information available.

**RENAL IMPAIRMENT**
Manufacturer advises caution in severe impairment and monitor for toxicity—limited information available.

**MONITORING REQUIREMENTS**
- **Manufacturer advises monitor white blood cell count regularly, especially at treatment initiation; also monitor for signs and symptoms of infection.**
- **Manufacturer advises assess left ventricular ejection fraction in patients at risk of congestive heart failure at baseline and during treatment as clinically indicated; consider performing ECGs if concomitant use with drugs that can prolong QT-interval.**
- **Manufacturer advises monitor for pulmonary symptoms indicative of interstitial lung disease or pneumonitis.**

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- **Midostaurin for untreated acute myeloid leukaemia (June 2018) NICE TA523**

Midostaurin is recommended, within its marketing authorisation, as an option in adults for treating newly diagnosed acute FLT3-mutation-positive myeloid leukaemia with standard daunorubicin and cytarabine as induction therapy, with high-dose cytarabine as consolidation therapy, and alone after complete response as maintenance therapy. It is recommended only if the manufacturer provides midostaurin with the discount agreed in the patient access scheme.

www.nice.org.uk/guidance/ta523

**Scottish Medicines Consortium (SMC) decisions**
SMC No. 1330/18

The Scottish Medicines Consortium has advised (June 2018) that midostaurin (Rydapt®) is accepted for use within NHS Scotland for the treatment of adults with newly diagnosed acute myeloid leukaemia who are FMS-like tyrosine kinase 3 (FLT3) mutation-positive, when used in combination with standard daunorubicin and cytarabine induction and high-dose cytarabine consolidation chemotherapy, and for patients in complete response followed by midostaurin single agent maintenance therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS** There is variation in the licensing of different medicines containing the same drug.

**Capsule**
- **CAUTIONARY AND ADVISORY LABELS 21, 25**
- **EXCIPIENTS: May contain Alcohol**
  - **Rydapt (Novartis Pharmaceuticals UK Ltd) ▼**
  - Midostaurin 25 mg Rydapt 25mg capsules | 56 capsule £5,609.94

Nilotinib

**DRUG ACTION**
Nilotinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

**Newly diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (initiated by a specialist)**
- **BY MOUTH**
  - Adult: 300 mg twice daily, for dose adjustments due to side-effects—consult product literature continued →

www.getintopharma.com
PREGNANCY

CONCEPTION AND CONTRACEPTION

Frequency not known ▶ Uncommon

CAUTIONS

Clinically significant bradycardia, congestive heart failure, hepatitis B infection, history of pancreatitis, recent myocardial infarction, susceptibility to QT-interval prolongation (including electrolyte disturbances), unstable angina.

CAUTIONS, FURTHER INFORMATION

Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus in those with active infection.

INTERACTIONS → Appendix 1: nilotinib

SIDE-EFFECTS

Common or very common Alopoeia, anaemia, anemia, pectoris, anxiety, appetite abnormal, arrhythmias, arthralgia, asthenia, bone marrow disorders, cardiac conduction disorders, chest discomfort, constipation, cough, decreased leucocytes, depression, diabetes mellitus, diarrhoea, dizziness, dry eye, dyslipidaemia, dyspnoea, electrolyte imbalance, eosinophilia, eye discomfort, eye disorders, eye inflammation, fever, flushing, gastrointestinal discomfort, gastrointestinal disorders, headaches, hepatic disorders, hyperbilirubinaemia, hyperglycaemia, hypertension, increased risk of infection, insomnia, muscle complaints, muscle weakness, myocardial infarction, nausea, neoplasms, neutropenia, oedema, pain, palpitations, peripheral neuropathy, QT interval prolongation, respiratory disorders, sensation abnormal, skin reactions, sweat changes, taste altered, thrombocytopenia, vertigo, vomiting, weight changes.

Uncommon Atherosclerosis, cerebrovascular insufficiency, chills, cyanosis, erectile dysfunction, gout, haemorrhage, heart failure, hyperaemia, malaise, oral disorders, pancreatitis, peripheral vascular disease, temperature sensation altered, vision disorders.

Frequency not known Breast abnormalities, chorioretinopathy, diastolic dysfunction, dry mouth, facial swelling, gynaecomastia, hepatitis B reactivation, hyperparathyroidism, hyperuricaemia, hypoglycaemia, lethargy, memory loss, menorrhagia, oesophageal pain, oopharyngeal pain, pericardial effusion, pericarditis, restless legs, sebaceous hyperplasia, syncope, tremor, urinary disorders, urine discolouration.

CONCEPTION AND CONTRACEPTION

Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for up to two weeks after stopping treatment.

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies; see also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

CAUTIONS

Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises caution (risk of increased exposure).

MONITORING REQUIREMENTS

Manufacturer advises monitor lipid profiles before initiating treatment, at 3 and 6 months, and then yearly thereafter; monitor blood glucose before initiating treatment and then periodically during treatment, as clinically indicated.

Manufacturer advises monitor full blood count every 2 weeks for the first 2 months of treatment, then monthly thereafter, or as clinically indicated.

Manufacturer advises perform baseline ECG before treatment and as clinically indicated thereafter; correct any electrolyte disturbances before treatment and monitor periodically during treatment.

Manufacturer advises monitor and actively manage cardiovascular risk factors during treatment.

DIRECTIONS FOR ADMINISTRATION

Manufacturer advises capsules should either be swallowed whole or the contents of each capsule may be dispersed in one teaspoon of apple sauce and taken immediately.

PRESCRIBING AND DISPENSING INFORMATION

All prescribers should be familiar with the Summary of Key Safety Recommendations for Tasigna® (nilotinib) provided by the manufacturer.

PATIENT AND CARER ADVICE

Manufacturer advises patients and carers should seek immediate medical attention if signs or symptoms of cardiovascular events occur.

All patients should be provided with the Important Information About How to Take Your Medication leaflet provided by the manufacturer.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016) NICE TA426

Nilotinib (Tasigna®) is recommended, within its marketing authorisation, as an option for untreated chronic phase Philadelphia-chromosome-positive CML in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme. www.nice.org.uk/guidance/ta426

Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016) NICE TA425

Nilotinib (Tasigna®) is recommended as an option for treating chronic or accelerated phase Philadelphia-chromosome-positive CML in adults, if they cannot have imatinib, or their disease is imatinib-resistant, and the manufacturer provides nilotinib with the discount agreed in the patient access scheme. www.nice.org.uk/guidance/ta425

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23, 25, 27

Tasigna (Novartis Pharmaceuticals UK Ltd)

Nilotinib (as Nilotinib hydrochloride monohydrate)

150 mg Tasigna 150mg capsules | 112 capsule Pkt £2,432.85

Nilotinib (as Nilotinib hydrochloride monohydrate)

200 mg Tasigna 200mg capsules | 112 capsule Pkt £2,432.85

www.getintopharma.com
**Nintedanib**

**INDICATIONS AND DOSE**

**OFEV®**

**Treatment of idiopathic pulmonary fibrosis**
- **By mouth**
- Adult: 150 mg twice daily, reduced if not tolerated to 100 mg twice daily, for dose adjustments due to side-effects, consult product literature

**VARGATEF®**

**Treatment of locally advanced, metastatic or locally recurrent non-small cell lung cancer of adenocarcinoma histology after first-line chemotherapy (in combination with docetaxel) (initiated under specialist supervision)**
- **By mouth**
- Adult: 200 mg twice daily on days 2–21 of a standard 21 day docetaxel cycle, for treatment following discontinuation of docetaxel and for dose adjustments due to side-effects, consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISks OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

**CAUTIONS**

History or risk factors for QT prolongation - impaired wound healing - increased risk of bleeding - patients at high risk of cardiovascular disease - previous abdominal surgery - recent history of hollow organ perforation - theoretical increased risk of gastrointestinal perforation - theoretical increased risk of venous thromboembolism

**INTERACTIONS** → Appendix 1: nintedanib

**SIDE-EFFECTS**

- Common or very common Abdominal pain - abscess - appetite decreased - dehydratation - diarrhoea - electrolyte imbalance - haemorrhage - hyperbilirubinaemia - hypertension - mucositis - nausea - neutropenia - peripheral neuropathy - sepsis - skin reactions - stomatitis - thrombocytopenia - venous thromboembolism - vomiting - weight decreased
- Uncommon Drug-induced liver injury - gastrointestinal perforation - myocardial infarction - pancreatitis - renal impairment

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with peanut or soya hypersensitivity.

**CONCEPTION AND CONTRA IndICATION**

Manufacturer advises exclude pregnancy before treatment and ensure effective contraception (in addition to barrier method) during treatment and for at least 3 months after last dose.

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in mild impairment (risk of increased exposure); avoid in moderate to severe impairment (limited information available).

**OFEV®**

**DOSE ADJUSTMENTS**

Manufacturer advises dose reduction to 100 mg twice daily in mild impairment.

**RENAL IMPAIRMENT**

Manufacturer advises caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- For OFEV®, manufacturer advises monitor full blood count before each treatment cycle and regularly thereafter; monitor hepatic function before each treatment cycle during combination therapy and monthly during monotherapy; monitor renal function during treatment; monitor for thromboembolic events; monitor prothrombin time, INR and for bleeding if used concomitantly with anticoagulants; monitor for cerebral bleeding in patients with stable brain metastases.
- For OFEV®, manufacturer advises monitor hepatic function before treatment initiation and during the first month of treatment, then at regular intervals during the subsequent 2 months and as clinically indicated thereafter; monitor renal function during treatment; monitor blood pressure as clinically indicated.

**PRESCRIBING AND DISPENSING INFORMATION**

**VARGATEF®**

Not to be taken on the same day as docetaxel therapy.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Nintedanib for previously treated locally advanced, metastatic, or locally recurrent non-small cell lung cancer (July 2015) NICE TA347
- Nintedanib (Vargatef®), in combination with docetaxel is recommended as an option for the treatment of patients with locally advanced, metastatic, or locally recurrent non-small-cell lung cancer of adenocarcinoma histology, that has progressed after first-line chemotherapy, only if the manufacturer provides nintedanib with the discount agreed in the patient access scheme.
  
  www.nice.org.uk/guidance/ta347

- Nintedanib for treating idiopathic pulmonary fibrosis (January 2016) NICE TA379
- Nintedanib (Ofev®) is recommended as an option for treating idiopathic pulmonary fibrosis, only if:
  - the patient has a forced vital capacity (FVC) between 50% and 80% of predicted,
  - the manufacturer provides nintedanib with the discount agreed in the patient access scheme, and,
  - treatment is stopped if disease progresses (a confirmed decline in percent predicted FVC of 10% or more) in any 12-month period.

- Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.
  
  www.nice.org.uk/guidance/ta379

- Scottish Medicines Consortium (SMC) decisions

  SMC No. 1076/15
  The Scottish Medicines Consortium has advised (October 2015) that nintedanib (Ofev®) is accepted for restricted use within NHS Scotland for the treatment of idiopathic pulmonary fibrosis in patients with a predicted forced vital capacity less than or equal to 80%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**

**EXCIPIENTS:** May contain Lecithin

- **Ofev** (Boehringer Ingelheim Ltd) ▼
  - Nintedanib (as Nintedanib esilate) 100 mg Ofev 100mg capsules | 60 capsule [£88] £1,151.10 (Hospital only)

www.getintopharma.com
Osimertinib

**DRUG ACTION**
Osimertinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**
Locally advanced or metastatic epidermal growth factor receptor T790M mutation-positive non-small-cell lung cancer (specialist use only)
- **BY MOUTH**
  - Adult: 80 mg once daily, for dose adjustment due to side-effects—consult product literature

**SIDE-EFFECTS**
- Common or very common
  - Diarrhoea - eyelid pruritus - increased risk of infection - nail discolouration - nail disorders - respiratory disorders - skin reactions - stomatitis
- Uncommon
  - Eye disorders - eye inflammation - QT interval prolongation

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**
Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**
Manufacturer advises avoid—may be present in milk based on animal studies.

**HEPATIC IMPAIRMENT**
Manufacturer advises avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**
Manufacturer advises caution in severe and end-stage impairment—limited information available.

**MONITORING REQUIREMENTS**
Manufacturer advises monitor ECG and electrolytes periodically in patients with risk factors for QTc interval prolongation; dose adjustment is advised if QTc interval is more than 500 milliseconds on at least 2 separate ECGs—consult product literature.

**DIRECTIONS FOR ADMINISTRATION**
Manufacturer advises tablet may be dispersed in 50 mL of non-carbonated water, by stirring until dispersed and swallowed immediately (do not crush). The residue must then be re-dispersed in an additional half a glass of water and immediately swallowed. Manufacturer advises if administration via a nasogastric tube is required, the tablet may be dispersed in 15 mL of non-carbonated water, by stirring until dispersed and the residue re-dispersed in an additional 15 mL of water (do not crush). The total 30 mL of liquid should then be administered as per the nasogastric tube manufacturer’s instructions with appropriate water flushes; the solution should be administered within 30 minutes of adding the tablets to water.

**PATIENT AND CARER ADVICE**
Missed doses
Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**CONTRA-INDICATIONS**
Congenital long QT syndrome

**CAUTIONS**
Elderly (more frequent dose adjustments may be required) - history of interstitial lung disease - radiation pneumonitis requiring steroid treatment - risk factors for QTc interval prolongation

**INTERACTIONS**
→ Appendix 1: osimertinib

**IMPORTANT SAFETY INFORMATION**
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 888.

**Scottish Medicines Consortium (SMC) decisions**
The Scottish Medicines Consortium (SMC) decisions

**NATIONAL FUNDING/ACCESS DECISIONS**
**NICE decisions**
- Osimertinib for treating locally advanced or metastatic EGFR T790M mutation-positive non-small-cell lung cancer (October 2016) NICE TA416
Osimertinib is recommended as an option, for use within the Cancer Drugs Fund, for treating locally advanced or metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non-small-cell lung cancer in adults whose disease has progressed only:
- after first-line treatment with an EGFR tyrosine kinase inhibitor, and
- if the conditions in the managed access agreement for osimertinib are followed.

Palbociclib

**DRUG ACTION**
Palbociclib is a highly selective inhibitor of cyclin-dependent kinases 4 and 6, which leads to disruption of cancer cell proliferation.

**INDICATIONS AND DOSE**
Locally advanced or metastatic breast cancer (initiated by a specialist)
- **BY MOUTH**
  - Adult: 125 mg once daily for 21 consecutive days of repeated 28 day cycles, for dose adjustments due to side-effects—consult product literature

**SIDE-EFFECTS**
- Common or very common
  - Alopecia - anaemia - appetite decreased - asthenia - diarrhoea - dry eye - epistaxis - excessive tearing - fever - infection - leucopenia - mucositis

**INTERACTIONS**
→ Appendix 1: palbociclib

**IMPORTANT SAFETY INFORMATION**
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 888.
Targeted therapy responsive malignancy

Pazopanib

27-Apr-2019

- Drug action
  - Pazopanib is a tyrosine kinase inhibitor.

- Indications and dose
  - First-line treatment of advanced renal cell carcinoma
  - Treatment of advanced renal cell carcinoma in patients who have had previous treatment with cytokine therapy
    - By mouth
      - Adult: 888 mg daily, adjust dose in steps of 200 mg according to tolerability; maximum 800 mg per day

- Treatment of selective subtypes of advanced soft-tissue sarcoma
  - By mouth
  - Adult: (consult product literature)

- Dose adjustments due to interactions
  - Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 400 mg daily.

- Important safety information
  - Risks of incorrect dosing of oral anti-cancer medicines
    - See Cytotoxic drugs p. 888.

- Contra-indications
  - Cerebral haemorrhage - clinically significant gastrointestinal haemorrhage - haemoptysis in the past 6 months

- Caution
  - Cardiac disease - increased risk of gastrointestinal fistula - increased risk of gastro-intestinal perforation - increased risk of haemorrhage - increased risk of thrombotic microangiopathy - permanently discontinue if symptoms develop - ischaemic stroke - myocardial infarction - risk of thrombotic events - susceptibility to QT-interval prolongation (including electrolyte disturbances) - transient ischaemic attack

- Common or very common

- Uncommon
  - Cerebrovascular insufficiency - eye disorders - haemolytic uraemic syndrome - menstrual cycle irregularities - myocardial infarction - myocardial ischaemia - oropharyngeal pain - pancreatitis - photosensitivity reaction - polycythaemia - QT interval prolongation - rhinorrhea - skin ulcer - thrombotic microangiopathy

- Side effects
  - There can be variation in the licensing of different medicines containing the same drug.

- Capsule
  - caution and advisory labels 1, 2, 25
  - Ibrance (Pfizer Ltd)

  - Palbociclib 75 mg
    - Ibrance 75mg capsules | 21 capsule (PFS) £2,950.00 (Hospital only) | 63 capsule (PFS) £8,850.00 (Hospital only)

  - Palbociclib 100 mg
    - Ibrance 100mg capsules | 21 capsule (PFS) £2,950.00 (Hospital only) | 63 capsule (PFS) £8,850.00 (Hospital only)

- Further information
  - Palbociclib with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER2-negative, locally advanced or metastatic breast cancer (December 2017)
  - NICE TA495

  - Palbociclib, with an aromatase inhibitor, is recommended within its marketing authorisation, as an option for treating hormone receptor-positive, human epidermal growth factor receptor 2 (HER2)–negative locally advanced or metastatic breast cancer as initial endocrine-based therapy in adults. Palbociclib is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

  - www.nice.org.uk/guidance/ta495

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (December 2017) that palbociclib (Ibrance®) is accepted for restricted use within NHS Scotland in combination with an aromatase inhibitor for the first-line treatment of hormone receptor (HR)–positive, human epidermal growth factor receptor 2 (HER2)–negative locally advanced or metastatic breast cancer. This advice is contingent upon the ongoing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- Medicinal forms
  - There can be variation in the licensing of different medicines containing the same drug.

- Capsule
Targeted therapy responsive malignancy

Rare or very rare  Posterior reversible encephalopathy syndrome (PRES)

CONCEPTION AND CONTRACEPTION  Effective contraception advised during treatment.

PREGNANCY  Avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

BREAST FEEDING  Discontinue breast-feeding.

HEPATIC IMPAIRMENT  Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. Dose adjustments: Manufacturer advises dose reduction to 200 mg daily in moderate impairment.

RENAL IMPAIRMENT  Use with caution if creatinine clearance less than 30 mL/minute—no information available.

MONITORING REQUIREMENTS

Monitor liver function before treatment and at weeks 3, 5, 7, and 9, then at months 3 and 4, and periodically thereafter as clinically indicated—consult product literature if elevated liver enzymes observed.

Monitor blood pressure within 1 week of treatment initiation, then frequently throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite anti-hypertensive therapy; discontinue if blood pressure persistently elevated despite anti-hypertensive therapy and pazopanib dose reduction—consult product literature).

Monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment.

Monitor for proteinuria.

Monitor thyroid function.

Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Pazopanib for the first-line treatment of advanced renal cell carcinoma (updated August 2013) NICE TA215

Pazopanib (Votrient™) is recommended as a first-line treatment option for people with advanced renal cell carcinoma:

- who have not received prior cytokine therapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1, and

- if the manufacturer provides pazopanib at the discounted price agreed under the patient access scheme.

People who are currently being treated with pazopanib for advanced metastatic renal cell carcinoma but who do not meet this criteria should have the option to continue their therapy until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/guidance/ta215

Scottish Medicines Consortium (SMC) decisions

SMC No. 676/11

The Scottish Medicines Consortium has advised (March 2011) that pazopanib (Votrient™) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland.

SMC No. 820/12

The Scottish Medicines Consortium has advised (December 2012) that pazopanib (Votrient™) is not recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have received prior chemotherapy for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy as the economic case was not demonstrated.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Ponatinib

INDICATIONS AND DOSE

Treatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate.

Treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate.

BY MOUTH

Adult: 45 mg once daily, for dose reductions due to side-effects or dose reduction due to risk of vascular occlusive events, consult product literature.

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises consider a reduced initial dose of 30 mg daily with concurrent use of potent inhibitors of CYP3A4.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PONATINIB: RISK OF VASCULAR OCCLUSIVE EVENTS—UPDATED ADVICE ON POSSIBLE DOSE REDUCTION (UPDATED APRIL 2017)

The benefits and risks of ponatinib were reviewed by the European Medicines Agency’s Committee on Medicinal Products for Human Use in 2014, which recommended that strengthened warnings should be added to the product information aimed at minimising the risk of blood clots and blockages in the arteries. Additional long-term follow-up data are now available that supports new advice on dose modification to reduce this risk. The MHRA advise that although the recommended starting dose of ponatinib remains unchanged, prescribers should consider reducing the dose for patients with chronic phase chronic myeloid leukaemia (CP-CML) who have achieved a major cytogenetic response while on treatment. The following factors should be taken into account in the individual patient assessment:

- cardiovascular risk;
- side-effects of ponatinib therapy (including cardiovascular and other dose-related toxicity);
- time to cytogenetic response;
- BCR-ABL transcript levels.

The MHRA recommends close monitoring of response, if dose reduction is undertaken.

MHRA/CHM ADVICE: RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS (MAY 2016)

An EU wide review has concluded that ponatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.
PREGNANCY

Uncommon

SIDE-EFFECTS

Cardiovascular status

- Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection through HBsAg treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

INTERACTIONS

Appendix 1: ponatinib

SIDE-EFFECTS

- Common or very common
  - Acute coronary syndrome
  - Alopecia
  - Anaemia
  - Appetite decreased
  - Arthralgia
  - Asthenia
  - Cerebrovascular insufficiency
  - Chills
  - Constipation
  - Cough
  - Diarrhoea
  - Dizziness
  - Dry eye
  - Dry mouth
  - Dysphonia
  - Dyspnoea
  - Electrolyte imbalance
  - Embolism and thrombosis
  - Erectile dysfunction
  - Eye inflammation
  - Febrile neutropenia
  - Fever
  - Fluid imbalance
  - Gastrointestinal discomfort
  - Gastroesophageal reflux disease
  - Haemorrhage
  - Headaches
  - Heart failure
  - Hyperglycaemia
  - Hypertension
  - Hypertrophiccardioma
  - Hyperuricaemia
  - Hypothyroidism
  - Increased risk of infection
  - Influenza like illness
  - Insomnia
  - Ischaemic heart disease
  - Lethargy
  - Mass
  - Muscle complaints
  - Nausea
  - Oedema
  - Pain
  - Pancreatitis
  - Pancytopenia
  - Pericardial effusion
  - Peripheral neuropathy
  - Peripheral vascular disease
  - Pleural effusion
  - Pulmonary hypertension
  - Sensation abnormal
  - Seizis
  - Skin reactions
  - Stomatitis
  - Sweath changes
  - Vasodilation
  - Vision disorders
  - Vomiting
  - Weight decreased

- Uncommon
  - Cardiac discomfort
  - Cardiomyopathy
  - Ischaemic coronary vasospasm
  - Hepatic disorders
  - Hepatic failure (including fatal cases)
  - Intracranial haemorrhage
  - Left ventricular dysfunction
  - Posterior reversible encephalopathy syndrome
  - Renal artery stenosis
  - Splenic infarction
  - Tumour lysis syndrome

CONCEPTION AND CONTRACEPTION

Ensure effective contraception during treatment in men and women; effectiveness of hormonal contraception unknown—alternative or additional methods of contraception should be used.

PREGNANCY

Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
Regorafenib

**DRUG ACTION** Regorafenib is an inhibitor of several protein kinases.

**INDICATIONS AND DOSE**

- **Metastatic colorectal cancer (specialist use only)**
- **Unresectable or metastatic gastrointestinal stromal tumours (specialist use only)**
- **Hepatocellular carcinoma (specialist use only)**

**BY MOUTH**

- Adult: 160 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustment due to side effects—consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

**CAUTIONS** Ensure measures to prevent hand-foot skin reaction - Gilbert’s syndrome—risk of hyperbilirubinaemia - history of ischaemic heart disease—monitor for signs and symptoms of myocardial ischaemia and intermittent treatment if signs of ischaemia or infarction develop - hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs) - may impair wound healing—withdraw treatment for major surgical procedures - predisposition to bleeding

**INTERACTIONS** → Appendix 1: regorafenib

**SIDE-EFFECTS**

- **Common or very common** Alopecia - anemia - appetite decreased - asthenia - diarrhea - dry mouth - dysphonia - electrolyte imbalance - fever - gastroesophageal reflux disease - headache - hyperbilirubinaemia - hypertension - hyperuricaemia - hypothyroidism - increased risk of infection - leucopenia - mucositis - musculoskeletal stiffness - nausea - pain - proteinuria - skin reactions - stomatitis - taste altered - thrombocytopenia - tremor - vomiting - weight decreased

- **Uncommon** Gastrointestinal fistula (discontinue) - gastrointestinal perforation (including fatal cases, discontinue) - hepatic disorders - myocardial infarction - myocardial ischaemia - nail disorder

- **Rare or very rare** Neoplasms - posterior reversible encephalopathy syndrome (PRES) - severe cutaneous adverse reactions (SCARs)

**CONCEPTION AND CONCEPTION**

Women of childbearing potential and men must use effective contraception during treatment and up to 8 weeks after last dose.

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**

Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**

Caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding.
- Monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least monthly thereafter and as clinically indicated—consult product literature if changes in liver function observed.

- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizure, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)—discontinue treatment if symptoms occur.

- Monitor biochemical, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction—consult product literature if signs or symptoms develop.

**DIRECTIONS FOR ADMINISTRATION**

- Tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat.

**PATIENT AND CARER ADVICE**

Counselling advised (administration).

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Regorafenib for previously treated unresectable or metastatic gastrointestinal stromal tumours (November 2017)**

NICE TA488

Regorafenib (Stivarga®) is recommended as an option for treating unresectable or metastatic gastrointestinal stromal tumours in adults whose disease has progressed on, or who are intolerant to, prior treatment with imatinib and sunitinib, only if:

- their Eastern Cooperative Oncology Group (ECOG) performance status is 0 to 1, and
- the manufacturer provides regorafenib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta488

- **Regorafenib for previously treated advanced hepatocellular carcinoma (January 2019)** NICE TA555

Regorafenib (Stivarga®) is recommended as an option for treating advanced unresectable hepatocellular carcinoma in adults who have had sorafenib, only if:

- they have Child–Pugh grade A liver impairment and an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1, and
- the manufacturer provides it according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta555

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1316/18

The Scottish Medicines Consortium has advised (May 2018) that regorafenib (Stivarga®) is accepted for use within NHS Scotland as monotherapy for the treatment of adults with hepatocellular carcinoma who have been previously treated with sorafenib. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

- **ELECTROLYTES:** May contain Sodium

- **Stivarga (Bayer Plc)**

  Regorafenib 40 mg Stivarga 40mg tablets | 84 tablet £3,744.00 (Hospital only)
Ribociclib

DRUG ACTION Ribociclib is an inhibitor of cyclin-dependent kinases 4 and 6, which are involved in cancer cell proliferation; their inhibition results in prevention of cancer cell growth.

INDICATIONS AND DOSE
Locally advanced or metastatic breast cancer (specialist use only)

BY MOUTH
Adult: 600 mg once daily for 21 consecutive days of repeated 28 day cycles, to be taken at approximately the same time each day, preferably in the morning, for dose adjustments due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 400 mg once daily; in those already taking 400 mg once daily, reduce dose to 200 mg once daily.

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 888.

CONTRA-INDICATIONS
Pre-existing QTc prolongation - risk factors for QTc prolongation (including concomitant use of drugs known to prolong QTc interval)

INTERACTIONS → Appendix 1: ribociclib

SIDE-EFFECTS
Common or very common Alopecia - anaemia - appetite decreased - asthenia - back pain - constipation - decreased leucocytes - diarrhoea - dry eye - dyspnoea - electrolyte imbalance - epistaxis - excessive tearing - fever - gastrointestinal discomfort - headache - hepatotoxicity - insomnia - nausea - neutropenia - peripheral oedema - QT interval prolongation - skin reactions - stomatitis - syncope - taste altered - thrombocytopenia - urinary tract infection - vomiting - weight decreased

ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with hypersensitivity to peanut or soya products.

HEPATIC IMPAIRMENT
Manufacturer advises caution in moderate to severe impairment (risk of increased exposure). Dose adjustments Manufacturer advises initial dose reduction to 400 mg once daily in moderate to severe impairment.

RENAL IMPAIRMENT
Manufacturer advises use with caution in severe renal impairment—limited information available.

MONITORING REQUIREMENTS
Manufacturer advises to perform full blood counts and liver function tests before initiating treatment, every 2 weeks for the first 2 cycles, at the beginning of the subsequent 4 cycles, and then as clinically indicated thereafter.

Manufacturer advises to assess ECG before initiating treatment (only initiate treatment in patients with QTcF values < 450 milliseconds); ECG should be repeated at approx. day 14 of the first cycle and at the beginning of the second cycle, then as clinically indicated.

Manufacturer advises to monitor serum electrolytes (including potassium, calcium, phosphorus and magnesium) before initiating treatment, at the beginning of the first 6 cycles and then as clinically indicated; any abnormality should be corrected before initiating treatment.

NATIONAL FUNDING/ACCESS DECISIONS
NICE decisions
Ribociclib with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER2-negative, locally advanced or metastatic breast cancer (December 2017) NICE TA496

Ribociclib, with an aromatase inhibitor, is recommended within its marketing authorisation, as an option for treating hormone receptor-positive, human epidermal growth factor receptor 2-negative, locally advanced or metastatic breast cancer as initial endocrine-based therapy in adults. Ribociclib is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

Scottish Medicines Consortium (SMC) decisions
SMC No. 1295/18
The Scottish Medicines Consortium has advised (March 2018) that ribociclib (Kisqali®) is accepted for use within NHS Scotland in combination with an aromatase inhibitor, for the treatment of postmenopausal women with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative locally advanced or metastatic breast cancer as initial endocrine-based therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet CAUTIONARY AND ADVISORY LABELS 3, 25
Ruxolitinib (as Ruxolitinib succinate) 200 mg Kisqali 200mg tablets | 21 tablet PDP £983.33 | 42 tablet PDP £1,966.67 | 63 tablet PDP £2,950.00

Ruxolitinib

DRUG ACTION Ruxolitinib is a selective inhibitor of the Janus-associate tyrosine kinases JAK1 and JAK2.

INDICATIONS AND DOSE
Treatment of disease-related splenomegaly or symptoms in patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis

BY MOUTH
Adult: (consult product literature or local protocols)

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 888.

CAUTIONS
Assess risk of developing infection before treatment—do not initiate until active serious infections are resolved

CAUTIONS, FURTHER INFORMATION
Tuberculosis Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during treatment.

INTERACTIONS → Appendix 1: ruxolitinib

SIDE-EFFECTS
Common or very common Anaemia - bruising - constipation - dizziness - dyslipidaemia - flatulence - haemorrhage - headache - hypotension - increased risk of infection - intracranial haemorrhage - neutropenia - sepsis - thrombocytopenia - weight increased

www.getintopharma.com
**Sorafenib**

**DRUG ACTION** Sorafenib is an inhibitor of multiple kinases.

**INDICATIONS AND DOSE**
- **Treatment of advanced renal cell carcinoma** when treatment with interferon α or interleukin-2 has failed or is unsuitable
- **Treatment of progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine**
- **Treatment of hepatocellular carcinoma**

**INDICATIONS**
- By mouth
- Adult: 400 mg twice daily, for dose adjustments due to side effects, consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 888.

**CAUTIONS**
- Cardiac ischaemia
- Major surgical procedures
- Potential risk of bleeding—treat tracheal, bronchial, or oesophageal infiltration with localised therapy before initiating sorafenib in patients with differentiated thyroid carcinoma (DTC) and consider permanent withdrawal of sorafenib in any patient that requires medical intervention for bleeding—susceptibility to QT-interval prolongation

**INTERACTIONS**
- Appendix 1: sorafenib

**SIDE EFFECTS**
- Common or very common
  - Alopecia
  - Anaemia
  - Appetite decreased
  - Arthralgia
  - Asthenia
  - Congestive heart failure
  - Constipation
  - Decreased leucocytes
  - Depression
  - Diarrhoea
  - Dry mouth
  - Dysphagia
  - Dysphonia
  - Electrolyte imbalance
  - Erectile dysfunction
  - Fever
  - Flushing
  - Gastrointestinal discomfort
  - Gastrointestinal disorders
  - Haemorrhage
  - Headache
  - Hypertension
  - Hypothyroidism
  - Increased risk of infection
  - Influenza-like illness
  - Intracranial haemorrhage
  - Mucositis
  - Muscle complaints
  - Myocardial infarction
  - Myocardial ischaemia
  - Nausea
  - Neoplasms
  - Neutropenia
  - Oral disorders
  - Pain
  - Peripheral neuropathy
  - Proteinuria
  - Renal failure
  - Rhabdomyolysis
  - Skin reactions
  - Taste altered
  - Thrombocytopaenia
  - Tinnitus
  - Weight decreased

- Uncommon
  - Cholangitis
  - Cholecystitis
  - Dehydration
  - Encephalopathy
  - Gynaecomastia
  - Hepatic disorders
  - Hypersensitivity vasculitis
  - Nephrotic syndrome
  - QT interval prolongation
  - Radiation injuries
  - Respiratory disorders

- Rare or very rare
  - Angioedema
  - Hypersensitivity vasculitis
  - Nephrotic syndrome
  - QT interval prolongation
  - Rhabdomyolysis
  - Severe cutaneous adverse reactions (SCARs)

**CONCEPTION AND CONTRACEPTION**
- Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888

**PREGNANCY**
- Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888

**BREAST FEEDING**
- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in severe impairment (no information available).

**MONITORING REQUIREMENTS**
- Consider periodic monitoring of ECG and electrolytes in patients susceptible to QT-interval prolongation.
- Monitor blood pressure regularly and consider permanent discontinuation of sorafenib if resistant to antihypertensive therapy.
- Monitor plasma-calcium concentration (increased risk of hypocalcaemia if history of hypoparathyroidism).
- Monitor thyroid stimulating hormone in patients with differentiated thyroid carcinoma.

---

**TARGETED THERAPY RESPONSIVE MALIGNANCY**

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**RENAL IMPAIRMENT**
- Reduce dose in severe impairment (consult product literature).

**MONITORING REQUIREMENTS**
- Monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated.
- Monitor for infection during treatment.
- Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Ruxolitinib for treating disease-related splenomegaly or symptoms in adults with myelofibrosis (March 2016)

**Ruxolitinib** (Jakavi®) is recommended as an option for treating disease-related splenomegaly or symptoms in adults with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post polycythaemia vera myelofibrosis, or post essential thrombocythaemia myelofibrosis, only if the patient has intermediate-2 or high-risk disease, and if the manufacturer provides ruxolitinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta386

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Jakavi (Novartis Pharmaceuticals UK Ltd)
- Ruxolitinib (as Ruxolitinib phosphate) 5 mg Jakavi 5mg tablets
  - 56 tablet pack £1.428.00 DT = £1.428.00
- Ruxolitinib (as Ruxolitinib phosphate) 10 mg Jakavi 10mg tablets
  - 56 tablet pack £2.856.00 DT = £2.856.00

www.getintopharma.com
Sunitinib

**Drug Action** Sunitinib is a tyrosine kinase inhibitor.

**Indications and Dose**

**Treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib**

- **Treatment of advanced or metastatic renal cell carcinoma**

- **Treatment of unresectable or metastatic pancreatic neuroendocrine tumours**

**Drug Interaction**

See Appendix I: Sunitinib

**Side-Effects**

- Cardiovascular disease: discontinue if congestive heart failure develops, hypertension, increased risk of bleeding, susceptibility to QT-interval prolongation

**Dose Adjustments due to Interactions**

- Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, dose may need to be increased in steps of 12.5 mg to a max. dose of 87.5 mg per day for gastro-intestinal stromal tumours or renal cell carcinoma, or to a max. dose of 62.5 mg per day for pancreatic neuroendocrine tumours.

**Aims for a healthy lifestyle**

- Maintain a healthy body weight
- Use non-oral contraception if female and of childbearing potential

**Medicinal Form**

- **Tablet**
  - Sunitinib (as Sorafenib tosylate) 200 mg Nexavar 200mg tablets
  - 112 tablet pack £13.576.56

**Selected Clinical Studies**

- **Sorafenib for treating advanced hepatocellular carcinoma (September 2017)** NICE TA474

- **Sorafenib is recommended as an option for treating advanced hepatocellular carcinoma only for patients with Child-Pugh grade A liver impairment, only if the manufacturer provides sorafenib within the agreed commercial access arrangement. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.**

- **Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, dose may need to be increased in steps of 12.5 mg to a max. dose of 87.5 mg per day for gastro-intestinal stromal tumours or renal cell carcinoma, or to a max. dose of 62.5 mg per day for pancreatic neuroendocrine tumours.**

**IMPORTANT SAFETY INFORMATION**

**RISK OF OSTEOONECROSIS OF THE JAW (JANUARY 2011)**

- Treatment with sunitinib may be a risk factor for the development of osteonecrosis of the jaw. Patients treated with sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

- Dental examination and appropriate preventive dentistry should be considered before treatment with sunitinib.

- If possible, invasive dental procedures should be avoided in patients treated with sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

**Risks of incorrect dosing of oral anti-cancer medicines**

See Cytotoxic drugs p. 888.

**Caution**

- Cardiovascular disease—discontinue if congestive heart failure develops, hypertension, increased risk of bleeding, susceptibility to QT-interval prolongation
1000 Targeted therapy responsive malignancy

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 14

Sunitinib (as Sunitinib malate) 25 mg
Sunitinib (as Sunitinib malate) 12.5 mg
Sunitinib (as Sunitinib malate) 50 mg

SIDE-EFFECTS

Common or very common Abscess • anaemia • anxiety • appetite decreased • arthralgia • asthenia • chest pain • chill • conjunctivitis • constipation • cough • cystitis • decreased leucocytes • dehydration • depression • diabetes mellitus • diarrhoea • dizziness • drowsiness • dyslipidaemia • dysphagia • dyspnoea • electrolyte imbalance • embolism and thrombosis • fever • gastrointestinal discomfort • gastrointestinal disorders • genital oedema • haemorrhage • headache • hypersensitivity • hypertension • increased risk of infection • insomnia • lacrimation disorder • mucositis • myalgia • nail disorder • nausea • neutropenia • oedema • oral disorders • pain • paraesthesia • post procedural infection • renal failure • respiratory disorders • scrotal oedema • sepsis • skin reactions • taste altered • thrombocytopenia • vomiting

Uncommon Healing impaired • intracranial haemorrhage • pericardial effusion

Tensirolimus

DRUG ACTION Tensirolimus is a protein kinase inhibitor.

INDICATIONS AND DOSE

First-line treatment of advanced renal cell carcinoma | Treatment of relapsed or refractory mantle cell lymphoma

BY INTRAVENOUS INFUSION

Adult: (consult product literature or local protocols)

INTERACTIONS → Appendix 1: tensirolimus

SIDE-EFFECTS

Common or very common Abscess • anaemia • anxiety • appetite decreased • arthralgia • asthenia • chest pain • chill • conjunctivitis • constipation • cough • cystitis • decreased leucocytes • dehydration • depression • diabetes mellitus • diarrhoea • dizziness • drowsiness • dyslipidaemia • dysphagia • dyspnoea • electrolyte imbalance • embolism and thrombosis • fever • gastrointestinal discomfort • gastrointestinal disorders • genital oedema • haemorrhage • headache • hypersensitivity • hypertension • increased risk of infection • insomnia • lacrimation disorder • mucositis • myalgia • nail disorder • nausea • neutropenia • oedema • oral disorders • pain • paraesthesia • post procedural infection • renal failure • respiratory disorders • scrotal oedema • sepsis • skin reactions • taste altered • thrombocytopenia • vomiting

Uncommon Healing impaired • intracranial haemorrhage • pericardial effusion

Sunitinib (as Sunitinib malate) 25 mg
Sunitinib (as Sunitinib malate) 50 mg

Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastrointestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer.

Sunitinib (as Sunitinib malate) 12.5 mg
Sunitinib (as Sunitinib malate) 50 mg

Sunitinib is recommended as first-line treatment for advanced renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1.

www.nice.org.uk/TA169

Sunitinib is recommended as first-line treatment for patients with unresectable or metastatic gastrointestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer.

www.nice.org.uk/TA179

Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

www.nice.org.uk/TA178

Everolimus and sunitinib for treating unresectable or metastatic neuroendocrine tumours in people with progressive disease (June 2017) NICE T4A49

Everolimus and sunitinib are recommended, within their marketing authorisations, as options for treating well- or moderately differentiated unresectable or metastatic neuroendocrine tumours (NETs) of pancreatic origin in adults with progressive disease.

www.nice.org.uk/guidance/T4A49

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (November 2009) that sunitinib (Sutent®) is accepted for use within NHS Scotland for the treatment of unresectable and/or metastatic malignant gastrointestinal stromal tumours after failure of imatinib. The Scottish Medicines Consortium has advised (May 2011) that sunitinib (Sutent®) is accepted for use within NHS Scotland for the treatment of unresectable or metastatic, well-differentiated pancreatic neuroendocrine tumours with disease progression in adults.
Targeted therapy responsive malignancy 1001

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor respiratory function.
  - Monitor blood lipids.

Tivozanib

- **DRUG ACTION** Tivozanib is a tyrosine kinase inhibitor.

- **INDICATIONS AND DOSE**
  - **Advanced renal cell carcinoma (specialist use only)**
    - **BY MOUTH**
      - **Adult:** 1340 micrograms once daily for 21 consecutive days of repeated 28 day cycles, for dose adjustments due to side effects—consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

- **CAUTIONS** History of arterial thromboembolic events - history of bleeding disorders - history of posterior reversible encephalopathy syndrome following tivozanib treatment - history of QT-interval prolongation - history of venous thromboembolic events - major surgical procedures—interrupt treatment - patients aged over 65 years—increased risk of adverse effects - pre-existing cardiac disease - risk factors for arterial thromboembolic events - risk factors for gastro-intestinal fistula - risk factors for gastro-intestinal perforation - risk factors for venous thromboembolic events - risk of bleeding

- **INTERACTIONS** → Appendix 1: tivozanib

- **SIDE EFFECTS**
  - **Common or very common** Alopecia - anaemia - angina pectoris - appetite decreased - arthralgia - asthma - chills - constipation - cough - diarrhoea - dizziness - dry mouth - dysphagia - dysphonia - dyspnoea - embolism and thrombosis - fever - flushing - gastrointestinal discomfort - gastrointestinal disorders - haemorrhage - headache - hypertension - hypothyroidism - increased risk of infection - insomnia - myalgia - myocardial infarction - nasal complaints - nausea - oral disorders - pain - pancreatitis - peripheral neuropathy - peripheral oedema - proteinuria - skin reactions - tachycardia - taste altered - tinnitus - vertigo - visual impairment - vomiting - weight decreased
  - **Uncommon** Ear congestion - excessive tearing - goitre - hyperhidrosis - hyperthyroidism - memory loss - mucositis - muscle weakness - pulmonary oedema - QT interval prolongation - thrombocytopenia - transient ischaemic attack
  - **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES)

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men, women of childbearing potential, and their partners during treatment and for at least one month after the last dose; an additional barrier method of contraception should be used in women using hormonal contraceptives. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild-to-moderate impairment—monitor patients for tolerability; avoid in severe impairment.

- **Dose adjustments** Manufacturer advises reduce dose to 1340 micrograms on alternate days in moderate impairment—increased risk of adverse effects due to increased exposure.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—limited information available.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises perform liver function tests
  - Monitor patients for symptoms of gastro-intestinal perforation or fistula.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Tivozanib for treating advanced renal cell carcinoma (March 2018) NICE TA512

Tivozanib is recommended as an option for treating advanced renal cell carcinoma in adults, only if:

  - they have had no previous treatment, and
  - the manufacturer provides tivozanib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta512

Scottish Medicines Consortium (SMC) decisions

SMC No. 1335/18

The Scottish Medicines Consortium has advised (July 2018) that tivozanib (Fotivda®) is accepted for restricted use within NHS Scotland for the first line treatment of adults with advanced renal cell carcinoma. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

www.getintopharma.com
Trametinib

12-Jul-2018

**DRUG ACTION**
Trametinib is a protein kinase inhibitor.

**INDICATIONS AND DOSE**
Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with dabrafenib) (specialist use only) Advanced non-small cell lung cancer with a BRAF V600 mutation (in combination with dabrafenib) (specialist use only)

**SIDE-EFFECTS**
Increased risk of haemorrhage — increased risk of infection — intracranial haemorrhage — left ventricular dysfunction — lymphoedema — mucositis — nausea — oedema — respiratory disorders — skin reactions — stomatitis — vision disorders — vomiting

**INTERACTIONS**
Chorioretinopathy - gastrointestinal disorders - heart failure - retinal detachment - retinal occlusion - rhabdomyolysis

**CONTRA-INDICATIONS**
History of retinal vein occlusion — predisposing factors for retinal vein occlusion — left ventricular dysfunction — breast cancer — impaired left ventricular function — diabetes mellitus — hypertension

**HANDLING AND STORAGE**
Store in an ambient temperature of 2–8°C; once opened, bottle may be stored for 30 days at not more than 30°C.

**IMPRESSANT SAFETY INFORMATION**
MHRA/CHM ADVICE (MARCH 2016): TRAMETINIB: RISK OF GASTROINTESTINAL PERFORATION AND COLITIS
A review by EU medicines regulators has concluded that trametinib can cause gastrointestinal perforation or colitis.

**CONTRA-INDICATIONS**
History of retinal vein occlusion — predisposing factors for retinal vein occlusion — left ventricular dysfunction — breast cancer — impaired left ventricular function — diabetes mellitus — hypertension

**CAUTIONS**
Concomitant antiplatelet or anticoagulant therapy—increased risk of haemorrhage — conditions that could impair left ventricular function — elderly (more frequent dose adjustments may be required) — impaired left ventricular function — predisposing factors for retinal vein occlusion — risk factors for gastrointestinal perforation

**INTERACTIONS**
Appendix 1: trametinib

**SIDE-EFFECTS**
Common or very common Abdominal pain — alopecia — anaemia — asthenia — bradycardia — constipation — cough — dehydration — diarrhoea — dry mouth — dyspnoea — eye inflammation — fever — haemorrhage — hypersensitivity — hypertension — increased risk of infection — intracranial haemorrhage — left ventricular dysfunction — lymphoedema — mucositis — nausea — oedema — respiratory disorders — skin reactions — stomatitis — vision disorders — vomiting

**NICE decisions**
Trametinib in combination with dabrafenib for treating unresectable or metastatic melanoma (June 2016) NICE TA396
Trametinib (Mekinist®) in combination with dabrafenib (Tafinlar®) is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic melanoma in adults with a BRAF V600 mutation when the manufacturer provides trametinib and dabrafenib with the discounts agreed in the patient access schemes.

www.nice.org.uk/guidance/ta396

Dabrafenib with trametinib for adjuvant treatment of resected BRAF V600 mutation-positive melanoma (October 2018) NICE TA544
Dabrafenib (Tafinlar®) with trametinib (Mekinist®) is recommended, within its marketing authorisation, as an option for the adjuvant treatment of resected stage III BRAF V600 mutation-positive melanoma in adults. It is recommended only if the manufacturer provides dabrafenib and trametinib with the discounts agreed in the commercial arrangements.

www.nice.org.uk/guidance/ta544
Targeted therapy responsive malignancy

Scottish Medicines Consortium (SMC) decisions
SMC No. 1161/16
The Scottish Medicines Consortium has advised (August 2016) that trametinib (Mekinist®), in combination with dabrafenib, is accepted for restricted use within NHS Scotland for first-line treatment of adults with unresectable or metastatic melanoma with a BRAF V600 mutation. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 3, 23, 25
    - Trametinib 500 microgram Mekinist 0.5mg tablets | 7 tablet POM £280.00 | 30 tablet POM £1,200.00
    - Trametinib 2 mg Mekinist 2mg tablets | 7 tablet POM £1,120.00 | 30 tablet POM £4,800.00

Vandetanib

- **DRUG ACTION** Vandetanib is a tyrosine kinase inhibitor.

- **INDICATIONS AND DOSE**
  - Treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease
  - **BY MOUTH**
    - Adult: 300 mg once daily, for dose adjustment due to side effects—consult product literature

- **CONTRA-INDICATIONS** Congenital long QT syndrome - QT interval greater than 480 milliseconds
- **CAUTIONS** Brain metastases (intracranial haemorrhage reported) - electrolyte disturbances - history of torsades de pointes - hypertension - phototoxicity reactions reported (wear protective clothing and/or sunscreen) - susceptibility to QT-prolongation
- **INTERACTIONS** → Appendix 1: vandetanib
- **SIDE-EFFECTS**
- **CONCESSION AND CONTRACEPTION** Effective contraception required during and for at least 4 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (serum bilirubin greater than 1.5 times the upper limit of normal).
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute.
  - **Dose adjustments** Reduce dose to 200 mg if creatinine clearance 30–49 mL/minute.
- **MONITORING REQUIREMENTS** Monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year.
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer vandetanib tablets. Phototoxicity reaction Patients should be advised to wear protective clothing and/or sunscreen.
  - Alert card An alert card should be provided.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Vandetanib for treating medullary thyroid cancer (December 2018) NICE TA550 Vandetanib (Caprelsa®) is **not** recommended, within its marketing authorisation, for treating aggressive and symptomatic medullary thyroid cancer in adults with unresectable, locally advanced or metastatic disease.
    - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
    - www.nice.org.uk/guidance/ta550

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Caprelsa (Genzyme Therapeutics Ltd) ▼
      - Vandetanib 100 mg Caprelsa 100mg tablets | 30 tablet POM £2,500.00
      - Vandetanib 300 mg Caprelsa 300mg tablets | 30 tablet POM £5,000.00
Vemurafenib

- **DRUG ACTION** Vemurafenib is a BRAF kinase inhibitor.

- **INDICATIONS AND DOSE**
  Monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma
  - **BY MOUTH**
  - Adult: 960 mg twice daily, for dose adjustment due to side effects—consult product literature

- **SIDE-EFFECTS**
  - Common or very common: Acute tubular necrosis, nephritis, acute interstitial
  - Frequency not known: Acute kidney injury
  - **CONCEPTION AND CONTRACEPTION** Effective contraception required during for at least 6 months after treatment.
  - **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
  - **BREAST FEEDING** Avoid—no information available.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure)—monitor ECG monthly during the first 3 months of treatment, followed by at least every 3 months thereafter (if QTc interval is prolonged, consult product literature).
  - **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
  - **MONITORING REQUIREMENTS**
    - Monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not recommended if QT interval greater than 500 milliseconds at baseline).
    - Monitor liver function before treatment and periodically thereafter.
    - Monitor for uveitis, iritis and retinal vein occlusion.
    - Monitor for cutaneous and non-cutaneous squamous cell carcinoma and new primary melanoma before, during and for up to 6 months after treatment—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food).

- **PATIENT AND CARER ADVICE** Counselling advised (administration).
  - Drug rash with eosinophilia and systemic symptoms (DRESS syndrome) Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - **NICE decisions**
      - Vemurafenib for treating locally advanced or metastatic BRAF V600 mutation-positive malignant melanoma (December 2012) NICE TA269
      - Vemurafenib is recommended as an option for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma only if the manufacturer provides vemurafenib with the discount agreed in the patient access scheme.
      - www.nice.org.uk/TA269
    - **Scottish Medicines Consortium (SMC) decisions**
      - The Scottish Medicines Consortium has advised (November 2013) that vemurafenib (Zelboraf®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

- **CONTRA-INDICATIONS** Wild-type BRAF malignant melanoma

- **CAUTIONS** Electrolyte disturbances - prior or concurrent cancer associated with RAS mutations—increased risk of tumour progression - susceptibility to QT-prolongation

- **INTERACTIONS**
  - Common or very common 7th nerve paralysis - alopecia - appetite decreased - arthralgia - arthritis - asthenia - connective tissue disorders - constipation - cough - diarrhoea - dizziness - eye inflammation - fever - folliculitis - headache - myalgia - nausea - neoplasms - pain - panniculitis - peripheral oedema - photosensitivity reaction - QT interval prolongation - radiation injuries - skin reactions - taste altered - vomiting - weight decreased
  - Uncommon Liver injury - neutropenia - pancreatitis - peripheral neupathy - retinal occlusion - severe cutaneous adverse reactions (SCARs) - vasculitis
  - Rare or very rare Acute tubular necrosis - nephritis acute interstitial
  - Frequency not known Acute kidney injury

- **ANTINEOPLASTICS, OTHER**
  - **Niraparib**
    - **DRUG ACTION** Niraparib is an inhibitor of PARP enzymes which are involved in DNA repair. PARP inhibition results in disruption of cellular homoeostasis and cell death.

- **INDICATIONS AND DOSE**
  - Ovarian cancer (initiated by a specialist) | Fallopian tube cancer (initiated by a specialist) | Peritoneal cancer (initiated by a specialist)
    - **BY MOUTH**
    - Adult: 300 mg once daily, consider initial dose of 200 mg in patients with body-weight less than 58 kg, for dose adjustments due to side-effects—consult product literature

- **IMPROT SAFETY INFORMATION**
  - **RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
    - See Cytotoxic drugs p. 888.
  - **CAUTIONS** Pre-existing hypertension (control before treatment initiation)
  - **SIDE-EFFECTS**
    - Common or very common Anorexia - anxiety - appetite decreased - arthralgia - back pain - conjunctivitis -

▸ Uncommon Pancytopenia
▸ Frequency not known Neoplasms

CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception in women of childbearing potential during treatment and for 1 month after receiving the last dose.

PREGNANCY

Manufacturer advises avoid—limited information available.

BREAST FEEDING

Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.

HEPATIC IMPAIRMENT

Manufacturer advises caution in severe impairment (no information available).

RENAL IMPAIRMENT

Manufacturer advises caution in severe impairment—no information available.

MONITORING REQUIREMENTS

▸ Manufacturer advises monitor full blood count weekly for the first month of treatment, then monthly for the next 10 months and periodically thereafter.
▸ Manufacturer advises monitor blood pressure monthly for the first year of treatment and periodically thereafter.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Manufacturer advises patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness and fatigue.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▸ Niraparib for maintenance treatment of relapsed, platinum-sensitive ovarian, fallopian tube and peritoneal cancer (July 2018) NICE TA528

Niraparib (Zejula 8) is recommended for use within the Cancer Drugs Fund as an option for treating relapsed, platinum-sensitive high-grade serous epithelial ovarian, fallopian tube or primary peritoneal cancer that has responded to the most recent course of platinum-based chemotherapy in adults, only if:

▸ they have a germline BRCA mutation and have had 2 courses of platinum-based chemotherapy, or
▸ they do not have a germline BRCA mutation and have had 2 or more courses of platinum-based chemotherapy, and

▸ the conditions in the managed access agreement for niraparib are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

wm:nice.org.uk/guidance/ta528

Scottish Medicines Consortium (SMC) decisions

SMC No. 1341/18

The Scottish Medicines Consortium has advised (August 2018) that niraparib (Zejula 8) is accepted for restricted use within NHS Scotland as monotherapy for the maintenance treatment of adults with platinum-sensitive relapsed high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete or partial) to platinum-based chemotherapy. It is restricted to those patients who do not have a germline BRCA mutation. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

▸ Zejula (Tesaro UK Ltd)

Niraparib (as Niraparib tosylate monohydrate) 100 mg Zejula 100 mg capsules | 56 capsule (PO) £4,500.00 (Hospital only) | 84 capsule (PO) £6,750.00 (Hospital only)

Olaparib

DRUG ACTION

Olaparib is a PARP inhibitor. PARP are enzymes that repair damaged DNA in cancer cells and, in the absence of functional BRCA, inhibition of PARP results in an inability of cancer cells to repair. Therefore, inhibition of PARP results in an antineoplastic effect.

INDICATIONS AND DOSE

Ovarian cancer (initiated by a specialist) | Fallopian tube cancer (initiated by a specialist) | Peritoneal cancer (initiated by a specialist)

▸ BY MOUTH USING CAPSULES
▸ Adult: 400 mg twice daily, patients should start treatment no later than 8 weeks after completion of their final dose of the platinum-containing regimen, for dose adjustments due to side-effects—consult product literature
▸ BY MOUTH USING TABLETS
▸ Adult: 300 mg twice daily, patients should start treatment no later than 8 weeks after completion of their final dose of the platinum-containing regimen, for dose adjustments due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

▸ Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4 is unavoidable, reduce dose of capsules to 200 mg twice daily and tablets to 150 mg twice daily.
▸ Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose of capsules to 150 mg twice daily and tablets to 100 mg twice daily.

DOSE EQUIVALENCE AND CONVERSION

▸ Manufacturer advises capsules and tablets are not interchangeable on a milligram-for-milligram basis due to differences in dosing and bioavailability.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

MHRA/CHM ADVICE: LYNPARZA 8 (OLAPARIB): RISK OF MEDICATION ERRORS WITH NEW PHARMACEUTICAL FORM (MAY 2018)

A tablet formulation of olaparib was approved by the European Commission in May 2018. Capsules and tablets are not to be substituted on a milligram-to-milligram basis due to differences in dosing and bioavailability of each formulation. Prescribers should specify the formulation and dosage of olaparib on each prescription and pharmacists should ensure that the correct formulation and dose is dispensed. Patients should be instructed on the correct dose they should take for their capsules or tablets and if switched, informed of the difference in dosing.

INTERACTIONS → Appendix 1: olaparib

SIDE-EFFECTS

▸ Common or very common Anaemia - appetite decreased - diarrhoea - dizziness - fatigue - gastrointestinal discomfort - headache - lymphopenia - nausea - neutropenia - skin
**Targeted therapy responsive malignancy**

Rucaparib

**DRUG ACTION** Rucaparib is a PARP inhibitor. PARP are enzymes that repair damaged DNA in cancer cells and, in the absence of functional BRCA, inhibition of PARP results in an inability of cancer cells to repair. Therefore inhibition of PARP results in an antineoplastic effect.

**INDICATIONS AND DOSE**
- **Ovarian cancer (initiated by a specialist)**
- **Fallopian tube cancer (initiated by a specialist):**
  - Peritoneal cancer (initiated by a specialist)

Targeted therapy responsive malignancy 1007

Venetoclax 07-Sep-2017

**DRUG ACTION** Venetoclax is a potent, selective inhibitor of B-cell lymphoma-2 (BCL-2).

**INDICATIONS AND DOSE**

Chronic lymphocytic leukaemia in the presence of 17p deletion or TP53 mutation when a B-cell receptor pathway inhibitor is unsuitable or ineffective (specialist use only): Chronic lymphocytic leukaemia in the absence of 17p deletion or TP53 mutation when both chemoimmunotherapy and a B-cell receptor pathway inhibitor has been ineffective (specialist use only)

- **BY MOUTH**
  - Adult: (consult product literature)
  - Chronic lymphocytic leukaemia in patients who have received at least one prior therapy in combination with rituximab (specialist use only)
  - BY MOUTH
  - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

**CAUTIONS**

Ensure adequate hydration

**INTERACTIONS**

- Appendix 1: venetoclax

**SIDE-EFFECTS**

- Common or very common: Anaemia - constipation - diarrhoea - electrolyte imbalance - fatigue - hyperuricaemia - increased risk of infection - lymphopenia - nausea - neutropenia - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises ensure effective, non-hormonal contraception during and for 30 days after treatment in women of child-bearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate impairment (increased risk of toxicity); avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**

Manufacturer advises close monitoring (increased risk of tumour lysis syndrome); use only if potential benefit outweighs risk in severe impairment—no information available.

**MONITORING REQUIREMENTS**

Manufacturer advises monitor renal function before starting treatment.

**PATIENT AND CARER ADVICE**

Hydration

Manufacturer advises patients should drink 1.5–2 L of water daily, starting 2 days before and throughout the dose-titration phase; intravenous fluids should be administered for those who cannot maintain an adequate level of oral hydration with consideration of overall risk of tumour lysis syndrome.

Vomiting

Manufacturer advises that if vomiting occurs following dose administration, no additional doses should be taken on that day and the next dose should be taken at the normal time.

**Missed doses**

Manufacturer advises that if a dose is more than 8 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Venetoclax for treating chronic lymphocytic leukaemia (November 2017) NICE TA487

Venetoclax is recommended for use within the Cancer Drugs Fund, within its authorisation, as an option for treating chronic lymphocytic leukaemia in adults:

- with a 17p deletion or TP53 mutation and when a B-cell receptor pathway inhibitor is unsuitable, or whose disease has progressed after a B-cell receptor pathway inhibitor or
- without a 17p deletion or TP53 mutation, and whose disease has progressed after both chemoimmunotherapy and a B-cell receptor pathway inhibitor, and
- only if the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA487

- Venetoclax with rituximab for previously treated chronic lymphocytic leukaemia (February 2019) NICE TA561

Venetoclax (Venclyxto®) with rituximab is recommended, within its marketing authorisation, as an option for treating chronic lymphocytic leukaemia in adults who have had at least 1 previous therapy. It is recommended only if the manufacturer provides it according to the commercial arrangement.

www.nice.org.uk/guidance/ta561

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (August 2017) that venetoclax (Venclyxto®) is accepted for use within NHS Scotland as monotherapy for the treatment of chronic lymphocytic leukaemia:

- in the presence of 17p deletion or TP53 mutation in patients who are unsuitable for or have failed a B-cell receptor pathway inhibitor; or
- in the absence of 17p deletion or TP53 mutation in patients who have failed both chemoimmunotherapy and a B-cell receptor pathway inhibitor.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Vismodegib**

- **DRUG ACTION** Vismodegib is a hedgehog pathway inhibitor.

- **INDICATIONS AND DOSE**
  
  Symptomatic metastatic basal cell carcinoma | Locally advanced basal cell carcinoma not appropriate for surgery or radiotherapy
  
  ▶ **BY MOUTH**
  
  Adult: 150 mg once daily

- **SIDE-EFFECTS**

  - Common or very common 
    
    Alopecia - amenorrhea - appetite decreased - arthralgia - asthenia - constipation - dehydration - diarrhoea - gastrointestinal discomfort - hair growth abnormal - muscle complaints - nausea - pain - skin reactions - taste altered - vomiting - weight decreased
  
  - Frequency not known 
    
    Epiphyses premature fusion

- **CONCEPTION AND CONTRACEPTION**

  Women must use contraceptive methods while taking vismodegib and for 3 months after the final dose of vismodegib. Men must use a condom during treatment and for 3 months after the last dose.

- **PREGNANCY**

  Important: teratogenic risk—may cause severe birth defects and embryo-fetal death.

- **BREAST FEEDING**

  Avoid during treatment and for 3 months after the final dose.

- **RENAI IMPAIRMENT**

  No information available—manufacturer advises caution in severe impairment.

- **PRESCRIBING AND DISPENSING INFORMATION**

  Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer’s Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme’s pregnancy prevention measures—consult product literature for further information.

- **PATIENT AND CARER ADVICE**

  Conception and contraception Counselling on pregnancy and contraception advised. Patients must comply with the manufacturer’s pregnancy prevention programme.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE decisions**
    
    Vismodegib for treating basal cell carcinoma (November 2017) NICE TA489
    
    Vismodegib is not recommended within its marketing authorisation for treating symptomatic metastatic basal cell carcinoma, or locally advanced basal cell carcinoma that is inappropriate for surgery or radiotherapy, in adults. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.[12]

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**

  CAUTIONARY AND ADVISORY LABELS 25

  - Erivedge (Roche Products Ltd) ▼

  **Vismodegib 150 mg** Erivedge 150mg capsules | 28 capsule pack £6,285.00 (Hospital only)

---

**Afiblercept**

- **DRUG ACTION** Afiblercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PIGF). Afiblercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

- **INDICATIONS AND DOSE**

  In combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen

  ▶ **BY INTRAVENOUS INFUSION**

  Adult: (consult local protocol)

- **CONTRA-INDICATIONS**

  Moderate or severe congestive heart failure - uncontrolled hypertension

- **CAUTIONS**

  Febrile neutropenia - history of cardiovascular disease (may be exacerbated by hypertension) - increased risk of haemorrhage (including fatal events) - increased risk of hypertension - increased risk of thromboembolic events (consult product literature if event occurs) - may impair wound healing— withhold treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed - neutropenic infection - risk of fistula formation (discontinue if fistula develops) - risk of neutropenia - risk of thrombocytopenia

- **INTERACTIONS**

  ▶ Appendix 1: afiblercept

- **SIDE-EFFECTS**

  - Common or very common 
    
    Cataract - eye discomfort - eye disorders - eye inflammation - haemorrhage - retinal pigment epithelial tear - vision disorders
  
  - Uncommon 
    
    Lens opacity

- **CONCEPTION AND CONTRACEPTION**

  Exclude pregnancy before treatment. Effective contraception required during and for at least 6 months after treatment in men and women. Contraceptive advice should be given to men and women before therapy begins (and should cover the duration of contraception required after therapy has ended).

- **PREGNANCY**

  Manufacturer advises avoid—toxicity in animal studies. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

- **BREAST FEEDING**

  Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**

  Manufacturer advises caution in severe impairment (no information available).

- **RENAL IMPAIRMENT**

  Caution in severe impairment— no information available.

- **MONITORING REQUIREMENTS**

  ▶ Monitor blood pressure at initiation and at least fortnightly during treatment (do not initiate treatment if pre-existing hypertension is uncontrolled) – consult product literature if hypertension develops during treatment.

  ▶ Monitor for signs of gastro-intestinal perforation (discontinue if perforation develops).

  ▶ Monitor full blood count, including differential count and platelets at baseline and before each treatment cycle.
Monitor for proteinuria before each treatment administration (consult product literature if symptoms develop).

Monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly—consult product literature if severe diarrhoea occurs.

Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, altered mental status, nausea, vomiting, headache, or visual disturbance).

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE decisions**

    - Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014) NICE TA307

    Aflibercept in combination with irinotecan and fluorouracil-based therapy is **not** recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen.

    [www.nice.org.uk/guidance/TA307](http://www.nice.org.uk/guidance/TA307)

Blood and blood-forming organs

1 Anaemias

Anaemias

Anaemia treatment considerations
Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia
Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxyurea may reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxyurea may not become evident for several months.

G6PD deficiency
Glucose-6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed favism and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:
Hypoplastic, haemolytic, and renal anaemias

1011

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of sideroblastic anaemia respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both idiopathic acquired and hereditary sideroblastic anaemias. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high. Reversible sideroblastic anaemias respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid p. 587 treatment, pyridoxine hydrochloride is also indicated.

Corticosteroids

Anabolic steroids, pyridoxine hydrochloride p. 587

1.1 Hypoplastic, haemolytic, and renal anaemias

Other drugs used for Hypoplastic, haemolytic, and renal anaemias

Eltrombopag, p. 1032

ANABOLIC STEROIDS > ANDROSTAN DERIVATIVES

Oxymetholone

- INDICATIONS AND DOSE
  - Aplastic anaemia
  - Adult: 1–5 mg/kg daily for 3 to 6 months

- INTERACTIONS → Appendix 1: oxymetholone

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - Capsule
    - Oxymetholone (Non-proprietary)
    - Oxymetholone 50 mg Oxymetholone 50mg capsules | 50 capsule £47.50 £0.95

Fluoroquinolones (including ciprofloxacin, moxifloxacin)

Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)

- Anticyclichemotherapy
- Antilymphocyte immunoglobulin, rituximab p. 882

Hypoplastic, haemolytic, and renal anaemias

Anabolic steroids, pyridoxine hydrochloride p. 1080, antilymphocyte immunoglobulin, rituximab p. 882 (unlicensed indication), and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired aplastic anaemia; the response rate may be increased when ciclosporin p. 838 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from ‘special order’ manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.
**EPOETINS**

**Epoetins**

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOIETINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (UPDATED JANUARY 2018)**

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal. More severe cases were recorded with long-acting agents (darbepoetin alfa and methoxy polyethylene glycol-epoetin beta).

Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

**MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION**

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

**MHRA/CHM ADVICE (DECEMBER 2007 AND JULY 2008) ERYTHROPOIETINS—TUMOUR PROGRESSION AND SURVIVAL IN PATIENTS WITH CANCER**

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of symptomatic anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis

**CONTRA-INDICATIONS**

- Patients unable to receive thromboprophylaxis - pure red cell aplasia following erythropoietin therapy - uncontrolled hypertension

**CAUTIONS**

- Aluminium toxicity (can impair the response to erythropoietin) - concurrent infection (can impair the response to erythropoietin) - correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment. - during dialysis (increase in unfractionated or low molecular weight heparin dose may be needed) - epilepsy - inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled - ischaemic vascular disease - malignant disease - other inflammatory disease (can impair the response to erythropoietin) - risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident - risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy - sickle-cell disease (lower target haemoglobin concentration may be appropriate) - sudden stabbing migraine-like pain (warning of a hypertensive crisis) - thrombocytosis (monitor platelet count for first 8 weeks)

**SIDE-EFFECTS**

- **Common or very common**
  - Arthralgia - embolism and thrombosis - headache - hypertension (dose-dependent) - influenza like illness - skin reactions - stroke
- **Uncommon**
  - Hypertensive crisis (in isolated patients with normal or low blood pressure) - respiratory tract congestion - seizure
- **Rare or very rare**
  - Thrombocytosis
- **Frequency not known**
  - Pure red cell aplasia (more common following subcutaneous administration in patients with chronic renal failure)

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypertensive crisis**

In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin. Pure red cell aplasia There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

**MONITORING REQUIREMENTS**

- Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients.

**Darbepoetin alfa**

**INDICATIONS AND DOSE**

**Symptomatic anaemia associated with chronic renal failure in patients on dialysis**

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
  - Adult: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL.; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when
PREGNANCY
Manufacturer advises avoid.

Adult: BY INTRAVENOUS INJECTION
Adult: BY SUBCUTANEOUS INJECTION

BNF manufacturer advises caution.

malignancies receiving chemotherapy (November 2014) NICE TA323
Erythropoiesis-stimulating agents (epoetin alfa, beta, theta and zeta, and darbepoetin alfa) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy.

If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used.
www.nice.org.uk/guidance/ta323

Epoetin alfa

**INDICATIONS AND DOSE**

**Eprex® PRE-FILLED SYRINGES**

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

- **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, maintenance dose can be given as a single dose or in divided doses, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

- **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

- **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

**INTERACTIONS** → Appendix 1: epoetin alfa

**SIDE-EFFECTS**

- Common or very common: Chills, cough, diarrhoea, fever, myalgia, nausea, pain, peripheral oedema, vomiting.
- Uncommon: Hyperkalaemia.

**BREAST FEEDING**: Unlikely to be present in milk. Minimal effect on infant.

**HEPATIC IMPAIRMENT**: Manufacturer advises caution in chronic hepatic failure.

**PRESCRIBING AND DISPENSING INFORMATION**: Epoetin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see **Biological medicines and Biosimilar medicines**, under Guidance on prescribing p. 1.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Erythropoiesis-stimulating agents (epoetin and darbepoetin) for treating anaemia in people with cancer having chemotherapy (November 2014) NICE TA323

Erythropoiesis-stimulating agents (epoetin alfa, beta, theta and zeta, and darbepoetin alfa) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy.

If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used.

INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure

BY SUBCUTANEOUS INJECTION

Adult: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 ml over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 ml; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

BY INTRAVENOUS INJECTION

Adult: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 ml over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 ml; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

BY SUBCUTANEOUS INJECTION

Adults: Initially 450 units/kg once weekly for 4 weeks, dose to be given weekly as a single dose or in 3–7 divided doses, increase dose after 4 weeks (if a rise in haemoglobin of at least 1 g/100 ml not achieved), increased to 900 units/kg once weekly, dose to be given weekly as a single dose or in 3–7 divided doses, if adequate response obtained reduce dose by 25–50%, discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 ml after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 ml over 4 weeks or if haemoglobin concentration exceeds 12 g/100 ml; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy; maximum 60 000 units per week

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable

BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

Adult: consult product literature

SIDE-EFFECTS

Unlikely to be present in milk. Minimal effect on infant.

HEPATIC IMPAIRMENT

Manufacturer advises caution in chronic hepatic failure.

Epoetin zeta

**INDICATIONS AND DOSE**

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

- **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

- **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 50 units/kg 3 times a week, adjusted according to response, in steps of 25 units/kg 3 times a week, dose to be adjusted at intervals of at least 4 weeks; maintenance 25–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

- **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 50 units/kg 3 times a week, adjusted according to response, in steps of 25 units/kg 3 times a week, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

Symptomatic anaemia in adults receiving cancer chemotherapy

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, only increase dose if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks; restart at a dose approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

- **BY INTRAVENOUS INJECTION**
  - Adult: 600 units/kg twice weekly for 3 weeks before surgery, intravenous injection to be given over 1–5 minutes, consult product literature for details and advice on ensuring high iron stores

**INTERACTIONS**: Appendix 1: epoetin zeta

**SIDE-EFFECTS**

- Common or very common: Asthenia, dizziness
- Uncommon: Intracranial haemorrhage

**PRECAUTIONS**

- **PREGNANCY**: No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.
- **BREAST FEEDING**: Unlikely to be present in milk. Minimal effect on infant.
- **HEPATIC IMPAIRMENT**: Manufacturer advises caution in chronic hepatic failure.

**PREScribing AND DISPensing INFORMATION** Epoetin zeta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and not currently treated with erythropoietins

- **INDICATIONS AND DOSE**
  - **Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and not currently treated with erythropoietins**
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
    - **Adult:** Initially 600 nanograms/kg every 2 weeks, subcutaneous route preferred in patients not on haemodialysis; dose to be adjusted according to response at intervals of at least 1 month, maintenance dose of double the previous fortnightly dose may be given once a month if haemoglobin concentration is above 10 g/100 mL, reduce dose by approximately 25% if rate of rise in haemoglobin concentration exceeds 2 g/100 mL in 1 month or if haemoglobin concentration is increasing or approaching 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, dose may be increased by approximately 25% if the rate of rise in haemoglobin concentration is less than 1 g/100 mL over 1 month; further increases of approximately 25% may be made at monthly intervals until the individual target haemoglobin concentration is obtained.

  - **Symptomatic anaemia associated with chronic kidney disease in patients not on dialysis and not currently treated with erythropoietins**
    - **INITIALLY BY SUBCUTANEOUS INJECTION**
    - **Adult:** Initially 1.2 micrograms/kg every month, alternatively (by subcutaneous injection or by intravenous injection) initially 600 nanograms/kg every 2 weeks, subcutaneous route preferred in patients not on haemodialysis, dose to be adjusted according to response at intervals of at least 1 month, patients treated once every 2 weeks may be given a maintenance dose of double the previous fortnightly dose once a month if haemoglobin concentration is above 10 g/100 mL, reduce dose by approximately 25% if rate of rise in haemoglobin concentration exceeds 2 g/100 mL in 1 month or if haemoglobin concentration is increasing or approaching 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, dose may be increased by approximately 25% if the rate of rise in haemoglobin concentration is less than 1 g/100 mL over 1 month; further increases of approximately 25% may be made at monthly intervals until the individual target haemoglobin concentration is obtained.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOIETINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (UPDATED JANUARY 2018)

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal. More severe cases were recorded with long-acting agents (darbepoetin alfa and methoxy polyethylene glycol-epoetin beta).

Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

**CONTRA-INDICATIONS** Pure red cell aplasia following erythropoietin therapy; uncontrolled hypertension

**CAUTIONS** Bone marrow fibrosis (can impair the response to erythropoietin) - concurrent infection (can impair the response to erythropoietin) - haematological disease (can impair the response to erythropoietin) - haemolysis (can impair the response to erythropoietin) - inflammatory or traumatic episodes (can impair the response to erythropoietin) - malignant disease - occult blood loss (can impair the response to erythropoietin) - severe aluminium toxicity (can impair the response to erythropoietin)

**SIDE-EFFECTS**

- **Common or very common** Hypertension (dose-dependent)
- **Uncommon** Embolism and thrombosis - headache
- **Rare or very rare** Hot flush - hypertensive encephalopathy - rash maculopapular
- **Frequency not known** Pure red cell aplasia (discontinue) - severe cutaneous adverse reactions (SCARs) - thrombocytopenia

**PREGNANCY** No evidence of harm in animal studies—manufacturer advises caution.
Blood and nutrition

  - Methoxy polyethylene glycol-epoetin beta 833.333 microgram per 1 ml Mircera 250micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (amp) £367.03

#### IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

### Eculizumab

- **DRUG ACTION**
  - Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

#### INDICATIONS AND DOSE

**Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 600 mg once weekly for 4 weeks, then increased to 900 mg once weekly for 1 week; maintenance 900 mg every 12–16 days

**Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week; maintenance 1.2 g every 12–16 days

#### CONTRA-INDICATIONS

- Patients unvaccinated against *Neisseria meningitidis* • unresolved *Neisseria meningitidis* infection

#### CAUTIONS

- Active systemic infection

### CAUTIONS, FURTHER INFORMATION

- Meningococcal infection: Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.

#### INTERACTIONS

- Appendix 1: monoclonal antibodies

#### SIDE-EFFECTS

- **Common or very common**
  - Alopecia • asthenia • chills • cough • decreased leucocytes • diarrhoea • dizziness • fever • gastrointestinal discomfort • headache • hypertension • increased risk of infection • influenza like illness • joint disorders • muscle complaints • nausea • oropharyngeal pain • pain • skin reactions • sleep disorders • taste altered • tremor • vomiting

- **Uncommon**
  - Abscess • anxiety • appetite decreased • chest discomfort • constipation • cystitis • depression • dysuria • haemorrhage • hot flush • hyperhidrosis • hypersensitivity • hypotension • meningitis meningococcal • mood swings • nasal complaints • oedema • palpitations • paraesthesia • sepsis • spontaneous penile erection • throat irritation • tinnitus • vascular disorders • vertigo • vision blurred

- **Rare or very rare**
  - Abnormal clotting factor • conjunctival irritation • feeling hot • gastrooesophageal reflux disease • gingival discomfort • Grave’s disease • infusion related reaction • jaundice • malignant melanoma • menstrual disorder • syncope • urogenital tract gonococcal infection
1.2 Iron deficiency anaemia

Anaemia, iron deficiency

Iron deficiency, treatment and prophylaxis

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g., gastric erosion, gastrointestinal cancer).

Prophylaxis with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

Oral iron
Iron salts should be given by mouth unless there are good reasons for using another route.

Iron salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulfate; for prophylaxis of iron-deficiency anaemia, ferrous sulfate may be effective.

**Compound preparations**

Preparations containing iron and folic acid p. 1025 are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy.

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain ascorbic acid p. 1082 to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins (except folic acid for pregnant women).

**Modified-release preparations**

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

**Parenteral iron**

Iron can be administered parenterally as iron dextran p. 1020, iron sucrose p. 1021, ferric carboxymaltose p. 1020, or iron isomaltoside 1000 p. 1021. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not require iron immediately.
Anaemias

Iron (injectable)

INDICATIONS AND DOSE
Iron-deficiency anaemia
- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

SIDE-EFFECTS
- Rare or very rare Face oedema - flatulence
- CAUTIONS Allergic disorders - eczema - hepatic dysfunction - immune conditions - infection (discontinue if ongoing bacteraemia) - inflammatory conditions - oral iron should not be given during or for at least 5 days after the last injection - severe asthma

SIDE-EFFECTS
- Common or very common Dizziness - flushing - headache - hypertension - hypophosphataemia - hypotension - nausea - taste altered
- Rare or very rare Angioedema - anxiety - circulatory collapse - influenza like illness - malaise - pallor - palpitations - psychiatric disorder - seizure - syncope - tremor

INTERACTIONS
- Appendix 1: iron (injectable)
- PRESCRIBING AND DISPENSING INFORMATION A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

INTERACTIONS
- By slow intravenous injection, or by intravenous infusion
- Adult: Doses calculated according to body-weight and iron deficit (consult product literature)

SIDE-EFFECTS
- Rare or very rare Face oedema - flatulence
- CAUTIONS Allergic disorders - eczema - hepatic dysfunction - immune conditions - infection (discontinue if ongoing bacteraemia) - inflammatory conditions - oral iron should not be given during or for at least 5 days after the last injection - severe asthma

SIDE-EFFECTS
- Common or very common Dizziness - flushing - headache - hypertension - hypophosphataemia - hypotension - nausea - taste altered
- Rare or very rare Angioedema - anxiety - circulatory collapse - influenza like illness - malaise - pallor - palpitations - psychiatric disorder - seizure - syncope - tremor

INTERACTIONS
- Appendix 1: iron (injectable)
- PRESCRIBING AND DISPENSING INFORMATION A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

INTERACTIONS
- By slow intravenous injection, or by intravenous infusion

INTERACTIONS
- Appendix 1: iron (injectable)
- PRESCRIBING AND DISPENSING INFORMATION A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.
Iron deficiency anaemia 1021

DIRECTIONS FOR ADMINISTRATION
- With intravenous use: For intravenous infusion (Cosmofer®), give intermittently in Glucose 5% or Sodium chloride 0.9%, dilute 100–200 mg in 100 mL infusion fluid; give 25 mg over 15 minutes initially, then at a rate not exceeding 6.67 mg/minute; total dose infusion diluted in 500 mL infusion fluid and given over 4–6 hours (initial dose 25 mg over 15 minutes).

PRESCRIBING AND DISPENSING INFORMATION
- A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Cosmofer (Pharmacosmos UK Ltd) ▴
  - Iron (as iron dextran) 50 mg per 1 mL Cosmofer 500 mg/10 mL solution for injection ampoules | 2 ampoule (£29.45) £79.70
  - Cosmofer 100 mg/2 mL solution for injection ampoules | 5 ampoule (£30.85)

Iron isomaltoside 1000

INDICATIONS AND DOSE
- Iron-deficiency anaemia
- By intravenous injection
- Adult: (consult product literature)

INTERACTIONS
- Appendix 1: iron (injectable)

SIDE-EFFECTS
- Uncommon: Asthenia
- Rare or very rare: Drowsiness, urine discolouration

PREGNANCY
- Avoid in first trimester.

HEPATIC IMPAIRMENT
- Manufacturer advises caution—monitor iron status to avoid iron overload; avoid where iron overload is a precipitating factor (particularly porphyria cutanea tarda).

DIRECTIONS FOR ADMINISTRATION
- For intravenous infusion (Venoferr®), give intermittently in Sodium chloride 0.9%, dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over 15 minutes initially, then give at a rate not exceeding 3.33 mg/minute.

PRESCRIBING AND DISPENSING INFORMATION
- A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Venoferr (Vifor Pharma UK Ltd, Imported (United States)) ▴
  - Iron (as iron sucrose) 20 mg per 1 mL Venoferr 100 mg/5 mL solution for injection vials | 5 vial (£43.52) £217.60
  - Venoferr 50 mg/2.5 mL solution for injection vials | 5 vial (£39.00)

MINERALS AND TRACE ELEMENTS
- Iron (oral)

SIDE-EFFECTS
- Common or very common: Constipation, diarrhoea, gastrointestinal discomfort, nausea
- Uncommon: Vomiting
- Frequency not known: Appetite decreased, faeces discoloured

SIDE-EFFECTS, FURTHER INFORMATION
- Iron can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

Overdose
- For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1359.

MONITORING REQUIREMENTS
- Therapeutic response: The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

PRESCRIBING AND DISPENSING INFORMATION
- In children: Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered. The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

PATIENT AND CARER ADVICE
- Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discoulour stools.

Iron sucrose

INDICATIONS AND DOSE
- Iron-deficiency anaemia
- By slow intravenous injection, or by intravenous infusion
- Adult: Doses calculated according to body-weight and iron deficit (consult product literature)

INTERACTIONS
- Appendix 1: iron (injectable)
**Ferric maltol**

**INDICATIONS AND DOSE**

*Iron-deficiency anaemia*

- **BY MOUTH**
  - Adult: 30 mg twice daily continued until iron stores are replenished; usual duration at least 12 weeks

**CONTRA-INDICATIONS**

Exacerbation of inflammatory bowel disease; haemochromatosis; haemoglobin less than 9.5 g/dL; iron overload syndromes; repeated blood transfusions

**INTERACTIONS** → Appendix 1: iron (oral)

**SIDE-EFFECTS**

- Common or very common: Flatulence
- Uncommon: Headache, joint stiffness, pain in extremity, skin reactions; small intestinal bacterial overgrowth, thirst

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (December 2016) that ferric maltol (Feraccru®) is not recommended for use within NHS Scotland for the treatment of iron deficiency anaemia in adults with inflammatory bowel disease as the economic case was not demonstrated.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 23

- Feraccru® (Shield Therapeutics UK Ltd)
  - Iron (as Ferric maltol) 30 mg
  - Feraccru 30mg capsules
  - 56 capsule (Rx) £47.60 + VAT £47.60

**Ferrous fumarate**

**INDICATIONS AND DOSE**

*Iron-deficiency anaemia (prophylactic)*

- **BY MOUTH USING TABLETS**
  - Child 12-17 years: 210 mg 1–2 times a day
  - Adult: 210 mg 1–2 times a day
- **BY MOUTH USING SYRUP**
  - Child 12-17 years: 280 mg twice daily
  - Adult: 280 mg twice daily

*Iron-deficiency anaemia (therapeutic)*

- **BY MOUTH USING TABLETS**
  - Child 12-17 years: 210 mg 2–3 times a day
  - Adult: 210 mg 2–3 times a day
- **BY MOUTH USING SYRUP**
  - Child 12-17 years: 280 mg twice daily
  - Adult: 280 mg twice daily

**GALFER® CAPSULES**

*Iron-deficiency anaemia (prophylactic)*

- **BY MOUTH**
  - Child 12-17 years: 305 mg daily
  - Adult: 305 mg daily

*Iron-deficiency anaemia (therapeutic)*

- **BY MOUTH**
  - Child 12-17 years: 305 mg twice daily
  - Adult: 305 mg twice daily

**GALFER® SYRUP**

*Iron-deficiency anaemia (prophylaxis)*

- **BY MOUTH**
  - Child 1 month–11 years: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established; maximum 20 mL per day
  - Child 12-17 years: 10 mL once daily
  - Adult: 10 mL once daily

*Iron-deficiency anaemia (therapeutic)*

- **BY MOUTH**
  - Child 1 month–11 years: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses; maximum 20 mL per day
  - Child 12-17 years: 10 mL 1–2 times a day
  - Adult: 10 mL 1–2 times a day

**INTERACTIONS** → Appendix 1: iron (oral)

**SIDE-EFFECTS**

- Faecal impaction; haematosiderosis

**PRESCRIBING AND DISPENSING INFORMATION**

Non-proprietary ferrous fumarate tablets may contain 210 mg (68 mg iron), syrup may contain approx. 140 mg (45 mg iron)/5 mL; Galfer® capsules contain ferrous fumarate 305 mg (100 mg iron).

**PATIENT AND CARER ADVICE**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

    Adult: 1–2 capsules daily, capsule can be opened and sprinkled on food

- FERROGRAD®
  Iron-deficiency anaemia (prophylactic and therapeutic)
  - BY MOUTH
    Child 6-17 years: 1 tablet daily
    Adult: 1 tablet daily

- IRONORM® DROPS
  Iron-deficiency anaemia (prophylactic)
  - BY MOUTH
    Adult: 2.4–4.8 mL daily
  Iron-deficiency anaemia (therapeutic)
  - BY MOUTH
    Adult: 4 mL 1–2 times a day

- INTERACTIONS → Appendix 1: iron (oral)
- SIDE-EFFECTS Tooth discoloration

- PRESCRIBING AND DISPENSING INFORMATION
  Iron content
  Ferrous sulfate 200 mg is equivalent to 65 mg iron; Ironorm® drops contain ferrous sulfate 125 mg (equivalent to 25 mg iron)/mL; Feospan® suspensions contain ferrous sulfate 150 mg (47 mg iron) (spansule = capsules m/r); Ferrograd® tablets contain ferrous sulfate 255 mg (105 mg iron).
  With oral use in adults Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

1024 Anaemias

1.3 Megaloblastic anaemia

Anaemia, megaloblastic

Overview
Most megaloblastic anaemias result from a lack of either vitamin B12 or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is pernicious anaemia in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B12.

Vitamin B12 is also needed in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare syndrome of congenital transcobalamin II deficiency.

Vitamin B12 should be given prophylactically after total gastrectomy or total ileal resection (or after partial gastrectomy if a vitamin B12 absorption test shows vitamin B12 malabsorption). Apart from dietary deficiency, all other causes of vitamin B12 deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B12 orally and none for vitamin B12 intrinsic factor complexes given by mouth. Vitamin B12 in larger oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 1026 has completely replaced cyanocobalamin p. 1025 as the form of vitamin B12 of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B12 neuropathy.

Folic acid p. 1025 has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B12 is administered concurrently otherwise neuropathy may be precipitated.

In folate-deficient megaloblastic anaemia (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in chronic haemolytic states, malabsorption, or in renal dialysis, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn’s disease, rheumatic disease, and severe psoriasis.

Folinic acid p. 941 is also effective in the treatment of folate deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs; it is given as calcium folinate.

There is no justification for prescribing multiple ingredient vitamin preparations containing vitamin B12 or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 1089.
**VITAMINS AND TRACE ELEMENTS** > **FOLATES**

---

**Folic acid**

**INDICATIONS AND DOSE**

**Folate-deficient megaloblastic anaemia**

- **BY MOUTH**
  - Adult: 5 mg once weekly, to be taken before conception and until week 12 of pregnancy.
  - Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy.

**Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see Neural tube defects (prevention in pregnancy) p. 1089)**

- **BY MOUTH**
  - Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy.

**Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant see Neural tube defects (prevention in pregnancy) p. 1089)**

- **BY MOUTH**
  - Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy.

**Prevention of methotrexate-induced side-effects in rheumatoid disease**

- **BY MOUTH**
  - Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose.

**Prevention of methotrexate side-effects in severe Crohn’s disease**

- **BY MOUTH**
  - Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose.

**Prophylaxis in chronic haemolytic states**

- **BY MOUTH**
  - Adult: 5 mg every 1–7 days, frequency dependent on underlying disease.

**Prophylaxis of folate deficiency in dialysis**

- **BY MOUTH**
  - Child 1 month–11 years: 250 micrograms/kg once daily (max. per dose 10 mg).
  - Child 12–17 years: 5–10 mg once daily.
  - Adult: 5 mg every 1–7 days.

**Prophylaxis of folate deficiency in patients receiving parenteral nutrition**

- **BY INTRAVENOUS INFUSION**
  - Adult: 15 mg 1–2 times a week, usually given by intravenous infusion in the parenteral nutrition solution.

---

**SIDE-EFFECTS**

Possible side-effects of folic acid include nausea, vomiting, and diarrhea. Rarely, it can cause an allergic reaction.

---

**PRESCRIBING AND DISPENSING INFORMATION**

Available as capsules, oral suspensions, solution for injection, tablets, and sugar-free solutions. Dosages range from 400 micrograms to 5 mg daily, depending on the condition.

---

**MEDICINAL FORMS**

- **Tablet**
  - Folic acid (Non-proprietary)

www.getintopharma.com
Iron overload

Overview
Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially thalassaemia major, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Veneesction may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 1028 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is not added to the blood and is not given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by administration of ascorbic acid p. 1082 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.
Desferrioxamine mesilate infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

ANTIDOTES AND CHELATORS ▶ IRON CHELATORS

<table>
<thead>
<tr>
<th>Deferasirox</th>

</thead>
<tbody>
<tr>
<td><strong>DRUG ACTION</strong> Deferasirox is an oral iron chelator.</td>
</tr>
</tbody>
</table>

**INDICATIONS AND DOSE**

Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

- **BY MOUTH**
  - Adult: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg
  - Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only)
    - **BY MOUTH**
      - Adult: Initially 7 mg/kg once daily, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

**CHRONIC IRON OVERLOAD WHEN DESFERRIOXAMINE IS CONTRA-INDICATED OR INADEQUATE IN NON-TRANSFUSION-DEPENDENT THALASSEMIAS SYNDROMES (SPECIALIST USE ONLY)**

- **BY MOUTH**
  - Adult: Initially 7 mg/kg once daily, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration and liver iron concentration (consult product literature); maximum 14 mg/kg per day

**CAUTIONS**

- Elderly (increased risk of side-effects) - history of liver cirrhosis - not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) - platelet count less than 50x10^9/litre - risk of gastro-intestinal ulceration and haemorrhage - unexplained cytopenia—consider treatment interruption

**INTERACTIONS** ▶ Appendix 1: Iron chelators

**SIDE-EFFECTS**

- Common or very common Constipation - diarrhoea - gastrointestinal discomfort - headache - nausea - skin reactions - urine abnormalities - vomiting
- Uncommon Anxiety - catarrh - cholelithiasis - deafness - dizziness - fatigue - fever - gastrointestinal disorders - gastrointestinal haemorrhage (including fatal cases) - hepatic disorders - laryngeal pain - maculopathy - oedema - renal tubular disorders - sleep disorder
- Rare or very rare Optic neuritis
- Frequency not known Acute kidney injury - alopecia - anaemia aggravated - angioedema - hypersensitivity vasculitis - metabolic acidosis - nephritis tubulo-interstitial - nephrolithiasis - neutropenia - pancreatitis acute - pancytopenia - renal tubular necrosis - severe cutaneous adverse reactions (SCARs) - thrombocytopenia

(Deferoxamine Mesilate)

- **INDICATIONS AND DOSE**
  - **Iron poisoning**
    - By continuous intravenous infusion
  - **Adult:** Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service
  - **Aluminium overload in dialysis patients**
    - By intravenous infusion
    - Adult: (consult product literature or local protocols)

<table>

<tr>
<td>Adult: The dose should reflect the degree of iron overload</td>
<td>Adult: 20–50 mg/kg daily</td>
</tr>
</tbody>
</table>

- **CAUTIONS**
  - Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

- **INTERACTIONS**
  - Appendix 1: iron chelators

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain (reducing dose and increasing gradually may improve tolerance) - agranulocytosis - appetite increased - arthralgia - diarrhoea (reducing dose and increasing gradually may improve tolerance) - fatigue - headache - nausea (reducing dose and increasing gradually may improve tolerance) - neutropenia - urinary discoulouration - vomiting (reducing dose and increasing gradually may improve tolerance)
  - Frequency not known
    - Skin reactions - zinc deficiency

- **CONCEPTION AND CONTRACEPTION**

- **PREGNANCY**
  - Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
  - Monitor plasma-zinc concentration.

- **PATIENT AND CARER ADVICE**
  - Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

- **Oral solution**
  - CAUTIONARY AND ADVISORY LABELS 14
    - Ferriprox (Swedish Orphan Biovitrum Ltd)
      - Ferriprone 100 mg per 1 ml Ferriprone 100mg/ml oral solution sugar-free | 500 ml £152.39 DT + £152.39
  - Ferriprox 500 mg Ferriprox 500mg tablets | 100 tablet £175.20 DT + £152.39

3 Neutropenia and stem cell mobilisation
3.1 Neutropenia

Neutropenia

Management

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia.
and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim below (unglycosylated rhG-CSF) and lenograstim p. 1030 (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Pegfilgrastim p. 1031 is a polyethylene glycol-conjugated (‘pegylated’) derivative of filgrastim; pegylation increases the duration of filgrastim activity. Lipegfilgrastim p. 1031 is a polyethylene glycol-conjugated via a glycine linker derivative of filgrastim. Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

**IMMUNOSTIMULANTS**

Granulocyte-colony stimulating factors

- **DRUG ACTION** Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.
- **CAUTIONS** Malignant myeloid conditions - pre-malignant myeloid conditions - risk of splenomegaly and rupture—spleen size should be monitored—sickle-cell disease
- **SIDE-EFFECTS**
  - Common or very common: Arthralgia - cutaneous vasculitis - dyspnoea - haemoptysis - headache - hypersensitivity - leucocytosis - pain - spleen abnormalities - thrombocytopenia
  - Uncommon: Acute febrile neutrophilic dermatosis - capillary leak syndrome - hypoxia - pulmonary oedema - respiratory disorders - sickle cell anaemia with crisis
- **PREGNANCY** Manufacturers advise avoid—toxicity in animal studies.
- **BREAST FEEDING** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.
- **MONITORING REQUIREMENTS**
  - Full blood counts including differential white cell and platelet counts should be monitored.
  - Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

Filgrastim

(Recombinant human granulocyte-colony stimulating factor; G-CSF)

- **INDICATIONS AND DOSE**
  - Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)
  - Adult: 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes
  - Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRavenous INFUSION**
      - Adult: 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route
      - **Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)**
        - **BY SUBCUTANEOUS INJECTION**
          - Adult: 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion
      - **Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)**
        - **BY SUBCUTANEOUS INJECTION**
          - Adult: 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature
      - **Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)**
        - **BY SUBCUTANEOUS INJECTION**
          - Adult 18–59 years: 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature
  - Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol
  - Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol
  - Persistent neutropenia in HIV infection (specialist use only)
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day
  - **CONTRA-INDICATIONS** Severe congenital neutropenia (Kostmann’s syndrome) with abnormal cytogenetics
  - **CAUTIONS** Osteoporotic bone disease (monitor bone density if given for more than 6 months) - secondary acute myeloid leukaemia
  - **SIDE-EFFECTS**
    - Common or very common: Anaemia - diarrhoea - dysuria - haemorrhage - hepatomegaly - hyperuricaemia - hypotension - osteoporosis - rash
**Lenograstim**

(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (Neupogen®); (Nivestim®); (Zarzio®) give continuously or intermittently in Glucose 5%; for a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution.

**PRESCRIBING AND DISPENSING INFORMATION** Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Accofil (Accord Healthcare Ltd)**
  - Filgrastim 60 mega u per 1 ml Accofil 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pf) £284.20
  - Filgrastim 96 mega u per 1 ml Accofil 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pf) £455.70
- **Neupogen (Amgen Ltd)**
  - Filgrastim 30 mega u per 1 ml Neupogen 30million units/1ml solution for injection vials | 5 vial (Pf) £263.52
  - Neupogen Singleject (Amgen Ltd)
  - Filgrastim 60 mega u per 1 ml Neupogen Singleject 30million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Pf) £52.70
  - Filgrastim 96 mega u per 1 ml Neupogen Singleject 48million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Pf) £84.06
- **Nivestim (Pfizer Ltd)**
  - Filgrastim 60 mega u per 1 ml Nivestim 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pf) £246.50
  - Nivestim 120 million units/0.2ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pf) £153.00
  - Filgrastim 96 mega u per 1 ml Nivestim 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pf) £395.25
- **Zarzio (Sanbo Ltd)**
  - Filgrastim 60 mega u per 1 ml Zarzio 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pf) £250.75
  - Filgrastim 96 mega u per 1 ml Zarzio 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pf) £399.50

**SIDE-EFFECTS**

- Common or very common Abdominal pain - asthenia
- Rare or very rare Erythema nodosum - pyoderma gangrenosum - toxic epidermal necrolysis

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

**EXCipients:** May contain Phenylalanine

www.getintopharma.com
Lipegfilgrastim
(Glycopegylated recombinant methionyl human granulocyte-colony stimulating factor)

- **INDICATIONS AND DOSE**
  Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 6 mg, for each chemotherapy cycle, given approximately 24 hours after chemotherapy, dose expressed as filgrastim

- **CAUTIONS**
  - Myelosuppressive chemotherapy
  - Common or very common Chest pain • hypokalaemia • skin eruption

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - **Lonquex** (Teva UK Ltd)
      Lipegfilgrastim 10 mg per 1 ml
      Lonquex 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £652.06
  - **Pelmeg** (Napp Pharmaceuticals Ltd)
    Pelmeg 6mg/0.6ml solution for injection pre-filled syringes with Onpro kit | 1 pre-filled disposable injection £686.38 (Hospital only)
  - **Pelgraz** (Accord Healthcare Ltd)
    Pelgraz 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £686.37 (Hospital only)
  - **Ziextenzo** (Sanofizod Ltd)
    Ziextenzo 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £617.74

Pegfilgrastim
(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

- **INDICATIONS AND DOSE**
  Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 6 mg for each chemotherapy cycle, to be given at least 24 hours after chemotherapy, dose expressed as filgrastim

- **CAUTIONS**
  - Acute leukaemia • myelosuppressive chemotherapy
  - Common or very common Myalgia • nausea
  - Uncommon Glomerulonephritis

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - **Neulasta** (Amgen Ltd)
      Filgrastim (as Pegfilgrastim) 10 mg per 1 ml
      Neulasta 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £686.38
      Neulasta 6mg/0.6ml solution for injection pre-filled syringes with Onpro kit | 1 pre-filled disposable injection £686.38 (Hospital only)
    - **Plerixafor** (Sanofi)
      Plerixafor 20 mg per 1 ml
      Plerixafor 20mg/0.2ml solution for injection | 1 vial £882.77
  - **Filgrastim (as Pegfilgrastim)**
    Filgrastim (as Pegfilgrastim) 10 mg per 1 ml
    Filgrastim (as Pegfilgrastim) 10 mg per 1 ml
    Filgrastim (as Pegfilgrastim) 10 mg per 1 ml
    Filgrastim (as Pegfilgrastim) 10 mg per 1 ml
    Nominal 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £686.37 (Hospital only)
    Nominal 6mg/0.6ml solution for injection pre-filled syringes with Onpro kit | 1 pre-filled disposable injection £686.38 (Hospital only)

3.2 Stem cell mobilisation
IMMUNOSTIMULANTS > CHEMOKINE RECEPTOR ANTAGONISTS

Plerixafor
Plerixafor is a chemokine receptor antagonist.

- **INDICATIONS AND DOSE**
  Mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma (specialist use only)
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 240 micrograms/kg daily usually for 2–4 days (max 7 days), to be administered 6–11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor

- **SIDE-EFFECTS**
  - Common or very common Arthralgia • constipation • diarrhoea • dizziness • dry mouth • erythema • fatigue • flatulence • gastrointestinal discomfort • headache • hyperhidrosis • malaise • muscle/skeletal pain • nausea • oral hypoesthesia • sleep disorders • vomiting
  - Uncommon Hypersensitivity

- **CONCEPTION AND CONTRACEPTION**
  Use effective contraception during treatment—teratogenic in animal studies.

- **PREGNANCY**
  Manufacturer advises avoid unless essential—teratogenic in animal studies.

- **BREAST FEEDING**
  Manufacturer advises avoid—no information available.

- **RENAI IMPAIRMENT**
  No information available if creatinine clearance less than 20 mL/minute.
  Dose adjustments Reduce dose to 150 micrograms/kg daily if creatinine clearance 20–50 mL/minute.

- **MONITORING REQUIREMENTS**
  Monitor platelets and white blood cell count.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - **Mozobil** (Sanofi)
      Mozobil 24mg/1.2ml solution for injection vials | 1 vial £4,882.77

4 Platelet disorders

Platelet disorders
Idiopathic thrombocytopenic purpura
Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a corticosteroid, e.g. prednisolone p. 678, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

Immunoglobulin preparations, are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (Rh) immunoglobulin p. 1289 is effective in raising the platelet count in about 80% of
unplasplenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin p. 1290 for intravenous use, but further doses are usually required. Other therapies that have been tried in refractory idiopathic thrombocytopenic purpura include: azathioprine p. 836, cyclophosphamide p. 894, vincristine sulfate p. 929, ciclosporin p. 838, and danazol p. 742. Rituximab p. 882 [unlicensed indication] may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 110 may be given to reduce the severity of haemorrhage.

Eltrombopag below and romiplostim p. 1034 are thrombopoietin receptor agonists. They are licensed for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments, such as corticosteroids or immunoglobulins. Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

### Essential thrombocythaemia

Anagrelide below inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. An at risk patient is defined by one or more of the following features: over 60 years of age, or a platelet count greater than 1000 x 10^9/L or history of thrombo-haemorrhagic events. Anagrelide should be initiated under specialist supervision.

### 4.1 Essential thrombocythaemia

**Other drugs used for Essential thrombocythaemia**

| Hydroxyurea, p. 935 |

### ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

#### Anagrelide

| 28-May-2018 |

**INDICATIONS AND DOSE**

Essential thrombocythaemia in patients who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: Initially 500 micrograms twice daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

**CAUTIONS**
Cardiovascular disease—assess cardiac function before and regularly during treatment. concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment. risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment

**INTERACTIONS**
Appendix 1: anagrelide

**SIDE-EFFECTS**
- Common or very common Anaemia · arrhythmias · asthenia · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headaches · nausea · palpitations · skin reactions · vomiting
- Uncommon Alopecia · appetite decreased · arthralgia · chest pain · chills · confusion · congestive heart failure · constipation · depression · dry mouth · dysphonia · erectile function · fever · haemorrhage · hypertension · insomnia · malaise · memory loss · myalgia · nervousness · oedema · pain · pancreatitis · pancytopenia · pneumonia · pulmonary hypertension · respiratory disorders · sensation abnormal · syncope · thrombocytopenia · weight changes
- Rare or very rare Angina pectoris · cardiomyopathy · coordination abnormal · drowsiness · dysarthria · influenza like illness · myocardial infarction · nocturia · pericardial effusion · postural hypotension · renal failure · tinnitus · vasodilation · vision disorders
- Frequency not known Hepatitis · nephritis · tubulointerstitial

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

**PREGNANCY**
Manufacturer advises avoid (toxicity in animal studies).

**BREAST FEEDING**
Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Manufacturer advises use with caution in mild impairment; avoid in moderate-to-severe impairment or if serum transaminases exceed 5 times the upper limit of normal.

**RENAL IMPAIRMENT**
Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
- Monitor liver function.
- Monitor serum creatinine.
- Monitor urea.
- Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.

**PATIENT AND CARER ADVICE**
- Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

- **Anagrelide (Non-proprietary)**
  - Anagrelide (as Anagrelide hydrochloride) 500 microgram Anagrelide 500microgram capsules | 100 capsule £404.57 DT + £336.62
  - Xagrid (Shire Pharmaceuticals Ltd) Anagrelide (as Anagrelide hydrochloride) 500 microgram Xagrid 500microgram capsules | 100 capsule £404.57 DT + £336.62

### 4.2 Immune thrombocytopenia

#### ANTIHAEMORRHAGICS > THROMBOPOIETIN RECEPTOR AGONISTS

| 17-Aug-2018 |

**INDICATIONS AND DOSE**
Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

- **BY MOUTH**
  - Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50x10^9/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
  - Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50x10^9/litre or more—consult product literature for
dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

Treatment of thrombocytopenia associated with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy (under expert supervision)

▶ BY MOUTH

▶ Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of 50–75 × 10^9/litre during antiviral therapy—consult product literature for dose adjustments, discontinue if inadequate response after 2 weeks treatment at maximum dose; maximum 100 mg per day

Acquired severe aplastic anaemia in patients either refractory to or heavily pretreated with prior immunosuppressive therapy and are unsuitable for haematopoietic stem cell transplantation (under expert supervision)

▶ BY MOUTH

▶ Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50 × 10^9/litre or more—consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day

Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50 × 10^9/litre or more—consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ELTROMBOPAG (REVOLADE®): REPORTS OF INTERFERENCE WITH BILIRUBIN AND CREATININE TEST RESULTS (JULY 2018)

See Effect on laboratory tests.

● CAUTIONS Patients of East Asian origin • risk factors for thromboembolism

● INTERACTIONS ▶ Appendix 1: eltrombopag

● SIDE-EFFECTS

▶ Common or very common Abnormal loss of weight • alopecia • anaemia • anxiety • appetite abnormal • arthralgia • asthenia • catact • chest discomfort • chills • concentration impaired • confusion • constipation • cough • depression • diarrhoea • dizziness • drowsiness • dry eye • dry mouth • dysphagia • dyspnoea • eye discomfort • eye disorders • fever • gastrointestinal discomfort • gastrointestinal disorders • haemolytic anaemia • haemorrhage • headaches • hepatic disorders • hyperbilirubinaemia • hyperglycaemia • hypoglycaemia • increased risk of infection • influenza like illness • iron overload • lymphopenia • malaise • memory loss • menorrhagia • mood altered • muscle complaints • nasal complaints • nausea • neutropenia • oedema • oral disorders • oropharyngeal complaints • pain • palpitations • QT interval prolongation • sensation abnormal • skin reactions • sleep disorders • splenic infarction • sweat changes • syncope • taste altered • urine discolouration • vertigo • vision disorders • vomiting • weight decreased

▶ Uncommon Ainosocytosis • arhythmias • balance impaired • cardiovascular disorder • cyanosis • ear pain • electrolyte imbalance • embellishment and thrombosis • eosinophilia • eye inflammation • feeling hot • feeling jittery • food poisoning • gout • hemiparesis • increased leukocytes • lens opacity • muscle weakness • myocardial infarction • nephritis lupus • nerve disorders • rectosigmoid cancer • renal failure • retinal pigment epitheliopathy • sinus disorder • sleep apnoea • speech disorder • sunburn • thrombocytopenia • tremor • urinary disorders • urine abnormalities • vasodilation • wound inflammation

● CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment.

● PREGNANCY Avoid—toxicity in animal studies.

● BREAST FEEDING Manufacturer advises avoid.

● HEPATIC IMPAIRMENT

▶ When used for Idiopathic thrombocytopenic purpura Manufacturer advises consider avoiding.

▶ When used for Severe aplastic anaemia Manufacturer advises caution.

▶ When used for Thrombocytopenia associated with chronic hepatitis C infection Manufacturer advises caution (increased risk of hepatic decompensation and thromboembolic events).

Dose adjustments

▶ When used for Idiopathic thrombocytopenic purpura Manufacturer advises initial dose reduction to 25 mg once daily and wait at least 3 weeks before upward titration of dose.

▶ When used for Severe aplastic anaemia Manufacturer advises initial dose reduction to 25 mg once daily and wait at least 2 weeks before upward titration of dose.

● RENAL IMPAIRMENT Use with caution.

● PRE-TREATMENT SCREENING For severe aplastic anaemia, manufacturer advises do not initiate if patients have existing cytogenetic abnormalities of chromosome 7.

● MONITORING REQUIREMENTS

▶ Manufacturer advises monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.

▶ Manufacturer advises regular ophthalmological examinations for cataract formation.

▶ Manufacturer advises peripheral blood smear prior to initiation to establish baseline level of cellular morphologic abnormalities; once stabilised, full blood count with white blood cell count differential should be performed monthly.

▶ For Idiopathic thrombocytopenic purpura, manufacturer advises monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50 × 10^9/litre or more for at least 4 weeks), then monthly thereafter; monitor platelet count weekly for 4 weeks following treatment discontinuation.

▶ For Severe aplastic anaemia, manufacturer advises bone marrow examination with aspirations for cytogenetics prior to initiation, at 3 months of treatment and 6 months thereafter.

▶ For Thrombocytopenia associated with chronic hepatitis C infection, manufacturer advises monitor platelet count every week before and during antiviral treatment until a stable platelet count is reached (50–75 × 10^9/litre), then monitor full blood count including platelet count and peripheral blood smears monthly thereafter.

● EFFECT ON LABORATORY TESTS Eltrombopag is highly coloured and can cause serum discolouration and interference with total bilirubin and creatinine testing. If laboratory results are inconsistent with clinical observations, manufacturer advises re-testing using another method to help determine the validity of the result.

● DIRECTIONS FOR ADMINISTRATION Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron,
magnesium, zinc, or selenium to reduce possible interference with absorption.

- **PATIENT AND CARER ADVICE** Patient counselling is advised on how to administer eltrombopag tablets.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - **Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura (updated October 2018)**
      - **NICE TA293**
      - Eltrombopag (Revolade®) is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

      Patients currently receiving eltrombopag whose disease does not meet these criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

      www.nice.org.uk/guidance/ta293

- **Scottish Medicines Consortium (SMC) decisions**
  - **SMC No. 625/10**
    - The Scottish Medicines Consortium has advised (August 2010) that eltrombopag (Revolade®) is accepted for restricted use within the NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicinal forms containing the same drug.

  - **Tablet**
    - **Revolade** (Novartis Pharmaceuticals UK Ltd)
      - Eltrombopag (as Eltrombopag olamine) 25 mg Revolade 25mg tablets | 28 tablet | £77.00 DT + £77.00
      - Eltrombopag (as Eltrombopag olamine) 50 mg Revolade 50mg tablets | 28 tablet | £1,540.00 DT + £1,540.00
      - Eltrombopag (as Eltrombopag olamine) 75 mg Revolade 75mg tablets | 28 tablet | £2,310.00 DT + £2,310.00

---

**Romiplostim**

- **DRUG ACTION** Romiplostim is an Fc–peptide fusion protein that binds to and activates the thrombopoietin (TPO) receptor, thereby increasing platelet production.

- **INDICATIONS AND DOSE** Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)

  - **BY SUBCUTANEOUS INJECTION**
    - **Adult:** Initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg once weekly (max. per dose 10 micrograms/kg once weekly) until a stable platelet count of 50x10⁹/litre or more is reached, consult product literature for further details of dose adjustments, discontinue treatment if inadequate response after 4 weeks at maximum dose

- **CAUTIONS** Risk factors for thromboembolism

- **SIDE-EFFECTS**
  - **Common or very common** Anaemia - angioedema - arthralgia - asthenia - bone marrow disorders - chills - constipation - diarrhoea - dizziness - embolism and thrombosis - fever - flushing - gastrointestinal discomfort - headaches - hypersensitivity - increased risk of infection - influenza like illness - muscle complaints - nausea - pain - palpitations - peripheral oedema - sensation abnormal - skin reactions - sleep disorders

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; consider avoiding in moderate to severe impairment (risk of thromboembolic complications).

- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor full blood count and peripheral blood smears for morphological abnormalities before and during treatment.

- **Driving and skilled tasks** Manufacturer advises that patients and their carers should be counselled on the effects on driving and the performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - **Romiplostim for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (updated October 2018)**
      - **NICE TA221**
      - Romiplostim (Nplate®) is recommended as an option for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in adults, only if:

        - their condition is refractory to standard active treatments and rescue therapies, or
        - they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

      Romiplostim is recommended only if the manufacturer makes it available with the discount agreed in the patient access scheme.

      Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

      www.nice.org.uk/guidance/ta221

- **Scottish Medicines Consortium (SMC) decisions**
  - **SMC No. 553/09**
    - The Scottish Medicines Consortium has advised (October 2009) that romiplostim (Nplate®) is accepted for restricted use within the NHS Scotland for adult chronic immune (idiopathic) thrombocytopenic purpura (ITP) splenectomised patients who are refractory to other treatments (e.g. corticosteroids, immunoglobulins) and as second-line treatment for adult non-splenectomised patients where surgery is contra-indicated. Romiplostim is restricted use within NHS Scotland for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in adults, only if:
Fluid and electrolyte imbalances

Nutrition and metabolic disorders

1 Fluid and electrolyte imbalances

Fluids and electrolytes

Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

Oral potassium

Compensation for potassium loss is especially necessary:
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see warning on renal insufficiency). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are seldom required with the small doses of diuretics given to treat hypertension; potassium-sparing diuretics (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 227 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride daily (in divided doses) by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency (common in the elderly) to reduce the risk of hyperkalaemia.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable.

When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes) calls for urgent treatment with calcium gluconate 10% p. 1045 by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% p. 1041 given over 5–15 minutes, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. Salbutamol p. 252 [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 1038 should be considered (important: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in mild hyperkalaemia or in moderate hyperkalaemia when there are no ECG changes.

Oral sodium and water

Sodium chloride p. 1040 is indicated in states of sodium depletion and usually needs to be given intravenously. In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate, according to the acid-base status of the patient, may be sufficient.

Oral rehydration therapy (ORT)

As a worldwide problem diarrhoea is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch. Oral rehydration solutions should:
- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants). The WHO oral rehydration solution contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na+ 75 mmol, K+ 20 mmol, Cl− 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children’s fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

**Oral bicarbonate**

Sodium bicarbonate is given by mouth for chronic acidotic states such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe metabolic acidosis, sodium bicarbonate can be given intravenously.

Sodium bicarbonate may also be used to increase the pH of the urine; it is also used in dyspepsia.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where hyperchloremic acidosis is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral potassium bicarbonate, although acute or severe deficiency should be managed by intravenous therapy.

**Parenteral preparations for fluid and electrolyte imbalance**

#### Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 1040 or glucose 5% p. 1041) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

**Intravenous sodium**

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in sodium depletion, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected...
by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

**Compound sodium lactate** (Hartmann’s solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloremic acidosis. Sodium chloride with glucose solutions p. 1041 are indicated when there is combined water and sodium depletion. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

**Intravenous glucose**

Glucose solutions (5%) are used mainly to replace water deficit. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given in regimens with calcium and insulin for the emergency management of **hyperkalaemia**. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

**Intravenous potassium**

Potassium chloride with sodium chloride intravenous infusion p. 1040 is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should not involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

**Bicarbonate and lactate**

Sodium bicarbonate p. 1038 is used to control severe metabolic acidosis (pH<7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (L.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For **chronic acidotic states**, sodium bicarbonate can be given by mouth.

**Plasma and plasma substitutes**

Plasma and plasma substitutes (‘colloids’) contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose (‘crystalloids’), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solution p. 1047, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient’s blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solution may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

**Plasma substitutes**

Dextran, gelatin p. 1048, and the hydroxyethyl starch, tetrasarch, are macromolecular substances which are metabolised slowly. Dextran and gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicemia; they may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Dextran and gelatin are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion.

Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

Plasma substitutes should not be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of some plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.
BICARBONATE

**Sodium bicarbonate**

- **INDICATIONS AND DOSE**
  - Alkalisation of urine | Relief of discomfort in mild urinary-tract infections
  - **BY MOUTH**
  - Adult: 3 g every 2 hours until urinary pH exceeds 7, to be dissolved in water

- **Maintenance of alkaline urine**
  - **BY MOUTH**
  - Adult: 5–10 g daily, to be dissolved in water

- **Chronic acidic states such as uraemic acidosis or renal tubular acidosis**
  - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%).

- **SIDE-EFFECTS**
  - With intravenous use | Skin exfoliation | soft tissue necrosis | ulcer
  - With oral use | Abdominal cramps | burping | flatulence | hypokalaemia | metabolic alkalosis

- **PREGNANCY**
  - With oral use | Use with caution in urinary conditions.

- **HEPATIC IMPAIRMENT**
  - With oral use | Manufacturer advises caution in cirrhosis. Salt restriction will be covered in the prelinis.

- **RENAL IMPAIRMENT**
  - With oral use | Avoid (except for specialised role in some forms of renal disease).

- **CONTRA-INDICATIONS**
  - With oral use | Salt restricted diet

- **CAUTIONS**
  - Avoid prolonged use in urinary conditions | cardiac disease | elderly | patients on sodium-restricted diet | respiratory acidosis

- **INTERACTIONS**
  - With intravenous use | Sodium bicarbonate
  - With oral use | Alkalinisation of urine | maintenance of alkaline urine

- **SIDE-EFFECTS**
  - With intravenous use | Skin exfoliation | soft tissue necrosis | ulcer
  - With oral use | Abdominal cramps | burping | flatulence | hypokalaemia | metabolic alkalosis

- **PREGNANCY**
  - With oral use | Use with caution in urinary conditions.

- **HEPATIC IMPAIRMENT**
  - With oral use | Manufacturer advises caution in cirrhosis. Salt restriction will be covered in the prelinis.

- **RENAL IMPAIRMENT**
  - With oral use | Avoid (except for specialised role in some forms of renal disease).

- **MONITORING REQUIREMENTS**
  - With intravenous use | Plasma-pH and electrolytes should be monitored.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use | For slow intravenous injection use a small volume of hypertonic solution (such as 50 mL of 8.4%). For continuous intravenous infusion a weaker solution of 1.26% solution can be infused over 3–4 hours.
  - With oral use | Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - With oral use | Sodium bicarbonate 500 mg capsules contain approximately 6 mmol each of Na⁺ and HCO₃⁻; Sodium bicarbonate 600 mg capsules contain approximately 7 mmol each of Na⁺ and HCO₃⁻. Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.

  - With intravenous use | Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na⁺ and HCO₃⁻/litre), various other strengths available.

- **PATIENT AND CARER ADVICE**
  - With oral use | Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection, liquid

Potassium chloride with potassium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 1057.
Potassium chloride with sodium chloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 1057, sodium chloride below.

**INDICATIONS AND DOSE**

**Electrolyte imbalance**
- **BY INTRAVENOUS INFUSION**
  - Adult: Depending on the deficit or the daily maintenance requirements (consult product literature)

**INTERACTIONS**

- Appendix 1: potassium chloride

**PRESCRIBING AND DISPENSING INFORMATION**

**Potassium chloride**
- **0.15% w/v solution for injection**
  - Each 1 ml contains 0.15 g potassium chloride.
  - Store in a cool dark place.

**Sodium chloride**
- **0.9% w/v solution for injection**
  - Each 1 ml contains 9 g sodium chloride.
  - Store in a cool dark place.

**MONITORING REQUIREMENTS**

- The jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

**SIDE-EFFECTS**

- With intravenous use: Chills, fever, hypervolaemia, hypotension, local reaction, localised pain, paraesthesia, skin reactions, tremor, vascular irritation, venous thrombosis.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Effervescent tablets**
- Sando-K (HK Pharma Ltd)
  - Potassium bicarbonate 400 mg, Potassium chloride 600 mg
  - Each tablet contains potassium bicarbonate 400 mg, potassium chloride 600 mg and sodium chloride 285 mg (8 mmol Cl-).

**INTERACTIONS**

- Appendix 1: potassium chloride

**PRESCRIBING AND DISPENSING INFORMATION**

**Potassium chloride**
- **0.15% w/v solution for injection**
  - Each 1 ml contains 0.15 g potassium chloride.
  - Store in a cool dark place.

**Sodium chloride**
- **0.9% w/v solution for injection**
  - Each 1 ml contains 9 g sodium chloride.
  - Store in a cool dark place.

**MONITORING REQUIREMENTS**

- The jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

**SIDE-EFFECTS**

- With intravenous use: Chills, fever, hypervolaemia, hypotension, local reaction, localised pain, paraesthesia, skin reactions, tremor, vascular irritation, venous thrombosis.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, injection, infusion, solution for infusion

Infusion
- **Potassium chloride with sodium chloride (Non-proprietary)**
  - Potassium chloride 3 mg per 1 ml, Sodium chloride 9 mg per 1 ml
  - Potassium chloride 0.3% (potassium 20 mmol/500 ml) / Sodium chloride 0.9% infusion 500 ml bags | 1 bag (PST) £0.95
  - Potassium chloride 0.3% (potassium 40 mmol/1 litre) / Sodium chloride 0.9% infusion 1 litre bags | 1 bag (PST) £0.95
  - Potassium chloride 1.5 mg per 1 ml, Sodium chloride 9 mg per 1 ml
  - Potassium chloride 0.15% (potassium 20 mmol/1 litre) / Sodium chloride 0.9% infusion 1 litre bags | 1 bag (PST) £0.95
  - Potassium chloride 0.1% (potassium 10 mmol/500 ml) / Sodium chloride 0.9% infusion 500 ml bags | 1 bag (PST) 81.30–81.67
  - Potassium chloride 2 mg per 1 ml, Sodium chloride 9 mg per 1 ml
  - Steriflex No. 28 potassium chloride 0.2% (potassium 27 mmol/litre) / sodium chloride 0.9% infusion 1 litre bags | 1 bag (PST) £2.20

**ELECTROLYTES AND MINERALS**

**SODIUM CHLORIDE**

**INDICATIONS AND DOSE**

**Prophylaxis of sodium chloride deficiency**
- **BY MOUTH**
  - Adult: 4–8 tablets daily, to be taken with water, up to maximum 20 tablets daily in severe depletion

**Chronic renal salt wasting**
- **BY MOUTH**
  - Adult: Up to 20 tablets daily, to be taken with appropriate fluid intake
Fluid and electrolyte imbalances

Sodium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 1040, glucose below.

- INDICATIONS AND DOSE
  - Combined water and sodium depletion
    - BY INTRAVENOUS INFUSION
    - Adults: (consult product literature)
  - MONITORING REQUIREMENTS
    - Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.
  - MEDICINAL FORMS
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion
  - Infusion
    - Sodium chloride with glucose (Non-proprietary)
      - Sodium chloride 4.5 mg per 1 ml, Glucose anhydrous 25 mg per 1 ml Sodium chloride 0.45% / Glucose 2.5% infusion 500ml Viallo bags | 1 bag (PO) £0.95

NUTRIENTS > SUGARS

Glucose

(Dextrose Monohydrate)

- INDICATIONS AND DOSE
  - Establish presence of gestational diabetes
    - BY MOUTH
      - Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid
  - Oral glucose tolerance test
    - BY MOUTH
      - Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid
  - Hypoglycaemia
    - BY INTRAVENOUS INFUSION
    - Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs
    - Adult: 10 g, to be administered as Glucose 20% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs
  - Energy source
    - BY INTRAVENOUS INFUSION
    - Adult: 1–3 litres daily, solution concentration of 20–50% to be administered
  - Water replacement
    - BY INTRAVENOUS INFUSION
    - Adult: The volume of glucose solution needed to replace deficits may vary (consult product literature)
  - Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)
    - BY INTRAVENOUS INFUSION
    - Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes
  - Management of diabetic ketoacidosis
    - BY INTRAVENOUS INFUSION
    - Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre
    - Adult: Glucose 10% should be given once blood-glucose concentration falls below 14 mmol/litre, to be administered into a large vein through a large-gauge needle at a rate of 125 ml/hour, in addition to the sodium chloride 0.9% infusion

DOSE EQUIVALENT AND CONVERSION

- 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

- CAUTIONS
  - Do not give alone except when there is no significant loss of electrolyte prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances
**SID-EFFECTS** Chills · electrolyte imbalance · fever · fluid imbalance · hypersensitivity · local reaction · localised pain · polyuria · rash · venous thrombosis

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use in children: Injections containing more than 10% glucose can be irri tant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.
- PRESCRIBING AND DISPENSING INFORMATION: Glucose BP is the mono hydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.

**EXCEPTIONS TO LEGAL CATEGORY**
- With intravenous use: Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution, solution for infusion for injection

**Solution for infusion**
- **Glucose** (Non-proprietary)
  - Glucose anhydrous 200 mg per 1 ml: Glucose 20% solution for infusion 100 ml vials | 1 vial (£): £6.00
  - Glucose anhydrous 500 mg per 1 ml: Glucose 50% solution for infusion 20 ml ampoules | 10 ampoules (£): £12.00–£14.00 DT = £12.00
  - Glucose 50% solution for infusion 50 ml vials | 25 vials (£): £50.00–£60.00 DT = £50.01

**Oral solution**
- **Rapilose OGGT** (Galen Ltd)
  - Glucose 250 mg per 1 ml: Rapilose OGGT solution | 300 ml £3.48

**Gel**
- **Dextrogel** (Nexeceuticals Ltd)

- Steriflex No.34 glucose 50% infusion 500 ml bags | 1 bag (£): £3.11

**Glucose anhydrous 700 mg per 1 ml**
- **Steriflex** 70% concentrate for solution for infusion 500 ml Viaflex bags | 1 bag (£): £3.84

**Combinations available:** Potassium chloride with glucose, p. 1039 · Potassium chloride with glucose and sodium chloride, p. 1039 · Sodium chloride with glucose, p. 1041

**ORAL REHYDRATION SALTS**

**Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride**

(Formulated as oral rehydration salts)

**INDICATIONS AND DOSE**
- **Fluid and electrolyte loss in diarrhoea**
  - **BY MOUTH**
    - Child 1-11 months: 1–1½ times usual feed volume to be given
    - Child 1-11 years: 200 ml, to be given after every loose motion
    - Child 12-17 years: 200–400 ml, to be given after every loose motion, dose according to fluid loss
    - Adult: 200–400 ml, to be given after every loose motion, dose according to fluid loss

**DIRECTIONS FOR ADMINISTRATION**
- Reconstitute 1 sachet with 200 ml of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na+ 60 mmol, K+ 20 mmol, Cl− 60 mmol, citrate 10 mmol, and glucose 90 mmol.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral powder formulations may include black currant, citrus, or natural.

**PATIENT AND CARER ADVICE**
- After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

Meditines for Children leaflet: Oral rehydration salts
www.medicinesforchildren.org.uk/oral-rehydration-salts

**Potassium chloride with rice powder, sodium chloride and sodium citrate**

(Formulated as oral rehydration salts)

**INDICATIONS AND DOSE**
- **Fluid and electrolyte loss in diarrhoea**
  - **BY MOUTH**
    - Adult: 200–400 ml, to be given after every loose motion, dose according to fluid loss

**DIRECTIONS FOR ADMINISTRATION**
- Reconstitute 1 sachet with 200 ml of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na+ 60 mmol, K+ 20 mmol, Cl− 50 mmol and citrate 10 mmol.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral powder formulations may include apricot, black currant, or raspberry.

**PATIENT AND CARER ADVICE**
- Patients and carers should be advised how to reconstitute Dioralyte® Relief oral powder.
- After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

www.getintopharma.com
**1.1 Calcium imbalance**

**Calcium imbalance**

**Calcium supplements**

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of calcium gluconate injection 10% p. 1045 should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. Calcium chloride injection p. 1045 is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia. Concurrent hypomagnesaemia should be corrected with magnesium sulfate p. 1051.

See the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia.

**Severe hypercalcaemia**

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 1040. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If severe hypercalcaemia persists drugs which inhibit mobilisation of calcium from the skeleton may be required. The bisphosphonates are useful and pamidronate disodium p. 729 is probably the most effective.

Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 733 can be used for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. Further treatment is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

**Hyperparathyroidism**

Paricalcitol p. 1087 is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic kidney disease.

Parathyroidectomy may be indicated for hyperparathyroidism.

---

**Hypercalcaemia and hypercalciuria**

**CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS**

**Cinacalcet**

**DRUG ACTION** Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

**INDICATIONS AND DOSE**

- **Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis**
  - **BY MOUTH**
    - Adult: Initially 30 mg once daily, dose to be adjusted every 2–4 weeks; maximum 180 mg per day

- **Treatment of hypercalcaemia in parathyroid carcinoma**
  - **BY MOUTH**
    - Adult: Initially 30 mg twice daily (max. per dose 90 mg 4 times a day), dose to be adjusted every 2–4 weeks according to response

**CAUTIONS** Treatment should not be initiated in patients with hypocalcaemia

**INTERACTIONS**

- **Appendix 1: cinacalcet**

**SIDE-EFFECTS**

- **Common or very common** Appetite decreased · asthenia · back pain · constipation · cough · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · headache · hypersensitivity · hypotension · muscle complaints · nausea · paraesthesia · rash · seizure · upper respiratory tract infection · vomiting

- **Frequency not known** Heart failure aggravated · osteodystrophy · QT interval prolongation · tetany · ventricular arrhythmia

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment.

**MONITORING REQUIREMENTS**

- Measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism, and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma.

- In secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months.
Etelcalcetide

26-Jul-2017

Etelcalcetide reduces parathyroid hormone secretion, which leads to a decrease in serum calcium concentrations.

INDICATIONS AND DOSE

Secondary hyperparathyroidism in patients with chronic kidney disease on haemodialysis

BY INTRAVENOUS INJECTION

Adult: Initially 5 mg 3 times a week, then increased in steps of 2.5–5 mg if required, dose to be increased at intervals of at least 4 weeks; usual maintenance 2.5–15 mg 3 times a week, max. dose 15 mg 3 times a week; consult product literature for information on missed doses, and for dose adjustment due to parathyroid hormone levels or serum-calcium concentrations

CAUTIONS

Conditions that may worsen with hypocalcaemia - hypocalcaemia (do not initiate if serum-calcium concentration is less than the lower limit of normal range) - switching from cinacalcet (do not initiate until 7 days after the last dose of cinacalcet)

CAUTIONS, FURTHER INFORMATION

Conditions that may worsen with hypocalcaemia. Manufacturer advises caution with use in patients with conditions that may worsen with hypocalcaemia, including predisposition to QT-interval prolongation, history of seizures, and history of congestive heart failure - serum-calcium concentration should be closely monitored.

INTERACTIONS

Appendix 1: etelcalcetide

SIDE-EFFECTS

Common or very common Diarrhoea; electrolyte imbalance - headache; heart failure aggravated; hypotension; muscle complaints; nausea; paraesthesia - QT interval prolongation; vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Manufacturer advises if formation of anti-etelcalcetide antibodies with a clinically significant effect is suspected, contact manufacturer to discuss antibody testing.

PREGNANCY

Manufacturer advises avoid — limited information available.

BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

MONITORING REQUIREMENTS

Manufacturer advises monitor parathyroid hormone level 4 weeks after treatment initiation or dose adjustment and approximately every 1–3 months during maintenance treatment; monitor serum-calcium concentration before treatment initiation, within 1 week of initiation or dose adjustment, and then approximately every 4 weeks during maintenance treatment.

HANDLING AND STORAGE

Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.

PATIENT AND CARER ADVICE

Manufacturer advises patients and their carers should be told to seek medical advice if symptoms of hypocalcaemia occur.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Etelcalcetide (as Etelcalcetide hydrochloride) 5 mg per 1 ml Parsabiv 2.5mg/0.5ml solution for injection vials | 6 vial £136.87 Parsabiv 10mg/2ml solution for injection vials | 6 vial £227.84 Parsabiv 5mg/1ml solution for injection vials | 6 vial £163.92

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (September 2017) that etelcalcetide (Parsabiv) is not recommended for use within NHS Scotland for the treatment of secondary hyperparathyroidism in patients with chronic kidney disease on haemodialysis as the economic case was not demonstrated.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

  - Calcium chloride (Non-proprietary)
    - Calcium chloride dihydrogen 100 mg per 1 ml Calcium chloride 10% solution for injection 10ml pre-filled syringes | 1 pre-filled disposable injection P £9.42 DT + £9.42
    - Calcium chloride dihydrogen 147 mg per 1 ml Calcium chloride 14.7% solution for injection 5ml ampoules | 10 ampoule P £120.98
      - Calcium chloride 14.7% solution for injection 10ml ampoules | 10 ampoule P £88.28 DT + £88.28

Calcium gluconate

- **INDICATIONS AND DOSE**
  - Severe acute hypocalcaemia or hypocalcaemic tetany
    - **INITIALLY BY SLOW INTRAVENOUS INJECTION**
      - Adult: Initially 10–20 mL, calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be administered with continued →
plasma-calcium and ECG monitoring, and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence, alternatively (by continuous intravenous infusion), initially 50 mL/hour, adjusted according to response, infusion to be administered using 100 mL of calcium gluconate 10% diluted in 1 litre of glucose 5% or sodium chloride 0.9%

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes)
- **BY SLOW INTRAVENOUS INJECTION**
- Adult: 10–20 mL, calcium gluconate 10% should be administered, dose titrated and adjusted to ECG improvement

**Calcium deficiency** | Mild asymptomatic hypocacalaemia
- **BY MOUTH**
- Adult: Dose according to requirements

**DOSE EQUIVALENCE AND CONVERSION**
- 0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

---

**Calcium lactate**

**INDICATIONS AND DOSE**

- **Calcium deficiency**
  - Adult: Dose according to requirements

**INTERACTIONS** → Appendix 1: calcium salts

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Calcium lactate (Non-proprietary)
      - Calcium lactate 300 mg | Calcium lactate 300mg tablets | 84 tablet [DT = £4.57] | 84 tablet [GSS] £4.57 DT = £4.57

---

**Calcium phosphate**

**INDICATIONS AND DOSE**

- **Indications listed in combination monographs (available in the UK only in combination with other drugs)**
  - **BY MOUTH**
  - Adult: Doses listed in combination monographs

**INTERACTIONS** → Appendix 1: calcium salts

**SIDE-EFFECTS**
- Epigastric pain · gastrointestinal disorder · hypercalcaemia

**MEDICINAL FORMS**
- No licensed medicines listed.

---

**Parathyroid hormones and analogues**

**Parathyroid hormone**  
(Human recombinant parathyroid hormone)

**DRUG ACTION**
- Parathyroid hormone is produced by recombinant DNA technology; endogenous parathyroid hormone is involved in modulating serum calcium and phosphate levels, regulating renal calcium and phosphate excretion, activating vitamin D, and maintaining normal bone turnover.

**INDICATIONS AND DOSE**

- **Chronic hypoparathyroidism (specialist use only)**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS**
- Bone metastases · current or previous radiation therapy to skeleton · increased risk factors for osteosarcoma (including Paget’s disease or hereditary disorders) · pseudohypoparathyroidism · skeletal malignancy · unexplained raised levels of bone-specific alkaline phosphatase

**CAUTIONS**
- Concomitant use of cardiac glycosides (hypercacalaemia may predispose to digitalis toxicity)—monitor cardiac glycoside levels and check for signs and symptoms of digitalis toxicity · concomitant use of drugs that affect calcium levels · young adults with open epiphyses—increased risk of osteosarcoma

**INTERACTIONS** → Appendix 1: parathyroid hormone

**SIDE-EFFECTS**
- Common or very common Electrolyte imbalance · fatigue · pain in extremity

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hypercalcaemia is more likely during initial dose titration; if severe hypercalcaemia develops, hydrate and consider suspending treatment (including calcium supplement and active vitamin D).

**PREGNANCY**
- Manufacturer advises use only if potential benefit outweighs risk—no information available.
1.2 Low blood volume

BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

### Albumin solution

**(Human Albumin Solution)**

- **INDICATIONS AND DOSE**
  - Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions)
  - Plasma exchange (with isotonic solutions)
  - Severe hypoaalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%)
  - Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

- **CONTRA-INDICATIONS**
  - Cardiac failure · severe anaemia

- **CAUTIONS**
  - Correct dehydration when administering concentrated solution · history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · increased capillary permeability

- **SIDE-EFFECTS**
  - Rare or very rare
    - Fever · flushing · nausea · shock · urticaria

- **MONITORING REQUIREMENTS**
  - Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Infusion**
    - Flexbumin (Baxalta UK Ltd)
      - Albumin solution human 200 gram per 1 litre Flexbumin 20% infusion 100ml bags | 1 bag [P01 00]
      - Flexbumin 20% infusion 50ml bags | 1 bag [P01 00]
    - Solution for infusion
      - Albunorm (Octapharma Ltd)
        - Albumin solution human 50 mg per 1 ml Albunorm 5% solution for infusion 250ml bottles | 1 bottle [P01 00 £33.75]
        - Albunorm 5% solution for infusion 100ml bottles | 1 bottle [P01 00 £13.50]
        - Albunorm 5% solution for infusion 500ml bottles | 1 bottle [P01 00 £67.50]
      - Albumin solution human 200 mg per 1 ml Albunorm 20% solution for infusion 100ml bottles | 1 bottle [P01 00 £44.00]
      - Albunorm 20% solution for infusion 500ml bottles | 1 bottle [P01 00 £27.00]
    - Alburex (CSL Behring UK Ltd)
      - Albumin solution human 50 mg per 1 ml Alburex 5% solution for infusion 500ml vials | 1 vial [P01 00 £50.00]
    - Albumin solution human 200 mg per 1 ml Alburex 20% solution for infusion 100ml vials | 1 vial [P01 00 £40.00]
    - Albutein (Grifols UK Ltd)
      - Albumin solution human 50 mg per 1 ml Albutein 5% solution for infusion 500ml vials | 1 vial [P01 00]
      - Albutein 5% solution for infusion 250ml vials | 1 vial [P01 00]
Fluid and electrolyte imbalances

Gelatin

- **INDICATIONS AND DOSE**
  - Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 500–1000 ml, use 3.5–4% solution

- **CAUTIONS**
  - Cardiac disease · severe liver disease

- **SIDE-EFFECTS**
  - Rare or very rare: Chills · dyspnoea · fever · hyperhidrosis · hypersensitivity · hypertension · hypotension · hypoxia · tachycardia · tremor · urticaria · wheezing

- **PREGNANCY**
  - Manufacturer of Geloplasma® advises avoid at the end of pregnancy.

- **HEPATIC IMPAIRMENT**
  - Manufacturers advise avoid preparations that contain lactate (risk of impaired lactate metabolism).

- **RENAL IMPAIRMENT**
  - Use with caution in renal impairment.

- **MONITORING REQUIREMENTS**
  - Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
  - Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - The gelatin is partially degraded.
  - Gelaspan® contains succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na⁺ 151 mmol, K⁺ 4 mmol, Mg²⁺ 1 mmol, Cl⁻ 103 mmol, Ca²⁺ 1 mmol, acetate 24 mmol/litre; Gelofusine® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 124 mmol/litre; Geloplasma® contains partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na⁺ 150 mmol, K⁺ 5 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 100 mmol, lactate 30 mmol/litre; Isoplex® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 145 mmol, K⁺ 4 mmol, Mg²⁺ 0.9 mmol, Cl⁻ 105 mmol, lactate 25 mmol/litre; Volplex® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 125 mmol/litre.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Infusion

- Gelaspan® (B.Braun Medical Ltd)
  - Gelatin 40 mg per 1 ml Gelaspan 4% infusion 500ml Ecobags | 1 bag (P) £5.55 (Hospital only)
  - Gelofusine® (B.Braun Medical Ltd)
  - Gelatin 40 mg per 1 ml Gelofusine 4% infusion 1 litre Ecobags | 1 bag (P) £9.31
  - Geloplasma® (Fresenius Kabi Ltd)
  - Gelatin 30 mg per 1 ml Geloplasma 3% infusion 500ml Freeflex bags | 20 bag (P) £5.15
  - Isoplex® (Kent Pharmaceuticals Ltd)
  - Gelatin 40 mg per 1 ml Isoplex 4% infusion 500ml bags | 10 bag (P) £75.00 (Hospital only)
  - Volplex® (Kent Pharmaceuticals Ltd)
  - Gelatin 40 mg per 1 ml Volplex 4% infusion 500ml bags | 10 bag (P) £47.00 (Hospital only)

**PLASMA SUBSTITUTES**

Dextran 70 with sodium chloride

- **INDICATIONS AND DOSE**
  - Initial treatment of hypovolaemia with hypotension induced by traumatic injury

  - **BY INTRAVENOUS INFUSION**
    - Adult: 250 ml, to be given over 2–5 minutes using RescueFlow®, followed immediately by administration of isotonic fluids.

- **CAUTIONS**
  - Cardiac disease · hyperosmolality · severe hypoglycaemia · severe liver disease

- **SIDE-EFFECTS**
  - Anaphylactic reaction

- **PREGNANCY**
  - Avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death.

- **RENAL IMPAIRMENT**
  - Use with caution.

- **MONITORING REQUIREMENTS**
  - Where possible, monitor central venous pressure.
  - Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
  - Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

- **EFFECT ON LABORATORY TESTS**
  - Can interfere with some laboratory tests—dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dextran 70 is dextran with an average molecular weight of about ‘70 000’.

- **MEDICINAL FORMS**
  - No licensed medicines listed.

Albinum solution human 200 mg per 1 ml Albutein 20% solution for infusion 100ml vials | 1 vial (P) £9
  - Albutein 20% solution for infusion 50ml vials | 1 vial (P) £8
  - Biotest (Biotest UK Ltd)
  - Albinum solution human 50 mg per 1 ml Human Albinum Biotest 5% solution for infusion 250ml vials | 1 vial (P) £5
  - Albinum solution human 200 mg per 1 ml Human Albinum Biotest 20% solution for infusion 50ml vials | 1 vial (P) £8
  - Human Albinum Biotest 20% solution for infusion 100ml vials | 1 vial (P) £9
  - Grifols (Grifols UK Ltd)
    - Albinum solution human 50 mg per 1 ml Human albinum Grifols 5% solution for infusion 500ml bottles | 1 bottle (P) £42.75
    - Human albinum Grifols 5% solution for infusion 250ml bottles | 1 bottle (P) £21.38
    - Human albinum Grifols 5% solution for infusion 100ml bottles | 1 bottle (P) £9.30
  - Zenalb (Bio Products Laboratory Ltd)
    - Albinum solution human 45 mg per 1 ml Zenalb 4.5% solution for infusion 250ml bottles | 1 bottle (P) £46.80
    - Zenalb 4.5% solution for infusion 500ml bottles | 1 bottle (P) £55.02
    - Albinum solution human 200 mg per 1 ml Zenalb 20% solution for infusion 100ml bottles | 1 bottle (P) £54.00
    - Zenalb 20% solution for infusion 50ml bottles | 1 bottle (P) £27.00

Notes:

- **cross-matching or biochemical measurements, and these**
  - is dextran with an average molecular weight of about

- **PLASMA SUBSTITUTES**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 500–1000 ml, use 3.5–4% solution
Magnesium imbalance 1049

1.3 Magnesium imbalance

Magnesium imbalance

Overview
Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate p. 1051 as an osmotic laxative. Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypermagnesaemia (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia
Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/l; up to 160 mmol Mg2+ over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution p. 1050 is available as a licensed preparation and, magnesium glycerophosphate tablets and liquid p. 1050 [unlicensed] are available from ‘special-order’ manufacturers or specialist importing companies.

Arrhythmias
Magnesium sulfate injection has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salves of rapid ventricular tachycardia show the characteristic twisting wave front known as torsade de pointes.

Myocardial infarction
Limited evidence that magnesium sulfate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulfate for this purpose is not recommended.

Eclampsia and pre-eclampsia
Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent...
seizures in women with eclampsia. Regimens may vary between hospitals. Calcium gluconate injection p. 1045 is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with pre-eclampsia in whom there is concern about developing eclampsia. The patient should be monitored carefully.

1.3a Hypomagnesaemia

**ELECTROLYTES AND MINERALS > MAGNESIUM**

**Magnesium aspartate**

- **INDICATIONS AND DOSE**
  - Treatment and prevention of magnesium deficiency
  - **BY MOUTH**
  - Adult: 10–20 mmol daily, taken as 1–2 sachets of Magnaspartate® powder.

- **CONTRA-INDICATIONS** Disorders of cardiac conduction
- **INTERACTIONS** → Appendix 1: magnesium

- **SIDE-EFFECTS**
  - Uncommon: Diarrhoea, faeces soft
  - Rare or very rare: Fatigue, hypermagnesaemia
  - Frequency not known: Gastrointestinal irritation

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

- **OVERDOSE**
  - Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

- **RENAL IMPAIRMENT** Avoid in severe impairment (eGFR less than 30 mL/minute/1.73²).
- **DIRECTIONS FOR ADMINISTRATION** Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Magnaspartate® contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.

- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer magnesium aspartate powder.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

  - **Powder**
    - Magnescoid (Imported (Germany))
    - Magnesium (as Magnesium aspartate hydrochloride) 121.5 mg Magnescoid (magnesium 5mmol) oral powder 5 sachets
    - Magnaspartate (KoRa Healthcare)
    - Magnesium (as Magnesium aspartate) 243 mg Magnaspartate 243mg/magnesium 10mmol oral powder sachets | 10 sachet (£33.35)

- **DOSE EQUIVALENCE AND CONVERSION**
  - Magnesium glycerocephosphate 1 g is approximately equivalent to Mg²⁺ 4 mmol or magnesium 97 mg.

**NEOMAG® CHEWABLE TABLETS**

- **Hypomagnesaemia**
  - **BY MOUTH**
  - Adult: Initially 1–2 tablets 3 times a day, dose to be adjusted according to the serum total magnesium level.

- **DOSE EQUIVALENCE AND CONVERSION**
  - Each Neomag® chewable tablet contains Mg²⁺ 4 mmol or magnesium 97 mg.

- **UNLICENSED USE** Preparations other than Neomag® are not licensed for use.

- **INTERACTIONS** → Appendix 1: magnesium

- **SIDE-EFFECTS** Diarrhoea, hypermagnesaemia

- **OVERDOSE** Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

- **RENAL IMPAIRMENT** Increased risk of toxicity.

- **Dose adjustments** Avoid or reduce dose.

- **NEOMAG® CHEWABLE TABLETS** Manufacturer advises to avoid in severe impairment.

- **MONITORING REQUIREMENTS** Manufacturer advises to monitor serum magnesium levels every 3–6 months.

- **DIRECTIONS FOR ADMINISTRATION** Neomag® chewable tablets Manufacturer advises that tablets may be broken into quarters and chewed or swallowed with water.

**SCOTTISH MEDICINES CONSORTIUM (SMC) DECISIONS**

The Scottish Medicines Consortium (SMC) has advised (September 2017) that magnesium glycerocephosphate (Neomag®) is accepted for use within NHS Scotland as an oral magnesium supplement for the treatment of patients with chronic magnesium loss, hypomagnesaemia or drug-induced hypomagnesaemia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, powder

  - **Tablet**
    - Mag-4 (Ennogen Healthcare Ltd)
    - Magnesium (as Magnesium glycerocephosphate) 9.72 mg Mag-4 (magnesium 9.72mg (4mmol)) tablets | 30 tablet (£84.50)

  - **Oral solution**
    - LiquiMag GP (Fontus Health Ltd)
    - Magnesium (as Magnesium glycerocephosphate) 24.25 mg per 1 mL LiquiMag GP (magnesium 121.25mg/5ml (5mmol/5ml)) oral solution sugar-free | 200 mL £49.99
    - MagnaPhos (TriOn Pharma Ltd)
    - Magnesium (as Magnesium glycerocephosphate) 19.44 mg per 1 mL MagnaPhos (magnesium 97.2mg/5ml (4mmol/5ml)) oral solution | 200 mL £37.87 DT = £37.84
    - Magnesium (as Magnesium glycerocephosphate) 24.25 mg per 1 mL MagnaPhos (magnesium 121.25mg/5ml (5mmol/5ml)) oral solution | 200 mL £37.87 DT = £37.87

  - **Chewable tablet**
    - EXCIPENTS: May contain Aspartame
    - MagnEss Gly (Essential-Healthcare Ltd)
    - Magnesium (as Magnesium glycerocephosphate) 9.72 mg MagnEss Gly 9.72mg (4mmol) chewable tablets sugar-free | 50 tablet £13.89 DT = £22.77
    - MagnaPhate (Arjun Products Ltd)
    - Magnesium (as Magnesium glycerocephosphate) 9.72 mg MagnaPhate (magnesium 9.72mg (4mmol)) chewable tablets sugar-free | 50 tablet £22.64 DT = £22.77
Magnesium sulfate

**INDICATIONS AND DOSE**

Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

- **BY INTRAVENOUS INFUSION**
  - Child 2-17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes
  - Adult: 1.2–2 g, to be given over 20 minutes

Prevention of seizures in pre-eclampsia

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours, if seizure occurs, additional dose of 2 g by intravenous injection to be administered

Treatment of seizures and prevention of seizure recurrence in eclampsia

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Up to 40 g, given over a period of up to 5 days, dose given depends on the amount required to replace the deficit (allowing for urinary losses)

**Hypomagnesaemia**

- **BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: Up to 40 g, given over a period of up to 5 days, dose given depends on the amount required to replace the deficit (allowing for urinary losses)

**Hypomagnesaemia maintenance (e.g. in intravenous nutrition)**

- **BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 2.5–5 g daily, usual dose 3 g daily

Emergency treatment of serious arrhythmias

- **BY INTRAVENOUS INJECTION**
  - Adult: 2 g, to be given over 10–15 minutes, dose may be repeated once if necessary

Rapid bowel evacuation (acts in 2–4 hours)

- **BY MOUTH**
  - Adult: 5–10 g, dose to be mixed in a glass of water, taken preferably before breakfast

**DOSE EQUIVALENCE AND CONVERSION**

- Magnesium sulfate heptahydrate 1 g equivalent to Mg²⁺ approx. 4 mmol.

**UNLICENSED USE**

- Unlicensed indication in severe acute asthma and continuing respiratory deterioration in anaphylaxis.

**CONTRA-INDICATIONS**

- With oral use in rapid bowel evacuation—acute gastrointestinal conditions (in adults)

**CAUTIONS**

- With oral use in rapid bowel evacuation—elderly and debilitated patients (in adults)

**INTERACTIONS**

- Appendix 1: magnesium

**SIDE-EFFECTS**

- Rare or very rare

- With oral use in Paralytic ileus (in adults)

- Frequency not known

- With intravenous use Electrolyte imbalance

- With oral use Diarrhoea (in adults) - gastrointestinal discomfort (in adults) - hypermagnesaemia (in adults)

**Overdose**

- Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

**PREGNANCY**

- When used for Hypomagnesaemia or Arrhythmias or Prevention of seizures in pre-eclampsia or Treatment of seizures and prevention of seizure recurrence in eclampsia or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis Not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression. Sufficient amount may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns.

**HEPATIC IMPAIRMENT**

- Avoid in hepatic coma if risk of renal failure.

**RENAL IMPAIRMENT**

- Increased risk of toxicity.
  - Dose adjustments: Avoid or reduce dose.

**MONITORING REQUIREMENTS**

- Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump). For intravenous injection, in arrhythmias, hypomagnesaemia, eclampsia, and pre-eclampsia, give continuously in Glucose 5% or Sodium chloride 0.9%. Concentration of magnesium sulfate heptahydrate should not exceed 20% (200 mg/mL or 0.8 mmol/mL Mg²⁺); dilute 1 part of magnesium sulfate injection 50% with at least 1.5 parts of water for injections. Max. rate 150 mg/minute (0.6 mmol/minute Mg²⁺).

**PRESCRIBING AND DISPENSING INFORMATION**

- With intramuscular use or intravenous use The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg²⁺) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

**EXCEPTIONS TO LEGAL CATEGORY**

- With oral use in adults Magnesium sulfate is on sale to the public as Epsom Salts.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

**Solution for injection**

- **Magnesium sulfate (Non-properitary)**
  - Magnesium sulfate heptahydrate 500 mg per 1 ml
  - Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 10ml ampoules | 10 ampoule (Pfizer) £21.70–£21.71 DT = £21.71 | 50 ampoule (Pfizer) £21.71
  - Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 20ml vials | 10 vial (Pfizer) £57.40
Blood and nutrition
regimens, see Intravenous nutrition p.
parenteral nutrition dehypophosphataemic vitamin D-resistant rickets. addition to vitamin D in a small minority of patients with analogue or calcimimetics.
concomitant use of a calcium supplement, a vitamin D development of renal bone disease; this could include the part of a multiple therapeutic approach to control the disease on haemodialysis or peritoneal dialysis. It is used as treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 4 mmol/litre or more that cannot be controlled by a phosphate supplements; efficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis.
For phosphate requirements in total parenteral nutrition regimens, see Intravenous nutrition p. 1071.

Phosphate-binding agents
Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate binding agents and can cause aluminium accumulation.
Sevelamer p. 1054 is licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.
Lanthanum p. 1053 is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.
Sucroferric oxyhydroxide p. 1054 is licensed for the control of hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis. It is used as part of a multiple therapeutic approach to control the development of renal bone disease; this could include the concomitant use of a calcium supplement, a vitamin D analogue or calcimimetics.

1.4 Phosphate imbalance

Phosphate imbalance

Phosphate supplements
Oral phosphate supplements p. 1055 may be required in addition to vitamin D in a small minority of patients with hyperphosphataemic vitamin D-resistant rickets.
Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis.

Phosphate-binding agents
Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate binding agents and can cause aluminium accumulation.

Sevelamer p. 1054 is licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.
Lanthanum p. 1053 is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.
Sucroferric oxyhydroxide p. 1054 is licensed for the control of hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis. It is used as part of a multiple therapeutic approach to control the development of renal bone disease; this could include the concomitant use of a calcium supplement, a vitamin D analogue or calcimimetics.
**Hyperphosphataemia**

**INDICATIONS AND DOSE**

Hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD) | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet

- **BY MOUTH**
  - Adult: 1.5–3 g daily in divided doses, dose to be adjusted according to serum-phosphate concentration every 2–3 weeks, to be taken with or immediately after meals

**CAUTIONS**

Acute peptic ulcer - bowel obstruction - Crohn’s disease - ulcerative colitis

**INTERACTIONS** → Appendix 1: lanthanum

**SIDE-EFFECTS**

- **Common or very common** Constipation - diarrhoea - electrolyte imbalance - gastrointestinal discomfort - gastrointestinal disorders - headache - nausea - vomiting
- **Uncommon** Alopecia - appetite abnormal - arthralgia - asthenia - burping - chest pain - dizziness - dry mouth - eosinophilia - hyperglycaemia - hyperhidrosis - hyperparathyroidism - increased risk of infection - irritable bowel syndrome - malaise - myalgia - oral disorders - osteoporosis - pain - peripheral oedema - taste altered - thirst - vertigo - weight decreased

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises caution—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution (may be excreted in bile—possible risk of slower elimination and increased plasma concentrations in patients with reduced bile flow)—monitor liver function tests.

**DIRECTIONS FOR ADMINISTRATION**

Tablets are to be chewed. Each sachet of powder to be mixed with soft food and consumed within 15 minutes.

**PATIENT AND CARER ADVICE**

Patient and carers should be given advice on how to administer lanthanum tablets and powder.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 286/06

The Scottish Medicines Consortium has advised (May 2007) that lanthanum chewable tablets (Fosrenol®) are accepted for restricted use within NHS Scotland for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.

SMC No. 640/10

The Scottish Medicines Consortium has advised (October 2010) that lanthanum (Fosrenol®) is not recommended for use within NHS Scotland for the control of hyperphosphataemia in patients with chronic renal failure not on dialysis with serum phosphate levels >1.78 mmol/L in whom a low phosphate diet alone is insufficient to control serum phosphate levels, as the clinical and economic analysis presented was not demonstrated.

SMC No. 821/12

The Scottish Medicines Consortium has advised (December 2012) that lanthanum oral powder (Fosrenol®) is accepted for restricted use within NHS Scotland as a second-line agent in the control of hyperphosphataemia in chronic renal failure patients on haemodialysis or CAPD.
Sevelamer  

**INDICATIONS AND DOSE**

RENAGEL®  
Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis  
- **BY MOUTH**  
  - Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be given with meals and adjusted according to serum-phosphate concentration; usual dose 2.4–12 g daily in 3 divided doses

RENAVELA® 2.4G ORAL POWDER SACHETS  
Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis: Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more  
- **BY MOUTH**  
  - Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks—consult product literature; usual dose 6 g daily in 3 divided doses

RENAVELA® 800MG TABLETS  
Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis: Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more  
- **BY MOUTH**  
  - Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks; usual dose 6 g daily in 3 divided doses

**CONTRA-INDICATIONS**  
Bowel obstruction

**CAUTIONS**  
Gastro-intestinal disorders

**SIDE-EFFECTS**  
- Common or very common: Constipation, diarrhoea, gastrointestinal discomfort, gastrointestinal disorders, nausea, vomiting
- Frequency not known: Skin reactions

**PREGNANCY**  
Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**  
RENAVELA® 2.4G ORAL POWDER SACHETS  
Unlikely to be present in milk (however, manufacturer advises avoid).

Sucroferric oxyhydroxide  

**INDICATIONS AND DOSE**

Hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis  
- **BY MOUTH**  
  - Adult: Initially 1.5 g daily in 3 divided doses, dose to be taken with meals, then adjusted in steps of 500 mg every 2–4 weeks, dose adjusted according to serum-phosphate concentration; maintenance 1.5–2 g daily in divided doses; maximum 3 g per day

**CONTRA-INDICATIONS**  
Haemochromatosis, iron accumulation disorders

**CAUTIONS**  
Gastrointestinal disorders, hepatic disorders, major gastrointestinal surgery, peritonitis in the last 3 months

**SIDE-EFFECTS**  
- Common or very common: Constipation, diarrhoea, gastrointestinal discomfort, gastrointestinal disorders, nausea, product taste abnormal, tooth discolouration, vomiting
- Uncommon: Dysphagia, dyspnoea, electrolyte imbalance, fatigue, headache, skin reactions, tongue discolouration

www.getintopharma.com
1.4b Hypophosphataemia

LAXATIVES  OSMOTIC LAXATIVES

Phosphate

- INDICATIONS AND DOSE
  - Treatment of moderate to severe hypophosphatemia
    - BY INTRAVENOUS INFUSION
      - Adult: (consult product literature)
  - Established hypophosphataemia (with monobasic potassium phosphate)
    - BY INTRAVENOUS INFUSION
      - Adult: 9 mmol every 12 hours, increased if necessary up to 0.5 mmol/kg (max. per dose 50 mmol), increased dose to be used in critically ill patients; dose to be infused over 6–12 hours, according to severity
  - Vitamin D-resistant hypophosphatemic osteomalacia
    - BY MOUTH USING EFFERVESCENT TABLETS
      - Adult: 4–6 tablets daily, using Phosphate Sandoz®.

- SIDE-EFFECTS
  - COMMON SIDE-EFFECTS
    - Diarrhoea
  - SPECIFIC SIDE-EFFECTS
    - With intravenous use: Acute kidney injury · extravasation necrosis · hypocalcaemia · hypotension · metastatic calcification · oedema
    - With oral use: Abdominal distress
  - SIDE-EFFECTS, FURTHER INFORMATION
    - Diarrhoea is a common side-effect and should prompt a reduction in dosage.
  - RENAL IMPAIRMENT
    - Dose adjustments: Reduce dose.
    - Monitoring: Monitor closely in renal impairment.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Chewable tablet
    - Phosphate Sandoz (HK Pharma Ltd) ▼
    - Iron (as Sucroferric oxyhydroxide) 500 mg
  - Solution for infusion
    - Sodium dihydrogen phosphate anhydrous 1.936 gram
      - 100 tablet £19.39 DT = £19.39
  - Infusion
    - Phosphate (Non-proprietary)
      - Potassium dihydrogen phosphate 136 mg per 1 ml
      - Potassium dihydrogen phosphate 13.6% (potassium 10mmol/10ml) solution for infusion 10ml ampoules: 10 ampoule £101.96 DT = £101.96

1.5 Potassium imbalance

1.5a Hyperkalaemia

Calcium polystyrene sulfonate

- INDICATIONS AND DOSE
  - Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
    - BY MOUTH
      - Adult: 15 g 3–4 times a day
    - BY RECTUM
      - Adult: 30 g, retained for 9 hours followed by irrigation to remove resin from colon

- CONTRA-INDICATIONS
  - Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · sarcoidosis

- INTERACTIONS
  - Appendix 1: polystyrene sulfonate

- SIDE-EFFECTS
  - Appetite decreased · constipation (discontinue—avoid magnesium-containing laxatives) · diarrhoea · electrolyte imbalance · epigastric discomfort · gastrointestinal disorders · gastrointestinal necrosis (in combination with sorbitol) · hypercalcaemia (in dialysed patients and occasionally in those with renal impairment) · increased risk of infection · nausea · vomiting

- PREGNANCY
  - Manufacturers advise use only if potential benefit outweighs risk—no information available.

- BREAST FEEDING
  - Manufacturers advise use only if potential benefit outweighs risk—no information available.

- MONITORING REQUIREMENTS
  - Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

- DIRECTIONS FOR ADMINISTRATION
  - With rectal use: Mix each 30 g of resin with 150 mL of water or 10% glucose.
Patiromer calcium 13-Sep-2018

**INDICATIONS AND DOSE**

**Hyperkalaemia**
- **BY MOUTH**
  - Adult: Initially 8.4 g once daily; adjusted in steps of 8.4 g as required, dose adjustments should be made at intervals of at least one week; maximum 25.2 g per day

**PHARMACOKINETICS**
- Onset of action 4–7 hours.

**CAUTIONS** Risk factors for hyperkalaemia (calcium partially released from counterion complex) - severe gastrointestinal disorders (ischaemia, necrosis, and intestinal perforation reported with other potassium binders)

**INTERACTIONS** → Appendix 1: patiromer calcium

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - constipation - diarrhoea - flatulence - hypomagnesaemia
- **Uncommon** Nausea - vomiting

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available (although no effects on the infant are anticipated).

**MONITORING REQUIREMENTS** Manufacturer advises monitor for electrolyte disturbances, particularly plasma-potassium (as clinically indicated) and plasma-magnesium (continue to monitor for at least 1 month after initiation of treatment).

**DIRECTIONS FOR ADMINISTRATION**
- Manufacturer advises Veltassa® should be mixed with approx. 40 mL of water, then stirred and mixed with a further approx. 40 mL of water; the powder will not dissolve. More water may be added as needed. The mixture should be taken within 1 hour of preparation. Apple juice or cranberry juice may be used instead of water, other liquids should be avoided as they may contain high amounts of potassium.
- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C) prior to dispensing; once dispensed, patient may store below 25°C for up to 6 months.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2084

The Scottish Medicines Consortium (SMC) has advised (August 2018) that patiromer calcium (Veltassa®) is not recommended for use within NHS Scotland for the treatment of hyperkalaemia in adults as the economic case was not demonstrated.

---

**Sodium polystyrene sulfonate**

**INDICATIONS AND DOSE**

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
- **BY MOUTH**
  - Adult: 15 g 3–4 times a day
  - **BY RECTUM**
  - Adult: 30 g, retain for 9 hours followed by irrigation to remove resin from colon

**CONTRA-INDICATIONS** Obstructive bowel disease

**CAUTIONS** Congestive heart failure - hypertension - oedema

**INTERACTIONS** → Appendix 1: polystyrene sulfonate

**SIDE-EFFECTS** Appetite decreased - bezoar - constipation (discontinue - avoid magnesium-containing laxatives) - diarrhoea - electrolyte imbalance - epigastric discomfort - gastrointestinal disorders - increased risk of infection - nausea - necrosis (in combination with sorbitol) - vomiting

**PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.

**RENAL IMPAIRMENT** Use with caution.

**MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

**DIRECTIONS FOR ADMINISTRATION**
- With rectal use Mix each 30 g of resin with 150 mL of water or 10% glucose.
- With oral use Administer dose (powder) in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Powder**

**CAUTIONARY AND ADVISORY LABELS** 13
- Veltassa® (Vifor Fresenius Medical Care Renal Pharma UK Ltd)
- Patiromer calcium (as Patiromer sorbitex calcium)
- Patiromer calcium (as Patiromer sorbitex calcium)

www.getintopharma.com
1.5b Hypokalaemia

**ELECTROLYTES AND MINERALS** > **POTASSIUM**

### Potassium bicarbonate with potassium acid tartrate

#### INDICATIONS AND DOSE

**Hyperkalaemic acidosis associated with potassium deficiency (as in some renal tubular and gastrointestinal disorders)**
- **BY MOUTH**
- **Adults:** (consult product literature)

#### CONTRA-INDICATIONS

- Hypochloraemia · plasma-potassium concentration above 5 mmol/litre

#### CAUTIONS

- Cardiac disease · elderly

#### SIDE-EFFECTS

- Abdominal pain · diarrhoea · flatulence · nausea · vomiting

#### RENAL IMPAIRMENT

- Avoid in severe impairment.

#### DIRECTIONS FOR ADMINISTRATION

- **Prevention of hypokalaemia (patients with normal diet)**
- **BY INTRAVENOUS INFUSION**
  - **Potassium bicarbonate** 500 mg Potassium bicarbonate 300 mg, Potassium acid tartrate 300 mg
  - Potassium acid tartrate 300 mg, Potassium bicarbonate 500 mg

#### PRESCRIBING AND DISPENSING INFORMATION

- These tablets do not contain chloride.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

**Effervescent tablet**

- **CAUTIONARY AND ADVISORY LABELS** 13, 21
- **Potassium bicarbonate with potassium acid tartrate (Non-proprietary)**
- **Potassium acid tartrate 300 mg, Potassium bicarbonate 500 mg** Potassium (potassium 6.5mmol) effervescent tablets BPC 1968 | 56 tablet \( \text{MRP} \) £81.27 DT + £90.99

### Potassium chloride

#### INDICATIONS AND DOSE

**Prevention of hypokalaemia (patients with normal diet)**
- **BY MOUTH**
- **Adults:** 2–4 g daily in divided doses

**Electrolyte imbalance**
- **BY INTRAVENOUS INFUSION**
- **Adults:** Dose dependent on deficit or the daily maintenance requirements

#### CONTRA-INDICATIONS

- Plasma-potassium concentration above 5 mmol/litre

#### CAUTIONS

- With intravenous use seek specialist advice in very severe potassium depletion or difficult cases
- With oral use Cardiac disease · elderly · hiatus hernia (with modified-release preparations) · history of peptic ulcer (with modified-release preparations) · intestinal stricture (with modified-release preparations)

#### INTERACTIONS

- **Appendix 1: potassium chloride**

#### SIDE-EFFECTS

**GENERAL SIDE-EFFECTS**

- Hyperkalaemia

**SPECIFIC SIDE-EFFECTS**

- **With oral use** Abdominal cramps · diarrhoea · gastrointestinal disorders · nausea · vomiting

#### RENAL IMPAIRMENT

- Avoid in severe impairment.

**Dose adjustments** Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia.

**Monitoring**

- Close monitoring required in renal impairment—high risk of hyperkalaemia.

#### MONITORING REQUIREMENTS

- **Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.**
- **With intravenous use** ECG monitoring should be performed in difficult cases.

#### DIRECTIONS FOR ADMINISTRATION

- **With oral use** Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to hyperkalaemic states).
- **With intravenous use** Potassium chloride concentrate must be diluted with not less than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and mixed well. Ready-mixed infusion solutions should be used where possible; alternatively, potassium chloride concentrate as ampoules containing 1.5 g (K 20 mmol) in 10 mL, is thoroughly mixed with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours with specialist advice and ECG monitoring in difficult cases. For peripheral intravenous infusions, the concentration of potassium should not usually exceed 40 mmol/L. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.

#### PRESCRIBING AND DISPENSING INFORMATION

**Kay-Cee-L®** contains 1 mmol/mL each of K+ and Cl-.

**Potassium Tablets**

- **With oral use** Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperkalaemic states.

**PATIENT AND CARER ADVICE**

- Patient or carers should be given advice on how to administer potassium chloride modified-release tablets.
- **Salt substitutes** A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. LoSalt® and Ruthmol®). These should not be used by patients with renal failure as potassium intoxication may result.

#### LESS SUITABLE FOR PRESCRIBING

- Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, solution for injection, infusion, solution for infusion

**Modified-release tablet**

- **CAUTIONARY AND ADVISORY LABELS** 25, 27
- **Potassium chloride (Imported)**
- **Potassium chloride 600 mg** Kaleorid LP 600mg tablets | 30 tablet \( \text{MRP} \) £N0.30 600mg tablets | 100 tablet \( \text{MRP} \) £N0.85

1058 Metabolic disorders

2 Metabolic disorders

2.1 Acute porphyrías

Acute porphyrías

Overview

The acute porphyrías (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 75 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrías are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Where there is no safe alternative, drug treatment for serious or life-threatening conditions should not be withheld from patients with acute porphyria. Where possible, the clinical situation should be discussed with a porphyria specialist for advice on how to proceed and monitor the patient. In the UK clinical advice can be obtained from the National Acute Porphyria Service or from the UK Porphyria Medicines Information Service (UKPMIS)—see details below.

Haem arginate p. 1059 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyric crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from two centres (University Hospital of Wales and King’s College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrías

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered safe in acute porphyrías is available from the UKPMIS, see Useful resources below.

Further information may be obtained from: porphyria.eu/ and also from:

- The UK Porphyria Medicines Information Service (UKPMIS)
- University Hospital of Wales
- CF14 4XW
- Cardiff
- (029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Anabolic steroids
- Antidepressants, MAOIs (contact UKPMIS for advice)
- Antidepressants, Tricylic and related (contact UKPMIS for advice)
- Barbiturates (includes primidone and thiopental)
- Contraceptives, hormonal (for detailed advice contact UKPMIS or a porphyria specialist)
- Hormone replacement therapy (for detailed advice contact UKPMIS or a porphyria specialist)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact UKPMIS for advice)
- Progestogens (for detailed advice contact UKPMIS or a porphyria specialist)
- Protease inhibitors (contact UKPMIS for advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonylureas (glipizide and glimepiride are thought to be safe)
- Taxanes (contact UKPMIS for advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe Drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Busulfan
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clemastine
- Clindamycin
- Cocaine
- Danazol
- Dapsone
- Diltiazem
- Disopyramide
- Disulfiram
- Ergometrine
- Ergotamine
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate
- Flutamide
- Fosaprepitant
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Iosfamide
- Indapamide
- Indomethacin
- Indinavir
- Indomethacin
- Indinavir
- Indomethacin
- Indinavir
- Indomethacin
- Indinavir
- Indomethacin
- Indinavir
- Indomethacin
- Indinavir
2.2 Carnitine deficiency

AMINO ACIDS AND DERIVATIVES

Levcarnitin (Carnitine)

- **INDICATIONS AND DOSE**
  - **Primary carnitine deficiency due to inborn errors of metabolism**
    - **BY MOUTH**
      - Adult: Up to 200 mg/kg daily in 2-4 divided doses; maximum 3 g per day
    - **BY SLOW INTRAVENOUS INJECTION**
      - Adult: Up to 100 mg/kg daily in 2-4 divided doses, to be administered over 2-3 minutes
  - **Secondary carnitine deficiency in haemodialysis patients**
    - **INITIALLY BY SLOW INTRAVENOUS INJECTION**
      - Adult: 20 mg/kg, to be administered over 2-3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

- **CAUTIONS**
  - Diabetes mellitus

- **SIDE-EFFECTS**
  - Rare or very rare Abdominal cramps · diarrhoea · nausea · skin odour abnormal · vomiting

SIDE-EFFECTS, FURTHER INFORMATION Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

- **PREGNANCY**
  - Appropriate to use; no evidence of teratogenicity in animal studies.

- **RENAL IMPAIRMENT**
  - Accumulation of metabolites may occur with chronic oral administration in severe impairment.

- **MONITORING REQUIREMENTS**
  - Monitoring of free and acyl carnitine in blood and urine recommended.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

  **Solution for injection**
  - **Levcarnitin (Non-proprietary)**
    - L-Carnitine 200 mg per 1 ml Carnitor 1g/5ml solution for injection ampoules | 5 ampoule (50) £59.50
  - **Oral solution**
    - Carnitor (Logixx Pharma Solutions Ltd)
      - L-Carnitine 300 mg per 1 ml L-Carnitine 1.5g/5ml (30%) oral solution paediatric [20 ml (50) £71.40 DT + £71.40 | 40 ml (50) £118.00]
      - Carnitor oral single dose 1g solution sugar-free [10 unit dose (50) £35.00 DT + £35.00]
Chewable tablet
- Carnitor (Logix Pharma Solutions Ltd)
  L-Carnitine 1 gram  Carnitor 1g chewable tablets  | 10 tablet POM £35.00
Capsule
- Levcarnitine (Non-proprietary)
  L-Carnitine 250 mg  Bio-Carnitine 250mg capsules  | 125 capsule £11.06

2.3 Cystinosis

2.3a Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine
(Cysteamine)

- **INDICATIONS AND DOSE**
  Nephropathic cystinosis (specialist use only)
  - **BY MOUTH**
    - Adult (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses
  - **TO THE EYE**
    - Adult: Apply 1 drop 4 times a day, to be applied to both eyes (minimum 4 hours between doses); dose may be reduced according to response (minimum daily dose 1 drop in each eye)

- **DOSE EQUIVALENCE AND CONVERSION**
  - With oral use
    - 1.3 g/m² is approximately equivalent to 50 mg/kg.

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**
Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

**CAUTIONS**
- When used by eye  Contact lens wearers
- With oral use  dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

**SIDE-EFFECTS**
- Common or very common
  - When used by eye (topical)  Dry eye  eye discomfort  eye disorders  - vision blurred
  - With oral use  Appetite decreased  asthenia  breath odour  diarrhoea  drowsiness  encephalopathy  fever  gastrointestinal discomfort  headache  nausea  skin reactions  vomiting
  - Uncommon
    - With oral use  Compression fracture  gastrointestinal ulcer  - hair colour changes  hallucination  - joint hyperextension  leg pain  leucopenia  musculoskeletal disorders  nephrotic syndrome  nervousness  osteopenia  seizure
  - Frequency not known
    - With oral use  Depression  intracranial pressure increased  - papilloedema
  - **ALLERGY AND CROSS-SENSITIVITY**  Contra-indicated if history of hypersensitivity to penicillamine.

**PREGNANCY**
- With oral use  Manufacturer advises avoid—teratogenic and toxic in animal studies.

- **BREAST FEEDING**
  - With oral use  Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - With oral use  Leucocyte-cystine concentration and haematological monitoring required—consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

- **HANDLING AND STORAGE**
  - When used by eye  Manufacturer advises store in a refrigerator (2–8°C)—after opening store at room temperature up to 25°C for up to 7 days; protect from light.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions
    - With oral use  The Scottish Medicines Consortium has advised (November 2017) that mercaptamine (Procysbi®) is not recommended for use within NHS Scotland for the treatment of proven nephropathic cystinosis.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
    - Gastro-resistant capsule
      - Procysbi (Chiesi Ltd)
      - Mercaptamine (as Mercaptamine bitartrate) 25 mg  Procysbi 25mg gastro-resistant capsules  | 60 capsule POM £335.97
      - Mercaptamine (as Mercaptamine bitartrate) 75 mg  Procysbi 75mg gastro-resistant capsules  | 250 capsule POM £4,199.65
    - Eye drops
      - EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
      - Cystaran (Imported (United States))
        - Mercaptamine (as Mercaptamine hydrochloride) 4.4 mg per 1 ml  Cystaran 0.44% eye drops  | 15 ml POM £8
      - Cystadrops (Recordati Rare Diseases UK Ltd)
        - Mercaptamine (as Mercaptamine hydrochloride) 3.8 mg per 1 ml  Cystadrops 3.8mg/ml eye drops  | 5 ml POM £86.60
  - Capsule

- **CAUTIONARY AND ADVISORY LABELS 21**
  - Cystagon (Recordati Rare Diseases UK Ltd)
    - Mercaptamine (as Mercaptamine bitartrate) 50 mg  Cystagon 50mg capsules  | 100 capsule POM £70.00 DT + £70.00
    - Mercaptamine (as Mercaptamine bitartrate) 150 mg  Cystagon 150mg capsules  | 100 capsule POM £190.00 DT + £190.00

- **2.4 Fabry’s disease**

ENZYMES

Agalsidase alfa

- **DRUG ACTION**
  - Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

- **INDICATIONS AND DOSE**
  - Fabry’s disease (specialist use only)
    - **BY INTRAVENOUS INFUSION**
    - Adult: 200 micrograms/kg every 2 weeks

- **INTERACTIONS**
  - → Appendix 1: agalsidase

- **SIDE-EFFECTS**
  - Common or very common
    - Arrhythmias  - asthenia  chest discomfort  - chills  cough  diarrhoea  dizziness  dyspnœa  excessive tearing  fever  flushing  gastrointestinal discomfort  headache  hoarseness  hypersonia  hypertension  increased risk of infection  influenza like illness  joint disorders  malaise  musculoskeletal discomfort  myalgia  nausea  otoxicity  pain  -
palpitations • peripheral oedema • peripheral swelling • rhinorhoea • sensation abnormal • skin reactions • taste altered • temperature sensation altered • throat complaints • tremor • vomiting

▶ Uncommon Altered smell sensation • angioedema • hypersensitivity • sensation of pressure

▶ Frequency not known Heart failure • hypodipsia • hypotension • myocardial ischaemia

SIDE-EFFECTS, FURTHER INFORMATION Infusion-related reactions; manage by slowing the infusion rate, or minimise by pre-treatment with an antihistamine or corticosteroid — consult product literature.

PREGNANCY Use with caution.

BREAST FEEDING Use with caution — no information available.

DIRECTIONS FOR ADMINISTRATION Administration for intravenous infusion, give intermittently in sodium chloride 0.9%; dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

MEDIKLJN FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Replagal (Shire Pharmaceuticals Ltd)
Agalsidase beta 1 mg per 1 ml Replagal 1.5mg/3.5ml solution for infusion vials | 1 vial (£20.18)

PAEDIATRIC USE

Adult: 35 mg 1061 dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

MIGALASTAT (Migalastat HCL)

Drug action Migalastat is a pharmacological chaperone that binds to the active sites of certain mutant forms of alpha-galactosidase A, thereby stabilising these mutant forms in the endoplasmic reticulum, and facilitating normal trafficking to lysosomes.

INDICATIONS AND DOSE

Fabry's disease (specialist use only)

▶ BY MOUTH
Adult: 123 mg once daily on alternate days, take at the same time of day, at least 2 hours before or after food

SIDE-EFFECTS

Common or very common Constipation • defaecation urgency • depression • diarrhoea • dizziness • dry mouth • dyspnoea • epistaxis • fatigue • gastrointestinal discomfort • headache • muscle complaints • nausea • pain in extremity • palpitations • proteinuria • sensation abnormal • skin reactions • torture • vertigo

PREGNANCY Manufacturer advises avoid — toxicity in animal studies.

BREAST FEEDING Manufacturer advises avoid — present in milk in animal studies.

RENAL IMPAIRMENT Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS Manufacture advises monitor renal function, echocardiographic parameters and biochemical markers every 6 months.

PATIENT AND CARER ADVICE
Missed doses Manufacturer advises if a dose is missed entirely for the day, the missed dose should not be taken and the next dose should be taken on the normal day and at the normal time (not to be taken on 2 consecutive days).

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions
Migalastat for treating Fabry disease (February 2017)
NICE HST4
Migalastat is recommended, within its marketing authorisation, as an option for treating Fabry disease in people over 16 years of age with an amenable mutation, only if migalastat is provided with the discount agreed in the patient access scheme, and only if enzyme replacement therapy would otherwise be offered.

www.nice.org.uk/guidance/hst4

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium (November 2016) has advised that migalastat (Galafold®) is accepted for restricted use within NHS Scotland for long-term treatment of adults and adolescents aged 16 years and older with a confirmed diagnosis of Fabry disease (x-
2.5 Gaucher’s disease

Other drugs used for Gaucher’s disease Miglustat, p. 1066

Eliglustat

BY MOUTH

Adult: 84 mg once daily

Type 1 Gaucher disease (CYP2D6 poor metabolisers) (under expert supervision)

BY MOUTH

Adult: 84 mg twice daily

CONTRA-INDICATIONS Cardiac disease (no information available) - concurrent use of Class IA and Class III antiarrhythmics - long QT syndrome (no information available)

INDICATIONS AND DOSE

Type 1 Gaucher disease (CYP2D6 poor metabolisers) (under expert supervision)

BY MOUTH

Adult: 84 mg once daily

Eliglustat (as Eliglustat tartrate) 84.4 mg Cerdelga 84mg capsules £19,164.96

IMIGLUCERASE

BY INTRAVENOUS INFUSION

Adult: Initially 60 units/kg every 2 weeks; maintenance, adjusted according to response, doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly

SIDE-EFFECTS

Common or very common Angioedema - cough - dyspnoea - hypersensitivity - skin reactions

PREGNANCY Manufacturer advises use with caution - limited information available.

BREAST FEEDING No information available.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Eliglustat for treating type 1 Gaucher disease (June 2017)

Eliglustat is recommended within its marketing authorisation for treating type 1 Gaucher disease, that is, for long-term treatment in adults who are cytochrome P450 2D6 poor, intermediate or extensive metabolisers. Eliglustat is only recommended when the manufacturer provides it with the discount agreed in the patient access scheme.

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (December 2017) that eliglustat (Cerdelga (Amicus Therapeutics UK Ltd) ▼) is accepted for use within NHS Scotland for the long-term treatment of adult patients with type 1 Gaucher disease who are CYP2D6 poor metabolisers, intermediate metabolisers or extensive metabolisers. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

Eliglustat is only recommended when the manufacturer advises use with caution for patients with type 1 Gaucher disease who are CYP2D6 poor, intermediate or extensive metabolisers. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

CONTRA-INDICATIONS Cardiac disease (no information available) - concurrent use of Class IA and Class III antiarrhythmics - long QT syndrome (no information available)

INTERACTIONS

Common or very common Arthralgia - constipation - dyspepsia - fatigue - gastrointestinal disorders - nausea - palpitations

Frequency not known Syncpe

PREGNANCY Manufacturer advises avoid—limited information available.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

PRE-TREATMENT SCREENING Manufacturer advises CYP2D6 metaboliser status should be determined before initiation of treatment.

MONITORING REQUIREMENTS

For treatment-naive patients showing less than 20% spleen volume reduction after 9 months of treatment, manufacturer advises monitor for further improvement or consider an alternative treatment.

For patients with stable disease who have switched from enzyme replacement therapy, manufacturer advises monitor for disease progression—consider reinstiution of enzyme replacement therapy or an alternative treatment if response sub-optimal.

PRESCRIBING AND DISPENSING INFORMATION The manufacturer of Cerdelga ® has provided a Prescriber Guide, which includes a prescriber checklist.

PATIENT AND CARER ADVICE A patient alert card should be provided.

Velaglucerase alfa

**Drug Action** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher’s disease.

**Indications and Dose**

**Type I Gaucher’s disease (specialist use only)**
- By intravenous infusion
  - Adult: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

**Side-effects**
- Common or very common Arthralgia · asthenia · chest discomfort · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hypersensitivity · hypertension · hypotension · infusion related reaction · nausea · pain · skin reactions · tachycardia
- Electrolytes: May contain sodium chloride

**Further Information** Infusion-related reactions are very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature. 

**Pregnancy**
- Manufacturer advises use with caution—limited information available.

**Breast Feeding**
- Manufacturer advises caution—no information available.

**Monitoring Requirements**
- Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.

**Directions for Administration**
- Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane® powder.

**Prescribing and Dispensing Information**
- Betaine should be used in conjunction with dietary restrictions and may be given with supplements of vitamin B12, pyridoxine, and folate under specialist advice.

**National Funding/Access Decisions**
- Scottish Medicines Consortium (SMC) decisions

2.7 Hypophosphatasia

ENZYMES

Asfotase alfa

- **DRUG ACTION** Asfotase alfa is a human recombinant tissue-nonspecific alkaline phosphatase that promotes mineralisation of the skeleton.

- **INDICATIONS AND DOSE**
  - Paediatric-onset hypophosphatasia (initiated by a specialist)
  - Adult: 2 mg/kg 3 times a week, alternatively 1 mg/kg 6 times a week, dosing frequency depends on body-weight—consult product literature for further information

- **CAUTIONS** Hypersensitivity reactions

- **SIDE-EFFECTS**
  - Common or very common: Bruising tendency - chills - cutis laxa - fever - headache - hypersensitivity - irritability - lipohypertrophy - myalgia - nausea - oral hypoesthesia - pain - skin reactions - vasodilatation

- **CAUTIONS, FURTHER INFORMATION**
  - Hypersensitivity reactions. Reactions, including signs and symptoms consistent with anaphylaxis, have occurred within minutes of administration and can occur in patients on treatment for more than one year; if these reactions occur, manufacturer advises immediate discontinuation of treatment and initiation of appropriate medical treatment. For information on re-administration, consult product literature.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor serum parathyroid hormone and calcium concentrations—supplements of calcium and oral vitamin D may be required.
  - Manufacturer advises periodic ophthalmological examination and renal ultrasounds.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises max. 1 mL per injection site; administer multiple injections if more than 1 mL is required—consult product literature.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C).

- **PATIENT AND CARER ADVICE**
  - Injection guides. The manufacturer has produced injection guides for patients and carers to support training given by health care professionals.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE decisions**
    - Asfotase alfa for treating paediatric-onset hypophosphatasia (August 2017) NICE HST6
    - Asfotase alfa is recommended as an option for treating paediatric-onset hypophosphatasia only:
      - for people who meet the criteria for treatment within the managed access arrangement (see section 4.18 of the guidance), and
      - for the duration of this arrangement and in line with the other conditions it specifies, and
    - when the manufacturer provides asfotase alfa with the confidential commercial terms agreed with NHS England.
    - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.
    - [www.nice.org.uk/guidance/HST6](www.nice.org.uk/guidance/HST6)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - Strensiq (Alexion Pharma UK Ltd)
    - Asfotase alfa 40 mg per 1 mL
    - Strensiq 18 mg/0.45 mL solution for injection vials | 12 vial (£50) £12,700.80 (Hospital only)
    - Strensiq 28 mg/0.7 mL solution for injection vials | 12 vial (£50) £15,756.80 (Hospital only)
    - Strensiq 40 mg/mL solution for injection vials | 12 vial (£50) £28,224.00 (Hospital only)
    - Asfotase alfa 100 mg per 1 mL
    - Strensiq 80 mg/0.8 mL solution for injection vials | 12 vial (£50) £56,448.00 (Hospital only)

2.8 Mucopolysaccharidosis

ENZYMES

Elosulfase alfa

- **DRUG ACTION** Elosulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylgalactosamine-6-sulfatase (GALNS) deficiency.

- **INDICATIONS AND DOSE**
  - **Mucopolysaccharidosis IVA (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
    - Adult: 2 mg/kg once weekly

- **CAUTIONS**
  - Elderly—no information available
  - Infusion-related reactions

  - **CAUTIONS, FURTHER INFORMATION**
    - Infusion-related reactions. Infusion-related reactions can occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30–60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during re-administration following a severe reaction.

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain - chills - diarrhoea - dizziness - dysphagia - fever - headache - hypersensitivity - infusion related reaction - myalgia - nausea - ophthalmological pain - vomiting

  - **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

  - **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.

  - **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Vimizim®), give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 mL infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 mL/hour, then increase to a rate of 6 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 mL/hour to max. 36 mL/hour; body-weight...
25 kg or over, dilute requisite dose to final volume of 250 mL and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 mL/hour, then increase to a rate of 12 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 mL/hour to max. 72 mL/hour.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.
- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE decisions**
  - Elosulfase alfa for treating mucopolysaccharidosis type IVa (December 2015) NICE HST2
  - Elosulfase alfa, within its marketing authorisation, is recommended for funding for treating mucopolysaccharidosis type IVa (MPS IVa) according to the conditions in the managed access agreement for elosulfase alfa.
  - www.nice.org.uk/guidance/HST2

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

**EXCIPIENTS:** May contain Polysorbates, sorbitol

- **Vimizim** (Biogen Idec Ltd) ▼
- **Elosulfase alfa 1 mg per 1 ml** Vimizim 5mg/5ml concentrate for solution for infusion vials | 1 vial (1065) £522.00

### Galsulfase

- **DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

### Indications and dose

- **Mucopolysaccharidosis VI (specialist use only)**
  - **BY INTRAVENOUS INFUSION**
    - Adult: 1 mg/kg once weekly

- **CAUTIONS** Acute febrile illness (consider delaying treatment) - acute respiratory illness (consider delaying treatment) - infusion-related reactions can occur - respiratory disease

- **SIDE-EFFECTS** Abdominal pain - anemia - chest pain - chills - conjunctivitis - corneal opacity - dysphonia - ear pain - face oedema - hypertension - increased risk of infection - infusion related reaction - malaise - nasal congestion - reflexes absent - umbilical hernia

### Side-effects, further information

Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Elaprase®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

- **Naglazyme** (BioMarin Europe Ltd) ▼
- **Galsulfase 1 mg per 1 ml** Naglazyme 5mg/5ml solution for infusion vials | 1 vial (582) £982.00

### Idursulfase

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

### Indications and dose

- **Mucopolysaccharidosis II (specialist use only)**
  - **BY INTRAVENOUS INFUSION**
    - Adult: 500 micrograms/kg once weekly

- **CAUTIONS** Acute febrile respiratory illness (consider delaying treatment) - infusion-related reactions can occur - severe respiratory disease

- **SIDE-EFFECTS**
  - **Common or very common** Arthralgia - chest pain - cough - dyspnea - face oedema - hypertension - hypotension - nausea - oedema - respiratory disorders - skin reactions - tongue swelling - tremor - vomiting

- **Frequency not known** Hypersensitivity

### Side-effects, further information

Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

### Directions for administration

For intravenous infusion (Naglazyme®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours.

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Laronidase

- **DRUG ACTION** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

- **INDICATIONS AND DOSE**
  - Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)
    - **BY INTRAVENOUS INFUSION**
      - Adult: 100 units/kg once weekly

- **CAUTIONS** Infusion-related reactions can occur

- **INTERACTIONS** → Appendix 1: laronidase

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain · alopecia · anaphylactic reaction · angioedema · chills · cough · diarrhea · dizziness · dyspnoea · fatigue · fever · flushing · headache · hypotension · influenza like illness · joint disorders · nausea · pain · pallor · paraesthesia · peripheral coldness · respiratory disorders · restlessness · skin reactions · sweat changes · tachycardia · temperature sensation altered · vomiting
  - Frequency not known Cyanosis · hypoxia · oedema

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor immunoglobulin G (IgG) antibody concentration.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Aldurazyme 
  
  ), give intermittently in Sodium chloride 0.9%; body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for infusion**
    - ELECTROLYTES: May contain Sodium
      - Aldurazyme (Genzyme Therapeutics Ltd)
        - Laronidase 100 unit per 1 ml Aldurazyme 500units/5ml solution for infusion vials | 1 vial | £444.70

  - **Medication**
    - There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - Zavesca (Actelion Pharmaceuticals UK Ltd)
    - Miglustat 100 mg | Zavesca 100mg capsules | 84 capsule | £3,934.17 (Hospital only)

2.9 Niemann-Pick type C disease

- **ENZYME INHIBITORS** > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

Miglustat

- **DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

- **INDICATIONS AND DOSE**
  - Mild to moderate type I Gaucher’s disease for whom enzyme replacement therapy is unsuitable (under expert supervision)
    - **BY MOUTH**
      - Adult: 100 mg 3 times a day, reduced if not tolerated to 100 mg 1–2 times a day

- **TREATMENT OF PROGRESSIVE NEUROLOGICAL MANIFESTATIONS OF NIEMANN-PICK TYPE C DISEASE (UNDER EXPERT SUPERVISION)**
  - **BY MOUTH**
    - Adult: 200 mg 3 times a day

- **SIDE-EFFECTS**
  - Common or very common Appetite decreased · asthenia · chills · constipation · depression · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache · insomnia · libido decreased · malaise · muscle spasms · muscle weakness · nausea · peripheral neuropathy · sensation abnormal · thrombocytopenia · tremor · vomiting · weight decreased

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.

- **PREGNANCY**
  - Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution (no information available).

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m²

  - **Dose adjustments**
    - For Gaucher’s disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m².
    - Initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m².
    - For Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m².
    - Initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor cognitive and neurological function.
  - Monitor growth and platelet count in Niemann-Pick type C disease.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
2.10 Pompe disease

ENZYMES

Alglucosidase alfa

- **DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

- **INDICATIONS AND DOSE**
  - **Pompe disease (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 20 mg/kg every 2 weeks
  - **CAUTIONS**
    Cardiac dysfunction • infusion-related reactions—consult product literature • respiratory dysfunction

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain • angioedema • arthralgia • chest discomfort • chills • cough • cyanosis • diarrhoea • dizziness • fatigue • feeling hot • fever • flushing • hypotension • irritable • local swelling • muscle complaints • nausea • oedema • pallor • paraesthesia • respiratory disorders • skin reactions • thrombosis • tremor • vomiting
  - **Frequency not known** Abdominal pain • angioedema • apnoea • arthralgia • cardiac arrest • dyspnoea • excessive tearing • eye inflammation • headache • hypotension • nephrotic syndrome • peripheral coldness • proteinuria • vasoconstriction

- **SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions are very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

- **PREGNANCY** Toxicity in animal studies, but treatment should not be withheld.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor closely if cardiac dysfunction.
  - Monitor closely if respiratory dysfunction.
  - Monitor immunoglobulin G (IgG) antibody concentration.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (**Myozyme®**), give intermittently in Sodium chloride 0.9%; reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - **Myozyme (Genzyme Therapeutics Ltd)**
    - Alglucosidase alfa 50 mg Myozyme 50mg powder for concentrate for solution for infusion vials | 1 vial (£356.06) (Hospital only)

2.11 Tyrosinaemia type I

ENZYME INHIBITORS

4- HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

Nitisinone

**(NTBC)**

- **INDICATIONS AND DOSE**
  - Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)
    - **BY MOUTH**
      - Adult: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

- **INTERACTIONS**
  - **Appendix 1: nitisinone**

- **SIDE-EFFECTS**
  - **Common or very common**
    - Corneal opacity • eye inflammation • eye pain • granulocytopenia • leucopenia • photophobia • thrombocytopenia
  - **Uncommon**
    - Leucocytosis • skin reactions

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoid—adverse effects in animal studies.

- **PRE-TREATMENT SCREENING**
  - Slit-lamp examination of eyes recommended before treatment.

- **MONITORING REQUIREMENTS**
  - Monitor liver function regularly.
  - Monitor platelet and white blood cell count every 6 months.

- **DIRECTIONS FOR ADMINISTRATION**
  - Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Oral suspension**
  - **Orfadin (Swedish Orphan Biovitrum Ltd)**
    - Nitisinone 4 mg per 1 ml Orfadin 4mg/1ml oral suspension sugar-free | 90 ml (£1,692.00 DT + £1,692.00)
    - Nitisinone 5 mg Nitisinone 5mg capsules | 60 capsule (£845.25)
    - Nitisinone 10 mg Nitisinone 10mg capsules | 60 capsule (£1,546.50)
  - **Orfadin (Swedish Orphan Biovitrum Ltd)**
    - Nitisinone 2 mg Nitisinone 2mg capsules | 60 capsule (£423.00)
    - Nitisinone 5 mg Nitisinone 5mg capsules | 60 capsule (£1,127.00)
    - Nitisinone 10 mg Nitisinone 10mg capsules | 60 capsule (£2,062.00)

- **Capsule**
  - **Nitisinone (Non-proprietary)**
    - Nitisinone 2 mg Nitisinone 2mg capsules | 60 capsule (£564.00)
    - Nitisinone 5 mg Nitisinone 5mg capsules | 60 capsule (£1,000.00)
    - Nitisinone 10 mg Nitisinone 10mg capsules | 60 capsule (£2,062.00)

- **Powder for solution for infusion**
  - **Myozyme (Genzyme Therapeutics Ltd)**
    - Alglucosidase alfa 50 mg Myozyme 50mg powder for concentrate for solution for infusion vials | 1 vial (£356.06) (Hospital only)
2.12 Urea cycle disorders

AMINO ACIDS AND DERIVATIVES

Carglumic acid

- **INDICATIONS AND DOSE**
  - Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)
    - By mouth
      - Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses
  - Hyperammonaemia due to organic acidaemia (under expert supervision)
    - By mouth
      - Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

**IMPORTANT SAFETY INFORMATION**

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS
For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- **SIDE-EFFECTS**
  - Common or very common Hyperhidrosis
  - Uncommon Bradycardia; diarrhoea; fever; vomiting
  - Frequency not known Rash

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Dispensible tablet**

**CAUTIONARY AND ADVISORY LABELS** 13

- Carglumic acid (Non-proprietary)
  - Carglumic acid 200 mg: Carglumic acid 200mg dispersible tablets sugar-free sugar-free | 5 tablet (POD) £21.69 sugar-free | 60 tablet (POD) £2,624.30
  - Carbaglu (Recordati Rare Diseases UK Ltd)
    - Carbaglu 200 mg: Carbaglu 200mg dispersible tablets sugar-free | 5 tablet (POD) £299.00 sugar-free | 15 tablet (POD) £897.00 sugar-free | 60 tablet (POD) £3,499.00
  - Ucedane (Lucane Pharma Ltd)
    - Ucedane 200 mg: Ucedane 200mg dispersible tablets sugar-free | 60 tablet (POD) £3,300.00

**DRUGS FOR METABOLIC DISORDERS**

AMMONIA LOWERING DRUGS

Glycerol phenylbutyrate

- **DRUG ACTION** Glycerol phenylbutyrate is a nitrogen-binding agent that provides an alternative vehicle for waste nitrogen excretion.

- **INDICATIONS AND DOSE**
  - Urea cycle disorders (specialist use only)
    - By mouth, or by gastrostomy tube, or by nasogastric tube
    - Adult (body surface area up to 1.3 m²): Initially 9.4 g/m² daily in divided doses, usual maintenance 5.3–12.4 g/m² daily in divided doses, each dose should be rounded up to the nearest 0.5 mL and given with each meal. For dose adjustments based on individual requirements—consult product literature
    - Adult (body surface area 1.3 m² and above): Initially 8 g/m² daily in divided doses, usual maintenance 5.3–12.4 g/m² daily in divided doses, each dose should be rounded up to the nearest 0.5 mL and given with each meal. For dose adjustments based on individual requirements—consult product literature

**IMPORTANT SAFETY INFORMATION**

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS
For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- **CONTRA-INDICATIONS** Treatment of acute hyperammonaemia

- **CAUTIONS** Elderly—limited information available - intestinal malabsorption - pancreatic insufficiency

- **INTERACTIONS** Appendix 1: glycerol phenylbutyrate

- **SIDE-EFFECTS**
  - Common or very common Appetite abnormal - constipation - diarrhoea - dizziness - fatigue - food aversion - gastrointestinal discomfort - gastrointestinal disorders - headache - menstrual cycle irregularities - nausea - oral disorders - peripheral oedema - skin reactions - tremor - vomiting

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

- **Dose adjustments** Manufacturer advises use lowest possible dose—consult product literature.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises may be added to a small amount of apple sauce, ketchup,
or squash puree and used within 2 hours. For administration advice via nasogastric or gastrostomy tube—consult product literature.

- **HANDLING AND STORAGE**  Manufacturer advises discard contents of bottle 14 days after opening.
- **PATIENT AND CARER ADVICE**  Driving and skilled tasks  Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**

### Scottish Medicines Consortium (SMC) decisions

**SNC No. 1342/18**

The Scottish Medicines Consortium (SMC) has advised (August 2018) that glycerol phenylbutyrate (Ravicti<sup>®</sup>) is accepted for use within NHS Scotland as an adjunctive therapy for chronic management of adult and paediatric patients aged 2 months and older with urea cycle disorders who cannot be managed by dietary protein restriction and/or amino acid supplementation alone. Glycerol phenylbutyrate must be used with dietary protein restriction and, in some cases, dietary supplements. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution.
- **SIDE-EFFECTS**

#### Sodium phenylbutyrate

- **INDICATIONS AND DOSE**

  **Long-term treatment of urea cycle disorders**

  (as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy) (under expert supervision)

  - **BY MOUTH**
  - **Adult:** 9.9–13 g/m<sup>2</sup> daily in divided doses, with meals; maximum 20 g per day

- **INTERACTIONS**

  - **Common or very common**  Abdominal pain · anaemia · appetite decreased · constipation · depression · headache · irritability · leucocytosis · leucopenia · menstrual cycle irregularities · metabolic acidosis · metabolic alkalosis · nausea · oedema · renal tubular acidosis · skin reactions · syncope · taste altered · thrombocytopenia · thrombocytosis · vomiting · weight increased
  - **Uncommon**  Anorectal haemorrhage · aplastic anaemia · arrhythmia · gastrointestinal disorders · pancreatitis

- **CONCEPTION AND CONTRACEPTION**  Manufacturer advises adequate contraception during administration in women of child-bearing potential.

- **PREGNANCY**  Avoid—toxicity in animal studies.

- **BREAST FEEDING**  Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**  Manufacturer advises caution.

- **RENAL IMPAIRMENT**  Manufacturer advises use with caution (preparations contain significant amounts of sodium).

- **DIRECTIONS FOR ADMINISTRATION**  Granules should be mixed with food before taking. *Ravicti*<sup>®</sup> granules must not be administered by nasogastric or gastrostomy tubes.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution.

#### Granules

- **Ammonaps (Swedish Orphan Biovitrum Ltd)**
  - Sodium phenylbutyrate 940 mg per 1 gram Ammonaps 940mg/g granules sugar-free | 266 gram (POD) £860.00 DT = £860.00
  - **Pheburane** (Lucane Pharma Ltd)
  - Sodium phenylbutyrate 483 mg per 1 gram Pheburane 483mg/g granules | 174 gram (POD) £131.00

#### Tablet

- **Ammonaps (Swedish Orphan Biovitrum Ltd)**
  - Sodium phenylbutyrate 500 mg Ammonaps 500mg tablets | 250 tablet (POD) £493.00 DT = £493.00

### 2.13 Wilson’s disease

#### Other drugs used for Wilson’s disease

Penicillamine, p. 1097

#### ANTIDOTES AND CHELATORS

##### COPPER ABSORPTION INHIBITORS

#### Zinc acetate

- **INDICATIONS AND DOSE**

  **Wilson’s disease (initiated under specialist supervision)**

  - **BY MOUTH**
  - **Adult:** 50 mg 3 times a day (max. per dose 50 mg 5 times a day) adjusted according to response

- **DOSE EQUIVALENT AND CONVERSION**

  Doses expressed as elemental zinc.

- **PHARMACOKINETICS**

  - Symptomatic Wilson’s disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS**  Portal hypertension (risk of hepatic decompensation when switching from chelating agent)

- **INTERACTIONS**  → Appendix 1: zinc

- **SIDE-EFFECTS**

  - **Common or very common**  Epigastric discomfort (usually transient)
  - **Uncommon**  Leucopenia · sideroblastic anaemia
  - **Frequency not known**  Condition aggravated

- **SIDE-EFFECTS, FURTHER INFORMATION**

  Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.

- **PREGNANCY**

  **Dose adjustments**  Reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.

- **BREAST FEEDING**  Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.
BLOOD AND NUTRITION

Selenium deficiency

Overview
Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

INDICATIONS AND DOSE
Selenium deficiency
- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Adult: 100–500 micrograms daily

3.2 Zinc deficiency

Zinc deficiency

Overview
Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia sparsely lowers plasma–zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disorders, or in zinc-losing states.

Zinc is used in the treatment of Wilson’s disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption. Parenteral nutrition regimens usually include trace amounts of zinc. If necessary, further zinc can be added to intravenous feeding regimens.

ELECTROLYTES AND MINERALS > ZINC

Zinc sulfate

INDICATIONS AND DOSE
Zinc deficiency or supplementation in zinc-losing conditions
- BY MOUTH USING EFFERVESCENT TABLETS
- Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in

www.getintopharma.com
Water and taken after food, dose expressed as elemental zinc
- Child (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- Adult (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

Additional elemental zinc for intravenous nutrition
- By intravenous injection
  - Adults: 6.5 mg daily (Zn + 100 micromol)

Unlicensed use Solvazine® is not licensed for use in acrodermatitis enteropathica.

Interactions → Appendix 1: zinc

Side-effects Diarrhoea - gastritis - gastrointestinal discomfort - nausea - vomiting

Pregnancy Crosses placenta; risk theoretically minimal, but no information available.

Breast feeding Present in milk; risk theoretically minimal, but no information available.

Renal impairment Accumulation may occur in acute renal failure.

Prescribing and dispensing information Each Solvazine® tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).

Medicinal forms There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet Cautionary and advisory labels 13, 21
  - Solvazine (Galen Ltd) Zinc sulfate monohydrate 125 mg. Solvazine 125mg effervescent tablets sugar-free | 90 tablet [P] £17.20 DT + £17.20

4 Nutrition (intravenous)

Intravenous nutrition

Overview
When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Proprietary Infusion Fluids for Parenteral Feeding p. 1072.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B₁₂ as hydroxocobalamin p. 1026, is given by intramuscular injection; regular vitamin B₁₂ injections are not usually required unless total parenteral nutrition continues for many months. Folic acid p. 1025 is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of nonessential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose p. 1041) and electrolytes.

Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcals) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

Fat emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolality with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. Additives should not be mixed with fat emulsions unless compatibility is known.

Administration
Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases product literature and other specialist literature should be consulted.

NUTRIENTS > PARENTERAL NUTRITION

Parenteral nutrition supplements

- **INDICATIONS AND DOSE**
  - **Supplement in intravenous nutrition**
    - **BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION**
    - Adult: (consult product literature)

**Dipeptiven 20g/100ml Concentrate for Solution for Infusion Bottles**

Amino acid supplement for hypercatabolic or hypermetabolic states

- **BY INTRAVENOUS INFUSION**
- Adult: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

- **CAUTIONS**
- **Pedtrac® Solution for Infusion 10ml Vials** Reduced biliary excretion - reduced biliary excretion in cholestatic liver disease - reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required) - total parenteral nutrition exceeding one month

- **Directions for Administration** Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases specialist pharmacy advice, product literature, and other specialist literature should be consulted. Compatibility with the infusion solution must be ascertained before adding supplementary preparations. Additives should not be mixed with fat emulsions unless compatibility is known.

**Cernevit Solution for Injection Vials and Diluent** Dissolve in 5 mL water for injections.

**Pedtrac® Solution for Infusion 10ml Vials** For addition to Vaminolact®, Vamin® 14 Electrolyte-Free solutions, and glucose intravenous infusions.

**Additrace Solution for Infusion 10ml Ampoules** For addition to Vamin® solutions and glucose intravenous infusions.

**Dipeptiven 20g/100ml Concentrate for Solution for Infusion Bottles** For addition to infusion solutions containing amino acids.

**Addiphos® Vials** For addition to Vamin® solutions and glucose intravenous infusions.

**Decan Concentrate for Solution for Infusion 40ml Bottles** For addition to infusion solutions.

**Tracutil® Ampoules** For addition to infusion solutions.

**Solivito N Powder for Solution for Infusion Vials** Solvito N® powder for reconstitution contains biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 micrograms, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantethenate 16.5 mg, thiamine mononitrate 3.1 mg.

**Vitlipid N Adult Emulsion for Infusion 10ml Ampoules** Vitlipid N® adult emulsion contains vitamin A 330 units, ergocalciferol 20 units, dl-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for injection**

- **Cernevit (Baxter Healthcare Ltd)**
  - Cyanocobalamin 6 microgram, Biotin 69 microgram, Folic acid 414 microgram, Thiamine 3.51 mg, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Pantothenic acid (as Dexamethasone) 17.25 mg, Nicotinamide 4.6 mg, Ascorbic acid 125 mg, Alpha tocopherol 11.2 unit, Colecalciferol 220 unit, Retinol 3500 unit

- **Decan (Baxter Healthcare Ltd)**
  - Calcium gluconate 3500 unit, Magnesium 125 mg, Sodium chloride 989 microgram, Magnesium chloride 99 microgram per 1 mL, Sodium fluoride 210 microgram per 1 mL, Copper chloride 340 microgram per 1 mL, Ferric chloride 544 microgram per 1 mL, Zinc chloride 1.36 mg per 1 mL

- **Additrace (Fresenius Kabi Ltd)**
  - Sodium glycerophosphate 216 mg per 1 mL, Sodium carbonate 4.32g/20ml concentration for solution for infusion 1 mL vial £5.60

- **Dipeptiven (Fresenius Kabi Ltd)**
  - Sodium molybdate 4.85 microgram per 1 mL, Chromic chloride 5.33 microgram per 1 mL, Sodium selenite 10.5 microgram per 1 mL, Potassium iodide 16.6 microgram per 1 mL, Manganese chloride 99 microgram per 1 mL, Sodium fluoride 210 microgram per 1 mL, Copper chloride 340 microgram per 1 mL, Ferric chloride 544 microgram per 1 mL, Zinc chloride 1.36 mg per 1 mL

- **Pedtrac® (Fresenius Kabi Ltd)**
  - Manganese (as Manganese chloride) 1 microgram per 1 mL, Iodine (as Potassium iodide) 1 microgram per 1 mL, Selenium (as Sodium selenite) 2 microgram per 1 mL, Copper (as Copper chloride) 20 microgram per 1 mL, Fluoride (as Sodium fluoride)
Enteral nutrition

Overview

The body’s reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary food with extra calorie sources and by persuading the patient to take supplementary snacks of ordinary food between the meals.

In patients who cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS).

Coeliac disease

Coeliac disease is caused by an abnormal immune response to gluten. For management and further information, see Coeliac disease p. 37.

Phenylketonuria

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

Sapropterin dihydrochloride below, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

5.1a Phenylketonuria

**DRUGS FOR METABOLIC DISORDERS ▶ TETRAHYDROBIOPTERIN AND DERIVATIVES**

**Sapropterin dihydrochloride**

*Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)*

- **INDICATIONS AND DOSE**
  - **Phenylketonuria** (adjunct to dietary restriction of phenylalanine) (specialist use only)
    - **BY MOUTH**
      - Adult: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

- **CAUTIONS** History of convulsions
- **INTERACTIONS** → Appendix 1: sapropterin
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · cough · diarrhoea · headache · laryngeal pain · nasal congestion · vomiting
  - **Frequency not known** Hypersensitivity
- **PREGNANCY** Manufacturer advises caution—consider only if strict dietary management inadequate.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

6 Vitamin deficiency

Vitamins

Overview
Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general 'pick-me-ups' is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 1082 and pyridoxine hydrochloride p. 1080, is unscientific and can be harmful.

Dental patients
It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

Vitamin A
Deficiency of vitamin A p. 1079 (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin B group
Deficiency of the B vitamins, other than vitamin B$_6$, is rare in the UK and is usually treated by preparations containing thiamine p. 1080 (B$_1$), riboflavin (B$_2$), and nicotinamide p. 1272, which is used in preference to nicotinic acid p. 201, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate p. 233, and pantothetic acid or pantothenol may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke’s encephalopathy and Korsakoff’s psychosis, especially as seen in chronic alcoholism, are best treated initially by the parenteral administration of B vitamins (Pabrinex®), followed by oral administration of thiamine in the longer term. Anaphylaxis has been reported with parenteral B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride (B$_6$) deficiency is rare, but it may occur during isoniazid p. 587 therapy or penicillamine p. 1097 treatment in Wilson’s disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia. There is evidence to suggest that pyridoxine hydrochloride may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

Nicotinic acid inhibits the synthesis of cholesterol and triglyceride. Folic acid p. 1025 and vitamin B$_12$ are used in the treatment of megaloblastic anaemia. Folic acid p. 941 (available as calcium folinate) is used in association with cytotoxic therapy.

Vitamin C
Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly. Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proven.

Vitamin D
The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets. They include ergocalciferol p. 1086 (calciferol, vitamin D$_2$), colecalciferol p. 1084 (vitamin D$_3$), dihydrotachysterol p. 1086, alfalcaldip p. 1083 (1α-hydroxycholecalciferol), and calcitrol p. 1083 (1,25-dihydroxycholecalciferol). Simple vitamin D deficiency can be prevented by taking an oral supplement of ergocalciferol (calciferol, vitamin D$_2$) or colecalciferol (vitamin D$_3$) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for severe deficiency. Patients who do not respond should be referred to a specialist.
Preparations containing colecalciferol with calcium carbonate p. 1085 are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency.

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfalcacidol or calcitriol should be prescribed if patients with severe renal impairment require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis.

Paricalcitol p. 1087, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic kidney disease.

Vitamin E

The daily requirement of vitamin E (tocopherol) has not been well defined but is probably 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestasis. In young children with congenital cholestasis, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities, which usually respond only to the parenteral administration of vitamin E.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Menadione sodium phosphate p. 1089 is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K.

Other compounds

Potassium aminobenzoate p. 1080 has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma and Peyronie’s disease. In Peyronie’s disease there is some evidence to support efficacy in reducing progression when given early in the disease; however, there is no evidence for reversal of the condition. The therapeutic value of potassium aminobenzoate in scleroderma is doubtful.

**VITAMINS AND TRACE ELEMENTS**

**MUTIVITAMINS**

### Vitamin A and D

**INDICATIONS AND DOSE**

Prevention of vitamin A and D deficiency

- **BY MOUTH**
  - Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D
  - Adult: (consult product literature)

**UNLICENSED USE**

- In children Not licensed in children under 6 months of age.

**SIDE-EFFECTS**

- **Overdose** Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - **Vitamins A and D (Non-proprietary)**
    - **Vitamin D 400 unit, Vitamin A 4000 unit**
    - **Capsules BPC 1973** 28 capsule £2.81 84 capsule £6.73-£8.42 DT = £8.42

### Vitamins A, C, and D

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A below, ascorbic acid p. 1082.

**INDICATIONS AND DOSE**

Prevention of vitamin deficiency

- **BY MOUTH**
  - Child 1 month–4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

**INTERACTIONS** → Appendix 1: ascorbic acid · vitamin A

**PRESCRIBING AND DISPENSING INFORMATION**

This drug contains vitamin D; consult individual vitamin D monographs.

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

*Healthy Start Vitamins for women* (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Oral drops**
  - **Healthy Start Children’s Vitamin** (Secretary of State for Health)
    - **Vitamin A and D3 concentrate.55 mg per 1 ml, Sodium ascorbate 18.58 mg per 1 ml, Ascorbic acid 150 mg per 1 ml, Vitamin D 2000 iu per 1 ml, Vitamin A 5000 iu per 1 ml** Healthy Start Children’s Vitamin drops | 10 ml

### Vitamin A

(Retinol)

**INDICATIONS AND DOSE**

Vitamin A deficiency

- **BY MOUTH**
  - Child 1-11 months: 5000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
  - Child 1-17 years: 10 000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency

**UNLICENSED USE**

Preparations containing only vitamin A are not licensed.
1080 Vitamin deficiency

**Potassium aminobenzoate**

- **INDICATIONS AND DOSE**
  - Peyronie’s disease | Scleroderma
    - **BY MOUTH**
      - Adult: 12 g daily in divided doses, to be taken after food
  
- **CONTRA-INDICATIONS** Hyperkalaemia | severe liver damage

- **CAUTIONS** Interrupt treatment during periods of low food intake (such as fasting, anorexia and nausea)—increased risk of hypoglycaemia

- **INTERACTIONS** → Appendix 1: potassium aminobenzoate

- **SIDE-EFFECTS** Hepatitis | hypoglycaemia

- **PREGNANCY** Manufacturer advises avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises unknown if excreted in milk—risk to infant cannot be excluded.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution—increased risk of hyperkalaemia; avoid if GFR less than 45 mL/minute.

- **MONITORING REQUIREMENTS** Manufacturer advises liver function tests should be performed monthly—discontinue immediately if elevated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Powder**
    - **CAUTIONARY AND ADVISORY LABELS** 13, 21
      - **Potaba** (Cheplapharm Arzneimittel GmbH)
        - Potassium aminobenzoate 3 gram
          - Potaba 3g sachets
            - 40 sachets £34.31 DT = £34.31

**Pyridoxine hydrochloride**

(Vitamin B₆)

- **INDICATIONS AND DOSE**
  
  - **Deficiency states**
    - **BY MOUTH**
      - Adult: 20–50 mg 1–3 times a day
  
  - **Isoniazid-induced neuropathy (prophylaxis)**
    - **BY MOUTH**
      - Adult: 10–20 mg daily
  
  - **Isoniazid-induced neuropathy (treatment)**
    - **BY MOUTH**
      - Adult: 50 mg 3 times a day
  
  - **Idiopathic sideroblastic anaemia**
    - **BY MOUTH**
      - Adult: 100–400 mg daily in divided doses
  
  - **Prevention of penicillamine-induced neuropathy in Wilson’s disease**
    - **BY MOUTH**
      - Adult: 20 mg daily
  
  - **Premenstrual syndrome**
    - **BY MOUTH**
      - Adult: 50–100 mg daily

- **UNLICENSED USE** Not licensed for prophylaxis of penicillamine-induced neuropathy in Wilson’s disease.
  
  - Not licensed for treatment of premenstrual syndrome.

**IMPORTANT SAFETY INFORMATION**

Prolonged use of pyridoxine in a dose of 10 mg daily is considered safe but the long-term use of pyridoxine in a dose of 200 mg or more daily has been associated with neuropathy. The safety of long-term pyridoxine supplementation with doses above 10 mg daily has not been established.

- **SIDE-EFFECTS** Peripheral neuritis
  - **Overdose** Overdosage induces toxic effects.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Pyridoxine hydrochloride (Non-proprietary)
      - Pyridoxine hydrochloride 10 mg
        - 28 tablet £16.31 DT = £16.31
      - Pyridoxine hydrochloride 20 mg
        - 500 tablet £35.00 DT = £35.00
      - Pyridoxine hydrochloride 50 mg
        - 28 tablet £16.31 DT = £15.75
  
  - **Oral solution**
    - **Pyridose** (TriOn Pharma Ltd)
      - Pyridoxine hydrochloride 20 mg per 1 ml
        - 100 ml £29.86 DT = £36.79
  
  - **Capsule**
    - Pyridoxine hydrochloride (Non-proprietary)
      - Pyridoxine hydrochloride 100 mg
        - Vitamin B6 100mg capsules
          - 100 capsule £5.50
          - 120 capsule £11.00

**Thiamine**

(Vitamin B₁)

- **INDICATIONS AND DOSE**
  
  - **Mild deficiency**
    - **BY MOUTH**
      - Adult: 25–100 mg daily
Severe deficiency
▶ BY MOUTH
▶ Adult: 200–300 mg daily in divided doses

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVISE (SEPTEMBER 2007)**

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

- **CAUTIONS** Anaphylaxis may occasionally follow injection.
- **BREAST FEEDING** Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, modified-release tablets, vitamin B compound tablets, and vitamin B compound strong tablets.

- **modified-release tablet**
  ▶ Thiamine (Non-proprietary)
  Thiamine hydrochloride 100 mg Vitamin B1 100mg modified-release tablets | 90 tablet £4.46

- **tablet**
  ▶ Thiamine (Non-proprietary)
  Thiamine hydrochloride 25 mg Vitamin B1 25mg tablets | 100 tablet £
  Thiamine hydrochloride 50 mg Thiamine 50mg tablets | 28 tablet £1.67–1.80 | 100 tablet £6.72 DT = £3.99
  Thiamine hydrochloride 100 mg Thiamine 100mg tablets | 28 tablet £1.76–1.72 | 100 tablet £11.55 DT = £5.74
  ▶ Benerva (Teofarma)
  Thiamine hydrochloride 50 mg Benerva 50mg tablets | 100 tablet £4.00 DT = £3.99
  Thiamine hydrochloride 100 mg Benerva 100mg tablets | 100 tablet £6.29 DT = £5.74

**Vitamin B complex**

**INDICATIONS AND DOSE**

Treatment of deficiency
▶ BY MOUTH USING TABLETS
▶ Adult: 1–2 tablets 3 times a day, this dose is for vitamin B compound tablets

**Prophylaxis of deficiency**
▶ BY MOUTH USING TABLETS
▶ Adult: 1–2 tablets daily, this dose is for vitamin B compound tablets

- **LESS SUITABLE FOR PRESCRIBING** Vitamin B compound tablets, vitamin B compound strong tablets, and Vigranon ® syrup are less suitable for prescribing.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Vitamin B complex (Non-proprietary)**
  Riboflavin 1 mg, Thiamine hydrochloride 1 mg, Nicotinamide 15 mg Vitamin B compound tablets | 28 tablet £21.30 DT = £26.63
  Pyridoxine hydrochloride 2 mg, Riboflavin 2 mg, Thiamine hydrochloride 5 mg, Nicotinamide 20 mg Vitamin B compound strong tablets | 28 tablet £7.00 DT = £8.81

**Vitamin B substances with ascorbic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, thiamine p. 1080, ascorbic acid p. 1082.

- **INDICATIONS AND DOSE**
  Parenteral vitamins B and C for rapid correction of severe depletion or malabsorption (e.g. in alcoholism, after acute infections, postoperatively, or in psychiatric states) | Maintenance of vitamins B and C in chronic intermittent haemodialysis
  ▶ BY INTRAVENOUS INFUSION
  ▶ INITIALLY BY INTRAVENOUS INFUSION
  ▶ Adult: See MHRA/CHM advice in thiamine p. 1080 monograph (consult product literature).

**Treatment of Wernicke's encephalopathy**
▶ BY INTRAVENOUS INFUSION OR BY DEEP INTRAMUSCULAR INJECTION
▶ Adult: 1 pair once daily for at least 3–5 days, give deep intramuscular injection into the gluteal muscle

**Prophylaxis of Wernicke's encephalopathy in alcohol dependence**
▶ BY INTRAVENOUS INFUSION OR BY DEEP INTRAMUSCULAR INJECTION
▶ Adult: 1 pair twice daily for up to 7 days, give deep intramuscular injection into the gluteal muscle

**Haemodialysis**
▶ BY INTRAVENOUS INFUSION
▶ Adult: 1 pair every 2 weeks

**UNLICENSED USE**

- **Pabrinex** ® doses in BNF may differ from those in product literature.

**INTERACTIONS**
▶ Appendix 1: ascorbic acid

**DIRECTIONS FOR ADMINISTRATION**

Give (Pabrinex ® I/V High Potency) intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Ampoules contents should be mixed, diluted, and administered without delay; give over 30 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

Some formulations of Pabrinex ® may contain benzyl alcohol (avoid in neonates). Pabrinex ® I/V High Potency injection is for intramuscular use only. Pabrinex ® I/V High Potency injection is for intravenous use only.

**MEDICINAL FORMS**

- **There can be variation in the licensing of different medicines containing the same drug.**

**Solution for injection**

- **EXCipients:** May contain Benzyl alcohol
  ▶ **Pabrinex Intramuscular High Potency** (Kyowa Kirin Ltd)
  Pabrinex Intramuscular High Potency solution for injection 5ml and 2ml ampoules | 20 ampoule (£90) £22.53 DT = £22.53
  ▶ **Pabrinex Intravenous High Potency** (Kyowa Kirin Ltd)
  Pabrinex Intravenous High Potency solution for injection 5ml and 5ml ampoules | 12 ampoule (£90) £16.23 | 20 ampoule (£90) £22.53 DT = £22.53

www.getintopharma.com
Vitamins with minerals and trace elements

**INDICATIONS AND DOSE**

**FORCEVAL® CAPSULES**

Vitamin and mineral deficiency and as adjunct in synthetic diets

- **BY MOUTH**
  - Adult: 1 capsule daily, one hour after a meal

**KETOVITE® LIQUID**

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets

- **BY MOUTH**
  - Adult: 5 mL daily, use with Ketovite® Tablets for complete vitamin supplementation.

**KETOVITE® TABLETS**

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets

- **BY MOUTH**
  - Adult: 1 tablet 3 times a day, use with Ketovite® Liquid for complete vitamin supplementation.

**PRESCRIBING AND DISPENSING INFORMATION**

To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

**PATIENT AND CARER ADVICE**

KETOVITE® LIQUID

Ketovite® liquid may be mixed with milk, cereal, or fruit juice.

KETOVITE® TABLETS

Tablets may be crushed immediately before use.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral emulsion**

- **Ketovite** (Essential Pharmaceuticals Ltd)
  - Cyanocobalamin 2.5 microgram per 1 ml, Choline chloride 30 mg per 1 ml, Ergocalciferol 80 unit per 1 ml, Vitamin A 500 unit per 1 ml Ketovite liquid sugar-free | 150 ml $19.10

**Tablet**

- **Ketovite** (Essential Pharmaceuticals Ltd)
  - Biotin 170 microgram, Folic acid 250 microgram, Pyridoxine hydrochloride 330 microgram, Acetomenaphthone 500 microgram, Riboflavin 1 mg, Thiamine hydrochloride 1 mg, Calcium pantothenate 1.16 mg, Nicotinamide 3.3 mg, Alpha tocopheryl acetate 5 mg, Ascorbic acid 16.6 mg, Inositol 50 mg
  - Capsule tablets | 100 tablet price $9.21

**Capsule**

- **Forceval** (Forum Health Products Ltd)
  - Cyanocobalamin 3 microgram, Selenium 50 microgram, Biotin 100 microgram, Iodine 140 microgram, Chromium 200 microgram, Molybdenum 250 microgram, Folic acid 400 microgram, Thiamine 1.2 mg, Riboflavin 1.6 mg, Copper 2 mg, Pyridoxine 2 mg, Manganese 3 mg, Pantothenic acid 4 mg, Potassium 4 mg, Tocopheryl acetate 10 mg, Iron 12 mg, Zinc 15 mg, Nicotinamide 18 mg, Magnesium 30 mg, Ascorbic acid 60 mg, Phosphorus 77 mg, Calcium 100 mg, Ergocalciferol 400 unit, Vitamin A 2500 unit
  - Forceval capsules | 15 capsule price $5.46 | 30 capsule price $9.32 | 90 capsule price $28.77

**VITAMINS AND TRACE ELEMENTS › VITAMIN C**

**Ascorbic acid**

(Vitamin C)

**INDICATIONS AND DOSE**

Prevention of scurvy

- **BY MOUTH**
  - Adult: 25–75 mg daily

**TREATMENT OF SCURVY**

- **BY MOUTH**
  - Adult: Not less than 250 mg daily in divided doses

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

- Iron overload Ascorbic acid should not be given to patients with cardiac dysfunction.

  In patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

**SIDE-EFFECTS**

Diarrhoea - gastrointestinal disorder - hypercalcaemia - oxalate nephrolithiasis - polyuria

**PRESCRIBING AND DISPENSING INFORMATION**

It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

**Tablet**

EXCIPIENTS: May contain Aspartame

- **Ascorbic acid (Non-proprietary)**
  - Ascorbic acid 50 mg | 10 tablet | $0.62
  - Ascorbic acid 100 mg | 28 tablet | $1.05 DT = $0.05
  - Ascorbic acid 200 mg | 28 tablet | $1.40 DT = $0.04
  - Ascorbic acid 250 mg | 28 tablet | $1.96 DT = $0.07
  - Ascorbic acid 500 mg | 28 tablet | $2.68 DT = $0.07
  - Ascorbic acid 1000 mg chewable tablets | 30 tablet | $3.95
  - Ascorbic acid (as Sodium ascorbate) 500 mg | 10 tablet | $0.26

**Chewable tablet**

CAUTIONARY AND ADVISORY LABELS 24

EXCIPIENTS: May contain Aspartame

- **Ascur (Ennogen Healthcare Ltd)**
  - Ascorbic acid 100 mg chewable tablets | 30 tablet | $3.95

Combination available: Vitamin B substances with ascorbic acid, p. 1081. Vitamins A, C and D, p. 1079

**VITAMINS AND TRACE ELEMENTS › VITAMIN D AND ANALOGUES**

**Vitamin D and analogues (systemic)**

**CONTRA-INDICATIONS**

- Hypercalcaemia - metastatic calcification

**SIDE-EFFECTS**

- Common or very common: Abdominal pain - headache - hypercalcaemia - hypercalciuria - nausea - skin reactions

- Uncommon: Appetite decreased - constipation - thirst - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Overdose**

Symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation,
**Alfalcacidol (1,25-Hydroxycholecalciferol)**

**INDICATIONS AND DOSE**

Patients with severe renal impairment requiring vitamin D therapy

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
  - Adult: Initially 1 microgram daily, dose to be adjusted to avoid hypercalcemia; maintenance 0.25–1 microgram daily
  - Elderly: Initially 500 nanograms daily, dose adjusted to avoid hypercalcemia; maintenance 0.25–1 microgram daily

**Prevention of vitamin D deficiency in renal or cholestatic liver disease**

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
  - Child 1 month–11 years: 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day
  - Child 12–17 years: 1 microgram once daily, dose to be adjusted as necessary

**Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism**

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
  - Child 1 month–11 years: body-weight up to 20 kg: 15–30 nanograms/kg once daily (max. per dose 500 nanograms)
  - Child 1 month–11 years: body-weight 20 kg and above: 250–500 nanograms once daily, dose to be adjusted as necessary
  - Child 12–17 years: 250–500 nanograms once daily, dose to be adjusted as necessary

**DOSE EQUIVALENCES AND CONVERSION**

- One drop of alfalcacidol 2 microgram/mL oral drops contains approximately 100 nanograms alfalcacidol.

**INTERACTIONS**

- Nephrolithiasis • take care to ensure correct dose in infants
- Appendix 1: vitamin D substances
- Abdominal discomfort • rash pustular
- Asthenia • diarrhoea • malaise • myalgia • urolithiasis
- Rare • Dizziness
- Confusion • renal impairment
- Manufacturer advises avoid—no information available.
- Monitor plasma-calcium concentration in renal impairment.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**

- **EXCIPIENTS**: May contain Alcohol, propylene glycol
  - **One-Alpha (LEO Pharma)**
    - Alfalcacidol 2 microgram per 1 ml One-Alpha 2 micrograms/1 ml solution for injection ampoules | 10 ampoule [PDR] £41.13
    - One-Alpha 1 micrograms/0.5 ml solution for injection ampoules | 10 ampoule [PDR] £21.57

**Oral drops**

- **EXCIPIENTS**: May contain Alcohol
  - **One-Alpha (LEO Pharma)**
    - Alfalcacidol 2 microgram per 1 ml One-Alpha 2 micrograms/ml oral drops sugar-free | 10 ml [PDR] £21.30 DT = £21.30

**Capsules**

- **EXCIPIENTS**: May contain Sesame oil
  - **Alfalcacidol (Non-proprietary)**
    - Alfalcacidol 250 nanogram Alfalcacidol 250 nanogram capsules | 30 capsule [PDR] £5.00 DT = £4.94
    - Alfalcacidol 500 nanogram Alfalcacidol 500 nanogram capsules | 30 capsule [PDR] £10.00 DT = £9.89
    - Alfalcacidol 1 microgram Alfalcacidol 1 microgram capsules | 30 capsule [PDR] £13.82
    - **One-Alpha (LEO Pharma)**
      - Alfalcacidol 250 nanogram Alfalcacidol One-Alpha 250 nanogram capsules | 30 capsule [PDR] £3.37 DT = £4.94
      - Alfalcacidol 500 nanogram Alfalcacidol One-Alpha 0.5 microgram capsules | 30 capsule [PDR] £6.27 DT = £5.89
      - Alfalcacidol 1 microgram One-Alpha 1 microgram capsules | 30 capsule [PDR] £8.75 DT = £13.82

**Calcitriol (1,25-Dihydroxycholecalciferol)**

**INDICATIONS AND DOSE**

**Renal osteodystrophy**

- **BY MOUTH**
  - Adult: Initially 250 nanograms daily, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

**Renal osteodystrophy (in patients with normal or only slightly reduced plasma-calcium concentration)**

- **BY MOUTH**
  - Adult: Initially 250 nanograms once daily on alternate days, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

**Established postmenopausal osteoporosis**

- **BY MOUTH**
  - Adult: 250 nanograms twice daily, plasma-calcium concentration and creatinine to be monitored (consult product literature)

**INTERACTIONS**

- Appendix 1: vitamin D substances
- Common or very common Urinary tract infection
- Frequency not known Abdominal pain upper • apathy • arrhythmia • dehydration • drowsiness • fever • growth retardation • muscle weakness • paralytic ileus • polydipsia • psychiatric disorder • sensory disorder • urinary disorders • weight decreased

**RENA L IM PA IRMENT**

- Manufacturer advises avoid—no information available.
- Monitor plasma-calcium concentration in renal impairment.

**MONITORING REQUIREMENTS**

- Monitor plasma calcium, phosphate, and creatinine during dosage titration.
- Monitor plasma-calcium concentration in patients receiving high doses.
### DIRECTIONS FOR ADMINISTRATION
Contents of capsule may be administered by oral syringe.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**
- **Calcitriol (non-proprietary)**
  - Calcitriol 250 nanogram Calcitriol 250nanogram capsules | 30 capsule [PDP] £5.41–£18.04
  - Calcitriol 500 nanogram Calcitriol 500nanogram capsules | 30 capsule [PDP] £9.68–£32.25
- **Rocaltriol (Roche Products Ltd)**
  - Rocaltriol 250 nanogram Rocaltriol 250nanogram capsules | 100 capsule [PDP] £18.04 DT = £18.04
  - Rocaltriol 500 nanogram Rocaltriol 500nanogram capsules | 100 capsule [PDP] £32.25 DT = £32.25

**Oral solution**
- **Colecalciferol (Non-proprietary)**
  - Colecalciferol 400 unit Colecalciferol 400unit tablets | 60 tablet £15.50
  - Colecalciferol 800 unit Colecalciferol 800unit tablets | 30 tablet [PDP] £3.60–£4.32 DT = £3.60

  - Pro D3 (Synergy Biologies Ltd)
  - Colecalciferol 2000 unit per 1 ml Pro D3 2,000units/ml liquid | 50 ml £16.80 | 100 ml £22.50
Colecalciferol with calcium carbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 1084, calcium carbonate p. 1045.

- **INDICATIONS AND DOSE**
  - Prevention and treatment of vitamin D and calcium deficiency
  - **BY MOUTH**
    - Adult: Dosed according to the deficit or daily maintenance requirements (consult product literature)

- **INTERACTIONS**  
  - Appendix 1: calcium salts - vitamin D substances

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **Accrete D3** contains calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units); **Adcal-D3** tablets contain calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units); **Calcio D3** contains calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet; **Calcios** contains calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet; **Calcios D3** contains calcium carbonate 2.5 g (calcium 1000 mg or Ca2+ 25 mmol), colecalciferol 22 micrograms (880 units)/sachet; **Calcios D3 Forte** contains calcium carbonate 3.75 g (calcium 1500 mg or Ca2+ 37.5 mmol), colecalciferol 33 micrograms (1320 units)/sachet; **Calcios D3 Forte** contains calcium carbonate 5.6 g (calcium 2200 mg or Ca2+ 56 mmol), colecalciferol 55 micrograms (2200 units)/sachet;

Carbonate (calcium 500 mg or Ca\(^{2+}\) 12.5 mmol), colecalciferol 10 micrograms (400 units); *Kalcipos-D\(^{®}\) contains calcium carbonate (calcium 500 mg or Ca\(^{2+}\) 12.5 mmol), colecalciferol 20 micrograms (800 units); *Natecal D\(^{®}\) contains calcium carbonate 1.5 g (calcium 600 mg or Ca\(^{2+}\) 15 mmol), colecalciferol 10 micrograms (400 units); consult product literature for details of other available products.

Flavours of chewable and soluble forms may include orange, lemon, aniseed, peppermint, molasses, or tutti-frutti.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

#### Effervescent granules

- **Calcium carbonate 1.5 gram, Colecalciferol 880 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 880 unit**
- **Calcium carbonate 1.5 gram, Colecalciferol 800 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 800 unit**
- **Calcium carbonate 1.5 gram, Colecalciferol 440 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 440 unit**

#### Effervescent tablet

- **Calcium carbonate 1.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 1.5 gram, Colecalciferol 200 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 200 unit**
- **Calcium carbonate 1.25 gram, Colecalciferol 440 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 440 unit**

#### Chewable tablet

- **Calcium carbonate 1.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 1.5 gram, Colecalciferol 200 unit**

#### Chewable caplet

- **Calcium carbonate 1.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 400 unit**

#### Chewable formulation

- **Calcium carbonate 1.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 400 unit**

#### Oral solution

- **Calcium carbonate 1.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 1.5 gram, Colecalciferol 200 unit**

### Medicinal forms

- **Calcium carbonate 1.5 gram, Colecalciferol 200 unit**
- **Calcium carbonate 1.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 200 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 400 unit**

### Colecalciferol with calcium phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 1084, calcium phosphate p. 1046.

#### INDICATIONS AND DOSE

- **Calcium and vitamin D deficiency**
  - **By mouth**
  - **Adult:** (consult product literature)

#### INTERACTIONS

- Appendix 1: calcium salts - vitamin D substances

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Powder

- **Calcium carbonate 1.5 gram, Colecalciferol 800 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 800 unit**

#### Dihydrotachysterol

- **Calcium carbonate 1.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 1.5 gram, Colecalciferol 200 unit**

#### Ergocalciferol (Calciferol; Vitamin D\(_3\))

- **Calcium carbonate 1.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 1.5 gram, Colecalciferol 200 unit**

#### Oral solution

- **Calcium carbonate 1.5 gram, Colecalciferol 400 unit**
- **Calcium carbonate 2.5 gram, Colecalciferol 400 unit**

#### Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease

- **By mouth**
- **Adult:** Up to 40 000 units daily
Hypocalcaemia of hypoparathyroidism to achieve normocalcaemia

- **BY MOUTH**
  - Adult: Up to 100 000 units daily

**Prevention of vitamin D deficiency**

- **BY MOUTH**
  - Adult: 400 units daily

**Treatment of vitamin D deficiency**

- **BY MOUTH**
  - Adult: 800 units daily, higher doses may be necessary for severe deficiency

- **CAUTIONS** Take care to ensure correct dose in infants
- **INTERATIONS** → Appendix 1: vitamin D substances

**RENAL IMPAIRMENT**

Monitoring: Monitor plasma-calcium concentration in patients receiving high doses.

**MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

**PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied.

When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

**Tablet**

- Ergo-02 (Enogen Healthcare Ltd)
  - Ergocalciferol 12.5 microgram: Ergo-02 12.5 microgram tablets | 30 tablet
- Ergoral (Cubic Pharmaceuticals Ltd)
  - Ergocalciferol 125 microgram: Ergoral D 5,000 unit tablets | 30 tablet
- Ergocalciferol 250 microgram: Ergoral D 10,000 unit tablets | 30 tablet

**Oral solution**

- Uvesterol (Imported (France))
  - Ergocalciferol 1500 unit per 1 ml: Uvesterol D 1,500 units/ml oral solution sugar-free | 20 ml [P ]
- Eciferal (Rhodes Pharma Ltd)
  - Ergocalciferol 3000 unit per 1 ml: Eciferal D 3,000 units/ml liquid | 60 ml [P ]

**Capsule**

- Eciferal (Rhodes Pharma Ltd)
  - Ergocalciferol 1.25 mg: Eciferal D 50,000 unit capsules | 10 capsule
- Ergoral (Cubic Pharmaceuticals Ltd)
  - Ergocalciferol 1.25 mg: Ergoral D 50,000 unit capsules | 10 capsule

**Ergocalciferol with calcium lactate and calcium phosphate**

**(Calcium and vitamin D)**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol p. 1086, calcium lactate p. 1046.

- **INDICATIONS AND DOSE**
  - Prevention of calcium and vitamin D deficiency
  - Treatment of calcium and vitamin D deficiency
  - **BY MOUTH**
  - Adult: (consult product literature)

**INTERACTIONS** → Appendix 1: calcium salts - vitamin D substances

**DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed before administration, or may be chewed.

**PRESCRIBING AND DISPENSING INFORMATION** Each tablet contains calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca²⁺ 2.4 mmol), ergocalciferol 10 micrograms (400 units).

**PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer calcium and ergocalciferol tablets.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - Ergocalciferol with calcium lactate and calcium phosphate (Non-proprietary)
    - Ergocalciferol 10 microgram, Calcium phosphate 150 mg, Calcium lactate 300 mg: Calcium and Ergocalciferol tablets | 28 tablet [P ] £25.55 DT = £22.94

**Paricalcitol**

**INDICATIONS AND DOSE**

Prevention and treatment of secondary hyperparathyroidism associated with chronic kidney disease

- **BY MOUTH**
  - Adult: (consult product literature)

Prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure in patients on haemodialysis

- Adult: To be administered via haemodialysis access (consult product literature)

**INTERACTIONS** → Appendix 1: vitamin D substances

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common: Asthenia, nausea, vomiting, weakness, paresthesia, dry mouth, malaise - muscle complaints - pain
- Uncommon: Angioedema, laryngeal oedema
- Frequency not known: Angioedema, laryngeal oedema

**SPECIFIC SIDE-EFFECTS**

- Uncommon
  - With oral use: Breast tenderness, gastrointestinal discomfort, gastroesophageal reflux disease, palpitations - peripheral oedema, pneumonia
  - With parenteral use: Alopecia, anaemia, anxiety, arrhythmias, asthma, appetite disturbance, breast cancer, breast pain, cardiac arrest, cerebrovascular insufficiency, chest pain, coma, condition aggravated - confusion, conjunctivitis, cough, delirium, depersonalisation, dyspepsia, dysphagia, dysphoria - ear disorder, erectile dysfunction, fever, gait abnormal - gastrointestinal disorders, glaucoma - haemorrhage, hirsutism, hyperhidrosis, hyperparathyroidism, hypertension, hypotension, increased risk of infection, insomnia, joint disorders, leucopenia, lymphadenopathy, myalgia, nausea, oedema, pulmonary oedema - sensation abnormal - sepsis - syncope - weight decreased
- PREGNANCY: Manufacturer advises avoid — toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid — no information available.

**MONITORING REQUIREMENTS**

- Monitor plasma calcium and phosphate during dose titration and at least monthly when stabilised.
- Monitor parathyroid hormone concentration.
**VITAMINS AND TRACE ELEMENTS**

### Vitamin E

#### Alpha tocopherol

**Tocopherol**

- **INDICATIONS AND DOSE**
  - Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis
  - **BY MOUTH USING ORAL SOLUTION**
  - Child: 17 mg/kg daily, dose to be adjusted as necessary

- **CAUTIONS**
  - Predisposition to thrombosis

- **SIDE-EFFECTS**
  - Common or very common: Diarrhoea
  - Uncommon: Alopecia, amenorrhoea

- **PREGNANCY**
  - Manufacturer advises caution, no evidence of harm in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution. Risk of renal toxicity due to polyethylene glycol content.

- **MONITORING REQUIREMENTS**
  - Tocofersolan is a water-soluble form of D-alpha tocopherol.

#### Alpha tocopheryl acetate

**Tocopherol**

- **INDICATIONS AND DOSE**
  - Vitamin E deficiency
  - **BY MOUTH**
  - Child: 2–10 mg/kg daily, increased if necessary up to 20 mg/kg daily
  - Malabsorption in cystic fibrosis
  - **BY MOUTH**
  - Child 1–11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - **EXCipients:** May contain ethanol, propylene glycol
  - **Zemplar** (AbbVie Ltd)
    - Paricalcitol 5 microgram per 1 ml Zemplar 5 micrograms/ml solution for injection vials | 5 vial (Rx) £62.00 (Hospital only)
  - **Capsule**
    - **EXCipients:** May contain ethanol
    - **Zemplar** (AbbVie Ltd)
      - Paricalcitol 1 microgram Zemplar 1 microgram capsules | 28 capsule (Rx) £69.44 DT = £69.44
      - Paricalcitol 2 microgram Zemplar 2 microgram capsules | 28 capsule (Rx) £138.88 DT = £138.88

#### Vitamin E deficiency

- Child 1-11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Child 12-17 years: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- Adult: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

- **Vitamin E deficiency in cholestasis and severe liver disease**
  - **BY MOUTH**
  - Child 1-month-11 years: Initially 100 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily
  - Child 12-17 years: Initially 200 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily

#### Malabsorption in abetalipoproteinaemia

- **BY MOUTH**
  - Adult: 50–100 mg/kg once daily

- **CAUTIONS**
  - Predisposition to thrombosis

- **INTERACTIONS**
  - Appendix 1: vitamin E substances

- **SIDE-EFFECTS**
  - Abdominal pain

- **PREGNANCY**
  - No evidence of safety of high doses.

- **BREAST FEEDING**
  - Excreted in milk; minimal risk, although caution with large doses.

- **MONITORING REQUIREMENTS**
  - Increased bleeding tendency in vitamin-K deficient patients or those taking anticoagulants (prothrombin time and INR should be monitored).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: chewable tablet

#### Oral suspension

- **EXCipients:** May contain Sucrose
  - **Alpha tocopheryl acetate (Non-proprietary)**
    - Alpha tocopheryl acetate 100 mg per 1 ml
      - Alpha tocopheryl acetate 500 mg/5 ml oral suspension | 100 ml (Rx) £67.97 DT = £67.97
    - **Liqua-E** (TriOn Pharma Ltd)
      - Alpha tocopheryl acetate 100 mg per 1 ml
        - Liqua-E 500 mg/5 ml oral suspension | 100 ml £52.96 DT = £67.97

#### Chewable tablet

- **E-Tabs** (Ennogen Healthcare Ltd)
  - Alpha tocopheryl acetate 100 mg | E-Tabs 100 mg chewable tablets | 30 tablet £87.30
- **Ephynal** (Imported (Italy))
  - Alpha tocopheryl acetate 100 mg | Ephynal 100 mg chewable tablets | 30 tablet £163.65

- **Capsule**
  - **Alpha tocopheryl acetate (Non-proprietary)**
    - Alpha tocopheryl acetate 75 unit | Vitamin E 75 unit capsules | 100 capsule £13.05
    - Alpha tocopheryl acetate 200 unit | Vitamin E 200 unit capsules | 30 capsule £10.05
    - Alpha tocopheryl acetate 400 unit | Vitamin E 400 unit capsules | 30 capsule £15.12
  - **E-Caps** (Ennogen Healthcare Ltd)
    - Alpha tocopheryl acetate 75 unit | E-Caps 75 unit capsules | 100 capsule £109.50
    - Alpha tocopheryl acetate 100 unit | E-Caps 100 unit capsules | 30 capsule £94.40
    - Alpha tocopheryl acetate 200 unit | E-Caps 200 unit capsules | 30 capsule £189.50
    - Alpha tocopheryl acetate 400 unit | E-Caps 400 unit capsules | 30 capsule £128.50
    - Alpha tocopheryl acetate 1000 unit | E-Caps 1,000 unit capsules | 30 capsule £130.20

www.getintopharma.com
VITAMINS AND TRACE ELEMENTS  >  VITAMIN K

**Menadiol sodium phosphate**

- **INDICATIONS AND DOSE**
  - **Prevention of Vitamin K deficiency in malabsorption syndromes**
    - **BY MOUTH**
      - **Adult:** 10–40 mg daily, dose to be adjusted as necessary

- **CONTRA-INDICATIONS**
  - Infants - neonates

- **CAUTIONS**
  - G6PD deficiency (risk of haemolysis), vitamin E deficiency (risk of haemolysis)

- **PREGNANCY**
  - Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.

- **MEDICINAL FORMS**
  - No licensed medicines listed.

**Phytomenadione**

*(Vitamin K₃)*

- **INDICATIONS AND DOSE**
  - **Major bleeding in patients on warfarin (in combination with dried prothrombin complex or fresh frozen plasma)**
    - **BY MOUTH**
      - **Adult:** 5 mg for 1 dose, stop warfarin treatment
    - **INR > 8.0 with minor bleeding in patients on warfarin**
      - **BY SLOW INTRAVENOUS INJECTION**
        - **Adult:** 1–3 mg, stop warfarin treatment, dose may be repeated if INR still too high after 24 hours, restart warfarin treatment when INR <5
    - **INR > 8.0 with no bleeding in patients on warfarin**
      - **BY MOUTH**
        - **Adult:** 1–5 mg, intravenous preparation to be used orally, stop warfarin treatment, repeat dose if INR still too high after 24 hours, restart warfarin treatment when INR <5
    - **INR 5.0–8.0 with minor bleeding in patients on warfarin**
      - **BY SLOW INTRAVENOUS INJECTION**
        - **Adult:** 1–3 mg, stop warfarin treatment, restart warfarin treatment when INR <5
    - **Reversal of anticoagulation prior to elective surgery (after warfarin stopped)**
      - **BY MOUTH**
        - **Adult:** 1–5 mg, intravenous preparation to be used orally, dose to be given the day before surgery if INR ≥1.5
    - **Reversal of anticoagulation prior to emergency surgery (when surgery can be delayed 6–12 hours)**
      - **BY INTRAVENOUS INJECTION**
        - **Adult:** 5 mg as a single dose, if surgery cannot be delayed, dried prothrombin complex can be given in addition to phytomenadione and the INR checked before surgery

- **UNLICENSED USE**
  - Oral use of intravenous preparations is unlicensed.

- **CAUTIONS**
  - Intravenous injections should be given very slowly—risk of vascular collapse

- **PREGNANCY**
  - Use if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Present in milk.

- **HEPATIC IMPAIRMENT**

- **DIRECTIONS FOR ADMINISTRATION**
  - Konakion® MM Paediatric Konakion® MM Paediatric may be administered by mouth or by intramuscular injection or by intravenous injection. For intravenous injection, may be diluted with Glucose 5% if necessary.
  - Konakion® MM Konakion® MM may be administered by slow intravenous injection or by intravenous infusion in glucose 5%; *not* for intramuscular injection. For intravenous infusion (Konakion® MM), give intermittently in Glucose 5%; dilute with 55 ml; may be injected into lower part of infusion apparatus.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

- **Solution for injection**

  - **EXCIPIENTS:** May contain Glycocholic acid, lecithin
  - Konakion MM (Cheplapharm Arzneimittel GmbH)
    - Phytomenadione 10 mg per 1 ml Konakion MM Paediatric 2mg/0.2ml solution for injection ampoules | 5 ampoules | £4.71
    - Konakion MM 10mg/1ml solution for injection ampoules | 10 ampoule | £3.78

---

**Neural tube defects (prevention in pregnancy)**

**Neural tube defects (prevention in pregnancy)**

**Description of condition**

Neural tube defects represent a group of congenital defects, caused by incomplete closure of the neural tube within 28 days of conception. The most common forms are anencephaly, spina bifida and encephalocele. The main risk factors are maternal folate deficiency, maternal vitamin B₁₂ deficiency, previous history of having an infant with a neural tube defect, smoking, diabetes, obesity, and use of antiepileptic drugs. For information on smoking cessation see Smoking cessation p. 497.

**Prevention in pregnancy**

- **LEGO** Pregnant women or women who wish to become pregnant should be advised to take supplementation with folic acid p. 1025 before conception and until week 12 of pregnancy.
- A higher daily dose (see folic acid) is recommended for women at a high risk of conceiving a child with a neural tube defect, including women who have previously had an infant with a neural tube defect, who are receiving antiepileptic medication (see Epilepsy p. 305), or who have diabetes or sickle-cell disease.

## 1 Arthritis

### Osteoarthritis and soft-tissue disorders

**Overview**

For pain relief in osteoarthritis and soft-tissue disorders, paracetamol p. 444 should be used first and may need to be taken regularly. A topical NSAID or topical capsaicin 0.025% p. 483 should also be considered, particularly in knee or hand osteoarthritis. An oral NSAID can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an opioid analgesic may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered before a NSAID in patients taking low-dose aspirin.

Intra-articular corticosteroid injections may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation. Non-drug measures, such as weight reduction and exercise, should also be encouraged.

Glucosamine p. 1095 and rabeprazole sodium are not recommended for the treatment of osteoarthritis. Hyaluronic acid and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate p. 1169 (Durolane®, Euflexxa®, Femhylar®, Orthovisc®, Ostenil®, Ostenil Plus®, Renexa®, Suplasyrn®, Synocrom®, Synvisc®) or hylan G-F 20 (Synvisc®) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation. Sodium hyaluronate (SportVis®) is also licensed for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

### Rheumatoid arthritis

**Description of condition**

Rheumatoid arthritis is a chronic systemic inflammatory disease that causes persistent symmetrical joint synovitis (inflammation of the synovial membrane) typically of the small joints of the hands and feet, although any synovial joint can be affected. Synovitis presents as pain and prolonged stiffness that tends to be worse at rest or following periods of inactivity, swelling, tenderness, and heat in the affected joints. Other symptoms of rheumatoid arthritis include rheumatoid nodules and non-specific symptoms such as malaise, fatigue, fever, and weight loss.

As the disease progresses, it can cause joint deformity and affect different organs of the body, such as the heart, lungs, and eyes; therefore early diagnosis and treatment of rheumatoid arthritis is essential to reduce the impact of the disease.

Palindromic rheumatism is a rare form of inflammatory arthritis which causes attacks of joint pain and swelling similar to rheumatoid arthritis, but the joints return to normal in between attacks. Patients with palindromic rheumatism may later develop rheumatoid arthritis.

**Aims of treatment**

The aims of treatment are to relieve the symptoms of rheumatoid arthritis, achieve disease remission or low disease activity if remission cannot be achieved, and to improve the patient’s ability to perform daily activities.

**Non-drug treatment**

Patients with rheumatoid arthritis should have access to a multidisciplinary team, and may benefit from physiotherapy to encourage exercise, enhance flexibility of joints and strengthen muscles. Psychological interventions such as relaxation, stress management, and cognitive coping skills to support patients with their perception and management of their disease can also be offered.

**Drug treatment**

All patients with suspected persistent synovitis of unknown cause should be referred to a specialist for advice as soon as possible to confirm diagnosis and evaluate disease activity.

In patients with newly diagnosed active rheumatoid arthritis, monotherapy with a conventional disease-modifying antirheumatic drug (DMARD), either oral methotrexate p. 913, leflunomide p. 1096, or sulfasalazine p. 44, should be given as first-line treatment; hydroxychloroquine sulfate p. 1095, a weak DMARD, is an alternative in patients with mild rheumatoid arthritis or those with palindromic rheumatism. Treatment should be started as soon as possible, ideally within 3 months of onset of persistent symptoms, and the dose should be titrated to the maximum tolerated effective dose.

Conventional DMARDs have a slow onset of action and can take 2–3 months to take effect. Consider short-term bridging treatment with a corticosteroid (by oral, intramuscular, or intra-articular administration) when starting treatment with a new DMARD to provide rapid symptomatic control, while waiting for the DMARD to take
effect. Short-term corticosteroids should also be given to rapidly decrease inflammation during flare-ups.

If symptoms of rheumatoid arthritis are inadequately controlled despite dose escalation on DMARD monotherapy, combination therapy with another conventional DMARD (either oral methotrexate p. 913, leflunomide p. 1096, sulfasalazine p. 44, or hydroxychloroquine sulfate p. 1095) should be given.

Treatment with a tumour necrosis factor (TNF) alpha inhibitor (either adalimumab p. 1108, certolizumab pegol p. 1111, etanercept p. 1113, golimumab p. 1115, or infliximab p. 1116), other biological DMARD (either abatacept p. 1107, sarilumab p. 1099, or tocilizumab p. 1101), or targeted synthetic DMARD (either baricitinib p. 1104 or tofacitinib p. 1105) is recommended if there has been an inadequate response to combination therapy with conventional DMARDS. See National funding/access decisions for individual drugs for full prescribing information.

Rituximab p. 882 in combination with methotrexate p. 913 is an alternative option for patients with severe active rheumatoid arthritis who have had an inadequate response to, or are intolerant of other DMARDS, including at least one TNF alpha inhibitor. See National funding/access decisions for rituximab p. 882.

In patients with established rheumatoid arthritis, the long-term use of corticosteroids should only be continued if all other treatments options (including biological and targeted synthetic DMARDS) have been offered.

Patients with active rheumatoid arthritis should be monitored monthly until the treatment target (either remission or low disease activity) has been achieved, and all patients with rheumatoid arthritis should be reviewed annually. In patients who have maintained the treatment target for at least 1 year without corticosteroids, cautiously reducing drug doses to the lowest that are clinically effective, or tapering and stopping at least one drug if the patient is being treated with two or more DMARDS should be considered.

Older conventional DMARDS such as sodium aurothiomalate p. 1098 (gold), azathioprine p. 836, cyclosporin p. 838 and penicillamine p. 1097 are no longer commonly used in practice due to the availability of newer, more effective drugs.

Pain relief

Short-term use of an oral non-steroidal anti-inflammatory drug (NSAID) or a selective cyclo-oxygenase-2 inhibitor should be considered for additional control of pain in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

Surgery

Surgery may be an option for some patients if drug treatment has failed to adequately manage persistent pain due to joint damage or other identifiable soft tissue causes, if there is worsening of joint function, progressive deformity, or persistent localised synovitis.

Useful Resources

Psoriatic arthritis and other peripheral spondyloarthritides

Monotherapy with local corticosteroid injections should be considered for non-progressive monoarthritis (see Corticosteroids, inflammatory disorders p. 1153).

Standard DMARDs, such as methotrexate p. 913, leflunomide p. 1096 or sulfasalazine p. 44, can be used for patients with peripheral polyarthritis, oligoarthritis, or persistent or progressive monoarthritis associated with peripheral spondyloarthritis.

Standard DMARDs, such as methotrexate p. 913 or leflunomide p. 1096 can also be used for patients with psoriatic arthritis.

The choice of DMARD will depend on numerous factors such as the patient’s circumstances (such as pregnancy planning and alcohol consumption), comorbidities (such as uveitis, psoriasis and inflammatory bowel disease), and potential side-effects.

If a standard DMARD taken at the maximum tolerated dose for at least 3 months does not provide adequate relief from symptoms, a switch to, or the addition of, another standard DMARD can be considered.

An NSAID can be used as an adjunct to standard DMARDs or biological DMARDs to manage symptoms. If NSAIDs do not provide adequate relief from symptoms, consider corticosteroid injections or short-term oral corticosteroid therapy as an adjunct to standard DMARDs or biological DMARDs to manage symptoms.

If extra-articular disease is adequately controlled by an existing standard DMARD but peripheral spondyloarthritides is not, consider adding another standard DMARD.

Further options for psoriatic arthritis

The targeted DMARD apremilast p. 1119, used alone or in combination with standard DMARDs, is recommended for the treatment of active and progressive psoriatic arthritis if the patient has peripheral arthritis with 3 or more tender joints and 3 or more swollen joints, and the psoriatic arthritis has not responded to at least 2 standard DMARDs given alone or in combination.

The biological DMARDs etanercept p. 1113, infliximab p. 1116, golimumab p. 1115 and adalimumab p. 1108 (TNF-alpha inhibitors) are recommended for the treatment of active and progressive psoriatic arthritis if the patient has peripheral arthritis with 3 or more tender joints and 3 or more swollen joints, and the psoriatic arthritis has not responded to at least 2 standard DMARDs given alone or in combination.

Ustekinumab p. 1103, alone or in combination with methotrexate, is recommended for treating active psoriatic arthritis when treatment with TNF-alpha inhibitors is contra-indicated but would otherwise be considered or the patient has had treatment with one or more TNF-alpha inhibitors. The response to treatment should be assessed at 24 weeks and should only be continued if there is clear evidence of response.

Reactive arthritis

After treating the initial infection, do not offer long-term (4 weeks or longer) treatment with an antibacterial solely to manage reactive arthritis caused by a gastrointestinal or genito-urinary infection.

Useful Resources

Rheumatic disease, suppressing drugs

Overview

Certain drugs such as those affecting the immune response can suppress the disease process in rheumatoid arthritis and psoriatic arthritis, see Rheumatoid arthritis p. 1091 or Spondyloarthritis p. 1092. Systemic and discoid lupus erythematosus are sometimes treated with chloroquine p. 616 or hydroxychloroquine sulfate p. 1095.

The choice of a disease-modifying antirheumatic drug (DMARD) should take into account co-morbidity and patient preference. Methotrexate p. 913, sulfasalazine p. 44, intramuscular gold, and penicillamine p. 1097 are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

Gold

Gold, given as sodium aurothiomalate p. 1098, is licensed for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose must be given followed by doses at weekly intervals until there is definite evidence of remission. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

Penicillamine

Penicillamine has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Sulfasalazine

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints [unlicensed indication]. Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

Antimalarials

The antimalarial hydroxychloroquine sulfate is used to treat rheumatoid arthritis of mild inflammatory activity; chloroquine is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed.

Chloroquine and hydroxychloroquine sulfate are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis. Chloroquine and hydroxychloroquine sulfate are better tolerated than gold or penicillamine. Retinopathy rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

Mepacrine hydrochloride p. 505 is sometimes used in discoid lupus erythematosus [unlicensed].
Drugs affecting the immune response

Methotrexate is a DMARD used in active rheumatoid arthritis. Methotrexate is usually given by mouth once a week, adjusted according to response. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid p. 1025 given every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Leflunomide p. 1096 acts on the immune system as a DMARD. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months.

Drugs that affect the immune response are also used in the management of severe cases of systemic lupus erythematosus and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of polymyositis that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine p. 836 is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide, methotrexate, or azathioprine [unlicensed indication] may be used.

Juvenile idiopathic arthritis

Many children with juvenile idiopathic arthritis (juvenile chronic arthritis) do not require DMARDs. Methotrexate is effective; sulfasalazine is an alternative [unlicensed indication] but it should be avoided in systemic-onset juvenile idiopathic arthritis. Gold and penicillamine are no longer used. Cytokine modulators have a role in juvenile idiopathic arthritis.

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab is licensed for moderate to severe active rheumatoid arthritis when response to other DMARDs (including methotrexate) has been inadequate; it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive psoriatic arthritis and severe active ankylosing spondylitis that have not responded adequately to other DMARDs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

Adalimumab also has a role in inflammatory bowel disease and plaque psoriasis.

Certolizumab pegol is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to DMARDs (including methotrexate) has been inadequate. Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

Etanercept is licensed for the treatment of moderate to severe active rheumatoid arthritis either alone or in combination with methotrexate when the response to other DMARDs is inadequate and in severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate. It is also licensed for the treatment of active and progressive psoriatic arthritis inadequately responsive to other DMARDs, and for severe ankylosing spondylitis inadequately responsive to conventional therapy. Etanercept also has a role in plaque psoriasis.

Golimumab is licensed in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis when response to DMARD therapy (including methotrexate) has been inadequate; it is also licensed in combination with methotrexate for patients with severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive psoriatic arthritis, as monotherapy or in combination with methotrexate p. 913, when response to DMARD therapy has been inadequate; it is also licensed for the treatment of severe active ankylosing spondylitis when there is an inadequate response to conventional treatment.

Infliximab p. 1116 is licensed for the treatment of active rheumatoid arthritis in combination with methotrexate when the response to other DMARDs, including methotrexate, is inadequate; it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of ankylosing spondylitis, in patients with severe axial symptoms who have not responded adequately to conventional therapy, and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive psoriatic arthritis which has not responded adequately to DMARDs.

Rituximab p. 882 is licensed in combination with methotrexate for the treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other DMARDs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them. Rituximab has a role in malignant disease.

Abatacept p. 1107 prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active rheumatoid arthritis in combination with methotrexate, in patients unresponsive to other DMARDs (including methotrexate or a tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors.

Anakinra p. 1098 inhibits the activity of interleukin-1.

Anakinra (in combination with methotrexate) is licensed for the treatment of rheumatoid arthritis which has not responded to methotrexate alone. Anakinra is no longer recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop.

Baricitinib p. 1104 and tofacitinib p. 1105 are licensed alone or in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis in patients who have had an inadequate response to, or who are intolerant to, one or more DMARDs.

Belimumab p. 845 inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as an adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy.

Sarilumab p. 1099 is a recombinant human monoclonal antibody that specifically binds to interleukin-6 receptors and blocks the activity of pro-inflammatory cytokines; it is...
licensed alone or in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to one or more DMARDs.

Secukinumab p. 1100 inhibits the activity of interleukin-17A. Secukinumab is licensed for the treatment of active psoriatic arthritis, in combination with methotrexate or alone, which has not responded adequately to DMARDs; it is also licensed for the treatment of ankylosing spondylitis, in patients who have not responded adequately to conventional therapy. Secukinumab also has a role in plaque psoriasis. Tocilizumab p. 1101 antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to at least one DMARD or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated.

Ustekinumab p. 1103 inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more DMARDs.

**Other drugs used for Arthritis**

Aceclofenac, p. 1132 • Celecoxib, p. 1132 • Cyclophosphamide, p. 894 • Dexamethasone, p. 1132 • Diclofenac sodium, p. 1135 • Etodolac, p. 1138 • Etoricoxib, p. 1139 • Flurbiprofen, p. 1140 • Ibuprofen, p. 1141 • Indomethacin, p. 1143 • Ixekizumab, p. 1259 • Ketoprofen, p. 1144 • Mefenamic acid, p. 1145 • Meloxicam, p. 1146 • Nabumetone, p. 1147 • Naproxen, p. 1148 • Piroxicam, p. 1149 • Salicylic acid, p. 1150 • Tenoxicam, p. 1151 • Tiaprofenic acid, p. 1152

**Glucosamine**

*Drug Action* Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin.

**Indications and Dose**

**ALETIS®**

Symptomatic relief of mild to moderate osteoarthritides of the knee

- **By mouth**
- Adult: 1250 mg once daily, review treatment if no benefit after 2–3 months

**DOLENIO®**

Symptomatic relief of mild to moderate osteoarthritides of the knee

- **By mouth**
- Adult: 1500 mg once daily, review treatment if no benefit after 2–3 months

**GLUSARTEL®**

Symptomatic relief of mild to moderate osteoarthritides of the knee

- **By mouth**
- Adult: 1500 mg once daily, dose to be dissolved in at least 250 mL of water, review treatment if no benefit after 2–3 months

**Caution** Asthma - impaired glucose tolerance - predisposition to cardiovascular disease

**Interactions** → Appendix 1: glucosamine

**Side-effects**

- Common or very common Constipation - diarrhoea - fatigue - gastrointestinal discomfort - headache - nausea

**Hydroxychloroquine sulfate**

*Drug Action* Active rheumatoid arthritis (administered on expert advice) • Systemic and discoid lupus erythematosus (administered on expert advice) • Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

- **By mouth**
  - Adult: 200–400 mg daily, daily maximum dose to be based on ideal body-weight; maximum 6.5 mg/kg per day

**Caution** Acute porphyrias p. 1058 • Diabetes (may lower blood glucose) • Elderly • G6PD deficiency • May aggravate myasthenia gravis • May exacerbate psoriasis • Neurological disorders (especially in those with a history of epilepsy—may lower seizure threshold) • Severe gastro-intestinal disorders

**Caution: Further Information** Screening for retinopathy A review group convened by the Royal College of Ophthalmologists has updated guidelines on screening for chloroquine and hydroxychloroquine retinopathy (Hydroxychloroquine and Chloroquine Retinopathy: Recommendations on Screening 2018). Recent data have highlighted that hydroxychloroquine retinopathy is more common than previously reported. Screening recommendations for hydroxychloroquine:
Arthritis

- All patients planning to be on long-term treatment should receive a baseline examination (including fundus photography and spectral domain optical coherence tomography) within 6–12 months of treatment initiation.
- Annual screening is recommended in all patients who have taken hydroxychloroquine for greater than 5 years.
- Annual screening may be commenced before 5 years of treatment if additional risk factors for retinal toxicity exist, such as concomitant tamoxifen therapy, impaired renal function (eGFR less than 60 mL/minute/1.73 m²) or high-dose therapy (greater than 5 mg/kg/day of hydroxychloroquine sulfate).

INTERACTIONS → Appendix 1: hydroxychloroquine

SIDE-EFFECTS
- Common or very common Abdominal pain - appetite decreased - diarrhoea - emotional lability - headache - nausea - skin reactions - vision disorders - vomiting
- Uncommon Alopecia - corneal oedema - dizziness - eye disorders - hair colour changes - nervousness - neuromuscular dysfunction - retinopathy - seizure - tinnitus - vertigo
- Frequency not known Acute hepatic failure - agranulocytosis - anaemia - angioedema - bone marrow disorders - bronchospasm - cardiac conduction disorders - cardiomyopathy - hearing loss - hypoglycaemia - leucopenia - movement disorders - muscle weakness - myopathy - photosensitivity reaction - psychosis - reflexes absent - severe cutaneous adverse reactions (SCARs) - thrombocytopenia - tremor - ventricular hypertrophy

OVERDOSE Hydroxychloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

PREGNANCY It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

BREAST FEEDING Avoid—risk of toxicity in infant.

HEPATIC IMPAIRMENT Caution in moderate to severe hepatic impairment.

RENAL IMPAIRMENT Manufacturer advises caution.

Monitoring Monitor plasma-hydroxychloroquine concentration in severe renal impairment.

MONITORING REQUIREMENTS Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists).

PRESCRIBING AND DISPENSING INFORMATION To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

MEDICINAL FORMS There can be a variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21
- Hydroxychloroquine sulfate (non-proprietary)
  - Hydroxychloroquine sulfate 200 mg Hydroxychloroquine 200mg tablets | 60 tablet [PHB] £32.49 DT = £3.70
  - Quinoric (Bristol Laboratories Ltd)
  - Hydroxychloroquine sulfate 200 mg Quinoric 200mg tablets | 60 tablet [PHB] £4.75 DT = £3.70

Leflunomide

MODERATE AND DOSE

Moderate to severe active rheumatoid arthritis (specialist use only)

BY MOUTH
- Adult: Initially 100 mg once daily for 3 days, then reduced to 10–20 mg once daily

Active psoriatic arthritis (specialist use only)

BY MOUTH
- Adult: Initially 100 mg once daily for 3 days, then reduced to 20 mg once daily

CONTRA-INDICATIONS Serious infection - severe hypoproteinaemia - severe immunodeficiency

CAUTIONS Anaemia (avoid if significant and due to causes other than rheumatoid arthritis). History of tuberculosis - impaired bone-marrow function (avoid if significant and due to causes other than rheumatoid arthritis). Leucopenia (avoid if significant and due to causes other than rheumatoid arthritis). Thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis)

INTERACTIONS → Appendix 1: leflunomide

SIDE-EFFECTS
- Common or very common Abdominal pain - accelerated hair loss - appetite decreased - asthenia - diarrhoea - dizziness - gastrointestinal disorders - headache - leucopenia - nausea - oral disorders - paraesthesia - peripheral neuropathy - skin reactions - tendon disorders - vomiting - weight decreased
- Uncommon Anaemia - anxiety - electrolyte imbalance - hyperlipidaemia - taste altered - thrombocytopenia
- Rare or very rare Agranulocytosis - eosinophilia - hepatic disorders - infection - pancreatitis - pancytopenia - respiratory disorders - sepsis - severe cutaneous adverse reactions (SCARs) - vasculitis
- Frequency not known Cutaneous lupus erythematosus - hypuricaemia - pulmonary hypertension - renal failure

SIDE-EFFECTS, FURTHER INFORMATION Discontinue treatment and institute washout procedure in case of serious side-effect (consult product literature).

Hepatotoxicity Potentially life-threatening hepatotoxicity reported usually in the first 6 months. Discontinue treatment and institute washout procedure—consult product literature or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure.

CONCEPTION AND CONTRACEPTION Effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature). The concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature.

PREGNANCY Avoid—active metabolite teratogenic in animal studies.

BREAST FEEDING Present in milk in animal studies—manufacturer advises avoid.

HEPATIC IMPAIRMENT Manufacturer advises avoid—active metabolite may accumulate.

RENAL IMPAIRMENT Manufacturer advises avoid in moderate or severe impairment—no information available.

PRE-TREATMENT SCREENING Exclude pregnancy before treatment.

www.getintopharma.com
\[ \text{TREATMENT CESSION} \]
Washout Procedure The active metabolite persists for a long period; to aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception, stop treatment and give either colestyramine p. 197 or charcoal, activated p. 1366. Procedure may be repeated as necessary.

\[ \text{MONITORING REQUIREMENTS} \]
- Monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks.
- Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks.
- Monitor blood pressure.

\[ \text{INTERACTIONS} \]
- Lupus erythematosus
- Neurological involvement in Wilson’s disease

\[ \text{SIDE-EFFECTS} \]
- Common or very common: Proteinuria - thrombocytopenia
- Rare or very rare: Alopeica - breast enlargement (males and females) - connective tissue disorders - haematuria (discontinue immediately if cause unknown)
- Hypersensitivity - oral disorders - skin reactions

\[ \text{FURTHER INFORMATION} \]
Proteinuria occurs in up to 30% of patients — can be a sign of immune-mediated nephropathy. Discontinue immediately if nephrotoxicity occurs.

Nausea and rash more common early in treatment if full dose used from initiation. Delayed rash can occur after months or years of treatment — manufacturer advises reduce dose.

\[ \text{CONTRA-INDICATIONS} \]
Lupus erythematosus

\[ \text{CAUTIONS} \]
Neurological involvement in Wilson’s disease

\[ \text{MEDICINAL FORMS} \]
There can be variation in the licensing of different medicines containing the same drug.

\[ \text{DRUG ACTION} \]
Penicillamine aids the elimination of copper ions in Wilson’s disease (hepatolenticular degeneration).

\[ \text{INDICATIONS AND DOSE} \]
Severe active rheumatoid arthritis (administered on expert advice)
- BY MOUTH: Initially 125–250 mg daily for 1 month, then increased in steps of 125–250 mg, at intervals of not less than 4 weeks; maintenance 500–750 mg daily in divided doses, then reduced in steps of 125–250 mg every 12 weeks, dose reduction attempted only if remission sustained for 6 months; maximum 1.5 g per day.
- Elderly: Initially up to 125 mg daily for 1 month, then increased in steps of up to 125 mg, at intervals of at least 4 weeks; maximum 1 g per day.

Wilson’s disease
- BY MOUTH: Initially 1.5–2 g daily in divided doses, adjusted according to response, to be taken before food; maintenance 0.75–1 g daily, a dose of 2 g daily should not be continued for more than one year; maximum 2 g per day.
- Elderly: 20 mg/kg daily in divided doses, adjusted according to response.

Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids)
- BY MOUTH
- Adult: Initially 500 mg daily in divided doses, to be increased slowly over 3 months; maintenance 1.25 g daily.

Cystinuria, prophylactic
- BY MOUTH
- Adult: 0.5–1 g daily, maintain urinary cystine below 300 mg/litre and adequate fluid intake (at least 3 litres daily), to be taken at bedtime.
- Elderly: Minimum dose to maintain urinary cystine below 200 mg/litre is recommended.

\[ \text{SIDE-EFFECTS} \]
- Common or very common: Proteinuria - thrombocytopenia
- Rare or very rare: Alopeica - breast enlargement (males and females) - connective tissue disorders - haematuria (discontinue immediately if cause unknown)
- Hypersensitivity - oral disorders - skin reactions

\[ \text{SIDE-EFFECTS, FURTHER INFORMATION} \]
Proteinuria occurs in up to 30% of patients — can be a sign of immune-mediated nephropathy. Discontinue immediately if nephrotoxicity occurs.

Nausea and rash more common early in treatment if full dose used from initiation. Delayed rash can occur after months or years of treatment — manufacturer advises reduce dose.

\[ \text{ALLERGY AND CROSS-SENSITIVITY} \]
Patients who are hypersensitive to penicillin may react rarely to penicillamine.

\[ \text{PREGNANCY} \]
Fetal abnormalities reported rarely; avoid if possible.

\[ \text{BREAST FEEDING} \]
Manufacturer advises avoid unless potential benefit outweighs risk — no information available.

\[ \text{RENAL IMPAIRMENT} \]
Dose adjustments: Reduce dose and monitor renal function or avoid (consult product literature).

\[ \text{MONITORING REQUIREMENTS} \]
Consider withdrawal if platelet count falls below 120 000/mm³ or white blood cells below 2500/mm³ or if 3 successive falls within reference range (can restart at reduced dose when counts return to known reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).

Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase).

A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase.

Longer intervals may be adequate in cystinuria and Wilson’s disease.

\[ \text{PATIENT AND CARER ADVICE} \]
Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.
**Sodium aurothiomalate**

**INDICATIONS AND DOSE**

**Active progressive rheumatoid arthritis (administered on expert advice)**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: Test dose 10 mg, followed by 50 mg once weekly until there is definite evidence of remission, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, dose to be reduced gradually. Benefit is not expected until 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given.

**Relapse in patients who have previously received sodium aurothiomalate therapy for active progressive rheumatoid arthritis (administered on expert advice)**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 50 mg once weekly until control has been obtained again, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, if no response is seen within 2 months, alternative treatment should be sought.

**CONTRA-INDICATIONS**
- Exfoliative dermatitis
- Blood disorders
- History of bone marrow aplasia
- Necrotising enterocolitis
- Pulmonary fibrosis
- Systemic lupus erythematosus

**CAUTIONS**
- Colitis
- Eczema
- Elderly
- History of urticaria

**CAUTIONS, FURTHER INFORMATION**
- Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre.

**INTERACTIONS**
- Appendix 1: sodium aurothiomalate

**SIDE-EFFECTS**
- Abdominal pain
- Agranulocytosis
- Albuminuria
- Alopecia
- Asthenia
- Blood disorder
- Bone marrow disorders
- Circulatory collapse
- Dry cough
- Dyspnoea
- Encephalopathy
- Enterocolitis
- Eosinophilia
- Flashing
- Hepatic disorders
- Hypersensitivity
- Hypotension
- Leucopenia
- Nephrotic syndrome
- Nerve disorders
- Neutropenia
- Palpitations
- Respiratory disorders
- Shock
- Skin reactions
- Tachycardia
- Thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**
- Rash with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.

**PREGNANCY**
- Manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled.
- **Dose adjustments**
  - Consider reducing dose and frequency.

**BREAST FEEDING**
- Manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiosyncratic reactions.

**HEPATIC IMPAIRMENT**
- Manufacturer advises avoid in severe impairment.

**RENAI IMPAIRMENT**
- Caution in mild to moderate impairment. Avoid in severe impairment.

**MONITORING REQUIREMENTS**
- Urine tests and full blood counts (including total and differential white cell and platelet counts) must be performed before starting treatment and before each intramuscular injection.
- Monitor for pulmonary fibrosis with annual chest X-ray.

**PATIENT AND CARER ADVICE**
- Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop.

**SIDE-EFFECTS, FURTHER INFORMATION**
- Exfoliative dermatitis
- Rashes with pruritus
- Urticaria
- Fainting
- Shock
- Tachycardia
- Albuminuria
- Abdominal pain
- Dyspnoea
- Agranulocytosis
- Neutropenia
- Albuminuria
- Rash
- Pruritus
- Urticaria
- Fainting
- Shock
- Tachycardia
- Neutropenia
- Alopecia
- Asthenia
- Blood disorder
- Bone marrow disorders
- Circulatory collapse
- Dry cough
- Dyspnoea
- Encephalopathy
- Enterocolitis
- Eosinophilia
- Flashing
- Hepatic disorders
- Hypersensitivity
- Hypotension
- Leucopenia
- Nephrotic syndrome
- Nerve disorders
- Neutropenia
- Palpitations
- Respiratory disorders
- Shock
- Skin reactions
- Tachycardia
- Thrombocytopenia

**IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS**

**Anakinra**

**INDICATIONS AND DOSE**
- **Rheumatoid arthritis (in combination with methotrexate) which has not responded to methotrexate alone (specialist use only)**
  - **BY SUBCUTANEOUS INJECTION**
    - Adult: 100 mg once daily.
    - **Cryoisyrin-associated periodic syndromes (specialist use only)**
      - **BY SUBCUTANEOUS INJECTION**
        - Adult: 1–2 mg/kg daily.
        - **Still's disease (specialist use only)**
          - **BY SUBCUTANEOUS INJECTION**
            - Adult (body-weight up to 49 kg): 1–2 mg/kg daily.
            - Adult (body-weight 50 kg and above): 100 mg daily.

**CONTRA-INDICATIONS**
- Active infection - neutropenia (absolute neutrophil count less than 1.5 × 10^9/litre)—do not initiate — pre-existing malignancy.

**CAUTIONS**
- Elderly
- History of asthma (increased risk of serious infection)
- History of recurrent infection
- Predisposition to infection

**INTERACTIONS**
- Appendix 1: anakinra

**SIDE-EFFECTS**
- Common or very common
  - Headache
  - Infection
  - Neutropenia
  - Thrombocytopenia
- Uncommon
  - Skin reactions
- Frequency not known
  - Hepatitis

**SIDE-EFFECTS, FURTHER INFORMATION**
- Neutropenia reported commonly—discontinue if neutropenia develops.

**PREGNANCY**
- Manufacturer advises avoid.

**BREAST FEEDING**
- Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in severe impairment.

**RENAI IMPAIRMENT**
- Manufacturer advises caution in moderate impairment.
- **Dose adjustments**
  - Manufacturer advises consider alternate day dosing in severe impairment.
Sarilumab

**DRUG ACTION** Sarilumab is a recombinant human monoclonal antibody that specifically binds to interleukin-6 receptors and blocks the activity of pro-inflammatory cytokines.

**INDICATIONS AND DOSE** Moderate-to-severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to one or more disease-modifying anti-rheumatic drugs (as monotherapy or in combination with methotrexate) (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - **Adults:** 200 mg every 2 weeks, for dose adjustments due to neutropenia, thrombocytopenia, or liver enzyme elevations—consult product literature

**CONTRA-INDICATIONS** Do not initiate if absolute neutrophil count less than 2 \( \times 10^9 \)/litre · do not initiate if platelet count less than 150 \( \times 10^9 \)/microlitre · do not initiate if serum transaminases (ALT or AST) greater than 1.5 times the upper limit of normal · severe active infection

**CAUTIONS** Chronic or recurrent infection · elderly (increased risk of infection) · history of diverticulitis · history of intestinal ulceration · history of serious or opportunistic infection · predisposition to infection

**CAUTIONS, FURTHER INFORMATION**

- **Infection** Manufacturer advises caution in patients who have been exposed to tuberculosis, or who have lived in or travelled to areas of endemic tuberculosis or mycoses. Patients with latent tuberculosis should complete anti-tuberculosis therapy before initiation of sarilumab; consider anti-tuberculosis therapy before initiation of sarilumab in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed, and for those with a negative test for latent tuberculosis but have risk factors for tuberculosis—consultation with a tuberculosis specialist may be appropriate.

  Manufacturer advises patients should be brought up-to-date with current immunisation schedule before initiating treatment.

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- Common or very common Dyslipidaemia · increased risk of infection · neutropenia · thrombocytopenia
- Frequency not known Hypersensitivity · skin reactions

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for up to 3 months after treatment.

**PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.

**PRE-TREATMENT SCREENING** Manufacturer advises that patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**

- Manufacturer advises monitor for signs and symptoms of infection; monitor neutrophil count 4 to 8 weeks after treatment initiation and according to clinical judgement thereafter—discontinue if absolute neutrophil count less than 0.5 \( \times 10^9 \)/litre.
- Manufacturer advises monitor platelet count 4 to 8 weeks after treatment initiation and according to clinical judgement thereafter—discontinue if platelet count less than 50 \( \times 10^9 \)/microlitre.
- Manufacturer advises monitor hepatic transaminases (ALT and AST) 4 to 8 weeks after treatment initiation and every 3 months thereafter, and consider other liver function tests if clinically indicated—discontinue if ALT is greater than 5 times the upper limit of normal.
- Manufacturer advises monitor lipid profile approximately 4 to 8 weeks after treatment initiation and approximately every 6 months thereafter—hyperlipidaemia should be managed according to clinical guidelines.

**DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to avoid injecting into areas of the skin that are tender, damaged, or have bruises or scars; patients may self-administer Kevzara®, after appropriate training in subcutaneous injection technique.

**PRESCRIBING AND DISPENSING INFORMATION** Sarilumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name; see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
1100 Arthritis

Musculoskeletal system

Sarilumab for moderate-to-severe rheumatoid arthritis

PATIENT AND CARER ADVICE

HANDLING AND STORAGE
Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

PATIENT AND CARER ADVICE
Manufacturer advises patients should be advised to seek immediate medical attention if symptoms of a hypersensitivity reaction occur. Self-administration. Manufacturer advises patients and their carers should be given training in subcutaneous injection technique if appropriate.

Alert card
An alert card should be provided.

Missed doses
Manufacturer advises if a dose is more than 3 days late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions
- Sarilumab for moderate-to-severe rheumatoid arthritis (November 2017) NICE TA485
  - Sarilumab, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs), only if:
    - disease is severe (a disease activity score [DAS28] of more than 5.1), and
    - the manufacturer provides sarilumab with the discount agreed in the patient access scheme.

- Sarilumab, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to or who cannot have other DMARDs, including at least 1 biological DMARD, only if:
  - disease is severe (a DAS28 of more than 5.1), and
  - they cannot have rituximab, and
  - the manufacturer provides sarilumab with the discount agreed in the patient access scheme.

- Sarilumab can be used as monotherapy for people who cannot take methotrexate because it is contra-indicated or because of intolerance, when the above criteria are met.

- Sarilumab, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to rituximab and at least 1 biological DMARD, only if:
  - disease is severe (a DAS28 of more than 5.1), and
  - they cannot have rituximab, and
  - the manufacturer provides sarilumab with the discount agreed in the patient access scheme.

- Sarilumab can be used as monotherapy for people who cannot take methotrexate because it is contra-indicated or because of intolerance, when the above criteria are met.

- Sarilumab, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to rituximab and at least 1 biological DMARD, only if:
  - disease is severe (a DAS28 of more than 5.1), and
  - the manufacturer provides sarilumab with the discount agreed in the patient access scheme.

- Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After an initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

- Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

Scottish Medicines Consortium (SMC) decisions

SCM No. 1314/18
The Scottish Medicines Consortium has advised (April 2018) that sarilumab (Kevzara®) is accepted for restricted use within NHS Scotland for treatment of severely active rheumatoid arthritis (a disease activity score [DAS28] greater than 5.1) that has not responded to intensive therapy with a combination of conventional disease-modifying anti-rheumatic drugs (DMARDs). In patients with severe disease inadequately controlled by a TNF antagonist, it may be used in patients ineligible to receive rituximab. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Kevzara (Sandofi)▼
- Sarilumab 131.6 mg per 1 ml Kevzara 150mg/1.14ml solution for injection pre-filled syringes | 2 pre-filled disposable injection £912.25
- Sarilumab 175 mg per 1 ml Kevzara 200mg/1.14ml solution for injection pre-filled syringes | 2 pre-filled disposable injection £912.25
- Kevzara 200mg/1.14ml solution for injection pre-filled pen | 2 pre-filled disposable injection £912.25

Secukinumab

15-Aug-2017

DRUG ACTION
Secukinumab is a recombinant human monoclonal antibody that selectively binds to cytokine interleukin-17A (IL-17A) and inhibits the release of proinflammatory cytokines and chemokines.

INDICATIONS AND DOSE

Ankylosing spondylitis (initiated by a specialist)
- BY SUBCUTANEOUS INJECTION
  - Adult: 150 mg every week for 5 doses, then maintenance 150 mg every month, review treatment if no response within 16 weeks of initial dose

Psoriatic arthritis (initiated by a specialist)
- BY SUBCUTANEOUS INJECTION
  - Adult: 150 mg every week for 5 doses, then maintenance 150 mg every month, dose may be increased to 300 mg according to clinical response. Review treatment if no response within 16 weeks of initial dose

Psoriatic arthritis with concomitant moderate to severe plaque psoriasis or if inadequate response to anti-TNFα treatment (initiated by a specialist) Plaque psoriasis (initiated by a specialist)
- BY SUBCUTANEOUS INJECTION
  - Adult: 300 mg every week for 5 doses, then maintenance 300 mg every month, review treatment if no response within 16 weeks of initial dose

CONTRA-INDICATIONS
Severe active infection

CAUTIONS
Chronic infection - Crohn’s disease (monitor for exacerbations) - history of recurrent infection - predisposition to infection (discontinue if new serious infection develops)

CAUTIONS, FURTHER INFORMATION
Tuberculosis
Manufacturer advises that patients with latent tuberculosis should complete anti-tuberculosis therapy before starting secukinumab.

INTERACTIONS
- Appendix 1: monoclonal antibodies

SIDE-EFFECTS
Common or very common Diarrhoea - increased risk of infection - rhinorrhoea
Uncommon Conjunctivitis - neutropenia (usually mild and reversible) - urticaria

CONCEPTION AND CONTRACEPTION
Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 20 weeks after stopping treatment.

PREGNANCY
Manufacturer advises avoid—no information available.

BREAST FEEDING
Manufacturer advises avoid during treatment and for up to 20 weeks after discontinuing treatment—no information available.

DIRECTIONS FOR ADMINISTRATION
Manufacturer advises to take the syringe or pen out of the refrigerator
20 minutes before skin administration and to avoid injecting into areas of the skin that show psoriasis. Patients may self-administer Cosentyx® pre-filled pen.

**PATIENT AND CARER ADVICE**
- Self-administration: Patients and their carers should be given training in subcutaneous injection technique.
- Infection: Patients and their carers should be advised to seek immediate medical attention if symptoms of infection develop during treatment with secukinumab.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Secukinumab for treating moderate to severe plaque psoriasis (July 2015) NICE TA350
  - Secukinumab is recommended as an option for the treatment of moderate to severe plaque psoriasis in adults if:
    - the disease has failed to respond to standard systemic treatments (including ciclosporin, methotrexate, and PUVA), or when standard treatments are contra-indicated or not tolerated; and
    - the manufacturer provides secukinumab with the discount agreed in the patient access scheme.
  - Secukinumab should be withdrawn in patients whose psoriasis has not responded adequately within 12 weeks of initial dose; further treatment cycles are not recommended.
  - Patients whose treatment with secukinumab was started before this guidance was published, but does not meet these criteria, should have the option to continue treatment until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/TA350

- Secukinumab for active ankylosing spondylitis after treatment with non-steroidal anti-inflammatory drugs or TNF-alpha inhibitors (September 2016) NICE TA407
  - Secukinumab is recommended, within its marketing authorisation, as an option for treating active ankylosing spondylitis in adults who have responded inadequately to conventional therapy (non-steroidal anti-inflammatory drugs or TNF-alpha inhibitors) only if the manufacturer provides secukinumab with the discount agreed in the patient access scheme.
  - Assess response to secukinumab after 16 weeks of treatment and continue only if there is clear evidence of response, defined as a reduction in the Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) score to 50% of the pre-treatment value or by 2 or more units and a reduction in the spinal pain visual analogue scale (VAS) by 2 cm or more.
  - www.nice.org.uk/TA407

- Certolizumab pegol and secukinumab for treating active psoriatic arthritis after inadequate response to DMARDs (May 2017) NICE TA445
  - Secukinumab alone, or in combination with methotrexate, is recommended as an option for treating active psoriatic arthritis in adults only if:
    - it is used as described in the NICE technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (TA199 recommendations 1.1 and 1.2) or,
    - the person has had a tumour necrosis factor (TNF)-alpha inhibitor but their disease has not responded within the first 12 weeks or has stopped responding after 12 weeks or,
    - TNF-alpha inhibitors are contra-indicated but would otherwise be considered.
  - Secukinumab is only recommended if the manufacturer provides it as agreed in the patient access scheme.
  - Assess the response to secukinumab after 16 weeks of treatment. Treatment should only be continued if there is clear evidence of response, defined as an improvement in at least 2 of the 4 Psoriatic Arthritis Response Criteria (PsARC), 1 of which must be joint tenderness or swelling score, with no worsening in any of the 4 criteria. People whose disease has a Psoriasis Area and Severity Index (PASI) 75 response but whose PsARC response does not justify continuing treatment should be assessed by a dermatologist.
  - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/guidance/TA445

**Scottish Medicines Consortium (SMC) decisions**
- The Scottish Medicines Consortium has advised (June 2015) that secukinumab (Cosentyx®) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe plaque psoriasis in adults who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), or when standard treatments cannot be used because of intolerance or contra-indications.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Cosentyx** (Novartis Pharmaceuticals UK Ltd) ▼
  - Secukinumab 150 mg per 1 ml Cosentyx 150mg/1ml solution for injection pre-filled pens | 2 pre-filled disposable injection £123.84
  - Cosentyx 150mg/1ml solution for injection pre-filled syringes | 2 pre-filled disposable injection £86

**Tocilizumab**
24-May-2018

**INDICATIONS AND DOSE**
- Rheumatoid arthritis [severe, active and progressive, not previously treated with methotrexate] / Rheumatoid arthritis [moderate-to-severe, in combination with methotrexate or alone if methotrexate inappropriate, when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs]
  - **By intravenous infusion**
    - Adult: 8 mg/kg every 4 weeks (max. per dose 800 mg), for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature
  - **By subcutaneous injection**
    - Adult: 162 mg once weekly, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature
    - Giant cell arteritis [in combination with a tapering course of glucocorticoid or alone following discontinuation of glucocorticoid]
      - **By subcutaneous injection**
        - Adult: 162 mg once weekly, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, not to be used alone for acute relapses; review need for treatment beyond 52 weeks

**CONTRA-INDICATIONS**
- Do not initiate if absolute neutrophil count less than 2 × 10⁹/litre - severe active infection

**CAUTIONS**
- History of diverticulitis - history of intestinal ulceration - history of recurrent or chronic infection (interrupt treatment if serious infection occurs) - low absolute neutrophil count - low platelet count.
predisposition to infection (interrupt treatment if serious infection occurs)

**CAUTIONS, FURTHER INFORMATION**

- **Tuberculosis** Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - conjunctivitis - cough - dizziness - dyslipidaemia - dyspnoea - gastrointestinal disorders - headache - hypersensitivity - hypotension - increased risk of infection - leucopenia - neutropenia - oral disorders - peripheral oedema - skin reactions - weight increased
  - Uncommon Hypothyroidism - nephrolithiasis
  - Frequency not known Infusion related reaction - interstitial lung disease - pancytopenia - Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**

Discontinue if absolute neutrophil count less than 0.5 x 10⁹/litre or platelet count less than 50 x 10⁹/microlitre).

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless essential — toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid — no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution — consult product literature.

- **RENAL IMPAIRMENT**
  - With intravenous use Manufacturer advises monitor renal function closely in moderate-to-severe impairment — no information available.
  - With subcutaneous use Manufacturer advises monitor renal function closely in severe impairment — no information available.

- **PRE-TREATMENT SCREENING**
  - Tuberculosis Patients should be evaluated for tuberculosis before treatment.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor lipid profile 4–8 weeks after starting treatment and then as indicated.
  - Manufacturer advises monitor for demyelinating disorders.
  - Manufacturer advises monitor hepatic transaminases every 4–8 weeks for first 6 months of treatment, then every 12 weeks thereafter.
  - Manufacturer advises monitor neutrophil and platelet count 4–8 weeks after starting treatment and then as indicated.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous infusion, manufacturer advises give intermittently in Sodium chloride 0.9%; dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour.
  - With subcutaneous use For subcutaneous injection, manufacturer advises rotate injection site and avoid skin that is tender, damaged or scarred. Patients may self-administer RoActemra®, after appropriate training in subcutaneous injection technique.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE**
  - Manufacturer advises protect from light and store in a refrigerator (2–8 °C) — consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

- **PATIENT AND CARER ADVICE**
  - Manufacturer advises patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.
  - An alert card should be provided.

**Driving and skilled tasks** Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks — increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE decisions**
  - Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)
  - NICE TA375 Tocilizumab (RoActemra®), in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if all the following criteria are met:
    - disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
    - disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs), and
    - the manufacturers provide tocilizumab as agreed in the patient access schemes.
  - Tocilizumab can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.
  - Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.
  - Patients currently receiving tocilizumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their NHS clinician consider it appropriate to stop.
  - www.nice.org.uk/guidance/ta375

  **Tocilizumab for the treatment of rheumatoid arthritis (February 2012)**
  - NICE TA247 Tocilizumab (RoActemra®), in combination with methotrexate, is recommended as an option for the treatment of rheumatoid arthritis in adults if:
    - the disease has responded inadequately to DMARDs and a TNF inhibitor and the patient cannot receive rituximab because of contra-indications or intolerance, and
    - tocilizumab is used as described for TNF inhibitor treatments (specifically the recommendations on disease activity) in the NICE guidance Adalimumab, etanercept, infliximab, rituximab and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010), or
    - the disease has responded inadequately to one or more TNF inhibitor treatments and to rituximab
    - and the manufacturer provides tocilizumab with the discount agreed as part of the patient access scheme.
  - Patients currently receiving tocilizumab for the treatment of rheumatoid arthritis who do not meet these criteria should have the option to continue treatment until they and their clinicians consider it appropriate to stop.
  - www.nice.org.uk/guidance/ta247

  **Tocilizumab for treating giant cell arteritis (April 2018)**
  - NICE TA518 Tocilizumab (RoActemra®), when used with a tapering course of glucocorticoids (and when used alone after glucocorticoids), is recommended as an option for treating giant cell arteritis in adults, only if:
    - they have relapsing or refractory disease,
    - they have not already had tocilizumab,
    - tocilizumab is stopped after 1 year of uninterrupted treatment at most, and...
● the manufacturer provides it with the discount agreed in the patient access scheme. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta518

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2014

The Scottish Medicines Consortium has advised (September 2018) that tocilizumab (RoActemra) is accepted for restricted use within NHS Scotland for the treatment of giant cell arteritis in adults, subject to a 12-month clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

BY SUBCUTANEOUS INJECTION

Tocilizumab 180 mg per 1 ml RoActemra 162mg/0.9ml solution for injection pre-filled pen | 4 pre-filled disposable injection (POD) £913.12 DT = £913.12 RoActemra 162mg/0.9ml solution for injection pre-filled syringes | 4 pre-filled disposable injection (POD) £913.12 DT = £913.12 (Hospital only)

Solution for infusion

ELECTROLYTES: May contain Sodium

RoActemra (Roche Products Ltd)
Tocilizumab 20 mg per 1 ml RoActemra 400mg/20ml concentrate for solution for infusion vials | 1 vial (POD) £512.00 (Hospital only)
RoActemra 200mg/10ml concentrate for solution for infusion vials | 1 vial (POD) £256.00 (Hospital only)
RoActemra 80mg/4ml concentrate for solution for infusion vials | 1 vial (POD) £102.40 (Hospital only)

Ustekinumab

03-Oct-2017

● INDICATIONS AND DOSE

Moderate-to-severe plaque psoriasis that has not responded to other systemic treatments or photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications (specialist use only)

BY SUBCUTANEOUS INJECTION

Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, consider discontinuation if no response within 28 weeks

Adult (body-weight 100 kg and above): Initially 90 mg, then 90 mg after 4 weeks, then 90 mg every 12 weeks, consider discontinuation if no response within 28 weeks

Active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs (specialist use only)

BY SUBCUTANEOUS INJECTION

Adult: Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, consider discontinuation if no response within 28 weeks, higher doses of 90 mg may be used in patients with body-weight over 100 kg

Moderate to severe active Crohn’s disease in patients who have had an inadequate response with, lost response to, are intolerant to, or have contra-indications to either conventional therapy or a tumour necrosis factor alpha inhibitor (specialist use only)

BY INTRAVENOUS INFUSION

Adult (body-weight up to 56 kg): 260 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or if treatment is interrupted or response is lost, dosing frequency may be increased—consult product literature; review treatment if no response within 16 weeks of initial dose or increase in dosing frequency

Adult (body-weight 56-85 kg): 390 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or if treatment is interrupted or response is lost, dosing frequency may be increased—consult product literature; review treatment if no response within 16 weeks of initial dose or increase in dosing frequency

Adult (body-weight 86 kg and above): 520 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or if treatment is interrupted or response is lost, dosing frequency may be increased—consult product literature; review treatment if no response within 16 weeks of initial dose or increase in dosing frequency

CONTRA-INDICATIONS Active infection

CAUTIONS Development of malignancy · elderly · history of malignancy · predisposition to infection · start appropriate treatment if widespread erythema and skin exfoliation develop, and stop ustekinumab treatment if exfoliative dermatitis suspected

CAUTIONS, FURTHER INFORMATION

Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab.

INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

Common or very common Arthralgia · asthenia · back pain · diarrhoea · dizziness · headache · increased risk of infection · myalgia · nausea · ophthalmological pain · skin reactions · vomiting

Uncommon Depression · facial paralysis · hypersensitivity (may be delayed) · nasal congestion

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment.

PREGNANCY Avoid.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS

Monitor for non-melanoma skin cancer, especially in areas commonly sun-exposed, and dermatological malignancies.

DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intravenous infusion (Stelara®), give intermittently in Sodium Chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and give over at least 1 hour
through an in-line low-protein binding filter (pore size 0.2 micron); use within 4 hours of dilution.

**PATIENT AND CARER ADVICE**

Exfoliative dermatitis  Patients should be advised to seek prompt medical attention if symptoms suggestive of exfoliative dermatitis or erythrodermic psoriasis (such as increased redness and shedding of skin over a larger area of the body) develop.

Tuberculosis  Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- **Ustekinumab for treating active psoriatic arthritis (updated March 2017)** NICE TA180
  Ustekinumab is recommended as an option, alone or in combination with methotrexate, for treating active psoriatic arthritis in adults only when:
  - treatment with tumour necrosis factor (TNF) alpha inhibitors is contra-indicated but would otherwise be considered, or
  - the patient has had treatment with 1 or more TNF-alpha inhibitors.

- **Ustekinumab for treating active Crohn's disease after previous treatment (July 2017)** NICE TA456
  Ustekinumab is recommended as an option for treating moderately to severely active Crohn’s disease in adults who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a TNF-alpha inhibitor or have medical contra-indications to such therapies.

- **Ustekinumab for moderately to severely active Crohn's disease after previous treatment (July 2017)** NICE TA456
  Ustekinumab is recommended as an option for treating moderately to severely active Crohn's disease in adults either alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults who have responded inadequately to previous therapy with a non-biological disease-modifying anti-rheumatic drug, and failed on, or are unsuitable for, treatment with a TNF inhibitor.

The Scottish Medicines Consortium (SMC) has advised (July 2017) that ustekinumab (Stelara®) is accepted for use within NHS Scotland for the treatment of adults with moderately to severely active Crohn's disease who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a tumour necrosis factor-alpha antagonist or have medical contra-indications to such therapies. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**IMMUNOSUPPRESSANTS > PROTEIN KINASE INHIBITORS**

**Baricitinib**

- **DRUG ACTION** Baricitinib selectively and reversibly inhibits the Janus-associated tyrosine kinases JAK1 and JAK2.

- **INDICATIONS AND DOSE** Moderate-to-severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to, one or more disease-modifying anti-rheumatic drugs (as monotherapy or in combination with methotrexate) (initiated by a specialist)
  - **BY MOUTH**
    - Adult 18-74 years: 4 mg once daily, for dose adjustments due to side-effects or dose reduction due to history of infection or sustained control of disease activity, consult product literature
    - Adult 75 years and over: 2 mg once daily, for dose adjustments due to side-effects, consult product literature.

- **CONTRA-INDICATIONS** Absolute lymphocyte count less than 0.5 × 10^9 cells/litre (do not initiate) - absolute neutrophil count less than 1 × 10^9 cells/litre (do not initiate) - active tuberculosis - haemoglobin less than 8 g/dl (do not initiate)

- **CAUTIONS** Active, chronic or recurrent infection (interrupt treatment if no response to standard therapy) - risk of viral reactivation (consult product literature)

- **TUBERCULOSIS** Manufacturer advises consider anti-tuberculosis therapy prior to initiation of baricitinib in patients with previously untreated latent tuberculosis.

- **INTERACTIONS** → Appendix 1: baricitinib

- **SIDE-EFFECTS**
  - Common or very common  Dyslipidaemia · herpes zoster (interrupt treatment) · increased risk of infection · nausea · oropharyngeal pain · thrombocytosis
  - Uncommon Acne · neutropenia · weight increased
Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (September 2017) that baricitinib (Olumiant®) is accepted for restricted use within NHS Scotland for the treatment of active rheumatoid arthritis only if the following criteria are met:
- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, and
- disease has not responded to intensive therapy with a combination of conventional disease-modifying anti-rheumatic drugs, or
- disease inadequately controlled by a tumour necrosis factor antagonist and patients are ineligible to receive rituximab.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent of lower.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tofacitinib

DRUG ACTION
Tofacitinib selectively inhibits the Janus-associated tyrosine kinases JAK1 and JAK3.

INDICATIONS AND DOSE
Moderate to severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to one or more disease-modifying anti-rheumatic drugs (as monotherapy or in combination with methotrexate) (specialist use only) / Active psoriatic arthritis in patients who have had an inadequate response to, or are intolerant to one or more disease-modifying anti-rheumatic drugs (in combination with methotrexate) (specialist use only)

BY MOUTH

Adult: 5 mg twice daily, for dose adjustments due to side-effects—consult product literature

Moderate to severe active ulcerative colitis in patients who have had an inadequate or lost response to, or are intolerant to either conventional therapy or a biologic agent (specialist use only)

BY MOUTH

Adult: Initially 10 mg twice daily for 8 weeks, then maintenance 5 mg twice daily, if an adequate therapeutic response is not achieved after 8 weeks, the initial dose can be extended for an additional 8 weeks, discontinue treatment if no response. 16 weeks after initial dose, for dose adjustments due to side-effects, decreased response during maintenance treatment or following treatment interruption—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose with concurrent use of potent CYP3A4 inhibitors or drugs which are both moderate CYP3A4 and potent CYP2C19 inhibitors.
- Dose should be reduced to 5 mg once daily continued →
in patients receiving 5 mg twice daily. Dose should be reduced to 5 mg twice daily in patients receiving 10 mg twice daily.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: TOFACITINIB (XELJANZ®): INCREASED RISK OF PULMONARY EMBOLISM AND MORTALITY IN RHEUMATOID ARTHRITIS PATIENTS RECEIVING 10 MG TWICE DAILY IN A CLINICAL TRIAL (MARCH 2019)**

Due to these increased risks, prescribers are advised to adhere to the licensed dose for rheumatoid arthritis. Patients receiving tofacitinib, regardless of indication, should be monitored for signs and symptoms of pulmonary embolism and advised to seek immediate medical attention if they occur.

- **CONTRA-INDICATIONS**
  - Absolute lymphocyte count less than 750 cells/mm³ (do not initiate).
  - Absolute neutrophil count less than 1000 cells/mm³ (do not initiate).
  - Active infection including localized infection, active tuberculosis, haemoglobin less than 9 g/dL (do not initiate).

- **CAUTIONS**
  - Active, chronic or recurrent infection.
  - Elderly predisposition to infection.
  - Previous or current malignancy.
  - Raised serum transaminases (particularly in combination with potentially hepatotoxic drugs).
  - Risk of gastrointestinal perforation.
  - New onset abdominal signs.
  - Risk of viral reactivation.

**CAUTIONS, FURTHER INFORMATION**

Manufacturer advises monitor lymphocytes at baseline.

- **SIDE-EFFECTS**
  - Common or very common
    - Anaemia — cough, decreased appetite.
    - Diarrhoea — dyspepsia, fatigue, fever, gastritis.
    - Gastrointestinal discomfort.
    - Headache.
    - Hypertension.
    - Increased risk of infection.
    - Insomnia.
    - Joint disorders.
    - Musculoskeletal pain.
    - Nausea.
    - Peripheral oedema.
    - Skin reactions.
    - Vomiting.
    - Weight increased.

- **Uncommon**
  - Dehydration.
  - Hepatic steatosis.
  - Gastritis.
  - Muscle strain.
  - Neutropenia.
  - Non-melanoma skin cancer.
  - Parasthesia.
  - Sepsis.
  - Sinus congestion.
  - Tendinitis.

- **Rare or very rare**
  - Meningitis.
  - Cryptococcal.

- **Frequency not known**
  - Increased risk of pulmonary embolism (with high doses).

- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception during and for at least 4 weeks after treatment in women of child-bearing potential.

- **PREGNANCY**
  - Manufacturer advises avoid — toxicity in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoid — present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in moderate impairment.
  - Avoid in severe impairment.

**Dose adjustments**

- Manufacturer advises dose reduction in moderate impairment.
  - Consult product literature.

- **RENAI IMPAIRMENT**
  - Dose adjustments
  - Manufacturer advises reduce dose in severe impairment.
  - Consult product literature.

- **PRE-TREATMENT SCREENING**
  - Manufacturer advises patients should be evaluated for tuberculosis and viral hepatitis before treatment.

**MONITORING REQUIREMENTS**

- Manufacturer advises monitor for signs and symptoms of infection during and after treatment.
- Manufacturer advises periodic skin examination in patients at increased risk for skin cancer.
- Manufacturer advises monitor liver function routinely; monitor lipid profile 8 weeks after treatment initiation.
- Manufacturer advises monitor lymphocytes at baseline and every 3 months thereafter; neutrophils and haemoglobin should be monitored at baseline, after 4 to 8 weeks of treatment and every 3 months thereafter.

**DIRECTIONS FOR ADMINISTRATION**

Manufacturer advises tablets may be crushed and taken with water.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE decisions

- Tofacitinib for moderate-to-severe rheumatoid arthritis (October 2017) NICE TA480
  - Tofacitinib (Xeljanz®), with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to intensive therapy with a combination of conventional DMARDs, only if:
    - Disease is severe (a disease activity score [DAS28] of more than 5.1), and
    - The manufacturer provides tofacitinib with the discount agreed in the patient access scheme.

- Tofacitinib (Xeljanz®), with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to, or who cannot have, other DMARDs, including at least 1 biological DMARD, only if:
    - Disease is severe (a DAS28 of more than 5.1), and
    - They cannot have rituximab, and
    - The manufacturer provides tofacitinib with the discount agreed in the patient access scheme.

Tofacitinib can be used as monotherapy for adults who cannot take methotrexate because it is contra-indicated or because of intolerance, when the above criteria are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After an initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta480

- Tofacitinib for treating active psoriatic arthritis after inadequate response to DMARDs (October 2018) NICE TA543
  - Tofacitinib (Xeljanz®), with methotrexate, is recommended as an option for treating active psoriatic arthritis in adults, only if:
    - It is used as described in NICE’s technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (TA199 recommendations 1.1 and 1.2), or
    - The person has had a tumour necrosis factor (TNF)-alpha inhibitor but their disease has not responded within the first 12 weeks or has stopped responding after 12 weeks, or
    - TNF-alpha inhibitors are contra-indicated but would otherwise be considered (as described in NICE’s technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis).

Tofacitinib is only recommended if the manufacturer provides it according to the commercial arrangement. Assess the response to treatment after 12 weeks. Treatment should only be continued if there is clear evidence of response, defined as an improvement in at least 2 of the 4 Psoriatic Arthritis Response Criteria.
IMMUNOSUPPRESSANTS > T-CELL ACTIVATION INHIBITORS

Abatacept

**INDICATIONS AND DOSE**

Moderate-to-severe active rheumatoid arthritis (specialist use only) | Active psoriatic arthritis (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 125 mg once weekly, review treatment if no response within 6 months

Moderate-to-severe active rheumatoid arthritis (specialist use only) | Active psoriatic arthritis (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 125 mg once weekly, review treatment if no response within 6 months, subcutaneous dosing may be initiated with or without an intravenous loading dose—consult product literature

**CONTRA-INDICATIONS**

- Severe infection

**CAUTIONS**

- Do not initiate until active infections are controlled - elderly (increased risk of side-effects) - predisposition to infection (screen for latent tuberculosis and viral hepatitis) - progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)

**INTERACTIONS**

- > Appendix 1: abatacept

**SIDE-EFFECTS**

- **Common or very common**
  - Asthenia - cough - diarrhoea - dizziness - gastrointestinal discomfort - headaches - hypertension - increased risk of infection - nausea - oral ulceration - skin reactions - vomiting

- **Uncommon**

- **Rare or very rare**
  - Pelvic inflammatory disease - respiratory malignancy

**CONCEPTION AND CONTRACEPTION**

- Effective contraception required during treatment and for 14 weeks after last dose

**PREGNANCY**

- Manufacturer advises avoid unless essential

**BREAST FEEDING**

- Present in milk in animal studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose

**DIRECTIONS FOR ADMINISTRATION**

- For intravenous infusion, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

---

(PsA Re), 1 of which must be joint tenderness or swelling score, with no worsening in any of the 4 criteria. People whose disease has a Psoriasis Area and Severity Index (PASI) 75 response but whose PsA Re response does not justify continuing treatment should be assessed by a dermatologist.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta543](http://www.nice.org.uk/guidance/ta543)

**Scottish Medicines Consortium (SMC) decisions**

**SMC No. SMC216**

The Scottish Medicines Consortium has advised (January 2019) that tofacitinib (Xeljanz®) is accepted for use within NHS Scotland in combination with methotrexate for the treatment of adults with psoriatic arthritis whose disease has not responded adequately to at least two conventional DMARDs, given either alone or in combination. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**SMC No. SMC212**

The Scottish Medicines Consortium has advised (February 2019) that tofacitinib (Xeljanz®) is accepted for use within NHS Scotland for the treatment of adults with moderately to severely active ulcerative colitis who have had an inadequate response, lost response, or were intolerant to either conventional therapy or a biological agent. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Xeljanz (Pfizer Ltd) ▼
  - Tofacitinib (as Tofacitinib citrate) 5 mg Xeljanz 5mg tablets | 56 tablet [Pres] £60.63 (Hospital only)
  - Tofacitinib (as Tofacitinib citrate) 10 mg Xeljanz 10mg tablets | 56 tablet [Pres] £1,380.06 (Hospital only)
NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195

Abatacept, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other disease-modifying antirheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor, and who cannot use rituximab because of contra-indications or intolerance. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/TA195

- Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Abatacept, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if all the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
- the manufacturers provide abatacept as agreed in the patient access schemes.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving abatacept whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

IMMUNOSUPPRESSANTS

TUMOR NECROSIS FACTOR ALPHA (TNF-α) INHIBITORS

Adalimumab

INDICATIONS AND DOSE

- Plaque psoriasis (initiated by a specialist)
  BY SUBCUTANEOUS INJECTION
  Adult: Initially 80 mg, then 40 mg every 2 weeks, to be started 1 week after initial dose, review treatment if no response within 16 weeks—consult product literature

- Psoriatic arthritis (initiated by a specialist)
  BY SUBCUTANEOUS INJECTION
  Adult: 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks; dose to be increased only in patients receiving adalimumab alone, review treatment if no response within 12 weeks

- Ankylosing spondylitis (initiated by a specialist)
  BY SUBCUTANEOUS INJECTION
  Adult: 40 mg every 2 weeks, review treatment if no response within 12 weeks

- Axial spondyloarthitis (initiated by a specialist)
  BY SUBCUTANEOUS INJECTION
  Adult: 40 mg every 2 weeks, review treatment if no response within 12 weeks

- Demyelinating disorders (risk of exacerbation)
  Adult: Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, review treatment if no response within 12 weeks

- Adult: 20 mg once weekly, alternatively 40 mg every 2 weeks, review treatment if no response within 8 weeks

- Adult: 20 mg once weekly, alternatively 40 mg every 2 weeks, review treatment if no response within 8 weeks

- Adult: 20 mg once weekly, alternatively 40 mg every 2 weeks, review treatment if no response within 8 weeks

- Adult: 20 mg once weekly, alternatively 40 mg every 2 weeks, review treatment if no response within 8 weeks

- Adult: 20 mg once weekly, alternatively 40 mg every 2 weeks, review treatment if no response within 8 weeks

CONTRA-INDICATIONS

- Moderate or severe heart failure - severe infection

CAUTIONS

- Demyelinating disorders (risk of exacerbation) - do not initiate until active infections are controlled (discontinue if new serious infection develops) - hepatitis B virus—monitor for active infection - history of malignancy - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection

CAUTIONS, FURTHER INFORMATION

- Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin
test, chemoprophylaxis can be given concurrently with adalimumab.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**
  - Rare or very rare Cardiac arrest - pancrecytoma - Stevens-Johnson syndrome.

- **SIDE-EFFECTS, FURTHER INFORMATION** Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises can be used—excreted in breast milk at very low concentrations (limited information available).

- **PRE-TREATMENT SCREENING**
  - Tuberculosis: Manufacturer advises patients should be evaluated for active and latent tuberculosis before treatment.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor for infection before, during, and for 4 months after treatment.
  - Manufacturer advises monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.
  - For uveitis, manufacturer advises patients should be assessed for pre-existing or developing central demyelinating disorders before and at regular intervals during treatment.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Adalimumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

- **PATIENT AND CARER ADVICE** When used to treat hidradenitis suppurativa, patients and their carers should be advised to use a daily topical antiseptic wash on lesions during treatment with adalimumab.
  - Tuberculosis patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, or, and fever) develop.

- **Blood disorders** Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

- **Alert card** An alert card should be provided.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE decisions**
    - Adalimumab for plaque psoriasis in adults (June 2008) NICE TA146
    - Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks.
    - **Infliximab and adalimumab for Crohn’s disease (May 2010) NICE TA187**
      - Adalimumab is recommended for the treatment of severe active Crohn’s disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications.
      - Adalimumab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, adalimumab can be restarted.
    - **Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329**
      - Adalimumab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.
      - The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.
      - Adalimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.
    - **Eタネリcept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) NICE TA199**
      - Adalimumab is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).
      - Adalimumab should be discontinued if there is an inadequate response at 12 weeks.
      - Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195
      - Adalimumab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients

- **BNF 78**

- **Musculoskeletal system**

- **Arthritis 1109**

- **www.getintopharma.com**
who cannot use methotrexate because of intolerance or contra-indications, adalimumab can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/guidance/ta75

- Adalimumab, etanercept, infliximab, certolizumab pegol, golimum, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Adalimumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:
- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, and,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs).

Adalimumab can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving adalimumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta375

- TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF) - alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/guidance/ta383

- Adalimumab for treating moderate-to-severe hidradenitis suppurativa (June 2016) NICE TA392

Adalimumab is recommended, within its marketing authorisation, as an option for treating active moderate-to-severe hidradenitis suppurativa in adults whose disease has not responded to conventional systemic therapy. The drug is recommended only if the manufacturer provides it at the price agreed in the patient access scheme. Response should be assessed after 12 weeks of treatment, and the drug continued only if there is clear evidence of response, defined as a reduction of 25% or more in the total abscesses and inflammatory nodule count and no increase in abscesses and draining fistulas.

www.nice.org.uk/guidance/ta392

- Adalimumab and dexamethasone for treating non-infectious uveitis (July 2017) NICE TA460

Adalimumab is recommended as an option for treating non-infectious uveitis in the posterior segment of the eye in adults with inadequate response to corticosteroids, only if there is:
- active disease (that is, current inflammation in the eye), and
- inadequate response or intolerance to immunosuppressants, and
- systemic disease or both eyes are affected (or one eye is affected if the second eye has poor visual acuity), and
- worsening vision with a high risk of blindness (for example, risk of blindness that is similar to that seen in people with macular oedema).

Stop adalimumab for non-infectious uveitis in the posterior segment of the eye in adults with inadequate response to corticosteroids if there is one of the following:
- new active inflammatory choroidal or inflammatory retinal vascular lesions, or both, or
- a two-step increase in vitreous haze or anterior chamber cell grade, or
- worsening of best corrected visual acuity by three or more lines or 15 letters.

Patients currently receiving adalimumab whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta460

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium issued similar advice for plaque psoriasis to NICE TA146 in May 2009.

Certolizumab pegol

**INDICATIONS AND DOSE**

Moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (as monotherapy or in combination with methotrexate).

Severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate or other disease-modifying antirheumatic drugs (in combination with methotrexate). Active psoriatic arthritis when response to disease-modifying antirheumatic drugs has been inadequate (as monotherapy or in combination with methotrexate).

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, once clinical response is confirmed, an alternative maintenance dosing of 400 mg every 4 weeks can be considered, review treatment if no response within 12 weeks.

Treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs. Treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, alternatively maintenance 400 mg every 4 weeks, review treatment if no response within 12 weeks.

Moderate to severe plaque psoriasis.

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, an alternative maintenance dosing of 400 mg every 4 weeks can be considered in patients with insufficient response, review treatment if no response within 16 weeks.

**CONTRA-INDICATIONS**

Moderate to severe heart failure - severe active infection.

**CAUTIONS**

- Demyelinating CNS disorders (risk of exacerbation) - do not initiate until active infections are controlled (discontinue if new serious infection develops and until infection controlled) - hepatitis B virus (monitor for active infection) - history or development of malignancy - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection.

**CAUTIONS, FURTHER INFORMATION**

- Tuberculosis: Active tuberculosis should be treated with standard treatment for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculosis skin test, chemoprophylaxis can be given concurrently with certolizumab pegol.

**INTERACTIONS**

- Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- **Common or very common**
  - Abscess, asthenia, decreased leukocytes, eosinophilic disorders, fever, headaches, hepatic disorders, hypertension, increased risk of infection, nausea, neoplasms, neutropenia, pain, sensory disorder, skin reactions.

- **Uncommon**
  - Alopecia, anaemia, anxiety, appetite disorder, arthralgias, ascites, asthma, breast disorder, cardiomyopathy, chills, coronary artery disease, cough, cyst, dizziness, dyslipidaemia, electrolyte imbalance, embolism and thrombosis, eye inflammation, flushing, gastrointestinal discomfort, gastrointestinal disorders, haemorrhage, healing impaired, heart failure, hypercoagulation, influenza like illness, lactic acidosis, lymphopenia, menstrual cycle irregularities, mood disorder, muscle disorder, nail disorder, nerve disorders, oedema, oral disorders, oropharyngeal dryness, palpitations, photosensitivity reaction, renal impairment, respiratory disorders, sepsis, skin ulcer, solid organ neoplasms, skin reaction, syncope, systemic lupus erythematosus (SLE), temperature perception abnormal, thrombocytopenia, thrombosis, tinnitus, tremor, urinary tract disorder, vasculitis, vertigo, vision disorders, weight change.

- **Rare or very rare**
  - Atherosclerosis, atriointerventricular block, cholelithiasis, cognitive impairment, delirium, fistula, haemorrhoids, hair texture abnormal, movement disorders, nephritis, nephropathy, odynophagia, pancycopenia, panniculitis, pericarditis, polycythemia, Raynaud’s phenomenon, sarcoidosis, seizure, serum sickness, sexual dysfunction, splenomegaly, stroke, suicide attempt, telangiectasia, thyroid disorder.

- **Frequency not known**
  - Multiple sclerosis.

**SIDE-EFFECTS, FURTHER INFORMATION**

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRAINDICATIONS**

Manufacturer advises adequate contraception in women of childbearing potential during treatment and for 5 months after last dose.

**PREGNANCY**

Manufacturer advises use only if benefit outweighs risk — limited information available.

**PRE-TREATMENT SCREENING**

Tuberculosis. Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**

Monitor for infection before, during, and for 5 months after treatment.

**PATIENT AND CARER ADVICE**

Blood disorders. Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop. Tuberculosis. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss and fever) develop.

Alert card. An alert card should be provided.

**NATIONAL FUNDING/AFFORDABILITY DECISIONS**

- **NICE decisions**
  - Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Certolizumab pegol, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
- the manufacturers provide certolizumab pegol as agreed in the patient access schemes.

Certolizumab pegol can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After
initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving certolizumab pegol within the NHS whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/ta375

TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in adult patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs.

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

The response to treatment should be assessed 12 weeks after the start of treatment. Treatment should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/ta383

Cimzia

Cimzia® (Certolizumab pegol) is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/ta445

Cimzia® for treating moderate to severe plaque psoriasis (April 2019) NICE TA574

Certolizumab pegol (Cimzia®) is recommended as an option for treating plaque psoriasis in adults, only if:

- the disease is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10, and

- the disease has not responded to other systemic treatments, including ciclosporin, methotrexate and phototherapy, or these options are contraindicated or not tolerated, and

- the lowest maintenance dosage of certolizumab pegol is used after the loading dosage, and

- the manufacturer provides the drug according to the commercial arrangements.

Stop certolizumab pegol at 16 weeks if the psoriasis has not responded adequately. An adequate response is defined as:

- a 75% reduction in the PASI score (PASI 75) from when treatment started, or

- a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta574

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2132

The Scottish Medicines Consortium has advised (April 2019) that certolizumab pegol (Cimzia®) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe plaque psoriasis in adults who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), are intolerant to, or have a contraindication to these treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

Golimumab

01-Mar-2018

INDICATIONS AND DOSE

Ulcerative colitis (initiated by a specialist)

- Adult (body-weight up to 80 kg): Initially 200 mg, then 100 mg after 2 weeks; maintenance 50 mg every 4 weeks, if inadequate response, review treatment if no response after 4 doses

Rheumatoid arthritis (initiated by a specialist) | Psoriatic arthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist) | Non-radiographic axial spondyloarthritis (initiated by a specialist)

- BY SUBCUTANEOUS INJECTION
  - Adult (body-weight up to 100 kg): 50 mg once a month, on the same date each month, review treatment if no response after 3–4 doses

PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

CONCEPTION AND CONTRACEPTION

Manufacturer advises adequate contraception during treatment and for at least 6 months after last dose.

PREGNANCY

Use only if essential.

BREAST FEEDING

Manufacturer advises avoid during and for at least 6 months after treatment—present in milk in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises caution (no information available).

PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS

Monitor for infection before, during, and for 5 months after treatment.

DIRECTIONS FOR ADMINISTRATION

For doses requiring multiple injections, each injection should be administered at a different site. Missed dose If dose administered more than 2 weeks late, subsequent doses should be administered on the new monthly due date.

PATIENT AND CARER ADVICE

Tuberculosis All patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Alert card An alert card should be provided.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Golimumab for the treatment of psoriatic arthritis (April 2011) NICE TA220

Golimumab is an option for the treatment of active and progressive psoriatic arthritis in adults only if:

- golimumab is used as described in the NICE guidance (August 2010) for other tumour necrosis factor (TNF) inhibitors, and
- the manufacturer provides the 100 mg dose of golimumab at the same price as the 50 mg dose.

Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Golimumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if all the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
Arthritis

- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
- the manufacturers provides golimumab as agreed in the patient access schemes.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving treatment with golimumab whose disease do not meet the above criteria should have the option to continue their treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta375

Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs (June 2013) NICE TA225

Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in patients who have had an inadequate response to DMARDs, including a TNF inhibitor, if golimumab is used as described in the NICE technology appraisal guidance 195 (August 2010) for other TNF inhibitors, and the manufacturer provides the 100 mg dose of golimumab at the same price as the 50 mg dose.

www.nice.org.uk/guidance/ta225

TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

The response to treatment should be assessed 12 weeks after the start of treatment. Treatment should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF) - alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/guidance/ta383

Golimumab for treating non-radiographic axial spondyloarthritis (January 2018) NICE TA497

Golimumab is recommended, within its marketing authorisation, as an option for treating severe non-radiographic axial spondyloarthritis in adults whose disease has responded inadequately to, or who cannot tolerate, nonsteroidal anti-inflammatory drugs.

If patients and their clinicians consider golimumab to be one of a range of suitable treatments, including adalimumab, etanercept and certolizumab pegol, the least expensive (taking into account administration costs and patient access schemes) should be chosen.

Assess the response to golimumab 12 weeks after the start of treatment. Continue treatment only if there is clear evidence of response, defined as:

- a reduction in the Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) score to 50% of the pre-treatment value by or 2 or more units, and
- a reduction in the spinal pain visual analogue scale (VAS) score by 2 cm or more.

www.nice.org.uk/guidance/ta497

Infliximab, adalimumab and golimumab for treating moderately-to-severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329

Golimumab is an option for treating moderately-to-severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

Golimumab is recommended only if the manufacturer provides the 100 mg dose of golimumab at the same cost as the 50 mg dose, as agreed in the patient access scheme.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Golimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/guidance/ta329

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (July 2012) that golimumab (Simponi®) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive psoriatic arthritis in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

The Scottish Medicines Consortium has advised (February 2016) that golimumab (Simponi®) is accepted for use within NHS Scotland for the treatment of adults with severe, active non-radiographic axial spondyloarthritis with objective signs of inflammation as indicated by elevated C-reactive protein (CRP) and/or magnetic resonance imaging (MRI) evidence, who have had an inadequate response to, or are intolerant to non-steroidal anti-inflammatory drugs (NSAIDs). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

Simponi® (Merck Sharp & Dohme Ltd)

Golimumab 100 mg per 1 ml Simponi 50mg/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection £762.97 DT £762.97

Golimumab 50mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £762.97 DT £762.97

Simponi 100mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection £1,525.94 DT £1,525.94

Infliximab

INDICATIONS AND DOSE

Severe active Crohn’s disease

BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, then 5 mg/kg after 4 weeks, if condition has responded, then maintenance 5 mg/kg every 8 weeks

Fistulating Crohn’s disease

BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

Severe active ulcerative colitis

BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every
Tuberculosis

▶ CAUTIONS

- Contra-indications. Chemoprophylaxis should ideally be given to contact persons who have previously received adequate treatment for tuberculosis but who were previously not treated adequately. Chemoprophylaxis should be continued until symptoms of tuberculosis develop (e.g., persistent cough, weight loss, and fever).

- Contraindications. Patients with active tuberculosis should not be given prophylaxis until symptoms have resolved and sputum cultures are negative. Prophylaxis should not be given to patients with severe infections or those who are immunosuppressed.

- Precautions. Tuberculosis is highly contagious and can spread to susceptible individuals. Prophylaxis should be given to close contacts of patients with active tuberculosis, especially those who are immunocompromised or have underlying conditions that increase the risk of tuberculosis.

- Side-effects. Side-effects of prophylaxis may include gastrointestinal upset, rash, and fever. Rare side-effects may include hepatitis or pancreatitis.

- Monitoring requirements. Tuberculosis prophylaxis should be monitored regularly to assess for the development of adverse reactions and to ensure compliance with treatment.

- Directions for administration. Prophylaxis should be administered at least 2 hours after the last dose of anti-TB medication. The initial dose should be given after a prolonged period of 16 weeks. The maintenance dose should be given at least every 6 weeks. Patients should be monitored for the development of tuberculosis symptoms.

- Further information. The manufacturer advises prophylactic antypiretics, antihistamines, or hydrocortisone may be administered.

Musculoskeletal system

PRESCRIBING AND DISPENSING INFORMATION
Infliximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

PATIENT AND CARER ADVICE
Tuberculosis
Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders
Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Hypersensitivity reactions
Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

Alert card
An alert card should be provided.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Infliximab for plaque psoriasis in adults (January 2008) NICE TA134
Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.

www.nice.org.uk/TA134

Infliximab for acute exacerbations of ulcerative colitis (December 2008) NICE TA163
Infliximab is recommended as an option for the treatment of acute exacerbations of severe ulcerative colitis when treatment with ciclosporin is contra-indicated or inappropriate.

www.nice.org.uk/TA163

Infliximab and adalimumab for Crohn’s disease (May 2010) NICE TA187
Infliximab is recommended for the treatment of severe active Crohn’s disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.

www.nice.org.uk/TA187

Infliximab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA187

Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) NICE TA199
Infliximab is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination). Infliximab should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/TA199

Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329
Infliximab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Infliximab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/TA329

Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375
Infliximab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

• disease is severe, that is, a disease activity score (DAS28) greater than 5.1, and,
• disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs).

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving infliximab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383
Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs). Infliximab is recommended only if treatment is started with the least expensive infliximab product.

Patients currently receiving infliximab should continue treatment with the same infliximab product until they and their clinician consider it appropriate to stop.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

www.getintopharma.com
Treatment with another tumour necrosis factor (TNF) - alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

PHOSPHODIESTERASE TYPE-4 INHIBITORS

**Apremilast**

**DRUG ACTION** Apremilast inhibits the activity of phosphodiesterase type-4 (PDE4) which results in suppression of pro-inflammatory mediator synthesis and promotes anti-inflammatory mediators.

**INDICATIONS AND DOSE**

Active psoriatic arthritis (in combination with disease-modifying antirheumatic drugs or alone) in patients who have had an inadequate response or who have been intolerant to a prior disease-modifying antirheumatic drug therapy  
Moderate to severe chronic plaque psoriasis that has not responded to standard systemic treatments or phototherapy, or when these treatments cannot be used because of intolerance or contra-indications

**BY MOUTH**

- **Adult**: Initially 10 mg daily on day 1, then 10 mg twice daily on day 2, then 20 mg in the morning and 20 mg in the evening on day 3, then 20 mg twice daily on day 4, then 20 mg in the morning and 30 mg in the evening on day 5, then maintenance 30 mg twice daily, doses should be taken approximately 12 hours apart; review treatment if no response within 24 weeks of initiation

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (JANUARY 2017): APREMILAST (OTEZLA ®): RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR  
A review of evidence from clinical trials and postmarketing cases has suggested a causal association between apremilast and suicidal thoughts and behaviour.

**CAUTIONS**  
Concomitant use of drugs likely to cause psychiatric symptoms - history of psychiatric illness - low body-weight - consider discontinuation if weight loss is unexplained or clinically significant

**INTERACTIONS**  
Appendix 1: apremilast

**SIDE-EFFECTS**

- **Common or very common** Appetite decreased - back pain - cough - depression - diarrhoea - fatigue - gastrointestinal discomfort - gastrointestinal disorders - headaches - increased risk of infection - insomnia - nausea - vomiting

- **Uncommon** Gastrointestinal haemorrhage - rash - suicidal tendencies - weight decreased

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment and ensure effective contraception during treatment.

- **PREGNANCY** Avoid - teratogenic in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid - present in milk in animal studies.

- **RENAL IMPAIRMENT** Dose adjustments: Reduce dose if eGFR less than 30 mL/minute/1.73 m²; consult product literature for initial dose titration.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor body-weight regularly in patients underweight at the start of treatment.
  - Manufacturer advises monitor for psychiatric symptoms (including depression, suicidal ideation and behaviour) - discontinue treatment if new or worsening psychiatric symptoms are identified.

- **PATIENT AND CARER ADVICE**
  - Manufacturer advises patients and carers should be instructed to notify the prescriber of any changes in behaviour or mood, and of any suicidal ideation.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- **Apremilast for treating active psoriatic arthritis (February 2017) NICE TA433**
  - Apremilast, alone or in combination with disease-modifying antirheumatic drugs (DMARDs), is recommended as an option for treating active psoriatic arthritis in adults only if:
    - they have peripheral arthritis with 3 or more tender joints and 3 or more swollen joints and
    - their disease has not responded to adequate trials of at least 2 standard DMARDs, given either alone or in combination and
    - the manufacturer provides apremilast with the discount agreed in the patient access scheme.

  Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

  www.nice.org.uk/TA433

- **Apremilast for treating moderate to severe plaque psoriasis (November 2016) NICE TA419**
  - Apremilast is recommended as an option for treating chronic plaque psoriasis in patients whose disease has not responded to other systemic therapies, including ciclosporin, methotrexate and PUVA, or when these treatments are contra-indicated or not tolerated, only if:
    - the disease is severe, as defined by a total Psoriasis Area Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10 and
    - treatment is stopped if the psoriasis has not responded adequately at 16 weeks (defined as a 75% reduction in the PASI score (PASI 75) from when treatment started or a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from start of treatment), and
    - the manufacturer provides apremilast with the discount agreed in the patient access scheme.

  Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

  www.nice.org.uk/TA419

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (June 2015) that apremilast (Otezla ®) is accepted for restricted use within NHS Scotland for the treatment of active psoriatic
musculoskeletal system

arthritis attacks (at least can be used for the symptomatic treatment of frequent gouty heart failure since, unlike NSAIDs, it does not induce toxicity at higher doses, but it is of value in patients with injection can be effective in podagra. [unlicensed indication]. A corticosteroid by intramuscular corticosteroid can be used in acute monoarticular gout resistant to other treatments. Intra-articular injection of a alternative in those who cannot tolerate NSAIDs or who are retention; moreover, it can be given to patients receiving uricosurics are not effective in treating an acute attack and respond adequately to treatment with NSAIDs or to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is not indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

Fexaxostat is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is not indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.

Sulfinpyrazone can be used instead of allopurinol or in conjunction with it in cases that are resistant to treatment. Benzbromarone (available from ‘special-order’ manufacturers or specialist importing companies) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline. Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless not indicated in gout.

Other drugs used for Hyperuricaemia and gout Naproxen with esomeprazole, p. 1149

ALKALOIDS  PLANT ALKALOIDS

I Colchicine

- INDICATIONS AND DOSE

Acute gout

- BY MOUTH

- Adult: 500 micrograms 2–4 times a day until symptoms relieved, maximum 6 mg per course, do not repeat course within 3 days

Short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs

- BY MOUTH

- Adult: 500 micrograms twice daily

Prophylaxis of familial Mediterranean fever (recurrent polyserositis)

- BY MOUTH

- Adult: 0.5–2 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose by half with concurrent use of moderate inhibitors of CYP3A4.

- Manufacturer advises reduce dose by 75% (to one quarter of usual dose) with concurrent use of potent inhibitors of CYP3A4 or P-glycoprotein inhibitors; avoid concurrent use in patients with hepatic or renal impairment.

- UNLICENSED USE BNF doses may differ from those in the product literature. Use of colchicine for prophylaxis of familial Mediterranean fever (recurrent polyserositis) is an unlicensed indication.

Forms available from special-order manufacturers include: oral suspension, oral different medicines containing the same drug.
Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematologic malignancies

- BY MOUTH
- Adult: 120 mg once daily, to be started 2 days before start of cytotoxic therapy and continued for 7–9 days, according to chemotherapy duration

IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: SERIOUS HYPERSensitivity REACTIONS (JUNE 2012)**

There have been rare but serious reports of hypersensitivity reactions, including Stevens-Johnson syndrome and acute anaphylactic shock with febuxostat. Patients should be advised of the signs and symptoms of severe hypersensitivity; febuxostat must be stopped immediately if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

**CONTRA-INDICATIONS** Not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately

**CAUTIONS** Congestive heart failure - ischaemic heart disease - thyroid disorders - transplant recipients

**CAUTIONS, FURTHER INFORMATION** Administer prophylactic NSAID (not aspirin or salicylates) or colchicine for at least 30 days during treatment as indicated.

**INTERACTIONS** → Appendix 1: febuxostat

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea - gout aggravated - headache - hepatic disorders - nausea - oedema - skin reactions

- **Rare or very rare** Alopecia - angioedema - hyperhidrosis - hypersensitivity - musculoskeletal stiffness - nephritis - tubulointerstitial nephritis - nervousness - oral ulceration - pancreatitis - pancytopenia - rhabdomyolysis - severe cutaneous adverse reactions (SCARs) - thirst - thrombocytopenia - tinnitus - vision blurred

**PREGNANCY** Manufacturer advises avoid—limited information available.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

Dose adjustments

Manufacturer advises max. 80 mg daily in mild impairment; no dose information available in moderate to severe impairment.

**RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m²—no information available.

**PRE-TREATMENT SCREENING** Monitor liver function tests before treatment as indicated.

**MONITORING REQUIREMENTS** Monitor liver function tests periodically during treatment as indicated.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Febuxostat for the management of hyperuricaemia in patients with gout (December 2008) NICE TA164

Febuxostat (Adenuric®) is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness.

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 637/10 The Scottish Medicines Consortium has advised (September 2010) that febuxostat (Adenuric®) is accepted for restricted use within NHS Scotland for the treatment of chronic hyperuricaemia when treatment with allopurinol is inadequate, not tolerated or contra-indicated.

SMC No. 1153/16 The Scottish Medicines Consortium has advised (June 2016) that febuxostat (Adenuric®) is accepted for restricted use within NHS Scotland for the prevention and treatment of hyperuricaemia in patients undergoing chemotherapy for haematological malignancies at intermediate to high risk of tumour lysis syndrome, only when allopurinol is not tolerated or contra-indicated.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Febuxostat (Non-proprietary)**

  - Febuxostat 120 mg: Adenuric 120mg tablets | 28 tablet [POM]
  - £24.36 DT = £24.36

3 **Neuromuscular disorders**

**Neuromuscular disorders**

**Drugs that enhance neuromuscular transmission**

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 836 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

**Anticholinesterases**

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in *myasthenia gravis*. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions,
increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulphate p. 1334.

Neostigmine p. 1125 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulphate or propantheline bromide p. 86 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine bromide p. 1126 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

**Immunosuppressant therapy**

**Corticosteroids** are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive oestrogen prophylaxis.

In *generalised myasthenia gravis* prednisolone p. 678 is given. About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Smaller doses of corticosteroid are usually required in *ocular myasthenia*. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose.

In *generalised myasthenia gravis* azathioprine is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used. Ciclosporin p. 838, methotrexate p. 913, or mycophenolate mofetil p. 846 can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

**Acetylcholine-release enhancers**

Amifampridine p. 1126 is licensed for the symptomatic treatment of Lambert–Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

Fampridine p. 850 is licensed for the improvement of walking in patients with Multiple sclerosis p. 846 who have a walking disability.

**Skeletal muscle relaxants**

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with Multiple sclerosis p. 848 or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen p. 1128 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

A cannabis extract p. 1127 containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with Multiple sclerosis p. 848 in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

Danztrolone sodium p. 1346 acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly. Diazepam p. 343 can also be used. Sedation and occasionally extensor hypotonia are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses.

Tizanidine p. 1129 is an alpha₂-adrenoceptor agonist indicated for spasticity associated with Multiple sclerosis p. 848 or spinal cord injury.

**Other muscle relaxants**

The clinical efficacy of methocarbamol p. 1129 and meprobamate p. 346 as muscle relaxants is not well established, although they have been included in compound analgesic preparations.

**NEUROPROTECTIVE DRUGS**

### Riluzole

**INDICATIONS AND DOSE**

To extend life in patients with amyotrophic lateral sclerosis, initiated by specialist experienced in the management of motor neurone disease

- **BY MOUTH**

**CAUTIONS**

- History of abnormal hepatic function (consult product literature for details) • interstitial lung disease

**SIDE-EFFECTS, FURTHER INFORMATION**

- *Common or very common* Abdominal pain • asthenia • diarrhoea • dizziness • drowsiness • headache • nausea • oral paraesthesia • pain • tachycardia • vomiting

- *Uncommon* Anaemia • angioedema • interstitial lung disease • pancreatitis

- **FREQUENCY NOT KNOWN** Hepatitis • neutropenia

**SIDE-EFFECTS, FURTHER INFORMATION**

- White blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole.

**PREGNANCY** Avoid—no information available.

**BREAST FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid (risk of increased exposure).

**RENAL IMPAIRMENT** Avoid—no information available.

**PATIENT AND CARER ADVICE**

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur.

Driving and skilled tasks Dizziness or vertigo may affect performance of skilled tasks (e.g. driving).

www.getintopharma.com
**3.1 Muscular dystrophy**

**DRUGS FOR NEUROMUSCULAR DISORDERS**

Ataluren

**DRUG ACTION** Ataluren restores the synthesis of dystrophin by allowing ribosomes to read through premature stop codons that cause incomplete dystrophin synthesis in nonsense mutation Duchenne muscular dystrophy.

**INDICATIONS AND DOSE**

Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients (initiated by a specialist)

- **BY MOUTH**
  - Adult: (consult product literature)

**INTERACTIONS** → Appendix 1: ataluren

**SIDE-EFFECTS**

- Common or very common: Appetite decreased - constipation - cough - enuresis - fever - flatulence - gastrointestinal discomfort - haemorrhage - headache - hypertension - hypertriglyceridaemia - nausea - pain - rash erythematous - vomiting - weight decreased

**PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises discontinue breastfeeding—present in milk in animal studies.

**RENAL IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.

**MONITORING REQUIREMENTS** Manufacturer advises monitor renal function at least every 6–12 months, and cholesterol and triglyceride concentrations at least annually.

**DIRECTIONS FOR ADMINISTRATION** Manufacturer advises the contents of each sachet should be mixed with at least 30 mL of liquid (water, milk, fruit juice), or 3 tablespoons of semi-solid food (yoghurt or apple sauce).

**PATIENT AND CARER ADVICE** Manufacturer advises patients should maintain adequate hydration during treatment.

Missed doses Manufacturer advises if a morning or midday dose is more than 3 hours late, or an evening dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **Ataluren** for treating Duchenne muscular dystrophy with a nonsense mutation in the dystrophin gene (July 2016)

NICE HST3

Ataluren, within its marketing authorisation, is recommended for treating Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene in people aged 5 years and older who can walk, only when:

- the manufacturer provides ataluren with the discount agreed in the patient access scheme, and

- the conditions under which ataluren is made available.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **Ataluren** for treating Duchenne muscular dystrophy with a nonsense mutation in the dystrophin gene (July 2016)

NICE TA20

Riluzole

Manufacturer advises avoid—seizures, and vomiting.

**TETOS**

**PATIENT AND CARER ADVICE** Manufacturer advises patients should maintain adequate hydration during treatment.

**MEDICATION FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder.

**Oral suspension**

- **Teglatulik** (Martindale Pharmaceuticals Ltd)
  - Riluzole 5 mg per 1 ml Teglatulik 5mg/1ml oral suspension sugar-free $300.00 DT = $100.00

**Tablet**

- **Riluzole** (Non-proprietary)
  - Riluzone 50 mg Riluzole 50mg tablets | 56 tablet $320.00 DT = £12.08
  - **Rilutek** (Sanofi)
  - Riluzole 50 mg Rilutek 50mg tablets | 56 tablet $320.33 DT = £12.08

**SIDE-EFFECTS**

- Common or very common: Skin rash erythematous - hypertonia - hypotonia - increased muscle tone

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
**Nusinersen**

31-Aug-2018

- **DRUG ACTION** Nusinersen is an antisense oligonucleotide that increases the production of survival motor neurone (SMN) protein, thereby helping to compensate for the defect in the SMN1 gene found in 5q spinal muscular atrophy.

- **INDICATIONS AND DOSE**
  - 5q spinal muscular atrophy (initiated by a specialist)
  - **BY INTRATHecal INJECTION**
    - Adult: Initially 12 mg for 4 doses, on days 0, 14, 28 and 63, then 12 mg every 4 months, for advice on missed doses—consult product literature

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: NUSINERSEN (SPINRAZA ™): REPORTS OF COMMUNICATING HYDROCEPHALUS NOT RELATED TO MENINGITIS OR BLEEDING (JULY 2018)

Communicating hydrocephalus not related to meningitis or bleeding has been reported in patients treated with Spinraza™. Patients and caregivers should be informed about the signs and symptoms of hydrocephalus before Spinraza™ is started and should be instructed to seek medical attention in case of: persistent vomiting or headache, unexplained decrease in consciousness, and in children increase in head circumference. Patients with signs and symptoms suggestive of hydrocephalus should be further investigated by a physician with expertise in its management.

- **CAUTIONS** Risk factors for renal toxicity—monitor urine protein (preferably using a first morning urine specimen) - risk factors for thrombocytopenia and coagulation disorders—monitor platelet and coagulation profile before treatment
  - **PREGNANCY** Manufacturer advises avoid—no information available
  - **BREAST FEEDING** Manufacturer advises avoid—no information available.
  - **RENAL IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established
  - **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C); may be stored (in the original carton, protected from light) at or below refrigerator (–2–8 °C); may be stored (in the original carton, protected from light) at or below refrigerator (–2–8 °C)
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Spinraza** (Biogen Idec Ltd) ▲
  - Nusinersen (as Nusinersen sodium) 2.4 mg per 1 ml
  - Spinraza 12mg/5ml solution for injection vials | 1 vial £75,000.00

---

### 3.2 Myasthenia gravis and Lambert-Eaton myasthenic syndrome

#### ANTICHOLINESTERASES

**Anticholinesterases**

- **DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.
  - **CONTRA-INDICATIONS** Intestinal obstruction - urinary obstruction
  - **CAUTIONS** Arrhythmias - asthma (extreme caution) - atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection) but not given routinely because it may mask signs of overdosage - bradycardia - epilepsy - hyperthyroidism - hypotension - parkinsonism - peptic ulceration - recent myocardial infarction - vagotonia
  - **SIDE-EFFECTS** Abdominal cramps - diarrhoea - excessive tearing - hypersalivation - nausea - vomiting
  - **Overdose** Signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.
  - **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
  - **BREAST FEEDING** Amount probably too small to be harmful.

**Neostigmine**

*Neostigmine methylsulfate*

- **INDICATIONS AND DOSE**
  - **TREATMENT OF MYASTHENIA GRAVIS**
    - **BY MOUTH**
      - Adult: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
      - Adult: 1–2.5 mg, dose repeated at suitable intervals throughout the day (usual total daily dose 5–20 mg)
  - **REVERSAL OF NON-DEPOLARISING (COMPETITIVE) NEUROMUSCULAR BLOCKADE**
    - **BY INTRAVENOUS INJECTION**
      - Adult: 2.5 mg (max. per dose 5 mg), repeated if necessary after or with glycopyrronium or atropine, to be given over 1 minute

- **CAUTIONS**
  - With intravenous use glycopyrronium or atropine should also be given when reversing neuromuscular blockade
  - **INTERACTIONS** ▲ Appendix 1: neostigmine
  - **SIDE-EFFECTS**
    - With parenteral use Intestinal hypermotility - muscle spasms
  - **RENAL IMPAIRMENT**
    - Dose adjustments May need dose reduction.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection

- **Neostigmine (Non-proprietary)**
  - Neostigmine methylsulfate 2.5 mg per 1 ml
  - Neostigmine 2.5mg/1ml solution for injection ampoules | 10 ampoule Pack £5.45 | £7.72 DT + £6.13
- **Tablet**
  - **Neostigmine (Non-proprietary)**
    - Neostigmine bromide 15 mg
      - Neostigmine 15mg tablets | 140 tablet Pack £120.52 DT + £120.52
Pyridostigmine bromide

**DRUG ACTION** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

**INDICATIONS AND DOSE**

- **Myasthenia gravis**
  - **INITIALLY BY MOUTH**
  - **Adult:** 30–120 mg, doses to be given at suitable intervals throughout day; (by mouth) usual dose 0.3–1.2 g daily in divided doses, it is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily

- **PRECAUTIONS**
  - Use with caution.
  - **SIDE-EFFECTS** Gastrointestinal hypermotility - muscle cramps - rash
  - **RENAL IMPAIRMENT**
  - **Dose adjustments** Reduce dose; excreted by kidney.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

- **Tablet**
  - Pyridostigmine bromide (Non-proprietary)
  - Pyridostigmine bromide 60 mg: Pyridostigmine bromide 60mg tablets | 200 tablet (cost) £45.48 DT = £44.30
  - Mestinon (Meda Pharmaceuticals Ltd)
  - Pyridostigmine bromide 60 mg: Mestinon 60mg tablets | 200 tablet (cost) £45.57 DT = £44.30

**CHOLINERGIC RECEPTOR STIMULATING DRUGS**

Amifampridine

**INDICATIONS AND DOSE**

- **Symptomatic treatment of Lambert-Eaton myasthenic syndrome (specialist use only)**
  - **BY MOUTH**
  - **Adult:** Initially 15 mg daily in 3 divided doses, then increased in steps of 5 mg every 4–5 days, increased to up to 60 mg daily in 3–4 divided doses (max. per dose 20 mg); maximum 60 mg per day

- **CONTRA-INDICATIONS** Congenital QT syndromes - epilepsy - uncontrolled asthma

- **CAUTIONS** Non-paraneoplastic form of Lambert- Eaton myasthenic syndrome

- **INTERACTIONS** → Appendix 1: amifampridine

- **SIDE-EFFECTS** Anxiety - arrhythmia - asthenia - asthma - bronchial secretion increased - cough - dizziness - drowsiness - gastrointestinal disorder - headache - movement disorders - palpitations - paraesthesia - Raynaud’s phenomenon - seizure - sleep disorder - vision blurred

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

- **Dose adjustments** Manufacturer advises initial dose reduction to 5 mg twice daily in mild impairment, titrate in steps of 5 mg every 7 days.

**SIDE-EFFECTS**

- Abnormal Q-waves - atrial tachyarrhythmia - fibrillation or flutter - complete heart block or any heart block susceptible to evolve to complete heart block - heart failure (with ejection fraction less than 50%) - history of myocardial infarction - sinus node dysfunction - symptomatic coronary artery disease - ventricular tachyarrhythmia

- **CAUTIONS** Cardiac disorders other than those contra-indicated - epilepsy (increased risk of seizures)

- **INTERACTIONS** → Appendix 1: mexiletine

**DRUGS FOR NEUROMUSCULAR DISORDERS**

Mexiteline

**DRUG ACTION** Mexiletine is a sodium channel blocker which reduces the delay of muscle relaxation thereby decreasing muscle stiffness.

**INDICATIONS AND DOSE**

- **Myotonia in non-dystrophic myotonic disorders**
  - **BY MOUTH**
  - **Adult:** 167 mg once daily for at least 1 week, then increased if necessary to 333 mg daily in divided doses for at least 1 week, then increased if necessary to 500 mg daily in divided doses; maintenance 167–500 mg daily; maximum 500 mg per day

- **CONTRA-INDICATIONS** Abnormal Q-waves - atrial tachyarrhythmia - fibrillation or flutter - complete heart block or any heart block susceptible to evolve to complete heart block - heart failure (with ejection fraction less than 50%) - history of myocardial infarction - sinus node dysfunction - symptomatic coronary artery disease - ventricular tachyarrhythmia

- **CAUTIONS** Cardiac disorders other than those contra-indicated - epilepsy (increased risk of seizures)

- **INTERACTIONS** → Appendix 1: mexiletine

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - arrhythmias - asthenia - chest discomfort - drowsiness - headache - hypotension - insomnia - malaise - nausea - pain in extremity - paraesthesia - skin reactions - vasodilatation - vertigo - vision disorders

- **Uncommon** Seizure - speech disorder

- **Rare or very rare** Hepatic disorders - severe cutaneous adverse reactions (SCARs)

- **Frequency not known** Atrioventricular block - circulatory collapse - confusion - diarrhoea - gastrointestinal disorders - hallucination - leucopenia - lupus-like syndrome -
3.4 Nocturnal leg cramps

Nocturnal leg cramps

Quinine salts

Quinine salts p. 619, such as quinine sulfate are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdose and accidental fatalities have occurred.

3.5 Spasticity

CANNABINOIDS

Cannabis extract

- **INDICATIONS AND DOSE** Adjuvant to moderate to severe spasticity in multiple sclerosis (specialist use only)
  - By buccal administration
  - Adult: (consult product literature)
- **SIDE-EFFECTS**
  - **Common** or very common Appetite abnormal - balance impaired - concentration impaired - constipation - depression - diarrhoea - disorientation - dizziness - drowsiness - dry mouth - dysarthria - euphoric mood - feeling drunk - malaise - memory loss - nausea - oral disorders - perception altered - taste altered - vertigo - vision blurred - vomiting
  - **Uncommon** Abdominal pain upper - delusions - hallucinations - hyperactivity - palpitations - paranoia - pharyngitis - suicidal ideation - syncope - tachycardia - throat irritation - tooth discoloration
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during and for 3 months after treatment in men and women.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks.
- **BREAST FEEDING** Avoid—present in milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment (risk of accumulation with chronic dosing)—no information available.
- **RENAL IMPAIRMENT**
  - Monitoring: Manufacturer advises more frequent monitoring in significant renal impairment—possible risk of prolonged or enhanced effect.
  - **MONITORING REQUIREMENTS** Monitor oral mucosa—interrupt treatment if lesions or persistent soreness.
- **PATIENT AND CAREER ADVICE**
  - **Driving and skilled tasks** For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see Drugs and Driving under Guidance on prescribing p. 1.
**1128 Neurumuscular disorders**

**10 Musculoskeletal system**

- **MUSCLE RELAXANTS**

  ### Central Nervously Acting

  **Baclofen**

  **INDICATIONS AND DOSE**

  **Pain of muscle spasm in palliative care**
  - **BY MOUTH**
  - Adult: 5–10 mg 3 times a day
  **Hiccups due to gastric distension in palliative care**
  - **BY MOUTH**
  - Adult: 5 mg twice daily
  **Chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord**
  - **BY MOUTH**
  - Adult: Initially 5 mg 3 times a day, gradually increased; maintenance up to 60 mg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 100 mg per day
  **Severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures (specialist use only)**
  - **BY INTRATHECAL INJECTION**
  - Adult: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not given more often than every 24 hours to determine appropriate dose, then dose-titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis

  **INTERACTIONS**

  → Appendix 1: baclofen

  **SIDE-EFFECTS**

  **GENERAL SIDE-EFFECTS**

  - **Common or very common** Confusion, constipation, depression, diarrhoea, dizziness, drowsiness, dry mouth, euphoric mood, hallucination, headache, hyperhidrosis, hypotension, nausea, paraesthesia, skin reactions, urinary disorders, vision disorders, vomiting
  - **Uncommon** Bradycardia, hypothermia
  - **Rare or very rare** Withdrawal syndrome

  **SPECIFIC SIDE-EFFECTS**

  - **Common or very common**
    - With intrathecal use Anxiety, appetite decreased, asthenia, chills, dyspnoea, fever, hypersalivation, insomnia, neuromuscular dysfunction, oedema, pain, pneumonia, respiratory disorders, seizure, sexual dysfunction
    - With oral use Fatigue, gastrointestinal disorder, muscle weakness, myalgia, respiratory depression, sleep disorders
  - **Uncommon**
    - With intrathecal use Alopecia, deep vein thrombosis, dehydration, flushing, hypertension, hypoglycaemia, ileus, memory loss, pallor, paranoia, suicidal tendencies
  - **Rare or very rare**
    - With oral use Abdominal pain, erectile dysfunction, hepatic function abnormal, taste altered
    - Frequency not known
    - With intrathecal use Scoliosis

  **PREGNANCY**

  Manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies).

  **BREAST FEEDING**

  Present in milk—amount probably too small to be harmful.

  **HEPATIC IMPAIRMENT**

  With oral use Manufacturer advises use with caution—no information available.

  **RENAL IMPAIRMENT**

  Excreted by the kidney.

  **Dose adjustments**

  - With oral use Risk of toxicity—use smaller doses (e.g. 0.5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73 m² manufacturer advises use by mouth only if potential benefit outweighs risk.

  **TREATMENT CESSATION**

  Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).

  **PRESCRIBING AND DISPENSING INFORMATION**

  Flavours of oral liquid formulations may include raspberry.

  **Palliative care**

  For further information on the use of baclofen in palliative care, see www.medicinescomplete.com/#content/palliative/baclofen.

  **PATIENT AND CARER ADVICE**

  **Driving and skilled tasks**

  Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

  **MUSCLE RELAXANTS**

  **CENTRALLY ACTING**

  **CONTRA-INDICATIONS**

  - With intrathecal use Local infection, systemic infection
  - With oral use Avoid oral route in active peptic ulceration

  **CAUTIONS**

  **GENERAL CAUTIONS**

  - Cerebrovascular disease, diabetes, elderly, epilepsy, history of peptic ulcer, hypertonic bladder sphincter, Parkinson’s disease, psychiatric illness, respiratory impairment

  **SPECIFIC CAUTIONS**

  - With intrathecal use Coagulation disorders, malnutrition (increased risk of post-surgical complications), previous spinal fusion procedure

  **EXCIPIENTS** May contain Propylene glycol

  **Sativex** (Bayer Plc)

  *Test dose 1 dose Sativex oromucosal spray = 270 dose £375.00 DT = £375.00 (DC4-3)*

- **INDICATIONS AND DOSE**
  - **BY MOUTH**
    - Adult: 1.5 g 4 times a day; reduced to 750 mg 3 times a day if required
    - Elderly: Up to 750 mg 4 times a day, dose may be sufficient

- **CONTRA-INDICATIONS**
  - Brain damage - coma - epilepsy - myasthenia gravis - pre-coma

- **INTERACTIONS**
  - Appendix 1: methocarbamol

- **SIDE-EFFECTS**

- **PREGNANCY**
  - Manufacturer advises caution

- **BREASTFEEDING**
  - Present in milk in animal studies—manufacturer advises caution

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution (risk of increased half-life)

- **DOSE ADJUSTMENTS**
  - Manufacturer advises consider increasing dose interval in chronic impairment

- **RENA1 IMPAIRMENT**
  - Manufacturer advises caution

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

- **LESS SUITABLE FOR PRESCRIBING**
  - Less suitable for prescribing

**Tizanidine**
- **INDICATIONS AND DOSE**
  - **Spasticity associated with multiple sclerosis or spinal cord injury or disease**
    - **BY MOUTH**
      - Adult: Initially 2 mg daily, then increased in steps of 2 mg daily in divided doses, increased at intervals of at least 3–4 days and adjust according to response; usual dose up to 24 mg daily in 3–4 divided doses; maximum 36 mg per day

- **CAUTIONS**
  - Elderly

- **INTERACTIONS**
  - Appendix 1: tizanidine

- **SIDE-EFFECTS**
  - Common or very common: Arrhythmias - dizziness - drowsiness - dry mouth - fatigue - hypotension - rebound hypertension

- **RARE OR VERY RARE**
  - Gastrointestinal disorder - hallucination - hepatic disorders - muscle weakness - nausea - sleep disorders

- **FREQUENCY NOT KNOWN**
  - Abdominal pain - accommodation disorder - anxiety - appetite decreased - confusion - headache - QT interval prolongation - skin reactions - vomiting - withdrawal syndrome

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Treatment should be discontinued if liver enzymes are persistently raised—consult product literature

- **PREGNANCY**
  - Avoid (toxicity in animal studies)

- **BREASTFEEDING**
  - Avoid (present in milk in animal studies)

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution

- **RENA1 IMPAIRMENT**
  - Manufacturer advises caution

- **MONITORING REQUIREMENTS**
  - Monitor liver function monthly for first 4 months for daily doses of 12 mg or higher, and in those who develop unexplained nausea, anorexia or fatigue

- **TREATMENT CESSION**
  - Avoid abrupt withdrawal (risk of rebound hypertension and tachycardia); to minimise risk, discontinue gradually and monitor blood pressure

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS 2, 8**
    - **Tizanidine (Non-proprietary)**
      - Tizanidine (as Tizanidine hydrochloride) 2 mg Tizanidine 2mg tablets | 120 tablet (POM) £28.89 DT = £3.22
      - Tizanidine (as Tizanidine hydrochloride) 4 mg Tizanidine 4mg tablets | 120 tablet (POM) £40.07 DT = £3.97

4 Pain and inflammation in musculoskeletal disorders

Low back pain and sciatica 08-Mar-2017

Description of condition
Low back pain is in the lumbosacral area of the back. It can be described as non-specific, mechanical, musculoskeletal or simple (if it is not associated with serious or potentially serious causes). Episodes of back pain do not usually last long, with rapid improvements in pain and disability seen within a few weeks to months.

Sciatica (radicular pain or radiculopathy) is neuropathic leg pain secondary to compressive lumbosacral nerve root pathology.

Non-drug treatment
Exercise programmes, manual therapy, and psychological therapies should be considered for managing low back pain with or without sciatica. Spinal decompression may be considered in patients with sciatica when pain and function has not improved with non-surgical treatment (including drug treatment).

Drug treatment
An oral NSAID (see Non-steroidal anti-inflammatory drugs below) should be considered for managing acute low back pain, taking into consideration the gastrointestinal, cardio-renal and hepatic risks associated with NSAIDs; as well as the need for continued monitoring, and the possible need for gastrointestinal protective treatment (see NSAID-associated ulcers under Peptic ulceration p. 72).

A weak opioid, either alone or with paracetamol p. 444, can be used to manage acute low back pain only if an NSAID is contra-indicated, not tolerated or ineffective (see Opioid analogues under Analgesics p. 442). Paracetamol alone is ineffective for managing low back pain.

Benzodiazepines are sometimes used to manage acute low back pain (particularly in loss of lordosis); however evidence to support their use is very weak.

In patients with chronic low back pain who have had an inadequate response to non-drug treatment, NSAIDs should be considered as first-line therapy. Opioids should be the last treatment option considered and should be considered only in patients for whom other therapies have failed and only if the potential benefits outweigh the risks for individual patients. If indicated, opioids should only be prescribed for a limited period of time. Long term opioid therapy should be avoided.

Selective serotonin re-uptake inhibitors (SSRIs), serotonin and noradrenaline re-uptake inhibitors (SNRIs), tricyclic antidepressants, and antiepileptic drugs should not be offered for managing low back pain.

When non-surgical treatment is ineffective in patients with moderate and severe localised back pain arising from structures supplied by the medial branch nerve, radiofrequency denervation can be considered.

Sciatica
Patients with sciatica may require specific treatment for Neuropathic pain p. 483.

Patients with acute and severe sciatica may benefit from treatment with epidural injections of local anaesthetic and/or corticosteroid.

Useful Resources

Non-steroidal anti-inflammatory drugs 05-Jun-2017

Therapeutic effects
In single doses non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 444, but paracetamol is preferred, particularly in the elderly.

In regular full dosage NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analogues in the inflammatory arthritides (e.g. rheumatoid arthritis) and in some cases of advanced osteoarthritis. NSAIDs can also be of benefit in the less well defined conditions of back pain and soft-tissue disorders.

Choice
Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastrointestinal intolerance. Several other factors also influence susceptibility to gastrointestinal effects, and a NSAID should be chosen on the basis of the incidence of gastrointestinal and other side-effects.

Ibuprofen p. 1141 is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. It is unsuitable for conditions where inflammation is prominent, such as acute gout. Dextibuprofen p. 1133 is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:
Naproxen p. 1148 is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen).
Flurbiprofen p. 1140 may be slightly more effective than naproxen, and is associated with slightly more gastrointestinal side-effects than ibuprofen.
Ketoprofen p. 1144 has anti-inflammatory properties similar to ibuprofen and has more side-effects.
Dexketoprofen p. 1134, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.
Tiatrofenic acid p. 1152 is as effective as naproxen; it has more side-effects than ibuprofen.

Drugs with properties similar to those of propionic acid derivatives:
Diclofenac sodium p. 1135 and aceclofenac p. 1132 are similar in efficacy to naproxen.
Etodolac p. 1138 is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.
Indomethacin p. 1143 has an action equal to or superior to that of naproxen, but with a high incidence of side-effects
including headache, dizziness, and gastro-intestinal disturbances.

Mefenamic acid p. 1145 has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Meloxicam p. 1146 is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

Nabumetone p. 1147 is comparable in effect to naproxen.

Phenylbutazone is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

Piroxicam p. 1149 is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Sulindac p. 1150 is similar in tolerance to naproxen.

Tenoxicam p. 1151 is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Tolprofen p. 476 is licensed for the treatment of migraine.

Ketorolac trometamol p. 1342 and the selective inhibitor of cyclo-oxygenase-2, parecoxib p. 1342, are licensed for the short-term management of postoperative pain.

The selective inhibitors of cyclo-oxygenase-2, etoricoxib p. 1139 and celecoxib p. 1132, are as effective as non-selective NSAIDs such as diclofenac sodium and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Aspirin p. 121 has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

Dental and orofacial pain
Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen, diclofenac sodium, and diclofenac potassium p. 1135.

Asthma
Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

NSAIDs and cardiovascular events
All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. Although there are limited data regarding the thrombotic effects of acetylsalicylic acid, treatment advice has been updated in line with diclofenac, based on acetylsalicylic acid’s structural similarity to diclofenac and its metabolism to diclofenac. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib.

Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

NSAIDs and gastro-intestinal events
All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam, ketoprofen, and ketorolac trometamol are associated with the highest risk; indometacin p. 1143, diclofenac, and naproxen p. 1148 are associated with intermediate risk, and ibuprofen p. 1141 with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk (e.g. ibuprofen are generally preferred, to start at the lowest recommended dose) and not to use more than one oral NSAID at a time.

The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness.

Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment.

Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

NSAIDs and alcohol
Alcohol increases the risk of gastro-intestinal side-effects; this risk is higher in the elderly. Specialist sources recommend that concurrent use need not be avoided with moderate alcohol intake, but greater caution is warranted in those who drink more than the recommended daily limits.

Some cases of acute kidney injury have been attributed to use of NSAIDs and acute excessive alcohol consumption.

Advanced Pharmacy Services
Patients taking NSAIDs may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Other drugs used for Pain and inflammation in musculoskeletal disorders
Tramadol with dexketoprofen, p. 474
1332 Pain and inflammation in musculoskeletal disorders

ANALGESICS ▶ NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Aceclofenac

- INDICATIONS AND DOSE
  Pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis
  ▶ BY MOUTH
  Adult: 100 mg twice daily

- CONTRA-INDICATIONS
  Active gastro-intestinal bleeding - active gastro-intestinal ulceration - cerebrovascular disease - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - ischaemic heart disease - mild heart failure - peripheral arterial disease - severe heart failure

- CAUTIONS
  Allergic disorders - avoid in Acute porphyrias p. 1058 - cardiac impairment (NSAIDs may impair renal function) - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - history of cardiac failure - hypertension - left ventricular dysfunction - oedema - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated)

- INTERACTIONS ▶ Appendix 1: NSAIDs

- SIDE-EFFECTS
  ▶ Common or very common
  Diarrhoea - dizziness - gastrointestinal discomfort - nausea
  ▶ Uncommon
  Constipation - gastrointestinal disorders - oral disorders - skin reactions - vomiting
  ▶ Rare or very rare
  ▶ Frequency not known
  Acute coronary syndrome - agranulocytosis - asthma - confusion - hallucination - increased risk of arterial thromboembolism - increased risk of ischaemic stroke - malaise - meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - nephritis - tuberculosis - optic neuritis - photochromic reaction - platelet aggregation inhibition - respiratory tract reaction

SIDE-EFFECTS, FURTHER INFORMATION
For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- ALLERGY AND CROSS-SENSITIVITY
  Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- CONCEPTION AND CONTRACEPTION
  Caution — long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- PREGNANCY
  Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased.

- BREAST FEEDING
  Use with caution during breast-feeding. Manufacturer advises avoid.

- HEPATIC IMPAIRMENT
  Manufacturer advises caution in mild to moderate impairment; avoid in hepatic failure.

- Dose adjustments
  Manufacturer advises consider initial dose reduction to 100 mg daily in mild to moderate impairment.

- RENAL IMPAIRMENT
  Avoid if possible or use with caution; avoid in moderate to severe impairment.

- DOSE ADJUSTMENTS DUE TO INTERACTIONS
  Manufacturer advises reduce dose by half with concurrent use of fluconazole.

Celecoxib

- INDICATIONS AND DOSE
  Pain and inflammation in osteoarthritis
  ▶ BY MOUTH
  Adult: 200 mg daily in 1–2 divided doses, then increased if necessary to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose
  Pain and inflammation in rheumatoid arthritis
  ▶ BY MOUTH
  Adult: 100 mg twice daily, then increased if necessary to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose
  Ankylosing spondylitis
  ▶ BY MOUTH
  Adult: 200 mg daily in 1–2 divided doses, then increased if necessary up to 400 mg daily in 1–2 divided doses, discontinue if no improvement after 2 weeks on maximum dose

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises reduce dose by half with concurrent use of fluconazole.

- CONTRA-INDICATIONS
  Active gastro-intestinal bleeding - active gastro-intestinal ulceration - cerebrovascular disease - inflammatory bowel disease - ischaemic heart disease - mild to severe heart failure - peripheral arterial disease

- CAUTIONS
  Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - history of cardiac failure - hypertension - left ventricular dysfunction - oedema - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated)

- INTERACTIONS ▶ Appendix 1: NSAIDs
Pregnancy

Conception and Contraception

Frequency not known

Side-effects, Further Information

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

Allergy and Cross-sensitivity

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

Contra-indicated in patients with sulfonamide sensitivity.

Conception and Contraception

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

Pregnancy

Avoid (teratogenic in animal studies).

Breast Feeding

Avoid—present in milk in animal studies.

Hepatic Impairment

Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

Dose adjustments

Manufacturer advises initial dose reduction of 50% in moderate impairment.

Renal Impairment

Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments

The lowest effective dose should be used for the shortest possible duration.

Monitoring

In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Monitoring Requirements

Monitor blood pressure before and during treatment.

Medicinal Requirements

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Celecoxib (Non-proprietary)

Celecoxib 100 mg

Celecoxib 100 mg capsules | 60 capsule POM £21.55 DT = £2.72

Celecoxib 200 mg

Celecoxib 200 mg capsules | 30 capsule POM £21.55 DT = £1.01

Celebrex (Pfizer Ltd)

Celecoxib 100 mg

Celebrex 100mg capsules | 60 capsule POM £21.55 DT = £2.72

Celecoxib 200 mg

Celebrex 200mg capsules | 30 capsule POM £21.55 DT = £1.01

Dexibuprofen

21-May-2018

indications and dose

Osteoarthritis

By Mouth

Adult: 600–900 mg daily in up to 3 divided doses; increased if necessary up to 1200 mg daily (max. per dose 400 mg)

Dysmenorrhoea

By Mouth

Adult: 600–900 mg daily in up to 3 divided doses (max. per dose 400 mg)

Mild-to-moderate pain

By Mouth

Adult: 600 mg daily in up to 3 divided doses; increased if necessary up to 1200 mg daily (max. per dose 400 mg), higher dose for short-term use for acute pain

Contra-indications

Active gastro-intestinal bleeding—active gastro-intestinal ulceration—history of gastro-intestinal bleeding related to previous NSAID therapy—history of gastro-intestinal perforation related to previous NSAID therapy—history of recurrent gastro-intestinal ulceration (two or more distinct episodes) or history of recurrent gastro-intestinal ulceration (two or more distinct episodes)—severe heart failure

Caution

Allergic disorders—cardiac impairment (NSAIDs may impair renal function)–cerebrovascular disease–coagulation defects–congestive heart failure–connective-tissue disorders–Crohn’s disease (may be exacerbated)–elderly (risk of serious side-effects and fatalities)–ischaemic heart disease–malignant tumours–renal disease–risk factors for cardiovascular events—ulcerative colitis (may be exacerbated)—uncontrolled hypertension

Caution, Further Information

High-dose dexibuprofen–A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose dexibuprofen (≥ 1.2 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II–III), and uncontrolled hypertension

Interactions

→ Appendix 1: NSAIDs

Side-effects

Common or very common

Diarrhoea—dizziness—drowsiness—fatigue—gastrointestinal discomfort—headache—nausea—skin reactions—vertigo—vomiting

Uncommon

Angioedema—anxiety—gastrointestinal disorders—haemorrhage—increased risk of infection—insomnia—oral disorders—respiratory disorders—tinnitus—vision blurred—vitreous floaters

Rare or very rare

Agranulocytosis—alopecia—anaemia—asthma—blood disorder—bone marrow disorders—confusion—constipation—depression—fever—granulocytopenia—haemolytic anaemia—hearing impairment—hepatic disorders—hypersensitivity—hypotension—inflammatory bowel disease—irritability—leucopenia—malignant tumours—meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible)—nephritis tubulointerstitial—nephrotic syndrome—photosensitivity reaction—psychotic disorder—renal failure (more common in patients with pre-existing renal impairment)—severe cutaneous adverse reactions (SCARs)—shock—tachycardia—thrombocytopenia

Frequency not known

Fluid retention—generalised oedema—glomerulonephritis—increased risk of arterial
Pain and inflammation in musculoskeletal disorders

INDICATIONS AND DOSE

Short-term treatment of mild to moderate pain including dysmenorrhoea

BY MOUTH

Adult: 12.5 mg every 4–6 hours, alternatively 25 mg every 8 hours; maximum 75 mg per day

Elderly: 12.5 mg every 4–6 hours, alternatively 25 mg every 8 hours, initial max. 50 mg; maximum 75 mg daily

CONTRA-INDICATIONS

Active bleeding or bleeding disorders – active or recurrent gastro-intestinal haemorrhage – active or recurrent gastro-intestinal ulcer – chronic dyspepsia – Crohn’s disease – history of NSAID-associated gastro-intestinal bleeding or perforation – known photoallergic or phototoxic reactions during treatment with ketoprofen or fibrates – severe dehydration – severe heart failure – ulcerative colitis – varicella infection

CAUTIONS

INTERACTIONS

Appendix 1: NSAIDs

SIDE-EFFECTS

Common or very common Diarrhoea – gastrointestinal discomfort – nausea – vomiting

SIDE-EFFECTS, FURTHER INFORMATION

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID – which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

Caution — long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING

Use with caution during breast-feeding. Present in milk – but risk to infant minimal.

HEPATIC IMPAIRMENT

Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

Dose adjustments

Manufacturer advises initial dose reduction in mild to moderate impairment.

RENAL IMPAIRMENT

Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m².

Monitoring

Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Dose adjustments

Reduce initial dose.

The lowest effective dose should be used for the shortest possible duration.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS

Seractil (Gebro Pharma GmbH)

  - Adult: 75–150 mg daily in divided doses

**DILOMAX RETARD®**

**Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders**
- Adult: **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 1 capsule once daily

**VOLTAROL®**

**Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders**
- Adult: **BY MOUTH**
  - Adult: 1 capsule 1–2 times a day

**DILOMAX SR®**

**Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders**
- Adult: **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 1 capsule 1–2 times a day

**VOLTAROL® 75MG SR TABLETS**

**Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders**
- Adult: **BY MOUTH**
  - Adult: 1 tablet 1–2 times a day

**VOLTAROL® EMULGEL**

**Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis**
- **TO THE SKIN**
  - Adult: Apply 3–4 times a day, therapy should be reviewed after 14 days (or after 28 days for osteoarthritis)

**VOLTAROL® RETARD**

**Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders**
- Adult: **BY MOUTH**
  - Adult: 1 tablet once daily

**VOLTAROL® SOLUTION FOR INJECTION**

**Postoperative pain**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 75 mg 1–2 days a time for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

**Acute exacerbations of pain**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 75 mg 1–2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

**Urinary colic**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 75 mg, then 75 mg after 30 minutes if required

**Acute postoperative pain (in hospital setting)**
- **BY INTRAVENOUS INFUSION**
  - Adult: 75 mg, then 75 mg after 4–6 hours if required for maximum 2 days; maximum 150 mg per day

**Prevention of postoperative pain (in hospital setting)**
- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 25–50 mg, to be given after surgery over 15–60 minutes, then 5 mg/hour for maximum 2 days; maximum 150 mg per day

**CONTRA-INDICATIONS**
- With intravenous use
  - Dehydration
  - History of asthma
  - History of confirmed or suspected cerebrovascular bleeding
  - History of haemorrhagic diathesis
  - Hypoovolaemia
  - Operations with high risk of haemorrhage
- With systemic use
  - Active gastro-intestinal bleeding
  - Active gastro-intestinal ulceration
  - Avoid suppositories in proctitis
  - Cerebrovascular disease
  - History of gastro-intestinal bleeding related to previous NSAID therapy
  - History of gastro-intestinal perforation related to previous NSAID therapy
  - History of recurrent gastro-intestinal haemorrhage (two or more distinct episodes)
  - History of recurrent gastro-intestinal ulceration (two or more distinct episodes)
  - Ischaemic heart disease
  - Mild to severe heart failure
  - Peripheral arterial disease

**CAUTIONS**
- With systemic use
  - Allergic disorders
  - Cardiac impairment (NSAIDs may impair renal function)
  - Coagulation defects
  - Connective-tissue disorders
  - Croup’s disease (may be exacerbated)
  - Elderly (risk of serious side-effects and fatalities)
  - History of cardiac failure
  - Hypertension
  - Left ventricular dysfunction
  - Oedema
  - Risk factors for cardiovascular events
  - Ulcerative colitis (may be exacerbated)
- With topical use
  - Avoid contact with eyes
  - Avoid contact with inflamed or broken skin
  - Avoid contact with mucous membranes
  - Not for use with occlusive dressings
  - Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

**INTERACTIONS**
- Appendix 1: NSAIDs

**SIDE-EFFECTS**
- Common or very common
  - With systemic use
    - Appetite decreased
    - Diarrhoea
    - Dizziness
    - Gastrointestinal discomfort
    - Headache
    - Nausea
    - Oedema
    - Rash (discontinue)
    - Skin reactions
    - Vertigo
    - Vomiting
  - With topical use
    - Conjunctivitis
    - Muscle tone increased
    - Oedema
    - Rash (discontinue)
    - Sensation abnormal
    - Skin reactions
    - Skin ulcer

- Uncommon
  - With systemic use
    - Chest pain
    - Heart failure
    - Myocardial infarction
    - Palpitations
  - With topical use
    - Abdominal pain
    - Alopecia
    - Diarrhoea
    - Eye pain
    - Haemorrhage
    - Lacrimation disorder
    - Nausea
    - Seborrhoea

- Rare or very rare
  - With rectal use
    - Ulcerative colitis
    - Aggravated
  - With systemic use
    - Acute kidney injury
    - Agranulocytosis
    - Alopecia
    - Anaemia
    - Angioedema
    - Anxiety
    - Aplastic anaemia
    - Asthma
    - Chest pain
    - Confusion
    - Constipation
    - Depression
    - Drowsiness
    - Dysphoria
    - Erectile dysfunction
    - Fatigue
    - Haemolytic anaemia
    - Haemorrhage
    - Hearing impairment
    - Heart failure
    - Hepatic disorders
    - Hypersensitivity
    - Hypertension
    - Hypotension
    - Irritability
    - Leucopenia
    - Memory loss
    - Meningitis aseptic
    - Patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible
    - Myocardial infarction
    - Nephritis
    - Tubulointerstitial
    - Nephrotic syndrome
    - Oesophageal disorder
    - Oral disorders
    - Palpitations
    - Pancreatitis
    - Photosensitivity reaction
    - Pneumonitis
    - Proteinuria
    - Psychotic disorder
    - Renal papillary necrosis
    - Seizure
    - Sensation abnormal
    - Severe cutaneous adverse reactions (SCARs)
    - Shock
    - Sleep disorders
    - Stroke
    - Taste altered
    - Thrombocytopenia
    - Tinnitus
    - Tremor
    - Vasculitis
    - Vision disorders
- With topical use
  - Acute kidney injury
  - Asthma
  - Hypersensitivity
  - Photosensitivity reaction
  - Rash pustular
- Frequency not known
  - With parenteral use
    - Injection site necrosis

Pain and inflammation in musculoskeletal disorders

- **PROFESSION SPECIFIC INFORMATION**
  - **Dental practitioners’ formulation**
    - Diclofenac Sodium Tablets may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispersible tablet, oral suspension, oral solution

- **Modified-release tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 21, 25
    - **Diclofenac 75mg SR** (Dexcel-Pharma Ltd)
    - Diclofenac sodium 75 mg Diclofenac sodium 25 mg gastro-resistant tablets | 28 tablet (POM) £3.56 DT + £8.06
    - Diclofenac sodium 50 mg Diclofenac sodium 50mg gastro-resistant tablets | 28 tablet (POM) £4.97 DT + £1.89 | 84 tablet (POM) £2.48-£15.00
    - Diclofenac sodium 25 mg Diclofenac sodium 25mg gastro-resistant tablets | 28 tablet (POM) £1.77 | 84 tablet (POM) £1.50–£26.97
    - Diclofenac sodium 50 mg Diclofenac sodium 50mg gastro-resistant tablets | 28 tablet (POM) £4.42 | 84 tablet (POM) £8.05
    - Fenactol (Discovery Pharmaceuticals)
      - Diclofenac sodium 50 mg Fenactol 50mg gastro-resistant tablets | 100 tablet (POM) £3.70

- **Suppository**
  - Econac (Advanz Pharma)
    - Diclofenac sodium 100 mg Econac 100mg suppositories | 16 suppository (POM) £3.04 DT + £3.64
    - Voltarol (Novartis Pharmaceuticals UK Ltd)
      - Diclofenac sodium 12.5 mg Voltarol 12.5mg suppositories | 10 suppository (POM) £0.70 DT + £0.70
      - Diclofenac sodium 25 mg Voltarol 25mg suppositories | 10 suppository (POM) £1.24 DT + £1.24
      - Diclofenac sodium 50 mg Voltarol 50mg suppositories | 10 suppository (POM) £2.04 DT + £2.04
    - Diclofenac sodium 100 mg Voltarol 100mg suppositories | 10 suppository (POM) £3.64 DT + £3.64

- **Solution for injection**
  - **EXCIPIENTS:** May contain Benzyl alcohol, propylene glycol
    - Voltarol (Novartis Pharmaceuticals UK Ltd)
      - Diclofenac sodium 25 mg per 1 ml Voltarol 75mg/3ml solution for injection ampoules | 10 ampoule (POM) £9.91 DT = £9.91

- **Modified-release capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 21 (does not apply to Motifene 75 mg), 25
    - EXCIPIENTS: May contain Propylene glycol
      - Diclomax Retard (Galen Ltd)
        - Diclofenac sodium 100 mg Diclomax Retard 100mg capsules | 28 capsule (POM) £8.20 DT + £8.20
      - Diclofenac sodium 75 mg Diclofenac SR 75mg capsules | 56 capsule (POM) £11.40 DT = £11.40
    - Motifene (Daichi Sankyo UK Ltd)
      - Diclofenac sodium 75 mg Motifene 75mg modified-release capsules | 56 capsule (POM) £8.00 DT = £8.00

- With systemic use  Fertility decreased female  • fluid retention  • hallucination  • malaise  • optic neuritis  • platelet aggregation inhibition
- With topical use  Hair colour changes

**SIDE-EFFECTS, FURTHER INFORMATION**
- Topical application of large amounts of diclofenac can result in systemic effects.
- For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1130

**ALLERGY AND CROSS-SENSITIVITY**
- Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION**
- With systemic use  Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**
- With systemic use  Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**
- With systemic use  Use with caution during breast-feeding. Amount in milk too small to be harmful.
- With topical use  Patient packs for topical preparations carry a warning to avoid during breast-feeding.

**HEPATIC IMPAIRMENT**
- With systemic use  Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT**
- With systemic use  Avoid if possible or use with caution. Avoid in severe impairment.
- With intravenous use  Avoid intravenous use if serum creatinine greater than 160 micromol/litre. Contra-indicated in moderate or severe renal impairment.

**Dose adjustments**  • With systemic use  The lowest effective dose should be used for the shortest possible duration.

**Monitoring**  • With systemic use  In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use  For *intravenous infusion* (Voltarol®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution). For intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes. For continuous infusion give at a rate of 5 mg/hour.
  - With topical use  For topical preparations, apply with gentle massage only.

**PRESCRIBING AND DISPENSING INFORMATION**
- With oral use  Voltarol® dispersible tablets are more suitable for short-term use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months).

**PATIENT AND CARER ADVICE**
- For topical preparations, patients and their carers should be advised to wash hands immediately after use.
  - Photosensitivity  Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

Diclofenac sodium with misoprostol

22-Sep-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, diclofenac sodium p. 1135, misoprostol p. 77.

- **INDICATIONS AND DOSE**

  **ARTHROTEC® 50/200**

  Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

  - **BY MOUTH**
    - Adult: 1 tablet 2–3 times a day, take with food

  **MISOFEN® 50/200**

  Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis

  - **BY MOUTH**
    - Adult: 1 tablet 2–3 times a day, take with food

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Gastro-resitant tablet**

  **CAUTIONARY AND ADVISORY LABELS** 21, 25

  - **Arthrotec®** (Pfizer Ltd)
    - Misoprostol 200 microgram, Diclofenac sodium 50 mg **Arthrotec 50 gastro-resistant tablets** | 60 tablet [BM] £11.98 DT = £11.98
    - Misoprostol 200 microgram, Diclofenac sodium 75 mg **Arthrotec 75 gastro-resistant tablets** | 60 tablet [BM] £15.83 DT = £15.83
  - **Misofen®** (Morningside Healthcare Ltd)
    - Misoprostol 200 microgram, Diclofenac sodium 50 mg **Misofen 50mg/200microgram gastro-resistant tablets** | 60 tablet [BM] £11.98 DT = £11.98
    - Misoprostol 200 microgram, Diclofenac sodium 75 mg **Misofen 75mg/200microgram gastro-resistant tablets** | 60 tablet [BM] £15.83 DT = £15.83

- **INTERACTIONS** → Appendix 1: NSAIDs

  SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra–indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.

  **Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

  **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Modified-release tablet**

  **CAUTIONARY AND ADVISORY LABELS** 25

  - **Etodolac® (Non-proprietary)**
    - **Etodolac 600 mg** Etodolac 600mg modified-release tablets | 30 tablet [BM] £11.40 DT = £15.50

Etodolac

29-Jun-2016

- **INDICATIONS AND DOSE**

  **Pain and inflammation in rheumatoid arthritis and osteoarthritis**

  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Adult: 300–600 mg daily in 1–2 divided doses
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
    - Adult: 600 mg daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

  **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

  **INTERACTIONS** → Appendix 1: NSAIDs
**Etoricoxib** 23-Nov-2016

### INDICATIONS AND DOSE

**Pain and inflammation in osteoarthritis**
- **BY MOUTH**
  - Child 16-17 years: 30 mg once daily, increased if necessary to 60 mg once daily
  - Adult: 30 mg once daily, increased if necessary to 60 mg once daily

**Pain and inflammation in rheumatoid arthritis**
- **BY MOUTH**
  - Child 16-17 years: 60 mg once daily, increased if necessary to 90 mg once daily
  - Adult: 60 mg once daily, increased if necessary to 90 mg once daily

**Acute gout**
- **BY MOUTH**
  - Child 16-17 years: 120 mg once daily for maximum 8 days
  - Adult: 120 mg once daily for maximum 8 days

### CONTRA-INDICATIONS
Active gastro-intestinal bleeding - active gastro-intestinal ulceration - cerebrovascular disease - inflammatory bowel disease - ischaemic heart disease - mild to severe heart failure - peripheral arterial disease - uncontrolled hypertension (persistently above 140/90 mmHg)

### CAUTIONS
Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - coagulation defects - connective-tissue disorders - Crohn's disease (may be exacerbated) - dehydration - elderly (risk of serious side-effects and fatalities) - history of cardiac failure - hypertension - left ventricular dysfunction - oedema - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated)

### INTERACTIONS
Appendix 1: NSAIDs

### SIDE-EFFECTS
**Common or very common** Arrhythmias - asthenia - bronchospasm - constipation - diarrhea - dizziness - fluid retention - gastrointestinal discomfort - gastrointestinal disorders - headache - hypertension - increased risk of infection - influenza like illness - nausea - oedema - oral ulceration - palpitations - skin reactions - vomiting

**Rare or very rare** Angioedema - confusion - hepatic disorders - muscle complaints - severe cutaneous adverse reactions (SCARs) - shock

### FREQUENCY NOT KNOWN
Nephritis tubulointerstitial - nephropathy

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**Pregnancy** Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**Breast feeding** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in animal studies.

**Hepatic impairment** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

**Dose adjustments** Manufacturer advises max. 60 mg once daily in mild impairment; max. 30 mg once daily in moderate impairment.

**Renal impairment** Avoid if possible or use with caution.
  - In adults Avoid if eGFR less than 30 mL/minute/1.73 m².
  - In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**Monitoring requirements** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

www.getintopharma.com
Felbinac

**DRUG ACTION** Felbinac is an active metabolite of the NSAID fenbufen.

**INDICATIONS AND DOSE** Relief of pain in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- TO THE SKIN
  - Adult: Apply 2–4 times a day, therapy should be reviewed after 14 days; maximum 25 g per day

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal haemorrhage (two or more distinct episodes) - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

**CAUTIONS** Allergic disorders - avoid contact with eyes - avoid contact with inflamed or broken skin - avoid contact with mucous membranes - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - not for use with occlusive dressings - peripheral arterial disease - risk factors for cardiovascular events - topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported) - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS** Bronchospasm - gastrointestinal disorder - hypersensitivity - paraesthesia - photosensitivity reaction - skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1130.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY** Patient packs for topical preparations carry a warning to avoid during pregnancy.

**BREAST FEEDING** Patient packs for topical preparations carry a warning to avoid during breast-feeding.

**RENAL IMPAIRMENT** Avoid if possible or use with caution. Deterioration in renal function has also been reported after topical use.

**Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.

**PRESCRIBING AND DISPENSING INFORMATION** Caution—topical preparations not generally suitable for children.

**PATIENT AND CARER ADVICE** For topical preparations patients and carers should be advised to wash hands immediately after use.

---

Flurbiprofen

**INDICATIONS AND DOSE** Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

- BY MOUTH
  - Child 12-17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions
  - Adult: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

**Dysmenorrhoea**

- BY MOUTH
  - Child 12-17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day
  - Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

**CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS** Agranulocytosis - angioedema - aplastic anaemia - asthma - bronchospasm - confusion - constipation - Crohn’s disease - depression - diarrhoea - dizziness - drowsiness - dyspnoea - fatigue - fertility decreased female - gastrointestinal discomfort - gastrointestinal disorders - haemolytic anaemia - haemorrhage - hallucination - headache - heart failure - hepatic disorders - hypersensitivity - hypertension - malaise - meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - nausea - nephritis - tuberculosis - nephropathy - neutropenia - oedema - optic neuritis - oral ulceration - pancreatitis - paraesthesia - photosensitivity reaction - platelet aggregation inhibition - renal failure (more common in patients with pre-existing renal impairment) - respiratory tract reaction - severe cutaneous adverse reactions (SCARs) - skin reactions -

Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

**MEDITINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Gel**
  - Traxam (Advanz Pharma)
    - Felbinac 30 mg per 1 gram Traxam 3% gel | 100 gram POM £8.03 DT = £8.03

stroke • thrombocytopenia • tinnitus • vertigo • visual impairment • vomiting

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130.

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

RENAL IMPAIRMENT Avoid if possible or use with caution. Avoid in severe impairment.

Dose adjustments The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 21

Flurbiprofen (Non-proprietary)

Flurbiprofen 50 mg Flurbiprofen 100 mg

| Tablet | 100 tablet | POM | £21.30–£35.17 DT | £39.57

| Tablet | 100mg tablets | POM | £38.10–£77.21 DT | £70.78

Ibuprofen

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Mild to moderate pain including dysmenorrhoea | Postoperative analgesia | Migraine | Dental pain

Adult: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

Increase if necessary to 2.4 g daily in divided doses, dose to be increased only in severe cases

Mild to moderate pain | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 3–5 years: 50 mg 3 times a day; maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day

Child 6–11 months: 50 mg 3–4 times a day; maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day

Child 1–3 years: 100 mg 3 times a day; maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day

Child 4–6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day

Child 7–9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day

Child 10–11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day

Child 12–17 years: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

Pain and inflammation

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12–17 years: 1.6 g once daily, dose preferably taken in the early morning, increased to 2.4 g daily in 2 divided doses, to be increased only in severe cases

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 3 months–17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

Pain and inflammation in systemic juvenile idiopathic arthritis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 3 months–17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

Post-immunisation pyrexia in infants (on doctor’s advice only)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 2–3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

TO THE SKIN

Adult: Apply up to 3 times a day, ibuprofen gel 5% gel to be administered

FENBID FORTE

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

TO THE SKIN

Adult: Apply up to 4 times a day, therapy should be reviewed after 14 days

IBUGEL FORTE

Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

TO THE SKIN

Adult: Apply up to 3 times a day

UNLICENSED USE

With oral use in children Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

CONTRA-INDICATIONS

With systemic use Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure • varicella infection

CAUTIONS

With systemic use Allergic disorders (in adults) • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • heart
failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

CAUTIONS, FURTHER INFORMATION

High-dose ibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose ibuprofen (> 2.4 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II–III), and uncontrolled hypertension.

INTERACTIONS ▶ Appendix 1: NSAIDs

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Uncommon Gastrointestinal discomfort · hypersensitivity · rash (discontinue) · skin reactions

Rare or very rare Angioedema · dyspnoea

Frequency not known Asthma

SPECIFIC SIDE-EFFECTS

Uncommon

With oral use Headache · nausea

Rare or very rare

With oral use Acute kidney injury · agranulocytosis · anaemia · constipation · diarrhoea · gastrointestinal disorders · haemorrhage · leucopenia · liver disorder · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · oedema · oral ulceration · paronychia · oral papillary necrosis · severe cutaneous adverse reactions (SCARs) · shock · thrombocytopenia · vomiting

Frequency not known

With oral use Crohn’s disease · fertility decreased female · fluid retention · heart failure · hypertension · increased risk of arterial thrombembolism · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · respiratory tract reaction

With topical use Bronchospasm · renal impairment · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-stereoid anti-inflammatory drugs. p. 1130

With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

Overdose Overdose with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour.

For details on the management of poisoning, see Emergency treatment of poisoning p. 1359.

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

With systemic use in adults Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

BREAST FEEDING

With oral use Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.

With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

HEPATIC IMPAIRMENT

With oral use Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

RENAL IMPAIRMENT

With oral use Avoid if possible or use with caution. Avoid in severe impairment.

With topical use Deterioration in renal function has also been reported after topical use.

Dose adjustments ▶ With oral use The lowest effective dose should be used for the shortest possible duration.

Monitoring ▶ With systemic use In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

DIRECTIONS FOR ADMINISTRATION

With topical use For topical preparations, apply with gentle massage only.

PRESCRIBING AND DISPENSING INFORMATION

With oral use Flavours of syrup may include orange.

PATIENT AND CARER ADVICE

With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.

Photosensitivity

With topical use For topical preparations, patients or their carers should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary

▶ With oral use Ibuprofen Oral Suspension Sugar-free may be prescribed. Ibuprofen Tablets may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY

With topical use Small pack sizes of gel preparations may be available on sale to the public.

With oral use Oral preparations can be sold to the public in certain circumstances.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**INDICATIONS AND DOSE**

**Pain and moderate to severe inflammation in rheumatic disease and other musculoskeletal disorders**

- **By mouth using immediate-release medicines**
  - Adult: 50–200 mg daily in divided doses
- **By rectum**
  - Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg
- **By mouth using modified-release medicines**
  - Adult: 75 mg 1–2 times a day

**Acute gout**

- **By mouth using immediate-release medicines**
  - Adult: 150–200 mg daily in divided doses
- **By rectum**
  - Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg
- **By mouth using modified-release medicines**
  - Adult: 75 mg 1–2 times a day

**Dysmenorrhoea**

- **By mouth using immediate-release medicines**
  - Adult: Up to 75 mg daily
- **By rectum**
  - Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg
- **By mouth using modified-release medicines**
  - Adult: 75 mg daily

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

**CAUTIONS**

**GENERAL CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - epilepsy - heart failure - ischaemic heart disease - parkinsonism - peripheral arterial
Pain and inflammation in musculoskeletal disorders

- Seizures
- Severe cutaneous adverse reactions (SCARs)
- Skin reactions
- Syncope
- Thrombocytopenia
- Tinnitus
- Urine abnormalities
- Vasculitis
- Vertigo
- Vision disorders
- Vomiting

### SPECIFIC SIDE-EFFECTS

- With oral use: Diarrhoea, malaise, pulmonary oedema, sigmoid lesion perforation.
- With topical use: Photosensitivity.
- With rectal use: Discomfort.
- With systemic use: Active gastro-intestinal bleeding, active gastro-intestinal ulceration, history of gastro-intestinal bleeding, history of gastro-intestinal perforation, history of gastro-intestinal ulceration, severe heart failure.

### ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

### CONCEPTION AND CONTRACEPTION

Caution—Long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

### PREGNANCY

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

### BREAST FEEDING

Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.

### HEPATIC IMPAIRMENT

Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

### RENAL IMPAIRMENT

Avoid if possible or use with caution. Avoid in severe impairment.

### Dose adjustments

The lowest effective dose should be used for the shortest possible duration.

### Monitoring

In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

### MONITORING REQUIREMENTS

During prolonged therapy ophthalmic and blood examinations particularly advisable.

### PATIENT AND CARER ADVICE

- Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

### Suppository

- Indocid (Asgen Pharma Trading Ltd)
- Indometacin 100 mg Indocid 100mg suppositories | 10 suppository (PZN) £17.61 DT = £17.61

### Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 21

- Indometacin (Non-proprietary)
- Indometacin 25 mg Indometacin 25mg capsules | 28 capsule (PZN) £1.03 DT = £1.00
- Indometacin 50 mg Indometacin 50mg capsules | 28 capsule (PZN) £1.33 DT = £1.33

### Ketoprofen

15-May-2018

### INDICATIONS AND DOSE

Pain and mild inflammation in rheumatic disease and musculoskeletal conditions | Dysmenorrhoea | Acute gout

#### By mouth

- Adult: 100–200 mg once daily

### Relief of pain in rheumatic disease and musculoskeletal conditions

#### To the skin

- Adult: Apply 2–4 times a day for up to 7 days, ketoprofen 2.5% gel to be administered; maximum 15 g per day

### POWERGEL

#### Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis

#### To the skin

- Adult: Apply 2–3 times a day for up to max. 10 days

### CONTRA-INDICATIONS

- With systemic use: Active gastro-intestinal bleeding, active gastro-intestinal ulceration, history of gastro-intestinal bleeding, history of gastro-intestinal perforation, history of gastro-intestinal ulceration, severe heart failure

### CAUTIONS

- With systemic use: Allergic disorders, cardiac impairment (NSAIDs may impair renal function), cerebrovascular disease, coagulation defects, connective-tissue disorders, Crohn’s disease (may be exacerbated), elderly (risk of serious side-effects and fatalities), heart failure, ischaemic heart disease, peripheral arterial disease, risk factors for cardiovascular events, ulcerative colitis (may be exacerbated), uncontrolled hypertension.

- With topical use: Avoid contact with eyes; avoid contact with inflamed or broken skin; avoid contact with mucous membranes, not for use with occlusive dressings, topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

### INTERACTIONS

#### Appendix 1: NSAIDs

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- Uncommon Diarrhoea, paraesthesia, skin reactions
- Rare or very rare Hypersensitivity, photosensitivity reaction
- Frequency not known Angioedema

www.getintopharma.com
**SPECIFIC SIDE-EFFECTS**

- **Common or very common**
  - With oral use: Gastrointestinal discomfort, nausea, vomiting
  - With systemic use: Constipation, dizziness, drowsiness, fatigue, gastrointestinal disorders, headache, oedema, rash (discontinue)

- **Uncommon**
  - With oral use: Asthma, haemorrhagic anaemia, hepatic disorders, pancreatitis, shock, stomatitis, tinnitus, vision disorders, weight increased
  - With topical use: Renal impairment

- **Frequency not known**
  - With oral use: Frequency not known
  - With topical use: Frequency not known

**SIDE-EFFECTS, FURTHER INFORMATION**

Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1130

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID, which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONCEPTION**

- With systemic use: Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**

- With systemic use: Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possible persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - With topical use: Patient packs for topical preparations carry a warning to avoid during pregnancy.

**BREAST FEEDING**

- With systemic use: Use with caution during breast-feeding. Amount probably too small to be harmful but manufacturers advise avoid.
  - With topical use: Patient packs for topical preparations carry a warning to avoid during breast-feeding.

**HEPATIC IMPAIRMENT**

- With systemic use: Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
  - With topical use: Manufacturer advises caution.

**RENAL IMPAIRMENT**

- With systemic use: Avoid if possible or use with caution. Avoid in severe impairment.
  - With topical use: Deterioration in renal function has also been reported after topical use.

**Dose adjustments**

- With systemic use: The lowest effective dose should be used for the shortest possible duration.

**Monitoring**

- With systemic use: In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**DIRECTIONS FOR ADMINISTRATION**

- With topical use: For topical preparations apply with gentle massage only.

**PRESCRIBING AND DISPENSING INFORMATION**

- With topical use: Caution—topical preparations not generally suitable for children.
  - With oral use: Flavours of oral liquid formulations may include strawberry.

**PATIENT AND CARER ADVICE**

- With topical use: For topical preparations, patients and their carers should be advised to wash hands immediately after use.

**Photosensitivity**

- With topical use: Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity. Patients should be advised not to expose area treated to sunbeds or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

**EXCEPTIONS TO LEGAL CATEGORY**

- With topical use: Smaller pack sizes of gel preparations may be available on sale to the public.

- Adult: 500 mg 3 times a day

- CONTRA-INDICATIONS Active gastro-intestinal bleeding, active gastro-intestinal ulceration, history of gastro-intestinal bleeding related to previous NSAID therapy, history of gastro-intestinal perforation related to previous NSAID therapy, history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes), history of recurrent gastro-intestinal ulceration (two or more distinct episodes), inflammatory bowel disease, severe heart failure.

- CAUTIONS Acute porphyrias p. 1058; allergic disorders - cardiac impairment (NSAIDs may impair renal function), cerebrovascular disease, coagulation defects, connective tissue disorders, Crohn’s disease (may be exacerbated), elderly (risk of serious side-effects and fatalities), epilepsy, heart failure, ischaemic heart disease, peripheral arterial disease, risk factors for cardiovascular events, ulcerative colitis (may be exacerbated), uncontrolled hypertension.

- INTERACTIONS → Appendix 1: NSAIDs

- SIDE-EFFECTS Agranulocytosis, anaemia, angioedema, appetite decreased - asthma, bone marrow disorders - confusion - constipation, Crohn’s disease - depression, diarrhoea (discontinue), disseminated intravascular coagulation - dizziness - drowsiness - dyspnoea - dysuria - ear pain - eosinophilia - eye irritation - fatigue - fertility decreased female - gastrointestinal discomfort, gastrointestinal disorders, glomerulonephritis - glucose tolerance impaired - haemolytic anaemia - haemorrhage, hallucination - headache - heart failure - hepatic disorders - hyperphosphataemia, hyperkalaemia, hyperpotassemia - hyperkoalaemia, hypothyroidism - insomina, leucopenia - malaise - meningitis aseptic (patients with connective tissue disorders such as systemic lupus erythematosus may be especially susceptible), multi organ failure, nausea - nephritis acute interstitial - nephrotic syndrome - nervousness - neutropenia - oedema - optic neuritis - oral ulceration - palpitations, pancreatitis, paraesthesia - photosensitivity reaction - proteinuria - rash (discontinue) - renal failure (more common in patients with pre-existing renal impairment), renal failure non-oliguric - renal papillary necrosis, respiratory disorders, seizure - sepsis, severe cutaneous adverse reactions (SCARs) - skin reactions - thrombocytopenia - tinnitus - vertigo - vision disorders - vomiting.

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

Overdose Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent, require treatment. For details on the management of poisoning, see Emergency treatment of poisoning p. 1359, in particular, Convulsions.

- ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- BREAST FEEDING Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.

- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- RENAL IMPAIRMENT Avoid if possible or use with caution. Avoid in severe impairment.

- Dose adjustments The lowest effective dose should be used for the shortest possible duration.

- Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21 EXCPIENTS: May contain Ethanol

Meloxicam

INDICATIONS AND DOSE

Exacerbation of osteoarthritis (short-term)

- BY MOUTH

Child 12-17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

Adult: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

Pain and inflammation in rheumatic disease | Ankylosing spondylitis

- BY MOUTH

Child 16-17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required

Adult: 15 mg once daily, then reduced to 7.5 mg once daily if required

Elderly: 7.5 mg once daily

Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs

- BY MOUTH

Child 12-17 years (body-weight up to 50 kg): 7.5 mg once daily

Child 12-17 years (body-weight 50 kg and above): 15 mg once daily

UNLICENSED USE Not licensed for use in children under 16 years.

CONTRA-INDICATIONS Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy, history of gastro-intestinal perforation related to previous NSAID therapy, history of recurrent gastro-intestinal...
haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

- **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS**

  - **Common or very common** Constipation - diarrhoea - gastrointestinal discomfort - gastrointestinal disorders - headache - nausea - vomiting

  - **Uncommon** Anaemia - angioedema - burping - dizziness - drowsiness - electrolyte imbalance - fluid retention - flushing - haemorrhage - hepatic disorders - hypersensitivity - oedema - skin reactions - stomatitis - vertigo

  - **Rare or very rare** Acute kidney injury - asthma - conjunctivitis - leucopenia - mood altered - nighttime - palpitations - severe cutaneous adverse reactions (SCARs) - thrombocytopenia - tinnitus - vision disorders

  - **Frequency not known** Agranulocytosis - confusion - decreased fertility - decreased female - heart failure - increased risk of arterial thromboembolism - nephritis tubulointerstitial - nephritic syndrome - photosensitivity reaction - renal necrosis

- **SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID - which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution — long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possible persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Present in milk in animal studies — manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution.

  - In adults Avoid if eGFR less than 25 mL/minute/1.73 m².

  - In children Avoid if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².

- **Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

- **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

  - Nabumetone 500 mg: Reiflex 500 mg tablets | 60 tablet PGR £6.18

Naproxen

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease
- By mouth
  - Adult: 0.5–1 g daily in 1–2 divided doses

Pain and inflammation in musculoskeletal disorders

Dysmenorrhoea
- By mouth
  - Adult: Initially 500 mg, then 250 mg every 6–8 hours as required, maximum dose after the first day 1.25 g daily

Acute gout
- By mouth
  - Adult: Initially 750 mg, then 250 mg every 8 hours until attack has passed

CONTRA-INDICATIONS

Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

CAUTIONS

- Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

INTERACTIONS

Appendix 1: NSAIDs

SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCESSION AND CONTRACEPTION

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING

Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.

HEPATIC IMPAIRMENT

Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

RENAL IMPAIRMENT

Avoided if possible or use with caution. Avoid in severe impairment.

Dose adjustments: The lowest effective dose should be used for the shortest possible duration.

Monitoring: In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1154/16

The Scottish Medicines Consortium has advised (June 2016) that naproxen effervescent tablets (Stirlescent®) are accepted for restricted use within NHS Scotland for the treatment of rheumatoid arthritis, osteoarthritis, ankylosing spondylitis, acute musculoskeletal disorders, dysmenorrhoea and acute gout in adults unable to swallow naproxen tablets.

EXCEPTIONS TO LEGAL CATEGORY

Can be sold to the public for the treatment of primary dysmenorrhoea in women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets.
## Pain and inflammation in musculoskeletal disorders

### Piroxicam

#### INDICATIONS AND DOSE

**Rheumatoid arthritis (initiated by a specialist)**
- **Osteoarthritis (initiated by a specialist)**
- **Ankylosing spondylitis (initiated by a specialist)**

- **By mouth**
  - Adult: Up to 20 mg once daily

**Pain relief in musculoskeletal conditions**
- **Treatment in knee or hand osteoarthritis (adjunct)**

- **To the skin**
  - Adult: Apply 3–4 times a day, 0.5% gel to be applied; review treatment after 4 weeks

### IMPORTANT SAFETY INFORMATION

**CHMP ADVICE—PIROXICAM (JUNE 2007)**

- With systemic use
  - The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:
    - Piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
    - Piroxicam should not be used as first-line treatment
    - In adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
    - Piroxicam dose should not exceed 20 mg daily
    - Piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
    - Treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
    - Concomitant administration of a gastro-protective agent should be considered.

Topical preparations containing piroxicam are not affected by these restrictions.

### CONTRA-INDICATIONS

- With systemic use
  - Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · inflammatory bowel disease · severe heart failure

### CAUTIONS

- With systemic use
  - Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- With topical use
  - Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

### INTERACTIONS

- Appendix 1: NSAIDs

---

### Naproxen with esomeprazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, naproxen p. 1148, esomeprazole p. 78.

#### INDICATIONS AND DOSE

Patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs ineffective

- **By mouth**
  - Adult: 500/20 mg twice daily, dose expressed as x/y mg naproxen/esomeprazole

#### INTERACTIONS

- Appendix 1: NSAIDs · proton pump inhibitors

#### PRESCRIBING AND DISPENSING INFORMATION

Naproxen component is gastro-resistant.

SIDE-EFFECTS, FURTHER INFORMATION

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs, p. 1130

Topical application of large amounts can result in systemic effects.

ALLERGY AND CROSS-SENSITIVITY

- Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

- With systemic use Caution—Long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

- Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

BREAST FEEDING

- With systemic use Use with caution during breast-feeding. Amount too small to be harmful.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

HEPATIC IMPAIRMENT

- With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT

- With systemic use Avoid if possible or use with caution.
- With topical use Deterioration in renal function has also been reported after topical use.

Dose adjustments

- With systemic use The lowest effective dose should be used for the shortest possible duration.
- Monitoring

- With systemic use In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

DIRECTIONS FOR ADMINISTRATION

- Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing.
- With topical use For topical preparations apply with gentle massage only.

PRESCRIBING AND DISPENSING INFORMATION

- With topical use Caution—Topical preparations not generally suitable for children.
- PATIENT AND CARER ADVICE

- With topical use Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

LESS SUITABLE FOR PRESCRIBING

- With oral use Piroxicam is less suitable for prescribing.

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Sulindac

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Acute gout

BY MOUTH

- Adult: 200 mg twice daily for maximum duration
- 7–10 days in peri-articular disorders, dose may be reduced according to response; acute gout should respond within 7 days; maximum 400 mg per day

CONTRA-INDICATIONS

- Active gastro-intestinal bleeding—active gastro-intestinal ulceration—history of gastro-intestinal bleeding related to previous NSAID therapy
- History of gastro-intestinal perforation related to previous NSAID therapy
- History of recurrent gastro-intestinal haemorrhage (two or more distinct episodes)—history of recurrent gastro-intestinal ulceration (two or more distinct episodes)—severe heart failure

CAUTIONS

- Allergic disorders—cardiac impairment (NSAIDs may impair renal function)—cerebrovascular disease—coagulation defects—connective-tissue disorders—Crohn’s disease (may be exacerbated)—elderly (risk of serious side-effects and fatalities)—ensure adequate hydration—heart

www.getintopharma.com
failure • history of renal stones • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS**

- Acute psychosis • agranulocytosis • alopecia • angioedema • appetite decreased • arrhythmia • asthenia • asthma • bone marrow disorders • cholecystitis • confusion • constipation • Crohn’s disease aggravated • depression • diarrhea • dizziness • drowsiness • dyspnoea • dysuria • eye disorder • fever • gastrointestinal discomfort • gastrointestinal disorders • gynaecomastia • haemolytic anaemia • haemorrhage • hallucination • headache • hearing loss • heart failure • hepatic disorders • hyperglycaemia • hyperhidrosis • hyperkalaemia • hypersensitivity • hypertensive • increased risk of arterial thromboembolism • increased risk of infection • insomnia • leucopenia • malaise • meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • mucosal abnormalities • muscle weakness • nausea • nephritis tubulointerstitial • nephrotic syndrome • nerve disorders • nervousness • neutropenia • oedema • oral disorders • palpitations • pancreatitis • paraesthesia • photosensitivity reaction • psychiatric disorder • renal impairment • respiratory disorders • seizure • severe cutaneous adverse reactions (SCARs) • skin reactions • syncope • taste altered • thrombocytopenia • tinnitus • urine abnormalities • urine discoulouration • vertigo • vision disorders • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION**

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**

Use with caution during breast-feeding.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**RENA IMPAIRMENT**

Avoid if possible or use with caution. Avoid in severe impairment.

**Dose adjustments**

The lowest effective dose should be used for the shortest possible duration.

**Monitoring**

In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Tiaprofenic acid

#### INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders

- BY MOUTH
  - Adult: 300 mg twice daily

#### IMPORTANT SAFETY INFORMATION

CSM ADVICE

Following reports of severe cystitis the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop.

Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine).

- CONTRA-INDICATIONS Active bladder disease (or symptoms) - active gastro-intestinal bleeding - active gastro-intestinal ulceration - active prostate disease (or symptoms) - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - history of recurrent urinary-tract disorders (if urinary symptoms develop discontinue immediately and perform urine tests and culture) - severe heart failure

- CAUTIONS Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- INTERACTIONS ▶ Appendix 1: NSAIDs

- SIDE-EFFECTS Agranulocytosis - alopexia - anaemia - angioedema - aplastic anaemia - appetite decreased - asthma - bladder pain - bronchospasm - confusion - constipation - Crohn’s disease aggravated - cystitis - depression - diarrhoea - dizziness - drowsiness - dyspnoea - fatigue - fertility decreased female - fluid retention - gastrointestinal discomfort - gastrointestinal disorders - haemolytic anaemia - haemorrhage - hallucination - headache - heart failure - hepatic disorders - hypersensitivity - hypertension - increased risk of arterial thromboembolism - malaise - meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - nausea - nephritis tubulointerstitial - nephropathy - neutropenia - oedema - optic neuritis - oral ulceration - pancreatitis - paraesthesia - photosensitivity reaction - renal failure (more common in patients with pre-existing renal impairment) - severe cutaneous adverse reactions (SCARs) - skin reactions - sodium retention - thrombocytopenia - tinnitus - urinary disorders - urinary tract infection - vertigo - visual impairment - vomiting

SIDE-EFFECTS, FURTHER INFORMATION For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- BREAST FEEDING Use with caution during breast-feeding. Amount too small to be harmful.

- HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

Dose adjustments Reduce dose in mild or moderate impairment.

- RENAL IMPAIRMENT Avoid if possible or use with caution. Avoid in severe impairment.

Dose adjustments Reduce dose in mild or moderate impairment. The lowest effective dose should be used for the shortest possible duration.

Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Other drugs used for Local inflammation of joints and soft tissue

Betamethasone, p. 674

**CORTICOSTEROIDS**

Corticosteroids, inflammatory disorders

Systemic corticosteroids

Short-term treatment with corticosteroids can help to rapidly decrease inflammatory symptoms of rheumatoid arthritis. Long-term treatment in patients with established rheumatoid arthritis should only be continued after evaluating the risks and all other treatments have been considered.

*Polyarthritis nodosa* and *polymyositis* are usually treated with corticosteroids.

Systemic lupus erythematosus is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarthritis nodosa and polymyositis. Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with non-steroidal anti-inflammatory drugs, and possibly chloroquine p. 616 or hydroxychloroquine sulfate p. 1095, should be considered.

Ankylosing spondylitis should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by intra-articular injection to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for disease-modifying antirheumatic drugs (DMARDs) to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer’s elbow or compression neuropathies. In tendinitis, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone p. 1154 acetate or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

**Dexamethasone**

**DRUG ACTION** Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

**INDICATIONS AND DOSE**

Local inflammation of joints

- **BY INTRA-ARTICULAR INJECTION**
  - Adult: 0.3–3.3 mg, where appropriate, dose may be repeated at intervals of 3–21 days according to response, dose given according to size—consult product literature

Local inflammation of soft tissues

- **BY LOCAL INFILTRATION**
  - Adult: 1.7–5 mg, dose given according to size—consult product literature, where appropriate may be repeated at intervals of 3–21 days, use the 3.3 mg/mL injection preparation for this dose

**INTERACTIONS**

- Appendix 1: corticosteroids

**PREGNANCY** Dexamethasone readily crosses the placenta.

**PRESCRIBING AND DISPENSING INFORMATION**

Dexamethasone 3.8 mg/mL Injection has replaced dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Surgam** (Sanofi)
  - Tiapropholic acid 300 mg Surgam 300mg tablets | 56 tablet PSH £14.95 DT = £14.95

**5.2 Soft tissue disorders**

**Extravasation**

Local guidelines for the management of extravasation should be followed where they exist or specialist advice is sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with promptly to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

**Extravasation Prevention**

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula rested at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration.

Placing a glyceryl trinitrate p. patch distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

**Extravasation Management**

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

**Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 675 or dexamethasone p. 675 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury.

**Antihistamines** and **analgesics** may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.

The first method may be appropriate following extravasation of vesicant drugs and involves administration...
of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase p. physiological saline, applying warm compresses, elevating

Enzymes used in soft-tissue disorders
Collagenase
Collagenase below are proteolytic enzymes that are derived from the fermentation of Clostridium histolyticum and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren’s contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.

Hyaluronidase
Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

Rubefacients
Rubefacients act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefactive preparations may contain nicotinate and salicylate compounds, essential oils, capsicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

Topical NSAIDs
The use of a NSAID by mouth is effective for relieving musculoskeletal pain. Topical NSAIDs (e.g. felbinic p. 1140, ibuprofen p. 1141, ketoprofen p. 1144, and piroxicam p. 1149 may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis.

Capsaicin
A preparation containing capsaicin 0.025% p. 483 can be considered as an adjunct in hand or knee osteoarthritis. It may need to be used for 1–2 weeks before pain is relieved. A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia after lesions have healed, and for the relief of painful diabetic neuropathy.

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.

ENZYMES

Collagenase

DIRECTIONS FOR ADMINISTRATION
Reconstitution and injected volumes vary with site of injection—consult product literature.

Monitoring Requirements
Manufacturer advises monitor patients for at least 30 minutes after injection—risk of severe allergic reaction.

NATIONAL FUNDING/ACCESS DECISIONS
NICE decisions
Collagenase clostridium histolyticum for treating Dupuytren’s contracture (July 2017) NICE TA459

For people not taking part in the ongoing clinical trial (HTA-15-102/04), collagenase clostridium histolyticum (Xiapex®) is recommended as an option for treating Dupuytren’s contracture with a palpable cord in patients only if the following apply:

• There is evidence of moderate disease (functional problems and metacarpophalangeal joint contracture of 30° to 60° and proximal interphalangeal joint contracture of less than 30° or first web contracture) plus up to 2 affected joints, and

• Percutaneous needle fasciotomy is not considered appropriate, but limited fasciectomy is considered appropriate by the treating hand surgeon, and

• The choice of treatment (collagenase clostridium histolyticum or limited fasciectomy) is made on an individual basis after discussion between the responsible hand surgeon and the patient about the risks and benefits of the treatments available, and

• One injection is given per treatment session by a hand surgeon in an outpatient setting. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding.

### Hyaluronidase

**INDICATIONS AND DOSE**

- **Enhance permeation of subcutaneous or intramuscular injections**
  - By subcutaneous injection, or by intramuscular injection
  - Adult: 1500 units, to be dissolved directly into the solution to be injected (ensure compatibility)

- **Enhance permeation of local anaesthetics**
  - By local infiltration
  - Adult: 1500 units, to be mixed with the local anaesthetic solution

- **Enhance permeation of ophthalmic local anaesthetic**
  - To the eye
  - Adult: 15 units/mL, to be mixed with the local anaesthetic solution

**Hypodermoclysis**

- By subcutaneous injection
  - Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid

**Extravasation**

- By local infiltration
  - Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area as soon as possible after extravasation

**Haematoma**

- By local infiltration
  - Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area

**CONTRA-INDICATIONS** Avoid sites where infection is present - avoid sites where malignancy is present - do not apply direct to cornea - not for anaesthesia in unexplained premature labour - not for intravenous administration - not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists - not to be used to reduce swelling of bites - not to be used to reduce swelling of stings

**CAUTIONS** Elderly (control speed and total volume and avoid overhydration especially in renal impairment)

**SIDE-EFFECTS** Oedema - periocular oedema

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Hyaluronidase (Non-proprietary)**
  - Hyaluronidase 1500 unit
  - Hyaluronidase 1.500 unit powder for solution for injection ampoules | 10 ampoule £136.55

Eye

Eye treatment: drug administration
Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary. Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

Eye drops and eye ointments
Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

Also see warnings relating to eye drops and contact lenses.

Eye lotions
These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution p. 1169 is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye
Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Ophthalmic Specials
Certain eye drops, e.g. amphotericin p. 593, ceftazidime p. 528, cefuroxime p. 1171, colistimethate sodium p. 556, desferrioxamine mesilate p. 1028, dexamethasone p. 1162, gentamicin p. 1171, and vancomycin p. 534 can be prepared aseptically from material supplied for injection.

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. ‘Specials’ should only be prescribed in situations where a licensed product is not suitable for a patient’s needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk).

The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers
Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Eye preparations: control of microbial contamination
Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).
Multiple application eye drops for use in hospital wards are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In out-patient departments single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In eye surgery single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann’s solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

**Contact lenses**

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid (‘hard’ or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lens should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

*Acanthamoeba keratitis*, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

**Contact lenses and drug treatment**

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Treatment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 272 and hyaluronate sodium hydrochloride p. 180). Other drugs that may affect contact lens wear are isotretinoin p. 1270 (can cause conjunctival inflammation), aspirin p. 121 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 582 and sulfasalazine p. 44 (can discolor lenses).

## 1 Allergic and inflammatory eye conditions

### Eye, allergy and inflammation

**Corticosteroids**

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery. *Topical corticosteroids* are applied frequently for the first 24–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- a ‘red eye’, when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye.
- Bacterial, fungal, and amoebic infections pose a similar hazard;
- ‘steroid glaucoma’ can follow the use of corticosteroid eye preparations in susceptible individuals;
- a ‘steroid cataract’ can follow prolonged use.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

**Systemic corticosteroids** may be useful for ocular conditions. The risk of producing a ‘steroid cataract’ increases with the dose and duration of corticosteroid use.

**Intravitreal corticosteroids**

An intravitreal implant containing dexamethasone p. 1162 (Ozurdex®) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis.

An intravitreal implant containing fluocinolone acetonide p. 1192 (Iluvien®) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

**Eye care, other anti-inflammatory preparations**

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide p. 1161, and sodium cromoglicate p. 1161.

Eye drops containing antihistamines, such as antazoline (with xylometazoline hydrochloride p. 1203 as Otivine-Antisin®), azelastine hydrochloride p. 1160, epinastine hydrochloride p. 1160, ketotifen p. 1160, and olopatadine p. 1161, can be used for allergic conjunctivitis. Sodium cromoglicate (sodium cromoglycate) and nedocromil sodium eye drops p. 1161 can be useful for vernal
keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops are used for severe keratitis in patients with dry eye disease, which has not improved despite treatment with tear substitutes.

Ciclosporin p. 1165 is licensed for severe keratitis in patients with dry eye disease, which has not improved despite treatment with tear substitutes.

Ceneegermin p. 1165 is licensed for moderate to severe neurotrophic keratitis.

### 11.1 Allergic conjunctivitis

#### Other drugs used for Allergic conjunctivitis

Diclofenac sodium p. 1178

#### Antihistamines

##### Antazoline with xylometazoline

- **INDICATIONS AND DOSE**
  - **Allergic conjunctivitis**
    - **TO THE EYE**
    - Child 12-17 years: Apply 2–3 times a day for maximum 7 days
    - Adult: Apply 2–3 times a day for maximum 7 days
  - **SIDE-EFFECTS**
    - Drowsiness
    - Eye irritation
    - Headache
    - Hypersensitivity
    - Nasal irritation
    - Rhinitis
    - Taste altered
    - Visual impairment
  - **INTERACTIONS**
    - Appendix 1: antihistamines, non-sedating
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Eye drops**
      - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
      - Otrivine Antistin (Thea Pharmaceuticals Ltd)
      - Antazoline sulfate 5 mg per 1 ml
      - **Optilast (Meda Pharmaceuticals Ltd)**
      - Azelastine hydrochloride 500 microgram per 1 ml

##### Epinastine hydrochloride

- **INDICATIONS AND DOSE**
  - **Seasonal allergic conjunctivitis**
    - **TO THE EYE**
    - Child 12-17 years: Apply twice daily for maximum 8 weeks
    - Adult: Apply twice daily for maximum 8 weeks
  - **SIDE-EFFECTS**
    - Common or very common: Eye irritation
    - Uncommon: Taste bitter (if applied incorrectly)
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Eye drops**
      - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
      - *Relestat* (Allergan Ltd)
      - Epinastine hydrochloride 500 microgram per 1 ml

##### Ketotifen

- **INDICATIONS AND DOSE**
  - **Seasonal allergic conjunctivitis**
    - **TO THE EYE**
    - Child 3-17 years: Apply twice daily
    - Adult: Apply twice daily
  - **INTERACTIONS**
    - Appendix 1: antihistamines, sedating
  - **SIDE-EFFECTS**
    - Common or very common: Eye discomfort
    - Uncommon: Dry eye
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Eye drops**
      - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
      - *Ketofall* (Scope Ophthalmics Ltd)
      - *Ketotifen* (as Ketotifen fumarate) 250 microgram per 1 ml

##### Azelastine hydrochloride

- **INDICATIONS AND DOSE**
  - **Seasonal allergic conjunctivitis**
    - **TO THE EYE**
    - Child 12-17 years: Apply twice daily, increased if necessary to 4 times a day
    - Adult: Apply twice daily, increased if necessary to 4 times a day
  - **Perennial conjunctivitis**
    - **TO THE EYE**
    - Child 12-17 years: Apply twice daily, increased if necessary to 4 times a day for maximum duration of treatment 6 weeks
    - Adult: Apply twice daily, increased if necessary to 4 times a day, maximum duration of treatment 6 weeks
  - **SIDE-EFFECTS**
    - Common: Eye irritation
    - Uncommon: Taste bitter (if applied incorrectly)
  - **INTERACTIONS**
    - Appendix 1: antihistamines, non-sedating
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Eye drops**
      - **EXCIPIENTS:** May contain Benzalkonium chloride
**Olopatadine**

**INDICATIONS AND DOSE**

- **Seasonal allergic conjunctivitis**
  - **TO THE EYE**
  - Child 3–17 years: Apply twice daily for maximum 4 months
  - Adult: Apply twice daily for maximum 4 months

**SIDE-EFFECTS**

- **Common or very common** Asthenia - dry eye - eye discomfort - headache - nasal dryness - taste altered
- **Uncommon** Dizziness - eye disorders - eye inflammation - increased risk of infection - numbness - skin reactions - vision disorders
- **Frequency not known** Drowsiness - dyspnœa - malaise - nausea - vomiting

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**
  
  **EXCIPIENTS:** May contain Benzalkonium chloride
  
  Olopatadine (as Olopatadine hydrochloride) 1 mg per 1 ml
  
  **Olopatadine**

**MAST-CELL STABILISERS**

**Lodoxamide**

**INDICATIONS AND DOSE**

- **Allergic conjunctivitis**
  - **TO THE EYE**
  - Child 4–17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks
  - Adult: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

**SIDE-EFFECTS**

- **Common or very common** Dry eye - eye discomfort - eye disorders - vision disorders
- **Uncommon** Corneal deposits - dizziness - eye inflammation - headache - nausea
- **Rare or very rare** Nasal complaints - rash - taste altered

**MEDICATION FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**
  
  **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
  
  Alomide (Novartis Pharmaceuticals UK Ltd)
  
  Lodoxamide (as Lodoxamide trometamol) 1 mg per 1 ml
  
  **Lodoxamide**

**Nedocromil sodium**

**INDICATIONS AND DOSE**

- **Seasonal and perennial conjunctivitis**
  - **TO THE EYE**
  - Child 6–17 years: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis
  - Adult: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis

  **Seasonal keratoconjunctivitis**
  
  **TO THE EYE**
  
  Child 6–17 years: Apply 4 times a day
  
  Adult: Apply 4 times a day

**SIDE-EFFECTS**

- **Common or very common** Eye discomfort - eye strain - taste altered

**MEDICINAL FORMS**

- No licensed medicines listed.

**Sodium cromoglicate**

(Sodium cromoglicate)

**INDICATIONS AND DOSE**

- **Seasonal allergic conjunctivitis**
  - **TO THE EYE**
  - Child: Apply 4 times a day
  - Adult: Apply 4 times a day

**SIDE-EFFECTS**

- **Eye stinging**

**EXCEPTIONS TO LEGAL CATEGORY**

- Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

  **Eye drops**
  
  **Sodium cromoglicate**
  
  Sodium cromoglicate 20 mg per 1 ml
  
  **Opatanol**

**1.2 Inflammatory eye conditions**

**Other drugs used for inflammatory eye conditions**

Adalimumab, p. 1108

**ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS**

**Nepafenac**

**INDICATIONS AND DOSE**

- **Prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery**
  - **TO THE EYE**
  - Child: Apply 4 times a day
  - Adult: (consult product literature)

**SIDE-EFFECTS**

- **Common or very common** Eye discomfort - eye disorders - eye inflammation
- **Uncommon** Allergic dermatitis - corneal deposits - dizziness - dry eye - headache - nausea
- **Rare or very rare** Allergic conjunctivitis - dry eye - eye disorders - eye inflammation - headache - nasal dryness - taste altered

**MEDICATION FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**
  
  **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate, sodium metabisulphite, sodium chloride, water
  
  Nepafenac (Novartis Pharmaceuticals UK Ltd)
  
  Nepafenac (as Nepafenac sodium) 0.2% eye drops | 10 ml
  
  **Nepafenac**

**Scottish Medicines Consortium (SMC) decisions**

- The Scottish Medicines Consortium (SMC) has advised (May 2017) that nepafenac (Nevanac®) 3 mg/mL eye drops are accepted for use within NHS Scotland for the reduction in risk of postoperative macular oedema associated with cataract surgery in diabetic patients.

www.getintopharma.com
1162 Allergic and inflammatory eye conditions

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate

- Nevanac (Novartis Pharmaceuticals UK Ltd)
  - Nevanac 1 mg per 1 ml Nevanac 1mg/ml eye drops | 5 ml 
    - £14.92 DT + £14.92
  - Nevanac 3 mg per 1 ml Nevanac 3mg/ml eye drops | 3 ml 
    - £14.92 DT + £14.92

**CORTICOSTEROIDS**

**Betamethasone**

**DRUG ACTION** Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

**INDICATIONS AND DOSE**

**Local treatment of inflammation (short-term)**

- **TO THE EYE USING EYE DROP**
  - Child: Apply every 1–2 hours until controlled then reduce frequency
  - Adult: Apply every 1–2 hours until controlled then reduce frequency

- **TO THE EYE USING EYE OINTMENT**
  - Child: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops
  - Adult: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

**INTERACTIONS**

**SIDE-EFFECTS** Vision disorders

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye/nose drops solution**

**EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate

- Betnesol (RPH Pharmaceuticals AB)
  - Betnesol sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml 
    - £2.32 DT + £2.32
  - Vistanethasone (Martindale Pharmaceuticals Ltd)
  - Vistanethasone sodium phosphate 1 mg per 1 ml Vistanethasone 0.1% eye/ear/nose drops | 5 ml 
    - £1.02 | 10 ml 
    - £1.16 DT + £2.32

**Eye treatment**

- **Betamethasone (Non-proprietary)**
  - Betamethasone sodium phosphate 1 mg per 1 gram Betamethasone 0.1% eye ointment | 3 gram 
    - £3.48 DT + £4.11

**Combinations available:** *Betamethasone with neomycin*, p. 1164

**Dexamethasone**

**DRUG ACTION** Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

**INDICATIONS AND DOSE**

**Local treatment of inflammation (short-term)**

- **TO THE EYE USING EYE DROP**
  - Child: Apply 4–6 times a day
  - Adult: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

**Short term local treatment of inflammation (severe conditions)**

- **TO THE EYE USING EYE DROP**
  - Child: Apply every 30–60 minutes until controlled, reduce frequency when control achieved

**INTERACTIONS**

**SIDE-EFFECTS**

**UNLICENSED USE** Maxidex ® not licensed for use in children under 2 years. Dropodex ® not licensed for use in children.

**CONTRA-INDICATIONS**

- With intravitreal use Active ocular herpes simplex - active or suspected ocular infection - active or suspected periorcular infection - rupture of the posterior lens capsule in patients with aphakia, iris or transscleral fixated intra-ocular lens or anterior chamber intra-ocular lens - uncontrolled advanced glaucoma

- With intravitreal use history of ocular viral infection (including herpes simplex) - posterior capsule tear or iris defect (risk of implant migration into the anterior chamber which may cause corneal oedema and, in persistent severe cases, the need for corneal transplantation) - retinal vein occlusion with significant retinal ischaemia

**PREGNANCY** Dexamethasone readily crosses the placenta.

- With intravitreal use in adults Manufacturer advises avoid unless potential benefit outweighs risk — no information available.

**BREAST FEEDING**

- With intravitreal use in adults. Manufacturer advises avoid unless potential benefit outweighs risk — no information available.

**MONITORING REQUIREMENTS**

- With intravitreal use in adults. Monitor intra-ocular pressure and for signs of ocular infection. In patients with posterior capsule tear or iris defect monitor for implant migration to allow for; early diagnosis and management.

**PRESCRIBING AND DISPENSING INFORMATION**

- When used by eye Although multi-dose dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Dexamethasone intravitreal implant for the treatment of macular oedema secondary to retinal vein occlusion (July 2011) NICE TA229

  - With intravitreal use in adults Dexamethasone intravitreal implant is recommended as an option for the treatment of macular oedema following central retinal vein occlusion. Dexamethasone intravitreal implant is also recommended as an option for the treatment of macular oedema following branch retinal vein occlusion when:

Macular oedema following either branch retinal vein occlusion or central retinal vein occlusion (specialist use only) | Visual impairment due to diabetic macular oedema in adults who are pseudophakic, or who are insufficiently responsive to, or unsuitable for non-corticosteroid therapy (specialist use only) | For the treatment of inflammation of the posterior segment of the eye presenting as non-infectious uveitis (specialist use only)

- **BY INTRAVITREAL INJECTION**
  - Adult: 700 micrograms, to be administered into the affected eye, concurrent administration to both eyes not recommended. For further information on pre-treatment, administration and repeat dosing, consult product literature
treatment with laser photoocoagulation has not been beneficial, or

treatment with laser photoocoagulation is not considered suitable because of the extent of macular haemorrhage.

www.nice.org.uk/TA229

Dexamethasone intravitreal implant for treating diabetic macular oedema (July 2015) NICE TA349

With intravitreal use in adults Dexamethasone intravitreal implant is recommended as an option for treating diabetic macular oedema only if:

- the implant is to be used in an eye with an intraocular (pseudophakic) lens and
- the diabetic macular oedema does not respond to non-corticosteroid treatment, or such treatment is unsuitable.

www.nice.org.uk/TA349

Adalimumab and dexamethasone for treating non-infectious uveitis (July 2017) NICE TA460

With intravitreal use in adults Dexamethasone intravitreal implant is recommended as an option for treating non-infectious uveitis in the posterior segment of the eye in patients, only if there is:

- active disease (that is, current inflammation in the eye), and
- worsening vision with a risk of blindness. Patients currently receiving dexamethasone whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA460

Scottish Medicines Consortium (SMC) decisions

With intravitreal use in adults The Scottish Medicines Consortium has advised (June 2012) that dexamethasone intravitreal implant (Ozurdex®) is accepted for restricted use within NHS Scotland for the treatment of patients with macular oedema following central retinal vein occlusion, and in patients with branch retinal vein occlusion who are not clinically suitable for laser treatment, including patients with dense macular haemorrhage, or patients who have received and failed on previous laser treatment.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

### Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1162, neomycin sulfate p. 520.

#### INDICATIONS AND DOSE

Local treatment of eye inflammation and bacterial infection (short-term)
- TO THE EYE USING EYE DROP
  - Adult: Apply up to 6 times a day

**POTENCY**
- Betamethasone (as valerate) 0.1% with neomycin cream and ointment: potent.

#### INTERACTIONS

Appendix 1: corticosteroids • neomycin

#### LESS SUITABLE FOR PRESCRIBING

Betamethasone with neomycin eye-drops are less suitable for prescribing.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Ear/eye/nose drops solution**
  - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
  - **Betnesol-N** (RPN Pharmaceuticals AB)
    - Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [POD] £2.39 DT + £2.39

### Dexamethasone with framycetin sulfate and gramicidin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1162, framycetin sulfate p. 1195.

#### INDICATIONS AND DOSE

Local treatment of inflammation (short-term)
- TO THE EYE USING EYE DROP
  - Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency
  - Adult: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

#### CAUTIONS

Avoid prolonged use

#### INTERACTIONS

Appendix 1: corticosteroids

#### LESS SUITABLE FOR PRESCRIBING

Sofradex® is less suitable for prescribing.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Ear/eye drops solution**
  - **EXCIPIENTS:** May contain Polysorbates
    - **Sofradex** (Sanofis)
      - Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml Sofradex ear/eye drops | 8 ml [POD] £1.50

### Dexamethasone with hyromellose, neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1162, neomycin sulfate p. 520.

#### INDICATIONS AND DOSE

Local treatment of inflammation (short-term)
- TO THE EYE USING EYE DROP
  - Adult: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

Local treatment of inflammation (short-term)
- TO THE EYE USING EYE OINTMENT
  - Adult: Apply 3–4 times a day, alternatively, apply at night when used with eye drops

#### INTERACTIONS

Appendix 1: aminoglycosides • corticosteroids

#### LESS SUITABLE FOR PRESCRIBING

Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - **EXCIPIENTS:** May contain Benzalkonium chloride, polysorbates
    - **Maxitol** (Novartis Pharmaceuticals UK Ltd)
      - Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram Maxitol eye ointment | 3.5 gram [POD] £1.44

- **Eye drops**
  - **EXCIPIENTS:** May contain Benzalkonium chloride, polysorbates
    - **Maxitol** (Novartis Pharmaceuticals UK Ltd)
      - Dexamethasone 1 mg per 1 ml, Hyromellose 5 mg per 1 ml, Neomycin (as Neomycin sulfate) 3500 unit per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml Maxitol eye drops | 5 ml [POD] £1.68

### Dexamethasone with tobramycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1162, tobramycin p. 1171.

#### INDICATIONS AND DOSE

Local treatment of inflammation (short-term)
- TO THE EYE

#### INTERACTIONS

Appendix 1: aminoglycosides

#### LESS SUITABLE FOR PRESCRIBING

Dexamethasone with tobramycin eye-drops are less suitable for prescribing.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
    - **Tobradex** (Novartis Pharmaceuticals UK Ltd)
      - Dexamethasone 1 mg per 1 ml, Tobramycin 3 mg per 1 ml Tobradex 3mg/ml / 1mg/ml eye drops | 5 ml [POD] £5.37 DT + £5.37

  **IKERVIS ®**

  **Severe keratitis in dry eye disease that has not responded to treatment with tear substitutes (initiated by a specialist)**

  - **TO THE EYE**
  - **Adults:** Apply 1 drop once daily, to be applied to the affected eye(s) at bedtime, review treatment at least every 6 months

- **CONTRA-INDICATIONS** Active or suspected ocular or peri-ocular infection

- **CAUTIONS** Glaucoma—limited information available; history of ocular herpes—no information available

- **INTERACTIONS** → Appendix: ciclosporin

- **SIDE-EFFECTS**
  - **Common or very common** Eye discomfort · eye disorders · eye inflammation · vision blurred
  - **Uncommon** Eye deposit · increased risk of infection

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—no information available

- **BREAST FEEDING**
  - Manufacturer advises avoid—limited information.

- **DIRECTIONS FOR ADMINISTRATION**
  - Manufacturer advises keep eyes closed for 2 minutes after using eye drops to increase local drug action and reduce systemic absorption.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on how to perform driving and performance of skilled tasks—increased risk of blurred vision.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE decisions**

  - Ciclosporin for treating dry eye disease that has not improved despite treatment with artificial tears (December 2015)
  - NICE TA369

  Ciclosporin (Ikervis ®) is recommended as an option, within its marketing authorisation, for treating severe keratitis in patients with dry eye disease that has not improved despite treatment with tear substitutes.

  www.nice.org.uk/guidance/ta369

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**

  - **Ikervis** (Santen UK Ltd)
    - Ciclosporin 1 mg per 1 ml Ikervis 0.1% eye drops 0.3ml unit dose | 30 unit dose (POD) £72.00 DT = £72.00

- NERVE GROWTH FACTORS

  **Cenegermin**

  - **DRUG ACTION** Cenegermin is a recombinant form of human nerve growth factor which allows restoration of corneal integrity; endogenous human nerve growth factor is involved in the differentiation and maintenance of neurons.

  - **INDICATIONS AND DOSE**

    **Moderate or severe neurotrophic keratitis (specialist use only)**

    - **TO THE EYE**
    - **Adult:** Apply 1 drop 6 times a day, to be applied every 2 hours, starting in the morning and completing within 12 hours; treatment should be continued for 8 weeks

  - **CONTRA-INDICATIONS**

    - Eye infection—resolve before initiating treatment (if an infection occurs during treatment, cenegermin should be suspended until infection resolution) · patients requiring immediate corneal surgery (assess for risk of corneal melting or impending perforation before initiating treatment)

  - **CAUTIONS**

    - Ocular cancer—manufacturer recommends monitor for cancer progression before and after treatment

  - **SIDE-EFFECTS**

    - **Common or very common** Eye disorders · eye inflammation · eye pain · headache · photophobia
    - **Uncommon** Corneal abscess

  - **PREGNANCY** Manufacturer advises avoid—no information available.

  - **BREAST FEEDING** Manufacturer advises avoid—no information available.

  - **DIRECTIONS FOR ADMINISTRATION**

    - Manufacturer advises that other topical ophthalmic preparations should be administered at least 15 minutes before or after use.

  - **HANDLING AND STORAGE**

    - For information on storage of cenegermin, consult product literature.

  - **PATIENT AND CARER ADVICE**

    - Manufacturer advises patients and carers should be counselled on how to administer cenegermin eye drops.

  - **NATIONAL FUNDING/ACCESS DECISIONS**

    **NICE decisions**

    - Cenegermin for treating neurotrophic keratitis (July 2018)
    - NICE TA532

    Cenegermin (Oxervate ®) is not recommended, within its marketing authorisation, for treating moderate or severe neurotrophic keratitis in adults. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

    www.nice.org.uk/guidance/ta532

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**

  - **Oxervate** (Dompe UK Ltd)
  - Cenegermin 20 microgram per 1 ml Oxervate 20micrograms/ml eye drops preservative free | 1 ml (POD) (Hospital only)
1166 Dry eye conditions

1.2a Anterior uveitis

**ANTIMUSCARINICS**

**Antimuscarinics (eye)**

**CAUTIONS** Children under 3 months owing to the possible association between cyclopentolate and the development of amblyopia - darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. Mydriasis can precipitate acute angle-closure glaucoma (usually in those aged over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber) (in adults) - mydriasis can precipitate acute angle-closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber) (in children) - neonates at increased risk of systemic toxicity (in neonates)

**SIDE-EFFECTS** Dizziness, photophobia, skin reactions, tachycardia

**PATIENT AND CARER ADVICE** Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

**Atropine sulfate**

**INDICATIONS AND DOSE**

**Cycloplegia**

- Adult: (consult product literature)

**Anterior uveitis**

- Adult: (consult product literature)

**INTERACTIONS** → Appendix 1: atropine

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic side-effects can occur, particularly in children and the elderly.

**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose cyclopentolate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:** May contain Benzalkonium chloride

- Cyclopentolate hydrochloride (Bausch & Lomb UK Ltd)
  - Cyclopentolate hydrochloride 5 mg per 1 ml Minims cyclopentolate hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose £11.41 DT = £11.41
  - Cyclopentolate hydrochloride 10 mg per 1 ml Minims cyclopentolate hydrochloride 1% eye drops 0.5ml unit dose | 20 unit dose £11.68 DT = £11.68
  - Mydrilate (Intrapharm Laboratories Ltd)
  - Cyclopentolate hydrochloride 5 mg per 1 ml Mydrilate 0.5% solution | 5 ml £8.08 DT = £8.08
  - Cyclopentolate hydrochloride 10 mg per 1 ml Mydrilate 1% solution | 5 ml £8.08 DT = £8.08

**Homatropine hydrobromide**

**INDICATIONS AND DOSE**

**Anterior uveitis**

- Adult: (consult product literature)

**INTERACTIONS** → Appendix 1: homatropine

**MEDICINAL FORMS** Forms available from special-order manufacturers include: eye drops

2 Dry eye conditions

**Dry eye**

**Tear deficiency, ocular lubricants, and astringents**

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren’s syndrome) often responds to tear replacement therapy or pilocarpine p. 1183 given by mouth in adults. The severity of the condition and patient preference will often guide the choice of preparation.

Hypromellose p. 1168 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as acetylcysteine p. 1167 can be helpful.

The ability of carboxomers to cling to the eye surface may help reduce frequency of application to 4 times daily.
Polyvinyl alcohol p. 1168 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 1169, with or without trehalose, are also used in the management of tear deficiency.

Sodium chloride 0.9% drops p. 1169 are sometimes useful in tear deficiency, and can be used as ‘comfort drops’ by contact lens wearers, and to facilitate lens removal. They are also used to irrigate the eye. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery. Sodium chloride 0.5% eye drops are used for the short-term treatment of corneal oedema in adults.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

**Ocular Lubricants**

### Acetylcysteine

**INDICATIONS AND DOSE**

- **Tear deficiency** / **Impaired or abnormal mucus production**
  - TO THE EYE
  - Adult: Apply 3–4 times a day

**SIDE-EFFECTS**

Eye discomfort · eye redness

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Ilube** (Rayner Pharmaceuticals Ltd)
  - Acetylcysteine 50 mg per 1 ml Ilube 5% eye drops | 10 ml £16.90

**CARBOMERS**

(Polyacrylic acid)

**INDICATIONS AND DOSE**

- **Dry eyes including keratoconjunctivitis sicca, unstable tear film**
  - TO THE EYE
  - Child: Apply 3–4 times a day or when required
  - Adult: Apply 3–4 times a day or when required

**UNLICENSED USE**

- In children Some preparations not licensed for use in children.

**PRESCRIBING AND DISPENSING INFORMATION**

Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Eye gel**
  - EXCIPIENTS: May contain Benzalkonium chloride, cetrimide, disodium edetate
  - **Blephagel** (Thea Pharmaceuticals Ltd)
    - Carbomer 3.6 mg per 1 gram Blephagel 0.36% eye gel preservative free | 30 gram £7.53
  - **Liquivisc** (Thea Pharmaceuticals Ltd)
    - Carbomer 974P 2.5 mg per 1 gram Liquivisc 0.25% eye gel | 10 gram £4.50
  - **Eye drops**
    - **Gelfears** (Bausch & Lomb UK Ltd)
      - Carbomer 980 2 mg per 1 gram Gelfears 0.2% gel | 10 gram £2.80

**Hydroxyethylcellulose**

**INDICATIONS AND DOSE**

- **Tear deficiency**
  - TO THE EYE
  - Child: Apply as required
  - Adult: Apply as required

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose hydroxyethylcellulose eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - **Artificial tears** (Bausch & Lomb UK Ltd)
    - Hydroxyethylcellulose 4.4 mg per 1 ml Minims artificial tears
    - 0.44% eye drops 0.5ml unit dose | 20 unit dose £9.33

- **Viscotears** (Bausch & Lomb UK Ltd)
  - Carbomer 980 2 mg per 1 gram Viscotears 2mg/g liquid gel
    - 10 gram £1.59
    - Viscotears 2mg/g eye gel 0.6ml unit dose | 30 unit dose £5.42

**Carmellose sodium**

**INDICATIONS AND DOSE**

- **Dry eye conditions**
  - TO THE EYE
  - Child: Apply as required
  - Adult: Apply as required

**PRESCRIBING AND DISPENSING INFORMATION**

Some preparations are contained units which are resealable and may be used for up to 12 hours.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - **Carmellose sodium** (Non-proprietary)

Eye infections

Eye, infections

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial blepharitis is treated by application of an antibacterial eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after culturing organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Sodium hyaluronate and trehalose

21-Nov-2017

**INDICATIONS AND DOSE**

Dry eye conditions

- TO THE EYE
- Adult: Apply 1 drop 4–6 times a day

**PRESCRIBING AND DISPENSING INFORMATION** Sodium hyaluronate and trehalose preparations do not contain preservatives; multi-dose preparation can be used for up to 3 months.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - Thealoz Duo (Thea Pharmaceuticals Ltd)
  - Thealoz Duo eye drops preservative free | 10 ml £8.99
  - Thealoz Duo UD eye drops 0.4ml unit dose preservative free | 30 unit dose £6.99

**Soybean oil**

**INDICATIONS AND DOSE**

Dry eye conditions

- TO THE EYE
- Child: Apply up to 4 times a day
- Adult: Apply up to 4 times a day

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - Emustil (Rayner Pharmaceuticals Ltd)
  - Emustil eye drops 0.3ml unit dose preservative free | 20 unit dose £6.22

3 Eye infections

Antibacterials for eye infections

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 1173 has a broad spectrum of activity and is the drug of choice for superficial eye infections. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 1172, levofloxacin p. 1172, moxifloxacin p. 1172, and ofloxacin p. 1172; the aminoglycosides, gentamicin p. 1171 and tobramycin p. 1171 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and polymyxin B are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 1171 are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections. Propamidine isethionate p. 1173 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *actinomycetoma keratitis* [unlicensed indication].

Cefuroxime p. 1171 can be administered by intracameral injection for the prophylaxis of endophthalmitis following cataract surgery.

**With corticosteroids**

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should not be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- **Eye drops**, apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.
- **Eye ointment**, apply either at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

Antifungals for eye infections

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can
encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent in Scotland or Northern Ireland), or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk.

Antivirals for eye infections

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 1174 or ganciclovir p. 1174. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Slow-release ocular implants containing ganciclovir (available on a named-patient basis from specialist importing companies) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. See systemic treatment of CMV retinitis.

3.1 Bacterial eye infection

ANTIBACTERIALS > AMINOGLYCOSIDES

Gentamicin

- INDICATIONS AND DOSE

  Bacterial eye infections

  ➤ TO THE EYE

  ➤ Child: Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

  ➤ Adult: Apply 1 drop at least every 2 hours, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

  ➤ INTERACTIONS ➔ Appendix 1: aminoglycosides

  ➤ PRESCRIBING AND DISPENSING INFORMATION

  Eye drops may be sourced as a manufactured special or from specialist importing companies.

- MEDICINAL FORMS

  There can be variation in the licensing of different medicines containing the same drug. Forms available from specialist importing companies include:

  Ear/eye drops solution

  EXCipients: May contain benzalkonium chloride

  ➤ Gentamicin (Non-proprietary) Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml

  0.3% ear/eye drops | 10 ml

  £2.63 DT = £2.47

Tobramycin

- INDICATIONS AND DOSE

  Local treatment of infections

  ➤ TO THE EYE

  ➤ Child 1–17 years: Apply twice daily for 6–8 days

Bacterial eye infection 1171

Qty

Adult: Apply twice daily for 6–8 days

Local treatment of infections (severe infection)

➤ TO THE EYE

➤ Child 1–17 years: Apply 4 times a day for first day, then apply twice daily for 5–7 days

➤ Adult: Apply 4 times a day for first day, then apply twice daily for 5–7 days

➤ INTERACTIONS ➔ Appendix 1: aminoglycosides

➤ MEDICINAL FORMS

  There can be variation in the licensing of different medicines containing the same drug.

  Powder for solution for injection

  ➤ Aprokam (Thea Pharmaceuticals Ltd) Cefuroxime (as Cefuroxime sodium) 50 mg Aprokam 50 mg powder for solution for injection vials | 10 vial

  £49.95

ANTIBACTERIALS > MACROLIDES

Azithromycin

- INDICATIONS AND DOSE

  Trachomatous conjunctivitis caused by Chlamydia trachomatis Purulent bacterial conjunctivitis

  ➤ TO THE EYE

  ➤ Child: Apply twice daily for 3 days, review if no improvement after 3 days of treatment

  ➤ Adult: Apply twice daily for 3 days, review if no improvement after 3 days of treatment

  ➤ INTERACTIONS ➔ Appendix 1: macrolides
### Ciprofloxacin > QUINOLONES

**INDICATIONS AND DOSE**

**Superficial bacterial eye infection**
- **Child:** Apply 4 times a day for maximum duration of treatment 21 days
- **Adult:** Apply 4 times a day for maximum duration of treatment 21 days
- **TO THE EYE USING EYE OINTMENT**
  - **Child 1-17 years:** Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
  - **Adult:** Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
- **SUPERFICIAL BACTERIAL EYE INFECTION (SEVERE INFECTION)**
  - **TO THE EYE USING EYE DROP**
  - **Child:** Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days
  - **Adult:** Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days
- **Corneal ulcer**
  - **TO THE EYE USING EYE DROP**
  - **Child:** Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night
  - **Adult:** Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night
- **TO THE EYE USING EYE OINTMENT**
  - **Child 1-17 years:** Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night
  - **Adult:** Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night

**SIDE-EFFECTS**
- **UNLICENSED USE** Eye ointment not licensed for use in children under 1 year.
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
  - **Rare or very rare** Ear pain
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Eye drops**
  - **Exipients:** May contain Benzalkonium chloride
  - **Ciloxan (Novartis Pharmaceuticals UK Ltd)**
    - Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml
  - **Ciloxan 0.3% eye drops | 5 ml [FCA] £4.70 DT + £4.70**

---

### Levofloxacin

**INDICATIONS AND DOSE**

**Local treatment of eye infections**
- **TO THE EYE**
  - **Child 1-17 years:** Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days
  - **Adult:** Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days
- **INTERACTIONS** → Appendix 1: quinolones
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Although multi-dose levofloxacin eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **Exipients:** May contain Benzalkonium chloride
    - **Levofloxacin (Non-proprietary)**
      - Levofloxacin (as Levofloxacin hemihydrate) 5 mg per 1 ml
        - Levofloxacin 5mg/ml eye drops | 5 ml [FCA] £6.95 DT + £6.95
      - **Ofatux (Santen UK Ltd)**
        - Levofloxacin (as Levofloxacin hemihydrate) 5 mg per 1 ml
          - Ofatux 5mg/ml eye drops 0.3ml unit dose | 30 unit dose [FCA] £17.95 DT + £17.95
          - Ofatux 5mg/ml eye drops | 5 ml [FCA] £6.95 DT + £6.95

---

### Moxifloxacin

**INDICATIONS AND DOSE**

**Local treatment of infections**
- **TO THE EYE**
  - **Child:** Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days
  - **Adult:** Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
- **UNLICENSED USE** Eye ointment not licensed for use in children under 1 year.
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
  - **Rare or very rare** Conjunctival haemorrhage
  - **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Eye drops**
  - **Moxivig (Novartis Pharmaceuticals UK Ltd)**
    - Moxifloxacin (as Moxifloxacin hydrochloride) 5 mg per 1 ml
      - Moxivig 0.5% eye drops | 5 ml [FCA] £9.80 DT + £9.80

---

www.getintopharma.com
**Chloramphenicol**

**DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

**INDICATIONS AND DOSE**

**Superficial eye infections**

- **TO THE EYE USING EYE DROP**
  - Child: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient
  - Adult: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient

- **TO THE EYE USING EYE OINTMENT**
  - Child: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone
  - Adult: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

**INTERACTIONS**

- **Appendix 1: chloramphenicol**
- **SIDE-EFFECTS** Angioedema • bone marrow disorders • eye stinging • fever • paraesthesia • skin reactions
- **PREGNANCY** Avoid unless essential—no information on topical use but risk of “neonatal grey-baby syndrome” with oral use in third trimester.
- **BREAST FEEDING** Avoid unless essential—*theoretical* risk of bone–marrow toxicity.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose chloramphenicol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**SIDE-EFFECTS**

- **UNLICENSED USE** Not licensed for *Acanthamoeba keratitis* infections.
- **SIDE-EFFECTS** Eye discomfort • vision blurred
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

**EXCEPTIONS TO LEGAL CATEGORY** Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.
3.2 Viral eye infection  
3.2a Ophthalmic herpes simplex

### ANTIVIRALS > NUCLEOSIDE ANALOGUES

#### Aciclovir  
(Acyclovir)

- **INDICATIONS AND DOSE**  
  Herpes simplex infection (local treatment)  
  - TO THE EYE USING EYE OINTMENT  
  - Child: Apply 1 centimetre times a day continue for at least 3 days after complete healing  
  - Adult: Apply 1 centimetre times a day continue for at least 3 days after complete healing

- **INTERACTIONS**  
  → Appendix 1: aciclovir

- **SIDE-EFFECTS**
  - Common or very common: Eye inflammation - eye pain

- **PATIENT AND CARER ADVICE**  
  Medicines for Children leaflet: Aciclovir eye ointment for herpes simplex infections www.medicinesforchildren.org.uk/aciclovir-eye-ointment-herpes-simplex-infection-0

- **MEDICINAL FORMS**  
  There can be variation in the licensing of different medicines containing the same drug.

  - **Eye ointment**
    - Zovirax (GlaxoSmithKline UK Ltd)  
      Aciclovir 30 mg per 1 gram  
      Zovirax 3% ophthalmic ointment  
      4.5 gram  
      £3.34 DT = £3.34

- **Ganciclovir**  
  31-May-2018

- **INDICATIONS AND DOSE**  
  Acute herpetic keratitis  
  - TO THE EYE
