  - Adult: Apply 5 times a day until healing complete, then apply 3 times a day for a further 7 days, treatment does not usually exceed 21 days

  - **INTERACTIONS**  
    → Appendix 1: ganciclovir

  - **SIDE-EFFECTS**
    - Common or very common: Eye stinging - punctate keratitis

  - **ALLERGY AND CROSS-SENSITIVITY**  
    Contra-indicated in patents hypersensitive to valganciclovir, aciclovir, or valaciclovir.

  - **CONCEPTION AND CONTRACEPTION**  
    As teratogenicity and impaired fertility observed in animal studies with oral and intravenous ganciclovir, manufacturer advises women of childbearing potential should use effective contraception during treatment; men with partners of childbearing

### Eye procedures

#### 4 Eye procedures

### Nucleoside analogues

#### Mydriatics and cycloplegics

**Overview**  
Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

- Short-acting, relatively weak mydriatics, such as tropicamide 0.5% below (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Longer-acting options include cyclopentolate hydrochloride 1% p. 1166 (action up to 24 hours) or atropine sulfate p. 1166 (action up to 7 days).

- Phenylephrine hydrochloride p. 1175 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 1166 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

#### Other drugs used for Eye procedures

- Apraclonidine, p. 1187

### Antimuscarinics

#### Tropicamide

- **INDICATIONS AND DOSE**  
  Fundoscopy  
  - TO THE EYE  
  - Child: 0.5% eye drops to be applied 20 minutes before examination  
  - Adult: (consult product literature)

- **INTERACTIONS**  
  → Appendix 1: tropicamide

- **SIDE-EFFECTS**  
  Eye erythema - eye irritation (on prolonged administration) - eye pain - headache - hypotension - nausea - syncope - vision blurred

- **PRESCRIBING AND DISPENSING INFORMATION**  
  Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**  
  There can be variation in the licensing of different medicines containing the same drug.

  - **Eye drops**
    - EXCIPIENTS: May contain Benzalkonium chloride, edetic acid (edta)  
      Mydriacyl (Alcon Eye Care Ltd)  
      Tropicamide 10 mg per 1 ml  
      Mydriacyl 1% eye drops  
      5 ml  
      £1.60
MIOTICS > PARASYMPATHOMIMETICS

Acetylcholine chloride

INICATIONS AND DOSE
Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis

TO THE EYE
Adult: (consult product literature)

CAUTIONS
- Asthma • gastro-intestinal spasm • heart failure • hyperthyroidism • parkinsonism • peptic ulcer • urinary-tract obstruction
- SIDE-EFFECTS
  - Bradycardia • corneal decompensation • corneal oedema • dyspnoea • flushing • hyperhidrosis • hypotension
- PREGNANCY
  - Avoid unless potential benefit outweighs risk—no information available.
- BREAST FEEDING
  - Avoid unless potential benefit outweighs risk—no information available.

ME DI C INAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
- Irrigation
  - Miochol-E (Bausch & Lomb UK Ltd)
  - Acetylcholine chloride 20 mg
  - Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 1 vial (P00) £7.28
  - Miphetil (Farmitalia Zambon Ltd)
  - Acetylcholine chloride 20 mg
  - Miphetil 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoules (P00) €43.68
  - (Hospital only)

SYMPATHOMIMETICS > VASOCONSTRICTOR

Phenylephrine hydrochloride

INICATIONS AND DOSE
Mydriasis
- TO THE EYE
- Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging
- Adult: Apply 1 drop, to be administered before procedure, then apply 1 drop after 60 minutes if required, a drop of topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

CONTRA-INDICATIONS
- 10% strength eye drops in children • 10% strength eye drops in elderly • aneurysms • cardiovascular disease • hypertension • thyrotoxicosis

CAUTIONS
- Asthma • cerebral arteriosclerosis (in adults) • corneal epithelial damage • darkly pigmented iris is more resistant to pupillary dilation and caution should be exercised to avoid overdosage • diabetes (avoid eye drops in long-standing diabetes) • mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber • mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber • ocular hyperaemia • susceptibility to angle-closure glaucoma

INTERACTIONS
- Appendix 1: sympathomimetics, vasoconstrictor
- SIDE-EFFECTS
  - Arrhythmias • conjunctivitis allergic • eye discomfort • hypertension • myocardial infarction (usually after use of 10% strength in patients with pre-existing
cardiovascular disease) • palpitations • periorbital pallor (in children) • vision disorders

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose phenylephrine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE** Driving and skilled tasks Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### Eye drops
- May contain Disodium edetate, sodium metabisulphite
- **Phenylephrine hydrochloride** (Baush & Lomb UK Ltd)
  - Phenylephrine hydrochloride 25 mg per 1 ml Minims
  - Phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose £11.87
  - Phenylephrine hydrochloride 100 mg per 1 ml Minims
  - Phenylephrine hydrochloride 10% eye drops 0.5ml unit dose | 20 unit dose £11.87

#### Tropicamide with phenylephrine

The properties listed below are those particular to the combination only. For the properties of the components please consider, phenylephrine hydrochloride p. 1175, tropicamide p. 1174.

### INDICATIONS AND DOSE
- Pre-operative mydriasis | Diagnostic procedures when monotherapy insufficient
  - **TO THE EYE**
  - Adult: One insert to be applied into the lower conjunctival sac up to max. 2 hrs before procedure; remove insert within 30 minutes of satisfactory mydriasis, and within 2 hours of application

### INTERACTIONS
- Appendix 1: antiarrhythmics • sympathomimetics, vasoconstrictor • tropicamide

### DIRECTIONS FOR ADMINISTRATION
- Patients with severe dry eyes may require a drop of saline to improve insert tolerance.

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

#### Ophthalmic insert
- **Mydristar** (Thea Pharmaceuticals Ltd)
  - Tropicamide 28 mg, Phenylephrine hydrochloride 5.4 mg Mydristar 5.4mg/0.28mg ophthalmic inserts | 20 insert £84.00

#### Tropicamide with phenylephrine and lidocaine

**INDICATIONS AND DOSE**
- Mydriasis and intraocular anaesthesia during cataract surgery
  - **BY INTRACAMERAL INJECTION**
  - Adult: 0.2 mL for 1 dose, to be injected slowly at the start of the surgical procedure

#### DOSE EQUIVALENCE AND CONVERSION
- Each 0.2 mL dose of Mydristar® solution for injection contains 0.04 mg of tropicamide, 0.62 mg of phenylephrine hydrochloride and 2 mg of lidocaine hydrochloride.

**CONTRA-INDICATIONS**
- Cataract surgery combined with vitrectomy • history of acute, narrow-angle glaucoma • shallow anterior chamber

**CAUTIONS**
- Conditions where systemic exposure to phenylephrine or lidocaine could be harmful (consult product literature) • risk of floppy iris syndrome (consult product literature)

**INTERACTIONS**
- Appendix 1: antiarrhythmics • sympathomimetics, vasoconstrictor • tropicamide

**SIDE-EFFECTS**
- Uncommon: Headache • hyperaemia • hypertension • keratitis

**ALLERGY AND CROSS-SENSITIVITY**
- Contra-indicated in patients with known hypersensitivity to amide-type anaesthetics or atropine derivatives.

**PREGNANCY**
- Manufacturer advises avoid (systemic uptake after administration cannot be excluded)—insufficient data available for phenylephrine and tropicamide in pregnancy; lidocaine crosses the placenta but is not known to be harmful in animal studies.

**BREAST FEEDING**
- Manufacturer advises avoid—no data available for phenylephrine or tropicamide; lidocaine present in milk in small amount.

**PRE-TREATMENT SCREENING**
- Manufacturer advises patients must have demonstrated, at a previous visit, a satisfactory pupil dilatation with topical mydriatic treatment.

**PATIENT AND CARER ADVICE**
- Driving and skilled tasks
- Manufacturer advises patients should be counselled about the effects on driving and driving tasks.

**4.1 Post-operative pain and inflammation**

### Eye, surgical and peri-operative drug use

**Ocular peri-operative drugs**
- Ocular drugs commonly used for the preparation of the eye for surgery, drugs that are injected into the anterior chamber of the eye (intracameral use), is used for the prophylaxis of endophthalmitis after cataract surgery.

- Non-steroidal anti-inflammatory eye drops such as diclofenac sodium p. 1178, flurbiprofen p. 1178, ketorolac trometamol p. 1178, and nepafenac p. 1161, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Bromfenac p. 1178 is used for the treatment of postoperative inflammation following cataract surgery.

- Non-steroidal anti-inflammatory eye drops such as diclofenac sodium p. 1178, flurbiprofen p. 1178, ketorolac trometamol p. 1178, and nepafenac p. 1161, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Bromfenac p. 1178 is used for the treatment of postoperative inflammation following cataract surgery.

- Diclofenac sodium and flurbiprofen are also used to prevent the prophylaxis of endophthalmitis after cataract surgery.

- Apraclonidine p. 1187, an alpha-2-adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control
increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intraocular pressure prior to surgery.

Acetylcholine chloride p. 1175, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular sodium hyaluronate p. 1169 and balanced salt solution are used during surgical procedures on the eye.

Povidone-iodine p. 1175 is used for peri-ocular and conjunctival antisepsis before ocular surgery to support postoperative infection control.

**Ocular local anaesthetics**

Oxybuprocaine hydrochloride below and tetracaine below are widely used topical local anaesthetics. Proxymetacaine hydrochloride below causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride and fluorescein sodium p. 1177 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 222, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

**ANAESTHETICS, LOCAL**

**Fluorescein with lidocaine**

- **INDICATIONS AND DOSE**

  - Local anaesthetic
    - **TO THE EYE**
    - Adult: Apply as required

- **PRESCRIBING AND DISPENSING INFORMATION**

  Although multi-dose lidocaine and fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  - **Eye drops**
    - **Lidocaine and Fluorescein** (Bausch & Lomb UK Ltd)
      - Fluorescein sodium 2.5 mg per 1 ml
      - Lidocaine hydrochloride 40 mg per 1 ml
      - Minims lidocaine and fluorescein eye drops 0.5ml unit dose [POM] £11.69

**Oxybuprocaine hydrochloride**

(Benoxinate hydrochloride)

- **INDICATIONS AND DOSE**

  - Local anaesthetic
    - **TO THE EYE**
    - Adult: Apply as required

- **CONTRA-INDICATIONS**

  Avoid in preterm neonates

- **INTERACTIONS**

  → Appendix 1: anaesthetics, local

- **PRESCRIBING AND DISPENSING INFORMATION**

  Although multi-dose oxybuprocaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  - **Eye drops**
    - **Oxybuprocaine hydrochloride** (Bausch & Lomb UK Ltd)
      - Oxybuprocaine hydrochloride 4 mg per 1 ml
      - Minims oxybuprocaine hydrochloride 0.4% eye drops 0.5ml unit dose [POM] £10.56

**Proxymetacaine hydrochloride**

- **INDICATIONS AND DOSE**

  - Local anaesthetic
    - **TO THE EYE**
    - Adult: Apply as required

- **CONTRA-INDICATIONS**

  Avoid in preterm neonates

- **INTERACTIONS**

  → Appendix 1: anaesthetics, local

- **PRESCRIBING AND DISPENSING INFORMATION**

  Although multi-dose proxymetacaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  - **Eye drops**
    - **Proxymetacaine** (Bausch & Lomb UK Ltd)
      - Proxymetacaine hydrochloride 5 mg per 1 ml
      - Minims proxymetacaine hydrochloride 0.5% eye drops 0.5ml unit dose [POM] £12.12

**Tetracaine**

(Amethocaine)

- **INDICATIONS AND DOSE**

  - Local anaesthetic
    - **TO THE EYE**
    - Adult: Apply as required

- **INTERACTIONS**

  → Appendix 1: anaesthetics, local

- **SIDE-EFFECTS**

  Dermatitis · eye disorders · eye inflammation · paraesthesia

- **SIDE-EFFECTS, FURTHER INFORMATION**

  The systemic toxicity of local anaesthetics mainly involves the central nervous system; systemic side effects unlikely as minimal absorption following topical application.

- **PRESCRIBING AND DISPENSING INFORMATION**

  Although multi-dose tetracaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  - **Eye drops**
    - **Tetracaine** (Bausch & Lomb UK Ltd)
      - Tetracaine hydrochloride 5 mg per 1 ml
      - Minims tetracaine hydrochloride 0.5% eye drops 0.5ml unit dose [POM] £10.57 DT = £10.57
      - Tetracaine hydrochloride 10 mg per 1 ml
      - Minims tetracaine hydrochloride 1% eye drops 0.5ml unit dose [POM] £10.57 DT = £10.57

**Other drugs used for Post-operative pain and inflammation**

Diclofenac sodium, p. 1178

**NON-STEROIDAL ANTI-INFLAMMATORY DRUGS**

**Bromfenac**

- **INDICATIONS AND DOSE**

  Postoperative inflammation following cataract surgery

  - **TO THE EYE**
    - Adult: (consult product literature)

- **INTERACTIONS**

  → Appendix 1: NSAIDs
### Diclofenac sodium

**INDICATIONS AND DOSE**

Inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties) Postoperative inflammation in cataract surgery, strabismus surgery or argon laser trabeculoplasty | Pain in corneal epithelial defects after photorefractive keratectomy, radial keratotomy or accidental trauma | Seasonal allergic conjunctivitis

**SIDE-EFFECTS**

- **Common or very common**: Eye discomfort, - dry eye, - accidental trauma, - photorefractive keratectomy, - seasonal allergic conjunctivitis, - keratic deposits, - rash, - injection site reactions, - pruritus.

**INTERACTIONS**

- **Appendix 1: NSAIDs**

**MEDICINAL FORMS**

- **Eye drops**: May contain Benzalkonium chloride, disodium edetate, propylene glycol.
  - **Voltarol Ophtha (Thea Pharmaceuticals Ltd)**: Diclofenac sodium 1 mg per 1 ml | 5 ml | 900 microgram per 1 ml | 0.4 ml dose
  - **Ocufer (Allergan Ltd)**: Ketorolac trometamol 5 mg per 1 ml | 5 ml | 37.5 micrograms/ml
  - **Acular (Allergan Ltd)**: Flurbiprofen sodium 300 microgram per 1 ml | 40 unit dose

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

---

### Flurbiprofen

**INDICATIONS AND DOSE**

Inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties) Control of anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated

**SIDE-EFFECTS**

- **Common or very common**: Dry eye, eye discomfort, - eye disorders, - headaches.

**INTERACTIONS**

- **Appendix 1: NSAIDs**

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
5 Glaucoma and ocular hypertension

Glaucoma and ocular hypertension

11-Apr-2018

Description of condition

Glaucoma is a group of eye disorders characterised by a loss of visual field associated with pathological cupping of the optic disc and optic nerve damage. While glaucoma is generally linked to raised intraocular pressure, which is the main treatable risk factor, it can also occur when the intraocular pressure is within the normal range. Other risk factors include age, family history, ethnicity, corticosteroid use, myopia, type 2 diabetes mellitus, cardiovascular disease, and hypertension.

The most common form of glaucoma is chronic open-angle glaucoma (also known as primary open-angle glaucoma) where drainage of the aqueous humour through the trabecular meshwork is restricted, and the angle between the iris and the cornea is normal. Initially, this condition tends to be asymptomatic, however, as glaucoma progresses, patients may present with irreversible sight loss or visual field defects. Patients with ocular hypertension (an intraocular pressure greater than 21 mmHg) are at high risk of developing chronic open-angle glaucoma. The diagnosis, monitoring, and management of patients with ocular hypertension, suspected chronic open-angle glaucoma, or chronic open-angle glaucoma should be carried out by a specialist.

Acute angle-closure glaucoma is less common and occurs when the outflow of aqueous humour from the eye is totally obstructed by bowing of the iris against the trabecular meshwork. It is characterised by its abrupt onset of symptoms, and it is a sight-threatening medical emergency that requires urgent reduction of intraocular pressure to prevent loss of vision.

Aims of treatment

The aim of treatment is to control intraocular pressure to prevent the development or progression of glaucoma and subsequent visual field damage, or sight loss.

Ocular hypertension

A topical prostaglandin analogue, such as latanoprost p. 1184, tafluprost p. 1185, travoprost p. 1186, or bimatoprost p. 1184 (a synthetic prostamide), is recommended as first-line treatment in patients with an intraocular pressure of 24 mmHg or greater and who are at risk of visual impairment within their lifetime. When assessing patient’s risk of future visual impairment, the level of intraocular pressure, central corneal thickness measurement, family history, and life expectancy should be taken into consideration. Patients who are not at risk of visual impairment in their lifetime do not require treatment but should be monitored regularly.

If initial treatment with a topical prostaglandin analogue is not tolerated, an alternative prostaglandin analogue should be tried before switching to a topical beta-blocker such as betaxolol p. 1180, levobunolol hydrochloride p. 1180, or timolol maleate p. 1180. If treatment is still not tolerated, alternative options include carbonic anhydrase inhibitors such as brinzolamide p. 1181 or dorzolamide p. 1182, a topical sympathomimetic such as apraclonidine p. 1187 [unlicensed use] or brimonidine tartrate p. 1187, or a topical miotic such as pilocarpine p. 1183 [unlicensed use], given either as monotherapy or as combination therapy.

Alternatives as either monotherapy or combination therapy with drugs from different therapeutic classes (topical beta-blockers, carbonic anhydrase inhibitors, or topical sympathomimetics), should also be offered to patients with an intraocular pressure of 24 mmHg or more whose current treatment is not reducing intraocular pressure sufficiently to prevent the risk of progression to sight loss. The patient’s adherence and drug instillation technique should also be checked. If drug treatment still does not sufficiently reduce intraocular pressure to a satisfactory level, patients should be referred to a consultant ophthalmologist to discuss other options.

Preservative free eye drops should be used in patients who are allergic to preservatives, or those who have clinically significant ocular surface disease and are at high risk of conversion to chronic open-angle glaucoma.

Note: based on cost-effective analysis, NICE guidelines 81 recommend treatment with generic prostaglandin analogues as first-line, and non-generic prostaglandin analogues as third-line if topical beta-blocker treatment is ineffective.

Suspected chronic open-angle glaucoma

In patients with suspected chronic open-angle glaucoma and an intraocular pressure of 24 mmHg or greater, the same treatment recommendations as for the management of ocular hypertension should be followed. Patients with an intraocular pressure below 24 mmHg do not require drug treatment, but should be regularly monitored for changes in intraocular pressure and visual impairment.

Chronic open-angle glaucoma

Topical prostaglandin analogues such as latanoprost p. 1184, tafluprost p. 1185, travoprost p. 1186, or bimatoprost p. 1184 (a synthetic prostamide), are used first-line in patients with confirmed chronic open-angle glaucoma. If first-line treatment does not sufficiently reduce intraocular pressure and the patient’s adherence to treatment and eye drop instillation technique are both satisfactory, treatment with either a topical beta-blocker such as betaxolol p. 1180, levobunolol hydrochloride p. 1180, and timolol maleate p. 1180, a carbonic anhydrase inhibitor such as brinzolamide p. 1181 or dorzolamide p. 1182, a topical sympathomimetic such as apraclonidine p. 1187 or brimonidine tartrate p. 1187, or a combination of these, should be offered. When a particular drug is not tolerated, another drug from a different therapeutic class can be tried. Preservative free eye drops should be used in patients who are allergic to preservatives, or those who have clinically significant ocular surface disease. Alternative treatment options are laser trabeculoplasty or surgery with pharmacological augmentation (with mitomycin p. 919 [unlicensed indication]).

Patients with advanced chronic open-angle glaucoma should be offered surgery with pharmacological augmentation (with mitomycin p. 919 [unlicensed indication]). Treatment with a topical prostaglandin analogue should be initiated and continued until surgery takes place.

If surgery fails to adequately reduce the intraocular pressure, alternative options include drug treatment (a combination of topical drugs from different therapeutic classes may be needed), further surgery, laser trabeculoplasty, or cyclodiode laser treatment.
Betaxolol

**INDICATIONS AND DOSE**

Primary open-angle glaucoma

- **TO THE EYE**
- Adult: Apply twice daily

**CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

**CAUTIONS** Patients with corneal disease

**CAUTIONS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**INTERACTIONS** → Appendix 1: beta blockers, selective

**SIDE-EFFECTS**

- Common or very common Eye discomfort - eye disorders - vision disorders
- Uncommon Dry eye - eye inflammation - rhinitis
- Rare or very rare Cataract - rhinorrhea - skin reactions
- Frequency not known Angioedema - hypersensitivity

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose betaxolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

- Betagan (Allergan Ltd)

Levobunolol hydrochloride 5 mg per 1 ml Betagan 0.5% eye drops 5 ml [POD] £1.85 DT = £1.85

Betagan Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit dose [POD] £9.98 DT = £9.98

**Levobunolol hydrochloride**

**INDICATIONS AND DOSE**

Primary open-angle glaucoma

- **TO THE EYE**
- Adult: Apply 1–2 times a day

**CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

**CAUTIONS** Patients with corneal disease

**CAUTIONS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**INTERACTIONS** → Appendix 1: beta blockers, non-selective

**SIDE-EFFECTS**

- Common or very common Eye discomfort - eye disorders - eye inflammation
- Frequency not known Dry eye - eye disorders - vision blurred

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose levobunolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

- Betagan (Allergan Ltd)

Betagan Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit dose [POD] £9.98 DT = £9.98

**Timolol maleate**

**INDICATIONS AND DOSE**

Reduction of intra-ocular pressure in primary open-angle glaucoma

- **TO THE EYE**
- Adult: Apply twice daily

**TIMOPTOL-LA ®**

Reduction of intra-ocular pressure in primary open-angle glaucoma

- **TO THE EYE**
- Adult: Apply once daily

**TIOPEX ®**

Reduction of intra-ocular pressure in primary open-angle glaucoma

- **TO THE EYE**
- Adult: Apply once daily, to be applied in the morning

**CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

**CAUTIONS** Consider also cautions listed for systemically administered beta blockers.

**INTERACTIONS** → Appendix 1: beta blockers, non-selective

**SIDE-EFFECTS**

- Common or very common Eye discomfort - eye disorders - eye inflammation - vision disorders
- Rare or very rare Angioedema

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

- Betoptic (Novartis Pharmaceuticals UK Ltd)

Levobunolol hydrochloride 2.5 mg per 1 ml Betoptic 2.5% suspension eye drops 25% eye drops [POD] £0.25 DT = £0.25

Betoptic 2.5% eye drops suspension 0.25% unit dose | 50 unit dose [POD] £13.77 DT = £13.77

Betoptic (as Betaxolol hydrochloride) 5 mg per 1 ml Betoptic 0.5% eye drops 5 ml [POD] £1.90 DT = £1.90

**Scottish Medicines Consortium (SMC) decisions**

When used by eye the *Scottish Medicines Consortium* has advised (February 2014) that timolol gel eye drops (*Tiopex* ®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

**National Funding/Access Decisions Tiopex®**

- Scottish Medicines Consortium (SMC) decisions

- When used by eye the *Scottish Medicines Consortium* has advised (February 2014) that timolol gel eye drops (*Tiopex* ®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.
CARBONIC ANHYDRASE INHIBITORS

Acetazolamide

indications and dose
Reduction of intra-ocular pressure in open-angle glaucoma
Reduction of intra-ocular pressure in secondary glaucoma
Reduction of intra-ocular pressure peripheratively in angle-closure glaucoma

By mouth using immediate-release medicines, or by intravenous injection, or by intramuscular injection

Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

Glaucoma
By mouth using modified-release medicines
Adult: 250–500 mg daily

Epilepsy
By mouth using immediate-release medicines, or by intravenous injection, or by intramuscular injection
Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

contra-indications
Adrenocortical insufficiency
hypochloremic acidosis
hypokalaemia
hypotraumaemia
long-term administration in chronic angle-closure glaucoma

cautions
Avoid extravasation at injection site (risk of necrosis)
diabetes mellitus
elderly
impaired alveolar ventilation (risk of acidosis)
not generally recommended for long-term use
pulmonary obstruction (risk of acidosis)
renal calculi

interactions
Appendix 1: acetazolamide

side-effects

specific side-effects

frequency not known

specify possible side-effects

adverse effects, further information

Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally — patients should be told to report any unusual skin rash. If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering bicarbonate.

Allergy and cross-sensitivity
Contra-indicated if history of sulfonamide hypersensitivity.

pregnancy
Manufacturer advises avoid, especially in first trimester (toxicity in animal studies).

breast feeding
Amount too small to be harmful.

Hepatic impairment
Manufacturer advises avoid.

renal impairment
Avoid — risk of metabolic acidosis.

monitoring requirements
Monitor blood count and plasma electrolyte concentrations with prolonged use.

medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Eye gel

Excipients: May contain benzodiazepine bromide

Timolol (as Timolol maleate) 2.5 mg per 1 ml
Timolol-LA 0.25% ophthalmic gel-forming solution

Timolol (as Timolol maleate) 5 mg per 1 ml
Timolol-LA 0.5% ophthalmic gel-forming solution

Eye drops

Excipients: May contain benzalkonium chloride

Timolol maleate (Non-proprietary)

Timolol (as Timolol maleate) 2.5 mg per 1 ml
Timolol 0.25% eye drops
5 ml (PO) £0.98 DT = £0.98

Timolol (as Timolol maleate) 5 mg per 1 ml
Timolol 0.5% eye drops
5 ml (PO) £1.00 DT = £1.00

Eysano (Aspire Pharma Ltd)

Timolol (as Timolol maleate) 2.5 mg per 1 ml
Eysano 2.5 mg/ml eye drops
5 ml (PO) £8.45 DT = £8.45

Timolol (as Timolol maleate) 5 mg per 1 ml
Eysano 5 mg/ml eye drops
5 ml (PO) £9.65 DT = £9.65

Timolol (as Timolol maleate) 2.5 mg per 1 ml
Timolol 0.25% eye drops
5 ml (PO) £10.98 DT = £10.98

Timolol (as Timolol maleate) 5 mg per 1 ml
Timolol 0.5% eye drops
5 ml (PO) £13.12 DT = £13.12

Timolol (as Timolol maleate) 2.5 mg per 1 ml
Timolol 0.25% eye drops
5 ml (PO) £13.12 DT = £13.12

Timolol (as Timolol maleate) 5 mg per 1 ml
Timolol 0.5% eye drops
5 ml (PO) £13.12 DT = £13.12

Tiopex (Thea Pharmaceuticals Ltd)

Timolol (as Timolol maleate) 1 mg per 1 gram
Tiopex 1 mg/g eye gel 0.4 g unit dose
30 unit dose (PO) £7.49 DT = £7.49

Combinations available:
Bimatoprost with timolol, p. 1184
Brimonidine with timolol, p. 1188
Brinzolamide with timolol, p. 1182
Dorzolamide with timolol, p. 1183
Latanoprost with timolol, p. 1185
Travoprost with timolol, p. 1186

Glucone termal and ocular hypertension 1181

 disorders, leucopenia, nausea, renal colic, renal impairment, renal lesions, severe cutaneous adverse reactions (SCARs), skin reactions, thrombocytopenia, tinnitus, urinary tract discomfort, urine abnormalities, vomiting

frequency not known

Agranulocytosis, drowsiness, myopia, polyuria, taste altered, thirst

Specific side-effects

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 3

Acetazolamide (Non-proprietary)

Acetazolamide 250 mg Acetazolamide 250 mg tablets
112 tablet (PO) £75.36 DT = £12.81

Powder for solution for injection

Diamox (Advanz Pharma)

Acetazolamide 500 mg Diamox Sodium Parenteral 500 mg powder for solution for injection vials
1 vial (PO) £14.76

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 3, 25

Diamox SR (Advanz Pharma)

Acetazolamide 250 mg Diamox SR 250 mg capsules
30 capsule (PO) £16.66 DT = £16.66

Eyetox (Teva UK Ltd)

Acetazolamide 250 mg Eyetox 250 mg modified-release capsules
30 capsule (PO) £16.60 DT = £16.66

Brinzolamide

indications and dose
Reduction of intra-ocular pressure in oculc hypertension and open-angle glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

to the eye

Adult: Apply twice daily, then increased if necessary up to 3 times a day

contra-indications
Hyperchloraemic acidosis

**1182 Glaucoma and ocular hypertension**

- **CAUTIONS** Renal tubular immaturity or abnormality - systemic absorption follows topical application.
- **INTERACTIONS** → Appendix 1: brinzolamide
- **SIDE-EFFECTS**
  - **Common or very common** Eye discomfort - eye disorders - taste altered - vision disorders
  - **Rare or very rare** Alopecia - angina pectoris - drowsiness - irritability - optic nerve disorder - respiratory disorders - tinnitus
  - **Frequency not known** Appetite decreased - arthralgia - asthma - hypertension - malaise - peripheral oedema - tremor - urinary frequency increased - vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Use only if benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
      - **Brinzolamide (Non-proprietary)**
        - Brinzolamide 10 mg per 1 ml Brinzolamide 10mg/ml eye drops | 5 ml | $6.92 DT = $2.18
        - Azopt (Novartis Pharmaceuticals UK Ltd)
          - Brinzolamide 10 mg per 1 ml Azopt 10mg/ml eye drops | 5 ml | $6.92 DT = $2.18
  - **Eye drops**
    - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
      - **Timolol (as Timolol maleate)**
        - Timolol (as Timolol maleate) 5 mg per 1 ml, Brinzolamide 10 mg per 1 ml Azarga 10mg/ml mg/ml eye drops | 5 ml | $11.05 DT = $11.05

### Brinzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide p. 1181, timolol maleate p. 1180.

- **INDICATIONS AND DOSE** Raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate
  - **TO THE EYE**
  - **Adult:** Apply twice daily
- **INTERACTIONS** → Appendix 1: beta blockers, non-selective - brinzolamide
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
      - **Azarga** (Novartis Pharmaceuticals UK Ltd)
        - Timolol (as Timolol maleate) 5 mg per 1 ml, Brinzolamide 10 mg per 1 ml Azarga 10mg/ml mg/ml eye drops | 5 ml | $11.05 DT = $11.05

### Dorzolamide

10-Mar-2017

- **INDICATIONS AND DOSE** Raised intra-ocular pressure in ocular hypertension used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated | Open-angle glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated | Pseudo-exfoliative glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated
  - **TO THE EYE**
  - **Adult:** Apply 3 times a day
  - **Raised intra-ocular pressure in ocular hypertension as adjunct to beta-blocker** | Open-angle glaucoma as adjunct to beta-blocker | Pseudo-exfoliative glaucoma as adjunct to beta-blocker
    - **TO THE EYE**
    - **Adult:** Apply twice daily
- **CONTRA-INDICATIONS** Hyperchloraeamic acidosis
- **CAUTIONS** Chronic corneal defects - history of intra-ocular surgery - history of renal calculi - low endothelial cell count - systemic absorption follows topical application
- **INTERACTIONS** → Appendix 1: dorzolamide
- **SIDE-EFFECTS**
  - **Common or very common** Asthenia - eye discomfort - eye disorders - eye inflammation - headache - nauseae - paraesthesia - taste bitter - vision disorders
  - **Rare or very rare** Angioedema - bronchospasm - dizziness - dry mouth - dyspnoea - epistaxis - local reaction - pain - severe cutaneous adverse reactions (SCARs) - skin reactions - throat irritation - urolithiasis
- **SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can cause sulfonamide-like side-effects and may require discontinuation if severe.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dorzolamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain Benzalkonium chloride
- **Dorzolamide** (Non-proprietary)
  - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml

  - Eylamdo (Aspire Pharma Ltd.)
  - Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
  - Eylamdo 20mg/ml / 5mg/ml eye drops | 5 ml [POA] £14.29 DT = £14.29

---

**PILOCARPINE**

**DRUG ACTION** Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

**INDICATIONS AND DOSE**

Primary angle-closure glaucoma | Some secondary glaucomas

**TO THE EYE**

Adult: Apply up to 4 times a day

**CONTRA-INDICATIONS** Acute inflammatory disease of the anterior segment | acute iritis | anterior uveitis | conditions where pupillary constriction is undesirable | some forms of secondary glaucoma | (where pupillary constriction is undesirable)

**CAUTIONS** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdose | asthma | cardiac disease | care in conjunctival damage | care in corneal damage | epilepsy | gastrointestinal spasm | hypertension | hyperthyroidism | hypotension | marked vasomotor instability | Parkinson’s disease | peptic ulceration | retinal detachment has occurred in susceptible individuals and those with retinal disease | urinary-tract obstruction

**INTERACTIONS** → Appendix 1: pilocarpine

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea | headache | hyperhidrosis | hypersalivation | nausea | skin reactions | vision disorders | vomiting
- **Frequency not known** Bradycardia | bronchospasm | conjunctival vascular congestion | eye disorder (long term use) | eye disorders | hypotension | lens changes (long term use) | pain | paraesthesia | pulmonary oedema | sensitisation | vitreous haemorrhage

**PREGNANCY** Avoid unless the potential benefit outweighs risk—limited information available.

**BREAST FEEDING** Avoid unless the potential benefit outweighs risk—no information available.

**PRE-TREATMENT SCREENING** Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).

**MONITORING REQUIREMENTS** Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.

**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye drops**

- **EXCIPIENTS:** May contain Benzalkonium chloride
- **Pilocarpine** (Non-proprietary)
  - Pilocarpine hydrochloride 10 mg per 1 ml
  - Pilocarpine hydrochloride 1% eye drops | 10 ml [POA] £22.20 DT = £22.20
  - Pilocarpine hydrochloride 2% eye drops | 10 ml [POA] £22.77 DT = £22.77
  - Pilocarpine hydrochloride 4% eye drops | 10 ml [POA] £28.40 DT = £28.40

---

www.getintopharma.com
1184 Glaucoma and ocular hypertension

Bimatoprost

**INDICATIONS AND DOSE**

*Raised intra-ocular pressure in open-angle glaucoma| Ocular hypertension*

- **Adult:** Apply once daily, to be administered preferably in the evening

**CAUTIONS**

- Angle-closure glaucoma (no experience of use)
- Aphakia - asthma - chronic obstructive pulmonary disease
- Compromised respiratory function - congenital glaucoma
- (no experience of use) - contact lens wearers - history of significant ocular viral infections - inflammatory ocular conditions (no experience of use) - narrow-angle glaucoma (no experience of use) - neovascular glaucoma (no experience of use) - predisposition to bradycardia - predisposition to hypotension - pseudophakia with torn posterior lens capsule or anterior chamber lenses - risk factors for cystoid macular oedema - risk factors for iritis - risk factors for uveitis

**SIDE-EFFECTS**

- **Common or very common**  
  - Dry eye - eye discolouration - eye discomfort - eye disorders - eye inflammation - headache - hypertension - hyperviscosity - skin reactions - vision disorders
- **Uncommon**
  - Asthenia - dizziness - madarosis - nausea - retinal haemorrhage
- **Frequency not known**
  - Asthma - bradycardia - dyspnoea - hypotension - reactivation of infection

**PREGNANCY**

- Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

- Manufacturer advises avoid — present in milk in **animal** studies.

**HEPATIC IMPAIRMENT**

- Manufacturer advises use with caution in moderate-to-severe impairment — no information available.

**RENAL IMPAIRMENT**

- Use with caution — no information available.

**PRESCRIBING AND DISPENSING INFORMATION**

- Although multi-dose bimatoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**PATIENT AND CARER ADVICE**

- Changes to eye colour  
  Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**NATIONAL FUNDING/ACCESS DECISIONS**

*LUMIGAN®*

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (March 2013) that bimatoprost 300 micrograms/ml preservative-free eye drops (Lumigan® single-dose eye drops) are accepted for restricted use within NHS Scotland for the reduction of intra-ocular pressure in chronic open-angle glaucoma and ocular hypertension (as monotherapy or as adjunctive therapy to beta-blockers) in adults who have proven sensitivity to benzalkonium chloride.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:**  
- May contain Benzalkonium chloride

- **Bimatoprost (Non-proprietary)**
  - **Bimatoprost 300 microgram per 1 ml**
    - Bimatoprost 300 micrograms/ml eye drops | 3 ml | £10.30 DT = £10.30
  - **Eyreida (Aspire Pharma Ltd)**
    - **Bimatoprost 300 microgram per 1 ml**
      - Eyreida 0.3mg/ml eye drops | 3 ml | £11.71 DT = £11.71
  - **Lumigan (Allergan Ltd)**
    - **Bimatoprost 100 microgram per 1 ml**
      - Lumigan 100 micrograms/ml eye drops | 3 ml | £11.71 DT = £11.71 | 9 ml | £35.15
    - **Bimatoprost 300 microgram per 1 ml**
      - Lumigan 300 micrograms/ml eye drops 0.4ml unit dose | 30 unit dose | £13.75 DT = £13.75
  - **Sturilan (Actavis UK Ltd)**
    - **Bimatoprost 300 microgram per 1 ml**
      - Sturilan 0.3mg/ml eye drops | 3 ml | £9.27 DT = £10.30 | 9 ml | £27.81

**Bimatoprost with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, bimatoprost above, timolol maleate p. 1180.

**INDICATIONS AND DOSE**

*Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate*

- **TO THE EYE**
- **Adult:** Apply once daily

**INTERACTIONS**

- Appendix 1: beta-blockers, non-selective

**NATIONAL FUNDING/ACCESS DECISIONS**

*GANFORT® SINGLE USE*

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (October 2013) that Ganfort® unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension insufficiently responsive to topical beta-blockers or prostaglandin analogues who have proven sensitivity to preservatives.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:**

- May contain Benzalkonium chloride

- **Ganfort (Allergan Ltd)**
  - Bimatoprost 300 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml
    - Ganfort 0.3mg/ml / 5mg/ml eye drops | 3 ml | £14.16 DT = £14.16 | 9 ml | £38.15
    - Ganfort 0.3mg/ml / 5mg/ml eye drops 0.4ml unit dose | 30 unit dose | £17.94 DT = £17.94

**Latanoprost**

**INDICATIONS AND DOSE**

*Raised intra-ocular pressure in open-angle glaucoma| Ocular hypertension*

- **TO THE EYE**
- **Adult:** Apply once daily, to be administered preferably in the evening

**IMPORTANT SAFETY INFORMATION**

**MHRA/CiMH ADVICE:** LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015)

Following reformulation of Xalatan® with timolol, to allow for long-term storage at room temperature, there has been an
increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.

- **CONTRA-INDICATIONS** Active herpes simplex keratitis - history of recurrent herpetic keratitis associated with prostaglandin analogues
- **CAUTIONS** Angle-closure glaucoma (no experience of use) - aphakia - asthma - chronic obstructive pulmonary disease - compromised respiratory function - congenital glaucoma (no experience of use) - contact lens wearers - do not use within 5 minutes of thiomersal-containing preparations - history of significant ocular viral infections - inflammatory ocular conditions (no experience of use) - narrow-angle glaucoma (no experience of use) - neovascular glaucoma (no experience of use) - peri-operative period of cataract surgery - pseudophakia with torn posterior lens capsule or anterior chamber lenses - risk factors for cystoid macular oedema - risk factors for iritis - risk factors for uveitis
- **SIDE-EFFECTS**
  - Common or very common Eye discolouration - eye discomfort - eye disorders - eye inflammation - vision disorders
  - Uncommon Dry eye - rash
  - Rare or very rare Asthma - chest pain - dyspnoea - unstable angina
- **FREQUENCY not known** Arthralgia - dizziness - headache - myalgia - ophthalmic herpes simplex - palpitations
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** May be present in milk—manufacturer advises avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE** Changes in eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **MONOPOST**
  - **Scottish Medicines Consortium (SMC) decisions** The Scottish Medicines Consortium has advised (June 2013) that Monopost is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - dysphagia
  - gastrointestinal disorders - hypotension
  - hypertensive reactions - madarosis
  - musculoskeletal pain - myalgia
  - nausea
  - tinnitus
  - urinary disorders
  - vertigo
  - vomiting

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk — toxicity in animal studies.

**BREAST FEEDING**

Present in milk in animal studies; manufacturer advises avoid.

**PATIENT AND CARER ADVICE**

Changes to eye colour

Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with multicoloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Travoprost**

**INDICATIONS AND DOSE**

Raised intra-ocular pressure in open-angle glaucoma

Ocular hypertension

TO THE EYE

Adult: Apply once daily, to be administered preferably in the evening

**CAUTIONS**

History of significant ocular viral infections - angle-closure glaucoma (no experience of use) - aphakia

- asthma
- chronic obstructive pulmonary disease
- compromised respiratory function - congenital glaucoma (no experience of use) - contact lens wearers - inflammatory ocular conditions (no experience of use) - narrow-angle glaucoma (no experience of use) - neovascular glaucoma (no experience of use) - pseudophakia with torn posterior lens capsule or anterior chamber lenses - risk factors for cystoid macular oedema - risk factors for iritis - risk factors for uveitis

**SIDE-EFFECTS**

- Common or very common
  - Dry eye
  - eye discoloration
  - eye discomfort
  - eye disorders

- Uncommon
  - Cataract
  - cough
  - eye inflammation
  - hair changes
  - headache
  - nasal complaints
  - palpitations - seasonal allergy
  - skin reactions
  - throat irritation
  - vision disorders

- Rare or very rare
  - Allergic rhinitis
  - arthralgia
  - asthenia
  - asthma
  - constipation
  - dizziness
  - dry mouth
  - dysphonia
  - dysphagia
  - gastrointestinal disorders - hypotension
  - hypertensive reactions - madarosis
  - musculoskeletal pain - myalgia
  - nausea
  - tinnitus
  - urinary disorders
  - vertigo
  - vomiting

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk — toxicity in animal studies.

**BREAST FEEDING**

Present in milk in animal studies; manufacturer advises avoid.

**PATIENT AND CARER ADVICE**

Changes to eye colour

Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with multicoloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

**EXCIPIENTS:** May contain Propylene glycol

- Travoprost (Non-proprietary)
- Travoprost 40 microgram per 1 ml Travoprost 40 micrograms/ml eye drops | 2.5 ml [POD] £3.24 - £10.95 DT + £3.24

- Bonduc (Actavis UK Ltd)
- Travoprost 40 microgram per 1 ml Bonduc 40 micrograms/ml eye drops | 2.5 ml [POD] £10.94 DT + £3.24

- Travatan (Novartis Pharmaceuticals UK Ltd)
- Travoprost 40 microgram per 1 ml Travatan 40 micrograms/ml eye drops | 2.5 ml [POD] £10.95 DT + £3.24
Travoprost with timolol
The properties listed below are those particular to the combination only. For the properties of the components please consider, travoprost p. 1186, timolol maleate p. 1180.

I INDICATIONS AND DOSE
Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate

TO THE EYE
Adult: Apply once daily

INTERACTIONS → Appendix 1: beta blockers, non-selective

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops
Travoprost with timolol (Non-proprietary)
Travoprost 40 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml Travoprost 40micrograms/ml / Timolol 5mg/ml eye drops | 2.5 ml  £13.95 DT + £13.95
DuoTrav (Novartis Pharmaceuticals UK Ltd) Travoprost 40 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml DuoTrav 40micrograms/ml / 5mg/ml eye drops | 2.5 ml  £13.95 DT + £13.95  7.5 ml  £39.68

SYMPATHOMIMETICS → Alpha-2-adrenoceptor agonists
Apraclonidine
DRUG ACTION Apraclonidine is an alpha-2-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

INDICATIONS AND DOSE
Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

TO THE EYE
Adult: Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug

TO THE EYE
Adult: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

CONTRA-INDICATIONS History of severe or unstable and uncontrolled cardiovascular disease

CAUTIONS Cerebrovascular disease · depression · heart failure · history of angina · hypertension · loss of effect may occur over time · Parkinson’s syndrome · Raynaud’s syndrome · recent myocardial infarction · reduction in vision in end-stage glaucoma (suspend treatment) · severe coronary insufficiency · thromboangiitis obliterans · vasovagal attack

INTERACTIONS → Appendix 1: apraclonidine

SIDE-EFFECTS
Common or very common Eye disorders
Uncommon Bradycardia · conjunctival haemorrhage · diarrhoea · dry eye · eye discomfort · eye inflammation · gastrointestinal discomfort · irritability · libido decreased · nasal dryness · palpitations · postural hypotension · sensation abnormal · sleep disorders · syncope · vision disorders · vomiting
Rare or very rare Chest pain · dry mouth · fatigue · headache · hyperhidrosis · pain in extremity · pruritus · taste altered · temperature sensation altered

SIDE-EFFECTS, FURTHER INFORMATION Since absorption may follow topical application, systemic effects may occur – see clonidine hydrochloride p. 145.

Ocular intolerance Manufacturer advises withdrawal if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.

PREGNANCY Manufacturer advises avoid — no information available.

BREAST FEEDING Manufacturer advises avoid — no information available.

HEPATIC IMPAIRMENT Manufacturer advises use with caution and monitor, including close monitoring of cardiovascular parameters — no information available.

RENAL IMPAIRMENT Use with caution in chronic renal failure.

MONITORING REQUIREMENTS
Monitor intra-ocular pressure and visual fields.

PATIENT AND CARER ADVICE
Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops EXCIPIENTS: May contain Propylene glycol
Apraclonidine (as Apraclonidine hydrochloride) 10 mg per 1ml (Novartis Pharmaceuticals UK Ltd) Apraclonidine (as Apraclonidine hydrochloride) 5 mg per 1ml (Novartis Pharmaceuticals UK Ltd) Iopidine (as Iopidine hydrochloride) 5 mg per 1ml Iopidine (as Iopidine hydrochloride) 10 mg per 1ml

Use with caution in chronic renal failure.

Manufacturer advises withdrawal if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.

Apraclonidine is an alpha-2-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

Brimonidine tartrate
DRUG ACTION Brimonidine, an alpha-2-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

INDICATIONS AND DOSE
Raised intra-ocular pressure in open-angle glaucoma in patients for whom beta-blockers are inappropriate.

TO THE EYE
Adult: Apply twice daily

CAUTIONS Cerebral insufficiency · coronary insufficiency · depression · postural hypotension · Raynaud’s syndrome · severe cardiovascular disease · thromboangiitis obliterans

INTERACTIONS → Appendix 1: brimonidine

SIDE-EFFECTS
Common or very common Asthenia · dizziness · drowsiness · dry eye · dry mouth · eye discomfort · eye disorders · eye inflammation · gastrointestinal disorder · headache · hyperaemia · hypersensitivity · pulmonary reaction · sensation of foreign body · skin reactions · taste altered · vision disorders
Uncommon Arrhythmias · nasal dryness · palpitations
Rare or very rare Dyspnoea · hypertension · hypotension · insomnia · syncope
Frequency not known Face oedema · vasodilatation
PREGNANCY Manufacturer advises use only if benefit outweighs risk — limited information available.

BREAST FEEDING Manufacturer advises avoid — no information available.

Since absorption may follow topical application, systemic effects may occur – see clonidine hydrochloride p. 145.

Retinal disorders

6 Retinal disorders

6.1 Macular degeneration

Age-related macular degeneration

25-Apr-2018

Description of condition

Age-related macular degeneration is a progressive eye condition that affects the central area of the retina (macula). It occurs mainly in people aged 55 years and over and is a common cause of vision loss. The progressive loss of central vision affects the patient’s ability to see well enough to recognise faces, drive, and to read and write. Although the exact cause is unknown, known risk factors in addition to increasing age include smoking and a family history of age-related macular degeneration.

There are two types of age-related macular degeneration—dry and wet. Dry (non-neovascular) age-related macular degeneration progresses slowly as extensive wasting of macula cells occurs. Whereas, with wet (neovascular) age-related macular degeneration, new blood vessels develop beneath and within the retina, and can lead to a rapid deterioration of vision. Wet age-related macular degeneration is further classified as wet-active (neovascular lesions that may benefit from treatment) and wet-inactive (neovascular disease with irreversible structural change).

Aims of treatment

The aim of treatment is to slow down the progression of age-related macular degeneration and central vision loss; treatment is initiated under specialist care.

Treatment

Treatment is dependent on the stage and type of age-related macular degeneration, with drug treatment only recommended in patients with wet-active age-related macular degeneration. Counselling and support, advice on Smoking cessation p. 497, and use of visual aids is recommended in all patients with age related macular degeneration as appropriate.

Combigan An intravitreal anti-vascular endothelial growth factor (anti-VEGF), such as aflibercept p. 1008, ranibizumab p. 1190, or bevacizumab p. 862 (unlicensed use), is first-line treatment for patients with wet-active age-related macular degeneration. Counseling and support, advice on smoking cessation p. 497, and use of visual aids is recommended in all patients with age-related macular degeneration as appropriate.

Amsale An intravitreal anti-vascular endothelial growth factor (anti-VEGF), such as aflibercept p. 1008, ranibizumab p. 1190, or bevacizumab p. 862 (unlicensed use), is first-line treatment for patients with wet-active age-related macular degeneration. Counseling and support, advice on smoking cessation p. 497, and use of visual aids is recommended in all patients with age-related macular degeneration as appropriate.

Triamcinolone A corticosteroid designed for intraocular injection. It is approved for treating wet macular degeneration in the eye.

Photodynamic Therapy Photodynamic therapy alone should not be given to patients with wet-active age-related macular degeneration. It can be given as an adjunct to anti-VEGF treatment as a second-line option in the context of a randomised controlled trial. Intravitreal corticosteroids are not recommended in patients with wet-active age-related macular degeneration as there is limited evidence of benefit to a patient’s visual acuity.

Photodynamic therapy alone should not be given to patients with wet-active age-related macular degeneration. It can be given as an adjunct to anti-VEGF treatment as a second-line option in the context of a randomised controlled trial. Intravitreal corticosteroids are not recommended in patients with wet-active age-related macular degeneration as there is limited evidence of benefit to a patient’s visual acuity.

Patients should be advised to attend routine sight tests, self-monitor, and to report any changes in vision such as appearance of grey patches or blurred vision, straight lines appearing distorted, and objects appearing smaller than normal.

www.nice.org.uk/guidance/ng82
Macular degeneration 1189

ANTINEOPLASTIC DISEASES > VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Aflibercept

DRUG ACTION Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PIGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels.

INDICATIONS AND DOSE

Neovascular (wet) age-related macular degeneration (specialist use only)
- BY INTRAVITREAL INJECTION
  - Adult: Initially 2 mg once a month for 3 months, then 2 mg every 2 months, review treatment frequency after 12 months

Macular oedema secondary to retinal vein occlusion (specialist use only)
- BY INTRAVITREAL INJECTION
  - Adult: Initially 2 mg once a month until maximum visual acuity is achieved or there are no signs of disease activity (discontinue treatment if no improvement in visual and anatomic outcomes)

Diabetic macular oedema (specialist use only)
- BY INTRAVITREAL INJECTION
  - Adult: Initially 2 mg once a month for 5 months, then maintenance 2 mg every 2 months, review treatment frequency after 12 months (discontinue treatment if no improvement in visual and anatomic outcomes)

Myopic choroidal neovascularisation (specialist use only)
- BY INTRAVITREAL INJECTION
  - Adult: 2 mg for 1 dose, if visual or anatomic outcomes indicate that disease persists, additional doses may be administered; the interval between 2 doses should be greater than 1 month

CONTRA-INDICATIONS Clinical signs of irreversible ischaemic visual function loss - ocular or periorcular infection - severe intra-ocular inflammation

CAUTIONS Active systemic infection - diabetic patients with uncontrolled hypertension - discontinue treatment if stage 3 or 4 macular holes develop - consult product literature for full details - discontinue treatment in the event of arterial retinal detachment - consult product literature for full details - discontinue treatment in the event of retinal detachment - consult product literature for full details - patients at risk of retinal pigment epithelial tear - poorly controlled glaucoma - recent history of myocardial infarction - recent history of stroke - recent history of transient ischaemic attack

CAUTIONS, FURTHER INFORMATION Aflibercept is given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections — patients should be advised to report any signs of infection immediately.

INTERACTIONS Appendix 1: aflibercept

SIDE-EFFECTS
- Common or very common Cataract - eye discomfort - eye disorders - eye inflammation - haemorrhage - retinal pigment epithelial tear - vision disorders
- Uncommon Lens opacity

CONCEPTION AND CONTRACEPTION Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC FEEDING Manufacturer advises caution in severe impairment (no information available).

MONITORING REQUIREMENTS Monitor intra-ocular pressure following injection.

DIRECTIONS FOR ADMINISTRATION For further information on administration, consult product literature.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions
- Aflibercept solution for injection for treating wet age-related macular degeneration (July 2013) NICE TA294
  - Aflibercept solution for injection is recommended as an option for treating wet age-related macular degeneration only if:
    - it is used in accordance with the recommendations for ranibizumab in NICE TA 155 and
    - the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme.
  - www.nice.org.uk/guidance/TA294
- Aflibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014) NICE TA305
  - Aflibercept solution for injection is recommended as an option for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion only if the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme.
  - www.nice.org.uk/guidance/TA305
- Aflibercept for treating diabetic macular oedema (July 2015) NICE TA346
  - Aflibercept solution for injection is recommended as an option for treating visual impairment caused by diabetic macular oedema only if:
    - the eye has a central retinal thickness of 400 micrometres or more at the start of treatment and
    - the manufacturer provides aflibercept with the discount agreed in the patient access scheme.
  - www.nice.org.uk/guidance/TA346
- Aflibercept for treating visual impairment caused by macular oedema after branch retinal vein occlusion (September 2016) NICE TA409
  - Aflibercept is recommended, within its marketing authorisation, as an option for treating visual impairment in adults caused by macular oedema after branch retinal vein occlusion, only if the manufacturer provides aflibercept with the discount agreed in the patient access scheme.
  - www.nice.org.uk/guidance/TA409
- Aflibercept for treating choroidal neovascularisation (November 2017) NICE TA486
  - Aflibercept is recommended, within its marketing authorisation, as an option for treating visual impairment because of myopic choroidal neovascularisation in adults, only if the manufacturer provides aflibercept with the discount agreed in the patient access scheme.
  - If patients and their clinicians consider both aflibercept and ranibizumab to be suitable treatments, the least costly should be used, taking into account anticipated administration costs, dosage and price per dose.
  - www.nice.org.uk/guidance/TA486

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (October 2016) that aflibercept (Eylea®) is accepted for use within
**Retinal disorders**

Ranibizumab 24-Aug-2018

**Indications and Dose**

- **Neovascular (wet) age-related macular degeneration (specialist use only)**
- **Diabetic macular oedema (specialist use only)**
- **Macular oedema secondary to retinal vein occlusion (specialist use only)**
- **Choroidal neovascularisation (specialist use only)**
  - **By Intravitreal Injection**
    - Adult: Initially 500 micrograms once a month, to be administered into the affected eye, until maximum visual acuity is achieved or there are no signs of disease activity, for continued treatment and subsequent dose intervals—consult product literature, discontinue treatment if no improvement in visual and anatomic outcomes
  - **Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photoacoagulation (specialist use only)**
    - **By Intravitreal Injection**
      - Adult: 500 micrograms, to be administered at least 30 minutes after laser photoacoagulation

**Contraindications**

- Ocular or periocular infection—severe intraocular inflammation—signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion

**Cautions**

- Active systemic infection—diabetic macular oedema due to type 1 diabetes (limited information available)—diabetic patients with HbA1c over 12%—history of stroke—history of transient ischemic attack—patients at risk of retinal pigment epithelial tear—previous intravitreal injections—proliferative diabetic retinopathy—retinal detachment or macular hole (discontinue treatment if rhegmatogenous retinal detachment or stage 5 or 4 macular holes develop)—uncontrolled hypertension

**Caution, Further Information**

Ranibizumab is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

**Interactions**

- **Appendix 1: ranibizumab**

**Side-Effects**

- **Common or very common**
  - Anaemia
  - Anxiety
  - Arthralgia
  - Cataract
  - Cough
  - Dry eye
  - Eye discomfort
  - Eye disorders
  - Eye inflammation
  - Haemorrhage
  - Headache
  - Hypersensitivity
  - Increased risk of infection—lens opacity
  - Nausea
  - Retinal pigment epithelial tear
  - Vision disorders

- **Uncommon**
  - Corneal deposits

- **Frequency not known**
  - Arterial thromboembolism

**Conception and Contraception**

Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.

**Pregnancy**

Manufacturer advises avoid unless potential benefit outweighs risk.

**Breast Feeding**

Manufacturer advises avoid—no information available.

**Monitoring Requirements**

- Manufacturer advises monitor intraocular pressure, perfusion of the optic nerve head, and for signs of ocular infection following injection.
- Manufacturer advises monitor visual acuity.

**Directions for Administration**

For further information on administration, consult product literature.

**National Funding/Access Decisions**

**NICE decisions**

- Ranibizumab for treating choroidal neovascularisation associated with pathological myopia (November 2013) NICE TA298
- Ranibizumab is recommended as an option for treating visual impairment due to choroidal neovascularisation secondary to pathological myopia when the manufacturer provides ranibizumab with the discount agreed in the patient access scheme.
  - www.nice.org.uk/guidance/ta298
- Ranibizumab for the treating visual impairment caused by macular oedema secondary to retinal vein occlusion (May 2013) NICE TA283
- Ranibizumab is recommended as an option for treating visual impairment caused by macular oedema:
  - following central retinal vein occlusion or
  - following branch retinal vein occlusion only if treatment with laser photoacoagulation is not beneficial, or when laser photoacoagulation is not suitable because of the extent of macular haemorrhage and
  - only if the manufacturer provides ranibizumab with the discount agreed in the patient access scheme revised in the context of NICE technology appraisal guidance 274. Patients currently receiving ranibizumab whose disease does not meet the criteria listed above should be able to continue treatment until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/guidance/ta283
- Ranibizumab for treating diabetic macular oedema (February 2013) NICE TA274
- Ranibizumab is recommended as an option for the treatment of visual impairment due to diabetic macular oedema only if:
  - the eye has a central retinal thickness of 400 micrometres or more at the start of treatment and
  - the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).
  - Patients currently receiving ranibizumab for treating visual impairment due to diabetic macular oedema whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/guidance/ta274
- Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012) NICE TA155
- Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:
  - the best corrected visual acuity is between 6/12 and 6/96;
  - there is no permanent structural damage to the central fovea;
  - the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
  - there is evidence of recent presumed disease progression;
MACULAR ODEMA

1191

PHOTOSENSITISERS

Verteporfin

06-Feb-2019

- **DRUG ACTION** Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives.

- **INDICATIONS AND DOSE** Photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (specialist use only)
  - By intravenous infusion
  - Adult: 6 mg/m², dose to be given over 10 minutes

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058
- **CAUTIONS** Avoid extravasation - biliary obstruction - photosensitivity
- **INTERACTIONS** → Appendix 1: verteporfin
- **SIDE-EFFECTS**
  - Common or very common
    - Asthenia - dizziness - dyspnoea - headache - hypercholesterolaemia - hypersensitivity - infusion related chest pain - infusion related reaction - nausea - photosensitivity reaction - syncope - vision disorders
  - Uncommon
    - Eye inflammation - fever - haemorrhage - hyperaesthesia - hypertension - pain - retinal detachment - skin reactions
  - Rare or very rare
    - Malaise - retinal ischaemia
  - Frequency not known
    - Myocardial infarction - retinal pigment epithelial tear
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (teratogenic in animal studies).
- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding for 48 hours after administration.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment and avoid in severe impairment (no information available).
- **DIRECTIONS FOR ADMINISTRATION** For information on administration and light activation, consult product literature.
  - For intravenous infusion (Visudyne®), give intermittently in Glucose 5%; reconstitute each 15 mg with 7 ml water for injections to produce a 2 mg/mL solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion.
- **PATIENT AND CARER ADVICE** Photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for infusion**
  - Exipients: May contain Butylated hydroxytoluene
  - Visudyne® (Novartis Pharmaceuticals UK Ltd)
    - Verteoporfin 15 mg Visudyne 15 mg powder for solution for infusion vials | 1 vial (PBN) £850.00 (Hospital only)

6.2 Macular oedema

Other drugs used for Macular oedema

- Afibercept, p. 1008
- Dexamethasone, p. 675
- Ranibizumab, p. 1190

www.getintopharma.com
Fluocinolone acetonide

**INDICATIONS AND DOSE**

Treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies (specialist use only)

- **BY INTRAVITREAL INJECTION**
  - Adult: 190 micrograms, to be administered into the affected eye

**CONTRA-INDICATIONS**

- Active or suspected ocular infection
- Raised baseline intra-ocular pressure
- Concurrent vitreous haemorrhage or detachment within 2–7 days of the procedure
- Monitor intra-ocular pressure at least every 1–2 months following the procedure

**SIDE-EFFECTS**

- Common or very common: Cataract, eye discomfort, glaucoma, haemorrhage, vision blurred
- Uncommon: Eye disorders, headache
- Frequency not known: Thromboembolism

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**CAUTIONS**

- Raised baseline intra-ocular pressure
- Concurrent administration to both eyes not recommended.

**SIDE-EFFECTS, FURTHER INFORMATION**

The metabolites of idebenone may cause red-brown discolouration of the urine. This effect is harmless, but the manufacturer advises caution as it may mask colour changes due to other causes (e.g., renal or blood disorders).

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution (no information available).

**RENAL IMPAIRMENT**

Manufacturer advises use with caution—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Fluocinolone acetone intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy (November 2013) NICE TA301

- Fluocinolone acetone intravitreal implant (Iluvien) is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:
  - the implant is to be used in an eye with an intra-ocular (pseudophakic lens), and
  - the manufacturer provides fluocinolone acetone intravitreal implant with the discount agreed in the patient access scheme.

Scottish Medicines Consortium (SMC) decisions

SMC No. 864/13

The Scottish Medicines Consortium has advised (February 2014) that fluocinolone acetone intravitreal implant (Iluvien) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), and retreatment would take place only if the patient had previously responded to treatment with fluocinolone acetone and subsequently best corrected visual acuity had deteriorated to less than 20/32. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Implant**

- **Iluvien** (Alimera Sciences Ltd)
  - Fluocinolone acetone 190 microgram ILUVIEN 190 microgram intravitreal implant in applicator | 1 device | £5,500.00

### 6.3 Optic neuropathy

**DRUGS FOR METABOLIC DISORDERS**

**ANTIOXIDANTS**

**Idebenone**

**DRUG ACTION**

Idebenone is a nootropic and antioxidant that is thought to act by restoring cellular ATP generation, thereby reactivating retinal ganglion cells.

**INDICATIONS AND DOSE**

Leber’s Hereditary Optic Neuropathy (initiated by a specialist)

- **BY MOUTH**
  - Adult: 300 mg 3 times a day

**SIDE-EFFECTS**

- Common or very common: Cough, diarrheoa, increased risk of infection, pain
- Frequency not known: Agranulocytosis, anaemia, anxiety, appetite decreased, asthenia, delirium, dizziness, dyspepsia, hallucination, headache, hepatitis, leucopenia, malaise, movement disorders, nausea, neutropenia, poriomania, seizure, skin reactions, stupor, thrombocytopenia, urine discoloration, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

The metabolites of idebenone may cause red-brown discolouration of the urine. This effect is harmless, but the manufacturer advises caution as it may mask colour changes due to other causes (e.g., renal or blood disorders).

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution (no information available).

**RENAL IMPAIRMENT**

Manufacturer advises use with caution—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (May 2017) that idebenone (Raxone) is accepted for restricted use within NHS Scotland for the treatment of visual impairment in patients with Leber’s Hereditary Optic Neuropathy (LHON) who are not yet blind i.e., they do not meet the UK criteria to be registered as severely sight impaired. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

6.4 Vitreomacular traction

RECOMBINANT PROTEOLYTIC ENZYMES

Ocriplasmin

**INDICATIONS AND DOSE**
Treatment of vitreomacular traction, including when associated with a macular hole of diameter less than or equal to 400 microns (specialist use only)

- **BY INTRAVITREAL INJECTION**
- Adult: 125 micrograms for 1 dose, to be administered into the affected eye, concurrent administration to both eyes is not recommended

**CONTRA-INDICATIONS**
- Active or suspected ocular or periorbital infection
- Aphakia
- Exudative age-related macular degeneration
- High myopia
- History of rhegmatogenous retinal detachment
- Ischaemic retinopathies
- Large diameter macular hole (> 400 microns)
- Lens zonule instability
- Proliferative diabetic retinopathy
- Recent intra-ocular injection (including laser therapy)
- Recent ocular surgery
- Retinal vein occlusions
- Vitreous haemorrhage

**CAUTIONS**
- History of uveitis (including severe active inflammation)
- Non-proliferative diabetic retinopathy
- Significant eye trauma

**SIDE-EFFECTS**
- Common or very common: Dry eye, eye discomfort, eye disorders, eye inflammation, haemorrhage, retinal pigment epitheliopathy, vision disorders

**PREGNANCY**
- Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING**
- Manufacturer advises use only if potential benefit outweighs risk—no information available.

**MONITORING REQUIREMENTS**
- Monitor intra-ocular pressure, visual acuity, and for signs of intra-ocular inflammation or infection following injection.

**DIRECTIONS FOR ADMINISTRATION**
- For further information on administration, consult product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Ocriplasmin for treating vitreomacular traction (October 2013) NICE TA297
  - Ocriplasmin is recommended as an option for treating vitreomacular traction in adults, only if:
    - An epiretinal membrane is not present and
    - They have a stage II full-thickness macular hole with a diameter of 400 microns or less and/or
    - They have severe symptoms.
  - www.nice.org.uk/TA297

**Scottish Medicines Consortium (SMC) decisions**
- The Scottish Medicines Consortium has advised (July 2014) that ocriplasmin (Jetrea®) is accepted for restricted use within NHS Scotland for the treatment of patients with vitreomacular traction plus macular hole, regardless of whether they have epiretinal membrane formation, and in patients with vitreomacular traction alone (no epiretinal membrane and no macular hole).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Jetrea (Oxurion N.V.)
  - Ocriplasmin 1.25 mg per 1 ml
  - Jetrea 0.375mg/0.3ml solution for injection vials | 1 vial (£15.59) £2,500.00 (Hospital only)

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical aminoglycosides or polymyxins in patients with a perforated tympanic membrane or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic supplicative otitis media and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;

- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (EarCalm® spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol or ibuprofen, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin is the drug of choice; ciprofloxacin may be needed in pseudomonal infections which may occur if the patient has diabetes or is immunocompromised.

The skin of the pinna adjacent to the ear canal is often affected by eczema. A topical corticosteroid cream or ointment is then required, but prolonged use should be avoided.

Otitis media

Acute otitis media

Acute otitis media is a self-limiting condition that mainly affects children. It is characterised by inflammation in the middle ear associated with effusion and accompanied by the rapid onset of signs and symptoms of an ear infection. The infection can be caused by viruses or bacteria; often both are present simultaneously.

Children with acute otitis media usually present with symptoms such as ear pain, rubbing of the ear, fever, irritability, crying, poor feeding, restlessness at night, cough, or rhinorrhea. Symptoms usually resolve within 3 to 7 days without antibacterial drugs. The use of antibacterials generally does not prevent common complications of acute otitis media such as short-term hearing loss, perforated eardrum, or recurrent infection. Acute complications such as mastoiditis, meningitis, intracranial abscess, sinus thrombosis, and facial nerve paralysis, are rare.

Children and their carers should be given advice about the usual duration of acute otitis media, self-care of...

See also: Acute otitis media

www.getintopharma.com
symptoms such as pain and fever with paracetamol or ibuprofen p. 1141, and when to seek medical help. In children aged 3 years and over who do not have a perforated eardrum, pain can be relieved with anaesthetic ear drops in addition to oral analgesics [unlicensed use]. Children and their carers should be reassured that antibacterial drugs are usually not required.

An immediate antibacterial drug should be given if the child is systemically very unwell, has signs or symptoms of a more serious illness, or is at high risk of complications such as significant heart, lung, renal, liver or neuromuscular disease, immunosuppression, cystic fibrosis, or young children who were born prematurely. An immediate antibacterial drug can also be considered if otorrhoea is present, or in children under 2 years of age with bilateral otitis media. See Antibacterial therapy for otitis media in Ear infections, antibacterial therapy p. 511.

Children with acute otitis media associated with a severe systemic infection or acute complications should be referred to hospital. 

**Otitis media with effusion**

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibacterials are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

**Chronic otitis media**

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution p. 1199; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin p. 548 (or erythromycin p. 539 if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin p. 1196 or ofloxacin eye drops p. 1173 used in the ear [unlicensed use] or ear drops [both unlicensed; available from ‘special-order’ manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing aminoglycosides or polymyxins [unlicensed indications] cautiously in patients with chronic suppurative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiology should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

**Removal of ear wax**

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax can be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops p. 1200 are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 1200 or urea hydrogen peroxide p. 1200 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to cooperate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

1 Otitis externa

**ANTIBACTERIALS → AMINOGLYCOSIDES**

**Framycetin sulfate**

- **INDICATIONS AND DOSE**
  - **Bacterial infection in otitis externa**
    - **TO THE EAR**
    - Adult: (consult product literature)

- **CONTRA-INDICATIONS**
  - Perforated tympanic membrane

- **CAUTIONS**
  - Avoid prolonged use

- **SIDE-EFFECTS**
  - Local reaction

- **MEDICINAL FORMS**
  - No licensed medicines listed.

Combinations available: Dexamethasone with framycetin sulfate and gramicidin, p. 1164

**Gentamicin**

- **INDICATIONS AND DOSE**
  - **Bacterial infection in otitis externa**
    - **TO THE EAR**
    - Child: Apply 2–3 drops 4–5 times a day, (including a dose at bedtime)
    - Adult: Apply 2–3 drops 4–5 times a day, (including a dose at bedtime)

- **CONTRA-INDICATIONS**
  - Patent grommet (although may be used by specialists, see Ear p. 1194) • perforated tympanic membrane (although may be used by specialists, see Ear p. 1194)

- **CAUTIONS**
  - Avoid prolonged use

- **INTERACTIONS → Appendix 1: aminoglycosides**
Otitis externa

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ear/drops solution**

EXCIPIENTS: May contain Benzalkonium chloride

- **Gentamicin (Non-proprietary)**
- **Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml** Gentamicin 0.3% ear/drops | 10 ml | £2.63 DT + £2.47

**Gentamicin with hydrocortisone**

21-Dec-2017

**INDICATIONS AND DOSE**

Eczematous inflammation in otitis externa

- TO THE EAR
- Child: Apply 2–4 drops 4–5 times a day, (including a dose at bedtime)
- Adult: Apply 2–4 drops 4–5 times a day, (including a dose at bedtime)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 1194) perforated tympanic membrane (although may be used by specialists, see Ear p. 1194)
- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Local reaction
- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Gentamicin and hydrocortisone ear drops for inflammatory ear infections

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ear drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Gentamicin with hydrocortisone (Non-proprietary)**
- **Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml, Hydrocortisone acetate 10 mg per 1 ml** Gentamicin 0.3% / Hydrocortisone acetate 1% ear drops | 10 ml | £29.86 DT + £29.86

**Neomycin sulfate**

**INDICATIONS AND DOSE**

Bacterial infection in otitis externa

- TO THE EAR
- Child: (consult product literature)
- Adult: (consult product literature)

**CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 1194) perforated tympanic membrane (although may be used by specialists, see Ear p. 1194)

- **CAUTIONS** Avoid prolonged use
- **INTERACTIONS** → Appendix 1: neomycin
- **SIDE-EFFECTS** Local reaction

**MEDICINAL FORMS** No licensed medicines listed.

Combinations available: *Betamethasone with neomycin, p. 1164* - *Dexamethasone with glacial acetic acid and neomycin sulfate, p. 1199* - *Hydrocortisone with neomycin and polymyxin B sulfate, p. 1199*

**ANTIBACTERIALS**

**Ciprofloxacin (as Ciprofloxacin hydrochloride) 2 mg per 1 ml** Ciprofloxacin 0.25% unit dose | 15 unit dose (PFS) £6.01 DT + £1.01

Combinations available: *Ciprofloxacin with dexamethasone, p. 1198* - *Ciprofloxacin with fluocinolone acetonide, p. 1198*

**Chloramphenicol**

**DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

**INDICATIONS AND DOSE**

Bacterial infection in otitis externa

- TO THE EAR
- Child: Apply 2–3 drops 2–3 times a day
- Adult: Apply 2–3 drops 2–3 times a day

- **CAUTIONS** Avoid prolonged use
- **INTERACTIONS** → Appendix 1: chloramphenicol
- **SIDE-EFFECTS** Blood disorder - bone marrow depression
**Flumetasone pivalate with clioquinol**

**INDICATIONS AND DOSE**
- Eczematous inflammation in otitis externa | Mild bacterial or fungal infections in otitis externa
  - TO THE EAR
  - Child: 2–3 drops twice daily for 7–10 days, to be instilled into the ear
  - Adult: 2–3 drops twice daily for 7–10 days, to be instilled into the ear

**IMPORTANT SAFETY INFORMATION**
- MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)
  - See Corticosteroids, general use p. 670.

**CONTRA-INDICATIONS**
- Iodine sensitivity
- CAUTIONS: Avoid prolonged use, manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)
- SIDE-EFFECTS: Paraesthesia | skin reactions

**PATIENT AND CARER ADVICE**
- Clioquinol stains skin and clothing

**Prednisolone**

**DRUG ACTION**
- Prednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

**INDICATIONS AND DOSE**
- Eczematous inflammation in otitis externa
  - TO THE EAR
  - Child: Apply 1–2 drops every 2–3 hours, frequency to be reduced when relief obtained
  - Adult: Apply 1–2 drops every 2–3 hours, frequency to be reduced when relief obtained

**CONTRA-INDICATIONS**
- Avoid alone in the presence of untreated infection (combine with suitable anti-infective)
- CAUTIONS: Avoid prolonged use
- INTERACTIONS → Appendix 1: corticosteroids
1198 Otitis externa

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ear drops

Ear/eye drops solution
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
Betnesol-N (RPH Pharmaceuticals AB)
Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml
Betamethasone ear/eye drops | 10 ml £2.39 DT + £2.39

CORTICOSTEROIDS  COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1197, neomycin sulfate p. 1196.

INDICATIONS AND DOSE

ECZEMATOUS INFLAMMATION IN OTITIS EXTERNA

TO THE EAR USING EAR DROPS

Adult: Apply 2–3 drops 3–4 times a day
Child: Apply 2–3 drops 3–4 times a day

CONTRA-INDICATIONS  Patent grommet (although may be used by specialists, see Ear p. 1194) • perforated tympanic membrane (although may be used by specialists, see Ear p. 1194)

CAUTIONS  Avoid prolonged use

INTERACTIONS  → Appendix 1: corticosteroids • neomycin

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Betnesol-N (RPH Pharmaceuticals AB)
Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml
Betamethasone ear/eye/nose drops | 10 ml £2.39 DT + £2.39

Ciprofloxacin with dexamethasone

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 675, ciprofloxacin p. 1196.

INDICATIONS AND DOSE

ACUTE OTITIS MEDIA IN PATIENTS WITH TYPANOSTOMY TUBES

TO THE EAR

Adult: Apply 4 drops twice daily for 7 days
Child: Apply 4 drops twice daily for 7 days

CONTRA-INDICATIONS  Fungal ear infections • viral ear infections

CAUTIONS  Avoid prolonged use

INTERACTIONS  → Appendix 1: corticosteroids • quinolones

SIDE-EFFECTS

COMMON OR VERY COMMON  Ear discomfort

UNCOMMON  Ear infection fungal • flushing • irritability • malaise • otorrhoea • paraesthesia • skin reactions • taste altered • vomiting

RARE OR VERY RARE  Dizziness • headache • hearing loss • tinnitus

SIDE-EFFECTS, FURTHER INFORMATION  Manufacturer advises further evaluation of underlying conditions if otorrhoea persists after a full course, or if at least two episodes of otorrhoea occur within 6 months.

PREGNANCY  Manufacturer advises use only if potential benefit outweighs risk—no information available.

Breast Feeding  Manufacturer advises caution—no information available.

Patient and Carer Advice  Manufacturer advises counselling on administration.

Ciprofloxacin with fluocinolone acetonide

The properties listed below are those particular to the combination only. For the properties of the components please consider, ciprofloxacin p. 1196.

INDICATIONS AND DOSE

ACUTE OTITIS EXTERNA | ACUTE OTITIS MEDIA IN PATIENTS WITH TYPANOSTOMY TUBES

TO THE EAR

Adult: Apply 0.25 mL twice daily for 7 days

DOSE EQUIVALENCE AND CONVERSION

Each 0.25 mL dose contains 0.75 mg ciprofloxacin and 0.0625 mg of fluocinolone acetonide.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.
Dexamethasone with framycetin sulfate and gramicidin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 675, framycetin sulfate p. 1195.

- **INDICATIONS AND DOSE**
  - **Eczematous inflammation in otitis externa**
    - TO THE EAR
    - Child: 2–3 drops 3–4 times a day
    - Adult: 2–3 drops 3–4 times a day

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Ear drops**
  - EXCipients: May contain Polysorbates
    - Cetraxal Plus (Aspire Pharma Ltd)

Nose

Rhinitis

Rhinitis is often self-limiting. There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis. Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia. Sodium chloride 0.9% solution p. 1040 may be used as a douche or ‘sniff’ following endonasal surgery.

Drugs used in nasal allergy

Mild allergic rhinitis is controlled by antihistamines (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 277) or topical nasal corticosteroids; systemic nasal decongestants are of doubtful value. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal corticosteroids; sodium cromoglicate p. 1208 is an alternative, but may be less effective. The topical antihistamine azelastine hydrochloride p. 1204 is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

Montelukast p. 269 is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide can reduce watery rhinorhoea.

Very disabling symptoms occasionally justify the use of systemic corticosteroids for short periods, for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

Corticosteroids

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Nasal polyps

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the ‘head down’ position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

Pregnancy

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 1205, budesonide p. 1206, fluticasone p. 1206, or sodium cromoglicate may be considered.

Topical nasal decongestants

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of warm moist air may be useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (see under Aromatic inhalations, cough preparations and systemic nasal decongestants p. 286).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine hydrochloride p. 1205 nasal drops is the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline hydrochloride p. 1203 are more likely to cause a rebound effect.

Non-allergic watery rhinorhoea often responds well to treatment with the antimucuscarinic ipratropium bromide p. 1205.

Nasal preparations for infection

There is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis; see elimination of nasal staphylococci.

Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (Nasent®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 1204 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant Staphylococcus aureus (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.
1 Nasal congestion

SYMPATHOMIMETICS > VASOCONSTRICTOR

Ephedrine hydrochloride

- **INDICATIONS AND DOSE**
  - Nasal congestion | Sinusitis affecting the maxillary antrum
  - **BY INTRanasAL ADMINISTRATION**
    - Child 12-17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops
    - Adult: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril

- **CAUTIONS**
  - Avoid excessive or prolonged use
  - Cardiovascular disease (in children) · diabetes mellitus · elderly · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (risk of acute urinary retention) (in adults)
- **INTERACTIONS**
  - Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
  - Common or very common
    - Anxiety · headache · insomnia · nausea
  - Frequency not known
    - Appetite decreased · arrhythmia · circulation impaired · dermatitis · dizziness · drug dependence · dry mouth · dyspnoea · hallucination · hyperglycaemia · hyperhidrosis · hypersalivation · hypertension · hypokalaemia · hypotension · irritability · muscle weakness · mydriasis · pain · palpitations · paranoia · piloerection · rebound congestion · syncope · thirst · tremor · urinary disorders · vasoconstriction · vasodilatation · vomiting
  - **PREGNANCY**
    - Manufacturer advises avoid.
  - **BREAST FEEDING**
    - May suppress lactation; avoid if lactation
  - **HEPATIC IMPAIRMENT**
    - Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.
  - **RENAI IMPAIRMENT**
    - Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.
  - **LESS SUITABLE FOR PRESCRIBING**
    - Pseudoephedrine hydrochloride is less suitable for prescribing.
  - **EXCEPTIONS TO LEGAL CATEGORY**
    - Galpseud® and Sudafed® can be sold to the public provided no more than 180 mg of pseudoephedrine base (or salts) are supplied, and ephedrine base (or salts) are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

- **MEDICINE SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Ephedrine nasal drops may be prescribed.
  - **EXCEPTIONS TO LEGAL CATEGORY**
    - Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: nasal drops
    - **Nasal drops**
      - Ephedrine hydrochloride 10 mg per 1 ml
      - Ephedrine hydrochloride 5 mg per 1 ml
      - Ephedrine hydrochloride 0.5% nasal drops

---

**Ephedrine hydrochloride 10 mg per 1 ml**

- 10 ml  £1.90–£1.94 DT = £1.94

**Ephedrine hydrochloride 5 mg per 1 ml**

- Ephedrine 1% nasal drops

**Pseudoephedrine hydrochloride**

- **INDICATIONS AND DOSE**
  - Congestion of mucous membranes of upper respiratory tract
  - **BY MOUTH**
    - Child 6-11 years: 30 mg 3–4 times a day
    - Child 12-17 years: 60 mg 3–4 times a day
    - Adult: 60 mg 3–4 times a day

- **IMPORTANT SAFETY INFORMATION**
    - Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

- **CAUTIONS**
  - Diabetes · heart disease · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (in adults) · raised intra-ocular pressure (in children) · susceptibility to angle-closure glaucoma (in adults)

- **INTERACTIONS**
  - Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS**
  - Angle closure glaucoma · anxiety · arrhythmias · circulation impaired · dry mouth · hallucination · headache · hypertension · irritability · nausea · palpitations · psychotonic disorder · skin reactions · sleep disorders · tremor · urinary retention · vomiting

- **PREGNANCY**
  - Defective closure of the abdominal wall (gastrochisis) reported very rarely in newborns after first trimester exposure.

- **BREAST FEEDING**
  - May suppress lactation; avoid if lactation not well established or if milk production insufficient.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in severe impairment.

- **RENAI IMPAIRMENT**
  - Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.

- **LESS SUITABLE FOR PRESCRIBING**
  - Pseudoephedrine hydrochloride is less suitable for prescribing.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - Galpseud® and Sudafed® can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

- **MEDICINE SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Ephedrine nasal drops may be prescribed.
  - **EXCEPTIONS TO LEGAL CATEGORY**
    - Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**ORAL SOLUTION**

- **EXCIPIENTS:** May contain Alcohol
  - Galpseud® (Thornton & Ross Ltd)
    - Pseudoephedrine hydrochloride 6 mg per 1 ml
      - 30mg/5ml linctus sugar-free | 2000 ml  £14.00
    - Tablet
      - Galpseud® (Thornton & Ross Ltd)
        - Pseudoephedrine hydrochloride 60 mg
          - Galpseud 60mg tablets | 24 tablet  £2.25 | 100 tablet  £5.42 DT = £5.42

www.getintopharma.com
2 Nasal infection

Sinusitis (acute)

Description of condition

Sinusitis is an inflammation of the mucosal lining of the paranasal sinuses. Acute sinusitis (rhinosinusitis) is a self-limiting condition usually triggered by a viral upper-respiratory tract infection such as the 'common cold'. Occasionally, acute sinusitis may become complicated by a bacterial infection (see Antibacterial therapy for acute sinusitis in Nose infections, antibacterial therapy p. 513).

Patients with acute sinusitis usually present with symptoms of nasal blockage or congestion, nasal discharge, dental or facial pain or pressure, and reduction or loss of the sense of smell. Symptoms usually improve within 2 to 3 weeks without requiring treatment. Rarely, acute sinusitis may lead to orbital, intracranial or skeletal complications (e.g. periorbital cellulitis, symptoms or signs of meningitis).

Aims of treatment

Treatment is aimed at managing symptoms including pain, fever, and nasal congestion as well as treatment of bacterial infection if present.

Treatment

Patients presenting with symptoms for around 10 days or less, should be given advice about the usual duration of acute sinusitis, self-care of pain or fever with paracetamol p. 444 or ibuprofen p. 1141, and when to seek medical help. Patients should be reassured that antibiotics are usually not required. Some patients may try nasal saline or nasal decongestants, however there is limited evidence to show they help to relieve nasal congestion.

Patients presenting with symptoms for around 10 days or more with no improvement could be considered for treatment with a high-dose nasal corticosteroid, such as mometasone furoate p. 1207 [unlicensed use] or fluticasone p. 1206 [unlicensed use] for 14 days. Supply of a back-up antibiotic prescription could be considered and used if symptoms do not improve within 7 days, or if they worsen rapidly or significantly.

If the patient is systematically very unwell, has signs and symptoms of a more serious illness or condition, or is at high-risk of complications, an immediate antibiotic should be given. (see Antibacterial therapy for acute sinusitis in Nose infections, antibacterial therapy p. 513).

Patients presenting with symptoms of acute sinusitis associated with a severe systemic infection or with orbital or intracranial complications should be referred to hospital.
**ANTIBACTERIALS > AMINOGLYCOSIDES**

**Chlorhexidine with neomycin**

**INDICATIONS AND DOSE**
- **Eradication of nasal carriage of staphylococci**
  - **BY INTRANASAL ADMINISTRATION**
  - Child: Apply 2–3 times a day for 5 days;
  - Adult: Apply 2–3 times a day after treatment to confirm eradication.
  - Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril
- **Preventing nasal carriage of staphylococci**
  - **BY INTRANASAL ADMINISTRATION**
  - Child: Apply twice daily
  - Adult: Apply twice daily

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **EXCIPIENTS:** May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol).
    - **Naseptin** (Alliance Pharmaceuticals Ltd)
      - Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Naseptin nasal cream | 15 gram | £1.99 DT = £1.29

**Mupirocin**

**INDICATIONS AND DOSE**
- **BACTROBAN NASAL®**
  - **FOR ERADICATION OF NASAL CARRIAGE OF STAPHYLOCOCCUS AUREUS (MRSA)**
    - **BY INTRANASAL ADMINISTRATION**
    - Child: Apply 2–3 times a day for 10 days
    - Adult: Apply 4 times a day for 10 days

**SIDE-EFFECTS**
- Common or very common Skin reactions
- Uncommon Nasal mucosal disorder
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk — no information available.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Nasal ointment**
    - **Bactroban** (GlaxoSmithKline UK Ltd)
      - Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% nasal ointment | 3 gram | £4.24 DT = £4.24

**CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES**

**Betamethasone with neomycin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 674, neomycin sulfate p. 520.

**INDICATIONS AND DOSE**
- **NASAL INFECTION**
  - **BY INTRANASAL ADMINISTRATION USING NASAL DROPS**
    - Child: Apply 2–3 drops 2–3 times a day, to be applied into each nostril
    - Adult: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

**INTERACTIONS** → Appendix 1: corticosteroids - neomycin

**LESS SUITABLE FOR PRESCRIBING**
- Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Nasal drops**
    - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
    - **Betnesol-N** (RPH Pharmaceuticals AB)
      - Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N nasal drops | 10 ml | £2.39 DT = £2.39

3 **Nasal inflammation, nasal polyps and rhinitis**

**Other drugs used for Nasal inflammation, nasal polyps and rhinitis**
- Deslurateadine, p. 280 - Fexofenadine hydrochloride, p. 280 - Ketotifen, p. 286 - Rupatadine, p. 282

**ANTIHISTAMINES > NON-SEDATING**

**Azelastine hydrochloride**

**INDICATIONS AND DOSE**
- **ALLERGIC RHINITIS**
  - **BY INTRANASAL ADMINISTRATION**
    - Child 6–17 years: 1 spray twice daily, to be administered into each nostril
    - Adult: 1 spray twice daily, to be administered into each nostril

**DOSE EQUIVALENCE AND CONVERSION**
- 1 spray equivalent to 140 micrograms.

**INTERACTIONS** → Appendix 1: antihistamines, non-sedating

**SIDE-EFFECTS**
- Common or very common Taste bitter (if applied incorrectly)
- Uncommon Epistaxis - nasal complaints

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Spray**
    - **Rhinolast** (Meda Pharmaceuticals Ltd)
      - Azelastine hydrochloride 140 microgram per 1 actuation Rhinolast 140micrograms/dose nasal spray | 22 ml | £10.50 DT = £10.50

Combinations available: **Fluticasone with azelastine**, p. 1207
ANTIMUSCARINICS

Ipratropium bromide

**INDICATIONS AND DOSE**

- Rhinorrhoea associated with allergic and non-allergic rhinitis
  - **BY INTRANASAL ADMINISTRATION**
    - Child 12-17 years: 2 sprays 2–3 times a day, dose to be sprayed into each nostril
    - Adult: 2 sprays 2–3 times a day, dose to be sprayed into each nostril

**DOSE EQUIVALENCE AND CONVERSION**

- 1 metered spray of nasal spray = 21 micrograms.

**SIDE-EFFECTS**

- **Common or very common**
  - Epistaxis
  - Gastrointestinal motility disorder
  - Headache
  - Nasal complaints
  - Throat complaints
- **Uncommon**
  - Corneal oedema
  - Eye disorders
  - Eye pain
  - Nausea
  - Respiratory disorders
  - Stomatitis
  - Vision disorders
- **Rare or very rare**
  - Palpitations

**ALLERGY AND CROSS-SENSITIVITY**

- Contra-indicated in patients with hypersensitivity to atropine or its derivatives.

**PREGNANCY**

- Manufacturer advises only use if potential benefit outweighs the risk.

**BREAST FEEDING**

- No information available—manufacturer advises only use if potential benefit outweighs the risk.

**PATIENT AND CARER ADVICE**

- Patients or carers should be counselled on appropriate administration technique and warned against accidental contact with the eye (due to risk of ocular complications).

**Driving and skilled tasks**

- Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and vision disorders.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **Excipients:** May contain Benzalkonium chloride, diisodium edetate
- **Rinotec** (Sanofi)
  - Ipratropium bromide 21 microgram per 1 dose
  - Rinotec 21 micrograms/dose nasal spray | 180 dose | £6.36 DT = £6.54

CORTICOSTEROIDS

**Corticosteroids (intransal)**

**IMPORTANT SAFETY INFORMATION**

- **MHRA/CHM ADVICE:** CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHIARIOTREINOPIATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

- Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

**INDICATIONS AND DOSE**

- **BY INTRANASAL ADMINISTRATION**
  - Child 12–17 years: 200 micrograms per day
  - Adult: 400 micrograms per day

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Common or very common**
  - Altered smell sensation
  - Epistaxis
  - Headache
  - Nasal complaints
  - Taste altered
  - Throat irritation
- **Rare or very rare**
  - Glaucoma
  - Nasal septum perforation
  - Vision blurred

**INTERACTIONS**

- In children

**MONITORING REQUIREMENTS**

- Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids.

**INTERACTIONS**

- **Important information**

**EXCEPTIONS TO LEGAL CATEGORY**

- In adults

**EXCEPTIONS TO LEGAL CATEGORY**

- Preparations of beclometasone dipropionate can be sold to the public for nasal administration as a nasal spray.

**INDICATIONS AND DOSE**

- **BY INTRANASAL ADMINISTRATION**
  - Child 6–17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day
  - Adult: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

**SIDE-EFFECTS**

- **Common or very common**
  - Altered smell sensation
  - Epistaxis
  - Headache
  - Nasal complaints
  - Taste altered
  - Throat irritation
- **Rare or very rare**
  - Glaucoma
  - Nasal septum perforation
  - Vision blurred

**INTERACTIONS**

- **Important information**

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **Excipients:** May contain Benzalkonium chloride, polysorbates
- **Beclometasone dipropionate (Non-proprietary)**
  - Beclometasone dipropionate 50 microgram per 1 dose
  - Beconase Aqueous 50 micrograms/dose nasal spray | 200 dose | £2.63 DT = £3.02
- **Beconase** (GlaxoSmithKline UK Ltd, Omega Pharma Ltd)
  - Beclometasone dipropionate 50 microgram per 1 dose
  - Beconase Aqueous 50 micrograms/dose nasal spray | 200 dose | £2.63 DT = £3.02

**Driving and skilled tasks**

- Manufacturer advises patients and carers should be counselled on appropriate administration technique and warned against accidental contact with the eye (due to risk of ocular complications).
Budesonide

**DRUG ACTION** Budesonide is a glucocorticoid, which exerts significant local anti-inflammatory effects.

**INDICATIONS AND DOSE**

**Allergic rhinitis** | **Nasal polyps**
--- | ---
**BY INTRANASAL ADMINISTRATION**
- Child 6-17 years: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered to each nostril, reduced dose when control achieved
- Adult: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered to each nostril, reduced dose when control achieved

Prophylaxis and treatment of allergic and vasomotor rhinitis

**BY INTRANASAL ADMINISTRATION**
- Child 12-17 years: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril, reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved
- Adult: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 100 micrograms twice daily, dose to be administered to each nostril, reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved

**CONTRAINDICATIONS**
- Known hypersensitivity to any component of the formulation
- Adrenal insufficiency
- Treated with systemic corticosteroids within 2 months

**SIDE-EFFECTS**
- Nasal irritation, burning, or dryness
- Itching of the nasal mucosa
- Nasal ulceration
- Rhinitis medicamentosa

**INTERACTIONS**
- Reduced effect of budesonide with corticosteroids

**MEDICINAL FORMS**
- Nasal polyps: 64 micrograms per 1 dose
- Allergic rhinitis: 32 micrograms per 1 dose
- Nasal spray: 64 micrograms per 1 dose

**PRECAUTIONS**
- Avoid use in patients with a history of nasal carcinoma
- Use with caution in patients with a history of peptic ulcer disease

**SAFETY INFORMATION**
- Do not use if the bottle or cap is damaged
- Keep out of reach of children

**PRESCRIBING INFORMATION**
- Store at 2–8°C
- Do not freeze

**EXCEPTIONS TO LEGAL CATEGORY**
- Rare or very rare
- Adrenal suppression

**JUBN**
- Budesonide (Non-proprietary)
- Budesonide 64 microgram per 1 dose
- Budesonide 32 microgram per 1 dose
- Budesonide 16 microgram per 1 dose
- Budesonide 8 microgram per 1 dose

**APPENDICES**
- Appendix 1: corticosteroids

**REFERENCE**
- Budesonide 16 microgram per 1 dose

Fluticasone

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of allergic rhinitis and perennial rhinitis**

**BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**
- Child 4-11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning
- Child 12-17 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning

www.getintopharma.com
50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved

**Nasal polyps**

- **BY INTRANASAL ADMINISTRATION USING NASAL DROPS**
- **Child 6-17 years**: 27.5 micrograms once daily, to be sprayed into each nostril, reduced to 27.5 micrograms once daily, dose to be reduced once control achieved; use maximum effective dose
- **Child 12-17 years**: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose
- **Adult**: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

**DOSE Equivalence and Conversion**

- With intransal use
- 1 spray equivalent to 27.5 micrograms.

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS**

SIDE-EFFECTS, FURTHER INFORMATION: Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

**EXCEPTIONS TO LEGAL CATEGORY**

- With intranasal use in adults. Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **Excipients**: May contain Benzalkonium chloride, polysorbates
- **Fluticasone furoate 27.5 microgram per 1 dose** Avamys 27.5 micrograms/dose nasal spray
- **Flixonase** (GlaxoSmithKline Consumer Healthcare, GlaxoSmithKline UK Ltd)
- **Fluticasone propionate 50 microgram per 1 dose** Flixonase 50 micrograms/dose nasal spray
- **Nasofan** (Teva UK Ltd)

**Fluticasone with azelastine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 1206, azelastine hydrochloride p. 1204.

**INDICATIONS AND DOSE**

Moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate

- **BY INTRANASAL ADMINISTRATION**
- **Child 12-17 years**: 1 spray twice daily, dose to be administered into each nostril
- **Adult**: 1 spray twice daily, dose to be administered into each nostril

**INTERACTIONS** → Appendix 1: antihistamines, non-sedating - corticosteroids

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **Excipients**: May contain Benzalkonium chloride, polysorbates
- **Dymista (Meda Pharmaceuticals Ltd)**
- **Fluticasone propionate 50 microgram per 1 actuation, Azelastine hydrochloride 137 microgram per 1 actuation** Dymista 137 micrograms/dose nasal spray

- **Mometasone furoate**

**INDICATIONS AND DOSE**

Prophylaxis and treatment of seasonal allergic or perennial rhinitis

- **BY INTRANASAL ADMINISTRATION**
- **Child 3-11 years**: 50 micrograms daily, dose to be sprayed into each nostril
- **Child 12-17 years**: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril
- **Adult**: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**: Nasal ulceration occurs commonly with preparations containing mometasone furoate.
**Medications**

**Mast-cell stabilisers**

Ear, nose and oropharynx (Sodium cromoglicate)

- **Sodium cromoglicate**
  - **Indications and dose**
    - Prophylaxis of allergic rhinitis
      - By intranasal administration
        - Child: 1 spray 2–4 times a day, to be administered into each nostril
        - Adult: 1 spray 2–4 times a day, to be administered into each nostril
  - **Unlicensed use**
    - In children. Licensed for use in children (age range not specified by manufacturers).
  - **Exclusions to legal category**
    - Bronchospasm (transient)
    - Frequency not known: Local reaction
  - **Side-effects**
    - Rare or very rare: Bronchospasm (transient)
    - Frequency not known: Local reaction
  - **Medicinal forms**
    - No licensed medicines listed.

**Triamcinolone acetonide**

- **Drug action**
  - Triamcinolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effect.
- **Indications and dose**
  - Prophylaxis and treatment of allergic rhinitis
    - By intranasal administration
      - Child: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduced dose when control achieved; maximum duration of treatment 3 months
      - Adult: 110 micrograms once daily, dose to be sprayed into each nostril, reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduced dose when control achieved
  - **Side-effects**
    - Rare: Bronchospasm (transient)
    - Frequency not known: Local reaction
- **Exclusions to legal category**
  - Bronchospasm (transient)
  - Frequency not known: Local reaction
- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Spray**
    - **Excipients:** May contain benzalkonium chloride, polysorbates
    - **Mometasone furoate (Non-proprietary)**
      - Mometasone furoate 50 microgram per 1 dose — Nasacort
        - Nasacort (Sanofi) — 50 micrograms/dose nasal spray 140 dose [PND] £7.39 DT + £3.39
        - **Exciipients:** May contain benzalkonium chloride, disodium edetate, polysorbates
  - **Topical nasal spray**
    - **Excipients:** May contain benzalkonium chloride, disodium edetate, polysorbates
    - **Mometasone furoate (Non-proprietary)**
      - Mometasone furoate (Sanofi) — Nasonex
        - Nasonex (Merck Sharp & Dohme Ltd) — 50 micrograms/dose nasal spray 140 dose [PND] £7.68 DT + £1.71

**Treatment of dry mouth**

Overview

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g., antispasmodics, tricyclic antidepressants, and some antipsychotics), by diuretics, by irradiation of the head and neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, Aquora®, Biotène Oralbalance®, gel or Xerolin® can be used for any condition giving rise to a dry mouth. BioXtra®, Glandosane®, Saliva Orthana® and Salivez®, have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. Salivax® pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

Pilocarpine tablets p. 1210 are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren’s syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

**Artificial saliva products**

- **Artificial saliva products**
  - **As saliva orthana® lozenges**
    - Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral
  - **Indications and dose**
    - Dry mouth as a result of having (or having undergone) radiotherapy (ACBS)
    - Dry mouth as a result of sicca syndrome (ACBS)
  - **Prescribing and dispensing information**
    - As saliva orthana® lozenges do not contain fluoride.
    - As saliva orthana® lozenges (A S Pharma Ltd) — 30 lozenges[ACBS] — NHS indicative price = £3.50 - Drug Tariff (Part VIII)
    - Category C price = £3.50

**Lubricants**

**Sodium cromoglicate**

(Sodium cromoglicate)

- **Indications and dose**
  - Prophylaxis of allergic rhinitis
    - By intranasal administration
      - Child: 1 spray 2–4 times a day, to be administered into each nostril
      - Adult: 1 spray 2–4 times a day, to be administered into each nostril
  - **Side-effects**
    - Rare or very rare: Bronchospasm (transient)
    - Frequency not known: Local reaction
  - **Exclusions to legal category**
    - Bronchospasm (transient)

  - There can be variation in the licensing of different medicines containing the same drug.
AS SALIVA ORTHANA® SPRAY
Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

- INDICATIONS AND DOSE
Symptomatic treatment of dry mouth
  - BY MOUTH
  - Adult: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

- PROFESION SPECIFIC INFORMATION
Dental practitioners’ formulary
AS Saliva Orthana® Oral Spray may be prescribed.

BIOXTRA® GEL
Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

- INDICATIONS AND DOSE
Dry mouth as a result of having (or having undergone) radiotherapy | Dry mouth as a result of sicca syndrome
  - BY MOUTH
  - Adult: As required, apply to oral mucosa

- PROFESION SPECIFIC INFORMATION
Dental practitioners’ formulary
BioXtra® Gel may be prescribed.

BioXtra Dry Mouth oral gel (R.I.S. Products Ltd)
40 ml - NHS indicative price = £3.94 • Drug Tariff (Part IXa)

BIOTENE ORALBALANCE®
Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

- INDICATIONS AND DOSE
Symptomatic treatment of dry mouth
  - BY MOUTH
  - Adult: Apply as required, apply to gums and tongue

- PATIENT AND CARER ADVICE
Avoid use with toothpastes containing detergents (including foaming agents).

- PROFESION SPECIFIC INFORMATION
Dental practitioners’ formulary
BioTene Oralbalance® Saliva Replacement Gel may be prescribed as Artificial Saliva Gel.

BioTene Oralbalance dry mouth saliva replacement gel (Glassmanns Consumer Healthcare) Glucose oxidase 12000 unit,
Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg 50 gram - NHS indicative price = £4.46 • Drug Tariff (Part IXa)

GLANDOSANE®
Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

- INDICATIONS AND DOSE
Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)
  - BY MOUTH
  - Adult: As required, spray onto oral and pharyngeal mucosa

- PROFESION SPECIFIC INFORMATION
Dental practitioners’ formulary
Glandosane® Aerosol Spray may be prescribed.

Glandosane synthetic saliva spray lemon (Fresenius Kabi Ltd)
50 ml - NHS indicative price = £5.68 • Drug Tariff (Part IXa)

Glandosane synthetic saliva spray natural (Fresenius Kabi Ltd)
50 ml - NHS indicative price = £5.68 • Drug Tariff (Part IXa)

SALIVEZE®
Carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral

- INDICATIONS AND DOSE
Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)
  - BY MOUTH
  - Adult: Apply 1 spray as required, spray onto oral mucosa

- PROFESION SPECIFIC INFORMATION
Dental practitioners’ formulary
Saliveze® Oral Spray may be prescribed.

Saliveze mouth spray (Wyvern Medical Ltd)
50 ml - NHS indicative price = £3.50 • Drug Tariff (Part IXa)

SALIVIX®
Sugar-free, reddish-amber, acacia, malic acid and other ingredients.

- INDICATIONS AND DOSE
Symptomatic treatment of dry mouth
  - BY MOUTH USING PASTILLES
  - Adult: 1 unit as required, suck pastille
PARASYMPATHOMIMETICS

Pilocarpine

- INDICATIONS AND DOSE
  - Symptomatic treatment of dry mouth
  - BY MOUTH
  - Adult: 1 spray as required

- PROFESSION SPECIFIC INFORMATION
  - Dental practitioners’ formulary
    - Xerotic® Oral Spray may be prescribed as Artificial Saliva Oral Spray.
    - Xerotic® Pastilles (SpePharm UK Ltd)
      - 100 ml - NHS indicative price = £6.86 - Drug Tariff (Part Ixa)

- INDICATIONS AND CONTRA-INDICATIONS
  - Xerostomia following irradiation for head and neck cancer
    - BY MOUTH
    - Adult: 5 mg 3 times a day for 4 weeks; increased if tolerated to up to 30 mg daily in divided doses if required, to be taken with meals or immediately after eating (last dose always with evening meal); maximum therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months

  - Dry mouth and dry eyes in Sjögren's syndrome
    - BY MOUTH
    - Adult: 5 mg 4 times a day; increased if tolerated to up to 30 mg daily in divided doses if required, to be taken with meals and at bedtime, discontinue if no improvement after 2–3 months

- INTERACTIONS
  - Chloral hydrate:
  - Seizures

- SIDE-EFFECTS
  - Common or very common
    - Asthenia
    - Conjunctivitis
    - Constipation
    - Diarrhoea
    - Dizziness
    - Excessive tearing
    - Eye pain
    - Flushing
    - Gastrointestinal discomfort
    - Headache
    - Hyperhidrosis
    - Hypersalivation
    - Hypertension
    - Increased risk of infection
    - Nausea
    - Palpitations
    - Skin reactions
    - Urinary disorders
    - Vision disorders
    - Vomiting
  - Uncommon
    - Gastrointestinal disorders
  - Frequency not known
    - Afibrile: agitation
    - Arrhythmias
    - Atrialventricular block
    - Chills
    - Confusion
    - Hallucination
    - Hypotension
    - Memory loss
    - Psychiatric disorders
    - Respiratory distress
    - Shock
    - Tremor

- PREGNANCY
  - Avoid — smooth muscle stimulant; toxicity in animal studies.

- BREAST FEEDING
  - Manufacturer advises avoid — present in milk in animal studies.

- HEPATIC IMPAIRMENT
  - Manufacturer advises caution in moderate to severe cirrhosis.
  - Dose adjustments
    - Manufacturer advises initial dose reduction in moderate to severe cirrhosis.

- RENAL IMPAIRMENT
  - Manufacturer advises caution with tablets.

- PATIENT AND CARER ADVICE
  - Driving and skilled tasks
    - Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

  - Tablet

  - CAUTIONARY AND ADVISORY LABELS 21, 27

    - Salagen (Merus Labs Luxco S.a R.L.)
      - Pilocarpine hydrochloride 5 mg tablets, 84 tablet

- BNF 78

2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 1212 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 1212, may be useful in the treatment of ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine p. 1211 is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed.

Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.
Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled.

Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

There is no convincing evidence that gargles are effective in adults.

ANTISEPTICS AND DISINFECTANTS

Chlorhexidine

**INDICATIONS AND DOSE**

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of apthous ulcers

- **BY MOUTH USING MOUTHWASH**
  - Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)
  - Adult: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

Denture stomatitis

- **MOUTHWASH**
  - Adult: Cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

Oral hygiene and plaque inhibition and gingivitis

- **BY MOUTH USING DENTAL GEL**
  - Child: Apply 1–2 times a day, to be brushed on the teeth
  - Adult: Apply 1–2 times a day, to be brushed on the teeth

Oral candidiasis | Management of apthous ulcers

- **BY MOUTH USING DENTAL GEL**
  - Child: Apply 1–2 times a day, to affected areas
  - Adult: Apply 1–2 times a day, to affected areas

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of apthous ulcers

- **BY MOUTH USING OROMUCOSAL SPRAY**
  - Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces
  - Adult: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces

Bladder irrigation and catheter patency solutions

- **BY INTERVESICAL INSTILLATION**
  - Adult: (consult product literature)

**UNLICENSED USE**

*Corsodyl®* not licensed for use in children under 12 years (unless on the advice of a healthcare professional).

**SIDE-EFFECTS**

- Common or very common
  - With oromucosal use: Dry mouth, hypersensitivity, oral disorders, taste altered, tongue discolouration

**SIDE-EFFECTS, FURTHER INFORMATION**

If desquamation occurs with mucosal irritation, discontinue treatment.

**PATIENT AND CARER ADVICE**

- With oral (topical) use: Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**

*Corsodyl®* dental gel may be prescribed as Chlorhexidine Gluconate Gel; *Corsodyl®* mouthwash may be prescribed as Chlorhexidine Mouthwash; *Corsodyl®* oral spray may be prescribed as Chlorhexidine Oral Spray.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Dental gel**

- *Corsodyl* (GlaxoSmithKline Consumer Healthcare)
  - Chlorhexidine gluconate 10 mg per 1 gram
  - Chlorhexidine gluconate 0.2% catheter maintenance solution | 100 ml
- *Uro-Tainer* (chlorhexidine) (B.Braun Medical Ltd)
  - Chlorhexidine acetate 200 microgram per 1 ml

**Irrigation**

- Chlorhexidine (Non-proprietary)
  - Chlorhexidine acetate 200 microgram per 1 ml
  - Chlorhexidine acetate 0.2% irrigation solution | 100 ml

**Mouthwash**

- Chlorhexidine (Non-proprietary)
  - Chlorhexidine gluconate 2 mg per 1 ml
  - Chlorhexidine gluconate 0.2% mouthwash anised | 300 ml
  - Chlorhexidine gluconate 0.2% mouthwash natural | 300 ml
  - Chlorhexidine gluconate 0.2% mouthwash peppermint | 300 ml

**Hexetidine**

**INDICATIONS AND DOSE**

Oral hygiene

- **BY MOUTH USING MOUTHWASH**
  - Child 12-17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted
  - Adult: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

**SIDE-EFFECTS**

- Rare or very rare
  - Anaesthesia • taste altered
  - Frequency not known
  - Cough • dry mouth • dysphagia • dysphonia • nausea • salivary gland enlargement • vomiting

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Mouthwash**

- Oraldene (McNeil Products Ltd)
  - Hexetidine 1 mg per 1 ml
  - Oraldene 0.1% mouthwash peppermint sugar-free | 200 ml

**www.getintopharma.com**
Hydrogen peroxide

**DRUG ACTION** Hydrogen peroxide is an oxidising agent.

**INDICATIONS AND DOSE**

**Oral hygiene (with hydrogen peroxide 6%)**

- **BY MOUTH USING MOUTHWASH**
  - Child: Rinse or gargle 15 ml 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water
  - Adult: Rinse or gargle 15 ml 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water

**PEROXYL®**

**Oral hygiene**

- **BY MOUTH USING MOUTHWASH**
  - Child 6–17 years: Rinse or gargle 10 ml 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime
  - Adult: Rinse or gargle 10 ml up to 4 times a day for about 1 minute, to be used after meals and at bedtime

**PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.

**HANDLING AND STORAGE** Hydrogen peroxide bleaches fabric.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Hydrogen Peroxide Mouthwash may be prescribed.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Mouthwash**

- **Peroxyl** (Colgate-Palmolive (UK) Ltd)
  - Hydrogen peroxide 15 mg per 1 ml Peroxyl 1.5% mouthwash sugar-free £300 ml RET £2.94 OT £2.34

Sodium chloride

**INDICATIONS AND DOSE**

**Oral hygiene**

- **BY MOUTH USING MOUTHWASH**
  - Child: Rinse or gargle as required
  - Adult: Rinse or gargle as required

**DIRECTIONS FOR ADMINISTRATION** Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 ml, double-strength chloroform water 50 ml, water to 100 ml. To be diluted with an equal volume of warm water.

**PRESCRIBING AND DISPENSING INFORMATION** No mouthwash preparations available—when prepared extemporaneously, the BP states Sodium Chloride Mouthwash, Compound, BP consists of sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

In children The RCPCH and NPPG recommend that, when a liquid special of sodium chloride is required, the following strength is used: 5 mmol/mL.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Compound Sodium Chloride Mouthwash may be prescribed.

**MEDICINAL FORMS** No licensed medicines listed.

2.1 Dental caries

**Fluoride imbalance**

**Overview**

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.
VITAMINS AND TRACE ELEMENTS

Sodium fluoride

- **INDICATIONS AND DOSE**
  - Prophylaxis of dental caries for water content less than 300 micrograms/litre (0.3 parts per million) of fluoride ion
    - **BY MOUTH USING TABLETS**
    - Child 6 months-2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
    - Child 3-5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
    - Child 6-17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)
    - Adult: 1 mg daily, doses expressed as fluoride ion (F⁻)
  - Prophylaxis of dental caries for water content between 300 and 700 micrograms/litre (0.3-0.7 parts per million) of fluoride ion
    - **BY MOUTH USING TABLETS**
    - Child 6-5 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
    - Child 6-17 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
    - Adult: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
  - Prophylaxis of dental caries for water content above 700 micrograms/litre (0.7 parts per million) of fluoride ion
    - **BY MOUTH USING TABLETS**
    - Child 6-17 years: Supplements not advised
    - Adult: Supplements not advised
  - Prophylaxis of dental caries for individuals who are caries prone or medically compromised
    - **BY MOUTH USING MOUTHWASH**
    - Adult: Rinse or gargle 10 mL daily
  - **DOSE EQUIVALENCE AND CONVERSION**
    - Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.
    - These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry *(Br Dent / 1997, 182: 6–7).*

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE**

**Prophylaxis of dental caries**

- **BY MOUTH USING PASTE**
  - Child 10-17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush
  - Adult: Apply 1 centimetre twice daily, to be applied using a toothbrush

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE**

**Prophylaxis of dental caries**

- **BY MOUTH USING PASTE**
  - Child 16-17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush
  - Adult: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

**EN-DE-KAY® FLUORRINSE**

**Prophylaxis of dental caries for individuals who are caries prone or medically compromised**

- **BY MOUTH USING MOUTHWASH**
  - Adult: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL.

**CONTRA-INDICATIONS** Not for areas where drinking water is fluoridated

**SIDE-EFFECTS** Dental fluorosis

**DIRECTIONS FOR ADMINISTRATION**

- With oral use Tablets should be sucked or dissolved in the mouth and taken preferably in the evening.
- With oral (topical) use For mouthwash, rinse mouth for 1 minute and then spit out.

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** Brush teeth for 3 minutes before spitting out.

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** Brush teeth for 1 minute before spitting out.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral tablet formulations may include orange.

**PATIENT AND CARER ADVICE**

Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** Patients or carers should be given advice on how to administer sodium fluoride toothpaste.

Avoid drinking or rinsing mouth for 30 minutes after use.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Tablets may be prescribed as Sodium Fluoride Tablets. Oral drops may be prescribed as Sodium Fluoride Oral Drops.

Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.

Dental information

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE DENTAL PRACTITIONERS’ FORMULARY**

May be prescribed as Sodium Fluoride Toothpaste 1.1%.

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE DENTAL PRACTITIONERS’ FORMULARY**

May be prescribed as Sodium Fluoride Toothpaste 0.619%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Endekay** (Manx Healthcare Ltd)
  - Sodium fluoride 1.1 mg Endekay Fluotabs 3-6 Years 1.1mg tablets 200 tablet £2.38 DT = £2.38
  - Sodium fluoride 2.2 mg Endekay Fluotabs 6+ Years 2.2mg tablets 200 tablet £2.38 DT = £2.38

**Paste**

- **Colgate Duraphat** (Colgate-Palmolive (UK) Ltd)
  - Fluoride (as Sodium fluoride) 2.8 mg per 1 gram Colgate Duraphat 2800 ppm fluoride toothpaste sugar-free | 75 ml Pot £3.26 DT = £3.26
  - Fluoride (as Sodium fluoride) 5 mg per 1 gram Colgate Duraphat 5000 ppm fluoride toothpaste sugar-free | 51 gram Pot £6.50 DT = £6.50

**Chewable tablet**

- **Fluor-a-day** (DHP Healthcare Ltd)
  - Sodium fluoride 1.1 mg Fluor-a-day 1.1mg chewable tablets sugar-free | 200 tablet £3.38 DT = £3.38
  - Sodium fluoride 2.2 mg Fluor-a-day 2.2mg chewable tablets sugar-free | 200 tablet £3.38 DT = £3.38

www.getintopharma.com
oral ulceration and inflammation

Ulceration and inflammation
Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also Chemotherapy induced mucositis and myelosuppression under Cytotoxic drugs p. 888). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks’ duration require urgent referral to hospital to exclude oral cancer.

Simple mouthwashes
A saline mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes
Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of a chlorhexidine mouthwash p. 1211 is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids
Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ’prodromal’ phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone oromucosal tablets p. 1216 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclometasone dipropionate inhaler p. 257 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets p. 1216 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 1153), is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics
Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine hydrochloride 5% ointment p. 1214 or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine hydrochloride 10% solution as spray can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Preparations on sale to the public: many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer—the correct proprietary name should be ascertained as many products have very similar names but different active ingredients.

Benzydamine hydrochloride p. 1215 and flurbiprofen p. 1216 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzydamine hydrochloride mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillectomy and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat.

Choline salicylate p. 1217 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

Other preparations
Doxycycline p. 564 rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis
Low-dose doxycycline (Periostat®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharyngeal infections, antibacterial therapy p. 1217. See also Mouthwashes and other preparations for oropharyngeal use p. 1210 for mouthwashes used for oral hygiene and plaque inhibition.

Lidocaine hydrochloride
(Lignocaine hydrochloride)

www.getintopharma.com
**Indications and Dose**

**Warning** Painful inflammatory conditions of the oral cavity and throat and/or following dental treatment or dental extraction

- **By mouth using mouthwash**
- Adult: Rinse or gargle 15 mL for 2–3 days a day for 7 days, treatment may be extended to 6 weeks in mucositis caused by radiotherapy.

**Interactions**

- **Appendix 1: NSAIDs**
- **Appendix 1: Angioedema**
- **Frequency not known**
- **Uncommon** Oral disorders
- **Rare or very rare** Photosensitivity reaction • respiratory disorders • skin reactions

**Special Information**

- **Dental practitioners’ formulary**

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **Benzydamine hydrochloride (non-proprietary)**
  - Benzydamine hydrochloride 1.5 mg per 1 mL | 30 mL | £1.24 DT + £3.46
  - Difflam (Meda Pharmaceuticals Ltd)
  - Benzydamine hydrochloride 1.5 mg per 1 mL | 30 mL | £1.24 DT + £3.46

**Mouthwash**

- **Benzydamine hydrochloride (non-proprietary)**
  - Benzydamine hydrochloride 1.5 mg per 1 mL | 300 mL | £7.25
  - Difflam (Meda Pharmaceuticals Ltd)
  - Benzydamine hydrochloride 1.5 mg per 1 mL | 200 mL | £4.64

**Diclofenac**

28-Aug-2018

**Indications and Dose**

- Painful inflammatory conditions of the oral cavity and throat and/or following dental treatment or dental extraction
  - **By mouth using mouthwash**
  - Adult: Rinse or gargle 15 mL for 2–3 days a day for 7 days, treatment may be extended to 6 weeks in mucositis caused by radiotherapy.

**Interactions**

- **Appendix 1: NSAIDs**
- **Pregnancy** Manufacturer advises avoid unless essential.
- **Breastfeeding** Manufacturer advises avoid unless essential.
- **Directions for administration** Manufacturer advises mouthwash may be diluted with a little water.
Flurbiprofen

**Indications and dose**

**Relief of sore throat**

- **By mouth using lozenges**
  - Child 12-17 years: 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day
  - Adult: 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day

**Contra-indications**

- **Apparent or known sensitivity to flurbiprofen** or any other NSAID
- **Corticosteroid-sensitive asthma, angioedema, urticaria or rhinitis** have been precipitated by aspirin or any other NSAID

**Side-effects**

- Oral ulceration (move lozenge around the mouth; maximum 1 lozenge every 3 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day)

**Pharmacological properties**

- High glucocorticoid activity
- Insignificant mineralocorticoid activity

**Unlicensed use**

- With oral (topical) use in children: Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.

**Contra-indications**

- Untreated local infection

**Interactions**

- Appendix 1: corticosteroids

**Patient and carer advice**

- Patient counselling is advised for betamethasone soluble tablets (administration).

**Profession specific information**

- Dental practitioners’ formulary: Betamethasone Soluble Tablets 500 micrograms may be prescribed.

**Corticosteroids**

**Beclometasone dipropionate (Beclometasone dipropionate)**

**Indications and dose**

**Management of oral ulceration**

- **To the lesion using buccal tablet**
  - Child 1 month: 2 micrograms twice daily
  - Child 12–17 years: 2 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed
  - Adult: 2 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

**Unlicensed use**

- Use of soluble tablets and inhaler unlicensed in oral ulceration.

**Interactions**

- Appendix 1: corticosteroids

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Hydrocortisone**

**Drug action**

- Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

**Indications and dose**

- **Oral and perioral lesions**
  - **To the lesion using buccal tablet**
    - Child 1 month: 2 micrograms twice daily
    - Child 12–17 years: 2 micrograms 4 times a day
    - Adult: 2 micrograms 4 times a day

**Unlicensed use**

- With buccal use in children: Hydrocortisone mucoadhesive buccal tablets licensed for use in children (under 12 years—on medical advice only).

**Important safety information**

- MHRA/CHM Advice: Hydrocortisone muco-adhesive buccal tablets: Should not be used off-label for adrenal insufficiency in children due to serious risks (December 2018).

- The MHRA has received reports of off-label use of hydrocortisone muco-adhesive buccal tablets for adrenal insufficiency in children. Healthcare professionals are advised that:
  - Hydrocortisone muco-adhesive buccal tablets are indicated only for local use in the mouth for aphthous ulceration and should not be used to treat adrenal insufficiency;
  - Substitution of licensed oral hydrocortisone formulations with muco-adhesive buccal tablets can result in insufficient cortisol absorption and, in stress situations, life-threatening adrenal crisis;
  - Only hydrocortisone products licensed for adrenal replacement therapy should be used.

**Contra-indications**

- Untreated local infection

**Interactions**

- Appendix 1: corticosteroids

**Profession specific information**

- Dental practitioners’ formulary: Mucoadhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.
Salicylic acid and rhubarb extract

**INDICATIONS AND DOSE**
- Mild oral and perioral lesions
  - To the lesion
  - Child 16-17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours
  - Adults: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

**SIDE-EFFECTS**
- Common or very common Oral discolouration, tooth discolouration

**CONTRA-INDICATIONS**
- Children under 16 years

**PRESCRIBING AND DISPENSING INFORMATION**
- Choline Salicylate Dental Gel may be prescribed.
- Dental practitioners’ formulary

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- Oromucosal gel
  - Bonjela (Reckitt Benckiser Healthcare (UK) Ltd)
    - Choline salicylate 87 mg per 1 gram | 15 gram [G3] £3.55 DT + £2.91
    - Bonjela Original gel sugar-free | 15 gram [G3] £2.91 DT + £2.91

**EXCIPIENTS:**
- May contain Ethanol

---

**Salicylic acid with rhubarb extract**

**INDICATIONS AND DOSE**
- To the lesion
- Child 16-17 years: Apply 3–4 times a day maximum duration 7 days
- Adults: Apply 3–4 times a day maximum duration 7 days

**SIDE-EFFECTS**
- Common or very common Oral discolouration, tooth discolouration

---

**Oropharyngeal bacterial infections**

### Pericoronitis
Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.
- Metronidazole p. 542, or alternatively, amoxicillin p. 548
- **Suggested duration of treatment** 3 days or until symptoms resolve.

### Gingivitis (acute necrotising ulcerative)
Antibacterial required only if systemic features of infection.
- Metronidazole, or alternatively, amoxicillin
- **Suggested duration of treatment** 3 days or until symptoms resolve.

### Abscess (periapical or periodontal)
Antibacterial required only in severe disease with cellulitis or if systemic features of infection.
- Amoxicillin, or alternatively, metronidazole
- **Suggested duration of treatment** 5 days.

### Periodontitis
Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.
- Metronidazole, or alternatively in adults and children over 12 years, doxycycline p. 564

### Sore throat (acute)
Acute sore throat is usually triggered by a viral infection and is self-limiting. Symptoms can last for around 1 week, and most people will improve within this time without treatment with antibiotics, regardless of the cause.
- **Antibacterial therapy** is required only in patients with severe systemic symptoms, signs and symptoms of a more serious illness or condition, or those at high risk of complications. Patients with severe systemic infection or severe suppurative complications such as peri-tonsillar abscess (quinsy), acute otitis media, acute sinusitis or cellulitis should be referred to hospital.
- Phenoxymethylpenicillin p. 548
- **Suggested duration of treatment** 5 to 10 days.
- If penicillin-allergic, clarithromycin p. 538 (or erythromycin p. 539)
- **Suggested duration of treatment** 5 days.
5 Oropharyngeal fungal infections

Oropharyngeal fungal infections

Overview

Fungal infections of the mouth are usually caused by Candida spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

Thrush

Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child’s teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 1219 or miconazole p. 1219 may be needed. Fluconazole p. 595 is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

Acute erythematous candidiasis

Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

Denture stomatitis

Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

Miconazole oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

Chronic hyperplastic candidiasis

Chronic hyperplastic candidiasis (candidial leucoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole to eliminate candidal overgrowth. Patients should avoid the use of tobacco.

Angular cheilitis

Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (Candida spp.) and bacteria (Staphylococcus aureus and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream or fusidic acid ointment p. 571; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 1252 can be used.

Immunocompromised patients

See advice on prevention of fungal infections in Immunocompromised patients under Antifungals, systemic use p. 591.

Drugs used in oropharyngeal candidiasis

Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole p. 597 can be used for fluconazole-resistant infections.
If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate antifungal therapy; the patient’s partner may also require treatment to prevent reinfection.

Antiseptic mouthwashes are used in the prevention of oral candidiasis in immunocompromised patients and in the treatment of denture stomatitis.

**ANTIFUNGALS**  
**IMIDAZOLE ANTIFUNGALS**

### Miconazole

**INDICATIONS AND DOSE**

**Oral candidiasis**

- **BY MOUTH USING ORAL GEL**
  - Child 2–17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
  - Adult: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

**Intestinal candidiasis**

- Child 4 months-17 years: 5 mg/kg 4 times a day (max. per dose 250 mg) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared
- Adult: 5 mg/kg 4 times a day (max. per dose 250 mg) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

**CONTRA-INDICATIONS** Infants with impaired swallowing reflex

**CAUTIONS** Avoid in Acute porphyrias p. 1058

**INTERACTIONS** → Appendix 1: antifungals, azoles

**SIDE-EFFECTS**

- Common or very common Skin reactions (in adults)
- Frequency not known Angioedema

**PREGNANCY** Manufacturer advises avoid if possible—toxicity at high doses in animal studies.

**BREAST FEEDING** Manufacturer advises caution—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid.

**DIRECTIONS FOR ADMINISTRATION** Oral gel should be held in mouth, after food.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral gel may include orange.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer miconazole oromucosal gel.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulation
Miconazole Oromucosal Gel may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY** 15-g tube of oral gel can be sold to the public.

### Nystatin

**INDICATIONS AND DOSE**

**Oral candidiasis**

- Child: 100,000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved
- Adult: 100,000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved

**CONTRA-INDICATIONS** Infants with impaired swallowing reflex

**CAUTIONS** Avoid in Acute porphyrias p. 1058

**SIDE-EFFECTS**

- Common or very common Skin reactions (in adults)
- Frequency not known Angioedema

**PREGNANCY** Manufacturer advises avoid if possible— to toxic at high doses in animal studies.

**BREAST FEEDING** Manufacturer advises caution—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid.

**DIRECTIONS FOR ADMINISTRATION** Oral gel should be held in mouth, after food.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral gel may include orange.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer miconazole oromucosal gel.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulation
Miconazole Oromucosal Gel may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY** 15-g tube of oral gel can be sold to the public.

### Oropharyngeal viral infections

**Management**

Viral infections are the most common cause of a sore throat. They do not benefit from anti-infective treatment.

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzylamine hydrochloride p. 1215. The use of chlorhexidine mouthwash p. 1211 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir p. 633 is required. Valaciclovir p. 636 and famciclovir p. 635 are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme.
Skin conditions, management

Vehicles

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk/specials.

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. Shake lotions (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution

The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

Suitable quantities for prescribing

<table>
<thead>
<tr>
<th>Suitable quantities of dermatological preparations to be prescribed for specific areas of the body</th>
</tr>
</thead>
<tbody>
<tr>
<td>Area of body</td>
</tr>
<tr>
<td>Face</td>
</tr>
<tr>
<td>Both hands</td>
</tr>
<tr>
<td>Scalp</td>
</tr>
<tr>
<td>Both arms or both legs</td>
</tr>
<tr>
<td>Trunk</td>
</tr>
<tr>
<td>Groins and genitalia</td>
</tr>
</tbody>
</table>

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations. For suitable quantities of corticosteroid preparations, see relevant table.
Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided. The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlororeresol
- Edetic acid (EDTA)
- Ethylendiamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)lhexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulphite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

1 Dry and scaling skin disorders

Emollient and barrier preparations

Borderline substances

The preparations marked ‘ACBS’ are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed ‘ACBS’ will normally not be investigated.

Emollients

Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis. The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as aqueous cream and emulsifying ointment can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Emollient bath and shower preparations

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin;

recommended bath additive quantities for children reflect this.

MHRA/CHM advice (updated December 2018): Emollients: new information about risk of severe and fatal burns with paraffin-containing and paraffin-free emollients

Emollients are an important and effective treatment for chronic dry skin disorders and people should continue to use these products. However, healthcare professionals must ensure that patients and their carers understand the fire risk associated with the build-up of residue on clothing and bedding and can take action to minimise the risk. There is a fire risk with all paraffin-containing emollients, regardless of paraffin concentration, and it cannot be excluded with paraffin-free emollients. A similar risk may apply to products that are applied to the skin over large body areas, or in large volumes for repeated use for more than a few days.

Healthcare professionals should advise patients not to smoke or go near naked flames because clothing, bedding, dressings, and other fabrics that have been in contact with an emollient or emollient-treated skin can rapidly ignite. Washing these materials at high temperature may reduce emollient build-up but not totally remove it.

Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone p. 1236 or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

Nappy rash

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 1247 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids. If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream p. 1232 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

**IMMEDIATE SAFETY INFORMATION**

These preparations make skin and surfaces slippery—particular care is needed when bathing.

**DIRECTIONS FOR ADMINISTRATION**

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubes should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**PRESCRIBING AND DISPENSING INFORMATION**

Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Bath additive**

**CAUTIONARY AND ADVISORY LABELS**

**EMULSIDERM**

**Dry skin conditions including eczema and ichthyosis**

**TO THE SKIN**

- **Child 1-23 months:** 5–10 mL/bath, alternatively, to be rubbed into dry skin until absorbed.
- **Child 2-17 years:** 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed.
- **Adult:** 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed.

**OILATUM PLUS**

**Topical treatment of eczema, including eczema at risk from infection**

**TO THE SKIN**

- **Child 6-11 months:** 1 mL/bath, not to be used undiluted.
- **Child 1-7 years:** 1–2 capfuls/bath, not to be used undiluted.
- **Adult:** 1–2 capfuls/bath, not to be used undiluted.

**Barrier creams and ointments (Non-proprietary)**

- Cetostearyl alcohol 20 mg per 1 gram, Zinc oxide 75 mg per 1 gram, Beeswax white 100 mg per 1 gram, Arachis oil 305 mg per 1 gram, Castor oil 500 mg per 1 gram. **Zinc and Castor oil ointment:** 500 gram **GSL** £5.19.
- Metanium (Thornon & Ross Ltd)
  - Titanium salicylate 30 mg per 1 gram, Titanium peroxide 50 mg per 1 gram, Titanium dioxide 200 mg per 1 gram.
  - Metanium Nappy Rash ointment: 30 gram **GSL** £2.24 DT = £2.24

**Spray**

**CAUTIONARY AND ADVISORY LABELS**

- **Adult:** To the skin.
- **Child 2**
- **Child 1**
- **Child:** To be applied to the skin or used as a soap substitute.
- **Adult:** To be applied to the skin or used as a soap substitute.

**DIRECTIONS FOR ADMINISTRATION**

- **Emollients** may contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, woolfat and related substances (including lanolin).
- **Sprion** (M Loveridge Ltd)
  - Dimeticon 10.4 mg per 1 gram, Zinc oxide 125 mg per 1 gram.
- **Sprion aerosol spray:** 115 gram **GSL** £8.90 DT = £8.90

**Cream**

**EXCIPIENTS:** May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, woolfat and related substances (including lanolin).

- **Contrane** (LED Pharma)
  - Benzalkonium chloride 1 mg per 1 gram, Dimeticone 220 mg per 1 gram. **Contrace cream:** 100 gram **GSL** £0.88 DT = £0.88. 500 gram **GSL** £3.51.
- **Drapoline** (Supra Enterprises Ltd)
  - Benzalkonium chloride 100 microgram per 1 gram, Cetrimide 2 mg per 1 gram. **Drapoline cream:** 100 gram **GSL** £1.76. 200 gram **GSL** £2.86. 350 gram **GSL** £4.28.
- **Siopel** (Derma UK Ltd)
  - Cetrimide 3 mg per 1 gram, Dimeticone 1000 100 mg per 1 gram **Siopel cream:** 50 gram **GSL** £4.65.
- **Sudocrem** (Teva UK Ltd)
  - Benzyl cinnamate 1.5 mg per 1 gram, Benzyl alcohol 3.9 mg per 1 gram, Benzylo alcohol 1.0 mg per 1 gram, Wool fat hydrous 40 mg per 1 gram, Zinc oxide 152.5 mg per 1 gram. **Sudocrem antiseptic healing cream:** 30 gram **GSL** £1.45. 60 gram **GSL** £1.45. 125 gram **GSL** £2.15. 250 gram **GSL** £3.67. 400 gram **GSL** £5.25.

Pruritus of the elderly associated with dry skin

TO THE SKIN
- Elderly: To be used as a soap substitute

HYDROMOL® BATH AND SHOWER EMOLLIENT

Dry skin conditions | Eczema | Ichthyosis

TO THE SKIN
- Child 1 month-11 years: 0.5–2 capfuls/bath, alternatively apply to wet skin and rinse
- Child 12-17 years: 1–3 capfuls/bath, alternatively apply to wet skin and rinse
- Adult: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

Pruritus of the elderly

TO THE SKIN
- Elderly: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

LPL 63.4®

Dry skin conditions

TO THE SKIN
- Child 1 month-11 years: Apply 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Child 12-17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Adult: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

OILATUM® EMOLLIENT BATH ADDITIVE

Dry skin conditions including dermatitis and ichthyosis

TO THE SKIN
- Child 1 month-11 years: 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Child 12-17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse
- Adult: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

Pruritus of the elderly

TO THE SKIN
- Elderly: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

OILATUM® JUNIOR BATH ADDITIVE

Dry skin conditions including dermatitis and ichthyosis

TO THE SKIN
- Child 1 month-11 years: 0.5–2 capfuls/bath, alternatively, apply to wet skin and rinse
- Child 12-17 years: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse
- Adult: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse

Pruritus of the elderly

TO THE SKIN
- Elderly: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse

Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus

TO THE SKIN
- Child 1-11 months: 5 mL/bath, alternatively, to be applied to wet skin and rinse
- Child 1-17 years: 10 mL/bath, alternatively, to be applied to wet skin and rinse
- Adult: 10 mL/bath, alternatively, to be applied to wet skin and rinse

OQ® GENTLE WASH

Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus

TO THE SKIN
- Child: To be used as a soap substitute
- Adult: To be used as a soap substitute

continued
Dry and scaling skin disorders

See Emollient and barrier preparations p. 1221.
Skin infections

Antibacterial preparations for the skin

**Cellulitis**, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibiotic.

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of fusidic acid p. 571; mupirocin p. 1232 should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as fluclaxacin p. 554 (or clarithromycin p. 538 in penicillin allergy) should be used. Mild antisepsics can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected.

**Bacterial colonisation is generally inappropriate.** To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin sulphate p. 1230, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin p. 519. If large areas of skin are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins p. 1231, particularly in children, in the elderly, and in those with renal impairment. Resistant organisms are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive bacteria but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone–iodine p. 1276, chlorhexidine p. 1277, or alcohol can be used; their use should be discussed with the local microbiologist.

Tetrazol is p. 573 is licensed for the treatment of acute bacterial skin and skin structure infections. Silver sulfadiazine p. 1231 is used in the treatment of infected burns.

**Antibacterial preparations also used systemically**

Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 1218 for further information on angular cheilitis.

Metronidazole p. 1230 is used topically for rosacea and to reduce the odor associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

**Antifungal preparations for the skin**

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

**Dermatophytose**

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum),
foot (tinea pedis, athlete’s foot), or nail (tinea unguium). Scalp infection requires systemic treatment; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos). The imidazole antifungals clotrimazole p. 1232, econazole nitrate p. 1232, ketoconazole p. 1233, and miconazole p. 1233 are all effective. Terbinafine p. 1234 cream is also effective but it is more expensive. Other topical antifungals include griseofulvin p. 1234 and the undecenoates. Compound benzoic acid ointment (Whitfield’s ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete’s foot containing tolnaftate are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of amorolfine p. 1234 or toconazole p. 1233 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

Pityriasis versicolor

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo. Alternatively, selenium sulfide shampoo [unlicensed indication] can be used as a lotion (diluting with a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as clotrimazole, econazole nitrate, ketoconazole, and miconazole, or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal. Relapse is common, especially in the immunocompromised.

Candidiasis

Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole, econazole nitrate, ketoconazole, or miconazole; topical terbinafine is an alternative. Topical application of nystatin p. 1219 is also effective for candidiasis but it is ineffective against dermatophytoysis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 595; systemic treatment with terbinafine is not appropriate for refractory candidiasis.

Angular cheilitis

Miconazole cream is used in the fissures of angular cheilitis when associated with Candida.

Compound topical preparations

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 1247) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm.

Combination of a mild corticosteroid with either an imidazole or nystatin p. 1219 may be of use in the treatment of intertrigo associated with candida.

Scabies

Permethrin p. 1237 is used for the treatment of scabies (Sarcoptes scabiei); malathion p. 1237 can be used if permethrin is inappropriate.

Benzy1 benzoate p. 1236 is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 604 (available on a named patient basis from ‘special-order’ manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone; further doses may be required.

Application

Although acaricides have traditionally been applied after a hot bath, this is not necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Herpes labialis

Aciclovir cream can be used for the treatment of initial and recurrent oral herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth.

Antiviral preparations for the skin

Aciclovir cream p. 1238 is licensed for the treatment of initial and recurrent labial and genital herpes simplex infections; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for herpes zoster (shingles).

Herpes labialis

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth.

Parasiticidal preparations for the skin

These amounts are usually suitable for an adult for single application.
not successful. Oral administration of a sedating antihistamine at night may also be useful.

Head lice

Dimeticon p. 1236 is effective against head lice (Pediculus humanus capitis). It coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs and not recommended for use in children. Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

MHRA/CHM advice: Head lice eradication products: risk of serious burns if treated hair is exposed to open flames or other sources of ignition (March 2018)

Some products for the eradication of head lice infestations are combustible/flammable when on the hair and can ignite and cause serious harm in the presence of an open flame or other source of ignition such as when lighting cigarettes.

Patients and carers should be advised on the safe and correct use of head lice eradication treatments and if necessary, should be advised that they should not smoke around treated hair and that it should be kept away from open flames or other sources of ignition, including in the morning after overnight application until hair is washed.

Wet combing methods

Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at intervals for a minimum of 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: [www.ppa.org.uk/ppa/edt_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm)
- Health and Personal Social Services for Northern Ireland Drug Tariff: [www.hscbusiness.hscni.net/services/2034.htm](http://www.hscbusiness.hscni.net/services/2034.htm)

Crab lice

Permethrin and malathion are used to eliminate crab lice (Phthirus pubis). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.
ROSCIDEC®
Inflammatory papules and pustules of rosacea
▶ TO THE SKIN
▶ Adult: Apply twice daily for 6 weeks (longer if necessary)

ROZEX® CREAM
Inflammatory papules, pustules and erythema of rosacea
▶ TO THE SKIN
▶ Adult: Apply twice daily for 3–4 months

ROZEX® GEL
Inflammatory papules, pustules and erythema of rosacea
▶ TO THE SKIN
▶ Adult: Apply twice daily for 3–4 months

ZYOMET®
Acute inflammatory exacerbation of rosacea
▶ TO THE SKIN
▶ Adult: Apply twice daily for 8–9 weeks, to be applied thinly

• CAUTIONS Avoid exposure to strong sunlight or UV light
• INTERACTIONS ▶ Appendix 1: metronidazole
• SIDE-EFFECTS

ANTIBACTERIALS ▶ POLYMIXINS

Polymyxins

• INDICATIONS AND DOSE
  Bacterial skin infections
  ▶ TO THE SKIN
  ▶ Adult: Apply twice daily, may be applied more frequently if required

• CAUTIONS If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment.
• INTERACTIONS ▶ Appendix 1: polymyxins

SILVER SULFONAMIDES

Silver sulfadiazine

• INDICATIONS AND DOSE
  Prophylaxis and treatment of infection in burn wounds
  ▶ TO THE SKIN
  ▶ Child: Apply daily, may be applied more frequently if very exudative
  ▶ Adult: Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries
▶ TO THE SKIN
▶ Child: Apply every 2–3 days, consult product literature for details
▶ Adult: Apply every 2–3 days, consult product literature for details

Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions
▶ TO THE SKIN
▶ Adult: (consult product literature)

Adjunct to short-term treatment of infection in pressure sores
▶ TO THE SKIN
▶ Adult: Apply once daily or on alternate days

As an adjunct to short-term treatment of infection in leg ulcers
▶ TO THE SKIN
▶ Adult: Apply once daily or on alternate days, not recommended if ulcer is very exudative

• UNLICENSED USE
  ▶ In children No age range specified by manufacturer.

• CONTRA-INDICATIONS
  Not recommended for neonates

• CAUTIONS
  G6PD deficiency

CAUTIONS, FURTHER INFORMATION Plasma-sulfadiazine concentrations may approach therapeutic levels with side-effects and interactions as for sulfonamides if large areas of skin are treated.

• INTERACTIONS ▶ Appendix 1: silver sulfadiazine

• SIDE-EFFECTS
  ▶ Common or very common Leucopenia - skin reactions
  ▶ Rare or very rare Argyria (following treatment of large areas of skin or long term use) - renal failure

SIDE-EFFECTS, FURTHER INFORMATION Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

• ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with sensitivity to sulfonamides.

• PREGNANCY
  Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

• BREAST FEEDING
  Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

• HEPATIC IMPAIRMENT
  Manufacturer advises caution in significant hepatic impairment.

• RENAL IMPAIRMENT
  Manufacturer advises caution if significant impairment.

• MONITORING REQUIREMENTS
  Monitor for leucopenia.

• DIRECTIONS FOR ADMINISTRATION Apply with sterile applicator.
2.2 Fungal skin infections

Other drugs used for Fungal skin infections
Hydrocortisone with clotrimazole, p. 1251

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Clotrimazole

- **INDICATIONS AND DOSE**

  **Fungal skin infections**
  - **TO THE SKIN**
  - Child: Apply 2–3 times a day
  - Adult: Apply 2–3 times a day

- **CAUTIONS**
  - Avoid contact with eyes and mucous membranes

- **INTERACTIONS**
  - Contact with eyes and mucous membranes should be avoided
  - Other antifungals should be avoided

- **SIDE-EFFECTS**
  - Oedema, pain, paraesthesia, skin reactions, syncope

- **PREGNANCY**
  - Minimal absorption from skin; not known to be harmful

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Spray may be useful for application of clotrimazole to large or hairy areas of the skin

- **PATIENT AND CARER ADVICE**

### Amorolfine

#### INDICATIONS AND DOSE

**Fungal nail infections**

- **BY TRANSGUNGAL APPLICATION**
  - Child 12-17 years: Apply 1–2 times a week for 6 months to treat fingernails and for toenails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
  - Adult: Apply 1–2 times a week for 6 months to treat fingernails and for toenails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes

#### CAUTIONS

Avoid contact with ears - avoid contact with eyes and mucous membranes - use with caution in child likely to suck affected digits

#### SIDE-EFFECTS

- Rare or very rare Nail discolouration - skin reactions

#### PATIENT AND CARER ADVICE

Avoid nail varnish or artificial nails during treatment.

#### EXCEPTIONS TO LEGAL CATEGORY

In adults Amorolfine nail lacquer can be sold to the public if supplied for the treatment of mild cases of distal and lateral subungual onychomycoses caused by dermatophytes, yeasts and moulds; subject to treatment of max. 2 nails, max. strength of nail lacquer amorolfine 5% and a pack size of 3 mL.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Fungal skin infections 1235

SPECIFIC SIDE-EFFECTS
- Common or very common
- With oral use Appetite decreased· arthralgia· diarrhoea· gastrointestinal discomfort· gastrointestinal disorder· headache· myalgia· nausea
- Uncommon
- With oral use Taste altered· weight decreased
- With topical use Pain
- Rare or very rare
- With oral use Agranulocytosis· alopecia· cutaneous lupus erythematosus· dizziness· hepatic disorders· malaise· neutropenia· photosensitivity reaction· sensation abnormal· severe cutaneous adverse reactions (SCARs)· systemic lupus erythematosus (SLE)· thrombocytopenia· vertigo
- Frequency not known
- With oral use Anaemia· anxiety· depressive symptom· fatigue· fever· hearing impairment· influenza like illness· pancreatitis· pancytopenia· rhombodylosis· serum sickness-like reaction· smell altered· tinnitus· vasculitis· vision disorders
- With topical use Hypersensitivity

SIDE-EFFECTS, FURTHER INFORMATION
Liver toxicity With oral use; discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).

Serious skin reactions With oral use; discontinue treatment in progressive skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis).

PREGNANCY
- With topical use Manufacturer advises use only if potential benefit outweighs risk—animal studies suggest no adverse effects.
- With oral use Manufacturer advises use only if potential benefit outweighs risk—no information available.

BREAST FEEDING
- With topical use Manufacturer advises avoid—present in milk. Less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother’s chest.
- With oral use Avoid—present in milk.

HEPATIC IMPAIRMENT
- With oral use Manufacturer advises avoid (risk of increased exposure).

RENAL IMPAIRMENT
Dose adjustments
- With oral use Use half normal dose if eGFR less than 50 mL/minute/1.73 m² and no suitable alternative available.

MONITORING REQUIREMENTS
- With oral use Monitor hepatic function before treatment and then periodically after 4–6 weeks of treatment—discontinue if abnormalities in liver function tests.

PATIENT AND CARER ADVICE
- With oral use Manufacturer advises that patients should immediately report any signs or symptoms suggestive of liver dysfunction such as pruritus, unexplained persistent nausea, decreased appetite, anorexia, jaundice, vomiting, fatigue, right upper abdominal pain, dark urine, or pale stools. Patients with these symptoms should discontinue taking terbinafine and the patient’s liver function should be immediately evaluated.

EXCEPTIONS TO LEGAL CATEGORY
- With topical use Preparations of terbinafine hydrochloride (maximum 1%) can be sold to the public for use in those over 16 years for external use for the treatment of tinea pedis as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing maximum 30 mL spray or as a gel in a pack containing maximum 30 g gel.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Parasitic skin infections 1237

Malathion 06-Apr-2018

- INDICATIONS AND DOSE
  - Head lice
    - Child: Apply once weekly for 2 doses, rub preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours.
    - Adult: Apply once weekly for 2 doses, rub preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours.
  - Crab lice
    - Child: Apply once weekly for 2 doses, apply preparation over whole body,允许 to dry naturally, wash off after 12 hours or overnight.
    - Adult: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight.

- SIDE-EFFECTS
  - Scabies
    - Child: Apply once weekly for 2 doses, apply preparation over whole body, and wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated.
    - Adult: Apply once weekly for 2 doses, apply preparation over whole body, and wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated.

- CAUTIONS
  - In children Not licensed for use in children under 6 months except under medical supervision.

- IMPORTANT SAFETY INFORMATION
  - MHRA/CHM ADVICE: HEAD LICE ERADICATION PRODUCTS: RISK OF SERIOUS BURNS IF TREATED HAIR IS EXPOSED TO OPEN FLAMES OR OTHER SOURCES OF IGNITION (MARCH 2018)
  - See Skin infections p. 1228.

- UNLICENSED USE
  - In children Not licensed for use in children under 6 months except under medical supervision.

- CAUTIONS
  - Alcoholic lotions not recommended for use in children with severe eczema or asthma, or for scabies or crab lice.

- SIDE-EFFECTS
  - Scalp irritation - skin reactions

- PRESCRIBING AND DISPENSING INFORMATION
  - For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears.

- MEDICINAL FORMS
  - "Mervit" (proprietary) Permethrin 50 mg per 1 gram
  - "Creme Rinse" (proprietary) Permethrin 50 mg per 1 gram

Permethrin 12-Apr-2018

- INDICATIONS AND DOSE
  - Scabies
    - Child: Apply once weekly for 2 doses, apply 5% preparation over whole body including face, neck, scalp and ears then wash off after 8–12 hours. If hands are washed with soap within 8 hours of application, they should be treated again with cream.
  - Crab lice
    - Child: Apply once weekly for 2 doses, apply 5% cream over whole body, allow to dry naturally and wash off after 12 hours or after leaving on overnight.

- UNLICENSED USE
  - In children "Dermal Cream" (scabies), not licensed for use in children under 2 months; not licensed for treatment of crab lice in children under 18 years. "Creme Rinse" (head lice) not licensed for use in children under 6 months except under medical supervision.

- IMPORTANT SAFETY INFORMATION
  - MHRA/CHM ADVICE: HEAD LICE ERADICATION PRODUCTS: RISK OF SERIOUS BURNS IF TREATED HAIR IS EXPOSED TO OPEN FLAMES OR OTHER SOURCES OF IGNITION (MARCH 2018)
  - See Skin infections p. 1228.

- CAUTIONS
  - Avoid contact with eyes - children aged 2 months–2 years, medical supervision required for dermal cream (scabies) - children under 6 months, medical supervision required for cream rinse (head lice) - do not use on broken or secondarily infected skin.

- SIDE-EFFECTS
  - Scalp irritation - skin reactions

- PRESCRIBING AND DISPENSING INFORMATION
  - Manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears.

- MEDICINAL SUITABLE FOR PRESCRIBING
  - "Lyceal" Creme Rinse is less suitable for prescribing.

3 Inflammatory skin conditions

3.1 Eczema and psoriasis

Eczema

Types and management

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic eczema. Atopic eczema is the most common type and it usually involves dry skin as well as infection and lichenification.
eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

**Severe refractory eczema**

Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system. Alitretinoin p. 1262 is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

**Seborrhoeic dermatitis**

Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast Malassezia and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 1233 or coal tar p. 1253) and combinations of mild corticosteroids with suitable antimicrobials are used.

---

**Psoriasis**

**Management**

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

**Emollients**, in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in inflammatory psoriasis and in plaque psoriasis of palms and soles, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for **chronic stable plaque psoriasis** on extensor surfaces of trunk and limbs involves the use of vitamin D analogues, coal tar p. 1253, dithranol p. 1253, and the retinoid tazarotene p. 1262. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

**Scalp psoriasis** is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

**Facial, flexural and genital psoriasis** can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis). Calcipotriol p. 1263 or tacalcitol p. 1264 can be used for longer-term treatment, or if the response to mild or moderate potency topical corticosteroids is inadequate; calcipotriol p. 1263 is more likely to cause irritation. Low strength tar preparations can also be used. Pimecrolimus p. 1255 or tacrolimus p. 1256 by topical application [unlicensed indication] can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread unstable psoriasis of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute inflammatory psoriasis with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency. Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcitriol is an active form of vitamin D. Vitamin D and its analogues are used first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcitriol are less likely to irritate.

**Coal tar** has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes (‘short contact’). Specialist nurses may apply intensive treatment with dithranol paste which is covered by sterile nette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

Tazarotene, a retinoid, has a similar efficacy to vitamin D and its analogues, but is associated with higher incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin; application to the face and in flexures should also be avoided. Tazarotene does not stain and is odourless. A topical corticosteroid is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis) on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures (with a mild or moderate corticosteroid), and psoriasis of the scalp, palms, and soles (with a potent corticosteroid). Very potent corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. Eczema co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.
**Phototherapy**

Phototherapy is available in specialist centres under the supervision of a dermatologist. Ultraviolet B (UVB) radiation is usually effective for chronic stable psoriasis and for guttate psoriasis. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

**Photochemotherapy** combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including localised palmoplantar, pustular psoriasis. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

**Systemic treatment**

**Systemic treatment** is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (such as ciclosporin p. 838 and methotrexate p. 913).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose.

Acitretin p. 1261, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is psoriasis, but it is also used in disorders of keratinisation such as severe Darier’s disease (keratosis follicularis), and some forms of ichthyosis. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. The manufacturers of acitretin do not recommend continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Acitretin is teratogenic, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

**Topical treatment**

The vitamin D and analogues, calcipotriol p. 1263, calcitriol p. 1263, and tacalcitol p. 1264 are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia).

**Eczema and psoriasis, drugs affecting the immune response**

**Overview**

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

Pimecrolimus p. 1255 by topical application is licensed for mild to moderate atopic eczema. Tacrolimus p. 1256 is licensed for topical use in moderate to severe atopic eczema. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. Topical tacrolimus and pimecrolimus have a role in the treatment of psoriasis.

A short course of a systemic corticosteroid can be given for eczema flares that have not improved despite appropriate topical treatment.

Ciclosporin p. 838 by mouth can be used for severe psoriasis and for severe eczema. Azathioprine p. 836 or mycophenolate mofetil p. 846 are used for severe refractory eczema [unlicensed indication]. Dupilumab p. 1257 is licensed for the treatment of moderate to severe atopic eczema in patients requiring systemic therapy. Dimethyl fumarate p. 853 is licensed for the treatment of moderate to severe plaque psoriasis.

Methotrexate p. 913 can be used for severe psoriasis, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 1025 should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

Etanercept p. 1113, adalimumab p. 1108, and infliximab p. 1116 inhibit the activity of tumour necrosis factor (TNFs). They are used for severe plaque psoriasis either refractory to at least 2 standard systemic treatments and phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required. Secukinumab p. 1100 and ixekizumab p. 1259 inhibit the activity of interleukin-17A, brodalumab p. 1257 inhibits the activity of interleukin-17A and guselkumab p. 1258 inhibits the activity of interleukin-23. They are used for moderate to severe plaque psoriasis in patients who are candidates for systemic therapy. Secukinumab is also licensed for psoriatic arthritis and ankylosing spondylitis. Ustekinumab p. 1103 (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for severe plaque psoriasis that has not responded to at least 2 standard systemic treatments and phototherapy, or when these treatments cannot be used because of intolerance or contra-indications.

Adalimumab is also licensed for the treatment of active moderate to severe hidradenitis suppurativa (acne inversa) in patients who have had inadequate response to conventional systemic therapy. Adalimumab, etanercept, infliximab, ixekizumab and ustekinumab are also licensed for psoriatic arthritis.

**Other drugs used for Eczema and psoriasis**

Apremilast, p. 1119 - Certolizumab pegol, p. 1111
CORTICOSTEROIDS

Topical corticosteroids

Overview
Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema, contact dermatitis, insect stings, and eczema of scabies. Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are not recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). See the role of topical corticosteroids in the treatment of psoriasis.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus, and palmoplantar pustulosis. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing’s syndrome, depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion.

Choice of formulation
Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. Occlusive polythene or hydrocolloid dressings increase absorption, but also increase the risk of side effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF publications topical corticosteroids for the skin are categorised as ‘mild’, ‘moderately potent’, ‘potent’ or ‘very potent’; the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

Absorption through the skin
Mild and moderately potent topical corticosteroids are associated with few side-effects but care is required in the use of potent and very potent corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing’s syndrome, depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion.

Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

These amounts are usually suitable for an adult for a single daily application for 2 weeks.

Compound preparations
The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid p. 1286 facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

Topical corticosteroid preparation potencies
Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

Mild
- Hydrocortisone 0.1–2.5%
- Dioderm
- Mildison
- Synalar 1 in 10 dilution

Mild with antimicrobials
- Canesten HC
- Daktacort
- Econacort
- Fucidin H
- Nystaform-HC
- Terra-Cortril
- Timodine

Moderate
- Betnovate-RD
- Eumovate
- Haelan
- Modrasone
- Synalar 1 in 4 Dilution
- Ultralanum Plain

Moderate with antimicrobials
- Trimovate

Moderate with urea:
- Alphaderm

Potent with salicylic acid
- Diprosalic

Very potent
- Clarelux
- Dermovate
- Etrivex
- Nerisone Forte

Very potent with antimicrobials
- Cloetasol with neomycin and nystatin

Use in children
Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% is useful for treating nappy rash and hydrocortisone 1% for atopic eczema in childhood. A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient’s condition.

Corticosteroids (topical)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROID: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

CONTRA-INDICATIONS
- Acne - perioral dermatitis - potent corticosteroids in widespread plaque psoriasis - rosacea (in adults) - untreated bacterial, fungal or viral skin lesions

CAUTIONS
- Avoid prolonged use (particularly on the face) - cautions applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use.
- Dermatoses of infancy, including nappy rash (extreme caution required—treatment should be limited to 5–7 days) (in children) - infection - keep away from eyes.
- Use potent or very potent topical corticosteroids under specialist supervision (in children) - use potent or very potent topical corticosteroids under specialist supervision in psoriasis (can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity) (in adults)

SIDE-EFFECTS
- Uncommon - Adrenal suppression - hypertrichosis - skin depigmentation (may be reversible)
- Frequency not known - Local reaction

SIDE-EFFECTS, FURTHER INFORMATION
- Side-effects applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use. In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.

DIRECTIONS FOR ADMINISTRATION
- Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a fingertip unit (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.
- In children ‘Wet-wrap bandaging’ increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.

PRESCRIBING AND DISPENSING INFORMATION
- The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

PATIENT AND CARER ADVICE
- Patients or carers should be given advice on how to administer corticosteroid creams and ointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.
**Alclometasone dipropionate**

**INDICATIONS AND DOSE**

Inflammatory skin disorders such as eczemas

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly
  - Adult: Apply 1–2 times a day, to be applied thinly

**POTENCY**

- Alclometasone dipropionate cream 0.05%: moderate

**UNLICENSED USE**

- In children: Licensed for use in children (age range not specified by manufacturer).

**SIDE-EFFECTS**

- Vasodilation

**PATIENT AND CARER ADVICE**

- Patients or carers should be counselled on the application of alclometasone dipropionate cream.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

  - **Cream**
    - CAUTIONARY AND ADVISORY LABELS 15, 28
    - EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol
    - Alclometasone dipropionate (Non-proprietary)
    - Alclometasone dipropionate 500 microgram per 1 gram Boots Derma Care Eczema & Dermatitis Flare-Up 0.05% cream
    - 15 gram

**Betamethasone**

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly
  - Adult: Apply 1–2 times a day, to be applied thinly

**POTENCY**

- Betamethasone valerate 0.025% cream and ointment: moderate. Betamethasone valerate 0.1% cream, lotion, ointment, and scalp application: potent. Betamethasone valerate 0.12% foam: potent. Betamethasone dipropionate 0.05% cream, lotion, and ointment: potent.

**UNLICENSED USE**

- In children: Betacap®️, Betnovate®️ and Betnovate-RD®️ are not licensed for use in children under 1 year. Bettamousse®️ is not licensed for use in children under 6 years.

**CAUTIONS**

- Use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression

**INTERACTIONS**

- Appendix 1: corticosteroids

**SIDE-EFFECTS**

- Vasodilatation

**PATIENT AND CARER ADVICE**

- Patient counselling is advised for betamethasone cream, ointment, scalp application and foam (application).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, foam.

  - **Cream**
    - CAUTIONARY AND ADVISORY LABELS 15, 28

**Calcipotriol with betamethasone**

30-May-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcipotriol p. 1263, betamethasone p. 1243.

**INDICATIONS AND DOSE**

**DOVOBET® GEL**

Scalp psoriasis

- **TO THE SKIN**
  - Adult: Apply 1–4 g once daily usual duration of therapy 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, shampoo off after leaving on scalp overnight or during day, when different preparations containing calcipotriol used together, maximum total calcipotriol 5 mg in any one week.

Mild to moderate plaque psoriasis

- **TO THE SKIN**
  - Adult: Apply once daily for 8 weeks; if necessary, treatment may be continued beyond 8 weeks or repeated, on the advice of a specialist, apply to maximum 30% of body surface, when different preparations containing calcipotriol used together.

max. total calcipotriol 5 mg in any one week; maximum 15 g per day

**DOVOBET® OINTMENT**

Stable plaque psoriasis

- **TO THE SKIN**
  - Adult: Apply once daily for 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, apply to maximum 30% of body surface, when different preparations containing calcipotriol used together, maximum total calcipotriol 5 mg in any one week; maximum 15 g per day.

**ENTSTILAR®**

Psoriasis

- **TO THE SKIN**
  - Adult: Apply once daily to be applied to the affected area for up to 4 weeks—consult product literature for further information; maximum 15 g per day

- **CONTRA-INDICATIONS**

**ENTSTILAR®**

Erythrodermic psoriasis - pustular psoriasis

**INTERACTIONS**

- Appendix 1: corticosteroids - vitamin D substances

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (September 2016) that calcipotriol with betamethasone (Entstilar®) is accepted for use within NHS Scotland for the treatment of psoriasis vulgaris.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxytoluene

  - Combinations available: Clobetasol propionate with neomycin sulphate and nystatin, p. 1250

**Clobetasone butyrate**

**INDICATIONS AND DOSE**
- **Eczemas and dermatitis of all types**
  - Maintenance between courses of more potent corticosteroids
  - **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly
  - Adult: Apply 1–2 times a day, to be applied thinly

**POTENCY**
- Clobetasone butyrate 0.05% cream and ointment: moderate.

**DIFFICORTOLONE VALERATE**

**INDICATIONS AND DOSE**
- Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (using 0.3% diflucortolone valerate) | Short-term treatment of severe exacerbations (using 0.3% diflucortolone valerate) | Psoriasis (using 0.3% diflucortolone valerate)
  - **TO THE SKIN**
  - Child 4–17 years: Apply 1–2 times a day for up to 2 weeks, reducing strength as condition responds, to be applied thinly; maximum 60g per week
  - Adult: Apply 1–2 times a day for up to 2 weeks, reducing strength as condition responds, to be applied thinly; maximum 60g per week

**SEVERE INFAMMATORY SKIN DISORDERS**
- Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (using 0.1% diflucortolone valerate) | Psoriasis (using 0.1% diflucortolone valerate)
  - **TO THE SKIN**
  - Child: Apply 1–2 times a day for up to 4 weeks, to be applied thinly
  - Adult: Apply 1–2 times a day for up to 4 weeks, to be applied thinly

**POTENCY**
- Diflucortolone valerate 0.1% cream and ointment: potent.
- Diflucortolone valerate 0.3% cream and ointment: very potent.

**UNLICENSED USE**
- In children. Neresine® licensed for use in children (age range not specified by manufacturer); Neresone Forte® not licensed for use in children under 4 years.

**HAELAN® TAPE**

**CHRONIC LOCALISED RECALCITRANT DERMATOSES (BUT NOT ACUTE OR WEPPING)**

• **TO THE SKIN**
  » Child: Cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily
  » Adult: Cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily

**UNLICENSED USE**

• In children: Licensed for use in children (age range not specified by manufacturer).

**SIDE-EFFECTS**

Cushing’s syndrome - increased risk of infection - vasodilation

**PATIENT AND CARER ADVICE**

Patients or carers should be counselled on application of fludroxy cortide cream and ointment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

---

**Hydrocortisone**

21-Dec-2017

**DRUG ACTION** Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

**INDICATIONS AND DOSE** Mild inflammatory skin disorders such as eczemas

▶ TO THE SKIN

Child: Apply 1–2 times a day, to be applied thinly

Adult: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Hydrocortisone cream and ointment 0.5 to 2.5%: mild

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS** Vasodilation

**PRESCRIBING AND DISPENSING INFORMATION** When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied. Although Dioderm™ contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP.

**PATIENT AND CARER ADVICE** Patient counselling is advised for hydrocortisone cream and ointment (application).

**PROFESSION SPECIFIC INFORMATION** Dental practitioners’ formulation Hydrocortisone Cream 1% 15 g may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY** Over-the-counter hydrocortisone preparations Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema in patients over 10 years, to be applied sparingly over the affected area 1–2 times daily for no longer than 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete’s foot).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Cream**

**CAUTIONARY AND ADVISORY LABELS** 28

**EXCIPIENTS** May contain Benzyl alcohol, cetylstearyl alcohol (including lanolin), propylene glycol, salicylic acid, water.

**Hydrocortisone (Non-proprietary)**

Hydrocortisone 5 mg per 1 gram Hydrocortisone 0.5% cream | 15 gram (£44.00 DT) = £11.01 | 30 gram (£82.02 DT) = £88.00

Hydrocortisone 10 mg per 1 gram Hydrocortisone 1% cream | 15 gram (£105.00 DT) = £10.94 | 30 gram (£233.83 DT) = £11.88

Hydrocortisone 25 mg per 1 gram Hydrocortisone 2.5% cream | 15 gram (£234.00 DT) = £14.15 | 30 gram (£468.00 DT) = £10.74–£18.00

Betamethasone with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1243, salicylic acid p. 1286.

- **INDICATIONS AND DOSE**
  - DIPROSALIC® OINTMENT
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
  - TO THE SKIN
  - Child: Apply 1–2 times a day, max. 60 g per week
  - Adult: Apply 1–2 times a day, max. 60 g per week

- **POTENCY**
  - Betamethasone (as dipropionate) 0.05% with salicylic acid 3%: potent.

- **DIPROSALIC® SCALP APPLICATION**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
  - TO THE SKIN
  - Child: Apply 1–2 times a day, apply a few drops
  - Adult: Apply 1–2 times a day, apply a few drops
### Clobetasol propionate with neomycin sulfate and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasol propionate p. 1244, neomycin sulfate p. 1230.

#### INDICATIONS AND DOSE

Short-term treatment only of severe resistant inflammatory skin disorders such as calciritant eczemas associated with infection and unresponsive to less potent corticosteroids / Psoriasis associated with infection

- **TO THE SKIN**
- Adult: (consult product literature)

#### POTENCY

- Clobetasol propionate 0.05% with neomycin sulfate and nystatin cream and ointment: very potent.

#### INTERACTIONS

- Appendix 1: neomycin

#### PATIENT AND CARER ADVICE

- Patients or carers should be advised on application of clobetasol propionate, neomycin sulfate and nystatin containing preparations.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Fluocinolone acetonide with clioquinol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1246.

#### INDICATIONS AND DOSE

Inflammatory skin disorders such as eczemas associated with infection / Psoriasis associated with infection

- **TO THE SKIN**
- Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

#### POTENCY

- Clioquinol 3% with fluocinolone acetonide 0.025% cream and ointment: potent

#### INTERACTIONS

- Appendix 1: fluocinolone

#### PATIENT AND CARER ADVICE

Patient counselling is advised for clioquinol with fluocinolone acetonide cream and ointment (application). Ointment stains clothing.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Fluocinolone acetonide with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1246, neomycin sulfate p. 1230.

**INDICATIONS AND DOSE**
Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection
- **TO THE SKIN**
  - Child 1-7 years: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
  - Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

**POTENCY**
- Fluocinolone acetonide 0.025% with neomycin 0.5% cream and ointment: potent.

**INTERACTIONS** → Appendix 1: fluocinolone · neomycin

**PATIENT AND CARER ADVICE** Patients or carers should be counselled on the application of fluocinolone acetonide with neomycin preparations.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Ointment
- **CAUTIONARY AND ADVISORY LABELS** 28
  - SYNALAR N: May contain Propylene glycol, woolfat and related substances (including lanolin).
  - SYNALAR N (Reg Jofre UK Ltd)
  - Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram SYNALAR N ointment | 30 gram [POT] £4.36

Hydrocortisone with benzalkonium chloride, dimeticone and nystatin

15-Mar-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, dimeticone p. 1236.

**INDICATIONS AND DOSE**
Mild inflammatory skin disorders such as eczemas associated with infection
- **TO THE SKIN**
  - Child: Apply 3 times a day until lesion has healed, to be applied thinly
  - Adult: Apply 3 times a day until lesion has healed, to be applied thinly

**POTENCY**
- Benzalkonium with dimeticone, hydrocortisone acetate 0.5%, and nystatin cream: mild.

**INTERACTIONS** → Appendix 1: corticosteroids

**PATIENT AND CARER ADVICE** Patients or carers should be advised on application of benzalkonium with dimeticone and hydrocortisone and nystatin preparations.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Cream
- **CAUTIONARY AND ADVISORY LABELS** 28
  - EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sodium metabisulphite, sorbic acid
  - TIMODINE (Alliance Pharmaceuticals Ltd)
  - Benzalkonium chloride 1 mg per 1 gram, Hydrocortisone 5 mg per 1 gram, Dimeticone 350 100 mg per 1 gram, Nystatin 100000 unit per 1 gram TIMODINE cream | 30 gram [POT] £3.37

Hydrocortisone with chlorhexidine hydrochloride and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, chlorhexidine p. 1277.

**INDICATIONS AND DOSE**
Mild inflammatory skin disorders such as eczemas
- **TO THE SKIN**
  - Child: To be applied thinly (consult product literature)
  - Adult: To be applied thinly (consult product literature)

**POTENCY**
- Hydrocortisone 0.5% with chlorhexidine hydrochloride 1% and nystatin cream: mild
- Hydrocortisone 1% with chlorhexidine hydrochloride 1% and nystatin ointment: mild

**INTERACTIONS** → Appendix 1: corticosteroids

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on application of chlorhexidine hydrochloride with hydrocortisone and nystatin preparations.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Ointment
- **CAUTIONARY AND ADVISORY LABELS** 28
  - HYDROCORTISONE WITH CHLORHEXIDINE HYDROCHLORIDE AND NYSTATIN (Non-proprietary)
    - Chlorhexidine acetate 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystatin 100,000 units/g / Chlorhexidine acetate 1% / Hydrocortisone 1% ointment | 30 gram [POT] £5.29 DT = £5.29

Cream
- **CAUTIONARY AND ADVISORY LABELS** 28
  - EXCIPIENTS: May contain Benzy1 alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
  - Hydrocortisone with chlorhexidine hydrochloride and nystatin (Non-proprietary)
    - Hydrocortisone 5 mg per 1 gram, Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystatin 100,000 units/g / Chlorhexidine hydrochloride 1% / Hydrocortisone 0.5% cream | 30 gram [POT] £5.29 DT + £5.29

Hydrocortisone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, clotrimazole p. 1232.

**INDICATIONS AND DOSE**
Mild inflammatory skin disorders such as eczemas (associated with fungal infection)
- **TO THE SKIN**
  - Child: (consult product literature)
  - Adult: (consult product literature)

**POTENCY**
- Clotrimazole with hydrocortisone 1% cream: mild

**INTERACTIONS** → Appendix 1: antifungals, azoles · corticosteroids

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clotrimazole with hydrocortisone cream.

**EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube is on sale to the public for the treatment of athlete’s foot and fungal infection of skin folds with associated inflammation in patients 10 years and over.
Hydrocortisone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, fusidic acid p. 571.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **CAUTIONARY AND ADVISORY LABELS** 28
    - EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including ceteryl and stearyl alcohol)
    - Canesten HC (Bayer plc)
      - Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram Canesten HC cream | 30 gram | £2.42 DT = £2.42

Hydrocortisone with miconazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, miconazole p. 1233.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **CAUTIONARY AND ADVISORY LABELS** 28
    - EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including ceteryl and stearyl alcohol), polysorbates, potassium sorbate
      - Fucidin H (Fusidic acid / Hydrocortisone) (LEO Pharma)
      - Hydrocortisone acetate 10 mg per 1 gram, Fusidic acid 20 mg per 1 gram Fucidin H cream | 30 gram | £6.02 DT = £6.02
      - 60 gram | £12.05 DT = £12.05

- **INTERACTIONS** → Appendix 1: antifungals, azoles - corticosteroids
- **PATIENT AND CARER ADVICE** Patients or carers should be advised on the application of hydrocortisone with fusidic acid preparations.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS** 28
      - Daktacort (McNeil Products Ltd, Janssen-Cilag Ltd)
      - Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Daktacort ointment | 30 gram | £2.42 DT = £2.42

Hydrocortisone with oxymetazoline

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, oxymetazoline p. 567.

- **INDICATIONS AND DOSE** Mild inflammatory skin disorders such as eczemas
  - TO THE SKIN
    - Child: To be applied thinly (consult product literature)
    - Adult: To be applied thinly (consult product literature)
  - POTENCY
    - Hydrocortisone with oxymetazoline cream: mild
- **INTERACTIONS** → Appendix 1: corticosteroids - oxymetazoline
- **PATIENT AND CARER ADVICE** Patients should be given advice on the application of hydrocortisone with oxymetazoline ointment.

ICHTHAMMOL

- **INDICATIONS AND DOSE** Chronic ichthyosis
  - TO THE SKIN
    - Child 1-17 years: Apply 1–3 times a day
    - Adult: Apply 1–3 times a day
- **UNLICENSED USE** In children No information available.
- **SIDE-EFFECTS** Skin irritation
Ichthammol with zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, ichthammol p. 1252.

**INDICATIONS AND DOSE**

**Chronic lichenified eczema**
- **TO THE SKIN**
- **Adults:** (consult product literature)

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Impregnated dressing**
- **Ichthopaste** (Evolan Pharma AB)
  Ichthopaste bandage 7.5cm × 6m | 1 bandage £3.78

**DERMATOLOGICAL DRUGS** ANTRACEN

**DERIVATIVES**

**Dithranol** (Anthralin)

**INDICATIONS AND DOSE**

**Subacute and chronic psoriasis**
- **TO THE SKIN**
- **Adults:** (consult product literature)

**DITHROCREAM®**

**Subacute and chronic psoriasis**
- **TO THE SKIN**
- **Adults:** For application to skin or scalp, 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)

**MICANOL®**

**Subacute and chronic psoriasis**
- **TO THE SKIN**
- **Adults:** Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

**CONTRA-INDICATIONS** Acute and pustular psoriasis - hypersensitivity

**CAUTIONS** Avoid sensitive areas of skin - avoid use near eyes

**SIDE-EFFECTS** Skin reactions

**PREGNANCY** No adverse effects reported.

**BREAST FEEDING** No adverse effects reported.

**DIRECTIONS FOR ADMINISTRATION** When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.

**MICANOL®** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.

**PRESCRIBING AND DISPENSING INFORMATION** Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance.

**PATIENT AND CARER ADVICE** Dithranol can stain the skin, hair and fabrics.

**EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

- **Dithrocream (Dermal Laboratories Ltd)**
  Dithranol 1 mg per 1 gram Dithrocream 0.1% cream | 50 gram | £3.77 DT + £3.77
  Dithranol 2.5 mg per 1 gram Dithrocream 0.25% cream | 50 gram | £4.04 DT + £4.04
  Dithranol 5 mg per 1 gram Dithrocream 0.5% cream | 50 gram | £4.66 DT + £4.66
  Dithranol 10 mg per 1 gram Dithrocream 1% cream | 50 gram | £5.42 DT + £5.42
  Dithranol 20 mg per 1 gram Dithrocream 2% cream | 50 gram | £7.49 DT + £6.79

Combinations available: Coal tar with dithranol and salicylic acid, p. 1254

**Dithranol with salicylic acid and zinc oxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dithranol above, salicylic acid p. 1286.

**INDICATIONS AND DOSE**

**Subacute and chronic psoriasis**
- **TO THE SKIN**
- **Adult:** (consult local protocol)

**MEDICINAL FORMS** Forms available from special-order manufacturers include: ointment, paste

**DERMATOLOGICAL DRUGS** TARS

**Coal tar**

**INDICATIONS AND DOSE**

**Psoriasis | Chronic atopic eczema**
- **TO THE SKIN USING PASTE**
  - **Child:** Apply 1–3 times a day, start application with low-strength preparations
  - **Adult:** Apply 1–3 times a day, start application with low-strength preparations
- **TO THE SKIN**
  - **Child:** 100 mL/bath, to be added to an adult sized bath; add proportionally less for a child’s bath. Use Coal Tar Solution BP
  - **Adult:** 100 mL/bath, to be added to an adult sized bath. Use Coal Tar Solution BP

**ALPHOSYL 2 IN 1® SHAMPOO**

**Psoriasis | Seborrhoeic dermatitis | Scaling | Itching**
- **TO THE SKIN**
  - **Adult:** Apply every 2–3 days

**Dandruff**
- **TO THE SKIN**
  - **Adult:** Apply 1–2 times a week as required

www.getintopharma.com
**Coal tar with coconut oil and salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253, salicylic acid p. 1286.

**INDICATIONS AND DOSE**

- Scaly scalp disorders | Psoriasis | Seborrhoeic dermatitis | Dandruff | Cradle cap
  - TO THE SKIN USING SHAMPOO
    - Child: Apply daily as required
    - Adult: Apply daily as required

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Shampoo**

- Capasal (Dermal Laboratories Ltd)
  - Salicylic acid 5 mg per 1 gram, Coal tar distilled 10 mg per 1 gram, Coconut oil 10 mg per 1 gram
  - Capasal Therapeutic shampoo | 250 ml (£4.69)

**Coal tar with dithranol and salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253, dithranol p. 1253, salicylic acid p. 1286.

**INDICATIONS AND DOSE**

- Subacute and chronic psoriasis
  - TO THE SKIN
    - Child: Apply up to twice daily
    - Adult: Apply up to twice daily

**UNLICENSED USE**

- In children Psorin® is licensed for use in children (age range not specified by manufacturer).

**MEDICINAL FORMS**

- Forms available from special-order manufacturers include: ointment

**Coal tar with lecithin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253.

**INDICATIONS AND DOSE**

- Psoriasis
  - TO THE SKIN
  - Adult: Apply 1–2 times a day

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS:
NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS

See Emollient and barrier preparations p. 1221.

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Calamine and Coal Tar Ointment BP, consists of calamine 12.5 g, strong coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g.
ECZEMA AND PSORIASIS

**Coal tar with salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253, salicylic acid p. 1286.

- **INDICATIONS AND DOSE**
  - Psoriasis | Chronic atopic eczema
  - **Adult:** Apply 1–2 times a day
  - **Child:** Apply once weekly as required

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS

See Emollient and barrier preparations p. 1221.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - When prepared extemporaneously, the BP states Coal Tar and Salicylic Acid Ointment, BP consists of coal tar 2 g, salicylic acid 2 g, emulsifying wax 11.4 g, white soft paraffin 19 g, coconut oil 54 g, polysorbate ‘80’ 4 g,liquid paraffin 7.6 g.

- **MEDICINAL FORMS**

**Coal tar with salicylic acid and precipitated sulfur**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253, salicylic acid p. 1286.

- **INDICATIONS AND DOSE**
  - **COCOIS® OINTMENT**
    - Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff
      - **INITIALLY TO THE SKIN USING SCALP OINTMENT**
      - **Child 6-11 years:** Medical supervision required
      - **Child 12-17 years:** Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
      - **Adult:** Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
  - **SEBCO® OINTMENT**
    - Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff
      - **INITIALLY TO THE SKIN USING SCALP OINTMENT**
      - **Child 6-11 years:** Medical supervision required
      - **Child 12-17 years:** Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
      - **Adult:** Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

- **MEDICINAL FORMS**
  - Ointment

**Pimecrolimus**

- **INDICATIONS AND DOSE**
  - Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)
    - **TO THE SKIN**
    - **Adult:** Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)
  - Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated by a specialist)
    - **TO THE SKIN**
    - **Adult:** Apply twice daily until symptoms resolve (maximum duration of treatment 4 weeks)

- **UNLICENSED USE**
  - Pimecrolimus is not licensed for short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy.

- **CONTRA-INDICATIONS**
  - Application to malignant or potentially malignant skin lesions - application under occlusion - congenital epidermal barrier defects - contact with eyes - contact with mucous membranes - generalised erythroderma - immunodeficiency - infection at treatment site

- **CAUTIONS**
  - Alcohol consumption (risk of facial flushing and skin irritation) - avoid other topical treatments except emollients at treatment site - UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS**
  - Appendix 1: pimecrolimus

**Coal tar with zinc oxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253.

- **INDICATIONS AND DOSE**
  - Psoriasis | Chronic atopic eczema
  - **Adult:** Apply 1–2 times a day
  - **Child:** Apply 1–2 times a day

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS

See Emollient and barrier preparations p. 1221.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - No preparations available—when prepared extemporaneously, the BP states Zinc and Coal Tar Paste, BP consists of zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%.

- **MEDICINAL FORMS**
  - Ointment, paste

**IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS**
Side-effects

- Common or very common Increased risk of infection
- Rare or very rare Skin discoloration
- Frequency not known Skin papilloma

Pregnancy
Manufacturer advises avoid; toxicity in animal studies following systemic administration.

Breast-feeding
Manufacturer advises caution; ensure infant does not come in contact with treated areas.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82
  
  Tacrolimus 0.03% ointment to be applied thinly, reduce to once daily or switch to twice weekly.
  
  Topical tacrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).
  
  Topical tacrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years. Tacrolimus should be used within its licensed indications.
  
  www.nice.org.uk/TA82

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

- CAUTIONARY AND ADVISORY LABELS 4, 11, 28
- EXCIPIENTS: May contain Benzyl alcohol, ceteareth alcohol (including cetyl and stearyl alcohol), propylene glycol
  
  ▶ Elidel (Meda Pharmaceuticals Ltd)
  
  Pimecrolimus 10 mg per 1 gram. Elidel 1% cream | 30 gram POM £19.69 DT = £38.69 | 60 gram POM £37.41 DT = £74.81 |
  
  100 gram POM £59.07 DT = £59.07

DRUG ACTION

- Tacrolimus is a calcineurin inhibitor.

INDICATIONS AND DOSE

Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (initiated by a specialist)

- TO THE SKIN
  
  Adult: Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or 0.03% ointment if condition allows

Prevention of flares in patients with moderate to severe atopic eczema and experience in treating atopic eczema with systemic therapy (initiated under specialist supervision)

- TO THE SKIN
  
  Adult: Apply twice weekly, 0.1% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated under specialist supervision)

- TO THE SKIN
  
  Adult: Apply twice daily until symptoms resolve, 0.1% ointment to be applied thinly, reduce to once daily or switch to 0.03% ointment if condition allows, maximum duration of treatment 4 weeks

UNLICENSED USE

Short-term treatment of facial, flexural, or genital psoriasis is unlicensed.

CONTRA-INDICATIONS

Application to malignant or potentially malignant skin lesions - application under occlusion - avoid contact with eyes - avoid contact with mucous membranes - congenital epidermal barrier defects - generalised erythroderma - immunodeficiency - infection at treatment site

CAUTIONS

- UV light (avoid excessive exposure to sunlight and sunlamps)

INTERACTIONS

▶ Appendix 1: tacrolimus

SIDE-EFFECTS

- Common or very common Alcohol intolerance - increased risk of infection - sensation abnormal - skin reactions
- Uncommon Lymphadenopathy
- Frequency not known Malignancy - neoplasms

ALLERGY AND CROSS-SENSITIVITY

Contra-indicated if history of hypersensitivity to macrolides.

Pregnancy

Manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration.

Breast-feeding

Avoid - present in breast milk (following systemic administration).

Hepatic impairment

Manufacturer advises caution in hepatic failure.

PATIENT AND CARER ADVICE

Avoid excessive exposure to UV light including sunlight.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82
  
  Topical tacrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).
  
  Topical tacrolimus is recommended as an option for the second-line treatment for moderate to severe atopic eczema in adults and children over 2 years. Tacrolimus should be used within its licensed indications.
  
  www.nice.org.uk/guidance/TA82

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (April 2010) that tacrolimus 0.1% ointment (Protopic®) is accepted for restricted use within NHS Scotland for the prevention of flares in patients aged 16 years and over with moderate-to-severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with a specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

- CAUTIONARY AND ADVISORY LABELS 4, 11, 28
- EXCIPIENTS: May contain Beeswax
  
  ▶ Tacrolimus (Non-proprietary)
  
  Tacrolimus (as Tacrolimus monohydrate) 1 mg per gram

IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

**Brodalumab**

- **DRUG ACTION** Brodalumab is a recombinant human monoclonal antibody that binds with high affinity to interleukin-17RA and blocks the activity of pro-inflammatory cytokines.

- **INDICATIONS AND DOSE**
  - **Moderate-to-severe plaque psoriasis (under expert supervision)**
    - **BY SUBCUTANEOUS INJECTION**
    - Adult: 210 mg every week for 3 doses, followed by 210 mg every 2 weeks, consider discontinuing treatment if no response after 16 weeks

- **CONTRA-INDICATIONS**
  - Active Crohn’s disease - clinically significant active infection

- **CAUTIONS**
  - Chronic infection - history of Crohn’s disease (monitor for exacerbations) - history of depressive disorders (discontinue if new or worsening symptoms develop) - history of recurrent infection - history of suicidal ideation or behaviour (discontinue if new or worsening symptoms develop)

- **SIDE-EFFECTS**
  - Common or very common: Headache, fatigue, injection site pain, myalgia
  - Uncommon: Meningitis, Crohn’s disease, arthralgia

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises avoid, limitations may exist if they are brought up-to-date with current immunisation schedule before initiating treatment.

- **INTERACTIONS**
  - Appendix 1: monoclonal antibodies

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Kyntheum (LEO Pharma): 280 mg/2 ml injection pre-filled syringes | 2 pre-filled disposable injection | £1,280.00

**Dupilumab**

- **DRUG ACTION** Dupilumab is a recombinant human monoclonal antibody that inhibits interleukin-4 and interleukin-13 signaling; these cytokines are involved in atopic eczema.

- **INDICATIONS AND DOSE**
  - **Moderate-to-severe atopic eczema (specialist use only)**
    - **BY SUBCUTANEOUS INJECTION**
    - Adult: Initially 600 mg, followed by 300 mg every 2 weeks, if the psoriasis has not responded adequately, as defined:
      - a 75% reduction in the PASI score (PASI 75) from when treatment started, or
      - a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI, or these options are contra-indicated or not tolerated, and
      - the manufacturer provides the drug with the discount agreed in the patient access scheme.

- **SIDE-EFFECTS**
  - Common: Headache, nasopharyngitis, injection site reactions

- **CAUTIONS**
  - Asthma—consult product literature: helminth infection

**BNF 78**

---

**Ecema and psoriasis**

©getintopharma.com
**1258 Inflammatory skin conditions**

**Guselkumab**

**06-Jul-2018**

- **DRUG ACTION** Guselkumab is a recombinant human monoclonal antibody that binds selectively to interleukin-23 and blocks the activity of pro-inflammatory cytokines.

- **INDICATIONS AND DOSE**
  - **Moderate-to-severe plaque psoriasis (specialist use only)**
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: Initially 100 mg, then 100 mg after 4 weeks, then maintenance 100 mg every 8 weeks, consider discontinuation if no response after 16 weeks

- **CONTRA-INDICATIONS** Clinically significant active infection

- **CAUTIONS** Risk of infection

- **CAUTIONS, FURTHER INFORMATION**
  - Risk of infection: Manufacturer advises consider anti-tuberculosis therapy before initiation of guselkumab in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed. Manufacturer advises consider completion of appropriate immunisations according to current guidelines before initiating treatment (consult product literature for appropriate interval between vaccination and administration of guselkumab).

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**
  - Common or very common: Arthralgia, diarrhoea, headache, increased risk of infection, urticaria

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 12 weeks after treatment.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid during treatment and for up to 12 weeks after discontinuing treatment—no information available.

- **PRE-TREATMENT SCREENING** Manufacturer advises that patients should be evaluated for tuberculosis infection before treatment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of active tuberculosis during and after treatment.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to avoid injecting into areas of the skin that show psoriasis. Patients may self-administer Tremfya 
  - after appropriate training in subcutaneous injection technique.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light.

- **PATIENT AND CARER ADVICE**
  - Manufacturer advises patients and their carers should be advised to seek medical attention if signs or symptoms of infection occur (monitor closely and suspend treatment if infection is clinically significant or unresponsive to treatment). Self-administration: Manufacturer advises patients may self-administer following training in subcutaneous injection technique.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**
  - Guselkumab is recommended as an option for treating moderate to severe plaque psoriasis in adults, only if:
    - the disease is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a
Dermatology Life Quality Index (DLQI) of more than 10, and
- the disease has not responded to other systemic therapies, including ciclosporin, methotrexate and PUVA (psoralen and long-wave ultraviolet A radiation), or these options are contra-indicated or not tolerated, and
- the manufacturer provides the drug according to the commercial arrangement.

Stop guselkumab treatment at 16 weeks if the psoriasis has not responded adequately. An adequate response is defined as:
- a 75% reduction in the PASI score (PASI 75) from when treatment started, or
- a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta452

**SCOTTISH MEDICINES CONSORTIUM (SMC) DECISIONS**

SMC No. 1340/18

The Scottish Medicines Consortium has advised (June 2018) that guselkumab (Tremfya®) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe plaque psoriasis in adults who have failed to respond to conventional systemic therapies (including ciclosporin, methotrexate and phototherapy), are intolerant to, or have a contra-indication to these treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Tremfya (Janssen-Cilag Ltd)**
  - Guselkumab 100 mg per 1 ml Tremfya 100 mg/1 ml solution for injection pre-filled pens | 1 pre-filled disposable injection | £2,250.00
  - Tremfya 100 mg/1 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £2,250.00

**Ixeikizumab**

26-Jun-2017

**DRUG ACTION** Ixeikizumab is a human monoclonal antibody that binds to interleukin-17A and inhibits the release of pro-inflammatory cytokines and chemokines.

**INDICATIONS AND DOSE**

Moderate-to-severe plaque psoriasis (under expert supervision) / Psoriatic arthritis with concomitant moderate-to-severe plaque psoriasis (under expert supervision)

- **BY SUBCUTANEOUS INJECTION**
  - **Adults** Initially 160 mg for 1 dose, followed by 80 mg after 2 weeks, then 80 mg every 2 weeks for 5 further doses (at weeks 4, 6, 8, 10 and 12), then maintenance 80 mg every 4 weeks, consider discontinuation of treatment if no response after 16–20 weeks

Psoriatic arthritis (under expert supervision)

- **BY SUBCUTANEOUS INJECTION**
  - **Adults** Initially 160 mg for 1 dose, then maintenance 80 mg every 4 weeks, consider discontinuation of treatment if no response after 16–20 weeks

**CONTRA-INDICATIONS** Active infections (including active tuberculosis)

**CAUTIONS** Chronic infection—monitor carefully and discontinue if serious, unresponsive infection develops
- Crohn’s disease · Ulcerative colitis

**FURTHER INFORMATION**

- Severe hypersensitivity reactions
  - Severe hypersensitivity reactions have been reported—discontinue treatment immediately if symptoms occur.
- Latent tuberculosis
  - Manufacturer advises that patients with latent tuberculosis should complete anti-tuberculosis therapy before starting ixekizumab.
- Inflammatory bowel disease
  - Manufacturer advises to monitor closely for exacerbation.

**INTERACTIONS**

- Common or very common
  - Increased risk of infection · Nausea · Oropharyngeal pain
- Uncommon
  - Conjunctivitis · Neutropenia · Skin reactions · Thrombocytopenia
- Frequency not known
  - Angioedema · Dyspnoea · Hypersensitivity (occasionally late-onset) · Inflammatory bowel disease

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception during treatment and for at least 10 weeks after treatment in women of childbearing potential.

**PREGNANCY**

Manufacturer advises avoid—limited information available.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**DIRECTIONS FOR ADMINISTRATION**

Manufacturer advises to avoid injecting into areas of the skin that show psoriasis; injection sites may be alternated. Patients may self-administer Taltz® after appropriate training in subcutaneous injection technique.

**HANDLING AND STORAGE**

Manufacturer advises store in a refrigerator (2–8°C).

**PATIENT AND CARER ADVICE**

Self-administration if appropriate, patients and their carers should be given training in subcutaneous injection technique.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE DECISIONS**

- Ixeikizumab for treating moderate to severe plaque psoriasis (April 2017) NICE TA442
  - Ixeikizumab (Taltz®) is recommended as an option for treating plaque psoriasis only if:
    - the disease is severe, defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of 10 or more;
    - the disease has not responded to standard systemic therapies (e.g. ciclosporin, methotrexate and PUVA) or these treatments are contra-indicated or not tolerated, and
    - the manufacturer provides ixekizumab with the discount agreed in the patient access scheme
  - Ixeikizumab should be discontinued if there is an inadequate response at 12 weeks.

Patients currently receiving ixekizumab, whose disease does not meet the above criteria, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta442

- Ixeikizumab for treating active psoriatic arthritis after inadequate response to DMARDs (August 2018) NICE TA537
  - Ixeikizumab (Taltz®) alone, or with methotrexate, is recommended as an option for treating active psoriatic arthritis in adults only if:
    - it is used as described in the NICE technology appraisal guidance on etanercept, infliximab and adalimumab for...
the treatment of psoriatic arthritis (TA199 recommendations 1.1 and 1.2), or
- the person has had a tumour necrosis factor (TNF)-alpha inhibitor but their disease has not responded within the first 12 weeks or has stopped responding after the first 12 weeks, or
- TNF-alpha inhibitors are contra-indicated but would otherwise be considered (as described in the NICE technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis).

Ixekizumab is only recommended if the manufacturer provides it according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta537

Scottish Medicines Consortium (SMC) decisions

SMC No. 1223/17

The Scottish Medicines Consortium has advised (April 2017) that ixekizumab (Taltz®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe plaque psoriasis only in patients who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), are intolerant to, or have a contra-indication to these treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

SMC No. SMC2097

The Scottish Medicines Consortium has advised (October 2018) that ixekizumab (Taltz®) is accepted for restricted use within NHS Scotland, alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults whose disease has not responded adequately to at least two conventional disease-modifying anti-rheumatic drugs given either alone or in combination, and who have had an inadequate response to a tumour necrosis factor inhibitor.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Polysorbates

- Taltz (Eli Lilly and Company Ltd)
- Ixekizumab 80 mg per 1 ml Taltz 80mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £1,125.00 (Hospital only)
- Ixekizumab 80mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection £1,125.00 (Hospital only)

**Tildrakizumab**

**DRUG ACTION** Tildrakizumab is a recombinant human monoclonal antibody that specifically binds to interleukin-23 and inhibits the release of pro-inflammatory cytokines and chemokines.

**INDICATIONS AND DOSE**

**Moderate-to-severe plaque psoriasis (under expert supervision)**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 100 mg, then 100 mg after 4 weeks, then maintenance 100 mg every 12 weeks, consider discontinuation if no response after 28 weeks, in patients with a high disease burden, or with a body weight > 90kg, a dose of 200 mg may provide greater efficacy

**CONTRA-INDICATIONS** Clinically significant active infection

**CAUTIONS** Chronic infection · history of recurrent infection · recent serious infection

**CAUTIONS, FURTHER INFORMATION**

- Risk of infection  Manufacturer advises consider anti-tuberculosis therapy before initiation of tildrakizumab in patients with a history of tuberculosis, in whom an adequate course of treatment cannot be confirmed.

- Manufacturer advises consider completion of immunisations according to current guidelines before initiating treatment (consult product literature for appropriate interval between vaccination and administration of tildrakizumab).

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- Common or very common Back pain · diarrhoea · headache · increased risk of infection · nausea

**CONCEPTION AND CONTRACEPTION**  Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 17 weeks after stopping treatment.

**PREGNANCY**  Manufacturer advises avoid—limited information available.

**BREAST FEEDING**  Manufacturer advises avoid—limited information available.

**PRE-TREATMENT SCREENING**  Manufacturer advises patients should be evaluated for tuberculosis infection before treatment.

**MONITORING REQUIREMENTS**  Manufacturer advises monitor for signs and symptoms of active tuberculosis during and after treatment.

**DIRECTIONS FOR ADMINISTRATION**  Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration, and to avoid injecting into areas of the skin that are affected by psoriasis or are tender, bruised, red, hard, thick, or scaly. Patients may self-administer Ilumetri®, after appropriate training in subcutaneous injection technique.

**PRESCRIBING AND DISPENSING INFORMATION**

Tildrakizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

**HANDLING AND STORAGE**  Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

**PATIENT AND CARER ADVICE**  Manufacturer advises patients and their carers should be advised to seek medical advice if signs or symptoms of infection occur.

**NATIONAL FUNDING/ACCESS DECISIONS NICE decisions**

- Tildrakizumab for treating moderate to severe plaque psoriasis (April 2019) NICE TA575

Tildrakizumab (Ilumetri®) is recommended as an option for treating plaque psoriasis in adults, only if:

- the disease is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10, and

- the disease has not responded to other systemic treatments, including ciclosporin, methotrexate and phototherapy, or these options are contra-indicated or not tolerated, and

- the manufacturer provides the drug according to the commercial arrangement.
Consider stopping tildrakizumab between 12 weeks and 28 weeks if there has not been at least a 50% reduction in the PASI score from when treatment started. Stop tildrakizumab at 28 weeks if the psoriasis has not responded adequately. An adequate response is defined as:
- a 75% reduction in the PASI score (PASI 75) from when treatment started, or
- a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta575

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
**Excipients:** May contain Polysorbates
- Ilumetri (Almirall Ltd) ▼
  - Tildrakizumab 100 mg per 1 ml Ilumetri 100mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £3,241.00 | 2 pre-filled disposable injection | £6,241.00

**RETINOID AND RELATED DRUGS**

**Acitretin**

**DRUG ACTION** Acitretin is a metabolite of etretinate.

**INDICATIONS AND DOSE**
- Severe extensive psoriasis resistant to other forms of therapy (under expert supervision) / Palmoplantar pustulosis psoriasis (under expert supervision) / Severe congenital ichthyosis (under expert supervision)
  - **BY MOUTH**
    - Adult: Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

- Severe Darier's disease (keratosis follicularis) (under expert supervision)
  - **BY MOUTH**
    - Adult: Initially 10 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily

**CONTRA-INDICATIONS** Hyperlipidaemia

**CAUTIONS** Avoid excessive exposure to sunlight and unsupervised use of sunlamps - diabetes (can alter glucose tolerance—initial frequent blood glucose checks) - do not donate blood during and for 2 years after stopping therapy (teratogenic risk) - in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported) - investigate atypical musculoskeletal symptoms

**INTERACTIONS** ▸ Appendix 1: retinoids

**SIDE-EFFECTS**
- Common or very common Abdominal pain - arthralgia - brittle nails - conjunctivitis - diarrhoea - dry mouth - gastrointestinal disorder - haemorrhage - hair texture abnormal - headache - increased risk of infection - mucosal abnormalities - myalgia - nausea - oral disorders - peripheral oedema - skin reactions - thirst - vomiting - xerophthalmia
- Uncommon Dizziness - hepatic disorders - photosensitivity reaction - vision disorders
- Rare or very rare Bone pain - exostosis - idiopathic intracranial hypertension - peripheral neuropathy
- Frequency not known Angioedema - capillary leak syndrome - drowsiness - dysphonia - flushing - glucose tolerance impaired - granuloma - hearing impairment - hyperhidrosis - malaise - pyogenic granuloma - retinoic acid syndrome - taste altered - tinnitus

**SIDE-EFFECTS, FURTHER INFORMATION**

**Exostosis** Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which acitretin is a metabolite) and premature epiphyseal closure in children.

**Benign intracranial hypertension** Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used.

**PREGNANCY** Avoid—teratogenic.

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

**RENAL IMPAIRMENT** Avoid in severe impairment; increased risk of toxicity.

**MONITORING REQUIREMENTS**
- Monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.
- Check liver function at start, then every 4–6 weeks for 1 year and then every 3 months.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Prescribing for women of child-bearing potential
    - Female of child-bearing potential must be advised on pregnancy prevention.

  - Effective contraception must be used.
    - Oral contraceptives are recommended for patients aged 18 years and over.
    - Female patients must use an effective contraceptive method, which is known to be effective.
    - Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception.

  - Exclusion from treatment
    - Patients who are pregnant at the time of treatment or within 3 months of stopping treatment. They should be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

  - Effective contraception must be used.
    - Oral contraceptives are recommended for patients aged 18 years and over.
    - Female patients must use an effective contraceptive method, which is known to be effective.

  - Discontinue if
    - severe headache, nausea, vomiting, or visual disturbances occur.

  - **CAPSULE**
    - **CAUTIONARY AND ADVISORY LABELS** 10, 11, 21
    - **Acitretin (Non-proprietary)**
      - Acitretin 10 mg Acitretin 10mg capsules | 60 capsule | £23.80
      - Acitretin 25 mg Acitretin 25mg capsules | 60 capsule | £55.24

  - **RECOMMENDED DOSE**
    - **Acitretin 10 mg** Neotigason 10mg capsules | 60 capsule | £17.30
      - DT = £23.80
    - **Acitretin 25 mg** Neotigason 25mg capsules | 60 capsule | £43.00
      - DT = £55.24

www.getintopharma.com
Alitretinoin

10-Apr-2019

**INDICATIONS AND DOSE**

Severe chronic hand eczema refractory to potent topical corticosteroids

- **BY MOUTH**
  - Adult (prescribed by or under supervision of a consultant dermatologist): 30 mg once daily; reduced if not tolerated to 10 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse.
  - Severe chronic hand eczema refractory to potent topical corticosteroids in patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease

- **INTERACTIONS**
  - Manufacturer advises reduce dose to 10 mg once daily with concurrent use of potent inhibitors of CYP3A4, CYP2C8 and moderate inhibitors of CYP2C9.

- **CONTRA-INDICATIONS**
  - Hypervitaminosis A, uncontrolled hyperlipidaemia, uncontrolled hypothyroidism

- **CAUTIONS**
  - Avoid blood donation during treatment and for at least 1 month after stopping treatment.
  - Dry eye syndrome - history of depression

- **INTERACTIONS** → Appendix 1: retinoids

- **SIDE-EFFECTS**
  - Common or very common: Alopeica - anaemia - conjunctivitis - depression - dizziness - dry eye - dry mouth - eye irritation - fatigue - flushing - headache - hypercholesterolaemia - hypertension - hypertriglyceridaemia (risk of pancreatitis if triglycerides above 9 mmol/litre) - joint disorders - myalgia - nausea - oral disorders - skin reactions - tinnitus - vomiting
  - Uncommon: Bone disorders - cataract - dyspepsia - epistaxis - vision disorders
  - Rare or very rare: Idiopathic intracranial hypertension - nail disorder - photosensitivity reaction - vasculitis

- **Frequency not known**
  - Inflammatory bowel disease - mood altered - peripheral oedema - suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION: Dry eyes: Dry eyes may respond to lubricating eye ointment or tear replacement therapy.

**Benign intracranial hypertension**

Discontinue treatment if headache, nausea, vomiting, papilloedema, or visual disturbances occur.

- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception must be used.
  - Pregnancy prevention: In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment — perform pregnancy test in the first 3 days of the menstrual cycle.
  - Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods.

- **PREGNANCY**
  - Avoid — teratogenic.

- **BREAST FEEDING**
  - Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid — limited information available.

- **RENAL IMPAIRMENT**
  - Manufacturer advises avoid in severe impairment — no information available.

- **MONITORING REQUIREMENTS**
  - Monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease) — discontinue if uncontrolled hyperlipidaemia.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Prescribing for women of child-bearing potential. Each prescription for alitretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription.
  - Alitretinoin is teratogenic and must not be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician.

- **PATIENT AND CARER ADVICE**
  - A patient information leaflet should be provided.

- **Conception and contraception**
  - Women of child-bearing potential must be counselled on pregnancy prevention.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - **Alitretinoin for the treatment of severe chronic hand eczema** (August 2009)
      - **NICE TA177**
        - Alitretinoin (Toctino®) is recommended for the treatment of severe chronic hand eczema in adults that has not responded to potent topical corticosteroids. Treatment should be stopped as soon as an adequate response has been achieved (hands clear or almost clear), or if the eczema remains severe after 12 weeks, or if an adequate response has not been achieved by 24 weeks.
        - [www.nice.org.uk/guidance/ta177](http://www.nice.org.uk/guidance/ta177)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - **CAUTIONARY AND ADVISORY LABELS** 10, 11, 21
      - **Toctino** (Stiefel Laboratories (UK) Ltd)
        - **Alitretinoin 10 mg**

- **Tazarotene**

  **INDICATIONS AND DOSE**

  Mild to moderate plaque psoriasis affecting up to 10% of skin area

- **TO THE SKIN**
  - Adult: Apply once daily usually for up to 12 weeks, apply in the evening

- **CAUTIONS**
  - Avoid contact with eczematous skin - avoid contact with eyes - avoid contact with face - avoid contact with hair-covered scalp - avoid contact with inflamed skin - avoid contact with intertriginous areas

- **INTERACTIONS** → Appendix 1: retinoids

- **SIDE-EFFECTS**
  - Common or very common: Paraesthesia - skin reactions

SIDE-EFFECTS, FURTHER INFORMATION: Local irritation is more common with higher concentration and may require treatment interruption.
SALICYLIC ACID AND DERIVATIVES

Salicylic acid with zinc oxide

- **INDICATIONS AND DOSE**
  - **TO THE SKIN**
  - Adults: Apply twice daily

- **CAUTIONS**
  - Avoid broken skin - avoid inflamed skin
  - Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin.

- **SIDE-EFFECTS**
  - Skin reactions

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Zinc and Salicylic Acid Paste BP is also referred to as Lassar Paste. When prepared extemporaneously, the BP states Zinc and Salicylic Acid Paste, BP (Lassar’s Paste) consists of zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.

- **MEDICINAL FORMS**
  - Forms available from special-order manufacturers include: paste

VITAMINS AND TRACE ELEMENTS

- **VITAMIN D AND ANALOGUES**

  **Calcipotriol**
  (1,25-Dihydroxycholecalciferol)

- **INDICATIONS AND DOSE**
  - **TO THE SKIN**
  - Adults: Apply twice daily, not more than 35% of body surface to be treated daily; maximum 30 g per day

- **CONTRA-INDICATIONS**
  - Do not apply under occlusion - patients with calcium metabolism disorders
  - Erythodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) - generalised pustular psoriasis (enhanced risk of hypercalcaemia)

- **INTERACTIONS**
  - Appendix 1: vitamin D substances

- **SIDE-EFFECTS**
  - Common or very common Skin reactions
  - Uncommon Increased risk of infection
  - Rare or very rare Hypercalcaemia - hypercalciuria - photosensitivity reaction

- **PREGNANCY**
  - Manufactures advise avoid unless essential.

Limited evidence suggests that oxybutynin hydrochloride p. 778 [unlicensed indication] can be used to treat hyperhidrosis in patients whose symptoms are not adequately managed through lifestyle modifications and antiperspirants.

In more severe cases specialists use glycopyrronium bromide below as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. Botox® contains botulinum toxin type A complex p. 407 and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment.

### Antimuscarinics

#### Glycopyrronium bromide (Glycopyrrolate)

**INDICATIONS AND DOSE**

Iontophoretic treatment of hyperhidrosis

- **TO THE SKIN**
- Adult: Only 1 site to be treated at a time, maximum 2 sites treated in any 24 hours, treatment not to be repeated within 7 days (consult product literature)

**CONTRA-INDICATIONS**

Infected sites should be avoided. Infected sites may include inflammation, eczema, infection, and systemic effects unlikely with topical use.

**SIDE-EFFECTS**

Abdominal discomfort, eating disorder, pain, paraesthesia

**INTERACTIONS**

Appendix 1: glycopyrronium

**CONTRA-INDICATIONS, FURTHER INFORMATION**

The possibility of systemic side-effects should be considered; however, glycopyrronium is poorly absorbed and systemic effects are unlikely with topical use.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Perspiration

#### Hyperhidrosis

**Overview**

Aluminium chloride hexahydrate below is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.
5 Pruritus

Topical local antipruritics

Overview

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying causes should be treated. An emollient may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient. Levomenthol cream p. 1266 can be used to relieve pruritus; it exerts a cooling effect on the skin. Local antipruritics have a role in the treatment of pruritus in palliative care. Preparations containing crotamiton below are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective.

A topical preparation containing doxepin 5% p. 1266 is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in acute exudative dermatoses and intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

Topical local anaesthetics are indicated for the relief of local pain. Preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than 3 days; not generally suitable for young children and are less suitable for prescribing.

Topical antihistamines should be avoided in eczema and are not recommended for longer than 3 days. They are less suitable for prescribing.

Other drugs used for Pruritus

Alimemazine tartrate, p. 282 • Cetirizine hydrochloride, p. 279 • Chlorphenamine maleate, p. 283 • Coal tar with calamine, p. 1254 • Hydroxyzine hydrochloride, p. 285 • Levocetirizine hydrochloride, p. 281

Calamine with zinc oxide

15-Jan-2019

• INDICATIONS AND DOSE

Pruritus

➢ TO THE SKIN
➢ Child: (consult product literature)
➢ Adult: (consult product literature)

15-Jan-2019

• CONTRA-INDICATIONS

Avoid application of preparations containing zinc oxide prior to x-ray (zinc oxide may affect outcome of x-ray)

• LESS SUITABLE FOR PRESCRIBING

Less suitable for prescribing.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 15

➢ Calamine with zinc oxide (Non-proprietary)

Phenoxyethanol 5 mg per 1 gram, Zinc oxide 30 mg per 1 gram, Calamine 40 mg per 1 gram, Cetomacrogol emulsifying wax 50 mg per 1 gram, Self-emulsifying glyceryl monostearate 50 mg per 1 gram, Liquid paraffin 200 mg per 1 gram Aqueous calamine cream

100 gram G51 £1.43 DT = £1.43

Liquids

➢ Calamine with zinc oxide (Non-proprietary)

Phenol liquefied 5 mg per 1 ml, Sodium citrate 5 mg per 1 ml, Bentonite 30 mg per 1 ml, Glycerol 50 mg per 1 ml, Zinc oxide 50 mg per 1 ml, Calamine 150 mg per 1 ml

Calamine lotion

200 ml G35 £0.94–£1.09 DT = £1.09

Crotamiton

• INDICATIONS AND DOSE

Pruritus (including pruritus after scabies)

➢ TO THE SKIN
➢ Child 1 month–2 years (on doctor’s advice only): Apply once daily
➢ Child 3–17 years: Apply 2–3 times a day
➢ Adult: Apply 2–3 times a day

• CONTRA-INDICATIONS

Acute exudative dermatoses

• CAUTIONS

Avoid use in buccal mucosa - avoid use near eyes - avoid use on broken skin - avoid use on very inflamed skin - use on doctor’s advice for children under 3 years

• PREGNANCY

Manufacturer advises avoid, especially during the first trimester—no information available.

• BREAST FEEDING

No information available; avoid application to nipple area.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, hydroxybenzoates (parabens)

➢ Eurax (GloxsmithKline Consumer Healthcare)

Crotamiton 100 mg per 1 gram Eurax 10% cream

30 gram G35 £2.50 DT = £2.50

6 Rosacea and acne

Rosacea and Acne

Acne

Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.

*Mild to moderate acne* is generally treated with topical preparations. Systemic treatment with oral antibiotics is generally used for *moderate to severe acne* or where topical preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment co-cyproterone p. 1267 (cyproterone acetate with ethinyloestradiol); it is for women only.

*Severe acne*, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin p. 1270 for administration by mouth.

**Acne: topical preparations**

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide p. 1269 or to a topical retinoid. Alternatively, topical application of an antibacterial such as erithromycin p. 539 or clindamycin p. 1268 may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed.

**Benzoyl peroxide and azelaic acid**

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid p. 1269 has antimicrobial and antiinflammatory properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

**Topical antibacterials for acne**

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin p. 939. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of erythromycin and clindamycin are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause
sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin. Antibiometric resistance of Propionibacterium acnes is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

Some manufacturers of topical antibacterial preparations for acne advise that preparations containing alcohol are not suitable for use with benzoyl peroxide.

Topical retinoids and related preparations for acne

Topical tretinoin, its isomer isotretinoin, and adapalene p. 1259 (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. Isotretinoin is given by mouth in severe acne.

Other topical preparations for acne

Preparations containing aluminium oxide are not considered beneficial in acne.

A topical preparation of nicotinamide p. 1272 is available for inflammatory acne.

Acne: oral preparations

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomodel sodium treatment (e.g. with topical benzoyl peroxide) may also be required. Either oxytetracycline p. 567 or tetracycline p. 567 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used.

Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline p. 564 and lymecycline p. 566 are alternatives to tetracycline.

Although minocycline p. 566 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in an once or twice daily dose.

Erythromycin in a twice daily dose is an alternative for the management of acne but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim p. 574 may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

**Oral retinoid for acne**

The retinoid isotretinoin reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglutate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is teratogenic and must not be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme. Although a causal link between isotretinoin p. 1270 use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

**Rosacea**

Rosacea is not comedonal (but may exist with acne which may be comedonal). Brimonidine tartrate p. 1273 is licensed for the treatment of facial erythema in rosacea. The pustules and papules of rosacea respond to topical azelaic acid p. 1269, topical ivermectin p. 1273 or to topical metronidazole p. 1230. Alternatively oral administration of oxytetracycline p. 567 or tetracycline p. 567, or erythromycin p. 539, can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline p. 564 can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low daily doses for the treatment of facial rosacea. Isotretinoin is occasionally given in refractory cases [unlicensed indication]. Camouflagers may be required for the redness.

**6.1 Acne**

**ANTI-ANDROGENS**

**Co-cyprindiol**

- **INDICATIONS AND DOSE**

  Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials | Moderately severe hirsutism

  - **BY MOUTH**
    - Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058 • gallstones • heart disease associated with pulmonary hypertension or risk of embolus • history during pregnancy of cholestatic jaundice • history during pregnancy of...

  - **TO THE SKIN**
    - **Child:** Apply twice daily.
    - **Adult:** Apply twice daily.

- **INTERACTIONS**
  - **Appendix 1:** clindamycin
  - **SIDE-EFFECTS**
  - **Common or very common** Cholelithiasis, photosensitivity reaction.
  - **Frequency not known** Abdominal pain, abdominal distension, cholestasis, hepatic disease or cholestasis, jaundice, nausea.
ACNE VULGARIS

INDICATIONS AND DOSAGE

**Acne vulgaris**

- **TO THE SKIN**

  - **Child 12-17 years:** Apply 1–2 times a day, preferably apply after washing with soap and water, start treatment with lower-strength preparations
  - **Adults:** Apply 1–2 times a day, preferably apply after washing with soap and water, start treatment with lower-strength preparations

SIDE-EFFECTS

- **Common or very common** Skin reactions
- **Frequency not known** Facial swelling
  - **SIDE-EFFECTS, FURTHER INFORMATION** Reduce frequency or suspend use until skin irritation subsides and re-introduce at reduced frequency.

PATIENT AND CARER ADVICE

- **May bleach fabrics and hair.**

MEDICINAL FORMS

- **There can be variation in the licensing of different medicines containing the same drug.**

**Liquid**

- **Zinerty (LEO Pharma)**
  - Zinc acetate 12 mg per 1 ml, Erythromycin 40 mg per 1 ml Zinerty lotion | 30 ml \( £25.25 \) | 90 ml \( £50.02 \) DT = £0.02

**Antiseptics and Disinfectants**

Benzoyl peroxide

INDICATIONS AND DOSE

**Acne vulgaris**

- **TO THE SKIN**

  - **Child 12-17 years:** Apply 1–2 times a day, preferably apply after washing with soap and water, start treatment with lower-strength preparations
  - **Adults:** Apply 1–2 times a day, preferably apply after washing with soap and water, start treatment with lower-strength preparations

UNLICENSED USE

- Not licensed for use in treatment of infantile acne.

CAUTIONS

- Avoid contact with broken skin.
- Avoid contact with eyes.
- Avoid contact with mucous membranes.
- Avoid excessive exposure to sunlight.

SIDE-EFFECTS

- **Common or very common** Skin reactions
- **Frequency not known** Facial swelling
  - **SIDE-EFFECTS, FURTHER INFORMATION** Reduce frequency or suspend use until skin irritation subsides and re-introduce at reduced frequency.

PATIENT AND CARER ADVICE

- **May bleach fabrics and hair.**

MEDICINAL FORMS

- **There can be variation in the licensing of different medicines containing the same drug.**

**Liquid**

- **Brevoxyl** (GlaxoSmithKline Consumer Healthcare)
  - Benzoyl peroxide 40 mg per 1 gram Brevoxyl 4% cream | 50 gram \( £4.13 \) DT = £4.13

Gel

- **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, isopropyl palmitate, propylene glycol
  - **Brevoxyl** (GlaxoSmithKline Consumer Healthcare)
  - Benzoyl peroxide 50 mg per 1 gram Benzoyl peroxide 5% gel | 30 gram \( £5.44 \) DT = £5.44

**Cream**

- **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, isopropyl palmitate, propylene glycol
  - **Acnecide** (Galdemra (UK) Ltd)
    - Benzoyl peroxide 50 mg per 1 gram Acnecide 5% gel | 30 gram \( £5.44 \) DT = £5.44
    - Acnecide Wash 5% gel | 50 gram \( £5.44 \) DT = £5.44

COMBINATIONS AVAILABLE: **Adapalene with benzoyl peroxide**, p. 1270

**Benzoyl peroxide with clindamycin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, benzoyl peroxide above, clindamycin p. 1268.

INDICATIONS AND DOSE

**Acne vulgaris**

- **TO THE SKIN**

  - **Child 12-17 years:** Apply once daily, dose to be applied in the evening
  - **Adults:** Apply once daily, dose to be applied in the evening

INTERACTIONS

- **Appendix 1: clindamycin**

MEDICINAL FORMS

- **There can be variation in the licensing of different medicines containing the same drug.**

**Gel**

- **EXCIPIENTS:** May contain Disodium edetate
  - **Duac** (Stiefel Laboratories (UK) Ltd)
    - Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram, Benzoyl peroxide 30 mg per 1 gram Duac Once Daily gel (3% and 1%) | 30 gram \( £13.14 \) DT = £13.14 | 60 gram \( £26.28 \) DT = £26.28
  - **Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram, Benzoyl peroxide 50 mg per 1 gram Duac Once Daily gel (5% and 1%) | 30 gram \( £13.14 \) DT = £13.14 | 60 gram \( £26.28 \) DT = £26.28

**DERMATOLOGICAL DRUGS**

**Antiacneals**

Azelaic acid

INDICATIONS AND DOSE

**FINACEA**

- **Facial acne vulgaris**
  - **TO THE SKIN**
    - **Child 12-17 years:** Apply twice daily, discontinue if no improvement after 1 month
    - **Adults:** Apply twice daily, discontinue if no improvement after 1 month

**Papulopustular rosacea**

- **TO THE SKIN**
  - **Adults:** Apply twice daily, discontinue if no improvement after 2 months

**SKINOREN**

- **Acne vulgaris**
  - **TO THE SKIN**
    - **Child 12-17 years:** Apply twice daily
    - **Adults:** Apply twice daily

- **Acne vulgaris in patients with sensitive skin**
  - **TO THE SKIN**
    - **Child 12-17 years:** Apply once daily for 1 week, then apply twice daily
    - **Adults:** Apply once daily for 1 week, then apply twice daily

INTERACTIONS

- Avoid contact with eyes.
- Avoid contact with mouth.
- Avoid contact with mucous membranes.

SIDE-EFFECTS

- **Uncommon** Skin reactions
- **Rare or very rare** Asthma exacerbated - cheilitis
- **Frequency not known** Angioedema - eye swelling

MEDICINAL FORMS

- **There can be variation in the licensing of different medicines containing the same drug.**

**Cream**

- **EXCIPIENTS:** May contain Propylene glycol
  - **Skinoren** (Bayer Plc)
    - Azelaic acid 200 mg per 1 gram Skinoren 20% cream | 30 gram \( £4.49 \) DT = £4.49

**Gel**

- **EXCIPIENTS:** May contain Disodium edetate, polysorbates, propylene glycol
  - **Finacea** (Bayer Plc)

**RETINOID AND RELATED DRUGS**

**Adapalene**

INDICATIONS AND DOSE

- **Mild to moderate acne vulgaris**
  - **TO THE SKIN**
    - **Child 12-17 years:** Apply once daily, apply thinly in the evening
    - **Adults:** Apply once daily, apply thinly in the evening

www.getintopharma.com
### Unlicensed Use
- In children: Not licensed for use in infantile acne.

### Caution
- Avoid accumulation in angles of the nose - avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including sunlight, solariums) - avoid in severe acne involving large areas - caution in sensitive areas such as the neck.

### Interactions
- Appendix 1: retinoids

### Conception and Contraception
- Females of childbearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

### Pregnancy
- Avoid.

### Breast Feeding
- Amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas.

### Patient and Carer Advice
- If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

### Medicinal Forms
- There can be variation in the licensing of different medicines containing the same drug.

#### Cream
- CAUTIONARY AND ADVISORY LABELS 11
- EXCIPIENTS: May contain Disodium edetate, hydroxybenzoates (parabens)
  - Adapalene (Non-proprietary)
    - Adapalene 1 mg per 1 gram
      - Differin (Galderma (UK) Ltd).
  - Adapalene 1 mg per 1 gram
    - Differin 0.1% cream 45 gram (POM)
      - £16.43 DT = £16.43

#### Gel
- CAUTIONARY AND ADVISORY LABELS 11
- EXCIPIENTS: May contain Disodium edetate, propylene glycol
  - Adapalene (Non-proprietary)
    - Adapalene 1 mg per 1 gram
      - Differin (Galderma (UK) Ltd).
  - Adapalene 1 mg per 1 gram
    - Differin 0.1% gel 45 gram (POM)
      - £16.43 DT = £16.43

### Adapalene with benzoyl peroxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, adapalene p. 1269, benzoyl peroxide p. 1269.

#### Indications and dose
- Acne vulgaris
  - TO THE SKIN
    - Child 9–17 years: Apply once daily, to be applied thinly in the evening
    - Adult: Apply once daily, to be applied thinly in the evening

#### Interactions
- Appendix 1: retinoids

#### Conception and Contraception
- Females of childbearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

#### Patient and Carer Advice
- Gel may bleach clothing and hair.

#### National Funding/Access Decisions
- Scottish Medicines Consortium (SMC) decisions
  - The Scottish Medicines Consortium has advised (March 2014) that Epiduo™ should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

### Medicinal Forms
- There can be variation in the licensing of different medicines containing the same drug.

#### Gel
- CAUTIONARY AND ADVISORY LABELS 11
- EXCIPIENTS: May contain Disodium edetate, polysorbates, propylene glycol
  - Epiduo (Galderma (UK) Ltd)
    - Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per 1 gram
      - Epiduo 0.1%/2.5% gel 45 gram (POM) £19.53 DT = £19.53

### Isotretinoin

#### Indications and Dose
- Topical treatment of mild to moderate acne
  - TO THE SKIN
    - Adult: Apply 1–2 times a day, to be applied thinly

#### Special considerations
- Severe acne (under expert supervision) Acne which is associated with psychological problems (under expert supervision). Acne which has not responded to an adequate course of a systemic antibacterial (under expert supervision). Acne with scarring (under expert supervision). Systemic treatment of nodulo-cystic and conglobate acne (under expert supervision)

#### By mouth
- Adult: Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course.

### Important safety information
  - An EU-wide review has concluded that on rare occasions, oral isotretinoin, indicated for severe acne, may cause sexual side-effects, including erectile dysfunction and decreased libido.

#### Contra-indications
- With oral use: Hyperlipidaemia, hypervitaminosis A
- With topical use: Perioral dermatitis, rosacea

#### Caution
- With oral use: Avoid blood donation during treatment and for at least 1 month after treatment. Diabetes, dry eye syndrome (associated with risk of keratitis), history of depression, monitor for depression
- With topical use: Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid - alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) - avoid accumulation in angles of the nose - avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including sunlight, solariums) - avoid in severe acne involving large areas - avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics - caution in sensitive areas such as the neck, personal or familial history of skin cancer

#### Interactions
- Appendix 1: retinoids

#### Side-effects
- General side-effects
  - Skin reactions
  - Rare or very rare: Photosensitivity reaction
  - Specific side-effects
    - Common or very common
      - With oral use: Alopecia, anaemia, arthralgia, back pain, cheilitis, dry eye, eye discomfort, eye inflammation, haemorrhage, headache, increased risk of infection

www.getintopharma.com
myalgia - nasal dryness - neutropenia - proteinuria - skin fragility (trauma may cause blistering) - thrombocytopoenia
- thrombocytosis

- Rare or very rare

- Frequency not known
- With oral use Rhabdomyolysis - severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION
Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.

Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.

Visual disturbances require expert referral and possible withdrawal.

Psychiatric side-effects could require expert referral.

- CONCEPTION AND CONTRACEPTION

Pregnancy prevention

With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

- With topical use Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

- PREGNANCY

Contra-indicated in pregnancy (teratogenic).

- BREAST FEEDING

Avoid.

- HEPATIC IMPAIRMENT

With oral use Manufacturer advises avoid—limited information available.

- RENAL IMPAIRMENT

Dose adjustments

- With oral use In severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated.

- MONITORING REQUIREMENTS

With oral use Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).

- PRESCRIBING AND DISPENSING INFORMATION

Isotretinoin is an isomer of tretinoin.

PATIENT AND CARER ADVICE

- With oral use Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment. Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.

- With topical use Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

6.2 Rosacea

Other drugs used for Rosacea Azelaic acid, p. 1269

ANTHELMINTICS

Ivermectin 17-May-2017

- INDICATIONS AND DOSE
  Papulopustular rosacea
  ► TO THE SKIN
  ► Adult: Apply daily for up to 4 months, the treatment course may be repeated; discontinue if no improvement after 3 months

- INTERACTIONS → Appendix 1: ivermectin
- SIDE-EFFECTS
  - Common or very common Skin reactions
  - PREGNANCY Manufacturer advises avoid—limited information but toxicity following oral use in animal studies
  - BREAST FEEDING Manufacturer advises avoid—limited information but present in milk following oral use
  - HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).
  - DIRECTIONS FOR ADMINISTRATION Manufacturer advises apply thinly to the face only, avoiding contact with eyes, lips and mucosa.
  - PATIENT AND CARER ADVICE Wash hands immediately after use.

- NATIONAL FUNDING/ACCESS DECISIONS
  Scottish Medicines Consortium (SMC) decisions
  The Scottish Medicines Consortium has advised (December 2015) that ivermectin (Soolantra®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe inflammatory lesions of rosacea (papulopustular) where a topical treatment is considered appropriate.

  All Wales Medicines Strategy Group (AWMSG) decisions
  The All Wales Medicines Strategy Group has advised (April 2016) that ivermectin (Soolantra®) is recommended as an option for use within NHS Wales for the topical treatment of inflammatory lesions of rosacea (papulopustular) in adult patients.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
  - Cream
    CAUTIONARY AND ADVISORY LABELS 28 EXCipients: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, isopropyl palmitate, propylene glycol

    Ivermectin 10 mg per 1 gram Soolantra 10mg/g cream ▶ 30 gram [□] £16.29 DT = £16.29

- SYMPATHOMIMETICS › ALPHA_2-ADRENOCEPTOR AGONISTS
  Brimonidine tartrate 12-Jul-2017
  - DRUG ACTION Brimonidine, an alpha_2-adrenoceptor agonist, is used to reduce erythema in rosacea by cutaneous vasoconstriction.
  - INDICATIONS AND DOSE
    Facial erythema in rosacea
    ► TO THE SKIN
    ► Adult: Apply once daily until erythema subsides, apply thinly, divide dose over forehead, chin, nose, and cheeks, max. 1 g of gel per day
  - DOSE EQUIVALENCE AND CONVERSION
    - 1 g of gel contains 5 mg of brimonidine tartrate (equivalent to 3.3 mg of brimonidine).

- IMPORTANT SAFETY INFORMATION
  MHRA/CHM ADVISE: BRIMONIDINE GEL (MINIRAX®): RISK OF SYSTEMIC CARDIOVASCULAR EFFECTS (JUNE 2017)
  Systemic cardiovascular effects including bradycardia, hypotension, and dizziness have been reported after application of brimonidine gel. To minimise the possibility of systemic absorption, it is important to avoid application to irritated or damaged skin, including after laser therapy.

  MHRA/CHM ADVISE: BRIMONIDINE GEL (MINIRAX®): RISK OF EXACERBATION OF ROSACEA (NOVEMBER 2016)
  Symptom exacerbation has been reported very commonly in patients treated with brimonidine gel. Treatment should be initiated with a small amount of gel (less than the maximum dose) for at least 1 week, then increased gradually, based on tolerability and response. Patients should be counselled on the importance of not exceeding the maximum daily dose, and advised to stop treatment and seek medical advice if symptoms worsen during treatment.

- CAUTIONS Cerebral insufficiency · coronary insufficiency · depression · postural hypotension · Raynaud’s syndrome · severe cardiovascular disease · thromboangiitis obliterans
- INTERACTIONS → Appendix 1: brimonidine
- SIDE-EFFECTS
  - Common or very common Dizziness · dry mouth · flushing · headache · skin reactions
  - Uncommon Angioedema · eyelid oedema · feeling hot · nasal congestion · paraesthesia · peripheral coldness
  - Rare or very rare Bradycardia · hypotension
- PREGNANCY Manufacturer advises avoid—limited information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).
- RENAL IMPAIRMENT Manufacturer advises use with caution.
- DIRECTIONS FOR ADMINISTRATION Avoid contact with eyes, mouth, and mucous membranes; avoid use on irritated or damaged skin or open wounds; apply other topical preparations (including cosmetics) only after brimonidine gel has dried on skin.
- PATIENT AND CARER ADVICE Patients should be advised on administration of gel.
- Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).
Scalp and hair conditions

Overview
Dandruff is considered to be a mild form of seborrheic dermatitis. Shampoos containing antimicrobial agents such as pyrithione zine (which are widely available) and selenium below may have beneficial effects. Shampoos containing tar extracts may be useful and they are also used in psoriasis. Ketoconazole shampoo p. 1233 should be considered for more persistent or severe dandruff or for seborrheic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1255 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis p. 1239 that affects the scalp. Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

Cradle cap in infants may be treated with coconut oil or olive oil applications followed by shampooing.

Hirsutism
Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil p. 1275, corticosteroids, anabolic steroids, androgens, danazol p. 742, and progestogens.

Weight loss can reduce hirsutism in obese women. Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Ellorinethine p. 1275 an antiprotoseal coal, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical ellorinethine can be used as an adjunct to laser therapy for facial hirsutism in women.

Co-cyprindiol p. 1267 may be effective for moderately severe hirsutism. Metformin hydrochloride p. 692 is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

Androgenetic alopecia
Finasteride p. 787 is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

Other drugs used for Scalp and hair conditions
Coal tar,
p. 1253 - Coal tar with lecithin, p. 1254 - Coal tar with salicylic acid and precipitated sulfur, p. 1255

Cetrimide with undecenoic acid

INDICATIONS AND DOSE
Scalp psoriasis | Seborrhoeic dermatitis | Dandruff

TO THE SKIN
- Child: Apply 3 times a week for 1 week, then apply twice weekly
- Adult: Apply 3 times a week for 1 week, then apply twice weekly

MIRVASO®

INDICATIONS AND DOSE
Seborrhoeic scalp conditions associated with dandruff and scaling

TO THE SKIN
- Adult: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required
- Adult: Apply twice weekly for 2 weeks, then apply twice weekly for 2 weeks, then apply as required

VITAMINS AND TRACE ELEMENTS
Selenium

INDICATIONS AND DOSE
Seborrhoeic dermatitis | Dandruff

TO THE SKIN USING SHAMPOO
- Child 5–17 years: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required
- Adult: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required

TO THE SKIN USING SHAMPOO
- Adult: Apply once daily for 7 days, apply to the affected area and leave on for 10 minutes before rinsing off. The course may be repeated if necessary. Diluting with a small amount of water prior to application can reduce irritation

UNLICENSED USE
The use of selenium sulfide shampoo as a lotion for the treatment of pityriasis (tinea) versicolor is an unlicensed indication.

INTERACTIONS
Appendix 1: selenium

PATIENT AND CARER ADVICE
Avoid using 48 hours before or after applying hair colouring, straightening or waving preparations.
7.1 Alopecia

Other drugs used for Alopecia: Finasteride, p. 787

Vasodilators > Vasodilator Antihypertensives

Minoxidil

- Indications and Dose
  - **Regaine® for Men Extra Strength Foam**
    - Androgenetic alopecia
      - To the skin
      - Adult: Apply 0.5 capful twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 16 weeks
  - **Regaine® for Men Extra Strength Solution**
    - Androgenetic alopecia
      - To the skin
      - Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year
  - **Regaine® for Women Regular Strength**
    - Androgenetic alopecia
      - To the skin
      - Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

- Contra-Indications: Phaeochromocytoma
- Cautions: Avoid contact with broken, infected, shaved, or inflamed skin; avoid contact with eyes; avoid contact with mouth; avoid contact with mucous membranes; avoid inhalation of spray mist; avoid occlusive dressings

CAUTIONS, FURTHER INFORMATION: When used topically systemic effects usually; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

- Interactions: Appendix 1: minoxidil
- Side-Effектs
  - Common or very common: Hair changes
  - Uncommon: Hypotension

SIDE-EFFECTS, FURTHER INFORMATION: When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

- Pregnancy: Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.
- Breast Feeding: Present in milk but not known to be harmful.
- Patient and Carer Advice: Ensure hair and scalp dry before application. Patients and their carers should be advised to wash hands after application of liquid or foam.

7.2 Hirsutism

Other drugs used for Hirsutism: Co-cyprindiol, p. 1267

Antiprotozoals

Eflo르nithine

- Drug Action: An antiprotozoal drug that inhibits the enzyme ornithine decarboxylase in hair follicles.

- Indications and Dose
  - Adjunct to laser therapy for facial hirsutism in women
    - To the skin
    - Adult: Apply twice daily, to be applied thinly, discontinue use if no improvement after 4 months of treatment

- Side-Effects
  - Common or very common: Alopecia - increased risk of infection - paraesthesia - skin reactions
  - Uncommon: Face oedema - flushing - hair changes - oral disorders - skin haemorrhage
  - Rare or very rare: Skin neoplasm

- Pregnancy: Toxicity in animal studies—manufacturer advises avoid.
- Breast Feeding: Manufacturer advises avoid—no information available.
- Patient and Carer Advice: Medicines must be rubbed in thoroughly. Cosmetics may be applied over treated area 5 minutes after eflo르nithine, do not wash treated area for 4 hours after application.

- National Funding/Access Decisions
  - Scottish Medicines Consortium (SMC) decisions
    - SMC No. 159/05
    - The Scottish Medicines Consortium has advised (September 2005) that eflo르nithine 11.5% cream (Vaniqua®) for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used.

- Medicinal Forms: There can be variation in the licensing of different medicines containing the same drug.
8 Skin cleansers, antiseptics and desloughing agents

Skin cleansers, antiseptics and desloughing agents

Skin cleansers and antiseptics

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 1277 or povidone-iodine below, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics. Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Hydrogen peroxide p. 1278, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers. Hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate. Potassium permanganate below solution 1 in 10 000, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

Desloughing agents

Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised. Gravitational dermatitis may be complicated by infections, particularly minor wounds and infections, and perivesical skin is easily sensitised. Features of acute alcohol intoxication include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Overdose Features of acute alcohol intoxication include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis.

Emergency treatment of poisoning

For details on the management of poisoning, see Alcohol, under Emergency treatment of poisoning p. 1359.

Antiseptics and disinfectants

Potassium permanganate

- **INDICATIONS AND DOSE**
  - Cleansing and deodorising suppurating eczematous reactions and wounds
    - TO THE SKIN
    - Adult: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

- **CAUTIONS** Irritant to mucous membranes
- **DIRECTIONS FOR ADMINISTRATION** Potassium permanganate 0.1% solution to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution. With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.
- **PATIENT AND CARER ADVICE** Can stain clothing, skin and nails (especially with prolonged use).

Antiseptics and disinfectants

Alcohol (Industrial methylated spirit)

- **INDICATIONS AND DOSE**
  - Skin preparation before injection
    - TO THE SKIN
    - Child: Apply as required
    - Adult: Apply as required

- **CONTRA-INDICATIONS** Neonates
- **CAUTIONS** Avoid broken skin - flammable - patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

- **SIDE-EFFECTS**
  - Overdose
    - Features of acute alcohol intoxication include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis.
    - For details on the management of poisoning, see Alcohol, under Emergency treatment of poisoning p. 1359.

Antiseptics and disinfectants

Povidone-iodine

- **INDICATIONS AND DOSE**
  - Skin disinfection
    - TO THE SKIN
    - Child: (consult product literature)
    - Adult: (consult product literature)

Antiseptics and disinfectants

Potassium permanganate

- **INDICATIONS AND DOSE**
  - Cleansing and deodorising suppurating eczematous reactions and wounds
    - TO THE SKIN
    - Adult: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution
Skin cleansers, antiseptics and desloughing agents

VIDENE® SURGICAL SCRUB®

Skin disinfection
  TO THE SKIN
  Child: Use as a pre-operative scrub for hand and skin disinfection
  Adult: Use as a pre-operative scrub for hand and skin disinfection

VIDENE® TINCTURE

Skin disinfection
  TO THE SKIN
  Adult: Apply undiluted in pre-operative skin disinfection

CONTRA-INDICATIONS Avoid regular use in patients with thyroid disorders (in adults) - concomitant use of lithium - corrected gestational age under 32 weeks - infants body-weight under 1.5 kg - regular use in neonates

CAUTIONS Broken skin - large open wounds

Cautions, Further Information
  Large open wounds. The application of povidone-iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

VIDENE® TINCTURE Procedures involving hot wire cautery and diathermy

SIDE-EFFECTS
  Rare or very rare Eye erythema - punctate keratitis
  Frequency not known Cytotoxicity - eye discoloration
  PREGNANCY Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.

BREAST FEEDING Avoid regular or excessive use.

RENAL IMPAIRMENT Avoid regular application to inflamed or broken skin or mucosa.

EFFECT ON LABORATORY TESTS May interfere with thyroid function tests.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

Spray
  Betadine (Aspire Pharma Ltd)
  Povidone-iodine 25 mg per 1 gram Betadine 2.5% dry powder spray | 100 ml | £9.95 DT + €9.95

Liquid

CAUTIONARY AND ADVISORY LABELS 15 (Only for use with alcoholic solutions)
  Videne (Ecolab Healthcare Division)
  Povidone-iodine 75% surgical scrub solution | 100 ml | £1.97 DT + €1.97
  Povidone-iodine 100% surgical scrub solution | 160 ml | £1.97 DT + €1.97

ANTISEPTICS AND DISINFECTANTS > OTHER

Chlorhexidine

INDICATIONS AND DOSE

CEPTON® LOTION

For skin disinfection in acne
  TO THE SKIN
  Child: (consult product literature)
  Adult: (consult product literature)

CEPTON® SKIN WASH

For use as skin wash in acne
  TO THE SKIN
  Child: (consult product literature)
  Adult: (consult product literature)

HIBITANE® PLUS 5% CONCENTRATE SOLUTION

General and pre-operative skin disinfection
  TO THE SKIN
  Child: (consult product literature)

HIBISCUB®

Pre-operative hand and skin disinfection | General hand and skin disinfection
  TO THE SKIN
  Child: Use as alternative to soap (consult product literature)
  Adult: Use as alternative to soap (consult product literature)

HIBITANE OBSTETRIC®

For use in obstetrics and gynaecology as an antiseptic and lubricant
  TO THE SKIN
  Adult: To be applied to skin around vulva and perineum and to hands of midwife or doctor

HIBI® LIQUID HAND RUB+

Hand and skin disinfection
  TO THE SKIN
  Child: To be used undiluted (consult product literature)
  Adult: To be used undiluted (consult product literature)

HYDREX® SOLUTION

For pre-operative skin disinfection
  TO THE SKIN
  Child: (consult product literature)
  Adult: (consult product literature)

HYDREX® SURGICAL SCRUB

For pre-operative hand and skin disinfection | General hand disinfection
  TO THE SKIN
  Child: (consult product literature)
  Adult: (consult product literature)

UNISEPT®

For cleansing and disinfecting wounds and burns and swabbing in obstetrics
  TO THE SKIN
  Child: (consult product literature)
  Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

In preterm neonates, use sparingly, monitor for skin reactions, and do not allow solution to pool - risk of severe chemical burns.

CONTRA-INDICATIONS Alcoholic solutions not suitable before diathermy - not for use in body cavities

CAUTIONS Avoid contact with brain - avoid contact with eyes - avoid contact with meninges - avoid contact with middle ear

SIDE-EFFECTS Skin reactions

DIRECTIONS FOR ADMINISTRATION

HIBITANE® PLUS 5% CONCENTRATE SOLUTION For pre-operative skin preparation, dilute 1 in 10 (0.5%) with alcohol 70%. For general skin disinfection, dilute 1 in 100 (0.05%) with water. Alcoholic solutions not suitable for use before diathermy or on neonatal skin.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Cream
  Hibitane Obstetric (Derma UK Ltd)
  Chlorhexidine gluconate 10 mg per 1 gram Hibitane Obstetric 1% cream | 250 ml | £16.95
Chlorhexidine with cetrimide

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1277.

### INDICATIONS AND DOSE

**Skin disinfection such as wound cleansing and obstetrics**
- **TO THE SKIN**
  - Child: To be used undiluted
  - Adult: To be used undiluted

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- Chlorhexidine with cetrimide (Non-proprietary)
  - Chlorhexidine gluconate 1 mg per 1 gram, Cetrimide 5 mg per 1 gram
    - Savlon antiseptic cream
    - 15 gram [GSL £0.90]
  - 30 gram [GSL £1.19] 60 gram [GSL £1.91] 100 gram [GSL £2.78]

**Irrigation solution**
- Chlorhexidine with cetrimide (Non-proprietary)
  - Chlorhexidine acetate 150 microgram per 1 ml, Cetrimide 1.5 mg per 1 ml
    - Sterets Unisept 0.15% irrigation solution 1 litre bottles
      - 1 bottle [P]
  - Sterets Tisept
    - Chlorhexidine gluconate 150 microgram per 1 ml, Cetrimide 1.5 mg per 1 ml
      - Sterets Tisept solution 25ml sachets
      - 25 sachet [P] £5.33 DT = £5.33
      - Sterets Tisept solution 100ml sachets
      - 10 sachet [P] £6.85 DT = £6.85

## Diethyl phthalate with methyl salicylate

### INDICATIONS AND DOSE

**Skin preparation before injection**
- **TO THE SKIN**
  - Adult: Apply to the area to be disinfected

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**
- Diethyl phthalate with methyl salicylate (Non-proprietary)
  - Methyl salicylate 5 ml per 1 litre, Diethyl phthalate 20 ml per 1 litre, Castor oil 25 ml per 1 litre, Industrial methylated spirit
    - 950 ml per 1 litre
    - Surgical spirit
      - 200 ml [GSL £1.17 DT = £1.17]
      - 1000 ml [GSL £3.95]

## Hydrogen peroxide

### DRUG ACTION

Hydrogen peroxide is an oxidising agent.

### INDICATIONS AND DOSE

For skin disinfection, particularly cleansing and deodorising wounds and ulcers
- **TO THE SKIN**
  - Child: Apply 2–3 times a day for up to 3 weeks
  - Adult: Apply 2–3 times a day for up to 3 weeks

### UNLICENSED USE

In children licensed for use in children (age range not specified by manufacturer).

### CONTRA-INDICATIONS

Closed body cavities (in adults) - deep wounds (in adults) - large wounds (in adults) - use as
disinfection agent for surgical instruments (in adults) - use as enema (in adults) - use during surgery (in adults)

- **CAUTIONS** Avoid on eyes - avoid on healthy skin - incompatible with products containing iodine or potassium permanganate
- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20 vols) should be dispensed. Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions.
- **HANDLING AND STORAGE** Hydrogen peroxide bleaches fabric.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Cream**

- **Crystacide** (Reig Jofre UK Ltd)
  - Hydrogen peroxide 10 mg per 1 gram Crystacide 1% cream | 25 gram | £8.07 DT | £8.07 | 40 gram | £11.62

**Liquid**

- **Hydrogen peroxide (Non-proprietary)**
  - Hydrogen peroxide 60 mg per 1 ml Hydrogen peroxide 6% solution | 200 ml | £0.67 | 500 ml | £1.92 | 2000 ml | £9.33
  - Hydrogen peroxide 90 mg per 1 ml Hydrogen peroxide 9% solution | 200 ml | £0.72
  - Hydrogen peroxide 30 ml per 1 litre Hydrogen peroxide 3% solution | 200 ml | £0.63

- **Proflavine**

  - **INDICATIONS AND DOSE**
    - Infected wounds / infected burns
    - Adults: (consult product literature)

  - **PATIENT AND CARER ADVICE** Stains clothing.

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: liquid

**Irrigation solutions**

- **IRRIGATION SOLUTIONS**
  - Flowfusor sodium chloride 0.9% irrigation solution 120ml bottles (Frenius Kabi Ltd) Sodium chloride 9 mg per 1 ml bottle - NHS indicative price = £1.71 - Drug Tariff (Part Ixa)
  - Irriclens sodium chloride 0.9% irrigation solution aerosol spray (Convatec Ltd) Sodium chloride 9 mg per 1 ml 240 ml - NHS indicative price = £3.60 - Drug Tariff (Part Ixa)
  - Normasol sodium chloride 0.9% irrigation solution 100ml sachets (Molnlycke Health Care Ltd) Sodium chloride 9 mg per 1 ml 10 unit dose - NHS indicative price = £7.97 - Drug Tariff (Part Ixa)
  - Normasol sodium chloride 0.9% irrigation solution 25ml sachets (Molnlycke Health Care Ltd) Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £6.46 - Drug Tariff (Part Ixa)
  - Sodium chloride 0.9% irrigation solution 20ml Clinipod unit dose (Mayors Healthcare Ltd) Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £4.80 - Drug Tariff (Part Ixa)
  - Sodium chloride 0.9% irrigation solution 20ml ISO-POD unit dose (St George’s Medical Ltd) Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £4.95 - Drug Tariff (Part Ixa)
  - Sodium chloride 0.9% irrigation solution 20ml Irripod unit dose (Emrosh Healthcare Ltd) Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £4.90 - Drug Tariff (Part Ixa)

- **Sodium chloride 0.9% irrigation solution 20ml Sal-e Pods unit dose** (Emrosh Healthcare Ltd) Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £4.80 - Drug Tariff (Part Ixa)

- **Sodium chloride 0.9% irrigation solution 20ml unit dose** (Sal-Meds Ltd) Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £4.99 - Drug Tariff (Part Ixa)
- **Sodium chloride 0.9% irrigation solution 20ml Steripod unit dose** (Molnlycke Health Care Ltd) Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £7.06 - Drug Tariff (Part Ixa)
- **Sodium chloride 0.9% irrigation solution 20ml Sterowash unit dose** (Steroplast Healthcare Ltd) Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £7.36 - Drug Tariff (Part Ixa)
- **Sodium chloride 0.9% irrigation solution 20ml unit dose** (Bell, Sons & Co (Druggists) Ltd) Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £6.76 - Drug Tariff (Part Ixa)
- **Sodium chloride 0.9% irrigation solution 20ml unit dose** (Crest Medical Ltd) Sodium chloride 9 mg per 1 ml 25 unit dose - NHS indicative price = £4.99 - Drug Tariff (Part Ixa)
- **Stericlens sodium chloride 0.9% irrigation solution aerosol spray** (C D Medical Ltd) Sodium chloride 9 mg per 1 ml 200 ml - NHS indicative price = £2.07 - Drug Tariff (Part Ixa)

- **NHS indicative price = £3.15 - Drug Tariff (Part Ixa)**

### 8.1 Minor cuts and abrasions

#### Minor cuts and abrasions

**Management**

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulphonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and proflavine above may be used to treat infected wounds or burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide per. 1278 is used to clean minor cuts and abrasions.

Flexible collodion (see castor oil with collodion and clophophy, p. 1280) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

#### Glycerol with magnesium sulfate and phenol

- **INDICATIONS AND DOSE**
  - Treat carbuncles and boils
  - To the skin
  - Adult: To be applied under dressing

- **DIRECTIONS FOR ADMINISTRATION** Paste should be stirred before use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Paste**

- Glycerol with magnesium sulfate and phenol (Non-proprietary)
  - Phenol 5 mg per 1 gram, Magnesium sulfate dried 450 mg per 1 gram
  - Glycerol 550 mg per 1 gram Magnesium sulfate paste | 25 gram | £0.16–£1.24 | 50 gram | £0.91–£2.48 DT = £2.48
9 Skin disfigurement

Camouflagers

Overview
Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances
The preparations marked ‘ACBS’ can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

10 Sun protection and photodamage

Sunscreen

Sunscreen preparations
Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as polymorphic light eruption, solar urticaria, and it provokes the various cutaneous porphyrias. It also provokes (or at least aggravates) skin lesions of lupus erythematosus and may aggravate rosacea and some other dermatoses. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as sunburn) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include ageing changes and more importantly the initiation of skin cancer.

Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause sunburn. The long wavelengths (320–400 nm, known as UVA) are responsible for many photosensitivity reactions and photodermatoses. Both UVA and UVB contribute to long-term photodamage and to the changes responsible for skin cancer and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of...
 protección offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies.

Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions. For optimum photoprotection, sunscreen preparations should be applied thickly and frequently (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNF.

### Borderline substances

*Anthelios®* XL SPF 50+ Melt-in cream; *Sunsense®* Ultra; *Uvistar®* Lipscreen SPF 50; and *Uvistar®* Suncream SPF 30 and 50 (see Borderline substances) are regarded as drugs when prescribed for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity. Preparations with SPF less than 30 should not normally be prescribed.

### Photodamage

#### Overview

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments can be used for actinic keratosis. An emollient may be sufficient for mild lesions. Diclofenac sodium gel below is suitable for the treatment of superficial lesions in mild disease. Fluorouracil cream p. 1282 is effective against most types of non-hypertrophic actinic keratosis, a solution containing fluorouracil with salicylic acid p. 1282 is available for the treatment of low or moderately thick hyperkeratotic actinic keratosis. Imiquimod p. 1285 is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac sodium but lesions resolve faster. A short course of ingenol mebutate p. 1282 is licensed for the treatment of non-hypertrophic actinic keratosis; response to treatment can usually be assessed 8 weeks after the course. Photodynamic therapy in combination with methyl-5-aminolevulinate cream (Metvix®, available from Galderma) or 5-aminolaevulnic acid gel (Ameluz®, available from Spirit Healthcare) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing. Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

### ANALGESICS > NON-Steroidal ANTI-INFLAMMATORY DRUGS

#### Diclofenac sodium

**INDICATIONS AND DOSE**

**SOLARAZE®**

**Actinic keratosis**

- **TO THE SKIN**
- **Adult:** Apply twice daily for 60–90 days, to be applied thinly; maximum 8 g per day
- **INTERACTIONS**
- **Common or very common** Conjunctivitis - muscle tone increased - oedema - rash (discontinue) - sensation abnormal - skin reactions - skin ulcer
- **Uncommon** Abdominal pain - alopecia - diarrhoea - eye pain - haemorrhage - lacrimation disorder - nausea - seborrhoea
- **Rare or very rare** Acute kidney injury - asthma - hypersensitivity - photosensitivity reaction - rash pustular
- **Frequency not known** Hair colour changes

**SIDE-EFFECTS. FURTHER INFORMATION**

Topical application of large amounts of diclofenac can result in systemic effects.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**PREGNANCY** Patient packs for topical preparations carry a warning to avoid during pregnancy.

**BREAST FEEDING** Patient packs for topical preparations carry a warning to avoid during breast-feeding.
**1282 Sun protection and photodamage**

**DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.

**PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use. Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gel**
- **Excipients**: May contain Benzyl alcohol, fragrances, propylene glycol
- **Solaraze** (Almirall Ltd)
  - Diclofenac sodium 30 mg per 1 gram Solaraze 3% gel | 50 gram [POM] £36.30 DT = £36.30 | 100 gram [POM] £76.60

**SIDE-EFFECTS**
- **Common or very common**: Alopecia - diarrhoea - mucositis - nausea - neutropenia - skin reactions - stomatitis - thrombocytopenia - vomiting
- **Uncommon**: Dizziness - headache
- **Rare or very rare**: Abdominal pain - chills - diarrhoea - haemorrhagic fever - leucocytosis - pancytopenia - skin irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions) - skin ulcer
- **Frequency not known**: Conjunctival irritation - excessive tearing - ketariosis - taste altered
- **Conception and contraception**: Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- **Pregnancy**: Manufacturers advise avoid (teratogenic).
- **Breast feeding**: Manufacturers advise avoid.
- **Handling and storage**: Caution in handling—irritant to tissues.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- **Excipients**: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol
- **Efudix** (Meda Pharmaceuticals Ltd)
  - Fluorouracil 50 mg per 1 gram Efudix 5% cream | 40 gram [POM] £32.90 DT = £32.90

**Fluorouracil with salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorouracil above, salicylic acid p. 1286.

**INDICATIONS AND DOSE**

**Low or moderately thick hyperkeratotic actinic keratosis**
- **To the skin**
  - **Adult**: Apply once daily for up to 12 weeks, reduced to 3 times a week if severe side effects occur and until side-effects improve, to be applied to the affected area, if treating area with thin epidermis, reduce frequency of application and monitor response more often; maximum area of skin treated at one time, 25 cm² (e.g. 5 cm × 5 cm)

**INTERACTIONS** → Appendix 1: fluorouracil

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Actikerall solution**
- **CAUTIONARY AND ADVISORY LABELS**: 15
- **Fluorouracil 5 mg/g, Salicylic acid 100 mg/g Actikerall 5mg/g / 100mg/g cutaneous solution** | 25 ml [POM] £38.30 DT = £38.30

**PROTEIN KINASE C ACTIVATORS**

**Ingenol mebutate**

**INDICATIONS AND DOSE**

**Actinic keratosis on face and scalp**
- **To the skin**
  - **Adult**: Apply once daily for 3 days, use the 150 microgram/g gel

**Actinic keratosis on trunk and extremities**
- **To the skin**
  - **Adult**: Apply once daily for 2 days, use the 500 microgram/g gel

**CAUTIONS**
- Avoid contact with broken skin - avoid contact with eyes - avoid contact with inside of ears - avoid contact with inside of nostrils - avoid contact with lips - avoid occlusive dressings on treated area

**SIDE-EFFECTS**
- **Common or very common**: Headache - infection - local reaction - oedema - pain - skin reactions
- **Uncommon**: Parasthesia - skin ulcer
- **Pregnancy**: Not absorbed from skin, but manufacturer advises avoid.
- **Breast feeding**: Not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application.

**DIRECTIONS FOR ADMINISTRATION** One tube covers skin area of 25 cm². Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gel**
- **CAUTIONARY AND ADVISORY LABELS**: 15
- **Excipients**: May contain Benzyl alcohol
- **Picato** (LEO Pharma)
  - **Ingenol mebutate 150 microgram per 1 gram Picato 150micrograms/g gel | 1.41 gram [POM] £65.00 DT = £65.00**
  - **Ingenol mebutate 500 microgram per 1 gram Picato 500micrograms/g gel | 0.94 gram [POM] £65.00 DT = £65.00**
11 Superficial soft-tissue injuries and superficial thrombophlebitis

Topical circulatory preparations

Overview
These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

HEPARINOIDS

Heparinoid

- INDICATIONS AND DOSE
  Superficial thrombophlebitis | Bruising | Haematoma
  - TO THE SKIN
  - Adult: Apply up to 4 times a day

- CONTRA-INDICATIONS
  Should not be used on large areas of skin, broken or sensitive skin, or mucous membranes

- LESS SUITABLE FOR PRESCRIBING
  Hirudoid is less suitable for prescribing.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  **Cream**
  **EXCIPIENTS**: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)
  **Hirudoid (Genus Pharmaceuticals Ltd)**
  Heparinoid 3 mg per 1 gram Hirudoid 0.3% cream | 50 gram
  £3.99 DT = £3.99

- Gel
  **EXCIPIENTS**: May contain Fragrances, propylene glycol
  **Hirudoid (Genus Pharmaceuticals Ltd)**
  Heparinoid 3 mg per 1 gram Hirudoid 0.3% gel | 50 gram
  £3.99 DT = £3.99

12 Warts and calluses

Warts and calluses

Overview
Warts (verrucas) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid p. 1286, formaldehyde p. 1284, glutaraldehyde p. 1284 or silver nitrate p. 1285 are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion base are available but some patients may develop an allergy to colophony in the formulation; collodion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

Anogenital warts
The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. Podophyllotoxin p. 1284 (the major active ingredient of podophylum) may be used for soft, non-keratinised external anogenital warts. Patients with a limited number of external warts or keratinised lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod cream p. 1285 is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis. Camellia sinensis ointment below is licensed for the treatment of external anogenital warts.

Inosine pranobex p. 633 is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

**Camellia sinensis**

- **DRUG ACTION**
  Camellia sinensis is an extract from green tea leaves. The exact mechanism of action is not known; non-clinical studies have shown inhibition of the growth of activated keratinocytes, and anti-oxidative effects at the site of application.

- **INDICATIONS AND DOSE**
  Warts (external genital and perianal) in immunocompetent patients
  - TO THE LESION
  - Adult: Apply up to 250 mg 3 times a day until complete clearance of warts (maximum 16 weeks), do not exceed treatment period even if new warts develop; maximum 750 mg per day

  DOSE EQUIVALENCE AND CONVERSION
  - 250 mg is equivalent to 0.5 cm of ointment.

  **CAUTIONS**
  - Avoid broken skin
  - Avoid contact with eyes
  - Avoid contact with lips
  - Avoid contact with mouth
  - Avoid contact with nostrils
  - Avoid inflamed skin
  - Uncircumcised males (risk of phimosis)
  - Vulvar region

  **SIDE-EFFECTS**
  - **Uncommon**
    - Balanoposthitis
    - Increased risk of infection
    - Lymphatic abnormalities
    - Necrosis
    - Painful sexual intercourse
    - Phimosis
    - Skin reactions
    - Urinary disorders
  - **Frequency not known**
    - Urinary tract stenosis
    - Vaginal discharge

  **CONCEPTION AND CONTRACEPTION**
  Manufacturer advises Catephen may weaken condoms and vaginal diaphragms—alternative methods of contraception should be considered.

  **PREGNANCY**
  Manufacturer advises avoid—toxicity in animal studies.

  **BREAST FEEDING**
  Manufacturer advises risk to infant cannot be excluded—no information available.

  **HEPATIC IMPAIRMENT**
  Manufacturer advises avoid in severe impairment (limited information available).

  **DIRECTIONS FOR ADMINISTRATION**
  Manufacturer advises apply to each wart, ensuring a thin layer is left on the wart.

  **NATIONAL FUNDING/ACCESS DECISIONS**
  **Scottish Medicines Consortium (SMC) decisions**
  The Scottish Medicines Consortium has advised (April 2016) that camellia sinensis (green tea) leaf extract (Catephen®)
is accepted for restricted use within NHS Scotland for the treatment of external genital and perianal warts in patients not suitable for podophyllotoxin or who have not responded to treatment with podophyllotoxin.

**All Wales Medicines Strategy Group (AWMSG) decisions**

The All Wales Medicines Strategy Group has advised (October 2016) that green tea leaf extract (camellia sinensis), (Catephen \(^{\text{®}}\)), is recommended for restricted use within NHS Wales for the treatment of external genital and perianal warts in patients not suitable for podophyllotoxin or who have not responded to treatment with podophyllotoxin.

### Podophyllotoxin

**INDICATIONS AND DOSE**

**CONDYLONE**

*Condyloma acuminata affecting the penis or the female external genitalia*

- **TO THE LESION**
  - Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm\(^2\) in the male, maximum 50 single applications (‘loops’) per session (consult product literature)

**WARTICON \(^{\text{®}}\) CREAM**

*Condyloma acuminata affecting the penis or the female external genitalia*

- **TO THE LESION**
  - Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm\(^2\)

**WARTICON \(^{\text{®}}\) LIQUID**

*Condyloma acuminata affecting the penis or the female external genitalia*

- **TO THE LESION**
  - Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm\(^2\), maximum 50 single applications (‘loops’) per session (consult product literature)

**CAUTIONS**

Avoid normal skin. Avoid open wounds. Keep away from face. Very irritant to eyes.

**SIDE-EFFECTS**

Balanoposthitis. Skin irritation.

**PREGNANCY**

Avoid.

**BREAST FEEDING**

Avoid.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sorbic acid

- **Wartinon** (Phoenix Labs Ltd)
  - Podophyllotoxin 1.5 mg per 1 gram Wartinon 0.15% cream | 5 gram £17.83

**Liquid**

CAUTIONARY AND ADVISORY LABELS

- **Condylone** (Takeda UK Ltd)
  - Podophyllotoxin 5 mg per 1 ml Condylone 0.5% solution | 3.5 ml £14.49 DT = £14.49
  - Wartinon (Phoenix Labs Ltd)
  - Podophyllotoxin 5 mg per 1 ml Wartinon 0.5% solution | 3 ml £14.86

**ANTISEPTICS AND DISINFECTANTS**

### Formaldehyde

**INDICATIONS AND DOSE**

*Warts, particularly plantar warts*

- **TO THE LESION**
  - Child: Apply twice daily
  - Adult: Apply twice daily

**UNLICENSED USE**

In children. Licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**

Impaired peripheral circulation. Not suitable for application to anogenital region. Not suitable for application to face. Not suitable for application to large areas. Patients with diabetes at risk of neuropathic ulcers. Protect surrounding skin and avoid broken skin. Significant peripheral neuropathy.

**SIDE-EFFECTS**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Glutaraldehyde**

**INDICATIONS AND DOSE**

*Warts, particularly plantar warts*

- **TO THE LESION**
  - Child: Apply twice daily
  - Adult: Apply twice daily

**UNLICENSED USE**

In children. Licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**

Not for application to anogenital areas. Not for application to face. Not for application to mucosa. Protect surrounding skin.

**SIDE-EFFECTS**

Rare or very rare. Severe cutaneous adverse reactions (SCARs).

**FREQUENCY NOT KNOWN**

Rash. Skin irritation. (Discontinue if severe)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Paint**

- **Glutarol** (Dermal Laboratories Ltd)
  - Glutaraldehyde 100 mg per 1 ml Glutarol 10% cutaneous solution | 10 ml £14.59 DT = £2.07
ANTISEPTICS AND DISINFECTANTS › OTHER

Silver nitrate

- INDICATIONS AND DOSE
  Common warts
    - TO THE LESION
      - Child: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
      - Adult: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
  Verrucas
    - TO THE LESION
      - Child: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
      - Adult: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
  Umbilical granulomas
    - TO THE SKIN
      - Child: Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin
      - Adult: Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin

- UNLICENSED USE
  - In children: No age range specified by manufacturer.
  - CAUTIONS
    - Avoid broken skin - not suitable for application to ano-genital region - not suitable for application to face - not suitable for application to large areas - protect surrounding skin
  - SIDE-EFFECTS
    - Rare or very rare: Argyria - methaemoglobinemia
  - PATIENT AND CARER ADVICE
    - Patients should be advised that silver nitrate may stain fabric.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Stick
    - Avoca (Bray Group Ltd)
      - Silver nitrate 400 mg per 1 gram: Avoca 40% silver nitrate pencils | 1 applicator [P] £1.13 DT = £1.13
      - Silver nitrate 750 mg per 1 gram: Avoca 75% silver nitrate applicators | 100 applicator [P] £47.82
      - Avoca 75% silver nitrate applicators with thick handles | 50 applicator [P] £47.19
      - Silver nitrate 950 mg per 1 gram: Avoca 95% silver nitrate applicators | 100 applicator [P] £51.17
      - Avoca 95% silver nitrate pencils | 1 applicator [P] £2.56 DT = £3.08
      - Avoca wart and verruca treatment set | 1 applicator [P] £3.08 DT = £3.08

ANTIVIRALS › IMMUNE RESPONSE MODIFIERS

Imiquimod

- INDICATIONS AND DOSE
  ALDARA ®
  Warts (external genital and perianal)
    - TO THE LESION
      - Adult: Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night
  Superficial basal cell carcinoma
    - TO THE LESION
      - Adult: Apply daily for 5 nights of each week for 6 weeks, to be applied to lesion and 1 cm beyond it, assess response 12 weeks after completing treatment
  Actinic keratosis
    - TO THE LESION
      - Adult: Apply 3 times a week for 4 weeks, to be applied to lesion at night, assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist, maximum 2 courses
  ZYCLARA ™
  Actinic keratosis
    - TO THE SKIN
      - Adult: Apply once daily for 2 weeks, to be applied at bedtime to lesion on face or balding scalp, repeat course after a 2-week treatment-free interval, assess response 8 weeks after second course; maximum 2 sachets per day

- CAUTIONS
  - Autoimmune disease - avoid broken skin - avoid contact with eyes - avoid contact with lips - avoid contact with nostrils - avoid open wounds - immunosuppressed patients - not suitable for internal genital warts - uncircumcised males (risk of phimosis or stricture of foreskin)
  - SIDE-EFFECTS
    - Common or very common: Appetite decreased - arthralgia - asthenia - headaches - increased risk of infection - lymphadenopathy - myalgia - nausea - pain
    - Rare or very rare: Autoimmune disorder exacerbated
    - Frequency not known: Alopecia - cutaneous lupus erythematosus - severe cutaneous adverse reactions (SCARs)
  - CONCEPTION AND CONTRACEPTION
    - May damage latex condoms and diaphragms.
  - PREGNANCY
    - No evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution.
  - BREAST FEEDING
    - No information available.
  - DIRECTIONS FOR ADMINISTRATION
    - ZYCLARA ™: Important Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water.
    - ALDARA ®: Important Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.
Salicylic acid with lactic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid above.

### INDICATIONS AND DOSE

**CUPLEX®**

**Plantar and mosaic warts | Corns | Calluses**

- **TO THE LESION**
  - **Child:** Apply once daily, treatment may need to be continued for up to 3 months
  - **Adult:** Apply once daily, treatment may need to be continued for up to 3 months

**DUOFILM®**

**Plantar and mosaic warts**

- **TO THE LESION**
  - **Adult:** Apply daily, treatment may need to be continued for up to 3 months
  - **SALACTOL®**

**Warts, particularly plantar warts | Verrucas | Corns | Calluses**

- **TO THE LESION**
  - **Adult:** Apply daily, treatment may need to be continued for up to 3 months

**SALATAC®**

**Warts | Verrucas | Corns | Calluses**

- **TO THE LESION**
  - **Adult:** Apply daily, treatment may need to be continued for up to 3 months

### PRESCRIBING AND DISPENSING INFORMATION

Preparations of salicylic acid in a collodion basis (Cuplex® and Salactol®) are available but some patients may develop an allergy to colophony in the formulation.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Paint

**CAUTIONARY AND ADVISORY LABELS** 15

- **EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates
  - **Aldara®** (Meda Pharmaceuticals Ltd)
    - Imiquimod 50 mg per 1 gram Aldara 5% cream 250mg sachets | 12 sachet £46.60 DT + £46.60
  - **Zyclara®** (Meda Pharmaceuticals Ltd)
    - Imiquimod 37.5 mg per 1 gram Zyclara 3.75% cream 250mg sachets | 28 sachet £54.75 DT + £54.75

### SALICYLIC ACID AND DERIVATIVES

#### Salicylic acid

**INDICATIONS AND DOSE**

**OCCLUSAL®**

**Common and plantar warts**

- **TO THE LESION**
  - **Child:** Apply daily, treatment may need to be continued for up to 3 months
  - **Adult:** Apply daily, treatment may need to be continued for up to 3 months

**VERRUGON®**

**For plantar warts**

- **TO THE LESION**
  - **Child:** Apply daily, treatment may need to be continued for up to 3 months
  - **Adult:** Apply daily, treatment may need to be continued for up to 3 months

### UNLICENSED USE

- **In children** Not licensed for use in children under 2 years.
- **CAUTIONS** Avoid broken skin - impaired peripheral circulation - not suitable for application to anogenital region - not suitable for application to face - not suitable for application to large areas - patients with diabetes at risk of neuropathic ulcers - significant peripheral neuropathy
- **SIDE-EFFECTS** Skin irritation
- **PATIENT AND CARER ADVICE** Advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**OINTMENT**

- **Verrugon®** (Optima Consumer Health Ltd)
  - **Salicylic acid 500 mg per 1 gram** Verrugon complete 50% ointment | 6 gram £4.44 DT + £4.44

**LIQUID**

- **Occlusal®** (Alliance Pharmaceuticals Ltd)
  - **Salicylic acid 260 mg per 1 ml** Occlusal 26% solution | 10 ml £3.56 DT + £3.56

Chapter 14
Vaccines

1 Immunoglobulin therapy

IMMUNE SERA AND IMMUNOGLOBULINS IMMAUOGLOBULINS

Immunoglobulins

Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 1290 and disease-specific immunoglobulins.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult www.ivig.nhs.uk and Clinical Guidelines for Immunoglobulin Use, www.gov.uk/dh.

Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 1292 which is available from BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 1292 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 1290 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the Scottish National Blood Transfusion Service (SNBTS).

In Wales all immunoglobulins are available from the Welsh Blood Service (WBS).

In Northern Ireland all immunoglobulins are available from the Northern Ireland Blood Transfusion Service (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin (‘HNIG’) is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin (containing 10%–18% protein) is administered by intramuscular injection for the protection of susceptible contacts against hepatitis A virus (infectious hepatitis), measles and, to a lesser extent, rubella. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for intravenous administration is used as replacement therapy for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred.

Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for certain conditions, consult Clinical Guidelines for Immunoglobulin Use (www.gov.uk/dh).

Hepatitis A

Hepatitis A vaccine p. 1318 is recommended for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for prophylaxis in travellers.

Public Health England recommends the use of normal immunoglobulin in addition to hepatitis A vaccine for prevention of infection in close contacts (of confirmed cases
of hepatitis A) who are 60 years of age or over, have chronic liver disease (including chronic hepatitis B or C infection), or HIV infection (with a CD4 count < 200 cells per microlitre), or who are immunosuppressed; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts with chronic liver disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

**Measles**

Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Patients with congenital immunity who have come into close contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 1323 for prophyaxis following exposure to measles.

**Rubella**

Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 1323.

**Disease-specific immunoglobulins**

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.gov.uk/phe).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin p. 1290 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as post-exposure prophylaxis.

**Hepatitis B immunoglobulin**

Disease-specific hepatitis B immunoglobulin p. 1290 (‘HBIG’) is available for use in association with hepatitis B vaccine p. 1319 for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers. Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

**Rabies immunoglobulin**

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soap and water and specific rabies immunoglobulin p. 1292 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has been thoroughly healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine p. 1324 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

**Tetanus immunoglobulin**

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 1292 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 542 and wound cleansing, should also be used for the treatment of established cases of tetanus.

**Varicella-zoster immunoglobulin**

Varicella-zoster immunoglobulin p. 1292 (VZIG) is recommended for individuals who are at increased risk of severe varicella (neonates, pregnant women and immunosuppressed individuals with varicella-zoster virus immunoglobulin G antibody less than 150 mIU/mL) and who have no antibodies to varicella-zoster virus and who have significant exposure to chickenpox (varicella) or shingles (herpes zoster) during the infectious period.

Immunosuppressed patients receiving regular intravenous immunoglobulin replacement therapy only require varicella-zoster immunoglobulin if the most recent dose was administered more than 3 weeks before exposure.

Immunosuppressed patients on long term aciclovir p. 633 or valaciclovir p. 636 prophylaxis will require a temporary increase in their dose following exposure; for patients within 12 months of a stem cell transplant, varicella-zoster immunoglobulin should also be considered.

**Important:** for full details consult Guidance for issuing varicella-zoster immunoglobulin (VZIG) and Immunisation against infectious disease from Public Health England (www.gov.uk).

**Anti-D (RhD) immunoglobulin**

Anti-D (RhD) immunoglobulin p. 1289 is prepared from plasma from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (RhD) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D (RhD) immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (RhD) immunoglobulin is also given when significant fetal-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D (RhD) immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

Use of routine antenatal anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a
sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

MMR vaccine
Measles, mumps and rubella vaccine, live may be given in the postpartum period with anti-D (Rh) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

Anti-D (Rh(D)) immunoglobulin

**INDICATIONS AND DOSE**

To rhesus-negative woman for prevention of Rh(D) sensitisation, following birth of rhesus-positive infant

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks’ gestation

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks’ gestation

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, antenatal prophylaxis

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, antenatal prophylaxis (alternative NICE recommendation)

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 30 weeks gestation
### Hepatitis B immunoglobulin

#### INDICATIONS AND DOSE

**Prophylaxis against hepatitis B infection**
- **By intramuscular injection**
  - Adult: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure

**Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus–contaminated material**
- **By intravenous infusion**
  - Adult: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)

**Prevention of hepatitis B in haemodialysed patients**
- **By intravenous infusion**
  - Adult: (consult product literature)

**Prophylaxis against re-infection of transplanted liver**
- **By intravenous infusion**
  - Adult: (consult product literature)

**Prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients**
- **By subcutaneous injection**
  - Adult (body-weight up to 75 kg): 500 units once weekly, increased if necessary up to 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin
  - Adult (body-weight 75 kg and above): 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin

#### CAUTIONS

- IgA deficiency • Interference with live virus vaccines
- **INTERACTIONS** → Appendix 1: immunoglobulins
- **SIDE-EFFECTS**
  - Uncommon Abdominal pain upper • headache
  - Rare or very rare Cardiac discomfort • fatigue • hypersensitivity • hypertension • hypotension • muscle spasms • nasopharyngitis • oropharyngeal pain • palpitations • skin reactions

**PRESCRIBING AND DISPENSING INFORMATION**

- Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.

**HANDLING AND STORAGE**

- Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**
  - Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156

Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.

[www.nice.org.uk/TA156](http://www.nice.org.uk/TA156)

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **D-Gam (Bio Products Laboratory Ltd)**
  - Anti-D (RHO) immunoglobulin 500 unit per 1 ml D-Gam Anti-D immunoglobulin 500unit solution for injection vials | 1 vial (PoM) £38.25

- **Anti-D (RHO) immunoglobulin 1500 unit**
  - Anti-D (RHO) immunoglobulin 1500unit solution for injection vials | 1 vial (PoM) £58.00

- **Rhophylac (CSL Behring UK Ltd)**
  - Anti-D (RHO) immunoglobulin 750 unit per 1 ml Rhophylac 1,500units/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PoM) £46.50

---

### Normal immunoglobulin

**INDICATIONS AND DOSE**

**To control outbreaks of hepatitis A**
- **By deep intramuscular injection**
  - Adult: 500 mg

**Rubella in pregnancy, prevention of clinical attack**
- **By deep intramuscular injection**
  - Females of childbearing potential: 750 mg

**Antibody deficiency syndromes**
- **By subcutaneous infusion**
  - Adult: (consult product literature)

**SUBGAM®**

**Hepatitis A prophylaxis in outbreaks**
- **By intramuscular injection**
  - Adult: 750 mg

**UNLICENSED USE**

**SUBGAM®**

- Subgam® is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

**CONTRA-INDICATIONS**

- Patients with selective IgA deficiency who have known antibody against IgA
PRIVIGEN® Hyperprolinaemia (contains L-proline)
FLEBOGAMMA® DIF Hereditary fructose intolerance (contains sorbitol)
HIZENTRA® Hyperprolinaemia (contains L-proline)
GAMMAPLEX® Hereditary fructose intolerance (contains sorbitol)

CAUTIONS
- Agammaglobulinaemia with or without IgA deficiency - Hypogammaglobulinaemia with or without IgA deficiency - interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION
- Interference with live virus vaccines Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

Rare or very rare

- With subcutaneous use Diarrhoea - dizziness - drowsiness - fatigue - gastrointestinal discomfort - headaches - hypotension - local reaction - myalgia - nausea - pain - skin reactions
- With intramuscular use Chills
- With subcutaneous use Abdominal pain - arthralgia - musculoskeletal stiffness - myalgia - peripheral coldness - tremor

SIDE-EFFECTS
- Common or very common
- With intramuscular use Diarrhoea - dizziness - drowsiness - fatigue - gastrointestinal discomfort - headaches - hypotension - local reaction - myalgia - nausea - pain - skin reactions
- With subcutaneous use Paraesthesia
- Rare or very rare
- With intramuscular use Abdominal pain - arthralgia - musculoskeletal stiffness - myalgia - peripheral coldness - tremor
- Frequency not known

SIDE-EFFECTS, FURTHER INFORMATION
- Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.
- MONITORING REQUIREMENTS
- Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

DIRECTIONS FOR ADMINISTRATION
- Preparations for subcutaneous use May be administered by intramuscular injection if subcutaneous route not possible; intramuscular route not for patients with thrombocytopenia or other bleeding disorders.
- GAMUNEX® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.
- KIOVIG® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

PRESCRIBING AND DISPENSING INFORMATION
- Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.
- With intramuscular use Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).

HANDLING AND STORAGE
- Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- ELECTROLYTES: May contain Sodium
  - Hizentra (CSL Behring UK Ltd) Normal immunoglobulin human 200 mg per 1 ml Hizentra 2g/10ml solution for injection pre-filled syringes 1 1 pre-filled disposable injection (PRP) £108.00
  - Subgam (Bio Products Laboratory Ltd) Normal immunoglobulin human 160 mg per 1 ml Subgam 1.5g/9.375ml solution for injection vials 1 1 vial (PRP) £75.00
  - Subgam 4g/25ml solution for injection vials 1 1 vial (PRP) £200.00
  - Subgam 2g/12.5ml solution for injection vials 1 1 vial (PRP) £100.00
  - Subgam 4g/6.25ml solution for injection vials 1 1 vial (PRP) £50.00
  - Subgam 75mg/4.6875ml solution for injection vials 1 1 vial (PRP) £37.50

Solution for infusion
- EXCipients: May contain Glucose, maltose, sorbitol, sucrose
  - Normal immunoglobulin (Non-proprietary)
    - Normal immunoglobulin human 100 mg per 1 ml Normal immunoglobulin human 5g/50ml solution for infusion vials 1 1 vial (PRP)
    - Normal immunoglobulin human 2.5g/25ml solution for infusion vials 1 1 vial (PRP)
    - Normal immunoglobulin human 20g/200ml solution for infusion vials 1 1 vial (PRP)
    - Normal immunoglobulin human 10g/100ml solution for infusion vials 1 1 vial (PRP)
    - Normal immunoglobulin human 30g/300ml solution for infusion vials 1 1 vial (PRP)
  - Flebogammadif (Grifols UK Ltd) Normal immunoglobulin human 50 mg per 1 ml Flebogamma DIF 10g/200ml solution for infusion vials 1 1 vial (PRP) £100.00
    - Flebogamma DIF 2.5g/50ml solution for infusion vials 1 1 vial (PRP) £25.00
    - Flebogamma DIF 5g/100ml solution for infusion vials 1 1 vial (PRP) £255.00
    - Flebogamma DIF 500mg/10ml solution for infusion vials 1 1 vial (PRP) £30.00
    - Flebogamma DIF 2g/400ml solution for infusion vials 1 1 vial (PRP) £1,020.00
  - Gammaplex (Bio Products Laboratory Ltd) Normal immunoglobulin human 50 mg per 1 ml Gammaplex 10g/200ml solution for infusion vials 1 1 vial (PRP) £148.00 (Hospital only)
    - Gammaplex 5g/100ml solution for infusion vials 1 1 vial (PRP) £209.00 (Hospital only)
    - Gammaplex 20g/400ml solution for infusion vials 1 1 vial (PRP) £836.00 (Hospital only)
  - Gamunex (Grifols UK Ltd) Normal immunoglobulin human 100 mg per 1 ml Gamunex 10% 1g/10ml solution for infusion vials 1 1 vial (PRP) £42.50
    - Gamunex 10% 10g/100ml solution for infusion vials 1 1 vial (PRP) £425.00
    - Gamunex 10% 20g/200ml solution for infusion vials 1 1 vial (PRP) £850.00
    - Gamunex 10% 5g/50ml solution for infusion vials 1 1 vial (PRP) £212.50
  - Hizentra (CSL Behring UK Ltd) Normal immunoglobulin human 200 mg per 1 ml Hizentra 2g/10ml solution for infusion vials 1 1 vial (PRP) £108.00
    - Hizentra 1g/5ml solution for infusion vials 1 1 vial (PRP) £54.00
    - Hizentra 4g/20ml solution for infusion vials 1 1 vial (PRP) £216.00
  - Kiovig (Baxalta UK Ltd) Normal immunoglobulin human 100 mg per 1 ml Kiovig 5g/50ml solution for infusion vials 1 1 vial (PRP) £245.00
    - Kiovig 20g/200ml solution for infusion vials 1 1 vial (PRP) £980.00
    - Kiovig 10g/100ml solution for infusion vials 1 1 vial (PRP) £490.00
    - Kiovig 30g/300ml solution for infusion vials 1 1 vial (PRP) £1,470.00
    - Kiovig 2.5g/25ml solution for infusion vials 1 1 vial (PRP) £122.50
**1292 Immunoglobulin therapy**

**Tetanus immunoglobulin**

- **INDICATIONS AND DOSE**
  - **Post-exposure prophylaxis**
    - **BY INTRAMUSCULAR INJECTION**
    - **Child:** Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns.
    - **Adult:** Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns.
  - **Treatment of tetanus infection**
    - **BY INTRAMUSCULAR INJECTION**
    - **Child:** 150 units/kg, dose may be given over multiple sites.
    - **Adult:** 150 units/kg, dose may be given over multiple sites.

- **CAUTIONS**
  - IgA deficiency.
  - Interference with live virus vaccines.

- **INTERACTIONS**
  - Appendix 1: immunoglobulins.

- **SIDE-EFFECTS**
  - Rare or very rare: Arthralgia, chills, fatigue, fever, headache, hypersensitivity, hypotension, influenza-like illness, malaise, nausea, skin reactions, tachycardia, vomiting.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose. Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

- **HANDLING AND STORAGE**
  - Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Tetanus immunoglobulin (Non-proprietary)**
  - Tetanus immunoglobulin human 250 unit solution for injection vials | 1 vial £170.00

---

**Varicella-zoster immunoglobulin**

(=Antivaricella-zoster immunoglobulin)

- **INDICATIONS AND DOSE**
  - **Prophylaxis against varicella infection**
    - **BY DEEP INTRAMUSCULAR INJECTION**
    - **Adult:** 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.

- **CAUTIONS**
  - IgA deficiency.
  - Interference with live virus vaccines.

- **INTERACTIONS**
  - Appendix 1: immunoglobulins.

- **SIDE-EFFECTS**
  - Arthralgia, chills, fever, headache, hypersensitivity, hypotension, malaise, nausea, skin reactions, tachycardia, vomiting.
Post-exposure prophylaxis

IMMUNE SERA AND IMMUNOGLOBULINS

ANTITOXINS

Bezlotoxumab

- **Drug Action** Bezlotoxumab is a human monoclonal antitoxin antibody; it binds to *Clostridium difficile* toxin B and neutralises its activity, preventing recurrence of *Clostridium difficile* infection.

- **Indications and Dose** Prevention of recurrence of *Clostridium difficile* infection in patients at high risk of reinfection
  - **By intravenous infusion**
  - Adult: 10 mg/kg for 1 dose, to be administered during the course of antibacterial therapy for *Clostridium difficile* infection

- **Side-effects**
  - Common or very common Dizziness, dyspnoea, fatigue, fever, headache, hypertension, infusion related reaction, nausea
  - Pregnancy Manufacturer advises avoid unless essential—limited information available.
  - Breast Feeding Manufacturer advises avoid—no information available.
  - Directions for administration Manufacturer advises for intravenous infusion (Zinplava®), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute requisite dose to a concentration of 1–10 mg/mL with infusion fluid; give over 60 minutes via a central venous catheter or peripheral catheter using a low-protein binding filter (0.2–5 micron).
  - Handling and storage Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

- **Medical Forms** There can be variation in the licensing of different medicines containing the same drug.

  **Solution for infusion**
  - Excipients: May contain Polysorbates
  - Electrolytes: May contain Sodium
  - **Zinplava (Merck Sharp & Dohme Ltd)**
    - Bezlotoxumab 25 mg per 1 ml

Botulism antitoxin

- **Drug Action** A preparation containing the specific antitoxin globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

- **Indications and Dose** Post exposure prophylaxis of botulism
  - **By intramuscular injection**
  - Adult: (consult product literature)

- **Side-effects** Hypersensitivity

  **Side-effects, further information** It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

- **Pre-Treatment Screening** All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

- **Prescribing and Dispensing Information** Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank.

  The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

- **Medical Forms** No licensed medicines listed.

Diphtheria antitoxin

(Dip/Ser)

- **Indications and Dose** Passive immunisation in suspected cases of diphtheria
  - **By intravenous infusion**
  - Adult: Dose should be given without waiting for bacteriological confirmation (consult product literature)

- **Cautions**

  **Cautions, further information**
  - Hypersensitivity Hypersensitivity is common after administration; resuscitation facilities should be available. Diphtheria antitoxin is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis and vaccine.

- **Side-effects**
  - Common or very common Hypersensitivity

- **Pre-Treatment Screening** Diphtheria antitoxin is derived from horse serum and reactions are common; tests for hypersensitivity should be carried out before use.

- **Prescribing and Dispensing Information** Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).
4 Vaccination

Vaccination, general principles

Active immunity
Active immunity can be acquired by natural disease or by vaccination. Vaccines stimulate production of antibodies and other components of the immune mechanism; they consist of either:

- a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
- detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
- extracts of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Vaccines and HIV infection
HIV-positive individuals with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired; use of normal immunoglobulin should be considered after exposure to measles), varicella–zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; varicella–zoster immunoglobulin should be considered after exposure to chickenpox or herpes zoster), rotavirus;
- and the following inactivated vaccines:
  - anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive individuals should not receive:

- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought).

The above advice differs from that for other immunocompromised patients; Immunisation Guidelines for HIV-infected Adults issued by British HIV Association (BHIVA) are available at www.bhiva.org and, Immunisation of HIV-infected Children issued by Children’s HIV Association (CHIVA) are available at www.chiva.org.uk

Vaccines and asplenia
The following vaccines are recommended for asplenic patients, those with splenic dysfunction or complement disorders, depending on the age at which their condition is diagnosed:

- Haemophilus influenzae type b with meningococcal group C vaccine p. 1314;
- Influenza vaccine p. 1322;
- Meningococcal groups A with C and W135 and Y vaccine p. 1315 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 1314;
### Routine immunisation schedule

**When to immunise** | **Vaccine given and dose schedule (for details of dose, see under individual vaccines)**
---|---
**Neonates at risk only** | ▶ Bacillus Calmette-Guérin vaccine p. 1313 (at birth, see BCG vaccine p. 1297)
▶ Hepatitis B vaccine p. 1319 (at birth, see Hepatitis B vaccine p. 1300)
**8 weeks** | ▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1312 (Infanrix hexa®). First dose
▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1314 (Bexsero®). First dose
▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1316 (Prevenar 13®). First dose
▶ Rotavirus vaccine p. 1325 (Rotarix®). First dose
**12 weeks** | ▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine (Infanrix hexa®). Second dose
▶ Rotavirus vaccine (Rotarix®). Second dose
**16 weeks** | ▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine (Infanrix hexa®). Third dose
▶ Meningococcal group B vaccine (rDNA, component, adsorbed) (Bexsero®). Second dose
▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) (Prevenar 13®). Second dose
**1 year (on or after first birthday)** | ▶ Measles, mumps and rubella vaccine, live p. 1323 (MMR VaxPRO® or Priorix®). First dose
▶ Meningococcal group B vaccine (rDNA, component, adsorbed) (Bexsero®). Single booster dose
▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) (Prevenar 13®). Single booster dose
▶ Haemophilus influenzae type b with meningococcal group C vaccine p. 1314 (Menitorix®). Single booster dose
**2–10 years on 31st August 2019 (including children in reception class and school years 1, 2, 3, 4, 5, and 6)** | ▶ Influenza vaccine p. 1322 each year from September. Note: live attenuated influenza nasal spray is recommended (Fluenz Tetra®). If contra-indicated and child is in clinical risk group, use inactivated influenza vaccine (see Influenza vaccine p. 1301)
**3 years and 4 months, or soon after** | ▶ Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1311 (Repevax®). Single booster dose.
▶ Measles, mumps and rubella vaccine, live (MMR VaxPRO® or Priorix®). Second dose
**11–14 years (females only). First dose of HPV vaccine will be offered to females aged 12–13 years of age in England, Wales, and Northern Ireland, and 11–13 years of age in Scotland. For females aged 15 years and older, see Human papillomavirus vaccine p. 1300.** | ▶ Human papillomavirus vaccines p. 1321 (Gardasil®). 2 doses; second dose 6–24 months after first dose. If a 3-dose course of HPV vaccine has been started, where possible, the course should be completed (2 doses less than 6 months apart does not provide long-term protection). Only Gardasil® is offered as part of the national immunisation programme. Therefore for those females who started the schedule with Cervarix®, but did not complete the vaccination course, the course can be completed with Gardasil®. Ideally one vaccine should be used for the entire course.
**13–15 years** | ▶ Meningococcal groups A with C and W135 and Y vaccine p. 1315 (Nimenrix® or Menveo®). Single booster dose
**13–18 years** | ▶ Diphtheria with poliomyelitis and tetanus vaccine p. 1312 (Revax®). Single booster dose. **Note:** Can be given at the same time as the dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age.
**Females of child-bearing age susceptible to rubella** | ▶ Measles, mumps and rubella vaccine, live females of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—Exclude pregnancy before immunisation, and avoid pregnancy for one month after vaccination.
**Pregnant females** | ▶ Acellular pertussis-containing vaccine administered as diphtheria with pertussis, poliomyelitis vaccine and tetanus (Boostrix-IPV®). 1 dose from the 16th week of pregnancy, preferably after the fetal anomaly scan (weeks 18–20)
▶ Influenza vaccine (inactivated). Single dose administered from September, regardless of the stage of pregnancy (see Influenza vaccine p. 1301)

### Routine immunisations during adult life

**When to immunise** | **Vaccine given and dose schedule (for details of dose, see under individual vaccines)**
---|---
**Under 25 years, those entering university who are at risk of meningococcal disease** | ▶ Meningococcal groups A with C and W135 and Y vaccine (Nimenrix® or Menveo®). Single dose. **Note:** Should be offered to those aged under 25 years entering university who have not received the meningococcal groups A with C and W135 and Y vaccine over the age of 10 years
**During adult life, if not previously immunised or 5 dose course is incomplete** | ▶ Diphtheria with poliomyelitis and tetanus vaccine
**65 years** | ▶ Pneumococcal polysaccharide vaccine p. 1316
**From 65 years** | ▶ Influenza vaccine (inactivated) Each year from September (see Influenza vaccine p. 1301)
**70 years** | ▶ Varicella-zoster vaccine p. 1326 Single dose
Vaccines

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health. For further details of availability, see under individual publications/the-complete-routine-immunisation-schedule (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Immunisation schedule

Routine immunisations, sources of information

The immunisation schedule reflects advice from ‘The complete routine immunisation schedule’ produced by Public Health England (2018). For the most up to date immunisation schedule see: www.gov.uk/government/publications/the-complete-routine-immunisation-schedule

Vaccines for the immunisation schedule should be obtained from ImmForm at: www.immform.dh.gov.uk

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for respiratory complications for 48–72 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring.

Individuals with unknown or incomplete immunisation history

For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administrated where the routine childhood immunisation schedule has not been completed. For advice on dosing schedules for missed vaccinations, and the immunisation of individuals coming to the UK, consult Chapter 11, The UK immunisation schedule, in Immunisation against infectious disease– ‘The Green Book’. Public Health England, available at: www.gov.uk/government/publications/immunisation-schedule-the-green-book-chapter-11

Immunisations for healthcare and laboratory staff

Vaccine-preventable diseases that can be transmitted from person to person are a risk for staff and patients in healthcare environments, and staff in laboratory environments. Therefore, all staff must be up-to-date with their routine immunisations. In addition, specific immunisations are recommended for certain staff groups due to the risk of acquiring or passing on infection. For detailed recommendations, consult Chapter 12,
**Vaccination 1297**

**Anthrax vaccine**

**Overview**

Anthrax vaccine p. 1312 is made from antigens from inactivated *Bacillus anthracis* adsorbed onto an adjuvant. Anthrax immunisation is indicated for individuals who handle infected animals or process infected animal products where there is a potential risk of occupational exposure to *B. anthracis*. It is also recommended for occupations where workers are at risk of one-off high level exposures to anthrax (e.g. following a deliberate or accidental release of spores).

A 4-dose regimen is used for primary immunisation; a single booster dose should be given at 10-year intervals on up to 3 occasions to workers at potential continuous low level risk of exposure to anthrax. In those with potential intermittent high level exposure, a single booster dose should be offered just before entering situations with a specific high exposure risk. If such opportunities do not arise, a single booster dose should be given at 10-year intervals on up to 3 occasions to sustain protection.

In the event of proven or high probability of exposure to anthrax spores, a single booster dose should be given, in addition to antibacterial prophylaxis, except when a dose has been given in the preceding 12 months.

All suspected cases of anthrax must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

**Useful Resources**

**BCG vaccine**

**Overview**

*Bacillus Calmette-Guérin* vaccine p. 1313 should be given intradermally by operators skilled in the technique.

The expected reaction to successful *Bacillus Calmette-Guérin* vaccine is induration at the site of injection followed by a local lesion which starts as a papule and later ulcerates. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out and they are negative for tuberculin hypersensitivity:

- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years (there is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients) at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000.

List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at [www.gov.uk/ phe](http://www.gov.uk/phe).

Bladder instillations of BCG are licensed for the management of bladder carcinoma. See also Tuberculosis p. 578 for advice on chemoprophylaxis; for the treatment of infection following vaccination, seek expert advice.

**Tuberculosis Diagnostic Agents**

The Mantoux test is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at [www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation).

In the Mantoux test, the diagnostic dose is administered by intradermal injection of tuberculin purified protein derivative p. 1294 (PPD). The *Heaf* test (involving the use of multiple-puncture apparatus) is no longer available.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: *QuantiFERON®* TB Gold and *T-SPOT®. TB*. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see [www.gov.uk/phe](http://www.gov.uk/phe).

**Useful Resources**

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: [www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book).
Botulism antitoxin

Overview
A polyvalent botulism antitoxin p. 1293 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by Clostridium botulinum types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The handbook incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Cholera vaccine

Overview
Oral cholera vaccine p. 1313 contains inactivated Inaba (El-Tor biotype) and Ogawa strains of Vibrio cholerae, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of V. cholerae, serotype O1. Oral cholera vaccine is licensed for adults and children from 2 years of age who are travelling to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least one week before potential exposure. However, there is no requirement for cholera vaccination for international travel. After a full risk assessment, immunisation can be considered for the following individuals:

- relief or disaster aid workers;
- persons with remote itineraries in areas where cholera epidemics are occurring and there is limited access to medical care;
- travellers to potential cholera risk areas, for whom vaccination is considered potentially beneficial;
- individuals at occupational risk, such as laboratory workers who may be regularly exposed to cholera.

For dosing schedule, see cholera vaccine. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential. All suspected cases of cholera must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Contacts
Contacts of patients with cholera should maintain high standards of personal hygiene to avoid becoming infected. Cholera vaccine should not be used in the management of contacts of cases or in controlling the spread of infection.

Useful Resources

Diphtheria vaccine

Overview
Diphtheria-containing vaccines are prepared from the toxin of Corynebacterium diphtheriae and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antibody. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years, vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1312 (Infanrix hexa®) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine. Individuals aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

Diphtheria-containing vaccines for children over 10 years and adults

A low dose of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses.

Travel
Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

Contacts
Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with C. diphtheriae or C. ulcerans should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. Adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine is used for this purpose; immunity should be checked by
antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. See advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Haemophilus influenzae type B conjugate vaccine

Overview
Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis, hepatitis B and poliomyelitis vaccine (Infanrix hexa®), as a component of the primary course of childhood immunisation (see Immunisation schedule). For infants under 1 year, the course consists of 3 doses of a vaccine containing Haemophilus influenzae type b component with an interval of 1 month between doses. A booster dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 1 year of age, on or after the child’s first birthday.

Children 1–10 years who have not been immunised against Haemophilus influenzae type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, children born before August 2017 should be given 3 doses of the combined vaccine they were started on. The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive H. influenzae type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

Invasive Haemophilus influenzae type b disease
After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago. See also use of rifampicin p. 582 in the prevention of secondary cases of Haemophilus influenzae type b disease.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Hepatitis A vaccine

Overview
Hepatitis A vaccine p. 1318 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:

- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas;
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine Ambirix® can also be used.

Public Health England recommends the use of intramuscular normal immunoglobulin p. 1290 in addition to hepatitis A vaccine for prevention of infection in close contacts (of confirmed cases of hepatitis A) who are 60 years of age or over, have chronic liver disease, or HIV infection, or who are immunosuppressed. For further guidance, see Immunoglobulins p. 1287.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.
Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

Hepatitis B vaccine
Overview
Hepatitis B vaccine p. 1319 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto an adjuvant. It is made biosynthetically using recombinant DNA technology.
From August 2017, vaccination against hepatitis B is recommended as part of the routine immunisation schedule. Primary immunisation (see Routine immunisation schedule) requires 3 doses, administered at intervals of 1 month from the age of 2 months, to be given as part of the combined diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1312 (Infanrix hexa®).
As part of the selective neonatal immunisation programme, vaccination is recommended for neonates whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers). Hepatitis B vaccination is started immediately after birth with a dose of the monovalent hepatitis B vaccine (no later than 24 hours after delivery), followed by a second dose at 4 weeks; the routine immunisation combination vaccine (Infanrix hexa®) at weeks 8, 12 and 16; and a further dose of the monovalent hepatitis B vaccine at one year of age. Neonates born to highly infectious mothers should also receive hepatitis B immunoglobulin p. 1290 at the same time as the first dose of monovalent hepatitis B vaccine, but administered at a different site—more detailed guidance is given in the handbook Immunisation against Infectious Disease (www.gov.uk/government/publications/hepatitis-b-the-green-book-chapter-18).
Following significant exposure to hepatitis B (e.g. through needle-stick injury or unprotected sex) and for pre-exposure prophylaxis in high-risk groups, an ‘accelerated schedule’ using the single, monovalent hepatitis B vaccine is recommended immediately, with the second dose given 1 month after the initial dose, and the third dose given 2 months after the initial dose. For those at continued high risk following exposure, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook Immunisation against Infectious Disease.
Specific hepatitis B immunoglobulin can also be indicated for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection. If hepatitis B immunoglobulin is indicated, it should be given as soon as possible, ideally at the same time or within 24 hours of the first dose of vaccine, but not after seven days have elapsed since exposure. See also Hepatitis B immunoglobulin in Immunoglobulins p. 1287.
In the UK, groups at high-risk of hepatitis B include:
• individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
• patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
• individuals with chronic liver disease;
• healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients’ tissues;
• laboratory staff who handle material that may contain the virus;
• other occupational risk groups such as morticians and embalmers;
• staff and patients of day-care or residential accommodation for those with severe learning difficulties;
• staff and inmates of custodial institutions;
• those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
• families adopting children from countries with a high or intermediate prevalence of hepatitis B;
• foster carers and their families.
Following a primary course of immunisation, most people do not require a reinforcing dose of a hepatitis B-containing vaccine. A single booster dose should be offered to healthcare workers approximately five years after primary immunisation, to patients on renal dialysis with anti-HBs levels below 10mlU/mL, and at the time of a subsequent significant exposure.
Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses (available at www.dh.gov.uk/).
Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.
A combined hepatitis A and B vaccine p. 1317 is also available.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

Human papillomavirus vaccine
Overview
Human papillomavirus vaccine is available as a bivalent vaccine (Cervarix® or a quadrivalent vaccine (Gardasil®). Since 2012, only Gardasil® is offered as part of the national immunisation programme. Cervarix® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. Gardasil® is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against pre-cancerous and cervical cancer in males; genital warts in males and females; and oropharynx cancers in males.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

www.getintopharma.com
disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see Immunisation schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

Females receiving their first dose aged 15 years or older require a 3-dose schedule (see Cervarix® and Gardasil®), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

If a 3-dose course of vaccination had been started before September 2014 in a female aged under 15 years, then where possible this should be completed; the interrupted course should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Under the national programme in England, females remain eligible to receive the human papillomavirus vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.

### Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

### Influenza vaccine

#### Overview
While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 1322 in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

The influenza vaccines recommended for immunisation are the adjuvanted trivalent influenza vaccine (inactivated), high dose trivalent influenza vaccine (inactivated), cell-grown quadrivalent influenza vaccine (inactivated), standard egg-grown quadrivalent influenza vaccine (inactivated), and live attenuated influenza vaccine. The choice of vaccine is dependent on the person’s age and contra-indications.

The ideal time for immunisation is between September and early November.

Immunisation is recommended for people at high risk from influenza, and to reduce transmission of infection. Annual immunisation is strongly recommended for individuals aged 6 months and over with the following conditions:

- chronic respiratory disease;
- chronic heart disease;
- chronic liver disease;
- chronic renal disease at stage 3, 4 or 5;
- chronic neurological disease;
- complement disorders;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone p. 678: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily], and chemotherapy);
- HIV infection (regardless of immunostatus);
- morbid obesity (BMI of 40 kg/m² and above).

Annual influenza vaccine is also recommended for:

- children of specific ages, see Immunisation schedule p. 1296;
- all pregnant women (including those who become pregnant during the flu season);
- all adults aged 65 years and over (including those becoming 65 by 31 March 2020);
- residents of nursing or residential homes for the elderly and other long-stay facilities;
- carers of individuals whose welfare may be at risk if the carer falls ill;
- household contacts of immunocompromised individuals;
- frontline health and social care workers.

Children aged 6 months to less than 2 years of age in clinical risk groups should be offered the standard egg-grown quadrivalent inactivated influenza vaccine.

Children aged 2–17 years of age (including those in clinical risk groups) should be offered the live attenuated influenza vaccine, administered as a nasal spray (Fluenz tetra®). The live attenuated vaccine is thought to provide broader protection than inactivated vaccines. If the child is in a clinical risk group and the live attenuated vaccine is contra-indicated or otherwise unsuitable, offer standard egg-grown quadrivalent inactivated influenza vaccine.

Children aged 6 months to less than 9 years of age in clinical risk groups who have not had the influenza vaccine previously should be offered two doses of the appropriate influenza vaccine, four weeks apart.

Adults aged 18 to 64 years of age in clinical risk groups, pregnant females, and other eligible groups should be offered either the standard egg-grown quadrivalent inactivated influenza vaccine or the cell-grown quadrivalent inactivated influenza vaccine.

Adults aged 65 years and over should be offered either the adjuvanted trivalent inactivated influenza vaccine or the cell-grown quadrivalent inactivated influenza vaccine. The high dose trivalent inactivated influenza vaccine is equally suitable but is not eligible for reimbursement under the NHS flu vaccination 2019/2020 programme.

In the 2019/2020 national influenza immunisation programme, annual influenza vaccine will be offered to all children aged 2–10 years on 31st August 2019 (including those in reception class and school years 1, 2, 3, 4, 5, and 6).

For the management of influenza, see Influenza p. 561.

Japanese encephalitis vaccine

Overview

Japanese encephalitis is a mosquito-borne viral encephalitis caused by a Flavivirus. Japanese encephalitis vaccine p. 1323 (JIXARO)® is an inactivated vaccine adsorbed onto an adjuvant. It is recommended for individuals who are going to reside in an area where Japanese encephalitis is endemic or epidemic. Travellers to South and South-East Asia and the Far East should be immunised if staying for a month or longer in endemic areas during the transmission season. Other travellers with shorter exposure periods should also be immunised if the risk is considered sufficient. Immunisation is also recommended for laboratory staff at risk of exposure to the virus.

The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

In adults (aged under 65 years) and children (aged 2 months and over) at ongoing risk (including laboratory staff and long-term travellers), a single booster dose should be given 12 months after the primary immunisation course. A booster dose can be considered in adults aged 65 years and over, but the immune response is lower than in younger adults. For other travellers, a single booster dose should be given within 12–24 months after primary immunisation, before potential re-exposure to the Japanese encephalitis virus. Travellers aged 18–64 years should be offered a second booster dose at 10 years if they remain at risk.

Cases of Japanese encephalitis should be managed with supportive treatment.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre.

Measles, Mumps and Rubella vaccine

Overview

Measles vaccine has been replaced by a combined measles, mumps and rubella vaccine, live p. 1323 (MMR vaccine).

Measles, mumps and rubella vaccine, live aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contra-

indication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children at 1 year of age, on or after their first birthday. A second dose is given before starting school at 3 years and 4 months of age, or soon after (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, measles, mumps and rubella vaccine, live immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of measles, mumps and rubella vaccine, live in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

Measles, mumps and rubella vaccine, live should be used to protect against rubella in seronegative women of childbearing age (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously unimmunised and seronegative post-partum women (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts

Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months of age (or soon after) should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin after exposure to measles; routine measles, mumps and rubella vaccine, live immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is not suitable for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (see advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

Travel

Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should
receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months of age (or soon after) should still be given.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Meningococcal vaccine

Overview
Almost all childhood meningococcal disease in the UK is caused by Neisseria meningitidis serogroups B and C.

Meningococcal group C conjugate vaccine protects only against infection by serogroup C and Meningococcal group B vaccine protects only against infection by serogroup B. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the meningococcal groups A, C, W135, and Y conjugate vaccine is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

Meningococcal group B vaccines, Bexsero®, and Trumenba® are licensed in the UK against infection caused by Neisseria meningitidis serogroup B. The use of Bexsero® is recommended in the Immunisation Schedule. Bexsero® contains 3 recombinant Neisseria meningitidis serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against Neisseria meningitidis serogroup B. Trumenba® contains 2 recombinant Neisseria meningitidis serogroup B proteins. The proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

Childhood immunisation
Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of Neisseria meningitidis. Immunisation consists of 1 dose given at 12 months of age (as the haemophilus influenzae type b with meningococcal group C vaccine p. 1314) and a second dose given at 13–15 years of age (as the meningococcal groups A with C and W135 and Y vaccine p. 1315) (see Immunisation Schedule).

Meningococcal group B vaccine provides protection against infection by serogroup B of Neisseria meningitidis. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see Immunisation Schedule above). Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B vaccine (rDNA, component, adsorbed) p. 1314 followed by a second dose of meningococcal group B vaccine (rDNA, component, adsorbed) two months later. They should then be vaccinated according to the Immunisation Schedule (ensuring at least a two month interval between doses of meningococcal group B vaccines). Unimmunised children aged 12–23 months should be given 2 doses of meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months if they have received less than 2 doses in the first year of life. Unimmunised children aged 2–9 years should be given a single dose of meningococcal group C vaccine (as the haemophilus influenzae type b with meningococcal group C vaccine) followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age. From 2015, unimmunised individuals aged 10–25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine; a booster dose is not required.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel
Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org/).

Proof of vaccination with the tetravalent meningococcal groups A with C and W135 and Y vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts
For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with Neisseria meningitidis should be considered.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book
Pertussis vaccine

Overview
Pertussis vaccine is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of Bordetella pertussis. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 to 2 months from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with a combination vaccine of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1312 (Infanrix hexa®).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed. Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

Vaccination of pregnant women against pertussis

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis–specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine; Boostrix-IPV®) between 16 and 32 weeks of pregnancy. Public Health England has advised (2016) that the vaccine is probably best offered after the fetal anomaly scan at around 18–20 weeks. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 16–32 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

Contacts
Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

Side-effects
Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

Pneumococcal vaccine

Overview
The pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1316 and the pneumococcal polysaccharide vaccine p. 1316 protect against infection with Streptococcus pneumoniae (pneumococcus). Both vaccines contain polysaccharide from capsular pneumococci. The pneumococcal polysaccharide vaccine contains purified polysaccharide from 23 capsular types of pneumococcus, whereas the pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide from either 10 capsule types (Synflorix®) or 13 capsule types (Prevenar 13®). Both vaccines are inactivated.

Prevenar 13® is the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) used in the childhood Immunisation schedule p. 1296. The schedule consists of 3 doses given at separate intervals. The 23-valent pneumococcal polysaccharide vaccine is recommended for all adults aged 65 years and over, and for adults and children aged 2 years and over in the following at-risk groups:

- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac syndrome which could lead to splenic dysfunction);
- chronic respiratory disease (including severe asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immunosuppression because of disease (e.g. HIV infection, and genetic disorders affecting the immune system) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: adult and child 20 mg and over, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily, and chemotherapy);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur.

The 23-valent pneumococcal polysaccharide vaccine should also be considered for those at risk of occupational exposure to metal fume (e.g. welders). Where possible, the vaccine should be given at least 2 weeks (ideally 4–6 weeks) before splenectomy, chemotherapy, or radiotherapy; patients should be given advice about the increased risk of pneumococcal infection. If it is not possible to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy, and at least 3 months after completion of chemotherapy or radiotherapy. For patients with leukaemia or who have had a bone marrow transplant, refer to Chapter 25, Pneumococcal, in Immunisation against infectious disease – The Green Book for vaccination advice. A patient card and Information leaflet
Children diagnosed with at-risk conditions aged 10 years and over and adults

Individuals diagnosed or first presenting with an at-risk condition should be given a single dose of the 23-valent pneumococcal polysaccharide vaccine. No additional 23-valent pneumococcal polysaccharide vaccine is required at 65 years of age.

Severely immunocompromised individuals should be given a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) followed by the 23-valent pneumococcal polysaccharide vaccine at least 2 months after, irrespective of their previous pneumococcal vaccinations. If the 23-valent pneumococcal polysaccharide vaccine has already been given, the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) should be given at least 6 months after.

For further information on vaccination in patients with asplenia, see Vaccination, general principles p. 1294.

Revaccination

In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces side effects (e.g. chills, asthenia, and myalgia). Revaccination is therefore not recommended, except for individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and chronic renal disease), where revaccination is recommended every 5 years.

Management of cases

For the management of cases, contacts and outbreaks, refer to Chapter 25, Pneumococcal, in Immunisation against infectious disease—'The Green Book'.

Useful Resources

Recommendations reflect Chapter 25, Pneumococcal, in Immunisation against infectious disease—'The Green Book'.

Poliomyelitis vaccine

Overview

Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. Inactivated poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

Live (oral) poliomyelitis vaccine is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated
strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Travel
Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk/ or from the National Travel Health Network and Centre (www.nathnac.org/).

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

Rabies vaccine

Overview
Rabies vaccine p. 1324 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

Pre-exposure prophylaxis
Immunisation should be offered to those at high risk of exposure to rabies—labour staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with rabies handlers. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk/ or from the National Travel Health Network and Centre (www.nathnac.org/).

Useful Resources
Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

Rotavirus vaccine

Overview
Rotavirus vaccine p. 1325 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal
association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

---

**Tetanus vaccine**

**Overview**

Tetanus vaccine contains a cell-free purified toxin of Clostridium tetani adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses (see Routine immunisation schedule). Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school.

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine are given with an interval of 1 month between doses (see Diphtheria-containing vaccines for children over 10 years and adults).

When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

**Wounds**

Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- **For clean wounds**: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation who is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need)

- **For tetanus-prone wounds**: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

**Useful Resources**

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at: www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book

---

**Tick-borne encephalitis vaccine**

**Overview**

Tick-borne encephalitis vaccine, inactivated p. 1325 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are
Vaccines

1308 Vaccination

most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

Typhoid vaccine

07-Nov-2018

Overview

Typhoid vaccine p. 1217 is available as a Vi capsular polysaccharide (from Salmonella typhi) vaccine for injection and a live, attenuated Salmonella typhi vaccine for oral use.

Typhoid immunisation is advised for:

- travellers to areas where typhoid is endemic and whose planned activities put them at higher risk (country-by-country information is available from the National Travel Health Network and Centre);
- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely;
- laboratory personnel who, in the course of their work, may be exposed to Salmonella typhi.

Capsular polysaccharide typhoid vaccine is given as a single dose, usually by intramuscular injection. Children under 2 years [unlicensed] may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). A single booster dose should be given at 3-year intervals in adults and children over 2 years of age who remain at risk from typhoid fever.

Oral typhoid vaccine is a live, attenuated vaccine contained in an enteric-coated capsule recommended in individuals aged 6 years and over. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. If travelling from a non-endemic area to an area where typhoid is endemic, a booster consisting of 3 doses is recommended every 3 years. The oral typhoid vaccine should be avoided in immunosuppressed and HIV-infected individuals.

Prevention of typhoid primarily depends on improving sanitation and water supplies in endemic areas and on scrupulous personal, food and water hygiene.

All suspected cases of typhoid fever must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Varicella-zoster vaccine

Overview

The live varicella-zoster vaccine p. 1326, Varilrix® and Varivax®, are licensed for immunisation against varicella (chickenpox) in seronegative individuals. They are not recommended for routine use in children, but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends these vaccines for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy;
- healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

National shingles immunisation programme

The aim of the national shingles immunisation programme is to lower the incidence and severity of shingles in older people using the high potency, live varicella-zoster vaccine, Zostavax®. It is recommended that vaccination is routinely offered to people aged 70 years. A catch-up programme has also been rolled out (since 2013) in those aged 70–79 years, as this age group is likely to have the greatest benefit from vaccination.

In the 2016–2017 immunisation programme, varicella-zoster vaccine is recommended in adults who were 70 or 78 years of age on 1st September 2016. Patients who were eligible for vaccination in the first 3 years of the programme but have not been vaccinated against herpes zoster remain eligible until their 80th birthday; this includes patients who were aged 71–73 or 79 on 1st September 2016. Patients who have reached 80 years are no longer eligible for vaccination. A single dose of Zostavax® is likely to give protection for at least 7 years, but the need for, or timing of, a booster dose has not been established. Although Zostavax® is not recommended for the treatment of shingles or post-herpetic neuralgia, it can be given to those with a previous history of shingles; ideally the vaccine should be delayed until systemic antiviral therapy has been completed.

Varicella-zoster immunoglobulin p. 1292 is used to protect susceptible individuals at increased risk of severe varicella infection (see Immunoglobulins p. 1287).

Useful Resources

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

Yellow fever vaccine

Overview
Yellow fever vaccine, live p. 1327 is an attenuated preparation of yellow fever virus grown in chick eggs. Yellow fever vaccine, live is recommended for:
- laboratory workers handling infected material;
- individuals aged 9 months or older who are travelling to, or living in areas or countries with a risk of yellow fever transmission;
- individuals aged 9 months or older who are travelling to, or living in countries that require an International Certificate of Vaccination or Prophylaxis (ICVP) for entry (information about countries at risk of yellow fever is available from the National Travel Health Network and Centre).

Children aged under 9 months are at risk of vaccine-associated encephalitis, with the risk being inversely proportional to age. Children aged under 6 months should not be vaccinated. Children aged 6–9 months should only be vaccinated following a detailed risk assessment, and vaccination is generally only recommended if the risk of yellow fever transmission is high (such as during epidemics/epidemics). If travel is unavoidable, seek expert advice on whether to vaccinate.

A single-dose of yellow fever vaccine, live confers life-long immunity against yellow fever disease. Immunisation should be performed at least 10 days before travelling to an endemic area to allow protective immunity to develop and for the ICVP (if required) to become valid.

Reinforcing immunisation is not needed, except for a small subset of individuals at continued risk who may not have developed long-term protection from their initial yellow fever vaccine, live vaccination—seek expert advice.

Yellow fever vaccine, live should be avoided in HIV-infected and immunosuppressed individuals. If the yellow fever risk is unavoidable, consult the British HIV Association (bhiva.org/vaccination-guidelines.aspx) or other specialist advice.

All suspected cases of yellow fever must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

Vaccines for travel

Immunisation for travel
See advice on Malaria, treatment p. 613.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of poliomyelitis or tuberculosis should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100,000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100,000 is available from www.gov.uk/phe); it should preferably be given 3 months or more before departure.

Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, Health Information for Overseas Travel, www.dh.gov.uk).

Immunisation against meningococcal meningitis is recommended for a number of areas of the world.

Protection against hepatitis A is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is recommended and it is likely to be effective even if given shortly before departure; Public Health England recommends travellers can be vaccinated with hepatitis A vaccine up to the day of travel, and no longer recommends the use of normal immunoglobulin for travel prophylaxis. Special care must also be taken with food hygiene.

Hepatitis B vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against rabies is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.

There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on diphtheria, on Japanese encephalitis, and on tick-borne encephalitis is included in Health Information for Overseas Travel.

Food hygiene
In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable
bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

**Information on health advice for travellers**

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathric.org. The handbook, *Health Information for Overseas Travel* (2010), which draws together essential information for health care professionals regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

**VACCINES**

**Vaccines**

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED NOVEMBER 2017)

Following reports of death in neonates who received a live attenuated vaccine after exposure to a tumor necrosis factor alpha (TNF-α) inhibitor in utero, the MHRA has issued the following advice:

- any infant who has been exposed to immunosuppressive treatment from the mother either in utero during pregnancy or via breastfeeding should have any live attenuated vaccination deferred for as long as a postnatal influence on the immune status of the infant remains possible;
- in the case of infants who have been exposed to TNF-α inhibitors and other immunosuppressive biological medicines in utero, PHE advise that any live attenuated vaccination (e.g. BCG vaccine) should be deferred until the infant is age 6 months;
- PHE advise if there is any doubt as to whether an infant due to receive a live attenuated vaccine may be immunosuppressed due to the mother’s therapy, including exposure through breast-feeding, specialist advice should be sought.

**CONTRA-INDICATIONS**

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Impaired immune response Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.

- Impaired immune response and drugs affecting immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines.

Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: adults, at least 40 mg daily for more than 1 week; children, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

- Predisposition to neurological problems When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is recommended; advice on the management of fever (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is recommended.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

When there is a still evolving neurological problem, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

- **SIDE-EFFECTS**

  **Common or very common**
  - Appetite decreased · arthralgia (frequency not known in elderly) · diarrhoea (uncommon in elderly) · dizziness (uncommon in elderly) · fatigue · fever · headache · irritability · lymphadenopathy (uncommon in elderly) · malaise · myalgia · nausea

---

www.getintopharma.com
UNLICENSED USE Infanrix-IPV + HIB® not licensed for use in children over 36 months; Pediacel® not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

SIDE-EFFECTS

Common or very common Crying abnormal - drowsiness - restlessness

Uncommon Cough - extensive swelling of vaccinated limb - increased risk of infection - rhinorrhoea

Frequency not known Angioedema - apnoea - hypotonic-hyporesponsiveness episode - seizure

SIDE EFFECTS, FURTHER INFORMATION The incidence of local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis.

Public Health England has advised (2016) that the vaccine should not be withheld from children with a history to a preceding dose of: fever, irrespective of severity; hypotonic-hyporesponsive episodes; persistent crying or screaming for more than 3 hours; severe local reaction, irrespective of extent.

PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood schedule from health organisations or ImmForm.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and suspension for suspension for injection Infanrix-IPV + Hib® (GlaxoSmithKline UK Ltd) Infanrix-IPV + Hib® vaccine powder and suspension for suspension for injection 0.5ml pre-filled syringes 1 pre-filled disposable injection £2.26.

Vaccines with pertussis, poliomyelitis vaccine and tetanus

INDICATIONS AND DOSE

First booster dose

By intramuscular injection

Child 3-9 years: 0.5 mL, to be given 3 years after primary immunisation

Vaccination of pregnant women against pertussis (using low dose vaccines)

By intramuscular injection

Females of childbearing potential: 0.5 mL for 1 dose

SIDE-EFFECTS

Common or very common Abdominal pain

Uncommon Apathy (in children) - asthma - chills - drowsiness (very common in children) - dry throat (in children) - extensive swelling of vaccinated limb (very common in children) - oral herpes - pain - paraesthesia - sleep disorder (in children)
**1312 Vaccination**

- **Frequency not known** Angioedema - asthenia - hypotonic-hyporesponsive episode - seizure

**SIDE-EFFECTS, FURTHER INFORMATION** The incidence of local and systemic reactions is lower with acellular pertussis vaccines than with whole-cell pertussis vaccines used previously.

Compared with primary vaccination, injection site reactions are more common with booster doses of vaccines containing acellular pertussis.

Public Health England has advised (2016) that the vaccine should not be withheld from children with a history to a preceding dose of: fever, irrespective of severity; hypotonic-hyporesponsive episodes; persistent crying or screaming for more than 3 hours; severe local reaction, irrespective of extent.

- **PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.

**PRESCRIBING AND DISPENSING INFORMATION** Pregnant women should be vaccinated using low dose vaccines (brands may include Boostrix-IPV® or Repevax®).

Available as part of childhood immunisation schedule from health organisations or ImmForm.

Available for vaccination of pregnant women from ImmForm.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin, polymyxin b, streptomycin

- **Boostrix-IPV®** (GlaxoSmithKline UK Ltd)
  - Boostrix-IPV suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) | £22.74 DT + £20.00
- **Repevax** (Sanofi Pasteur)
  - Repevax vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) | £20.00 DT + £20.00

---

**Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine**

**INDICATIONS AND DOSE**

Primary immunisation (first dose)

- BY DEEP INTRAMUSCULAR INJECTION
  - Child 2 months: 0.5 mL for 1 dose

Primary immunisation (second dose)

- BY DEEP INTRAMUSCULAR INJECTION
  - Child 3 months: 0.5 mL for 1 dose, preferably administer at a different injection site to that of first dose

Primary immunisation (third dose)

- BY DEEP INTRAMUSCULAR INJECTION
  - Child 4 months: 0.5 mL for 1 dose, preferably administer at a different injection site to that of second dose

**SIDE-EFFECTS**

- Common or very common Anxiety - crying abnormal
- Uncommon Cough - drowsiness - extensive swelling of vaccinated limb - increased risk of infection
- Rare or very rare Angioedema - apnoea - hypotonic-hyporesponsive episode - seizure - swelling - thrombocytopenia

**PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and suspension for suspension for injection**

**EXCIPIENTS:** May contain Neomycin, polymyxin b

- **Infanrix Hexa** (GlaxoSmithKline UK Ltd)
  - Infanrix Hexa vaccine powder and suspension for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PFS) | £25.00

---

**VACCINES** BACTERIAL VACCINES

**Anthrax vaccine**

**INDICATIONS AND DOSE**

Immunisation against anthrax

- BY DEEP INTRAMUSCULAR INJECTION
  - Adult: Initially 0.5 mL every 3 weeks for 3 doses, followed by 0.5 mL after 6 months, to be administered in the deltoid region

Booster

- BY DEEP INTRAMUSCULAR INJECTION
  - Adult: 0.5 mL every 10 years for up to 3 doses, to be administered in deltoid region
Bacillus Calmette-Guérin vaccine (BCG Vaccine)

**INDICATIONS AND DOSE**

**Immunisation against tuberculosis**

- **BY INTRADERMAL INJECTION**
  - Child 1-11 months: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.
  - Child 1-17 years: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.
  - Adult: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.

**CONTRA-INDICATIONS**

Generalised septic skin conditions. A lesion-free site should be used to administer BCG vaccine to patients with eczema.

**CAUTIONS**

A lesion-free site should be used to administer BCG vaccine to patients with eczema. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

**INTERACTIONS**

Appendix 1: live vaccines

**SIDE-EFFECTS**

- Rare or very rare: Increased risk of infection - osteitis

**PRE-TREATMENT SCREENING**

Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculin protein (see tuberculin purified protein derivative p. 1294). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100,000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

**DIRECTIONS FOR ADMINISTRATION**

Intradermal injection technique. Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised, blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb ≥ 0.1 mL injection, 3 mm bleb ≥ 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

**PRESCRIBING AND DISPENSING INFORMATION**

Available from health organisations or direct from ImmForm (Secretary of State for Health) (SSI brand, multidose vial with diluent).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

EXCIPIENTS: May contain Thiomersal

- Anthrax vaccine (Non-proprietary) Anthrax vaccine (alum precipitated sterile filtrate) suspension for injection 0.5mL ampoules | 5 ampoule

- BioThrax (Secretary of State for Health) BioThrax suspension for injection 5mL multidose vials | 1 vial

£751.71 | 300 vial £225,513.09

**BioThrax**

Preparedness and Response (Porton Down).

---

Cholera vaccine

**INDICATIONS AND DOSE**

**Immunisation against cholera**

- **BY MOUTH**
  - Child 2-5 years: 1 dose every 1-6 weeks for 3 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure.
  - Child 6-17 years: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure.
  - Adult: 1 dose every 1-6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure.

**Booster**

- **BY MOUTH**
  - Child 2-5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated.
  - Child 6-17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated.
  - Adult: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated.

**CONTRA-INDICATIONS**

Acute gastro-intestinal illness.

**INTERACTIONS**

Appendix 1: cholera vaccine

**SIDE-EFFECTS**

- Uncommon: Gastrointestinal discomfort - gastrointestinal disorders.
- Rare or very rare: Chills - cough - dehydration - drowsiness - hyperhidrosis - increased risk of infection - insomnia - pulmonary reaction - syncope - taste altered - throat pain.
- Frequency not known: Angioedema - asthenia - dyspnoea - hypertension - influenza like illness - lymphadenitis - pain - paraesthesia - sputum increased.

---

www.getintopharma.com
Haemophilus influenzae type b with meningococcal group C vaccine

**INDICATIONS AND DOSE**

Booster dose (for infants who have received primary immunisation with a vaccine containing *Haemophilus influenzae* type b component) and primary immunisation against *Neisseria meningitidis*

- **BY INTRAMUSCULAR INJECTION**
  - Child 12-13 months: 0.5 mL for 1 dose
  - Immunisation against *Neisseria meningitidis* in an unimmunised patient
    - **BY INTRAMUSCULAR INJECTION**
      - Child 1-9 years: 0.5 mL for 1 dose

Booster dose (for children who have not been immunised against *Haemophilus influenzae* type b): Booster dose after recovery from *Haemophilus influenzae* type b disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-9 years: 0.5 mL for 1 dose

Booster dose after recovery from *Haemophilus influenzae* type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-7 years: 0.5 mL for 1 dose
  - Adult: 0.5 mL for 1 dose

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)

- **BY INTRAMUSCULAR INJECTION**
  - Child 2-7 years: 0.5 mL for 1 dose, this booster dose should be given after the second birthday, this is the second dose of haemophilus influenzae type B vaccine combined with meningococcal group C conjugate vaccine (the first dose is given during the routine immunisation schedule)

Meningococcal group B vaccine (rDNA, component, adsorbed)

**INDICATIONS AND DOSE**

**BEXSERO®**

Immunisation against *Neisseria meningitidis*, primary immunisation

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 444.
  - Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see paracetamol p. 444.

Immunisation against *Neisseria meningitidis*, primary immunisation booster dose

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 12-23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

Immunisation against *Neisseria meningitidis*, primary immunisation (in unimmunised patients)

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 6-11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)

  - Child 12-23 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12–24 months after completion of primary
Vaccination 1315

Meningococcal groups A with C and W135 and Y vaccine

**INDICATIONS AND DOSE**

**MENVEO**

Primary immunisation against *Neisseria meningitidis*

- **BY INTRAMUSCULAR INJECTION**
  - Child 13-15 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- **BY INTRAMUSCULAR INJECTION**
  - Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required
  - Adult 18-24 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against *Neisseria meningitidis* in those at risk of exposure to prevent invasive disease

- **BY INTRAMUSCULAR INJECTION**
  - Child 3-11 months: 0.5 mL every month for 2 doses, dose preferably injected into deltoid region
  - Child 1-17 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region
  - Adult: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Patients attending university for the first time (who have not received the routine meningococcal groups A with C and W135 and Y conjugate vaccine over the age of 10 years)

- **BY INTRAMUSCULAR INJECTION**
  - Adult 18-24 years: 0.5 mL for 1 dose

**NIMENRIX**

Primary immunisation against *Neisseria meningitidis*

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-17 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- **BY INTRAMUSCULAR INJECTION**
  - Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required
  - Adult 18-24 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against *Neisseria meningitidis* in those at risk of exposure

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-17 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region (or anterolateral thigh in children 12–23 months), then 0.5 mL after continued →

Meningococcal group C vaccine

**INDICATIONS AND DOSE**

Patients with confirmed serogroup C disease (who have previously been immunised)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-17 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital
  - Adult 18-24 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital

**SIDE-EFFECTS**

- **Common or very common** Anxiety (in children) · cough (in children) · crying (in children) · drowsiness (in children) · gastrointestinal discomfort (in children) · hyperhidrosis (in children) · increased risk of infection (in children)
  - **Uncommon** Chills · eyelid oedema (in children) · flushing (in children) · influenza like illness (rare in children) · joint stiffness (in children)
  - **Rare or very rare** Circulatory collapse (in children)
  - **Frequency not known** Angioedema · apnoea · asthena (uncommon in children) · dyspnoea · hypotonic-hyporesponsiveness episode · immune thrombocytopenic purpura · meningism (but no evidence that vaccine causes meningococcal C meningitis) · musculoskeletal stiffness (uncommon in children) · nasal congestion (uncommon in children) · oedema (uncommon in children) · pain (very common in children) · respiratory disorders (uncommon in children) · seizures (uncommon in children) · sensation abnormal (uncommon in children) · sleep disorders (very common in children) · Stevens-Johnson syndrome · syncope (uncommon in children)

**PRESCRIBING AND DISPENSING INFORMATION**

Available as part of childhood immunisation schedule from www.immform.dh.gov.uk.

**MATERIALS**

Available as pre-filled syringes 0.5 mL for 1 dose.

**SPACES**

Available as pre-filled syringes 10 mL for 1 dose.

**EXCIPIENTS**

- May contain kanamycin

**PRECAUTIONS**

- Use with caution in those with known hypersensitivity to the vaccine or any component.

**CONTRAINDICATIONS**

- Do not use in those with a previous severe allergic reaction to the vaccine.

**SIDE-EFFECTS**

- Common or very common: Crying abnormal (in children) · drowsiness (in children) · hypotonic-hyporesponsiveness episode

**PRECAUTIONS**

- Use with caution in those with known hypersensitivity to the vaccine or any component.

**CONTRAINDICATIONS**

- Do not use in those with a previous severe allergic reaction to the vaccine.

**SIDE-EFFECTS**

- Common or very common: Crying abnormal (in children) · drowsiness (in children) · hypotonic-hyporesponsiveness episode

**PRECAUTIONS**

- Use with caution in those with known hypersensitivity to the vaccine or any component.

**CONTRAINDICATIONS**

- Do not use in those with a previous severe allergic reaction to the vaccine.
Vaccines

1. Vaccination

1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection

- Adult: 0.5 mL for 1 dose, to be injected preferably into deltoid region, then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection

**Patients attending university for the first time (who have not received the routine meningococcal groups A with C and W135 and Y conjugate vaccine over the age of 10 years)**

- **BY INTRAMUSCULAR INJECTION**
  - Adult 18–24 years: 0.5 mL for 1 dose

**INDICATIONS AND DOSE**

**PREVENAR 13 ®**

- **INDICATIONS AND DOSE**
  - Primary immunisation against pneumococcal infection [first dose]
    - **BY INTRAMUSCULAR INJECTION**
      - Child 2 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year
  - Primary immunisation against pneumococcal infection [second dose]
    - **BY INTRAMUSCULAR INJECTION**
      - Child 4 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year
  - Primary immunisation against pneumococcal infection [booster dose]
    - **BY INTRAMUSCULAR INJECTION**
      - Child 1 year: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants under 1 year; deltoid muscle is preferred in older children
  - Immunisation against pneumococcal infection [in patients who are unimmunosuppressed or partially immunised]
    - **BY INTRAMUSCULAR INJECTION**
      - Child 3–11 months: 0.5 mL for 2 doses, given 2 months apart (interval may be reduced to 1 month to ensure immunisation schedule is completed), followed by 0.5 mL for 1 dose on their first birthday, given at least 2 months after the last dose. Anterolateral thigh is preferred site of injection in infants under 1 year
      - Child 12–23 months: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in children

**UNLICENSED USE**

- **MENVEO ®**
  - In children *Menveo®* is not licensed for use in children under 2 years.

**SIDE-EFFECTS**

- **Common or very common** Drowsiness
- **Uncommon** Crying - insomnia - numbness - pain in extremity
- **Frequency not known** Extensive swelling of vaccinated limb

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - **Menveo** (GlucoSmithKline UK Ltd) Menveo vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial | £30.00
  - **Nimenrix** (Pfizer Ltd) Nimenrix vaccine powder and solvent for solution for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection | £30.00 DT
- **£30.00**

**Pneumococcal polysaccharide conjugate vaccine (adsorbed)**

01-May-2019

**Immunisation against pneumococcal infection [immunised patients at increased risk]**

- **BY INTRAMUSCULAR INJECTION**
  - Child 14 months–17 years: 0.5 mL for 1 dose, given at least 2 months after primary immunisation booster dose, deltoid muscle is preferred site of injection in children
  - Adult: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults

**Immunisation against pneumococcal infection [unimmunised or partially immunised patients at increased risk]**

- **BY INTRAMUSCULAR INJECTION**
  - Child 3–11 months: 0.5 mL for 2 doses, given 2 months apart (interval may be reduced to 1 month to ensure immunisation schedule is completed), followed by 0.5 mL for 1 dose on their first birthday, given at least 2 months after the last dose, followed by 0.5 mL for 1 dose, given at least 2 months after the last dose. Anterolateral thigh is preferred site of injection in infants under 1 year
  - Adult: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults

**SYNFLORIX ®**

Immunisation against pneumococcal infection

- **BY INTRAMUSCULAR INJECTION**
  - Child 6 weeks–4 years: Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants (consult product literature)

**UNLICENSED USE**

- **PREVENAR 13 ®** The dose in BNF publications may differ from that in product literature.

**CONTRA-INDICATIONS** Concomitant use of high potency varicella-zoster vaccine (*Zostavax®*) with pneumococcal polysaccharide vaccine (in adults)

**SIDE-EFFECTS**

- **Common or very common** Drowsiness
- **Uncommon** Apnoea - crying abnormal - extensive swelling of vaccinated limb
- **Rare or very rare** Angioedema - hypotonic-hyporesponsiveness episode - Kawasaki disease - seizure

**PRESCRIBING AND DISPENSING INFORMATION**

**PREVENAR 13 ®** Available as part of childhood immunisation schedule from ImmForm www.immform.dh.gov.uk.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Suspension for injection**
  - **Prevenar** (Pfizer Ltd) Prevenar 13 vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection | £49.10 | 10 pre-filled disposable injection | £481.00
  - **Synflorix** (GlucoSmithKline UK Ltd) Synflorix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection | £27.60

**Pneumococcal polysaccharide vaccine**

01-May-2019

**INDICATIONS AND DOSE**

Primary immunisation against pneumococcal infection

- **BY INTRAMUSCULAR INJECTION**
  - Elderly: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults
Immunisation against pneumococcal infection [in patients at increased risk]

- By intramuscular injection
  - Child 2-7 years: 0.5 mL for 1 dose, dose should be administered at least 2 months after the last dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed), deltoid muscle is preferred site of injection in children and adults
  - Adult: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in adults, primary immunisation with the pneumococcal polysaccharide vaccine is not required when these patients reach 65 years of age

Immunisation against pneumococcal infection [revaccination; booster dose in patients with no spleen, splenic dysfunction or chronic kidney disease]

- By intramuscular injection
  - Child 7-17 years: 0.5 mL every 5 years, deltoid muscle is preferred site of injection in children and adults
  - Adult: 0.5 mL every 5 years, deltoid muscle is preferred site of injection in adults

**SIDE-EFFECTS**

- Angioedema - arthrosis - asthenia - chills - febrile seizure - haemolytic anaemia - injected limb mobility decreased - leucocytosis - lymphadenitis - nerve disorders - paraesthesia - peripheral oedema - thrombocytopenia

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Pneumococcal polysaccharide vaccine (Non-proprietary)
  - Pneumovax 23 (Merck Sharp & Dohme Ltd)
  - Pneumovax 23 solution for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection (POA) £16.80

Typhoid vaccine

**INDICATIONS AND DOSE**

**Immunisation against typhoid fever in children at high risk of typhoid fever**

- By intramuscular injection
  - Child 12-23 months: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection, response may be suboptimal

**Immunisation against typhoid fever**

- By intramuscular injection
  - Child 2-7 years: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
  - Adult: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
  - By mouth
  - Child 6-17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)
  - Adult: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)

**UNLICENSED USE**

- With intramuscular use in children Not licensed for use in children under 2 years.

**CONTRA-INDICATIONS**

- With oral use Acute gastro-intestinal illness

**INTERACTIONS**

- Appendix 1: live vaccines

**SIDE-EFFECTS**

- Common or very common
  - With oral use Gastrointestinal discomfort - influenza like illness

- Rare or very rare
  - With oral use Asthenia - back pain - chills - flatulence - paraesthesia
  - Frequency not known
  - With parental use Abdominal pain - asthma - shock - syncope

**DIRECTIONS FOR ADMINISTRATION**

Capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

**HANDLING AND STORAGE**

- With oral use It is important to store capsules in a refrigerator.

**PATIENT AND CARER ADVICE**

- With oral use Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

**VACCINES > VIRAL VACCINES**

**Hepatitis A and B vaccine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1318, hepatitis B vaccine p. 1319.

**INDICATIONS AND DOSE**

**AMBRIX**

Immunisation against hepatitis A and hepatitis B infection (primary course)

- By intramuscular injection
  - Child 1-15 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months for a dose, the deltoid region is the preferred site of injection in children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**TWINRIX**

Immunisation against hepatitis A and hepatitis B infection (primary course)

- By intramuscular injection
  - Child 16-17 years: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
  - Adult: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
Vaccination

Immunisation against hepatitis A and hepatitis B infection—accelerated schedule for travellers departing within 1 month

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: Initially 1 ml for 1 dose, then 1 ml after 7 days for 1 dose, then 1 ml after 14 days for 1 dose, then 1 ml for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttck (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
  - Adult: Initially 1 ml for 1 dose, then 1 ml after 7 days for 1 dose, then 1 ml after 14 days for 1 dose, then 1 ml for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttck (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**TWINRIX® PAEDIATRIC**

Immunisation against hepatitis A and hepatitis B infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 0.5 ml every month for 2 doses, then 0.5 ml after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttck (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**IMPORTANT SAFETY INFORMATION**

Ambirix® and Twinrix® are not recommended for post-exposure prophylaxis following percutaneous needlestick, ocular, or mucous membrane exposure to hepatitis B virus.

**PRESCRIBING AND DISPENSING INFORMATION**

**TWINRIX® ADULT** Primary course should be completed with Twinrix® (single component vaccines given at appropriate intervals may be used for booster dose).

**TWINRIX® PAEDIATRIC** Primary course should be completed with Twinrix® (single component vaccines given at appropriate intervals may be used for booster dose).

**AMBIRIX®** Primary course should be completed with Ambirix® (single component vaccines given at appropriate intervals may be used for booster dose).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin

- **Ambirix** (GliaxSmithKline UK Ltd)
  - Ambirix vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection £31.18 DT = £31.18
  - **Twinrix** (GliaxSmithKline UK Ltd)
  - Twinrix Paediatric vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection £20.79 DT = £20.79 Twinrix Adult vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection £33.31 DT = £33.31 | 10 pre-filled disposable injection £335.13

**SIDE-EFFECTS**

- **Common or very common** Asthenia (uncommon in children) - pain (uncommon in children)
- **Uncommon** Anxiety (in children) - chills (in adults) - cough - crying (in children) - ear pain (rare in children)
Hepatitis A with typhoid vaccine

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1318, typhoid vaccine p. 1317.

- **INDICATIONS AND DOSE**

  **HEPATYRIX®**

  Immunisation against hepatitis A and typhoid infection (primary course)
  - **BY INTRAMUSCULAR INJECTION**
    - Child 15-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines
    - Adult: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

  **VIATIM®**

  Immunisation against hepatitis A and typhoid infection (primary course)
  - **BY INTRAMUSCULAR INJECTION**
    - Child 16-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

  **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Suspension for injection**

  EXCIPIENTS: May contain Neomycin
  - **VAQTA** (Sanofi Pasteur)
    - ViATIM vaccine suspension for injection 1 mL pre-filled syringes | 1 pre-filled disposable injection (PSI) £35.76 DT + £35.76

  **Hepatitis B vaccine**

  - **INDICATIONS AND DOSE**

    **ENERIX B®**

    Immunisation against hepatitis B infection
    - **BY INTRAMUSCULAR INJECTION**
      - Child 1 month–15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
      - Child 16-17 years: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
      - Adult: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

  Immunisation against hepatitis B infection (accelerated schedule)
  - **BY INTRAMUSCULAR INJECTION**
    - Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
    - Child 1 month–15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
    - Child 16-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
    - Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
Immunisation against hepatitis B infection, alternative accelerated schedule
▶ BY INTRAMUSCULAR INJECTION
- Child 11-15 years: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule in exceptional cases, e.g. for travellers departing within 1 month)
▶ BY INTRAMUSCULAR INJECTION
- Adult: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by 20 micrograms after 14 days for 1 dose, followed by 20 micrograms for 1 dose, to be given 12 months after the first dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)
▶ BY INTRAMUSCULAR INJECTION
- Child 1 month-15 years: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients (accelerated schedule))
▶ BY INTRAMUSCULAR INJECTION
- Child 1 month-15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)

FENDRIX®
Immunisation against hepatitis B infection in renal insufficiency (including pre-haemodialysis and haemodialysis patients)
▶ BY INTRAMUSCULAR INJECTION
- Child 15-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection
▶ BY INTRAMUSCULAR INJECTION
- Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)
▶ BY INTRAMUSCULAR INJECTION
- Neonate: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16-17 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

**Neonate born to hepatitis B surface antigen-positive mother**
- **BY INTRAMUSCULAR INJECTION**
- Neonate: 5 micrograms every month for 3 doses, first dose given at birth with hepatitis B immunoglobulin injection (separate site), followed by 5 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

**Chronic haemodialysis patients**
- **BY INTRAMUSCULAR INJECTION**
- Child 16-17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

**SIDE-EFFECTS**
- Common or very common: Drowsiness, gastrointestinal disorder
- Uncommon: Influenza-like illness
- Rare or very rare: Sensation abnormal
- Frequency not known: Angioedema, anaemia, arthritis, encephalitis, encephalopathy, hypotension, meningitis, multiple sclerosis, muscle weakness, nerve disorders, paralysis, seizure, thrombocytopenia, vasculitis

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
**EXCIPIENTS:** May contain Thiomersal
- **Engerix® B** (GSKSmithKline UK Ltd)
- **Fendrix** (GlaxoSmithKline UK Ltd)
- **HBVAXPRO** (Merck Sharp & Dohme Ltd)

**Hepatitis B virus surface antigen 20 microgram per 1 ml**
- **Engerix® B** 10 micrograms/0.5 ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [Prescribing Information] £12.97 + £9.67
- **Engerix® B** 20 micrograms/1 ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [Prescribing Information] £12.97 + £9.67
- **Fendrix** (GlaxoSmithKline UK Ltd)
- **HBVAXPRO** Smicromgros/0.5 ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection [Prescribing Information] £8.95

**Hepatitis B virus surface antigen 10 microgram per 1 ml**
- HBVAXPRO Smicromgros/0.5 ml vaccine suspension for injection pre-filled syringes | 1 vial [Prescribing Information] £27.60 + £27.60

**Human papillomavirus vaccines**

**INDICATIONS AND DOSE**

**CERVARIX®**
Prevention of premalignant genital lesions and cervical cancer
- **BY INTRAMUSCULAR INJECTION**
- Child 9-14 years (female): 0.5 ml for 1 dose, followed by 0.5 ml after 5–7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose if or if the girl is then aged 15 years or more.
- Child 15-17 years (female): 0.5 ml for 1 dose, followed by 0.5 ml after 1–2.5 months for 1 dose, then 0.5 ml after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
- Adult (female): 0.5 ml for 1 dose, followed by 0.5 ml after 1–2.5 months for 1 dose, then 0.5 ml after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

**GARDASIL®**
Prevention of premalignant genital (cervical, vulvar and vaginal) and anal lesions, cervical and anal cancers, and genital warts
- **BY INTRAMUSCULAR INJECTION**
- Child 9-14 years (female): 0.5 ml for 1 dose, followed by 0.5 ml after 6 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
- Adult (female): 0.5 ml for 1 dose, followed by 0.5 ml after 6 months for 1 dose, then 0.5 ml after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

**DT = £**

**Prevention of premalignant genital (cervical, vulvar, and vaginal) and anal lesions, cervical and anal cancers, and genital warts (alternative schedule)**
- **BY INTRAMUSCULAR INJECTION**
- Child 9-14 years (female): 0.5 ml for 1 dose, followed by 0.5 ml for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 ml for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
- Adult (female): 0.5 ml for 1 dose, followed by 0.5 ml for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 ml for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

**www.getintopharma.com**
1322 Vaccination

**UNLICENSED USE**
- *GARDASIL®* Two dose schedule not licensed for use in girls aged 14 years.

**SIDE-EFFECTS**
- **Common or very common** Pain in extremity
- **Rare or very rare** Bronchospasm
- **Frequency not known** Acute disseminated encephalomyelitis - asthenia - chills - Guillain–Barre syndrome - immune thrombocytopenic purpura - syncope

**PREGNANCY** Not known to be harmful, but vaccination should be postponed until completion of pregnancy.

**PRESCRIBING AND DISPENSING INFORMATION** To avoid confusion, prescribers should specify the brand to be dispensed.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
- *Cervarix* (GlaxoSmithKline UK Ltd) Cervarix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PSM) £80.50
- *Gardasil* (Merck Sharp & Dohme Ltd) Gardasil vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PSM) £86.50

---

**Influenza vaccine**

**INDICATIONS AND DOSE**

**Annual immunisation against seasonal influenza**
- **BY INTRAMUSCULAR INJECTION**
  - Child 6 months–17 years: 0.5 mL for 1 dose
  - Adult: 0.5 mL for 1 dose
- **BY INTRADERMAL INJECTION**
  - Adult 18–59 years: 9 micrograms for 1 dose, dose to be injected into deltoid region
  - Adult 60 years and over: 15 micrograms for 1 dose, dose to be injected into deltoid region
- **BY INTRANASAL ADMINISTRATION**
  - Child 2–17 years: 0.1 mL for 1 dose, dose to be administered into each nostril

**Annual immunisation against seasonal influenza (for children in clinical risk groups who have not received seasonal influenza vaccine previously)**
- **BY INTRAMUSCULAR INJECTION**
  - Child 6 months–8 years: 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, after at least 4 weeks
- **BY INTRANASAL ADMINISTRATION**
  - Child 2–8 years: 0.1 mL for 1 dose, followed by 0.1 mL for 1 dose, after at least 4 weeks. 0.1 mL dose to be administered to each nostril

**UNLICENSED USE** The Joint Committee on Vaccination and Immunisation advises offering a second dose of vaccine for annual immunisation against seasonal influenza to children in clinical risk groups only.

**CONTRA-INDICATIONS** Preparations marketed by Pfizer, or CSL. Biotherapies in child under 5 years—increased risk of febrile convulsions

**FLUENZ TETRA** Active wheezing - comitant use with antiviral therapy for influenza - severe asthma

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Comitant use with antiviral therapy for influenza. Avoid influenza antiviral agents for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the influenza antiviral agent.

**CAUTIONS** Increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL. Biotherapies—use alternative influenza vaccine if available

**INTERACTIONS** → Appendix 1: live vaccines

**SIDE-EFFECTS**
- **Common or very common**
  - With intradermal use: Chills - local reactions - pain
  - With intramuscular use: Chills (uncommon in elderly) - hyperhidrosis - induration - local reactions - pain (uncommon in elderly)
  - With intranasal use: Nasal complaints
- **Uncommon**
  - With intradermal use: Hyperhidrosis
  - With intramuscular use: Cough (in adults)
  - With intranasal use: Epistaxis - face oedema
- **Rare or very rare**
  - With intradermal use: Nerve disorders - paraesthesia
  - With intramuscular use: Vasodilation (in adults)
- **Frequency not known**
  - With intradermal use: Angioedema - encephalomyelitis - febrile seizure - nervous system disorder - shock - thrombocytopenia - vasculitis
  - With intranasal use: Guillain–Barre syndrome

**ALLERGY AND CROSS-SENSITIVITY** Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL. (facilities should be available to treat anaphylaxis). Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.

**PREGNANCY** Inactivated vaccines not known to be harmful.

**FLUENZ TETRA®** Avoid in pregnancy.

**BREAST FEEDING** Inactivated vaccines not known to be harmful.

**FLUENZ TETRA®** Avoid in breast-feeding.

**PRESCRIBING AND DISPENSING INFORMATION** The available preparations are not licensed for use in all age-groups—further information can be found in the product literature for the individual vaccines.

**FLUARIX TETRA®** Ovalbumin content less than 100 nanograms/mL.

**PATIENT AND CARER ADVICE**

**FLUENZ TETRA®** Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Spray**
- EXCIPIENTS: May contain Gelatin, gentamicin
  - **Fluenz Tetra** (AstraZeneca UK Ltd) Fluenz Tetra vaccine nasal suspension 0.2ml unit dose | 10 unit dose (PSM) £180.00

**Suspension for injection**
- EXCIPIENTS: May contain Gentamicin, kanamycin, neomycin, polymyxin b
  - **Influenza vaccine (non-proprietary)** ▼
    - Trivalent influenza vaccine (split virion, inactivated) High Dose suspension for injection 0.5ml pre-filled syringes | 5 pre-filled disposable injection (PSM) £20.00
    - Influenza vaccine (split virion, inactivated) suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection (PSM) £65.90

Japanese encephalitis vaccine

**INDICATIONS AND DOSE**

**Immunisation against Japanese encephalitis**
- **BY INTRAMUSCULAR INJECTION**
  - **Child 2–35 months:** 0.25 ml every 28 days for 2 doses, alternatively 0.25 ml every 7 days for 2 doses, anterolateral thigh may be used as the injection site in infants; deltoid muscle is preferred site in older children, immunisation should be completed at least 1 week before potential exposure
  - **Child 3–17 years:** 0.5 ml every 28 days for 2 doses, alternatively 0.5 ml every 7 days for 2 doses, deltoid muscle is preferred site in older children, immunisation should be completed at least 1 week before potential exposure
  - **Adult:** 0.5 ml every 28 days for 2 doses, alternatively 0.5 ml every 7 days for 2 doses, deltoid muscle is preferred site in older children, immunisation should be completed at least 1 week before potential exposure

**First booster**
- **BY INTRAMUSCULAR INJECTION**
  - **Adult:** 0.5 ml after 1–2 years, deltoid muscle is preferred site of injection, for those at continued risk, the booster dose should be given 1 year after completing the primary course
  - **Elderly:** 0.5 ml after 1 year, for those at continued risk, deltoid muscle is preferred site of injection

**Second booster**
- **BY INTRAMUSCULAR INJECTION**
  - **Adult:** 0.5 ml after 10 years, for those at continued risk, deltoid muscle is preferred site of injection

**UNLICENSED USE**
- When used for immunisation against Japanese encephalitis The rapid schedule administered at days 0 and 7 is not licensed in children or the elderly.

**SIDE-EFFECTS**
- **Common or very common** Influenza like illness (frequency not known in children)
- **Uncommon** Abdominal pain (frequency not known in children) - asthenia (in adults) - chills (in adults) - hyperhidrosis (in adults) - migraine (in adults) - musculoskeletal stiffness (in adults) - vertigo (in adults)
- **Rare or very rare** Dyspnoea (in adults) - eyelid oedema (in adults) - neuritis (in adults) - pain in extremity (in adults) - palpitations (in adults) - paraesthesia (in adults) - peripheral oedema (in adults) - tachycardia (in adults) - taste altered (in adults) - thrombocytopenia (in adults)
- **Frequency not known** Cough (in children)

**PREGNANCY** Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

**MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Japanese encephalitis vaccine (Non-proprietary)** Japanese encephalitis GCVC vaccine solution for injection 1 ml vial | 1 vial
- **Japanese encephalitis GCVC vaccine solution for injection 20 ml vials | 1 vial**
- **Japanese encephalitis GCVC vaccine solution for injection 10 ml vials | 1 vial**

**Suspension for injection**
- **Ixaro (Valneva UK Ltd)** Ixaro vaccine suspension for injection 0.5 ml vial | 1 pre-filled disposable injection £9.79

**Measles, mumps and rubella vaccine, live**

**INDICATIONS AND DOSE**

**Primary immunisation against measles, mumps, and rubella (first dose)**
- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
  - **Child 12–13 months:** 0.5 ml for 1 dose

**Primary immunisation against measles, mumps, and rubella (second dose)**
- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
  - **Child 40 months–5 years:** 0.5 ml for 1 dose

**Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)**
- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
  - **Females of childbearing potential:** (consult product literature or local protocols)

**Children presenting for pre-school booster, who have not received the primary immunisation (first dose)**
- Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course | Control of measles outbreak | Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation
- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
  - **Child 6 months–17 years:** (consult product literature or local protocols)
  - **Adult:** (consult product literature or local protocols)

**UNLICENSED USE**
- In children Not licensed for use in children under 9 months.

**IMPORTANT SAFETY INFORMATION**

**MMR VACCINATION AND BOWEL DISEASE OR AUTISM**

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR...
vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/immunisation.

**CAUTIONS** Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion—leave an interval of at least 3 months before MMR immunisation.

**CAUTIONS, FURTHER INFORMATION**
- Administration with other vaccines: MMR vaccine should not be administered on the same day as yellow fever vaccine; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.
- MMR and varicella-zoster vaccine can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.
- **INTERACTIONS** → Appendix 1: live vaccines
- **SIDE-EFFECTS**
  - Uncommon: Increased risk of infection - rhinorrhea

**SIDE-EFFECTS, FURTHER INFORMATION** Malaise, fever, or a rash can occur after the first dose of MMR vaccine—most commonly about a week after vaccination and lasting about 2 to 3 days.

Febrile seizures occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection).

**Idiopathic thrombocytopenic purpura** Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. Samples should be sent to the Virus Reference Laboratory of the Health Protection Agency.

**Frequency of side effects** Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

**ALLERGY AND CROSS-SENSITIVITY** MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

**CONCEPTION AND CONTRACEPTION** Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.

**PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from health organisations or ImmForm www.immform.dh.gov.uk.

**Rabies vaccine**

**INDICATIONS AND DOSE**

**Pre-exposure prophylaxis**

- **BY INTRAMUSCULAR INJECTION**
  - Child: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region or anterolateral thigh in infants, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel
  - Adult: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel

**Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)**

- **BY INTRAMUSCULAR INJECTION**
  - Child: 1 mL after 1 year for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies
  - Adult: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies

**Pre-exposure prophylaxis booster dose (for patients at infrequent risk of exposure)**

- **BY INTRAMUSCULAR INJECTION**
  - Child: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region or anterolateral thigh in infants
  - Adult: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region

**Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary
  - Adult (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region, rabies immunoglobulin is not necessary
Rotavirus vaccine

**DRUG ACTION** Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

**INDICATIONS AND DOSE**

**Immunisation against gastro-enteritis caused by rotavirus**

**BY MOUTH**

- Child 6–23 weeks: 1.5 mL for 2 doses separated by an interval of at least 4 weeks, first dose must be given between 6–14 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

**SIDE-EFFECTS**

- Rare or very rare: abdominal pain, vomiting (postpone vaccination), diarrhea (postpone vaccination), diaphoresis

**CONTRA-INDICATIONS**

- History of intussusception - predisposition to intussusception - severe combined immunosuppression

**ADDITIONAL INFORMATION**

- Public Health England advises that immunisation with live vaccines should be delayed until 6 months of age in children born to mothers who received immunosuppressive biological therapy during pregnancy. In practice, this means that children born to mothers who were on immunosuppressive biological therapy during pregnancy will not be eligible to receive rotavirus vaccine.

**EXCIPIENTS:** May contain Neomycin

Rabies vaccine (Non-proprietary)

Powder and solvent for suspension for injection

- 1 vial £40.84

**Powder and solvent for solution for injection**

- Rabipur (GlaxoSmithKline UK Ltd)

  Rabipur vaccine powder and solvent for solution for injection 1mL vials

  - 1 vial £34.56

  Rabipur vaccine powder and solvent for solution for injection 1mL pre-filled syringes

  - 1 pre-filled disposable injection £34.56
Vaccines

1326 Vaccination

Varicella-zoster vaccine

- **INDICATIONS AND DOSE**

**VARILRIX ®**

- Prevention of varicella infection (chickenpox)
  - **BY SUBCUTANEOUS INJECTION**
  - Child 1–7 years: 0.5 mL every 4–6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh
  - Adult: 0.5 mL every 4–6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh

**VARIVAX ®**

- Prevention of varicella infection (chickenpox)
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1–12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
  - Child 13–17 years: 0.5 mL for 2 doses, interval of 4–8 weeks between each dose, to be administered preferably into the deltoid region
  - Adult: 0.5 mL for 2 doses, interval of 4–8 weeks between each dose, to be administered preferably into the deltoid region

- Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1–12 years: 0.5 mL for 2 doses, interval of 12 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)

**ZOSTAVAX ®**

- Prevention of herpes zoster (shingles)
  - **BY SUBCUTANEOUS INJECTION**
  - Adult 70–79 years: 0.65 mL for 1 dose, to be administered preferably into the deltoid region

- **CAUTIONS**

  - Post-vaccination close contact with susceptible individuals
  - Exceptional: children with severe immune deficiency or those receiving immunosuppressive therapy.

  - Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

  - Administration with MMR vaccine Varicella–zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

- **INTERACTIONS** → Appendix 1: live vaccines

- **SIDE-EFFECTS**

  - Common or very common Restlessness (in children) • Sleep disorder (in children)
  - Rare or very rare Asthenia • Autoimmune disorder (in adults) • Chills (uncommon in children) • Demyelination (in adults) • Drowsiness (in adults) • Dyspnoea • Eye pain • Gait abnormality • Gastrointestinal discomfort (uncommon in children) • Hyperhidrosis • Increased risk of infection • Influenza-like illness • Joint swelling (in adults) • Meningism • Meningitis aseptic (in adults) • Motor dysfunction • Musculoskeletal stiffness • Nerve disorders • Oedema • Pain • Seizures • Sensory disorder • Tachycardia (in adults) • Tinnitus • Vertigo • Vision disorders

- **ALLERGY AND CROSS-SENSITIVITY** Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **EXCIPIENTS:** May contain Gentamicin, neomycin

  - **TicoVac** (Pfizer Ltd)
    - TicoVac junior vaccine suspension for injection 0.25mL pre-filled syringes | 1 pre-filled disposable injection £28.00
    - TicoVac vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £32.00

- **SIDE-EFFECTS**

  - Common Cough • Drowsiness
  - Uncommon Cough • Drowsiness • Increased risk of infection
  - Rare or very rare Abdominal pain • Conjunctivitis • Kawasaki disease • Seizure • Stroke • Thrombocytopenia • Vasculitis
**CONCEPTION AND CONTRACEPTION** Avoid pregnancy for 3 months after vaccination.

**PRESCRIBING AND DISPENSING INFORMATION**

**ZOSTAVAX** Advice in the BNF may differ from that in product literature.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

**EXCIPIENTS:** May contain Gelatin, neomycin

- Varilrix (Merck Sharp & Dohme Ltd) Varilrix vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial (POD) £30.28
- Zostavax (Merck Sharp & Dohme Ltd) Zostavax vaccine powder and solvent for suspension for injection 0.505ml pre-filled syringes | 1 pre-filled disposable injection (POD) £99.96 DT + £99.96

**Powder and solvent for solution for injection**

**EXCIPIENTS:** May contain Neomycin

- Varilrix (GlaxoSmithKline UK Ltd) Varilrix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial (POD) £27.31

---

**VACCINATION**

**INDICATIONS AND DOSE**

**Immunisation against yellow fever**

- **BY DEEP SUBCUTANEOUS INJECTION**
  - Child 6-8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
  - Child 9 months-17 years: 0.5 mL for 1 dose
  - Adult: 0.5 mL for 1 dose

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE:** YELLOW FEVER VACCINE (STAMARIL®) AND FATAL ADVERSE REACTIONS: EXTREME CAUTION NEEDED IN PEOPLE WHO MAY BE IMMUNOSUPPRESSED AND THOSE 60 YEARS AND OLDER (APRIL 2019)

The yellow fever vaccine (Stamaril®) has been associated with an increased risk of life-threatening reactions and must not be given to patients with a history of thymus dysfunction (including myasthenia gravis and thymoma), to patients that are immunosuppressed, or that have had a thymectomy. Vaccination in patients aged 60 years and older should be administered with extreme caution, following a careful risk assessment. Prior to administering yellow fever vaccines, healthcare professionals are advised to familiarise themselves with any contra-indications and special precautions, and to defer vaccination if it is suspected that a patient is immunosuppressed, until specialist advice can be sought. Healthcare professionals administering vaccines should consult information in the YF Vaccine Centre code of practice and strengthen protocols and checklists to avoid inappropriate administration.

**CONTRA-INDICATIONS** Children under 6 months - history of thymus dysfunction

**CAUTIONS** Individuals over 60 years—greater risk of vaccine-associated adverse effects

**SIDE-EFFECTS, FURTHER INFORMATION**

- Common or very common Asthenia - crying (in children) - drowsiness (in children)
- Uncommon Abdominal pain
- Rare or very rare Rhinitis - yellow fever vaccine-associated neurotropic disease - yellow fever vaccine-associated viscerotropic disease
- Frequency not known Angioedema - influenza like illness - paraesthesia

**SIDE-EFFECTS**

- Fever
- Headache
- Chills
- Myalgia
- Fatigue
- Nausea
- Vomiting
- Abdominal pain
- Dizziness
- Asthenia
- Rhinitis
- Crying

**PREGNANCY** Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

**BREAST FEEDING** Avoid; seek specialist advice if exposure to virus cannot be avoided.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

- Stamaril (Sanofi Pasteur) Stamaril vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial (POD) £30.72

General anaesthesia

Anaesthesia (general)

Overview

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effects in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using ‘rapid sequence induction’); lower doses may be required in premedicated patients.

Total intravenous anaesthesia

This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations in ventilated adult patients.

Drugs used for intravenous anaesthesia

Propofol p. 1330, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures and sedation in adults in intensive care.

Thiopental sodium p. 338 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate p. 1330 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 1345 is used rarely. Ketamine causes less hypotension than thiopental sodium and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 343 or midazolam p. 340.

Inhalational anaesthetics

Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 1332 is being administered.
Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isoflurane p. 1332 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 1332 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 1333 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics.

Nitrous oxide

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For anaesthesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equanox®) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intraocular gas injection.

Malignant hyperthermia

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 1337 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene sodium p. 1346 is used in the treatment of malignant hyperthermia.

Sedation, anaesthesia, and resuscitation in dental practice

Overview

Sedation for dental procedures should be limited to conscious sedation. Diazepam p. 343 and temazepam p. 488 are effective anxiolytics for dental treatment in adults.

For details of sedation, anaesthesia, and resuscitation in dental practice see A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in Standards for Conscious Sedation in the Provision of Dental Care; report of an Intercollegiate Advisory Committee for Sedation in Dentistry, 2015 www.rcseng.ac.uk/~/media/files/rcs-library-and-publications/non-journal-publications/dental-sedation-report.pdf.

Surgery and long-term medication

Overview

The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period.

Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. See general advice on surgery in diabetic patients in Diabetes, surgery and medical illness p. 689.

Patients taking antifibrinolytic or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antifibrinolytic or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 133 or low molecular weight heparin therapy. In patients with stable angina, perioperative aspirin p. 121 should be only continued where there is a high thrombotic risk (e.g. patients with a recent acute coronary syndrome, coronary artery stents, or an ischaemic stroke).

Drugs that should not be stopped before surgery include combined oral contraceptives, see Contraceptives, hormonal p. 791; for advice on hormone replacement therapy, see Sex hormones p. 750. MAOIs can have important interactions with some drugs used during surgery, such as pethidine hydrochloride p. 470. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or
if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

**ANAESTHETICS, GENERAL**: Intravenous anaesthetics

### Etomidate

**Indications and dose**

**Induction of anaesthesia**

- **By slow intravenous injection**
- Adult: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)
- Elderly: 150–200 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)

#### Important safety information

Etomidate should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

#### Caution

- Acute circulatory failure (shock) - adrenal insufficiency. Avoid in Acute porphyrias.
- Cardiovascular disease - elderly - fixed cardiac output - hypovolaemia

**Further information**

- Adrenal insufficiency. Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.

#### Interactions

- Appendix 1: etomidate

#### Side-effects

- Common or very common: Apnoea, hypotension, movement disorders, nausea, respiratory disorders, skin reactions, vascular pain, vomiting
- Uncommon: Arrhythmias, cough, hiccup, hyperventilation, hypertension, muscle rigidity, neuromuscular dysfunction, nystagmus, procedural complications
- Frequency not known: Adrenal insufficiency, atrioventricular block, cardiac arrest, embolism and thrombosis, seizures, shock, Stevens-Johnson syndrome, trismus

**Pain on injection**

Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.

**Extraneous muscle movements**

Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

#### Pregnancy

May depress neonatal respiration if used during delivery.

#### Breastfeeding

Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

#### Hepatic impairment

Dose adjustments: Manufacturer advises reduce dose in liver cirrhosis.

#### Dose adjustments for administration

To be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous).

### Propofol

**Indications and dose**

**Induction of anaesthesia using 0.5% or 1% injection**

- **By slow intravenous injection, or by intravenous infusion**
- Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over
- Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

**Induction of anaesthesia using 2% injection**

- **By intravenous infusion**
- Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over
- Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

**Maintenance of anaesthesia using 1% injection**

- **Initially by intravenous infusion**
- Adult: Usual dose 4–12 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response, for debilitated patients use dose for elderly
- Elderly: Usual dose 3–6 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response

**Maintenance of anaesthesia using 2% injection**

- **By intravenous infusion**
- Adult: Usual dose 4–12 mg/kg/hour, for debilitated patients use dose for elderly
- Elderly: Usual dose 3–6 mg/kg/hour

**Sedation of ventilated patients in intensive care using 1% or 2% injection**

- **By continuous intravenous infusion**
- Adult: Usual dose 0.3–4 mg/kg/hour, adjusted according to response

**Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection**

- **By slow intravenous injection**
- Adult: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Propylene glycol

- **Hypnomidate** (Piramal Critical Care Ltd)
- **Etomidate 2 mg per 1 ml** Hypnomidate 20mg/10ml solution for injection ampoules | 5 ampoule (£6.90)

**Emulsion for injection**

- **Etomidate-Lipuro** (B.Braun Medical Ltd)
- **Etomidate 2 mg per 1 ml** Etomidate-Lipuro 20mg/10ml emulsion for injection ampoules | 10 ampoule (£16.09)

---

www.getintopharma.com
Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection
- INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

Maintenance of sedation for surgical and diagnostic procedures using 1% injection
- INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

Maintenance of sedation for surgical and diagnostic procedures using 2% injection
- INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, using 0.5% or 1% injection (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

IMPORTANT SAFETY INFORMATION
Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CAUTIONS Acute circulatory failure (shock), cardiac impairment, cardiovascular disease, elderly, epilepsy, fixed cardiac output, hypotension, hypovolaemia, raised intracranial pressure, respiratory impairment
- INTERACTIONS ➔ Appendix 1: propofol
- SIDE-EFFECTS
  - Common or very common Apnoea, arrhythmias, headache, hypotension, localised pain, nausea, vomiting
  - Uncommon Thrombosis
  - Rare or very rare Epileptiform seizure (may be delayed), pancreatitis, post procedural complications, pulmonary oedema, sexual disinhibition, soft tissue necrosis, urine discoloration
  - Frequency not known Drug use disorders, dyskinesia, euphoric mood, heart failure, hepatomegaly, hyperkalaemia, hyperlipidaemia, metabolic acidosis, renal failure, respiratory depression, rhabdomyolysis

SIDE-EFFECTS, FURTHER INFORMATION
Bradycardia
Bradycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.

Pain on injection Pain on injection can be reduced by intravenous lidocaine.

Propofol infusion syndrome Prolonged infusion of propofol doses exceeding 4mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.

PREGNANCY May depress neonatal respiration if used during delivery.

Dose adjustments Max. dose for maintenance of anaesthesia 6 mg/kg/hour.

- BREAST FEEDING Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- HEPATIC IMPAIRMENT Manufacturer advises caution.
- RENAL IMPAIRMENT Use with caution.
- MONITORING REQUIREMENTS Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.
- DIRECTIONS FOR ADMINISTRATION Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%, 0.5% emulsion for injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/ml. 1% emulsion for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (Diprivan®) or (Propofol-Lipuro®) or Sodium chloride 0.9% (Propofol-Lipuro®) only; dilute to a concentration not less than 2 mg/ml; use within 6 hours of preparation. 2% emulsion for infusion; do not dilute.

- PATIENT AND CARER ADVICE
  - Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Emulsion for infusion
- Propofol (Non-proprietary)
  - Propofol 10 mg per 1 ml Propofol 500mg/50ml emulsion for infusion vials | 1 vial (POM) £15.00 (Hospital only)
  - Propofol-Lipuro® 1% emulsion for infusion 50ml vials | 10 vial (POM) £97.56 (Hospital only)
  - Propofol 1g/100ml emulsion for infusion vials | 1 vial (POM) £15.00 (Hospital only)
  - Propofol-Lipuro® 1% emulsion for infusion 100ml vials | 10 vial (POM) £186.66 (Hospital only)
  - Propofol 20 mg per 1 ml Propofol 1g/50ml emulsion for infusion vials | 1 vial (POM) £15.00 (Hospital only)
  - Propofol-Lipuro® 2% emulsion for infusion 50ml vials | 10 vial (POM) £186.64 (Hospital only)
  - Diprivan (Aspen Pharma Trading Ltd)
    - Propofol 10 mg per 1 ml Diprivan 1% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection (POM) £10.68
    - Propofol 20 mg per 1 ml Diprivan 2% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection (POM) £15.16
  - Propoven (Fresenius Kabi Ltd)
    - Propofol 10 mg per 1 ml Propoven 1% emulsion for infusion 50ml vials | 10 vial (POM) £120.60 (Hospital only)
    - Propoven 1% emulsion for infusion 100ml vials | 10 vial (POM) £241.50 (Hospital only)
    - Propofol 20 mg per 1 ml Propoven 2% emulsion for infusion 50ml vials | 10 vial (POM) £241.50 (Hospital only)

Emulsion for injection
- Propofol (Non-proprietary)
  - Propofol 10 mg per 1 ml Propofol 200mg/20ml emulsion for injection vials | 5 vial (POM) £20.00 (Hospital only)
  - Propofol-Lipuro® 1% emulsion for injection 20ml ampoules | 5 ampoule (POM) £20.16 (Hospital only)
  - Diprivan (Aspen Pharma Trading Ltd)
    - Propofol 10 mg per 1 ml Diprivan 1% emulsion for injection 20ml ampoules | 5 ampoule (POM) £15.36 (Hospital only)
  - Propofol-Lipuro® (B. Braun Melsungen AG)
    - Propofol 5 mg per 1 ml Propofol-Lipuro 0.5% emulsion for injection 20ml ampoules | 5 ampoule (POM) £15.15
  - Propoven (Fresenius Kabi Ltd)
    - Propofol 10 mg per 1 ml Propoven 1% emulsion for injection 20ml ampoules | 5 ampoule (POM) £23.90 (Hospital only)

Volatile halogenated anaesthetics

**IMPORTANT SAFETY INFORMATION**

- **CONTRA-INDICATIONS** Susceptibility to malignant hyperthermia
- **CAUTIONS** Can trigger malignant hyperthermia - raised intracranial pressure (can increase cerebrospinal pressure)
- **SIDE-EFFECTS**
  - Common or very common: Agitation, apnoea, arrhythmias, chills, cough, dizziness, headache, hypersalivation, hypotension, hypotension, nausea, respiratory disorders, vomiting
  - Uncommon: Hypoxia
  - Frequency not known: Breath holding, cardiac arrest, haemorrhage, hepatic disorders, hyperkalaemia, malignant hyperthermia, QT interval prolongation, rhabdomyolysis, seizure
- **ALLERGY AND CROSS-SENSITIVITY** Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.
- **DIRECTIONS FOR ADMINISTRATION** Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks: Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends **to at least 24 hours** after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**Desflurane**

- **INDICATIONS AND DOSE**
  - Induction of anaesthesia (but not recommended)
    - **BY INHALATION**
      - Adult: 4–11%, to be inhaled through specifically calibrated vaporiser
  - Maintenance of anaesthesia (in nitrous oxide–oxygen)
    - **BY INHALATION**
      - Adult: 2–6%, to be inhaled through a specifically calibrated vaporiser
    - Maintenance of anaesthesia (in oxygen or oxygen-enriched air)
      - **BY INHALATION**
        - Adult: 2.5–8.5%, to be inhaled through a specifically calibrated vaporiser
  - **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
  - **SIDE-EFFECTS**
    - Common or very common: Coagulation disorder, conjunctivitis

**Isoflurane**

- **INDICATIONS AND DOSE**
  - Induction of anaesthesia (in oxygen or nitrous oxide–oxygen)
    - **BY INHALATION**
      - Adult: Initially 0.5%, increased to 3%, adjusted according to response, administered using specifically calibrated vaporiser
  - Maintenance of anaesthesia (in nitrous oxide–oxygen)
    - **BY INHALATION**
      - Adult: 1–2.5%, to be administered using specifically calibrated vaporiser; an additional 0.5–1% may be required when given with oxygen alone
  - Maintenance of anaesthesia in caesarean section (in nitrous oxide–oxygen)
    - **BY INHALATION**
      - Adult: 0.5–0.75%, to be administered using specifically calibrated vaporiser
  - **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
  - **SIDE-EFFECTS**
    - Carboxyhaemoglobinemia, chest discomfort, cognitive impairment, delirium, dyspnoea, ileus, mood altered (that can last several days), myoglobinuria, skin reactions
  - **PREGNANCY** May depress neonatal respiration if used during delivery.
  - **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**Nitrous oxide**

- **INDICATIONS AND DOSE**
  - Maintenance of anaesthesia in conjunction with other anaesthetic agents
    - **BY INHALATION**
      - Adult: 50–66%, to be administered using suitable anaesthetic apparatus in oxygen

**Anaesthesia**

- **ANAESTHETICS**
  - Common or very common: Myalgia, myocardial infarction, myocardial ischaemia, vasodilation
  - Frequency not known: Abdominal pain, asthenia, heart failure, hypokalaemia, malaise, metabolic acidosis, pancreatitis acute, shock, skin reactions, ventricular dysfunction, visual acuity decreased
  - **PREGNANCY** May depress neonatal respiration if used during delivery.
  - **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Inhalation vapour**
    - **Desflurane (Non-proprietary)**
      - Desflurane 1 ml per 1 ml Desflurane volatile liquid | 240 ml (£35.29) (Hospital only)

- **Isoflurane**
  - **Inhalation vapour**
    - **Isoflurane (Non-proprietary)**
      - Isoflurane 1 ml per 1 ml Isoflurane inhalation vapour | 250 ml (£35.29) (Hospital only)
    - **AErrane (Baxter Healthcare Ltd)**
      - Isoflurane 1 ml per 1 ml AErrane volatile liquid | 250 ml (£35.29) (Hospital only)

- **Nitrous oxide**
  - **Maintenance of anaesthesia**
    - **BY INHALATION**
      - Adult: 50–66%, to be administered using suitable anaesthetic apparatus in oxygen

**BNF**

- **1332 General anaesthesia**
  - **Voluntary halogenated anaesthetics**
Anaesthesia adjuvants

Sevoflurane

- **INDICATIONS AND DOSE**

  Induction of anaesthesia (in oxygen or nitrous oxide–oxygen)
  - **BY INHALATION**
    - Adult: Initially 0.5–1.0%, then increased to up to 8.0%, increased gradually, according to response, to be administered using specifically calibrated vaporiser

- **CAUTIONS**

  Susceptibility to QT-interval prolongation

- **INTERACTIONS**
  - ➔ Appendix 1: volatile halogenated anaesthetics

- **SIDE-EFFECTS**

  - Common or very common: Drowsiness, fever, hypothermia

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

### Inhalation vapour

- **Sevoflurane (Non-proprietary)**

  Sevoflurane 1 ml per 1 ml Sevoflurane volatile liquid | 250 ml [P38] £123.00 (Hospital only)

1 Anaesthesia adjuvants

### Pre-medication and peri-operative drugs

#### Drugs that affect gastric pH

Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastro-oesophageal reflux disease and in circumstances where gastric emptying may be delayed.

A H₂-receptor antagonist can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; ‘clear’ (non-particulate) antacids such as sodium citrate p.789 are preferred.

#### Antimuscarinic drugs

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some...
Anaesthesia

Inhalational anaesthetics. They are also used before or with
neostigmine p. 1125 to prevent bradycardia, excessive
salivation, and other muscarinic actions of neostigmine.
They also prevent bradycardia and hypotension associated
with drugs such as propofol p. 1330 and suxamethonium
chloride p. 1337.

Atropine sulfate p. 1334 is now rarely used for
premedication but still has an emergency role in the
treatment of vagotonic side-effects. Atropine sulfate may
have a role in acute arrhythmias after myocardial infarction.

Hyoscine hydrobromide p. 439 reduces secretions and also
provides a degree of amnesia, sedation, and anti-emesis.
Unlike atropine sulfate it may produce bradycardia rather
than tachycardia.

Glycopyrronium bromide p. 1335 reduces salivary
secretions. When given intravenously it produces less
tachycardia than atropine sulfate. It is widely used with
neostigmine for reversal of non-depolarising neuromuscular
blocking drugs.

Phenothiazines do not effectively reduce secretions when
used alone.

Sedative drugs

Fear and anxiety before a procedure (including the night
before) can be minimised by using a sedative drug, usually a
benzodiazepine. Premedication may also augment the
action of anaesthetics and provide some degree of pre-
operative amnesia. The choice of drug depends on the
individual, the nature of the procedure, the anaesthetic to be
used, and other prevailing circumstances such as
outpatients, obstetrics, and availability of recovery facilities.
The choice also varies between elective and emergency
procedures.

Premedics can be given the night before major surgery;
a further, smaller dose may be required before surgery.
Alternatively, the first dose may be given on the day of the
procedure.

Benzodiazepines

Benzodiazepines possess useful properties for premedication
including relief of anxiety, sedation, and amnesia; short-
acting benzodiazepines taken by mouth are the most
common premedicants. Benzodiazepines are also used in
intensive care units for sedation, particularly in those
receiving assisted ventilation. Flumazenil p. 1368 is used to
antagonise the effects of benzodiazepines.

Diazepam p. 343 is used to produce mild sedation with
amnesia. It is a long-acting drug with active metabolites and
a second period of drowsiness can occur several hours after
its administration. Peri-operative use of diazepam in
children is not recommended; its effect and timing of
response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations
formulated in organic solvents are painful on intravenous
injection and give rise to a high incidence of venous
thrombosis (which may not be noticed for several days after
the injection). Intramuscular injection of diazepam is painful and
absorption is erratic. An emulsion formulated for
intravenous injection is less irritant and reduces the risk of
venous thrombosis; it is not suitable for intramuscular
injection.

Temazepam p. 488 is given by mouth for premedication
and has a shorter duration of action and a more rapid onset
than oral diazepam; anxiolytic and sedative effects last
about 90 minutes although there may be residual
drowsiness.

Lorazepam p. 339 produces more prolonged sedation than
temazepam and it has marked amnestic effects.

Midazolam p. 340 is a water-soluble benzodiazepine that is
often used in preference to intravenous diazepam; recovery
is faster than from diazepam, but may be significantly longer
in the elderly, in patients with a low cardiac output, or after
repeated dosing. Midazolam is associated with profound
sedation when high doses are given intravenously or when it
is used with certain other drugs.

Other drugs for sedation

Dexmedetomidine p. 1346 and clonidine hydrochloride
p. 145 are alpha-agonists with sedative
properties. Dexmedetomidine is licensed for the sedation of
patients receiving intensive care who need to remain
responsive to verbal stimulation. Clonidine hydrochloride
[unlicensed indication] can be used by mouth or by
intravenous injection as a sedative agent when adequate
sedation cannot be achieved with standard treatment.

Antagonists for central and respiratory depression

Respiratory depression is a major concern with opioid
analgesics and it may be treated by artificial ventilation or be
reversed by naloxone hydrochloride p. 1369. Naloxone
hydrochloride will immediately reverse opioid-induced
respiratory depression but the dose may have to be repeated
because of the short duration of action of naloxone
hydrochloride; however, naloxone hydrochloride will also
antagonise the analgesic effect.

Flumazenil is a benzodiazepine antagonist for the reversal
of the central sedative effects of benzodiazepines after
anaesthetic and similar procedures. Flumazenil has a shorter
half-life and duration of action than diazepam or midazolam
so patients may become resedated.

Doxapram hydrochloride p. 299 is a central and respiratory
stimulant but is of limited value in anaesthesia.

ANTIMUSCARINICS

Atropine sulfate

- **INDICATIONS AND DOSE**
  - **Bradydysrhythmia due to acute massive overdosage of beta-
    blockers**
    - **BY INTRAVENOUS INJECTION**
      - Child: 40 micrograms/kg (max. per dose 3 mg)
      - Adult: 3 mg
  - **Treatment of poisoning by organophosphorus insecticide
    or nerve agent (in combination with pralidoxime chloride)**
    - **BY INTRAVENOUS INJECTION**
      - Child: 20 micrograms/kg every 5–10 minutes (max. per
dose 2 mg) until the skin becomes flushed and dry, the
pupils dilate, and bradycardia is abolished, frequency
of administration dependent on the severity of
poisoning
      - Adult: 2 mg every 5–10 minutes until the skin becomes
flushed and dry, the pupils dilate, and bradycardia is
abolished, frequency of administration dependent on
the severity of poisoning
  - **Symptomatic relief of gastro-intestinal disorders
    characterised by smooth muscle spasm**
    - **BY MOUTH**
      - Adult: 0.6–1.2 mg daily, dose to be taken at night
  - **Premedication**
    - **BY INTRAVENOUS INJECTION**
      - Child 12-17 years: 300–600 micrograms, to be
administered immediately before induction of
anaesthesia
      - Adult: 300–600 micrograms, to be administered
immediately before induction of anaesthesia
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR
      INJECTION**
      - Child 12-17 years: 300–600 micrograms, to be
administered 30–60 minutes before induction of
anaesthesia
      - Adult: 300–600 micrograms, to be administered
30–60 minutes before induction of anaesthesia
Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block

- By Intravenous injection
  - Child 12-17 years: 0.6–1.2 mg
  - Adult: 0.6–1.2 mg

Excessive bradycardia associated with beta-blocker use

- By Intravenous injection
  - Adult: 0.6–2.4 mg in divided doses (max. per dose 600 micrograms)

Bradycardia following myocardial infarction (particularly if complicated by hypotension)

- By Intravenous injection
  - Adult: 500 micrograms every 3–5 minutes; maximum 3 mg per course

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **INTERACTIONS** → Appendix 1: atropine
- **SIDE-EFFECTS**
  - Common or very common
  - Uncommon
    - With intravenous use: Psychotic disorder
  - Rare or very rare
    - With intravenous use: Angina pectoris - hypertensive crisis - seizure
  - Frequency not known
    - With intravenous use: Insomnia
  - With oral use: Angle closure glaucoma - arrhythmias - bronchial secretion altered - chest pain - dysphagia - fever - gastrointestinal disorders - mydriasis - staggering - thirst
  - **PREGNANCY** Not known to be harmful; manufacturer advises caution.
  - **BREAST FEEDING** May suppress lactation; small amount present in milk—manufacturer advises caution.

**MONITORING REQUIREMENTS**

- Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block. Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.
- **LESS SUITABLE FOR PRESCRIBING** Atropine tablets less suitable for prescribing. Any clinical benefit as a gastrointestinal antispasmodic is outweighed by atropinic side-effects.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, solution for infusion

**Tablet**

- Atropine sulfate (Non-proprietary) Atropine sulfate 600 microgram Atropine 600microgram tablets
  - 28 tablet (PCT) £52.92 DT = £52.92

**Solution for injection**

- **Atropine sulfate (Non-proprietary)**
  - Atropine sulfate 100 microgram per 1 ml Atropine 500micrograms/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PCT) £11.00 | 10 pre-filled disposable injection (PCT) £130.00
  - Atropine sulfate 200 microgram per 1 ml Atropine 1mg/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PCT) £7.29–£13.00 | 10 pre-filled disposable injection (PCT) £130.00
  - Atropine sulfate 300 microgram per 1 ml Atropine 3mg/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PCT) £7.29–£11.00 DT = £7.29 | 10 pre-filled disposable injection (PCT) £130.00
  - Atropine sulfate 400 microgram per 1 ml Atropine 400micrograms/1ml solution for injection ampoules | 10 ampoule (PCT) £102.26 DT = £102.26
  - Atropine sulfate 600 microgram per 1 ml Atropine 600micrograms/1ml solution for injection ampoules | 10 ampoule (PCT) £117.71 DT = £117.71
  - Atropine 600micrograms/1ml solution for injection ampoules | 1 pre-filled disposable injection (PCT) £7.29
  - Atropine sulfate 1 mg per 1 ml Atropine 1mg/1ml solution for injection ampoules | 10 ampoule (PCT) £94.68 DT = £94.68

**Glycopyrronium bromide**

**Intra-operative bradycardia**

- **By Intravenous injection**
  - Adult: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms), repeated if necessary

**Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block**

- **By Intravenous injection**
  - Adult: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms), repeated if necessary

**Bowel colic in palliative care / Excessive respiratory secretions in palliative care**

- **By Subcutaneous injection**
  - Adult: 20 micrograms every 4 hours and when required, hourly use is occasionally necessary, particularly in excessive respiratory secretions

- **By Subcutaneous Infusion**
  - Adult: 0.6–1.2 mg/24 hours

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **INTERACTIONS** → Appendix 1: glycopyrronium
- **SIDE-EFFECTS** Anhidrosis - bronchial secretion decreased - mydriasis

**PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of glycopyrronium bromide in palliative care, see www.medicinescomplete.com/#/content/palliative/glycopyrronium.
Neuromuscular blockade

Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as muscle relaxants. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should always have their respiration assiated or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 1125. Non-depolarising neuromuscular blocking drugs can be divided into the aminosteroid group, comprising pancuronium bromide p. 1339, rocuronium bromide p. 1339, and vecuronium bromide, and the benzylisoquinolinium group, comprising atracurium besilate p. 1337, cisatracurium p. 1338, and mivacurium p. 1338.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride p. 1337. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–60 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vecuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

Depolarising neuromuscular blocking drugs

Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium chloride but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

**Atracurium besilate**

(Tracurium besilate)

**INDICATIONS AND DOSE**

Neuromuscular blockade (short to intermediate duration) for surgery and intubation

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg as required, alternatively (by intravenous infusion) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
Atracurium besilate (Non-proprietary)

Atracurium injection/infusion, Genus), give continuously in Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.1–5 mg/mL.

For surgery and intubation
Neuromuscular blockade (intermediate duration) during surgery and intubation

Dose adjustments
Adult: Initially 150 micrograms/kg, then (by intravenous injection) maintenance 30 micrograms/kg every 20 minutes, alternatively (by intravenous infusion) initially 180 micrograms/kg/hour, then (by intravenous infusion) maintenance 60–120 micrograms/kg/hour, maintenance dose administered after stabilisation

Neuromuscular blockade (intermediate duration) during intensive care
Adult: Initially 150 micrograms/kg, Initial dose is optional, then (by intravenous infusion) 180 micrograms/kg/hour, adjusted according to response; (by intravenous infusion) usual dose 30–600 micrograms/kg/hour

Doses at extremes of body-weight
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

Interactions
Appendix 1: neuromuscular blocking drugs, non-depolarising

Side-effects
Common or very common Bradycardia

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Nimbex®, Nimbex Forte®), give continuously in Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL.

Mivacurium

Indications and dose
Neuromuscular blockade (short duration) during surgery and intubation

Initially by intravenous injection
Adult: 70–250 micrograms/kg; (by intravenous injection) maintenance 100 micrograms/kg every 15 minutes, alternatively (by intravenous infusion) maintenance 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 6–7 micrograms/kg/minute

Doses at extremes of body-weight
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

Caution
Burns (low plasma cholinesterase activity; dose titration required) - elderly

Interactions
Appendix 1: neuromuscular blocking drugs, non-depolarising

Side-effects
Unlikely Tachycardia

Hepatic impairment
Dose adjustments Reduce dose in severe impairment.

Renal impairment
Dose adjustments Clinical effect prolonged in renal failure—reduce dose according to response.

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute to a concentration of 500 micrograms/ml; may also be given undiluted. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
Mivacurium (Aspen Pharma Trading Ltd) Mivacuron 10mg/5ml solution for injection ampoules | 5 ampoule (PO) £13.95 Mivacuron 20mg/10ml solution for injection ampoules | 5 ampoule (PO) £22.57
**Pancuronium bromide**

**INDICATIONS AND DOSE**
- **Neuromuscular blockade (long duration) during surgery and intubation**
  - **BY INTRAVENOUS INJECTION**
  - **Adult:** Initially 100 micrograms/kg, then 20 micrograms/kg as required

**Neuromuscular blockade (long duration) during intensive care**
- **BY INTRAVENOUS INJECTION**
- **Adult:** Initially 100 micrograms/kg, initial dose is optional, then 60 micrograms/kg every 60–90 minutes

**DOSES AT EXTREMES OF BODY-WEIGHT**
- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

**SIDE-EFFECTS** Apnoea, arrhythmia, hypersalivation, increased cardiac output, miosis

**SIDE-EFFECTS, FURTHER INFORMATION** Pancuronium lacks histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia.

**HEPATIC IMPAIRMENT** Possibly slower onset, higher dose requirement, and prolonged recovery time.

**RENAL IMPAIRMENT** Use with caution; prolonged duration of block.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Pancuronium bromide (Non-proprietary)**
  - Pancuronium bromide 2 mg per 1 ml
  - Pancuronium bromide 4 mg/2 ml solution for injection ampoules | 10 ampoule £0.40
  - Pancuronium bromide 100 mg/5 ml solution for injection vials | 10 vial £28.00–£36.50 | 10 vial £57.00–£73.00

**Rocuronium bromide**

**INDICATIONS AND DOSE**
- **Neuromuscular blockade (intermediate duration) during surgery and intubation**
  - **INITIALLY BY INTRAVENOUS INJECTION**
  - **Adult:** Initially 600 micrograms/kg; (by intravenous injection) maintenance 150 micrograms/kg, alternatively (by intravenous infusion) maintenance 300–600 micrograms/kg/hour, adjusted according to response

**Neuromuscular blockade (intermediate duration) during intensive care**
- **INITIALLY BY INTRAVENOUS INJECTION**
- **Adult:** Initially 600 micrograms/kg, initial dose is optional; (by intravenous infusion) maintenance 300–600 micrograms/kg/hour for first hour, then (by intravenous infusion), adjusted according to response

**DOSES AT EXTREMES OF BODY-WEIGHT**
- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

**SIDE-EFFECTS** Procedural complications - tachycardia

**HEPATIC IMPAIRMENT**
- **Dose adjustments** Reduce dose.

**RENAL IMPAIRMENT**
- **Dose adjustments** Reduce maintenance dose; prolonged paralysis.

**DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion or via drip tubing, may be diluted with Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Rocuronium bromide (Non-proprietary)**
  - Rocuronium bromide 10 mg per 1 ml
  - Rocuronium bromide 50 mg/5 ml solution for injection ampoules | 10 ampoule £24.00
  - Rocuronium bromide 50 mg/5 ml solution for injection vials | 10 vial £28.00–£36.50 | 10 vial £57.00–£73.00

**Rocuronium bromide 10 mg per 1 ml**
- **Esmeron (Merck Sharp & Dohme Ltd)**
  - Rocuronium bromide 10 mg per 1 ml
  - Rocuronium bromide 50 mg/5 ml solution for injection vials | 10 vial £28.92 (Hospital only)

### 1.2 Neuromuscular blockade reversal

**Neuromuscular blockade reversal**

**Neuromuscular blockade reversal**

**Anticholinesterases**

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrrolate bromide p. 1335 or alternatively atropine sulphate p. 1334, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

**Other drugs for reversal of neuromuscular blockade**

Sugammadex p. 1340 is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium bromide or vecuronium bromide. In practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

**ANTICHOLINESTERASES**

**Neostigmine with glycopyrrolate bromide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, neostigmine p. 1125, glycopyrrolate bromide p. 1335.

**INDICATIONS AND DOSE**

**Reversal of non-depolarising neuromuscular blockade**
- **BY INTRAVENOUS INJECTION**
- **Adult:** 1–2 mL, repeated if necessary, alternatively 0.02 mL/kg/m², repeated if necessary; maximum 2 mL per course
1340 Anaesthesia adjuvants

1.3 Peri-operative analgesia

Peri-operative analgesia

Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain. Diclofenac sodium p. 1135, diclofenac potassium p. 1135, flurbiprofen p. 1140, ibuprofen p. 1141, ketoprofen p. 1144, paracetamol p. 444, parecoxib p. 1342, and ketorolac trometamol p. 1342 are licensed for postoperative use. Diclofenac and paracetamol can be given by injection as well as by mouth. Diclofenac sodium can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac sodium and ketoprofen are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketorolac trometamol is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.

Suppositories of diclofenac sodium and ketoprofen may be effective alternatives to the parenteral use of these drugs.

Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Preoperative use of opioid analgesics is generally limited to those patients who require control of existing pain. See general notes on opioid analgesics and their use in postoperative pain.

See the management of opioid-induced respiratory depression in Pre-medication and peri-operative drugs p. 1333.

Intra-operative analgesia

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil p. 1343, fentanyl p. 458, and remifentanil p. 1344 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.
Esketamine

**DRUG ACTION** Esketamine is an isomer of ketamine that blocks N-methyl-D-aspartate (NMDA) receptors and interrupts the association pathways of the brain, resulting in dissociative anaesthesia and analgesia.

**INDICATIONS AND DOSE**

**Induction and maintenance of anaesthesia (specialist use only)**
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 0.5–1 mg/kg, then maintenance 0.25–0.5 mg/kg every 10–15 minutes, adjusted according to response
- **BY INTRAMUSCULAR INJECTION**
  - Adult: 2–4 mg/kg, then maintenance 1–2 mg/kg every 10–15 minutes, adjusted according to response
- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Adult: 0.5–3 mg/kg/hour, adjusted according to response

**Analgesic supplementation of regional and local anaesthesia (specialist use only)**
- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Adult: 0.125–0.25 mg/kg/hour, adjusted according to response

**Analgesia in emergency medicine (specialist use only)**
- **BY INTRAMUSCULAR INJECTION**
  - Adult: 0.25–0.5 mg/kg, adjusted according to response
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 0.125–0.25 mg/kg, adjusted according to response

**MEDICINAL FORMS**

- **Solution for injection**
  - Vesierra (Pfizer Ltd)
    - Esketamine (as Esketamine hydrochloride) 5 mg per 1 ml Vesierra 25 mg/ml solution for injection ampoules | 10 ampoules [POS] £18.98 (Hospital only) [C2]
    - Esketamine (as Esketamine hydrochloride) 25 mg per 1 ml Vesierra 50 mg/ml solution for injection ampoules | 10 ampoules [POS] £26.31 (Hospital only) [C2]

**ANAESTHETICS, LOCAL**

Bupivacaine with fentanyl

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1349, fentanyl p. 458.

**INDICATIONS AND DOSE**

**During labour (once epidural block established)**
- **BY CONTINUOUS LUMBAR EPIDURAL INFUSION**
  - Adult: 10–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 16–30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours

**Postoperative pain (once epidural block established)**
- **BY CONTINUOUS EPIDURAL INFUSION**
  - Adult: 4–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 8–30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours, to be administered by thoracic, upper abdominal or lower abdominal epidural infusion

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Solution for infusion**
- **Bufyl (Advanz Pharma)**
  - Fentanyl 2 microgram per 1 ml, Bupivacaine hydrochloride 1 mg per 1 ml Bufyl 1 mg/ml and 2 micrograms/ml 250 ml infusion bags | 20 bag [POS] £170.00 (Hospital only) [C2]
  - Bufyl 1 mg/ml and 2 micrograms/ml 500 ml infusion bags | 10 bag [POS] £32.00 (Hospital only) [C2]
  - Fentanyl (as Fentanyl citrate) 2 microgram per 1 ml, Bupivacaine hydrochloride 1.25 mg per 1 ml Bufyl 1.25 mg/ml and
**Ketorolac trometamol**

**INDICATIONS AND DOSE**

**Short-term management of moderate to severe acute postoperative pain only**

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Adult (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
  - Adult (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
  - Elderly: Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day

**CONTRA-INDICATIONS**
Active or history of gastrointestinal bleeding - active or history of gastrointestinal ulceration - coagulation disorders - complete or partial syndrome of nasal polyps - confirmed or suspected cerebrovascular bleeding - dehydration - following operations with high risk of haemorrhage or incomplete haemostasis - haemorrhagic diatheses - history of gastrointestinal perforation - hypovolaemia - severe heart failure

**CAUTIONS**
- Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

**INTERACTIONS**
- Appendix 1: NSAIDs

**SIDE-EFFECTS**

abnormal - thirst - thrombocytopenia - tinnitus - ulcer - urinary disorders - vertigo - visual impairment - vomiting - weight increased - wound haemorrhage

**SID-EFFECTS, FURTHER INFORMATION**
- For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION**
  - Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY**
  - Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING**
  - Amount too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution—may increase risk of renal impairment; avoid in hepatic failure.

- **RENAL IMPAIRMENT**
  - Avoid if possible or use with caution. Avoid if serum creatinine greater than 160 micromol/litre.

- **Dose adjustments**
  - The lowest effective dose should be used for the shortest possible duration. Max. 60 mg daily by intramuscular injection or intravenous injection. Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous injection, give over at least 15 seconds.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Ketorolac trometamol (Non-proprietary)**
  - Ketorolac trometamol 30 mg per 1 ml
  - Ketorolac 30mg/1ml solution for injection ampoules | 5 ampoule [POM] £15.60–£20.00 DT + £5.36 (Hospital only)

- **Toradol (Atnahs Pharma UK Ltd)**
  - Ketorolac trometamol 30 mg per 1 ml
  - Toradol 30mg/1ml solution for injection ampoules | 5 ampoule [POM] £5.36 DT + £5.36 (Hospital only)

---

**Parecoxib**

**DRUG ACTION**

Parecoxib is a selective inhibitor of cyclooxygenase-2.

**INDICATIONS AND DOSE**

**Short-term management of acute postoperative pain**

- BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Adult: Initially 40 mg, then 20–40 mg every 6–12 hours as required for up to 3 days; maximum 80 mg per day
  - Elderly (body-weight up to 50 kg): Initially 20 mg; maximum 40 mg per day

**CONTRA-INDICATIONS**
Active gastro-intestinal bleeding - active gastro-intestinal ulceration - cerebrovascular disease - inflammatory bowel disease - ischaemic heart disease - mild to severe heart failure - peripheral arterial disease

**CAUTIONS**
- Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - dehydration - elderly (risk of serious side effects and fatalities) - following coronary artery bypass graft surgery - history of cardiac failure - hypertension - left
ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS**
  - Common or very common: Agitation · back pain · constipation · dizziness · gastrointestinal discomfort · gastrointestinal disorders · hyperhidrosis · hypertension · hypokalaemia · hypotension · increased risk of infection · insomnia · nausea · numbness · peripheral oedema · post procedural complications · renal impairment · respiratory disorders · skin reactions · vomiting
  - Uncommon: Appetite decreased · arthralgia · arthrosis · asthma · cerebrovascular insufficiency · dry mouth · ear pain · embolism and thrombosis · hypergammaglobulinemia · myocardial infarction · thrombocytopenia
  - Rare or very rare: Hypersensitivity · pancreatitis · perioral swelling
  - Frequency not known

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. Contra-indicated in patients with a history of allergic drug reactions including sulfonamide hypersensitivity.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).

**Dose adjustments** Manufacturer advises dose reduction to half the usual recommended dose in moderate impairment; maximum 40 mg daily.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution.

**Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) decisions**

  The **Scottish Medicines Consortium** has advised (January 2003) that parecoxib is **not** recommended for use within NHS Scotland.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Powder and solvent for solution for injection**

  - **Dynastat** (Pfizer Ltd)
    - Parecoxib (as Parecoxib sodium) 40 mg
  
  **Powder for solution for injection**

  - **Dynastat** (Pfizer Ltd)
    - Parecoxib (as Parecoxib sodium) 40 mg

**DOSAGES AT EXTREMES OF BODY-WEIGHT**

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **CAUTIONS, FURTHER INFORMATION**

  - Repeated intra-operative doses. Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

- **INTERACTIONS** → Appendix 1: opioids

- **SIDE-EFFECTS**
  - Common or very common: Apnoea · chills · fatigue · hypertension · movement disorders · muscle rigidity · procedural complications
  - Uncommon: Coma · hiccups · hypercapnia · pain · post procedural complications · respiratory disorders
  - Rare or very rare: Agitation · crying · epistaxis · vascular pain
  - Frequency not known: Cardiac arrest · cough · fever · loss of consciousness · seizure

**SIDE-EFFECTS, FURTHER INFORMATION** Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

- **BREAST FEEDING** Present in milk— withhold breast-feeding for 24 hours.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Dose adjustments Manufacturer advises dose reduction and cautious titration.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
1344 Anaesthesia adjuvants

- **DIRECTIONS FOR ADMINISTRATION** 5 mg/mL injection to be diluted before use. For continuous or intermittent intravenous infusion dilute in Glucose 5% or Sodium Chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

  **Solution for injection**
  - Alfentanil (Non-proprietary)
    - Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml Alfentanil 1mg/2ml solution for injection ampoules | 10 ampoule (POM) £7.95 DT + £6.34 (C07)
    - Alfentanil 25mg/50ml solution for injection vials | 1 vial (POM) £14.90 (C07)
    - Alfentanil 5mg/10ml solution for injection ampoules | 10 ampoule (POM) £2.78 (C07)
  - Papaveretum (as Papaveretum hydrochloride) 5 mg per 1 ml Papaveretum hydrochloride solution for injection ampoules | 10 ampoule (POM) £21.95 DT + £23.19 (C07)
  - Rapifen (as Rapifen hydrobromide) 500 microgram per 1 ml Rapifen 5mg/10ml solution for injection ampoules | 5 ampoule (POM) £14.50 (C07)
  - Rapifen 1mg/2ml solution for injection ampoules | 10 ampoule (POM) £6.34 DT + £6.34 (C07)
  - Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml Alfentanil 5mg/1ml solution for injection ampoules | 10 ampoule (POM) £23.19 DT + £23.19 (hospital only) (C07)

  **UNLICENSED USE** Remifentanil doses in BNF may differ from those in product literature.

  **CONTRA-INDICATIONS** Analgesia in conscious patients

  **INTERACTIONS** → Appendix 1: hyoscine - opioids

  **LESS SUITABLE FOR PRESCRIBING** Papaveretum with hyoscine hydrobromide is less suitable for prescribing.

  **MEDICINAL FORMS** No licensed medicines listed.

**Papaveretum with hyoscine hydrobromide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, papaveretum p. 469, hyoscine hydrobromide p. 439.

- **INDICATIONS AND DOSE**
  - Premedication
    - BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
    - Adult: 0.5–1 mL
  - INTERACTIONS → Appendix 1: hyoscine - opioids
  - LESS SUITABLE FOR PRESCRIBING Papaveretum with hyoscine hydrobromide is less suitable for prescribing.

**Remifentanil**

- **INDICATIONS AND DOSE**
  - Analgesia and enhancement of anaesthesia at induction (initial bolus injection)
    - BY INTRAVENOUS INJECTION
    - Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary
  - Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose
    - BY INTRAVENOUS INFUSION
    - Adult: 30–60 micrograms/kg/hour, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)**

- BY INTRAVENOUS INJECTION
  - Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial bolus dose**

- BY INTRAVENOUS INFUSION
  - Adult: 3–120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, in light anaesthesia additional doses can be given by intravenous injection every 2–5 minutes during the intravenous infusion

**Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia**

- BY INTRAVENOUS INFUSION
  - Adult: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5–6 micrograms/kg/hour

**Assisted ventilation: analgesia and sedation in intensive-care patients (for max 3 days)**

- BY INTRAVENOUS INFUSION
  - Adult: Initially 6–9 micrograms/kg/hour, then adjusted in steps of 1.5 micrograms/kg/hour, allow at least 5 minutes between dose adjustments; usual dose 0.36–4.44 micrograms/kg/hour, if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details)

**Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients**

- BY INTRAVENOUS INFUSION
  - Adult: Usual dose 15–45 micrograms/kg/hour, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements

**Cardiac surgery**

- Adult: (consult product literature)

**DOSES AT EXTREMES OF BODY-WEIGHT**
- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**SIDE-EFFECTS**

- **Common or very common** Apnoea - muscle rigidity - post procedural complications
- **Uncommon** Hypoxia
- **Rare or very rare** Cardiac arrest
- **Frequency not known** Agitation - atrioventricular block - hypertension - seizure

**SIDE-EFFECTS, FURTHER INFORMATION** In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by plasma esterases; it has short duration of action which is independent of dose and duration of infusion.

**Muscle rigidity** Remifentanil can cause muscle rigidity that can be managed by the use of neuromuscular blocking drugs.

**PREGNANCY** No information available.

**BREAST FEEDING** Avoid breast-feeding for 24 hours after administration—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (limited information available).

www.getintopharma.com
1.4 Peri-operative sedation

Conscious sedation for clinical procedures

Overview
Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be monitored carefully; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

Anaesthetics, General > NMDA Receptor Antagonists

Ketamine

- INDICATIONS AND DOSE
  - Induction and maintenance of anaesthesia for short procedures
    - By Intramuscular Injection
      - Adult: Initially 6.5–13 mg/kg, adjusted according to response, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia
take patients home. The dangers of taking alcohol should also be emphasised.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see Drugs and driving under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, spray

**Solution for injection**

- **Ketamine (Non-proprietary)**
  - Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml Ketamin 10 Curamed 50mg/5ml solution for injection ampoules | 10 ampoule (£0.21 CD)
  - Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml Ketamin 500mg/10ml solution for injection vials | 10 vial (£0.60 CD)
  - Ketamin 100mg/2ml solution for injection ampoules | 10 ampoule (£0.21 CD)
  - Ketoject (Pfizer Ltd)
  - Ketalar (Hospital only)

- **Dexmedetomidine (Non-proprietary)**
  - Dexmedetomidine (as Dexmedetomidine hydrochloride) 100 microgram per 1 ml Dexmedetomidine 1mg/10ml concentrate for solution for infusion vials | 4 vial (£5.60 CD)
  - Dexmedetomidine 400micrograms/4ml concentrate for solution for infusion vials | 4 vial (£12.70 CD)
  - Dexmedetomidine 200micrograms/2ml concentrate for solution for infusion ampoules | 5 ampoule (£78.30 CD)
  - Dexor (Orion Pharma (UK) Ltd)
  - Dexdor (Hospital only)

**HYPNOTICS, SEDATIVES AND ANXIOLYTIKS › NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES**

**Dexmedetomidine**

- **INDICATIONS AND DOSE**
  - **Maintenance of sedation during intensive care**
    - **BY INTRAVENOUS INJECTION**
      - Adult: 0.7 microgram/kg/hour, adjusted according to response; usual dose 0.2–1.4 micrograms/kg/hour
  - **BY RAPID INTRAVENOUS INJECTION**
    - Adult: 1–2 micrograms/kg
  - **BY INTRAVENOUS INFUSION**
    - Adult: 1–2 micrograms/kg/hour
  - **BY INTRADERMAL INJECTION**
    - Adult: 1 microgram/kg

**INTERACTIONS**

- **Common or very common**
  - Agitation
  - Locomotion
  - Hiccups
  - Delirium
  - Fever
  - Shivering
  - Sweating
  - Hypotension
  - Palpitations
  - Episodic hypertension
  - Dizziness
  - Gastrointestinal symptoms
  - Somnolence
  - Movement disorders

**SIDE-EFFECTS**

- **Gastrointestinal symptoms**
  - Nausea
  - Vomiting

- **Respiratory symptoms**
  - Tachypnoea
  - Dyspnoea
  - Hypoventilation

- **Cardiovascular effects**
  - Bradycardia
  - Hypotension
  - Hypertension

- **Central nervous system effects**
  - Sedation
  - Drowsiness
  - Restlessness
  - Agitation

- **Other effects**
  - Fatigue
  - Dry mouth
  - Thirst

**CONTRA-INDICATIONS**

- Hypersensitivity to dantrolene or any component of the preparation
- Myasthenia gravis
- Severe hypovolaemia
- Refractory ventricular arrhythmias
- Severe hypothermia
- Fever
- Severe hypotension
- Cardiac failure
- Acute cerebrovascular disorders
- Severe anaemia
- Significant dehydration
- During labour
- Adults with lung disease
- Children

**Dose adjustments** Manufacturer advises consider dose reduction.

- **MONITORING REQUIREMENTS**
  - Blood pressure
  - Heart rate
  - Oxygen saturation

**DIRECTIONS FOR ADMINISTRATION** To be diluted before use. For intravenous infusion given continuously in Glucose 5% or Sodium chloride 0.9%, dilute to a concentration of 4 micrograms/ml.

**INTERACTIONS**

- **Common or very common**
  - Propranolol
  - Aminophylline
  - Monoamine oxidase (MAO) inhibitors
  - Calcium channel blockers
  - Thromboxane synthase inhibitors
  - Thromboxane synthase inhibitors

- **SIDE-EFFECTS**
  - Bradycardia
  - Hypotension
  - Hypertension
  - Palpitations
  - Dizziness
  - Gastrointestinal symptoms
  - Somnolence
  - Movement disorders

- **INTERACTIONS**
  - **Common or very common**
    - Locomotion
    - Hypoglycaemia
    - Hyperthermia
    - Respiratory depression
    - Depression
    - Drowsiness
    - Agitation
    - Nausea
    - Vomiting
    - Hypotension
    - Hypertension
    - Palpitations
    - Gastrointestinal symptoms
    - Somnolence
    - Movement disorders
  - **SIDE-EFFECTS**
    - Bradycardia
    - Hypotension
    - Hypertension
    - Palpitations
    - Dizziness
    - Gastrointestinal symptoms
    - Somnolence
    - Movement disorders

**IMPORTANT SAFETY INFORMATION**

Dexametomidine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management.

**CONTRA-INDICATIONS**

- Acute cerebrovascular disorders - second- or third-degree AV block (unless pacemaker fitted) - uncontrolled hypotension

**CAUTIONS**

- Abrupt withdrawal after prolonged use - bradycardia - ischaemic heart disease - malignant hyperthermia - severe cerebrovascular disease (especially at higher doses) - severe neurological disorders - spinal cord injury

**INTERACTIONS**

- Appendix 1: dexametomidine

**SIDE-EFFECTS**

- **Common or very common**
  - Agitation
  - Arterial hypotension
  - Bradycardia
  - Hypotension
  - Hypertension
  - Palpitations
  - Vomiting

- **Uncommon**
  - Abdominal distension
  - Anopia
  - Atrioventricular block
  - Dyspnoea
  - Hallucination
  - Hypoalbuminaemia
  - Metabolic acidosis
  - Thirst

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution (increased risk of toxicity due to decreased clearance).

**Dose adjustments** Manufacturer advises consider dose reduction.

- **MONITORING REQUIREMENTS**
  - Blood pressure
  - Heart rate
  - Oxygen saturation

**DIRECTIONS FOR ADMINISTRATION** To be diluted before use. For intravenous infusion given continuously in Glucose 5% or Sodium chloride 0.9%, dilute to a concentration of 4 micrograms/ml.

**INTERACTIONS**

- **Common or very common**
  - Propranolol
  - Aminophylline
  - Monoamine oxidase (MAO) inhibitors
  - Calcium channel blockers
  - Thromboxane synthase inhibitors
  - Thromboxane synthase inhibitors

- **SIDE-EFFECTS**
  - Bradycardia
  - Hypotension
  - Hypertension
  - Palpitations
  - Dizziness
  - Gastrointestinal symptoms
  - Somnolence
  - Movement disorders

**INTERACTIONS**

- **Common or very common**
  - Locomotion
  - Hypoglycaemia
  - Hyperthermia
  - Respiratory depression
  - Depression
  - Drowsiness
  - Agitation
  - Nausea
  - Vomiting
  - Hypotension
  - Hypertension
  - Palpitations
  - Gastrointestinal symptoms
  - Somnolence
  - Movement disorders

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

**CONTRA-INDICATIONS**

- With oral use
  - Acute muscle spasm
  - Avoid when spasticity is useful, for example, locomotion

**CAUTIONS**

- With intravenous use
  - Avoid extravasation (risk of tissue necrosis)
- With oral use
  - Females (hepatotoxicity) - history of liver disorders (hepatotoxicity) - doses greater than 400 mg daily (hepatotoxicity) - impaired cardiac function - impaired pulmonary function - patients over 30 years (hepatotoxicity) - therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks

**INTERACTIONS**

- Appendix 1: dantrolene

**DIRECTIONS FOR ADMINISTRATION**

- **BY MOUTH**
  - Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals; usual dose 75 mg 3 times a day

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

**CONTRA-INDICATIONS**

- With oral use
  - Acute muscle spasm
  - Avoid when spasticity is useful, for example, locomotion

**CAUTIONS**

- With intravenous use
  - Avoid extravasation (risk of tissue necrosis)
- With oral use
  - Females (hepatotoxicity) - history of liver disorders (hepatotoxicity) - doses greater than 400 mg daily (hepatotoxicity) - impaired cardiac function - impaired pulmonary function - patients over 30 years (hepatotoxicity) - therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks

**INTERACTIONS**

- Appendix 1: dantrolene

**DIRECTIONS FOR ADMINISTRATION**

- **BY MOUTH**
  - Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals; usual dose 75 mg 3 times a day

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

**CONTRA-INDICATIONS**

- With oral use
  - Acute muscle spasm
  - Avoid when spasticity is useful, for example, locomotion

**CAUTIONS**

- With intravenous use
  - Avoid extravasation (risk of tissue necrosis)
- With oral use
  - Females (hepatotoxicity) - history of liver disorders (hepatotoxicity) - doses greater than 400 mg daily (hepatotoxicity) - impaired cardiac function - impaired pulmonary function - patients over 30 years (hepatotoxicity) - therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks

**INTERACTIONS**

- Appendix 1: dantrolene
Local anaesthesia

Anaesthesia (local)

Local anaesthetic drugs

The use of local anaesthetics by injection or by application to mucous membranes to produce local anaesthesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 1349 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Levobupivacaine p. 1351, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 130 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 1353) is about 90 minutes.

Prilocaine hydrochloride p. 1356 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride. A hyperbaric solution of prilocaine hydrochloride (containing glucose) may be used for spinal anaesthesia.

Ropivacaine hydrochloride p. 1357 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 1358, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

Administration by injection

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient’s age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

NHS Improvement has advised (September 2016) that, prior to administration, all injectable medicines must be drawn directly from their original ampoule or container into a syringe and should never be decanted into gallipots or open containers. This is to avoid the risk of medicines being confused with other substances, e.g. skin disinfectants, and to reduce the risk of contamination.
Local anaesthetics should not be injected into damaged skin, application to the middle ear (may cause ototoxicity), or into infected tissues; preservatives should not be used for caudal, epidural, or intrathecal injection into damaged skin, or into infected tissues.

Severe local anaesthetic-induced cardiovascular toxicity

Overview

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately. Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed.

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as Intralipid® [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guidelines, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity - Accompanying notes.

ANAESTHETICS, LOCAL

Adrenaline with articaine hydrochloride

(Carticaine hydrochloride with epinephrine)

28-Mar-2017

- INDICATIONS AND Dose

- infiltration anaesthesia in dentistry
- BY REGIONAL ADMINISTRATION
  - Adult: Consult expert dental sources

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- CONTRA-INDICATIONS Application to damaged skin - application to the middle ear (may cause ototoxicity) - complete heart block - injection into infected tissues - injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block)

CONTRA-INDICATIONS, FURTHER INFORMATION

- Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Inadequate absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
Bupivacaine hydrochloride

**INDICATIONS AND DOSE**

**Surgical anaesthesia, lumbar epidural block**

- **BY REGIONAL ADMINISTRATION**
- Adult: 75–150 mg, dose administered using a 5 mg/mL (0.5%) solution

**Surgical anaesthesia, field block**

- **BY REGIONAL ADMINISTRATION**
- Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, thoracic epidural block**

- **BY THORACIC EPIDURAL**
- Adult: 12.5–50 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, caudal epidural block**

- **BY REGIONAL ADMINISTRATION**
- Adult: 50–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, major nerve block**

- **BY REGIONAL ADMINISTRATION**
- Adult: 50–175 mg, dose administered using 5 mg/mL (0.5%) solution

**Acute pain, intra-articular block**

- **BY INTRA-ARTICULAR INJECTION**
- Adult: Up to 100 mg, dose administered using 2.5 mg/mL (0.25%) solution; when co-administered with bupivacaine by another route, total max. 150 mg

**Acute pain, thoracic epidural block**

- **BY CONTINUOUS EPIDURAL INFUSION**
- Adult: 6.3–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

**Acute pain, labour**

- **BY CONTINUOUS EPIDURAL INFUSION**
- Adult: 6.25–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

**Acute pain, lumbar epidural block**

- **INITIALLY BY LUMBAR EPIDURAL**
- Adult: 15–37.5 mg, then (by lumbar epidural) 15–37.5 mg, repeated when required at intervals of at least 30 minutes, dose administered by intermittent injection using a 2.5 mg/mL (0.25%) solution, alternatively (by continuous epidural infusion) 12.5–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

**Acute pain, field block**

- **BY REGIONAL ADMINISTRATION**
- Adult: Up to 150 mg, dose administered using 2.5 mg/mL (0.25%) solution

**DOSES AT EXTREMES OF BODY-WEIGHT**

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**MARCAINE HEAVY ®**

**Intrathecal anaesthesia for surgery**

- **BY INTRATECHAL INJECTION**
- Adult: 10–20 mg

**IMPORTANT SAFETY INFORMATION**

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS**

Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous
Regional anaesthesia (Bier’s block) should not be applied to damaged skin.

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS**
  - Cardiovascular disease • cerebral atheroma • debilitated patients (consider dose reduction) • elderly (consider dose reduction) • epilepsy • hypotension • hypovolaemia • impaired cardiac conduction • impaired respiratory function • myasthenia gravis • myocardial depression may be more severe and more resistant to treatment • shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

- **SIDE-EFFECTS**
  - Common or very common • Arrhythmias • dizziness • hypertension • hypotension • nausea • paraesthesia • urinary retention • vomiting

  - Uncommon • Neurotoxicity

  - Rare or very rare • Arachnoiditis • cardiac arrest • diplopia • nerve disorders • paraplegia • paresis • respiratory depression

**SIDE-EFFECTS, FURTHER INFORMATION**

Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

- **ALLERGY AND CROSS-SENSITIVITY**
  - hypersensitivity and cross-sensitivity. Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY**
  - Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.

- **Dose adjustments**

- **BREAST FEEDING**
  - Amount too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises use with caution in advanced liver dysfunction.

- **RENAL IMPAIRMENT**
  - Use with caution in severe impairment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Bupivacaine hydrochloride (Non-proprietary)**
  - Bupivacaine hydrochloride 2.5 mg per 1 ml
  - Bupivacaine 25mg/10ml (0.25%) solution for injection vials | 10 vial [PTD] [NS]
  - Bupivacaine 0.25% solution for injection 10ml Sure-Amp ampoules | 20 ampoule [PTD] £17.50 DT + £17.50
  - Bupivacaine hydrochloride 5 mg per 1 ml
  - Bupivacaine 50mg/10ml (0.5%) solution for injection vials | 10 vial [PTD] [NS]
  - Bupivacaine 100mg/20ml (0.5%) solution for injection vials | 10 vial [PTD] £18.30 DT + £18.30
  - Bupivacaine hydrochloride anhydrous 40 mg per 1 ml
  - Bupivacaine 40mg/ml (4%) solution for injection ampoules | 10 ampoule [PTD] [NS]
  - Bupivacaine hydrochloride 1.25 mg per 1 ml
  - Bupivacaine 312.5mg/250ml (0.125%) infusion bags | 20 bag [PTD] £248.47

**Bupivacaine with adrenaline**

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1349, adrenaline/epinephrine p. 222.

- **INDICATIONS AND DOSE**

  - **Surgical anaesthesia**
    - BY LUMBAR EPIDURAL, OR BY LOCAL INJECTION, OR BY CAUDAL EPIDURAL
    - Adult: (consult product literature)
  - **Acute pain management**
    - BY LUMBAR EPIDURAL, OR BY LOCAL INJECTION
    - Adult: (consult product literature)

- **IMPORTANT SAFETY INFORMATION**

Adrenaline/epinephrine must be used in a low concentration when administered with a local anesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **CAUTIONS**

  - **CAUTIONS, FURTHER INFORMATION**

  - In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

- **INTERACTIONS** → Appendix 1: anaesthetics, local - sympathomimetics, vasoconstrictor

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Bupivacaine with adrenaline (Non-proprietary)**
  - Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml
  - Bupivacaine hydrochloride 2.5 mg per 1 ml
  - Bupivacaine hydrochloride 5 mg per 1 ml
  - Bupivacaine hydrochloride anhydrous 2.5 mg per 1 ml
  - Adrenaline (base) 0.5% / 25mg/5ml (1 in 200,000) solution for injection ampoules | 10 ampoule [PTD] £46.00 DT + £46.00
  - Bupivacaine hydrochloride 5 mg per 1 ml
  - Bupivacaine hydrochloride anhydrous 5 mg per 1 ml
  - Adrenaline (base) 0.25% / 100mg/1ml (1 in 200,000) solution for injection ampoules | 10 ampoule [PTD] £51.75 DT + £51.75
  - Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml
  - Adrenaline (base) 0.5% / 25mg/5ml (1 in 200,000) solution for injection ampoules | 10 ampoule [PTD] £51.75 DT + £51.75
  - Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml
  - Carboestin-adrenaline 0.25% / 100/200 micrograms (100/200,000) solution for injection ampoules | 10 ampoule [PTD] £46.00 DT + £46.00
  - Carboestin-adrenaline 0.25% / 50/100 micrograms (50/100,000) solution for injection ampoules | 10 ampoule [PTD] £51.75 DT + £51.75
  - Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml
  - Carboestin-adrenaline 0.5% / 25mg/5ml (1 in 200,000) solution for injection ampoules | 10 ampoule [PTD] £51.75 DT + £51.75
  - Carboestin-adrenaline 0.5% / 50/100 micrograms (50/100,000) solution for injection ampoules | 10 ampoule [PTD] £51.75 DT + £51.75

www.getintopharma.com
Levobupivacaine

**INDICATIONS AND DOSE**

**Acute postoperative pain**
- **BY CONTINUOUS EPIDURAL INFUSION**
  - Adult: 12.5–18.75 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

**Acute labour pain**
- **BY LUMBAR EPIDURAL**
  - Adult: 15–25 mg, repeated at intervals of at least 15 minutes, dose administered using a 2.5 mg/mL (0.25%) solution; maximum 400 mg per day
- **BY CONTINUOUS EPIDURAL INFUSION**
  - Adult: 5–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

**Surgical anaesthesia, peripheral nerve block**
- **BY REGIONAL ADMINISTRATION**
  - Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, peribulbar nerve block**
- **BY REGIONAL ADMINISTRATION**
  - Adult: 37.5–112.5 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia for caesarean section**
- **BY LUMBAR EPIDURAL**
  - Adult: 75–150 mg, to be given over 15–20 minutes, dose administered using a 5 mg/mL (0.5%) solution

**Surgical anaesthesia**
- **BY LUMBAR EPIDURAL**
  - Adult: 50–150 mg, to be given over 5 minutes, dose administered using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution
- **BY INTRATHECAL INJECTION**
  - Adult: 15 mg, dose administered using a 5 mg/mL (0.5%) solution
- **BY LOCAL INFILTRATION**
  - Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

**DOSES AT EXTREMES OF BODY-WEIGHT**
- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS**

Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood maximises the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS**

Cardiovascular disease - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock

**INTERACTIONS**

- **Appendix 1: anaesthetics, local**

**SIDE-EFFECTS**

- **Common or very common** Anaeimia - back pain - dizziness - fever - headache - hypotension - nausea - procedural pain - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. Systemic toxicity may occur due to inadvertent intravascular injection. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

**ALLERGY AND CROSS-SENSITIVITY**

- Hypersensitivity and cross-sensitivity. Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**PREGNANCY**

Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid if possible in the first trimester—toxicity in animal studies. May cause fetal distress syndrome. Do not use for paracervical block in obstetrics. Do not use 7.5 mg/mL strength in obstetrics.

**BREAST FEEDING**

Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in hepatic impairment or patients with reduced hepatic blood flow (no information available).

**DIRECTIONS FOR ADMINISTRATION**

For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**

Levobupivacaine is an isomer of bupivacaine.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Levobupivacaine (Non-proprietary)**
  - **Levobupivacaine (as Levobupivacaine hydrochloride)** 2.5 mg per 1 ml Levobupivacaine 25mg/10ml solution for injection ampoules £9.00 (Hospital only) 5 ampoule (PO) 10.00 (Hospital only)
  - **Levobupivacaine (as Levobupivacaine hydrochloride)** 5 mg per 1 ml Levobupivacaine 50mg/10ml solution for injection ampoules £10.35 (Hospital only) 5 ampoule (PO) 15.50 (Hospital only)
  - **Levobupivacaine (as Levobupivacaine hydrochloride)** 7.5 mg per 1 ml Levobupivacaine 75mg/10ml solution for injection ampoules £13.45 (Hospital only) 5 ampoule (PO) 20.50 (£24.23 (Hospital only))

---

**Lidocaine hydrochloride**  
(Lignocaine hydrochloride)

- **INDICATIONS AND DOSE**
  - **Infiltration anaesthesia**
    - **By local infiltration**
      - Adult: Dose to be given according to patient’s weight and nature of procedure; max. 200 mg, maximum dose 500 mg if given in solutions containing adrenaline
  - **Doses at extremes of body-weight**
    - When used by local infiltration. To avoid excessive dosage in obese patients, weight-based doses for non-emergency indications may need to be calculated on the basis of ideal body-weight.
  - **Intravenous regional anaesthesia and nerve block**
    - **By regional administration**
      - Adult: Seek expert advice
  - **Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis)**
  - **Lubricant in cystoscopy | lubricant in proctoscopy**
    - **To the skin using ointment**
      - Adult: Apply 1–2 mL as required, avoid long-term use
    - **Sore nipples from breast-feeding**
      - **To the skin using ointment**
        - Adult: Apply using gauze and wash off immediately before next feed
    - **LMX 4®**
  - **Anaesthesia before venous cannulation or venepuncture**
    - **To the skin**
      - Child 1–2 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes
      - Child 3–11 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
      - Child 1–17 years: Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes
      - Adult: Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

---

**Versatis®**

**Postherpetic neuralgia**

- **To the skin**
  - Adult: Apply once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks, to be applied to intact, dry, non-hairy, non-irritated skin, up to 3 plasters may be used to cover large areas; plasters may be cut

**Xylocaine®**

**During delivery in obstetrics**

- **To the skin**
  - Adult: Up to 20 doses

---

**Important safety information**

- **When used by local infiltration**
  - The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS**
  - **When used by regional administration** All grades of atrioventricular block - application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - severe myocardial depression - should not be applied to damaged skin - sino-atrial disorders
  - **CONTRA-INDICATIONS, FURTHER INFORMATION**
    - **When used by regional administration** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS**
  - **When used by regional administration** Acute porphyrias p.1058 (consider infusion with glucose for its anti-porphyrinogenic effects) - children (consider dose reduction) - congestive cardiac failure (consider lower dose) - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - post cardiac surgery (consider lower dose) - shock

- **INTERACTIONS**
  - Appendix: antiarrhythmics

- **SIDE-EFFECTS**
  - With parenteral use: Anxiety - arrhythmias - atrioventricular block - cardiac arrest - circulatory collapse - confusion - dizziness - drowsiness - euphoric mood - headache - hypotension (may lead to cardiac arrest) - loss of consciousness - methaemoglobinemia - muscle twitching - myocardial contractility decreased - nausea - neurological effects - nystagmus - pain - psychosis - respiratory disorders - seizure - sensation abnormal - temperature sensation altered - tinnitus - tremor - vision blurred - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Toxic effects**

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

**Methaemoglobinemia**

Methylthioninium chloride is licensed for the acute symptomatic treatment of drug-induced methaemoglobinemia.

---

www.getintopharma.com
**Local anaesthesia 1353**

**Lidocaine with adrenaline**

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 103, adrenaline/epinephrine p. 222.

- **Indications and dose**
  - **Local anaesthesia**
    - **By local infiltration**
    - **Adult:** Dosed according to the type of nerve block required (consult product literature)

**Important safety information**

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

**Interactions**
- Appendix 1: antiarrhythmics, sympathomimetics, vasodilator

**Profession specific information**

**Dental information**

A variety of lidocaine injections with adrenaline is available in dental cartridges. Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, liquid, ointment.

**Solution for injection**

- **Lidocaine hydrochloride (Non-proprietary)**
  - **Lidocaine hydrochloride 5 mg per 1 ml** Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule (Pﬁzer) £1.00
  - **Lidocaine hydrochloride 10 mg per 1 ml** Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule (Pﬁzer) £1.15–£1.21

Lidocaine with prilocaine

25-Apr-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 103, prilocaine hydrochloride p. 1356.

- **INDICATIONS AND DOSE**

  **Anaesthesia before minor skin procedures including venepuncture**
  - **To the skin**
    - Child 1-2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day
    - Child 3-11 months: Apply up to 2 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
    - Child 1-11 years: Apply 1–5 hours before procedure, a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
    - Child 12-17 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)
  - Adult: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing

  **Anaesthesia on genital skin before injection of local anaesthetics**
  - **To the skin**
    - Adult: Apply under occlusive dressing for 15 minutes (males) or 60 minutes (females) before procedure

  **Anaesthesia before surgical treatment of lesions on genital mucosa**
  - **To the skin**
    - Adult: Apply up to 10 g, to be applied 5–10 minutes before procedure

  **Anaesthesia before cervical curettage**
  - **To the skin**
    - Adult: Apply 10 g in lateral vaginal fornices for 10 minutes

  **Anaesthesia before mechanical cleansing or debridement of leg ulcer**
  - **To the skin**
    - Adult: Apply up to 10 g for 30–60 minutes, to be applied under occlusive dressing

  **Fortacin**

  **Primary premature ejaculation**
  - **To the skin**
    - Adult: 3 sprays every 4 hours as required, to be applied to cover the glans penis (excess spray should be removed after 5 minutes and before intercourse); maximum 9 sprays per day

  **Dose equivalence and conversion**
  - For Fortacin®: Each dose of 3 sprays is equivalent to lidocaine 22.5 mg and prilocaine 7.5 mg.

---

**Lidocaine with cetrimide**

27-Apr-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 103, cetrimide hydrochloride p. 1354.

- **INDICATIONS AND DOSE**

  **Anaesthesia and disinfection in dental practice**
  - **To mucus membranes using oromucosal spray**
    - Adult: 10–20 mg, no more than 30 mg should be applied to the same quadrant of the buccal cavity—consult product literature, dose expressed as lidocaine

  **Anaesthesia in dental practice**
  - **To mucus membranes using dental gel**
    - Adult: Apply 100–500 mg, use cotton pellet for application to dried mucosa, dose expressed as weight of gel

  **DOSE EQUIVALENCE AND CONVERSION**
  - 1 metered dose of Xylonor® spray is equivalent to 10 mg of lidocaine.
  - 2 millimetres of Xylonor® gel is approximately equivalent to 100 mg of gel (approximately equivalent to 5 mg of lidocaine).

- **CAUTIONS**
  - Sepsis (risk of rapid systemic absorption) - traumatised mucosa (risk of rapid systemic absorption)

- **INTERACTIONS**
  - Appendix 1: antiarrhythmics

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - Oromucosal gel
      - Xylonor (Septodont Ltd)
      - Cetrimide 1.5 mg per 1 gram, Lidocaine 50 mg per 1 gram: Xylonor 5% gel sugar-free | 15 gram [POD] £4.00
        - Spray
          - Xylonor (Septodont Ltd)
          - Cetrimide 100 microgram per 1 gram, Lidocaine 10 mg per 1 gram: Xylonor 10% spray sugar-free | 36 gram [POD] £20.15

---

**Lidocaine with phenylephrine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 103, phenylephrine hydrochloride p. 189.

- **INDICATIONS AND DOSE**

  **Anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose**
  - **By intranasal administration**
    - Adult: Up to 8 sprays

- **INTERACTIONS**
  - Appendix 1: antiarrhythmics - sympathomimetics, vasoconstrictor

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - Spray
      - Lidocaine with phenylephrine (Non-proprietary)
        - Phenylephrine hydrochloride 5 mg per 1 ml, Lidocaine hydrochloride 50 mg per 1 ml: Lidocaine 5% / Phenylephrine 0.5% nasal spray | 2.5 ml [POD] £12.90 DT + £12.00

---

Adrenaline 100 micrograms/20 ml (1 in 200,000) solution for injection vials | 5 vial [POD] £8.85 DT + £8.85

www.getintopharma.com
DOSES AT EXTREMES OF BODY-WEIGHT
- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION
Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS
- Application to the middle ear (can cause ototoxicity).
- Avoid injection into inflamed or infected tissues.
- Avoid injection into inflamed tissues - complete heart block.

INTERACTIONS
- Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

SIDE-EFFECTS
- Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

CONTRA-INDICATIONS
- Type II diabetes: increased risk of toxic plasma concentrations in severe diabetes.

INTERACTIONS
- Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

SIDE-EFFECTS
- Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

CONTRA-INDICATIONS
- Application to the middle ear (can cause ototoxicity).
- Avoid injection into inflamed tissues.

INTERACTIONS
- Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

SIDE-EFFECTS
- Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

CONTRA-INDICATIONS
- Application to the middle ear (can cause ototoxicity).
- Avoid injection into inflamed tissues.

INTERACTIONS
- Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

SIDE-EFFECTS
- Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

CONTRA-INDICATIONS
- Application to the middle ear (can cause ototoxicity).
- Avoid injection into inflamed tissues.

INTERACTIONS
- Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

SIDE-EFFECTS
- Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

CONTRA-INDICATIONS
- Application to the middle ear (can cause ototoxicity).
- Avoid injection into inflamed tissues.

INTERACTIONS
- Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.

SIDE-EFFECTS
- Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.
Mepivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride p. 1355, adrenaline/epinephrine p. 222.

- **INDICATIONS AND DOSE**
  - **Infiltration anaesthesia and nerve block in dentistry**
    - **BY LOCAL INFILTRATION**
    - Adult: (consult product literature)

- **INTERACTIONS**
  - **Appendix 1: anaesthetics, local - sympathomimetics, vasoconstrictor**

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - **EXCIPIENTS:** May contain Sulfites
  - **Scandonest special** (Septodont Ltd)

- **Adrenaline 10 microgram per 1 ml, Mepivacaine hydrochloride 20 mg per 1 ml Scandonest special 2% solution for injection 2.2ml cartridges | 50 cartridge £21.95**

Prilocaine hydrochloride

- **INDICATIONS AND DOSE**
  - **DOSES AT EXTREMES OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
  - **CITANEST 1%**

- **Infiltration anaesthesia | Nerve block**
  - **BY REGIONAL ADMINISTRATION**
  - Adult: 100–200 mg/minute, alternatively may be given in incremental doses; dose adjusted according to site of administration and response, and in elderly and debilitated patients (smaller doses may be required); maximum 400 mg per course

- **PRILOTEKAL**

- **Spinal anaesthesia**
  - **BY INTRATHECAL INJECTION**
  - Adult: Usual dose 40–60 mg (max. per dose 80 mg), dose may need to be reduced in elderly or debilitated patients, or in late pregnancy

- **INTERACTIONS**
  - **Appendix 1: anaesthetics, local - sympathomimetics, vasoconstrictor**

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - **EXCIPIENTS:** May contain Sulfites
  - **Scandonest special** (Septodont Ltd)

- **Adrenaline 10 microgram per 1 ml, Mepivacaine hydrochloride 20 mg per 1 ml Scandonest special 2% solution for injection 2.2ml cartridges | 50 cartridge £21.95**

**IMPORTANT SAFETY INFORMATION**

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
  - **CAUTIONS**
    - Cardiovascular disease - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - severe or untreated hypertension - shock

- **INTERACTIONS**
  - **Appendix 1: anaesthetics, local - sympathomimetics, vasoconstrictor**

- **SIDE-EFFECTS**
  - **Common or very common** Arrhythmias - dizziness - hypotension - nausea - paraesthesia - vomiting
  - **Uncommon** Neurotoxicity
  - **Rare or very rare** Bradycardia after epidural block. Avoid paracervical or intrathecal anaesthesia. 

- **FURTHER INFORMATION**
  - **TOXIC EFFECTS**
    - Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

**Methaemoglobinemia**

- Methaemoglobinemia can be treated with an intravenous injection of methyleneblue.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY**
  - Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinemia reported).

- **Dose adjustments**
  - Use lower doses for intrathecal use during late pregnancy.

- **BREAST FEEDING**
  - Present in milk but not known to be harmful.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution.

- **Dose adjustments**
  - With intrathecal use Manufacturer advises consider dose reduction.

- **RENAL IMPAIRMENT**
  - Use with caution.

- **Dose adjustments**
  - Lower doses may be required for intrathecal anaesthesia.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **PRILOTEKAL**

- **Scottish Medicines Consortium (SMC) decisions**
  - With intrathecal use The Scottish Medicines Consortium has advised (December 2010) that prilocaine 2% hyperbaric solution for injection (Prilotekal®) is accepted for restricted use within NHS Scotland for use in spinal anaesthesia in ambulatory surgery settings.
**Prilocaine with felypressin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, prilocaine hydrochloride p. 1356.

- **INDICATIONS AND DOSE**
  - Dental anaesthesia
    - By regional administration
      - Adult: Consult expert dental sources for specific advice
  - Interactions
    - Appendix 1: anaesthetics, local
  - **SIDE-EFFECTS**
    - Bradycardia, cardiac arrest, dizziness, drowsiness, hypotension, loss of consciousness, methaemoglobinemia, myocardial contractility decreased, nervousness, respiratory arrest, seizure, tremor, vision blurred

**Solution for injection**
- Prilocaine hydrochloride 10 mg per 1 ml Citanest 1% solution for injection 5ml vials | 1 vial £0.96
- Prilotekal (Sintetica Ltd)
  - Prilocaine hydrochloride 20 mg per 1 ml Prilotekal 100mg/5ml solution for injection ampoules | 10 ampoule (PO) £78.80

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Citanest with Octapressin (Dentsply Ltd)
  - Prilocaine hydrochloride 30 mg per 1 ml, Felypressin 0.3 unit per 1 ml Citanest 3% with Octapressin Dental 0.066units/2.2ml solution for injection self aspirating cartridges | 50 cartridge

---

**Ropivacaine hydrochloride**

- **INDICATIONS AND DOSE**
  - Acute pain, peripheral nerve block
    - By regional administration
      - Adult: 10–20 mg/hour, dose administered as a continuous infusion or by intermittent injection using a 2 mg/mL (0.2%) solution
  - Acute pain, field block
    - By regional administration
      - Adult: 2–200 mg, dose administered using a 2 mg/mL (0.2%) solution
  - Acute pain, lumbar epidural block
    - By lumbar epidural
      - Adult: 20–40 mg, followed by 20–30 mg at least every 30 minutes, dose administered using a 2 mg/mL (0.2%) solution
  - Acute labour pain
    - By continuous epidural infusion
      - Adult: 12–20 mg/hour, dose administered using a 2 mg/mL (0.2%) solution
  - Acute postoperative pain
    - By continuous epidural infusion
      - Adult: Up to 28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution
  - Postoperative pain, thoracic epidural block
    - By continuous epidural infusion
      - Adult: 12–28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution
  - Surgical anaesthesia, field block
    - By regional administration
      - Adult: 7.5–225 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia, major nerve block (brachial plexus block)**
- By regional administration
  - Adult: 225–300 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia, thoracic epidural block (to establish block for postoperative pain)**
- By thoracic epidural
  - Adult: 38–113 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia for caesarean section**
- By lumbar epidural
  - Adult: 113–150 mg, to be administered in incremental doses using a 7.5 mg/mL (0.75%) solution

**DOSES AT EXTREMES OF BODY-WEIGHT**
- To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

**IMPORTANT SAFETY INFORMATION**

- Only should be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS**

- Application to the middle ear (can cause ototoxicity), avoid injection into infected tissues, avoid injection into inflamed tissues, complete heart block, preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block). Should not be applied to damaged skin.

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS**

- Acute porphyrias p. 1058, cardiovascular disease, debilitated patients (consider dose reduction), elderly (consider dose reduction), epilepsy, hypovolaemia, impaired cardiac conduction, impaired respiratory function, myasthenia gravis, shock.

**INTERACTIONS**

- Appendix 1: anaesthetics, local

**SIDE-EFFECTS**

- Common or very common
  - Arrhythmias, back pain, chills, dizziness, headache, hypotension, nausea, sensation abnormal, urinary retention, vomiting
- Uncommon
  - Anxiety, dyspnoea, hypothermia, neurotoxicity, syncope
- Rare or very rare
  - Cardiac arrest
- Frequency not known
  - Dyskinesia

**SIDE-EFFECTS, FURTHER INFORMATION**

- Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. The onset of toxicity can be unpredictable and delayed. Monitor as per local protocol for at least 30 minutes after administration.

**ALLERGY AND CROSS-SENSITIVITY**

- Hypersensitivity and cross-sensitivity. Hypersensitivity reactions occur mainly with the ester-type local anaesthetics. There can be variation in the licensing of different medicines containing the same drug.
anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Not known to be harmful. Do not use for paracervical block in obstetrics.
- **BREAST FEEDING** Not known to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

### Dose adjustments
Manufacturer advises consider dose reduction for repeat doses in severe impairment.

### RENAL IMPAIRMENT
Caution in severe impairment. Increased risk of systemic toxicity in chronic renal failure.

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**ELECTROLYTES**: May contain Sodium
- Ropivacaine hydrochloride (Non-proprietary) Tetracaine gel for local anaesthesia: Tetracaine 40 mg per 1 gram | 1.5 gram | £1.08
- Naropin (Aspen Pharma Trading Ltd) Tetracaine 40 mg per 1 gram | 1.5 gram | £1.08

**Infusion**

**ELECTROLYTES**: May contain Sodium
- Ropivacaine hydrochloride (Non-proprietary) Tetracaine gel for local anaesthesia: Tetracaine 40 mg per 1 gram | 1.5 gram | £1.08

**Gel**

**EXCIPIENTS**: May contain Hydroxybenzoates (parabens)
- Ametop (Forum Health Products Ltd) Tetracaine 40 mg per 1 gram | 1.5 gram | £1.08

**Tetracaine (Amethocaine)**

#### INDICATIONS AND DOSE

**Anaesthesia before venepuncture or venous cannulation**
- TO THE SKIN
  - Child 1 month–4 years: Apply contents of up to 1 tube (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation
  - Child 5–17 years: Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation
  - Adult: Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation

#### CONTRA-INDICATIONS
Should not be applied to damaged skin

#### SIDE-EFFECTS, FURTHER INFORMATION
The systemic toxicity of local anaesthetics mainly involves the central nervous system; systemic side effects unlikely as minimal absorption following topical application.

#### ALLERGY AND CROSS-SENSITIVITY
- Hypersensitivity and cross-sensitivity
  - Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

#### BREAST FEEDING
Not known to be harmful.

#### PATIENT AND CARER ADVICE
Medicines for Children leaflet: Tetracaine gel for local anaesthesia www.medicinesforchildren.org.uk/tetracaine-gel-local-anaesthesia

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Poisoning, emergency treatment

Overview
These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service be consulted when there is doubt about the degree of risk or about management.

Hospital admission
Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin p. 121, iron, paracetamol p. 444, tricyclic antidepressants, and co-phenetropine p. 66 (diphenoxylate with atropine, Lomotil®); the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information
TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number: Tel: 0344 892 0111.

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours).

General care
It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration
Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be used if the main site cannot be accessed. A bag-valve-mask device may be needed. Oxygen is not a substitute for adequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is often given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Blood pressure
Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 1040 or a colloid. Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service. Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amphetamines, phencyclidine, and cocaine.

Heart
Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis,
Emergency treatment of poisoning

1360

or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

Body temperature

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require urgent hospitalisation for assessment and supportive treatment.

Convulsions during poisoning

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 339 or diazepam p. 343 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 340 [unlicensed use in adults and children under 3 months] can be given by the buccal route or diazepam can be administered as a rectal solution.

Methaemoglobinaemia

Drug- or chemical-induced methaemoglobinaemia should be treated with methylthioninium chloride p. 1371 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthioninium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; therapy. Methylthioninium chloride reduces the ferric iron symptoms of tissue hypoxia are present despite oxygen absorption. The

is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

Active elimination techniques

Repeated doses of charcoal, activated by mouth enhance the elimination of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phentoobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should not be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalisation of the urine for salicylates.

Removal from the gastro-intestinal tract

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of emesis (e.g. with ipecacuanha) is not recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract ("body-packing"). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

Alcohol, acute intoxication

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

Aspirin poisoning

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).
Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

**Opioid poisoning**

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 1369 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone.

Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required.

Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate p. 1038 or magnesium sulfate p. 1051, or both. Arrhythmias may occur for up to 12 hours.

**Paracetamol poisoning**

In cases of intravenous paracetamol poisoning contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol p. 444 may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, patients who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese patients who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 1370 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine p. 1370 by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National Poisons Information Service for advice.
Emergency treatment of poisoning

Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylcysteine should be considered in all paracetamol p. 444 overdoses, and advice should be sought from the National Poisons Information Service.

**Acute overdose**

Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg of paracetamol taken in less than 1 hour. Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour. Patients who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of charcoal, activated p. 1366 should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Patients at risk of liver damage and, therefore, requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line (‘treatment line’) joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours. Acetylcysteine treatment should commence immediately in patients:

- whose plasma-paracetamol concentration falls on or above the treatment line on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylcysteine can be discontinued if the plasma-paracetamol concentration is later reported to be below the treatment line on the paracetamol treatment graph, provided that the patient is asymptomatic and liver function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the treatment line on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

**‘Staggered’ overdose, uncertain time of overdose, or therapeutic excess**

A ‘staggered’ overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a ‘staggered’ overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, patients who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol. For small adults, this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g. carbamazepine p. 311, efavirenz p. 644, nevirapine p. 645, phenobarbital p. 335, phenytoin p. 323, primidone p. 336, rifabutin p. 575, rifampicin p. 582, St John’s wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Patients with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient’s risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

**Acetylcysteine dose and administration**

For paracetamol overdosage, acetylcysteine is given in a total dose that is divided into 3 consecutive intravenous infusions over a total of 21 hours. The tables below include the dose of acetylcysteine, for adults and children of body-weight 40 kg and over, in terms of the volume of acetylcysteine Concentrate for Intravenous Infusion required for each of the 3 infusions. The requisite dose of acetylcysteine is added to glucose Intravenous Infusion 5% p. 1041.

**First infusion**

<table>
<thead>
<tr>
<th>Body-weight</th>
<th>Volume of Acetylcysteine Concentrate for Intravenous Infusion 200 mg/mL required to prepare first infusion</th>

</table>

Third infusion (based on an acetylcysteine dose of approx. 100 mg/kg; start immediately after completion of second infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 1 litre Glucose Intravenous Infusion 5%; infuse over 16 hours.

**Antidepressant poisoning**

Tricyclic and related antidepressants

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hypreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

Selective serotonin re-uptake inhibitors (SSRIs)

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or midazolam oromucosal solution [unlicensed use in adults and children under 3 months] (see Convulsions). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

Antimalarial poisoning

Overdose with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

**Antipsychotic poisoning**

Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 411 or diazepam p. 343 (emulsion preferred).

Second-generation antipsychotic drugs

Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 1366 can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 1368 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine–dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

**Beta blockers poisoning**

Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in patients with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (some of the torsade de pointes type). The effects of massive overdose can vary from one beta-blocker to another; propranolol overdose in particular may cause coma and convulsions.

**Acute massive overdose**

Acute massive overdose must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine sulfate p. 1334 is required to treat bradycardia. Cardiogenic shock unresponsive to atropine sulfate is probably best treated with an intravenous injection of glucagon p. 724 [unlicensed] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion. If glucagon is not available, intravenous isoprenaline (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative. A cardiac pacemaker can be used to increase the heart rate.
Emergency treatment of poisoning

**Calcium-channel blockers poisoning**

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated should be considered if the patient presents within 1 hour of overdose with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 1045 or calcium gluconate p. 1045 is given by injection; atropine sulphate is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

**Iron salts poisoning**

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatic cellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 1028, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

**Lithium poisoning**

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient’s depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum–lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum–lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within 1 hour of ingesting significant quantities of lithium. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

**Stimulant-drug poisoning**

Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam p. 343 or lorazepam p. 339; advice should be sought from the National Poisons Information Service on the management of hypertension.

Later, tachypnoea, anticonvulsants, and artificial respiration may be needed.

**Cocaine**

Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertension, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see Body temperature); hypertension and cardiac effects require specific treatment and expert advice should be sought.

**Ecstasy**

Ecstasy (methylenedioxymethamphetamine, MDMA) may cause severe reactions even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hypernatraemia has also been associated with ecstasy poisoning.

Treatment of methylenedioxymethamphetamine poisoning is supportive, with diazepam to control severe agitation or persistent convulsions and close monitoring including ECG.

Self-induced water intoxication should be considered in patients with ecstasy poisoning.

‘Liquid ecstasy’ is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

**Theophylline poisoning**

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 436 may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 1057 and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam or diazepam (see Convulsions). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a short-acting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.
Emergency treatment of poisoning

Cyanide poisoning
Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 1367 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should not be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 1367 followed by sodium thiosulfate p. 1367 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 1026 (Cyanokit®) — no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

Ethylene glycol and methanol poisoning
Fomepizole (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metal poisoning
Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases poisoning
Carbon monoxide
Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow oxygen 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 229. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, and ammonia
All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS Spray poisoning
CS spray, which is used for riot control, irritates the eyes (hence ‘tear gas’) and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agent poisoning
Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits (‘NAAS pods’) containing pralidoxime chloride p. 1367 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Pesticide poisoning
Organophosphorus insecticides
Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 1334 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

Snake bites and animal stings
Snake bites
Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (Vipera berus). The
Active elimination from the gastro-intestinal tract

Other poisons
Consult either the National Poisons Information Service day and night or TOXBASE.
The National Poisons Information Service (Tel: 0344 892 0111) will provide specialist advice on all aspects of poisoning day and night.

1 Active elimination from the gastro-intestinal tract

ANTIDOTES AND CHELATORS > INTESTINAL ADSORBENTS

Charcoal, activated

- INDICATIONS AND DOSE
  - Reduction of absorption of poisons in the gastro-intestinal system
    - BY MOUTH
      - Neonate: 1 g/kg.
      - Child 1 month-11 years: 1 g/kg (max. per dose 50 g)
      - Child 12-17 years: 50 g
      - Adult: 50 g
  - Active elimination of poisons
    - BY MOUTH
      - Neonate: 1 g/kg every 4 hours, dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy.
      - Child 1 month-11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy
      - Child 12-17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy
      - Adult: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy

- ACCELERATED ELIMINATION
  - Teriflunomide
    - BY MOUTH USING GRANULES
      - Adult: 50 g every 12 hours for 11 days
    - Accelerated elimination of leflunomide (washout procedure)
      - BY MOUTH USING GRANULES
      - Adult: 50 g 4 times a day for 11 days

- UNLICENSED USE
  - In adults Activated charcoal doses in BNF may differ from those in product literature.
  - Comatose patient (risk of aspiration—ensure airway is protected) drowsy patient (risk of aspiration—ensure airway protected) reduced gastrointestinal motility (risk of obstruction)
  - Bezoar constipation diarrhoea gastrointestinal disorders
  - Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.
  - There can be variation in the licensing of different medicines containing the same drug.

- Oral suspension
  - Charcodote (Teva UK Ltd)
    - Activated charcoal 200 mg per 1 ml Charcodote 200mg/ml oral suspension sugar-free £11.88

- Oral liquid
  - Charcodote 250 mg oral suspension 250 ml £5.40
  - Charcodote 50 mg oral suspension 250 ml £6.60
  - Charcodote 100 mg oral suspension 250 ml £8.70

- Oral granules
  - Charcodote 500 mg oral granules 250 g £4.30
2 Chemical toxicity

2.1 Cyanide toxicity

**ANTIDOTES AND CHELATORS**

**Dicobalt edetate**

- **INDICATIONS AND DOSE**
  - Severe poisoning with cyanides
    - **BY INTRAVENOUS INJECTION**
    - Child: Consult the National Poisons Information Service
    - Adult: 300 mg, to be given over 1 minute (or 5 minutes if condition less serious), dose to be followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity

- **CAUTIONS** Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness
- **SIDE-EFFECTS** Reflex tachycardia - vomiting
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - Dicobalt edetate (Non-proprietary)
      - Dicobalt edetate 15 mg per 1 ml Dicobalt edetate 300mg/20ml solution for injection ampoules | 6 ampoule [POM] £11.72

**Sodium nitrite**

- **INDICATIONS AND DOSE**
  - Poisoning with cyanides
    - **BY INTRAVENOUS INJECTION**
    - Child: Consult the National Poisons Information Service
    - Adult: 12.5 g, to be given over 10 minutes, dose may be repeated in severe cyanide poisoning

- **DOSE EQUIVALENCE AND CONVERSION**
  - 12.5 g equates to 50 mL of a 25% solution or 25 mL of a 50% solution.

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection
  - **Solution for injection**
    - Sodium thiosulfate (Non-proprietary)
      - Sodium thiosulfate 250 mg per 1 ml Sodium thiosulfate 12.5g/50ml solution for injection vials | 1 vial [POM] £

**2.2 Organophosphorus toxicity**

**Other drugs used for Organophosphorus toxicity** Atropine sulfate, p. 1334

**ANTIDOTES AND CHELATORS**

**Pralidoxime chloride**

- **INDICATIONS AND DOSE**
  - Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent
    - **BY INTRAVENOUS INJECTION**
    - Child: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day
    - Adult: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day

- **UNLICENSED USE** Pralidoxime chloride doses may differ from those in product literature.
  - In children Licensed for use in children (age range not specified by manufacturer).
  - **CONTRA-INDICATIONS** Poisoning with carbamates - poisoning with organophosphorus compounds without anticholinesterase activity
  - **CAUTIONS** Myasthenia gravis
  - **SIDE-EFFECTS** Dizziness - drowsiness - headache - hyperventilation - muscle weakness - nausea - tachycardia - visual impairment
  - **RENAI IMPAIRMENT** Use with caution.

- **DIRECTIONS FOR ADMINISTRATION** The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.
  - In children For intravenous infusion, reconstitute each vial with 20 mL Water for Injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh
Emergency treatment of poisoning

3 Drug toxicity
3.1 Benzodiazepine toxicity

ANTIDOTES AND CHELATORS ＞ BENZODIAZEPINE ANTAGONISTS

Flumazenil

INDICATIONS AND DOSE
Reversal of sedative effects of benzodiazepines in anaesthesia and clinical procedures
- **BY INTRAVENOUS INJECTION**
  - Adult: 200 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; usual dose 300–600 micrograms; maximum 1 mg per course

Reversal of sedative effects of benzodiazepines in intensive care
- **BY INTRAVENOUS INJECTION**
  - Adult: 300 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; maximum 2 mg per course

Reversal of sedative effects of benzodiazepines in intensive care (if drowsiness recurs after injection)
- **INITIALLY BY INTRAVENOUS INFUSION**
  - Adult: 100–400 micrograms/hour, adjusted according to response, alternatively (by intravenous injection) 300 micrograms, adjusted according to response

IMPORTANT SAFETY INFORMATION
Flumazenil should only be administered by, or under the direct supervision of, personnel experienced in its use.

CONTRA-INDICATIONS
Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

CAUTIONS
Avoid rapid injection following major surgery - avoid rapid injection in high-risk or anxious patients - benzodiazepine dependence (may precipitate withdrawal symptoms) - elderly - ensure neuromuscular blockade cleared before giving - head injury (rapid reversal of benzodiazepine sedation may cause convulsions) - history of panic disorders (risk of recurrence) - prolonged benzodiazepine therapy for epilepsy (risk of convulsions) - short-acting (repeat doses may be necessary - benzodiazepine effects may persist for at least 24 hours)

SIDE-EFFECTS
- Common or very common - Anxiety - diplopia - dry mouth - eye disorders - flushing - headache - hiccups - hyperhidrosis - hyperventilation - hypotension - insomnia - nausea - palpitations - paraesthesia - speech disorder - tremor - vertigo - vomiting
- Uncommon - Abnormal hearing - arrhythmias - chest pain - chills - cough - dyspnoea - nasal congestion - seizure (more common in patients with epilepsy)

- Frequency not known - Withdrawal syndrome
- PREGNANCY - Not known to be harmful.
- BREAST FEEDING - Avoid breast-feeding for 24 hours.
- HEPATIC IMPAIRMENT - Manufacturer advises caution (risk of increased half-life).
- Dose adjustments - Manufacturer advises cautious dose titration.

DIRECTIONS FOR ADMINISTRATION
For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Flumazenil (Non-proprietary)
  - Flumazenil 100 microgram per 1 ml
  - Flumazenil 500 micrograms/5 ml solution for injection ampoules | 5 ampoule £7.46 (Hospital only) | 5 ampoule £65.50– £70.00 | 10 ampoule £140.00

3.2 Digoxin toxicity

ANTIDOTES AND CHELATORS ＞ ANTIBODIES

Digoxin-specific antibody

INDICATIONS AND DOSE
Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary
- **BY INTRAVENOUS INFUSION**
  - Child: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)
  - Adult: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

DIRECTIONS FOR ADMINISTRATION
In adults For intravenous infusion (Digifab®), given intermittently in Sodium chloride 0.9%. Reconstitute with water for injections (4 mL/vial), then dilute with infusion fluid and give over 30 minutes.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
- Digifab (BTG International Ltd)
  - Digoxin-specific antibody fragments 40 mg
  - Digifab 40 mg powder for solution for infusion vials | 1 vial £75.00 (Hospital only)

3.3 Heparin toxicity

ANTIDOTES AND CHELATORS

Protamine sulfate

INDICATIONS AND DOSE
Overdosage with intravenous injection of unfractionated heparin
- **BY INTRAVENOUS INJECTION**
  - Adult: Dose to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 60–100 units heparin when given within 15 minutes; if longer than 15 minutes since heparin, less protamine required (consult product literature)

- Frequency not known - Withdrawal syndrome
- PREGNANCY - Not known to be harmful.
- BREAST FEEDING - Avoid breast-feeding for 24 hours.
- HEPATIC IMPAIRMENT - Manufacturer advises caution (risk of increased half-life).
- Dose adjustments - Manufacturer advises cautious dose titration.

DIRECTIONS FOR ADMINISTRATION
For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Flumazenil (Non-proprietary)
  - Flumazenil 100 microgram per 1 ml
  - Flumazenil 500 micrograms/5 ml solution for injection ampoules | 5 ampoule £7.46 (Hospital only) | 5 ampoule £65.50– £70.00 | 10 ampoule £140.00

BNF 78

Ambulance Services for Mid West and South East Wales—see TOXBASE for list of designated centres.

EXCEPTIONS TO LEGAL CATEGORY
Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection
- Pralidoxime chloride (imported (United States))
  - Pralidoxime chloride 1 gram
  - Pralidoxime Chloride 1g powder for solution for injection vials | 6 vial £20.46

Exceptions to legal category
Raised intracranial pressure, status epilepticus) controlled by medicine restriction does not apply where administration is for saving life in emergency.

1368 Drug toxicity

www.getintopharma.com
literature for details) as heparin rapidly excreted; maximum 50 mg

**Overdosage with intravenous infusion of unfractionated heparin**

- **BY INTRAVENOUS INJECTION**
  - Adult: 25–50 mg, to be administered once heparin infusion stopped at a rate not exceeding 5 mg/minute

**Overdosage with subcutaneous injection of unfractionated heparin**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 25–50 mg, to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises approx. 100 units heparin, then (by intravenous infusion), any remaining dose to be administered over 8–16 hours; maximum 50 mg per course

**Overdosage with subcutaneous injection of low molecular weight heparin**

- **BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION**
  - Adult: Dose to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); maximum 50 mg

**CAUTIONS** Excessive doses can have an anticoagulant effect

**SIDE-EFFECTS**

- Rare or very rare Hypertension, pulmonary oedema, non-cardiogenic edema
- Frequency not known Acute pulmonary vasoconstriction, back pain, bradycardia, circulatory collapse, dyspnoea, hypotension, nausea, vomiting, headache, fever

**ALLERGY AND CROSS-SENSITIVITY** Caution if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy and who may have antibodies to protamine).

**MONITORING REQUIREMENTS** Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.

**PRESCRIBING AND DISPENSING INFORMATION** The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Protamine sulfate (Non-proprietary)
  - Protamine sulfate 10 mg per 1 ml Protamine sulfate 100 mg/10 ml solution for injection ampoules | 5 ampoule (POM) \[\]
  - Protamine sulfate 50 mg/5 ml solution for injection ampoules | 10 ampoule (POM) £4.95

---

### 3.4 Opioid toxicity

**OPIOID RECEPTOR ANTAGONISTS**

- **Naloxone hydrochloride**

**INDICATIONS AND DOSE**

**Overdosage with opioids**

- **BY INTRAVENOUS INJECTION**
  - Child 1 month–11 years: Initially 100 micrograms/kg (max. per dose 2 mg), if no response, repeat at intervals of 1 minute to a max. of 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates, doses can be given by subcutaneous or intramuscular routes but only if intravenous route is not feasible; intravenous administration has more rapid onset of action
  - Child 12–17 years: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates, doses can be given by subcutaneous or intramuscular routes but only if intravenous route is not feasible; intravenous administration has more rapid onset of action

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes
  - Adult: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes

**Overdosage with opioids in a non-medical setting**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 400 micrograms every 2–3 minutes, each dose given in subsequent resuscitation cycles if patient not breathing normally, continue until consciousness regained, breathing normally, medical assistance available, or contents of syringe used up; to be injected into deltoid region or anterolateral thigh

**Reversal of postoperative respiratory depression**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Child 1 month–11 years: 1 microgram/kg, repeated every 2–3 minutes if required
  - Child 12–17 years: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours

---

www.getintopharma.com
Emergency treatment of poisoning

**MEDICINAL FORMS**

**With intravenous use in adults**

**PHARMACOKINETICS**

- Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

**DIRECTIONS FOR ADMINISTRATION**

**BREAST FEEDING**

- Frequency not known
- Uncommon
- Common or very common

**Titration of dose**

To avoid excessive dosage in obese patients, a ceiling dose for paracetamol overdosage.

**UNLICENSED USE**

Naloxone doses in BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

Doses used in acute opioid overdosage may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use.

**IMPORTANT SAFETY INFORMATION**

**FURTHER INFORMATION**

To avoid excessive dosage in obese patients, a ceiling dose for paracetamol overdosage.

**SIDE-EFFECTS**

- Common or very common: Arrhythmias - dizziness - headache - hypertension - hypotension - nausea - vomiting
- Uncommon: Diarrhoea - dry mouth - hyperhidrosis - hyperventilation - inflammation localised - pain - tremor - vascular irritation
- Rare or very rare: Anxiety - cardiac arrest - erythema multiforme - pulmonary oedema - seizure
- Frequency not known: Analgesia reversed - asthenia - chills - death - dyspnoea - fever - irritability - nasal complaints - piloerection - yawning
- PREGNANCY: Use only if potential benefit outweighs risk.
- BREAST FEEDING: Not orally bioavailable.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children: For continuous intravenous infusion, dilute to a concentration of up to 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.
- With intravenous use in adults: For intravenous infusion (Minjet® Naloxone Hydrochloride), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute to a concentration of up to 200 micrograms/mL and administer via an infusion pump.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Naloxone hydrochloride (Non-proprietary)
  - Naloxone hydrochloride 20 microgram per 1 ml Naloxone 40micrograms/2ml solution for injection ampoules | 10 ampoule | £5.00
  - Naloxone hydrochloride dihydrate 400 microgram per 1 ml Naloxone 400micrograms/1ml solution for injection ampoules | 10 ampoule | £36.00-£53.70 07 = £40.79
- Naloxone hydrochloride 1 mg per 1 ml Naloxone 2mg/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £16.80

**3.5 Paracetamol toxicity**

**ANTIDOTES AND CHELATORS**

**Acetylcysteine**

**INDICATIONS AND DOSE**

**Paracetamol overdose**

**BY INTRAVENOUS INFUSION**

- Child (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%
- Child (body-weight 20–39 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%
- Child (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%
- Adult (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%

**DOSES AT EXTREMES OF BODY WEIGHT**

To avoid excessive dosage in obese patients, a ceiling weight of 110 kg should be used when calculating the dose for paracetamol overdosage.

**IMPORANT SAFETY INFORMATION**

MHRA/CHM ADVICE: INTRAVENOUS ACETYLCYSTEINE FOR PARACETAMOL OVERDOSE: REMINDER OF AUTHORISED DOSE REGIMEN; POSSIBLE NEED FOR CONTINUED TREATMENT (JANUARY 2017)

The authorised dose regimen for acetylcysteine in paracetamol overdose is 3 consecutive intravenous infusions given over a total of 21 hours.

Continued treatment (given at the dose and rate as used in the third infusion) may be necessary depending on the clinical evaluation of the individual patient.

**CAUTIONS**

Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) - atopy - may slightly increase INR - may slightly increase prothrombin time

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Anaphylactoid reactions (with intravenous use) can be managed by suspending treatment and initiating appropriate
management. Treatment may then be restarted at lower rate.

**DIRECTIONS FOR ADMINISTRATION**
- **In children** Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if Glucose 5% is unsuitable.
- **In adults** For *Intravenous infusion* (Parvolex®), give continuously in Glucose 5% or Sodium chloride 0.9%. Glucose Intravenous Infusion 5% is the preferred fluid; Sodium Chloride Intravenous Infusion 0.9% is an alternative if Glucose Intravenous Infusion 5% is unsuitable.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium

- **Acetylcysteine (Non-proprietary)**
- **Acetylcysteine 200 mg per 1 ml** Acetylcysteine 2g/10ml solution for infusion ampoules | 10 ampoule £21.26–£24.99 DT = £21.26
- **Parvolex (Phoenix Labs Ltd)**
- **Acetylcysteine 200 mg per 1 ml** Parvolex 2g/10ml concentrate for solution for infusion ampoules | 10 ampoule £22.50 DT = £21.26

## 4 Methaemoglobinaemia

### ANTIDOTES AND CHELATORS

**Methylthioninium chloride**  
(Methylene blue)

**INDICATIONS AND DOSE**

**Drug- or chemical-induced methaemoglobinaemia**
- **BY SLOW INTRAVENOUS INJECTION**
  - **Child 3 months–17 years:** Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course
  - **Adult:** Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

**Aniline- or dapson-induced methaemoglobinaemia**
- **BY SLOW INTRAVENOUS INJECTION**
  - **Child 3 months–17 years:** Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course
  - **Adult:** Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course

**CAUTIONS** Chlorate poisoning (reduces efficacy of methylthioninium) - G6PD deficiency (seek advice from National Poisons Information Service) - methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service) - pulse oximetry may give false estimation of oxygen saturation

**INTERACTIONS** → Appendix 1: methylthioninium chloride

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - anxiety - chest pain - dizziness - headache - hyperhidrosis - nausea - pain in extremity - paraesthesia - skin reactions - taste altered - urine discolouration - vomiting

**SIDE-EFFECTS**

**Frequency not known** Aphasia - arthralgia - confusion - faeces discoloured - fever - haemolytic anaemia - hyperbilirubinaemia (in infants) - hypertension - hypotension - injection site necrosis - mydriasis - tremor

**PREGNANCY** No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.

**BREAST FEEDING** Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.

**RENAL IMPAIRMENT**

**Dose adjustments** Use with caution in severe impairment; dose reduction may be required.

**DIRECTIONS FOR ADMINISTRATION**
- **In children** For *intravenous injection*, may be diluted with Glucose 5% to minimise injection-site pain; not compatible with Sodium Chloride 0.9%.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- **Methylthioninium chloride (Non-proprietary)**
- **Methylthioninium chloride 5 mg per 1 ml** Methylthioninium chloride Proverb 50mg/10ml solution for injection ampoules | 5 ampoule £196.89

## 5 Snake bites

### IMMUNE SERA AND IMMUNOGLOBULINS

#### ANTITOXINS

**European viper snake venom antiserum**

**INDICATIONS AND DOSE**

**Systemic envenoming from snake bites** | **Marked local envenoming**

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- **Child:** Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
- **Adult:** Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

**Severe systemic envenoming from snake bites in patients presenting with clinical features**

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- **Child:** Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
- **Adult:** Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

**DIRECTIONS FOR ADMINISTRATION** By intravenous injection given over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride 0.9% (use 5 mL diluent/kg body-weight).

**PRESCRIBING AND DISPENSING INFORMATION** To order, email immform@dh.gsi.gov.uk.
MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Viper venom antiserum, European (equine) (Imported (Croatia))
  European viper snake venom antiserum 100 mg per 1 ml Viper venom antiserum, European (equine) 1g/10ml solution for injection vials | 1 vial
## Appendix 1 Interactions

Changes have been made to the interactions content in BNF publications. For more information, see [www.bnf.org/new-bnf-interactions/](http://www.bnf.org/new-bnf-interactions/).

Two or more drugs given at the same time can exert their effects independently or they can interact. Interactions may be beneficial and exploited therapeutically; this type of interaction is not within the scope of this appendix. Many interactions are harmless, and even those that are potentially harmful can often be managed, allowing the drugs to be used safely together. Nevertheless, adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse reactions to drugs p. 12), as for other adverse drug reactions.

Potentially harmful drug interactions may occur in only a small number of patients, but the true incidence is often hard to establish. Furthermore the severity of a harmful interaction is likely to vary from one patient to another. Patients at increased risk from drug interactions include the elderly and those with impaired renal or hepatic function. Interactions can result in the potentiation or antagonism of one drug by another, or result in another effect, such as renal impairment. Drug interactions may develop either through pharmacokinetic or pharmacodynamic mechanisms.

### Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or decreasing the amount of drug available to produce its pharmacological effects. Pharmacokinetic interactions occurring with one drug do not necessarily occur uniformly across a group of related drugs. **Affecting absorption** The rate of absorption and the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless a rapid effect is required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, can result in ineffective therapy.

**Affecting distribution** Due to changes in protein binding: To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing the proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug will usually be eliminated.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides but these interactions become clinically relevant mainly because warfarin metabolism is also inhibited.

**Induction or inhibition of drug transporter proteins:** Drug transporter proteins, such as P-glycoprotein, actively transport drugs across biological membranes. Transporters can be induced or inhibited, resulting in changes in the concentrations of drugs that are substrates for the transporter. For example, rifampicin induces P-glycoprotein, particularly in the gut wall, resulting in decreased plasma concentrations of digoxin, a P-glycoprotein substrate.

**Affecting metabolism** Many drugs are metabolised in the liver. Drugs are either metabolised by phase I reactions (oxidation, reduction, or hydrolysis) or by phase II reactions (e.g. glucoronidation).

Phase I reactions are mainly carried out by the cytochrome P450 family of isoenzymes, of which CYP3A4 is the most important isoenzyme involved in the metabolism of drugs. Induction of cytochrome P450 isoenzymes by one drug can increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducing drug, plasma concentrations increase and toxicity can occur.

Conversely when one drug inhibits cytochrome P450 isoenzymes, it can decrease the metabolism of another, leading to higher plasma concentrations, resulting in an increased effect with a risk of toxicity.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. With knowledge of which isoenzymes are involved in a drug’s metabolism, it is possible to predict whether certain pharmacokinetic interactions will occur. For example, carbamazepine is a potent inducer of CYP3A4, ketoconazole is potent inhibitor of CYP3A4, and midazolam is a substrate of CYP3A4.

Carbamazepine reduces midazolam concentrations, and it is therefore likely that other drugs that are potent inducers of CYP3A4 will interact similarly with midazolam. Ketoconazole, however, increases midazolam concentrations, and it can be predicted that other drugs that are potent inhibitors of CYP3A4 will interact similarly.

**Affecting renal excretion** Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible. Changes in urinary pH can also affect the reabsorption of a small number of drugs, including methenamine.
Relative importance of interactions

Levels of severity: Most interactions have been assigned a severity; this describes the likely effect of an unmanaged interaction on the patient.

- Severe—the result may be a life-threatening event or have a permanent detrimental effect.
- Moderate—the result could cause considerable distress or partially incapacitate a patient; they are unlikely to be life-threatening or result in long-term effects.
- Mild—the result is unlikely to cause concern or incapacitate the majority of patients.
- Unknown—used for those interactions that are predicted, but there is insufficient evidence to hazard a guess at the outcome.
- Levels of evidence: Most interactions have been assigned a rating to indicate the weight of evidence behind the interaction.

Study—for interactions where the information is based on formal study including those for other drugs with same mechanism (e.g. known inducers, inhibitors, or substrates of cytochrome P450 isoenzymes or P-glycoprotein).

Anecdotal—interactions based on either a single case report or a limited number of case reports.

Appendix 1 structure

1. Drugs
   - Drugs are listed alphabetically. If a drug is a member of a drug class, all interactions for that drug will be listed under the drug class entry; in this case the drug entry provides direction to the relevant drug class where its interactions can be found.
   - Within a drug or drug class entry, interactions are listed alphabetically by the interacting drug or drug class. The interactions describe the effect that occurs, and the action to be taken, either based on manufacturer’s advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. If two drugs have a pharmacodynamic effect in addition to a pharmacokinetic interaction, a cross-reference to the relevant pharmacodynamic effect table is included at the end of the pharmacokinetic message.

2. Drug classes
   - The drugs that are members of a drug class are listed underneath the drug class entry in a blue box. Interactions for the class are then listed alphabetically by the interacting drug or drug class. If the interaction only applies to certain drugs in the class, these drugs will be shown in brackets after the drug class name.

3. Supplementary information
   - If a drug has additional important information to be considered, this is shown in a blue box underneath the drug or drug class entry. This information might be food and lifestyle advice (including smoking and alcohol consumption), relate to the pharmacology of the drug or applicability of interactions to certain routes of administration, or it might be advice about separating administration times.

4. Pharmacodynamic effects
   - Tables at the beginning of Appendix 1 cover pharmacodynamic effects. If a drug is included in one or more of these tables, this will be indicated at the top of the list of interactions for the drug or drug class. In addition to the list of interactions for a drug or drug class, these tables should always be consulted.
   - Each table describes the relevant pharmacodynamic effect and lists those drugs that are commonly associated with the effect. Concurrent use of two or more drugs from the same table is expected to increase the risk of the pharmacodynamic effect occurring. Please note these tables are not exhaustive.

TABLE 9
Drugs that prolong the QT interval

The following is a list of some drugs that prolong the QT-interval (note that this list is not exhaustive). In general, manufacturers advise that the use of two or more drugs that are associated with QT prolongation should be avoided. Increasing age, female sex, cardiac disease, and some metabolic disturbances (notably hypokalaemia) predispose to QT prolongation—concurrent use of drugs that reduce serum potassium might further increase this risk (see table of drugs that reduce serum potassium).

Drugs that are not known to prolong the QT interval but are predicted (by the manufacturer) to increase the risk of QT prolongation include: domperidone, fingolimod, graniisetron, ivabradine, metlojquzine, moizostaline, palonosetron, and intravenous pentamidin. Most manufacturers advise avoiding concurrent use with drugs that prolong the QT interval.

### TABLE 13: Drugs that cause serotonin syndrome

The following is a list of some drugs that cause serotonin syndrome (note that this list is not exhaustive). See 'Serotonin Syndrome' and 'Monoamine-Oxidase Inhibitors' under Antidepressants drugs p. 359 for more information and for specific advice on avoiding monoamine-oxidase inhibitors during and after administration of other serotonergic drugs.

### Table 16
**Drugs that increase serum potassium**
The following is a list of some drugs that increase serum potassium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyperkalaemia (hyperkalaemia is particularly notable when ACE inhibitors or angiotensin-II receptor antagonists are given with spironolactone or eplerenone).

### Table 17
**Drugs that reduce serum potassium**
The following is a list of some drugs that reduce serum potassium concentrations (note that this list is not exhaustive and that other drugs can cause hypokalaemia in overdose). Concurrent use of two or more drugs from this list might increase the risk of hypokalaemia. Hypokalaemia can increase the risk of torsade de pointes, which might be additive with the effects of drugs that prolong the QT interval (see table of drugs that prolong the QT interval). Drugs that reduce serum potassium are predicted to increase the risk of digoxin toxicity.

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

Abacavir
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abacavir. Avoid. [Moderate] Theoretical
- HIV-protease inhibitors (tipranavir) slightly decrease the exposure to abacavir. Avoid. [Severe] Study

Abatacept
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Abatacept is predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies (golimumab). Avoid. [Severe] Theoretical

Abemaciclib
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to abemaciclib. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to abemaciclib. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to abemaciclib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 967. [Severe] Study
- Aprepitant is predicted to increase the exposure to abemaciclib. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) increase the exposure to abemaciclib. [Moderate] Study
- Cobistat is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 967. [Severe] Study
- Crizotinib is predicted to increase the exposure to abemaciclib. [Moderate] Study
- Enalapril is predicted to markedly decrease the exposure to abemaciclib. Avoid. [Severe] Study
- Enalapril (tetracycline) is predicted to decrease the efﬁcacy of abemaciclib. Avoid or adjust abemaciclib dose, p. 967. [Severe] Study
- Eprosartan is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 967. [Severe] Study
- Imatinib is predicted to increase the exposure to abemaciclib. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 967. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to abemaciclib. [Moderate] Study
- Mitotane is predicted to markedly decrease the exposure to abemaciclib. Avoid. [Severe] Study
- Netupitant is predicted to increase the exposure to abemaciclib. [Moderate] Study
- Nilotinib is predicted to increase the exposure to abemaciclib. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to abemaciclib. Avoid. [Severe] Study

Abiraterone
- General information Caution with concurrent chemotherapy—safety and efﬁcacy not established.
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abiraterone. Avoid. [Severe] Study
- Abiraterone is predicted to increase the exposure to beta blockers, selective (metoprolol). [Moderate] Study
- Abiraterone is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to abiraterone. Avoid. [Severe] Study
- Mitotane is predicted to decrease the exposure to abiraterone. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to abiraterone. Avoid. [Severe] Study

Acarbose → see Table 14 p. 1378 (antidiabetic drugs)
- Acarbose decreases the concentration of digoxin. [Moderate] Study
- HIV-protease inhibitors
- Grapefruit juice
- Enzalutamide
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole)
- Abemaciclib
- Abatacept
- Mitotane
- Netupitant
- Acipollo
- HIV-protease inhibitors
- Antiepileptics
- Abacavir
- TABLE 10 p. 1377 (nephrotoxicity)
- Enalapril
- Imatinib
- Antiarrhythmics (dronedarone)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole)
- Enalapril (tetracycline)
- Calcium channel blockers (diltiazem, verapamil)
- Imatinib
- Macrolides (clarithromycin)
- Mitotane
- Netupitant
- St John’s Wort
- Abiraterone
- Acarbose → see Table 14 p. 1378 (antidiabetic drugs)
- Acarbose decreases the concentration of digoxin. [Moderate] Study
- HIV-protease inhibitors
- Grapefruit juice
- Enzalutamide
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole)
- Abemaciclib
- Abatacept
- Mitotane
- Netupitant
- Acipollo
- HIV-protease inhibitors
- Antiepileptics
- Abacavir
- TABLE 10 p. 1377 (nephrotoxicity)
Antiepileptics ▶

- **Rifampicin** are predicted to increase the exposure to **agomelatine**. (Moderate) Study

- **Quinolones** are predicted to decrease the exposure to **afatinib**. (Moderate) Study

- **Mexiletine** are predicted to increase the exposure to **agomelatine**. (Moderate) Study

- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **agomelatine**. (Moderate) Study

- **Antiepileptics (carbamazepine)** are predicted to decrease the concentration of **albendazole**. (Moderate) Study

</table>

**Agalsidase**

- **Aminoglycosides** are predicted to decrease the effects of **agalsidase**. Avoid. (Moderate) Theoretical

- **Antiarrhythmics (amiodarone)** are predicted to decrease the effects of **agalsidase**. Avoid. (Moderate) Theoretical

- **Aminoglycosides (chloroquine)** are predicted to decrease the effects of **agalsidase**. Avoid. (Moderate) Theoretical

- **Hydroxychloroquine** is predicted to decrease the effects of **agalsidase**. (Moderate) Theoretical

**Agomelatine** ▶

- **Agomelatine** is predicted to decrease the exposure to **albendazole**. (Moderate) Study

- **H₂ receptor antagonists (cimetidine)** decrease the clearance of **albendazole**. (Moderate) Study

- **HIV-protease inhibitors (ritonavir)** decrease the exposure to **albendazole**. (Moderate) Study

- **Albendazole** slightly decreases the exposure to **levamisole** and **levamisole** moderately decreases the exposure to **albendazole**. (Moderate) Study

**Alcohol (beverage)** ▶

- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **anfinsals, azoles (itraconazole, ketoconazole)**. Avoid. (Moderate) Theoretical

- **Alcohol (beverage)** causes serious, potentially fatal, CNS depression when given with **clomethiazole**. Avoid. (Severe) Study ▶ Also see **TABLE 11 p. 1377**

- **Alcohol (beverage)** in those who drink heavily potentially decreases the anticoagulant effect of **coumarins**. (Severe) Study

- **Alcohol (beverage)** (excessive consumption) potentially increases the risk of gastrointestinal side-effects when given with **dimethyl fumarate**. Avoid. (Moderate) Theoretical

- **Alcohol (beverage)** causes an extremely unpleasant systemic reaction when given with **disulfiram**. Avoid for at least 24 hours before and up to 14 days after stopping treatment. (Severe) Study

- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **griseofulvin**. (Moderate) Anecdotal

- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **levamisole**. (Moderate) Study

- **Alcohol (beverage)** (excessive consumption) potentially increases the risk of lactic acidosis when given with **metformin**. Avoid excessive alcohol consumption. (Moderate) Theoretical

- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **metronidazole**. Avoid for at least 48 hours stopping treatment. (Moderate) Study

- **Alcohol (beverage)** causes rapid release of **opioids (hydromorphone, morphine)** (from extended-release preparations). Avoid. (Severe) Study ▶ Also see **TABLE 11 p. 1377**

- **Alcohol (beverage)** in those who drink heavily causes severe liver damage when given with **paracetamol**. (Severe) Study ▶ Also see **TABLE 1 p. 1375**

- **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical **pimecrolimus**. (Moderate) Study

- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **procarbazine**. (Moderate) Anecdotal

- **Alcohol (beverage)** potentially increases the concentration of **retinoids (acitretin)**. Avoid and for 2 months after stopping treatment. (Moderate) Study

- **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical **tacrolimus**. (Moderate) Study

- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **tiadazole**. Avoid for 72 hours stopping treatment. (Moderate) Theoretical

**Alcohol (beverage)** ▶

- **Alcohol (beverage)** causes rapid release of **opioids (hydromorphone, morphine)** (from extended-release preparations). Avoid. (Severe) Study ▶ Also see **TABLE 11 p. 1377**

- **Alcohol (beverage)** causes rapid release of **opioids (hydromorphone, morphine)** (from extended-release preparations). Avoid. (Severe) Study ▶ Also see **TABLE 11 p. 1377**

- **Alcohol (beverage)** causes rapid release of **opioids (hydromorphone, morphine)** (from extended-release preparations). Avoid. (Severe) Study ▶ Also see **TABLE 11 p. 1377**

- **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical **pimecrolimus**. (Moderate) Study

- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **procarbazine**. (Moderate) Anecdotal

- **Alcohol (beverage)** potentially increases the concentration of **retinoids (acitretin)**. Avoid and for 2 months after stopping treatment. (Moderate) Study

- **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical **tacrolimus**. (Moderate) Study

- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with **tiadazole**. Avoid for 72 hours stopping treatment. (Moderate) Theoretical

**Aldosterone antagonists** ▶

- **Aldosterone antagonists** are predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 193. (Severe) Theoretical

- **Aldosterone antagonists (spironolactone)** are predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 193. (Severe) Theoretical

- **Aldosterone antagonists (dronedarone)** are predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 193. (Severe) Study

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **eplerenone**. Avoid. (Moderate) Theoretical ▶ Also see **TABLE 18 p. 1379**

- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to **eplerenone**. Adjust **eplerenone** dose, p. 193. (Severe) Study

Aldosterone antagonists (continued)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study
- Busulfan is predicted to decrease the exposure to eplerenone. Avoid or monitor. (Moderate) Study
- Aprepitant is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 193. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 193. (Severe) Study. Also see TABLE 8 p. 1376
- Cobicistat is predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study
- Crizotinib is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 193. (Severe) Study
- Eplerenone very slightly increases the exposure to digoxin. (Mild) Study
- Spironolactone increases the concentration of digoxin. Monitor and adjust dose. (Moderate) Study
- Enalapril is predicted to decrease the exposure to eplerenone. Avoid. (Moderate) Theoretical
- HIV protease inhibitors are predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study
- Imitatinib is predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study
- Eplerenone potentially increases the concentration of lithium. Avoid. (Moderate) Theoretical
- Spironolactone potentially increases the concentration of lithium. (Moderate) Study
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study
- Macrolides (erythromycin) are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 193. (Severe) Study
- Mitotane is predicted to decrease the exposure to eplerenone. Avoid. (Moderate) Theoretical
- Spironolactone is predicted to decrease the effects of mitotane. Avoid. (Severe) Avoid
- Nilotinib is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 193. (Severe) Study
- Rifampicin is predicted to decrease the exposure to eplerenone. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to slightly decrease the exposure to eplerenone. Avoid. (Moderate) Study
- Alectinib is predicted to markedly increase the exposure to eplerenone. Avoid. (Severe) Study
- Alimemazine is increased in the concentration of digoxin. Avoid. (Severe) Study
- Alkylating agents
- Anticancer drugs: busulfan is predicted to increase the risk of thromboembolism when given with busulfan. Use with caution and adjust dose. (Moderate) Theoretical
- Avoid. (Severe) Study
- Aliskiren is predicted to markedly increase the exposure to aliskiren. (Moderate) Theoretical
- Calcium channel blockers (verapamil) moderately increase the exposure to aliskiren. [Moderate] Study → Also see TABLE 8 p. 1376
- Calcitriol markedly increases the exposure to aliskiren. Avoid. (Severe) Study → Also see TABLE 16 p. 1379
- Eliglustat is predicted to increase the exposure to aliskiren. Adjust dose. (Moderate) Study
- Grapefruit juice moderately decreases the exposure to aliskiren. Avoid. (Severe) Study
- HIV protease inhibitors (ritonavir, saquinavir) are predicted to increase the exposure to aliskiren. (Moderate) Theoretical
- Lapatinib is predicted to slightly decrease the exposure to aliskiren. (Moderate) Theoretical
- Avoid. (Severe) Study
- Alkylating agents are predicted to increase the exposure to aliskiren. (Moderate) Theoretical
- Aliskiren slightly decreases the exposure to loop diuretics (furosemide). (Moderate) Study → Also see TABLE 8 p. 1376
- Macrolides (azithromycin) are predicted to increase the exposure to aliskiren. (Moderate) Theoretical
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to aliskiren. (Moderate) Study
- Mirabegron is predicted to increase the exposure to aliskiren. (Mild) Theoretical
- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to aliskiren. (Moderate) Study
- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to aliskiren. (Moderate) Study
- Pitolisant is predicted to decrease the exposure to aliskiren. (Mild) Theoretical
- Ranolazine is predicted to increase the exposure to aliskiren. (Moderate) Theoretical
- Rifampicin decreases the exposure to aliskiren. (Moderate) Study
- St John’s Wort decreases the exposure to aliskiren. (Moderate) Study
- Statins (atorvastatin) slightly moderately increase the exposure to aliskiren. (Severe) Study
- Velpatasvir is predicted to increase the exposure to aliskiren. (Severe) Study
- Vemurafenib is predicted to increase the exposure to aliskiren. (Severe) Study
- Also see TABLE 5. p. 1375 (thromboembolism), TABLE 2 p. 1375 (nephrotoxicity), TABLE 5 p. 1375 (thromboembolism)

- Bendamustine • Busulfan • Carmustine • Chlorambucil • Cyclophosphamide • Dacarbazine • Estramustine • Ifosfamide • Lomustine • Melphan • Temozolomide • Thiopeta • Tresufan
- Antacids are predicted to decrease the absorption of estramustine. Avoid. (Moderate) Study
- Antifungals, azoles (itraconazole) are predicted to increase the exposure to cyclophosphamide. (Moderate) Study
- Antifungals, azoles (itraconazole) increase the risk of busulfan toxicity when given with busulfan. Monitor and adjust dose. (Moderate) Study
- Use with caution and adjust dose. (Moderate) Theoretical
- Alitretinoin is predicted to see retinoids
- Alkylating agents → see TABLE 15 p. 1378 (myelosuppression), TABLE 2 p. 1375 (nephrotoxicity), TABLE 5 p. 1375 (thromboembolism)

- Anticancer drugs: busulfan is predicted to increase the risk of thromboembolism when given with busulfan. Use with caution and adjust dose. (Moderate) Theoretical
- Aprepitant is predicted to increase the exposure to ifosfamide. (Severe) Theoretical
- Prophylactic and prophylactic vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylating agents. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- Mitotane is predicted to increase the exposure to ifosfamide. (Severe) Study
- Netupitant very slightly increases the exposure to cyclophosphamide. (Moderate) Study
- Paracetamol is predicted to decrease the clearance of busulfan. (Moderate) Theoretical
- Oral calcium salts decrease the absorption of estramustine. (Severe) Study
- Fosaprepitant is predicted to increase the exposure to ifosfamide. (Severe) Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylating agents. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- Metronidazole increases the risk of toxicity when given with busulfan. (Severe) Study
- Netupitant very slightly increases the exposure to cyclophosphamide. (Moderate) Study
- Paracetamol is predicted to decrease the clearance of busulfan. (Moderate) Theoretical

Interactions | Appendix 1

www.getintopharma.com
Alkylating agents – Alprazolam 1383

- Cyclophosphamide (high-dose) increases the risk of toxicity when given with pentostatin. Avoid. (Severe) Anecdotal → Also see TABLE 15 p. 1378 → Also see TABLE 5 p. 1375
- Rolapitant is predicted to increase the exposure to bendamustine. Avoid or monitor. (Moderate) Study
- Cyclophosphamide increases the risk of prolonged neuromuscular blockade when given with suxamethonium. (Moderate) Study

**Allopurinol**

- ACE inhibitors are predicted to increase the risk of hypersensitivity and haematological reactions when given with allopurinol. (Severe) Anecdotal
- Allopurinol potentially increases the risk of haematological toxicity when given with azathioprine. Adjust azathioprine dose. p. 836. (Severe) Study
- Allopurinol is predicted to decrease the effects of capetitabine. Avoid. (Severe) Study
- Allopurinol moderately increases the exposure to didanosine. Avoid. (Severe) Study
- Allopurinol potentially increases the risk of haematological toxicity when given with mercapturine. Adjust mercapturine dose, p. 912. (Severe) Study
- Allopurinol increases the risk of skin rash when given with penicillin (amoxicillin, ampicillin). (Moderate) Study
- Allopurinol is predicted to increase the risk of hyperuricaemia when given with pyrazinamide. (Moderate) Theoretical
- Thiazide diuretics are predicted to increase the risk of hypersensitivity reactions when given with allopurinol. (Severe) Theoretical

**Almotriptan**

→ Also see TABLE 13 p. 1378 (serotonin syndrome)
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to almotriptan. (Mild) Study
- Cobicistat increases the exposure to almotriptan. (Mild) Study
- Almotriptan is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after almotriptan. (Severe) Theoretical
- HIV-protease inhibitors increase the exposure to almotriptan. (Mild) Study
- Almotriptan is predicted to increase the exposure to almotriptan. (Mild) Study
- Macrolides (clarithromycin) increase the exposure to almotriptan. (Mild) Study

**Aloilgptin**

→ Also see TABLE 14 p. 1378 (antidiabetic drugs)

**Alpha blockers**

→ Also see TABLE 7 p. 1376 (first-dose hypotension), TABLE 8 p. 1376 (hypotension)
- Alfuzosin - doxazosin - indoramin - prazosin - tamsulosin - terazosin

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to tamsulosin. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, posaconazole) are predicted to increase the exposure to tamsulosin. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to doxazosin. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. (Moderate) Study

- Aprepitant is predicted to increase the exposure to tamsulosin. (Moderate) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tamsulosin. (Moderate) Theoretical → Also see TABLE 8 p. 1376
- Cobicistat is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. (Moderate) Study
- Cobicistat is predicted to increase the exposure to doxazosin. (Moderate) Study
- Crizotinib is predicted to increase the exposure to tamsulosin. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to doxazosin. (Moderate) Study

- Idelalisib is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. (Moderate) Study
- Idelalisib is predicted to increase the exposure to doxazosin. (Moderate) Study
- Idelalisib is predicted to increase the exposure to tamsulosin. (Moderate) Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to doxazosin. (Moderate) Study
- Macrolides (erythromycin) are predicted to increase the exposure to tamsulosin. (Moderate) Theoretical
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. (Moderate) Study
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the effects of indoramini. Avoid. (Severe) Theoretical → Also see TABLE 8 p. 1376
- Netupitant is predicted to increase the exposure to tamsulosin. (Moderate) Theoretical
- Nilotinib is predicted to increase the exposure to tamsulosin. (Moderate) Theoretical
- Alpha blockers cause significant hypertensive effects when given with phosphodiesterase type-5 inhibitors. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. (Severe) Study → Also see TABLE 8 p. 1378
- Ribociclib (high-dose) is predicted to increase the exposure to alfuzosin. Avoid. (Moderate) Theoretical

**Alpha tocopherol**

→ Also see vitamin E substances

**Alpha tocopheryl acetate**

→ Also see vitamin E substances

**Alprazolam**

→ Also see TABLE 11 p. 1377 (CNS depressant effects)
- Antiarhythmics (dronedarone) are predicted to increase the exposure to alprazolam. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to alprazolam. Adjust dose. (Moderate) Theoretical → Also see TABLE 11 p. 1377
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to alprazolam. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) moderately increase the exposure to alprazolam. Avoid. (Moderate) Study
- Antifungals, azoles (miconazole) are predicted to increase the exposure to alprazolam. Use with caution and adjust dose. (Moderate) Study
- Aprepitant is predicted to increase the exposure to alprazolam. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to alprazolam. (Severe) Study
- Cobicistat moderately increases the exposure to alprazolam. Avoid. (Moderate) Study
- Crizotinib is predicted to increase the exposure to alprazolam. (Severe) Study
- Enalaprilate is predicted to decrease the exposure to alprazolam. Adjust dose. (Moderate) Theoretical
- Fosaprepitant is predicted to increase the exposure to alprazolam. (Moderate) Study
- HIV-protease inhibitors moderately increase the exposure to alprazolam. Avoid. (Moderate) Study
- Idelalisib moderately increases the exposure to alprazolam. Avoid. (Moderate) Study
- Lomitapide is predicted to increase the exposure to alprazolam. (Severe) Study
- Macrolides (clarithromycin) moderately increase the exposure to alprazolam. Avoid. (Moderate) Study
- Macrolides (erythromycin) are predicted to increase the exposure to alprazolam. (Severe) Study
- Mitotane is predicted to decrease the exposure to alprazolam. Adjust dose. (Moderate) Theoretical
- Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to alprazolam. Monitor and adjust dose. (Moderate) Theoretical

Ataluren
▶ Antifungals, azoles
Amiloride
Amikacin
→ SSRIs
Phenothiazines
▶ Monoamine-oxidase B inhibitors
▶ HIV-protease inhibitors
Amfetamines
Amfetamines
→ Ambrisentan
→ Amantadine
▶ St John
▶ SSRIs
▶ Rifampicin
Alprazolam

Theoretical
is predicted to increase the risk of a hypertensive crisis when given with intravenous
is predicted to increase the risk of nephrotoxicity when given with aminoglycosides. Avoid. [Moderate] Study
Also see TABLE 17 p. 1379 (reduced serum potassium)
Table of Contents
FOOD AND LIFESTYLE
Smoking can increase aminophylline clearance and increased doses of aminophylline are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.

Aciclovir increases the exposure to aminophylline. Monitor and adjust dose. [Severe] Anecdotal
Aminophylline is predicted to decrease the efficacy of antiarrhythmics (adenosine). Separate administration by 24 hours. [Mild] Theoretical
Antiepileptics (fosphenytoin) are predicted to decrease the exposure to aminophylline. Adjust dose. [Moderate] Study
Antiepileptics (phenobarbital) are predicted to decrease the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
Antiepileptics (primidone) are predicted to increase the clearance of aminophylline. Adjust dose. [Moderate] Theoretical
Beta blockers, non-selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. [Severe] Theoretical
Combined hormonal contraceptives are predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
Aminophylline increases the risk of agitation when given with amfetamines. [Severe] Theoretical
Esketamine is predicted to increase the risk of seizures when given with aminophylline. Avoid. [Severe] Theoretical
H₂ receptor antagonists (cimetidine) increase the concentration of aminophylline. Adjust dose. [Severe] Study
HIV-protease inhibitors (ritonavir) decrease the exposure to aminophylline. Adjust dose. [Moderate] Study
Interferons are predicted to slightly increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
Iron chelators (deferasirox) are predicted to increase the exposure to aminophylline. Avoid. [Moderate] Theoretical
Isoniazid is predicted to affect the clearance of aminophylline. [Severe] Theoretical
Leflunomide decreases the exposure to aminophylline. Adjust dose. [Moderate] Study
Aminophylline is predicted to decrease the concentration of lithium. [Moderate] Theoretical
Macrolides (azithromycin) are predicted to increase the exposure to aminophylline. [Moderate] Theoretical
Macrolides (clarithromycin) are predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
Aminophylline is predicted to decrease the exposure to macrolides (erythromycin). Adjust dose. [Severe] Study
Methotrexate is predicted to decrease the clearance of aminophylline. [Moderate] Theoretical
Mexiletine is predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
Monoclonal antibodies (blinatumomab) are predicted to transiently increase the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
Monoclonal antibodies (carlumab) potentially affect the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
- Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
- Pentoxifylline is predicted to increase the concentration of aminophylline. Use with caution or avoid. [Severe] Theoretical
- Quinolones (ciprofloxacin) are predicted to increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical
- Rifampicin decreases the exposure to aminophylline. Adjust dose. [Moderate] Study
- Aminophylline is predicted to slightly increase the exposure to aminophylline. Avoid. [Moderate] Theoretical
- Rucaparib is predicted to increase the exposure to aminophylline. Monitor and adjust dose. [Moderate] Study
- SSRIs (fluvoxamine) moderately to markedly increase the exposure to aminophylline. Avoid. [Severe] Study
- ST John’s Wort is predicted to decrease the concentration of aminophylline. [Severe] Theoretical
- Sympathomimetics, vasoconstrictor (ephedrine) increase the risk of side-effects when given with aminophylline. Avoid in children. [Moderate] Study
- Teriflunomide decreases the exposure to aminophylline. Adjust dose. [Moderate] Study
- Valaciclovir is predicted to increase the exposure to aminophylline. [Severe] Anecdotal
- Aminosalicylic acid
  - Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Theoretical
  - Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with dapsone. [Severe] Theoretical
- Amiodarone → see antiarhythmic
- Amsulpride → see TABLE 9 p. 1377 (QT-interval prolongation), TABLE 11 p. 1377 (CNS depressant effects)
- Amisulpride is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 1377
- Amisulpride is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical
- Amitriptyline → see tricyclic antidepressants
- Amiodipine → see calcium channel blockers
- Amoxicillin → see penicillins
- Amphotericin → see TABLE 2 p. 1275 (nephrotoxicity), TABLE 17 p. 1379 (reduced serum potassium)
- Amphotericin increases the risk of toxicity when given with flucytosine. [Severe] Study
- Micafungin slightly increases the exposure to amphotericin. Avoid or monitor toxicity. [Moderate] Study
- Sodium stibogluconate increases the risk of cardiovascular side-effects when given with amphotericin. Separate administration by 14 days. [Severe] Study
- Ampicillin → see penicillins
- Amsacrine → see TABLE 15 p. 1378 (myelosuppression)
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Amsacrine increases the risk of cardiacdepression when given with antiarrhythmics. [Severe] Theoretical → Also see TABLE 11 p. 1377
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 11 p. 1377
- Antiepileptics (phenytoin) are predicted to decrease the exposure to ropivacaine. [Moderate] Theoretical
- Antimalarials (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. [Severe] Theoretical
- Dapsone is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. [Severe] Theoretical
- HIV- protease inhibitors (ritonavir) are predicted to decrease the exposure to rifampicin. [Moderate] Theoretical
- Leflunomide is predicted to decrease the exposure to ropivacaine. [Moderate] Theoretical
- Metoclopramide is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Avoid. [Severe] Theoretical
- Nitrates are predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Avoid. [Severe] Theoretical
- Nitrofurantoin is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. [Severe] Theoretical
- Paracetamol is predicted to increase the exposure to aminophylline. [Severe] Study
- Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. [Severe] Theoretical
- SSRIs (fluvoxamine) decrease the clearance of ropivacaine. Avoid prolonged use. [Moderate] Study
- Sulphonamides potentially increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. [Severe] Anecdotal
- Teriflunomide is predicted to decrease the exposure to ropivacaine. [Moderate] Theoretical
- Anagrelide → see TABLE 9 p. 1377 (QT-interval prolongation), TABLE 4 p. 1375 (antiplatelet effects)
- Combined hormonal contraceptives are predicted to increase the exposure to anagrelide. [Moderate] Theoretical
- Mescaline is predicted to increase the exposure to anagrelide. [Moderate] Theoretical
- Quinolones (ciprofloxacin) are predicted to increase the exposure to anagrelide. [Moderate] Theoretical
- SSRIs (fluvoxamine) are predicted to increase the exposure to anagrelide. [Moderate] Theoretical
- Anagrelide is predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Avoid. [Severe] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anakinra. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies (golimumab). Avoid. [Severe] Theoretical
- Angiotensin-II receptor antagonists → see TABLE 7 p. 1376 (first-dose hypotension), TABLE 8 p. 1376 (hypotension), TABLE 16 p. 1379 (increased serum potassium)
  - azilsartan - candesartan - eprosartan - irbesartan - losartan - olmesartan - telmisartan - valsartan
- Angiotensin-II receptor antagonists increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients, p. 179. [Severe] Study → Also see TABLE 8 p. 1376 → Also see TABLE 16 p. 1379
- Angiotensin-II receptor antagonists potentially increase the concentration of lithium. Monitor concentration and adjust dose. [Severe] Anecdotal

ROUTE-SPECIFIC INFORMATION
- Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
- Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. [Severe] Theoretical
- Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. [Severe] Theoretical
- Antiepileptics (fossphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinemia when given with topical prilocaine. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 11 p. 1377
Antacids

Aluminium hydroxide - magnesium carbonate - magnesium trisilicate

**SEPARATION OF ADMINISTRATION** Antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- **Antacids** are predicted to decrease the absorption of alkylating agents (e.g., *estramustine*). Avoid. [Moderate] Study
- **Antacids** decrease the absorption of antiepileptics (e.g., *Gabapentin*). Gabapentin should be taken 2 hours after antacids. [Moderate] Study
- **Antacids** decrease the absorption of antifungals, azoles (e.g., *itraconazole*) (capsule). **Antacids** should be taken 1 hour before or 2 hours after *itraconazole*. [Moderate] Study
- **Antacids** decrease the absorption of antifungals, azoles (e.g., *ketoconazole*). Separate administration by at least 2 hours. [Moderate] Study
- **Antacids** decrease the absorption of aspirin (high-dose). [Moderate] Study
- **Antacids** decrease the exposure to **bictegravir**. Separate administration by at least 2 hours. [Moderate] Study
- **Antacids** decrease the absorption of biphosphonates (e.g., *alendronic acid*). Alendronic acid should be taken at least 30 minutes before antacids. [Moderate] Study
- **Antacids** are predicted to decrease the absorption of biphosphonates (e.g., *ibandronic acid*). Avoid antacids for at least 6 hours before or 1 hour after *ibandronic acid*. [Moderate] Study
- **Antacids** decrease the absorption of biphosphonates (e.g., *risedronate*). Separate administration by at least 2 hours. [Moderate] Study
- **Antacids** decrease the absorption of biphosphonates (e.g., *sodium clodronate*). Avoid antacids for 2 hours before or 1 hour after *sodium clodronate*. [Moderate] Study
- **Antacids** are predicted to decrease the absorption of bosutinib. Bosutinib should be taken at least 12 hours before antacids. [Moderate] Study
- **Antacids** are predicted to decrease the absorption of ceritinib. Separate administration by 2 hours. [Moderate] Study
- **Antacids** are predicted to decrease the absorption of chenodeoxycholic acid. [Moderate] Study
- **Antacids** are predicted to decrease the absorption of cholic acid. Separate administration by 3 hours. [Mild] Study
- **Antacids** are predicted to decrease the absorption of corticosteroids (e.g., *deflazacort*). Separate administration by 2 hours. [Moderate] Study
- **Antacids** decrease the absorption of corticosteroids (e.g., *dexamethasone*). Separate administration by at least 2 hours. [Moderate] Study
- **Aluminium hydroxide** increases the risk of blocked enteral or nasogastric tubes when given with *enteral feeds*. [Moderate] Study
- **Antacids** are predicted to decrease the absorption of *erlotinib*. **Antacids** should be taken 4 hours before or 2 hours after *erlotinib*. (Moderate) Theoretical
- **Antacids** slightly to moderately decrease the exposure to *fibrates* (e.g., *gemfibrozil*). (Moderate) Study
- **Antacids** are predicted to slightly decrease the exposure to *gefitinib*. (Severe) Theoretical
- **Antacids** are predicted to decrease the absorption of HIV-protease inhibitors (e.g., *atazanavir*). Atazanavir should be taken 2 hours before or 1 hour after antacids. (Severe) Theoretical
- **Antacids** are predicted to decrease the absorption of HIV-protease inhibitors (e.g., *tipranavir*). Separate administration by 2 hours. (Moderate) Study
- **Antacids** decrease the absorption of hydroxychloroquine. Separate administration by at least 4 hours. (Moderate) Study
- **Antacids** decrease the absorption of *iron (oral)*. Iron (oral) should be taken 1 hour before or 2 hours after antacids. (Moderate) Study
- **Antacids** decrease the absorption of *nitrofurantoin*. Avoid. (Moderate) Theoretical
- **Antacids** decrease the absorption of nitrofurantoin. Avoid. (Moderate) Theoretical
- **Antacids** are predicted to decrease the absorption of *pazopanib*. Pazopanib should be taken 1 hour before or 2 hours after antacids. (Moderate) Theoretical
- **Antacids** decrease the absorption of *penicillamine*. Separate administration by 2 hours. (Mild) Study
- **Antacids** decrease the absorption of *phenothiazines*. (Moderate) Anecdotal
- **Antacids** increase the risk of metabolic alkalosis when given with *polystyrene sulfonate*. (Severe) Anecdotal
- **Antacids** decrease the absorption of *quinoles*. Quinolones should be taken 2 hours before or 4 hours after antacids. (Moderate) Study
- **Antacids** slightly decrease the exposure to *raltegravir*. Avoid. (Moderate) Study
- **Antacids** decrease the absorption of *rifampicin*. Rifampicin should be taken 1 hour before antacids. (Moderate) Study
- **Antacids** are predicted to decrease the exposure to *rilpivirine*. Antacids should be taken 2 hours before or 4 hours after *rilpivirine*. (Severe) Theoretical
- **Antacids** slightly decrease the exposure to *riociguat*. Antacids should be taken 2 hours before or 1 hour after *riociguat*. (Mild) Study
- **Antacids** moderately decrease the absorption of *statins* (e.g., *rosuvastatin*). Separate administration by 2 hours. (Moderate) Study
- **Antacids** decrease the absorption of *sulpiride*. Separate administration by 2 hours. (Moderate) Study
- **Antacids** decrease the absorption of *tetracyclines*. Separate administration by 2 to 3 hours. (Moderate) Study
- **Antacids** are predicted to decrease the absorption of *thyroid hormones* (e.g., *levothyroxine*). Separate administration by at least 4 hours. (Moderate) Anecdotal
- **Antacids** are predicted to decrease the absorption of *urodeoxycholic acid*. Separate administration by 2 hours. (Moderate) Theoretical
- **Antacids** are predicted to decrease the concentration of *velpatasvir*. Separate administration by 4 hours. (Moderate) Theoretical

**Antazoline** see anti-asthmatics, sedating

**Anthrycines** see TABLE 15 p. 1378 (myelosuppression), TABLE 5 p. 1375 (thromboembolism)
Dronedarone is predicted to increase the exposure to abemaciclib. (Moderate) Study

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to aflatin. Separate administration is recommended after 12 hours. (Moderate) Study

Amiodarone is predicted to decrease the effects of agalsidase. Avoid. (Moderate) Theoretical

Amiodarone is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 193. (Severe) Theoretical

Dronedarone is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 193. (Severe) Study

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to allekiron. (Severe) Study

Dronedarone is predicted to increase the exposure to alpha blockers (tamsulosin). (Moderate) Theoretical

Dronedarone is predicted to increase the exposure to alprazolam. (Severe) Study

Anaesthetics, local are predicted to increase the risk of cardiovascular side-effects when given with antiarrhythmics. (Severe) Theoretical → Also see TABLE 11 p. 1377

Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Use with caution or avoid. (Severe) Study

Propafenone increases the risk of cardiovascular side-effects when given with beta blockers, non-selective (propranolol). Use with caution or avoid. (Severe) Study
Antiarrhythmics (continued)

- Propafenone is predicted to increase the exposure to beta blockers, non-selective (timolol) and beta blockers, non-selective (timolol) are predicted to increase the risk of cardiodepression when given with propafenone. **(Severe) Anecdotal**

- Antiarrhythmics (amiodarone, diclopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective. Use with caution or avoid. **(Severe) Study** → Also see TABLE 6 p. 1276

- Propafenone is predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective (acebutolol, atenolol, betaaxolol, bisoprolol, celiprolol, esmolol). Use with caution or avoid. **(Severe) Study**

- Propafenone is predicted to increase the exposure to beta blockers, selective (metoprolol). **(Moderate) Study**

- Dronedarone is predicted to increase the exposure to bosutinib. Avoid or adjust dose. **(Severe) Theoretical** → Also see TABLE 9 p. 1377

- Dronedarone is predicted to increase the exposure to buspirone. Use with caution and adjust dose. **(Moderate) Study**

- Dronedarone is predicted to increase the exposure to cabozantinib. **(Moderate) Theoretical** → Also see TABLE 9 p. 1377

- Caffeine citrate decreases the efficacy of adenosine. Separate administration by 24 hours. **(SEDA) Study**

- Calcium channel blockers (diltiazem, verapamil) increase the exposure to d haze and d lawyers and increase the risk to calcium channel blockers (diltiazem, verapamil). **(Moderate) Study**

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to propafenone. Monitor and adjust dose. **(Moderate) Study**

- Dronedarone is predicted to increase the risk of cardiodepression when given with calcium channel blockers. **(Severe) Theoretical**

- Dronedarone is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **(Moderate) Study**

- Amiodarone is predicted to increase the risk of cardiodepression when given with calcium channel blockers (diltiazem, verapamil). Avoid. **(Severe) Theoretical** → Also see TABLE 6 p. 1376

- Disopyramide is predicted to increase the risk of cardiodepression when given with calcium channel blockers (verapamil). **(Severe) Theoretical**

- Dronedarone is predicted to increase the exposure to cariprazine. Avoid. **(Severe) Study**

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to ceritinib. **(Moderate) Theoretical** → Also see TABLE 9 p. 1377

- Amiodarone increases the concentration of ciclosporin. Monitor concentration and adjust dose. **(Severe) Study**

- Dronedarone is predicted to increase the concentration of ciclosporin. **(Severe) Study**

- Cobicitaz potentially increases the concentration of antiarrhythmics (amiodarone, disopyramide, flecainide, lidocaine). **(Severe) Theoretical**

- Cobicitaz very markedly increases the exposure to propafenone. Avoid. **(Severe) Study**

- Dronedarone is predicted to increase the exposure to propafenone. Monitor and adjust dose. **(Severe) Study**

- Dronedarone is predicted to increase the exposure to cobimetinib. **(Severe) Theoretical**

- Dronedarone is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4, p. 1120. **(Severe) Study**

- Dronedarone is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. **(Moderate) Study**

- Amiodarone increases the anticoagulant effect of coumarins. **(Severe) Study**

- Propafenone increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. **(Moderate) Study**

- Crizotinib is predicted to increase the exposure to propafenone. Monitor and adjust dose. **(Moderate) Study**

- Amiodarone increases the exposure to dabigatran. Adjust dabigatran dose, p. 136. **(Moderate) Study**

- Dronedarone slightly increases the exposure to dabigatran. Avoid. **(Severe) Study**

- Dronedarone is predicted to slightly increase the exposure to darifenacin. **(Moderate) Study**

- Darifenacin is predicted to increase the concentration of flecainide. **(Moderate) Theoretical**

- Dronedarone is predicted to increase the exposure to dasatinib. **(Severe) Study** → Also see TABLE 9 p. 1377

- Antiarrhythmics (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust digoxin dose, p. 109. **(Severe) Study** → Also see TABLE 6 p. 1376

- Propafenone increases the concentration of digoxin. Monitor and adjust dose. **(Severe) Study**

- Dipyr idam ole increases the exposure to adenosine. Avoid or adjust dose. **(Severe) Study**

- Dronedarone increases the risk of QT-prolongation when given with domperidone. Avoid. **(Severe) Study**

- Dronedarone is predicted to increase the exposure to dopamine receptor agonists ( bromocriptine). **(Severe) Theoretical**

- Dronedarone is predicted to increase the concentration of dopamine receptor agonists (cabergoline). **(Severe) Anecdotal**

- Dronedarone is predicted to moderately increase the exposure to dutasteride. **(Mild) Study**

- Amiodarone slightly increases the exposure to edoxaban. **(Severe) Study**

- Dronedarone slightly increases the exposure to edoxaban. Adjust edoxaban dose, p. 126. **(Severe) Study**

- Efavirenz is predicted to decrease the exposure to dronedarone. **(Severe) Theoretical** → Also see TABLE 9 p. 1377

- Antiarrhythmics (dronedarone, propafenone) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. **(Severe) Study**

- Dronedarone is predicted to moderately increase the exposure to encorafenib. **(Moderate) Study** → Also see TABLE 9 p. 1377

- Enzalutamide is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. **(Severe) Study**

- Enzalutamide is predicted to decrease the efficacy of propafenone. **(Moderate) Study**

- Dronedarone is predicted to increase the risk of ergotism when given with ergometrine. **(Severe) Theoretical**

- Dronedarone is predicted to increase the risk of ergotism when given with ergotamine. **(Severe) Theoretical**

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to ergotism. **(Moderate) Theoretical**

- Dronedarone is predicted to increase the concentration of everolimus. Avoid or adjust dose. **(Moderate) Study**

- Dronedarone is predicted to increase the exposure to fostoterodine. Adjust fostoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 777. **(SEDA) Study**

- Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to fidaxomicin. Avoid. **(Moderate) Study**

- Dronedarone is predicted to increase the exposure to gefitinib. **(Moderate) Theoretical**

- Dronedarone potentially increases the exposure to glecaprevir. **(Moderate) Theoretical**

- Grapefruit juice increases the exposure to amiodarone. Avoid. **(Moderate) Study**

- Grapefruit juice moderately increases the exposure to dronedarone. Avoid. **(Severe) Study**
Grapefruit juice increases the exposure to propafenone. Monitor and adjust dose. Moderate Study

Dronedarone is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 352. Moderate Theoretical

H₂ receptor antagonists (cimetidine) increase the exposure to amiodarone. Moderate Study

H₂ receptor antagonists (cimetidine) slightly increase the exposure to flecainide. Monitor and adjust dose. Mild Study

H₂ receptor antagonists (cimetidine) are predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Theoretical

HIV-protease inhibitors are predicted to increase the exposure to amiodarone. Avoid. Severe Theoretical

HIV-protease inhibitors are predicted to increase the exposure to disopyramide. Severe Theoretical

HIV-protease inhibitors very markedly increase the exposure to dronedarone. Avoid. Severe Study

HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to flecainide. Avoid or monitor side effects. Severe Theoretical

HIV-protease inhibitors are predicted to increase the exposure to lidoctaine. Avoid. Severe Study

HIV-protease inhibitors are predicted to increase the exposure to amiodarone. Avoid. Moderate Theoretical

Idelalisib is predicted to increase the exposure to ibritunib. Adjust ibritunib dose, p. 983. Theoretical

Dronedarone is predicted to increase the exposure to ibritunib. Adjust ibritunib dose with moderate inhibitors of CYP3A4, p. 983. Study

Idelalisib is predicted to increase the exposure to amiodarone. Avoid. Moderate Theoretical

Idelalisib very markedly increases the exposure to dronedarone. Avoid. Severe Study

Idelalisib is predicted to increase the exposure to propafenone. Monitor and adjust dose. Severe Study

Imatinib is predicted to increase the exposure to propafenone. Monitor and adjust dose. Severe Study

Imatinib is predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Study

Dronedarone is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 211. Severe Theoretical

Dronedarone is predicted to increase the exposure to ivacator. Adjust ivacator dose, p. 293 or tezacator with ivacator dose, p. 295 dose with moderate inhibitors of CYP3A4. Study

Dronedarone is predicted to increase the exposure to lapatinib. Moderate Study

Leidenivir increases the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. Severe Anecdotal

Letermovir is predicted to increase the concentration of amiodarone. Moderate Theoretical

Amiodarone is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical

Dronedarone is predicted to increase the exposure to lomitapide. Avoid. Moderate Theoretical

Dronedarone is predicted to increase the exposure to loperamide. Severe Theoretical

Dronedarone is predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. Moderate Study

Macrolides (clarithromycin) very markedly increase the exposure to dronedarone. Avoid. Severe Study

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to lidoctaine. Moderate Theoretical

Macrolides (erythromycin) are predicted to moderately increase the exposure to dronedarone. Avoid. Severe Theoretical

Macrolides (erythromycin) are predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Study

Mexitiline increases the risk of torsade de pointes when given with antiarrhythmics. Avoid. Severe Theoretical

Dronedarone is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. Severe Study

Dronedarone is predicted to increase the exposure to midostaurin. Moderate Theoretical

Mitotane is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. Severe Study

Mitotane is predicted to decrease the efficacy of propafenone. Moderate Study

Dronedarone increases the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. Moderate Study

Dronedarone is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. Moderate Study

Netupitant is predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Study

Nevirapine is predicted to decrease the exposure to dronedarone. Severe Theoretical

Nilotinib is predicted to increase the exposure to propafenone. Monitor and adjust dose. Moderate Study

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to nintedanib. Moderate Study

NSAIDs (celecoxib) are predicted to increase the exposure to antiarrhythmics (flecainide, propafenone). Monitor and adjust dose. Moderate Theoretical

Dronedarone is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. Moderate Theoretical

Dronedarone is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. Moderate Study

Amiodarone is predicted to increase the concentration of opioids (fentanyl). Moderate Theoretical

Dronedarone is predicted to increase the exposure to oxybutynin. Mild Theoretical

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to panobinostat. Adjust dose. Moderate Theoretical

Dronedarone is predicted to increase the exposure to paxopinib. Moderate Theoretical

Propafenone is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. Moderate Theoretical

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 812. Moderate Theoretical

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. Moderate Study

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Severe Theoretical

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. Moderate Theoretical

Amiodarone is predicted to increase the exposure to piprentasvir. Moderate Theoretical

Dronedarone is predicted to increase the exposure to pimozide. Avoid. Severe Theoretical

Dronedarone is predicted to increase the exposure to guetiapine. Avoid. Moderate Study

Quinolones (ciprofloxacin) slightly increase the exposure to lidocaine. Mild Study

Dronedarone is predicted to increase the exposure to ranolazine. Severe Study

Dronedarone is predicted to increase the exposure to ranolazine. Severe Study

www.getintopharma.com
Antiarrhythmics (continued)

- **Amiodarone** is predicted to increase the exposure to retinoids (all-transretinol). Adjust **all-transretinol** dose, p. 1262. [Moderate] Theoretical
- **Ribocilb** (high-dose) is predicted to increase the exposure to amiodarone. Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 1377
- **Dronedarone** is predicted to increase the exposure to **amiodarone**. Avoid. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the efficacy of **propafenone**. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to **rifampicin**. Avoid. [Moderate] Theoretical
- **Amiodarone** is predicted to increase the concentration of sofosbuvir. Avoid. [Moderate] Theoretical
- **Dronedarone** increases the concentration of sirolimus. [Severe] Anecdotal
- **Dronedarone** is predicted to increase the exposure to simvastatin. Adjust dose, p. 482. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the risk of rhabdomyolysis when given with amiodarone. Refer to specialist literature. [Severe] Anecdotal
- **Sofosbuvir** is predicted to increase the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. [Severe] Anecdotal
- **Dronedarone** is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Moderate] Study
- **Amiodarone** is predicted to increase the exposure to statins (fluvastatin). [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to statins (rosuvastatin). Adjust dose. [Severe] Study
- **Dronedarone** increases the risk of rhabdomyolysis when given with statins (simvastatin). Adjust simvastatin dose, p. 205. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 205. [Severe] Study
- **Amiodarone** is predicted to increase the exposure to sulfonylures. Use with caution and adjust dose. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 9 p. 1377
- **Dronedarone** is predicted to increase the concentration of tacrolimus. [Severe] Anecdotal
- **Dronedarone** is predicted to increase the concentration of tacrolimus. [Severe] Anecdotal
- **Dronedarone** is predicted to increase the concentration of teixobactin. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to tezacafutor. Adjust tezacafutor with vacafoot p. 295 dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Theophylline** decreases the efficacy of adenosine. Separate administration by 24 hours. [Mild] Study
- **Amiodarone** is predicted to increase the risk of thyroid dysfunction when given with thyroid hormones. Avoid. [Moderate] Study
- **Amiodarone** is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- **Dronedarone** given with a potent CYP3C19 inhibitor is predicted to increase the exposure to tofacitinib. Avoid tofacitinib dose, p. 1105. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4, p. 664. [Moderate] Study
- **Amiodarone** and dronedarone are predicted to increase the exposure to topotecan. [Severe] Study
- **Amiodarone** and dronedarone are predicted to increase the concentration of trametinib. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to trazodone. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to tricyclic antidepressants. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1377
- **Dronedarone** is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- **Amiodarone** is predicted to increase the concentration of velpatasvir. Avoid or monitor. [Moderate] Theoretical
- **Amiodarone** is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 9 p. 1377
- **Dronedarone** is predicted to increase the exposure to donepezil. [Severe] Study
- **Amiodarone** and dronedarone are predicted to increase the exposure to donepezil. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to donepezil. [Moderate] Study
- **Anticholinesterases, centrally acting** (bradycardia) → see TABLE 9 p. 1376

**donepezil** - **galantamine** - **rivastigmine**

- **Antiarrhythmics** (amiodarone, dronedarone) increase the risk of bradycardia when given with anticholinesterases, centrally acting. [Moderate] Anecdotal → Also see TABLE 6 p. 1376
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to donepezil. [Mild] Study
- **Antifungals**, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with beta blockers, non-selective. [Moderate] Anecdotal → Also see TABLE 6 p. 1376
- **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with beta blockers, selective. [Moderate] Anecdotal → Also see TABLE 6 p. 1376
- **Buproprion** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Calcium channel blockers** (diltiazem, verapamil) increase the risk of bradycardia when given with anticholinesterases, centrally acting. [Moderate] Anecdotal → Also see TABLE 6 p. 1376
- **Cinacalcet** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to donepezil. [Mild] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Idealisib** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study

www.getintopharma.com
Anticholinesterases, centrally acting – Antiepileptics 1391

- Macrolides (clarithromycin) are predicted to increase the exposure to galantamine. Monitor and adjust dose. (Moderate) Study
- Mitotane is predicted to decrease the exposure to donepezil. (MED) Study
- Anticholinesterases, centrally acting are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. (Moderate) Theoretical → Also see TABLE 6 p. 1376
- Rifampicin is predicted to decrease the exposure to donepezil. (MED) Study
- SSRI (fluoxetine, paroxetine) are predicted to increase the exposure to galantamine. Monitor and adjust dose. (Moderate) Study
- Anticholinesterases, centrally acting increase the effects of suxamethonium. (Moderate) Theoretical
- Terbutaline is predicted to increase the exposure to galantamine. Monitor and adjust dose. (Moderate) Study

Antiepileptics → see TABLE 1 p. 1375 (hepatotoxicity), TABLE 18 p. 1379 (hyponatraemia), TABLE 15 p. 1378 (myelosuppression), TABLE 12 p. 1378 (peripheral neuropathy), TABLE 11 p. 1377 (CNS depressant effects)

brivaracetam • carbamazepine • eslicarbazepine • ethosuximide • fosphenytoin • gabapentin • lacosamide • lamotrigine • levetiracetam • oxcarbazepine • paraldehyde • perampanel • phenobarbital • phenytoin • pregabaline • primidone • retigabine • rufinamide • stiripentol • tiagabine • topiramate • valproate • vigabatrin • zonisamide

FOOD AND LIFESTYLE Avoid taking milk, dairy products, carbonated drinks, fruit juices, or caffeine-containing food and drinks at the same time as stiripentol.

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abacavir. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to abemacil. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abiraterone. Avoid. (Severe) Study
- Acetazolamide potentially increases the risk of toxicity when given with valproate. (Severe) Study
- Acetazolamide potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children. (Severe) Theoretical
- Carbamazepine is predicted to decrease the exposure to afatinib. (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to apomorphine. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of albendazole. (Moderate) Study
- Alcohol (beverage) potentially increases the risk of visual disturbances when given with retigabine. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to aldosterone antagonists (epilone). Avoid. (Moderate) Study
- Carbamazepine decreases the exposure to aliskiren. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to alprazolam. Adjust dose. (Moderate) Theoretical → Also see TABLE 11 p. 1377
- Fosphenytoin is predicted to decrease the exposure to aminophylline. Adjust dose. (Moderate) Study
- Phenobarbital is predicted to decrease the exposure to aminophylline. Adjust dose. (Moderate) Theoretical
- Phenytoin decreases the exposure to aminophylline. Adjust dose. (Moderate) Study
- Primidone is predicted to increase the clearance of aminophylline. Adjust dose. (Moderate) Theoretical
- Stiripentol is predicted to increase the exposure to aminophylline. Avoid. (Moderate) Theoretical
- Antiepileptics (fonsphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. (Severe) Theoretical → Also see TABLE 11 p. 1377
- Phenytoin is predicted to decrease the exposure to antiepileptics, local (prilocaine). (Moderate) Theoretical
- Antacids decrease the absorption of gabapentin. Gabapentin should be taken 2 hours after antacids. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. (Severe) Study
- Antiarrhythmics (amiodarone) are predicted to slightly increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. (Severe) Study → Also see TABLE 12 p. 1378
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to antiarrhythmics (lidocaine). Avoid. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiepileptics (propafenone). (Moderate) Study
- Antiepileptics (carbamazepine) decrease the concentration of antiepileptics (brivaracatam). (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (brivaracatam). Adjust lamotrigine dose and monitor carbamazepine concentration, p. 318, p. 311. (Moderate) Study
- Antiepileptics (phenobarbital) affect the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) increase the concentration of antiepileptics (phenobarbital). Adjust dose. (Moderate) Study
- Antiepileptics (topiramate) increase the risk of carbamazepine toxicity when given with antiepileptics (carbamazepine). (Moderate) Study
- Antiepileptics (stiripentol) increase the concentration of antiepileptics (carbamazepine, phenobarbital). Avoid in Dravet syndrome. (Severe) Study
- Antiepileptics (carbamazepine) slightly decrease the exposure to antiepileptics (eslicarbazepine, oxcarbazepine). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (oxcarbazepine) are predicted to increase the concentration of antiepileptics (fosphenytoin). Monitor concentration and adjust dose. (Moderate) Study
- Antiepileptics (stiripentol) are predicted to increase the concentration of antiepileptics (fosphenytoin). (Severe) Study
- Antiepileptics (carbamazepine) affect the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. (Severe) Study
- Antiepileptics (eslicarbazepine) increase the exposure to antiepileptics (fosprenytoin, phenytoin) and antiepileptics (fosprenytoin, phenytoin) decrease the exposure to antiepileptics (eslicarbazepine). (Moderate) Study
- Antiepileptics (valproate) affect the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (valproate). (Severe) Study
- Antiepileptics (vigabatrin) decrease the concentration of antiepileptics (fossphenytoin, phenytoin). (MGd) Study
- Antiepileptics (fosprenytoin) decrease the concentration of antiepileptics (lamotrigine). Monitor and adjust lamotrigine dose, p. 318. (Moderate) Study
- Antiepileptics (phenobarbital, phenytoin, primidone) decrease the concentration of antiepileptics (lamotrigine). Monitor and adjust lamotrigine dose, p. 318. (Moderate) Study → Also see TABLE 11 p. 1377

www.getintopharma.com
Antiepileptics (continued)

- Antiepileptics (valproate) increase the exposure to antiepileptics (lamotrigine). Adjust lamotrigine dose and monitor rash, p. 318. (Severe) Study
- Antiepileptics (lamotrigine) are predicted to increase the concentration of antiepileptics (oxcarbazepine) and antiepileptics (oxcarbazepine) are predicted to decrease the concentration of antiepileptics (lamotrigine). Monitor side effects and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin) are predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (oxcarbazepine) decrease the concentration of antiepileptics (perampanel) and antiepileptics (perampanel) increase the concentration of antiepileptics (oxcarbazepine). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (oxcarbazepine) decrease the concentration of antiepileptics (perampanel) and antiepileptics (perampanel) increase the concentration of antiepileptics (oxcarbazepine). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (phenytoin) decrease the concentration of antiepileptics (phenobarbital) and antiepileptics (phenobarbital) affect the concentration of antiepileptics (phenytoin). (Moderate) Study
- Antiepileptics (fosphenytoin) increase the concentration of antiepileptics (phenobarbital) and antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) affect the concentration of antiepileptics (fosphenytoin). (Moderate) Study
- Antiepileptics (oxcarbazepine) are predicted to increase the concentration of antiepileptics (phenytoin). Monitor concentration and adjust dose. (Moderate) Study
- Antiepileptics (stiripentol) are predicted to increase the concentration of antiepileptics (phenytoin). Avoid in Dravet syndrome. (Severe) Study
- Antiepileptics (primidone) potentially decrease the concentration of antiepileptics (primidone) and antiepileptics (primidone) potentially decrease the concentration of antiepileptics (carbamazepine). Adjust dose. (Moderate) Anecdotal Study
- Antiepileptics (phenytoin) increase the concentration of antiepileptics (primidone) and antiepileptics (primidone) affect the concentration of antiepileptics (phenytoin). (Moderate) Study
- Antiepileptics (stiripentol) are predicted to increase the concentration of antiepileptics (phenytoin). (Moderate) Study
- Antiepileptics (valproate) affect the concentration of antiepileptics (primidone). Monitor and adjust dose. (Severe) Theoretical Study
- Antiepileptics (carbamazepine) slightly increase the clearance of antiepileptics (retigabine). (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to slightly increase the clearance of antiepileptics (retigabine). (Moderate) Study
- Antiepileptics (valproate) increase the exposure to antiepileptics (rufinamide). Adjust rufinamide dose, p. 326. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to antiepileptics (tiagabine). Monitor and adjust tiagabine dose, p. 311. (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (topiramate) and antiepileptics (topiramate) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antiepileptics (topiramate). (Mild) Study
- Antiepileptics (phenobarbital) decrease the concentration of antiepileptics (valproate) and antiepileptics (valproate) increase the concentration of antiepileptics (phenobarbital). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (topiramate) increase the risk of toxicity when given with antiepileptics (valproate). (Severe) Study
- Antiepileptics (carbamazepine) slightly to moderately decrease the concentration of antiepileptics (zonisamide) and antiepileptics (zonisamide) affect the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) slightly to moderately decrease the concentration of antiepileptics (zonisamide). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antiepileptics (zonisamide). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (topiramate) are predicted to increase the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. (Severe) Theoretical Study
- Antiepileptics (carbamazepine) are predicted to slightly increase the exposure to perampanel. (Mild) Study
- Antiepileptics (szolotone, valproate) increase the risk of phenytoin toxicity when given with carbamazepine. Monitor and adjust dose. (Severe) Anecdotal Study
- Antiepileptics (szolotone, miconazole) increase the risk of phenytoin toxicity when given with fosphenytoin. Monitor and adjust dose. (Severe) Anecdotal Study
- Antiepileptics (szolotone, miconazole) decrease the concentration of antiepileptics (fosphenytoin) and antiepileptics (phenytoin) decrease the concentration of antiepileptics (uremic). Avoid or monitor carbamazepine concentration and adjust dose accordingly, p. 311. (Severe) Theoretical Study
- Antiepileptics (szolotone, miconazole) increase the concentration of antiepileptics (phenytoin, phenytoin). Monitor concentration and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiepileptics (phenytoin). (Severe) Study
- Fosphenytoin very markedly decreases the exposure to antiepileptics (azoles). Avoid and for 14 days after stopping fosphenytoin. (Moderate) Study
- Phenobarbital decreases the concentration of antiepileptics, azoles (itraconazole). Avoid and for 14 days after stopping phenobarbital. (Moderate) Study
- Phenytoin very markedly decreases the exposure to antiepileptics, azoles (itraconazole). Avoid and for 14 days after stopping phenytoin. (Moderate) Study
- Primidone is predicted to decrease the concentration of antiepileptics, azoles (itraconazole). (Moderate) Theoretical Study
- Carbamazepine is predicted to decrease the efficacy of antiepileptics, azoles (itraconazole) and antiepileptics, azoles (itraconazole) increase the concentration of carbamazepine. Avoid and adjust dose. (Moderate) Theoretical Study
- Carbamazepine is predicted to decrease the efficacy of antiepileptics, azoles (itraconazole, voriconazole) and antiepileptics, azoles (itraconazole, voriconazole) increase the concentration of carbamazepine. Avoid and adjust dose. (Moderate) Theoretical Study
- Carbamazepine is predicted to decrease the efficacy of antiepileptics, azoles (ketonazole) and antiepileptics, azoles (ketonazole) slightly increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly, p. 311. (Moderate) Study
- Carbamazepine is predicted to decrease the concentration of antiepileptics, azoles (ketonazole). Avoid. (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) decrease the exposure to antiepileptics, azoles (ketonazole). Avoid. (Moderate) Study
- Primidone is predicted to decrease the concentration of antiepileptics, azoles (ketonazole, posaconazole). Avoid. (Moderate) Study
- Carbamazepine is predicted to decrease the efficacy of antiepileptics, azoles (posaconazole) and antiepileptics, azoles (posaconazole) increase the concentration of carbamazepine. Avoid. (Moderate) Theoretical Study
- Carbamazepine is predicted to decrease the concentration of antiepileptics, azoles (posaconazole). Avoid. (Moderate) Study
- Fosphenytoin decreases the exposure to antiepileptics, azoles (voriconazole) and antiepileptics, azoles (voriconazole) increase
Antiepileptics

Phenytoin decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to phenytoin. Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 599. (Moderate) Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antifungals, azoles (voriconazole). Avoid. (Moderate) Theoretical

Antihistamines, sedating (hydroxyzine) potentially increase the risk of overheating and dehydration when given with zonisamide. Avoid in children. (Severe) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antimalarials (artemether) (with lumefantrine). Avoid. (Severe) Study

Antimalarials (pyrimethamine) increase the risk of haematological toxicity when given with antiepileptics (phenobarbital, primidone). (Severe) Study

Antimalarials (pyrimethamine) are predicted to increase the risk of toxicitiy when given with antiepileptics (phenobarbital, primidone). (Severe) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of antimalarials (piperazine). Avoid. (Moderate) Theoretical

Antiepileptics (carbamazepine, phenobarbital, primidone) potentially increase the risk of toxicity when given with antiepileptics (phenobarbital, primidone). (Unclear) Study

Apalutamide potentially decreases the exposure to valproate. (Med) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to apremilast. Avoid. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to aprepitant. Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to antipirazole. Adjust antipirazole dose, p. 395. (Moderate) Study. Also see TABLE 1 p. 1377

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bazedoxifene. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to bedaquiline. Avoid. (Severe) Study. Also see TABLE 1 p. 1377

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (carvedilol, labetalol). (Moderate) Theoretical

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (propranolol). (Moderate) Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, selective (acetabutol, bisoprolol, metoprolol, nebivolol). (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Study

Oxcarbazepine is predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) slightly decrease the exposure to bortezomib. Avoid. (Severe) Study. Also see TABLE 12 p. 1378

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) affect the exposure to bosentan. Avoid. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to very markedly decrease the exposure to bosentan. Avoid. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to bupropion. (Severe) Study

Valproate increases the exposure to bupropion. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to buspirone. Use with caution and adjust dose. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to cabozantinib. Avoid. (Moderate) Study

Antiepileptics (fosphenytoin, phenytoin) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. (Moderate) Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study

Calcium channel blockers (diltiazem) increase the concentration of carbamazepine and carbamazepine is predicted to decrease the exposure to calcium channel blockers (diltiazem). Monitor concentration and adjust dose. (Severe) Aneodal

Calcium channel blockers (verapamil) increase the concentration of carbamazepine and carbamazepine is predicted to decrease the exposure to calcium channel blockers (verapamil). (Severe) Aneodal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). Avoid. (Moderate) Study

Calcium channel blockers (diltiazem, verapamil) potentially increase the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to cannabis extract. Avoid. (Severe) Theoretical. Also see TABLE 11 p. 1377

Capcetabine increases the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Aneodal

Carbapenems decrease the concentration of valproate. Avoid. (Severe) Aneodal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cariprazine. Avoid. (Severe) Theoretical. Also see TABLE 11 p. 1377

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of caspofungin. Adjust caspofungin dose, p. 592. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cetirizine. Avoid. (Severe) Theoretical

Antiepileptics (phenobarbital, primidone) are predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. (Moderate) Theoretical

Antiepileptics (phenobarbital, primidone) decrease the concentration of chloramphenicol. (Moderate) Study

Intravenous chloramphenicol increases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) affect the concentration of intravenous chloramphenicol. Monitor concentration and adjust dose. (Severe) Study

Chloridiazepoxide affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Study

Phenobarbital decreases the effects of Cholic acid. Avoid. (Moderate) Study
Antiepileptics (continued)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of ciclosporin. [Severe] Study
- Oxcarbazepine decreases the concentration of ciclosporin. [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the effects of clobazam. [Moderate] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. [Moderate] Study
- Carbamazepine is predicted to increase the risk of haematological toxicity when given with oral cladribine. [Moderate] Theoretical
- Clobazam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal
- Stiripentol increases the concentration of clobazam. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to clozapine. [Moderate] Anecdotal
- Carbamazepine is predicted to increase the risk of myelosuppression when given with clozapine. Avoid. [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- Oxcarbazepine is predicted to decrease the concentration of cobicistat. [Severe] Theoretical
- Cobicistat is predicted to very slightly increase the exposure to perampanel. [Mild] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to coformycin. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rifampicin, topiramate) are predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (fluticasone). [Unknown] Theoretical
- Antiepileptics (fosphenytoin, phenytoin) are predicted to alter the anticoagulant effect of coumarins. [Moderate] Anecdotal
- Antiepileptics (phenobarbital, primidone) decrease the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate] Study
- Carbamazepine decreases the effects of coumarins. Monitor and adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study
- Carbamazepine is predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study
- Phenytoin is predicted to decrease the exposure to dabigatran. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Danazol moderately increases the concentration of carbamazepine. Monitor and adjust dose. [Severe] Study
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinemia when given with dapoxetine. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- Lamotrigine is predicted to increase the risk of hyponatraemia when given with desmopressin. [Severe] Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical
- Desogestrel is predicted to increase the exposure to lamotrigine. [Moderate] Study
- Diazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- Diazoxide decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. [Moderate] Anecdotal
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. [Moderate] Anecdotal
- Disulfiram increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- Diazoxide is predicted to decrease the exposure to dolasetron. Adjust dose. [Severe] Study
- Oxcarbazepine is predicted to decrease the exposure to dolasetron. Adjust dose. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dolutegravir. [Severe] Study
- Oxcarbazepine is predicted to decrease the exposure to dolutegravir. Adjust dose. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to doravirine. Avoid. [Severe] Study
- Oxcarbazepine is predicted to decrease the exposure to doravirine. Avoid. [Severe] Theoretical
- Phenytoin is predicted to decrease the exposure to dolasetron. [Moderate] Theoretical
- Carbamazepine is predicted to decrease the exposure to edoxaban. [Moderate] Study
- Phenytoin is predicted to decrease the exposure to edoxaban. [Moderate] Theoretical
- Antiepileptics (fosphenytoin, phenytoin) slightly decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Theoretical
- Carbamazepine slightly decreases the exposure to efavirenz and efavirenz slightly decreases the exposure to carbamazepine. [Severe] Theoretical
- Phenobarbital is predicted to decrease the exposure to efavirenz and efavirenz affects the concentration of phenobarbital. [Severe] Theoretical
- Efavirenz is predicted to affect the efficacy of primidone and primidone is predicted to slightly decrease the exposure to efavirenz. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to elbasvir. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to eliglustat. Avoid. [Severe] Study
Antiepileptics

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of enzalutamide. Avoid. (Severe) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to encorafenib. (Severe) Theoretical

Enteral feeds decrease the absorption of phenytoin. (Severe) Study

Enzalutamide is predicted to slightly decrease the exposure to brivaracetam. (Moderate) Theoretical

Enzalutamide is predicted to decrease the exposure to perampanel. Monitor and adjust dose. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of ergotamine. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 979. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to eslicarbazepine. Avoid or adjust dose. (Severe) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of etosodore. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to exemestane. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fosoterodine. Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fosaprepit. Avoid. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to gefitinib. Avoid. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to gefitinib. Avoid. (Severe) Study

Antiepileptics (eslicarbazepine, oxcarbazepine) potentially decrease the exposure to glecaprevir. Avoid. (Severe) Study

Valproate potentially opposes the effects of glycerol phenbutyrate. (Moderate) Theoretical

Grapefruit juice slightly increases the exposure to carbamazepine. Monitor and adjust dose. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to grazoprevir. Avoid. (Severe) Study

Antiepileptics (phenobarbital, primidone) decrease the effects of griseofulvin. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 352. (Moderate) Study → Also see TABLE 11 p. 1377

Oxcarbazepine is predicted to decrease the concentration of guanfacine. Monitor and adjust guanfacine dose, p. 352. (Moderate) Theoretical

Guanfacine increases the concentration of valproate. Monitor and adjust dose. (Moderate) Study

H₂ receptor antagonists (cimetidine) transiently increase the concentration of carbamazepine. Monitor concentration and adjust dose. (Moderate) Study

H₂ receptor antagonists (cimetidine) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of haloperidol. Adjust dose. (Moderate) Study → Also see TABLE 11 p. 1377

Haloperidol potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children. (Severe) Theoretical

HIV-protease inhibitors are predicted to affect the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of HIV-protease inhibitors. (Severe) Theoretical

HIV-protease inhibitors are predicted to increase the exposure to carbamazepine and carbamazepine is predicted to decrease the exposure to HIV-protease inhibitors. Monitor and adjust dose. (Severe) Theoretical

HIV-protease inhibitors (ritonavir) slightly decrease the exposure to lamotrigine. (Severe) Study

HIV-protease inhibitors are predicted to very slightly increase the exposure to perampanel. (Mild) Study

HIV-protease inhibitors (ritonavir) are predicted to decrease the concentration of valproate. (Severe) Aneotal

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of etonogestrel. For FSH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to exemestane. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fosoterodine. Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fosaprepit. Avoid. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderate decrease the exposure to gefitinib. Avoid. (Severe) Study

Antiepileptics (eslicarbazepine, oxcarbazepine) potentially decrease the exposure to glecaprevir. Avoid. (Severe) Study

Valproate potentially opposes the effects of glycerol phenbutyrate. (Moderate) Theoretical

Grapefruit juice slightly increases the exposure to carbamazepine. Monitor and adjust dose. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to irinotecan. Avoid. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. (Moderate) Theoretical

Isoniazid increases the concentration of antiepileptics (fosphenytoin, phenytoin). (Moderate) Study → Also see TABLE 12 p. 1378

Isoniazid markedly increases the concentration of carbamazepine and carbamazepine increases the risk of hepatotoxicity when given with isoniazid. Monitor concentration and adjust dose. (Severe) Study → Also see TABLE 1 p. 1375
Antiepileptics (continued)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to ivacaftor. Avoid. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lopinavir. Avoid. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lopinavir. Avoid. [Severe] Study

- Carbamazepine is predicted to decrease the exposure to levetiracetam. [Moderate] Theoretical

- Letermovir is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the effects of levodopa. [Moderate] Study

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the effects of levetiracetam. [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of levodopa. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lomiptadine. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lopinavir. Avoid. [Severe] Study

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lopinavir. Avoid. [Severe] Study

- Antiepileptics (carbamazepine, oxcarbazepine) are predicted to increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lomiptadine. Monitor and adjust dose. [Moderate] Theoretical

- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of loop diuretics (furosemide). [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the effects of levofloxacin. [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lopinavir. Avoid. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lopinavir. Avoid. [Severe] Study

- Macrolides (clarithromycin) slightly increase the concentration of carbamazepine. Monitor concentration and adjust dose. [Severe] Study

- Macrolides (clarithromycin) are predicted to very slightly increase the exposure to perampanel. [Mild] Study

- Macrolides (erythromycin) markedly increase the concentration of carbamazepine. Monitor concentration and adjust dose. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study

- Phenytoin is predicted to decrease the exposure to melatonin. [Moderate] Theoretical

- Phenytoin is predicted to decrease the clearance of methotrexate. [Severe] Anecdotal

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to metformin. [Moderate] Study

- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of metyrapone. Avoid. [Moderate] Study

- Phenytoin is predicted to increase the clearance of mexiteline. Monitor and adjust dose. [Moderate] Study

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to minocycline. [Moderate] Study

- Carbamazepine markedly decreases the exposure to minocycline. Adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, phenobarbital, primidone) are predicted to decrease the exposure to modafinil. [Mild] Study

- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to modafinil and modafinil is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Theoretical

- Antiepileptics (phenobarbital, primidone) are predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. [Severe] Theoretical

- Carbamazepine is predicted to increase the risk of severe toxic reaction when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical

- Carbamazepine is predicted to decrease the effects of monoclonal antibodies (brentuximab vedotin). [Severe] Theoretical

- Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Moderate] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to montelukast. [Mild] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to nateglinide. [Mild] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to netupitant. Avoid. [Severe] Study

- Carbamazepine is predicted to decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium). [Moderate] Study

- Nevirapine is predicted to decrease the concentration of antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) and antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of nevirapine. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to nilotinib. Avoid. [Severe] Study

- Carbamazepine is predicted to decrease the exposure to nintedanib. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to nitisinone. Adjust dose. [Moderate] Theoretical

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease decrease
the efficacy of norethisterone. For FSRH guidance, see
Contraceptives, interactions p. 794. [Severe] Anecdotal

- Carbamazepine potentially decreases the exposure to
valproate. Monitor and adjust dose. [Moderate] Study

- Phenytoin is predicted to decrease the exposure to valproate.
Monitor and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
olanzapine. Avoid. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
olanzapine. Avoid. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
olanzapine. Avoid. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
olanzapine. Avoid. [Moderate] Study

- Oxybutynin is potentially increased the risk of overheating and
dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
opioids (alfentanil, fentanyl). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
opioids (buprenorphine). Monitor and adjust dose. [Moderate] Study

- Carbamazepine decreases the concentration of opioids
(tramadol). Adjust dose. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
osimertinib. Avoid. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to moderately decrease
the exposure to ospemifene. [Moderate] Study

- Oxybutynin potentially increases the risk of overheating and
dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
paliperidone. Monitor and adjust dose. [Severe] Study

- Valproate slightly increases the exposure to paliperidone.
Adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
paliperidone. Monitor and adjust dose. [Severe] Study

- Carbamazepine decreases the concentration of opioids
(paracetamol). [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
paracetamol. Avoid. [Moderate] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
daraprim (with ritonavir and ombitasvir). Avoid. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
azithromycin. Avoid. [Severe] Study

- Carbamazepine decreases the concentration of antiepileptics
(phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) decrease the concentration of
antiepileptics (phenobarbital, primidone). [Moderate] Study

- Antiepileptics (phenobarbital, primidone) decrease the concentration of
antiepileptics (phenobarbital, primidone). [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
azithromycin. Adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
rifampicin. Use with caution and adjust dose. [Moderate] Study

- Rifampicin decreases the concentration of antiepileptics
(phenobarbital, primidone). Use with caution and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
rifampicin. Avoid. [Moderate] Study

- Carbamazepine is predicted to decrease the exposure to
rifampicin. Avoid. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure to
rifampicin. Avoid. [Moderate] Study

- Rifampicin markedly increases the clearance of lamotrigine.
Adjust lamotrigine dose, p. 318. [Moderate] Study
Antiepileptics (continued)
- Oxcarbazepine is predicted to decrease the concentration of riipingvirine. Avoid. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to riperidone. Adjust dose. (Moderate) Study → Also see TABLE 11 p. 1377
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to rivanoxaban. Avoid unless patient can be monitored for signs of thrombosis. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to rolipram. Avoid. (Severe) Study
- Rucaparib is predicted to increase the exposure to phenytoin. Monitor and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to saxagliptin. (Unknown) Theoretical
- Valproate is predicted to increase the exposure to selexipag. Adjust dose. (Moderate) Study
- Valproate potentially decreases the effects of sodium phenylbutyrate. (Moderate) Anecdotal
- Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical
- Carbamazepine is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sorafenib. (Moderate) Theoretical
- SSRIs (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. (Severe) Anecdotal
- SSRIs (sertraline) potentially increase the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Anecdotal
- Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of SSRIs (paroxetine). (Moderate) Study
- St John's Wort is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. (Severe) Theoretical
- St John's Wort is predicted to decrease the exposure to brivaracetam. (Moderate) Theoretical
- St John's Wort is predicted to decrease the concentration of carbamazepine. Monitor and adjust dose. (Moderate) Theoretical
- St John's Wort is predicted to decrease the exposure to perampanel. Monitor and adjust dose. (Moderate) Theoretical
- St John's Wort is predicted to decrease the exposure to tiagabine. Avoid. (High) Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine) are predicted to decrease the exposure to statins (atorvastatin). Monitor and adjust dose. (Moderate) Theoretical → Also see TABLE 11 p. 1375
- Antiepileptics (fosphenytoin, phenytoin) potentially decrease the exposure to statins (atorvastatin, simvastatin). (Moderate) Anecdotal
- Carbamazepine moderately decreases the exposure to statins (simvastatin). Monitor and adjust dose. (Severe) Study → Also see TABLE 1 p. 1375
- Eslicarbazepine moderately decreases the exposure to statins (simvastatin). Monitor and adjust dose. (Moderate) Study
- Sulfonamides (sulfadiazine) are predicted to increase the concentration of fosphenytoin. Monitor and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) increase the effects of suxamethonium. (Moderate) Study
- Carbamazepine increases the risk of prolonged neuromuscular blockade when given with suxamethonium. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. (Severe) Study → Also see TABLE 12 p. 1378
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to taxanes (docetaxel). (Severe) Theoretical → Also see TABLE 12 p. 1378
- Tegafur potentially increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to tetracyclines (doxycycline). Monitor and adjust dose. (Moderate) Study → Also see TABLE 1 p. 1375
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tevacin. (Moderate) Theoretical
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to theophylline. Adjust dose. (Moderate) Study
- Antiepileptics (phenobarbital, primidone) are predicted to increase the clearance of theophylline. Adjust dose. (Moderate) Theoretical
- Carbamazepine potentially increases the clearance of theophylline and theophylline decreases the exposure to carbamazepine. Adjust dose. (Moderate) Anecdotal
- Striperintol is predicted to increase the exposure to theophylline. Avoid. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to increase the risk of hypothyroidism when given with thyroid hormones. (Moderate) Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of thyroid hormones. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ticagrelor. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tizanidine. (Severe) Study
- Antiepileptics (fosphenytoin, phenytoin) moderately decrease the exposure to tofacitinib. Avoid. (Severe) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure...
Antiepileptics

- Oxcarbazepine is predicted to decrease the concentration of voxelaprevir. Avoid. [Severe] Theoretical
- Valproate slightly increases the exposure to zidovudine. [Moderate] Study
- Carbamazepine moderately decreases the exposure to zopiclone. [Moderate] Study
- Carbazatepine (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to zopiclone. [Moderate] Study

Antifungals, azoles

- Since systemic absorption can follow topical application, the possibility of interactions with topical clotrimazole and ketoconazole should be borne in mind.
- In general, clotrimazole interactions relate to multiple-dose treatment.
- The use of carbonated drinks, such as cola, improves itraconazole, ketoconazole and posaconazole bioavailability.
- Interactions of miconazole apply to the oral gel formulation, as a sufficient quantity can be absorbed to cause systemic effects. Systemic absorption from intravaginal and topical formulations might also occur.

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to abemaciclib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 967. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 193. [Severe] Study
- Itraconazole markedly increases the exposure to aliskiren. Avoid. [Severe] Study
- Ketoconazole moderately increases the exposure to aliskiren. [Moderate] Study
- Itraconazole increases the risk of busulfan toxicity when given with alkylating agents (busulfan). Monitor and adjust dose. [Moderate] Study
- Miconazole is predicted to increase the concentration of alkylating agents (busulfan). Use with caution and adjust dose. [Moderate] Theoretical
- Itraconazole is predicted to increase the exposure to alkylating agents (cyclophosphamide). [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to almotriptan. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to alpha blockers (aluzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to alpha blockers (tamsulosin). [Theoretical]
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to alprazolam. [Severe] Study

Interactions | Appendix 1
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) moderately increase the exposure to alprazolam. Avoid. (Moderate) Study

- Itraconazole is predicted to increase the exposure to alprazolam. Use with caution and adjust dose. (Moderate) Theoretical
- Ketoconazole potentially decreases the exposure to aminoglycosides (tobramycin). (Moderate) Anecdotal
- Ketoconazole decreases the absorption of itraconazole (capsule). Antacids should be taken 1 hour before or 2 hours after itraconazole. (Moderate) Study
- Antacids decrease the absorption of ketoconazole. Separate administration by at least 2 hours. (Moderate) Study
- Ketoconazole is predicted to increase the exposure to antihistamines (disopyramide). Use with caution and adjust dose. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines (disopyramide). Avoid. (Severe) Theoretical
- Posaconazole is predicted to increase the exposure to antihistamines (disopyramide, dronedarone). Avoid. (Severe) Theoretical
- Fluconazole is predicted to increase the exposure to antihistamines (dronedarone). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very markedly increase the exposure to antihistamines (disopyramide). Avoid or adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine) are predicted to decrease the exposure to antihistamines (carbamazepine). Avoid or adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine), fosphenytoin, phenobarbital, phenytoin, primidone are predicted to decrease the exposure to fluconazole. Avoid. (Severe) Study
- Antiepileptics (fosphenytoin) very markedly decrease the exposure to itraconazole. Avoid and for 14 days after stopping fosphenytoin. (Moderate) Study
- Antiepileptics (fosphenytoin) decrease the exposure to voriconazole and voriconazole increases the exposure to antiepileptics (fosphenytoin). Avoid or adjust voriconazole dose and monitor phenytoin concentration. p. 599, p. 321. (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) decrease the exposure to ketocnazole. Avoid. (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to posaconazole. Avoid. (Moderate) Study
- Antiepileptics (phenobarbital) decrease the concentration of itraconazole. Avoid and for 14 days after stopping phenobarbital. (Moderate) Study
- Antiepileptics (phenobarbital) are predicted to decrease the concentration of ketoconazole. Avoid. (Moderate) Study
- Antiepileptics (phenobarbital) are predicted to decrease the concentration of posaconazole. Avoid. (Moderate) Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of voriconazole. Avoid. (Moderate) Theoretical
- Antiepileptics (phenytoin) very markedly decrease the exposure to itraconazole. Avoid and for 14 days after stopping phenytoin. (Moderate) Study
- Antiepileptics (phenytoin) decrease the exposure to voriconazole and voriconazole increases the exposure to antiepileptics (phenytoin). Avoid or adjust voriconazole dose and monitor phenytoin concentration. p. 599, p. 321. (Moderate) Study
- Antiepileptics (primidone) are predicted to decrease the concentration of itraconazole. (Moderate) Theoretical
- Miconazole increases the risk of carbamazepine toxicity when given with antiepileptics (carbamazepine). Monitor and adjust dose. (Severe) Anecdotal
- Miconazole increases the risk of phenytoin toxicity when given with antiepileptics (fosphenytoin). Monitor and adjust dose. (Severe) Theoretical
- Fluconazole increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine) are predicted to decrease the efficacy of antifungals, azoles (itraconazole, voriconazole) and antifungals, azoles (itraconazole, voriconazole) increase the concentration of antiepileptics (carbamazepine). Avoid or adjust dose. (Moderate) Theoretical → Also see TABLE 9 p. 1377
- Antiepileptics (primidone) are predicted to decrease the concentration of antifungals, azoles (ketocnazole, posaconazole). Avoid. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of carbamazepine (mefloquine). Avoid or monitor side effects. (Severe) Study
- Antifungals, azoles (posaconazole) are predicted to increase the exposure to antifungals, azoles (itraconazole, voriconazole). Avoid. (Severe) Theoretical
- Ketoconazole increases the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid and for 14 days after stopping ketoconazole. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Theoretical
Antifungals, azoles – Antifungals, azoles

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to aprepitant. [Moderate] Study

- Fluconazole is predicted to increase the exposure to aprepitant. [Moderate] Theoretical

- Voriconazole is predicted to increase the exposure to isavuconazole. [Moderate] Theoretical

- Posaconazole is predicted to increase the exposure to aprepitant. [Moderate] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. [Moderate] Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to aripiprazole. Avoid or adjust dose. [Moderate] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Theoretical] Study → Also see TABLE 1 p. 1375 → Also see TABLE 9 p. 1377

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Theoretical] Study → Also see TABLE 1 p. 1375 → Also see TABLE 9 p. 1377

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to betaxolol. Avoid. [Severe] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to beta, agonists (salmeterol). Avoid. [Severe] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical

- Posaconazole is predicted to increase the exposure to bictegravir. [Moderate] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) slightly increase the exposure to bortezomib. [Moderate] Study

- Fluconazole is predicted to increase the exposure to bosentan. [Severe] Study

- Bosentan is predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Theoretical

- Itraconazole is predicted to increase the exposure to bosentan. [Moderate] Theoretical

- Ketoconazole moderately increases the exposure to bosentan. [Moderate] Study

- Voriconazole is predicted to increase the exposure to bosentan. Avoid. [Severe] Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1377

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 1377

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bupropion. Adjust dose. [Moderate] Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bupropion. Use with caution and adjust dose. [Moderate] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bupropion. Adjust bupropion dose, p. 342. [Severe] Study

- Miconazole is predicted to increase the concentration of bupropion. Use with caution and adjust dose. [Moderate] Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to cabozantinib. [Moderate] Theoretical → Also see TABLE 9 p. 1377

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) slightly increase the exposure to cabozantinib. [Moderate] Study → Also see TABLE 9 p. 1377

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to isavuconazole. [Moderate] Theoretical

- Miconazole is predicted to increase the exposure to calcium channel blockers (amlodipine, clevidipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil). Use with caution and adjust dose. [Moderate] Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

- Fluconazole (high-dose) is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. [Severe] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to cariprazine. Avoid. [Severe] Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ceritinib. [Moderate] Theoretical → Also see TABLE 9 p. 1377

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ceritinib. [Moderate] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cisapride. [Severe] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cisapride. Avoid. [Severe] Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ciclosporin. [Severe] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the concentration of ciclosporin. Monitor and adjust dose. [Severe] Anaesthetic

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. [Moderate] Study

- Fluconazole is predicted to increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. [Moderate] Theoretical

- Miconazole is predicted to increase the exposure to cilostazol. Use with caution and adjust dose. [Moderate] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cinacalcet. Adjust dose. [Moderate] Study

- Antifungals, azoles (fluconazole, voriconazole) potentially increase the exposure to clomazem. Adjust dose. [Moderate] Theoretical

- Fluconazole is predicted to decrease the efficacy of clopidogrel. Avoid. [Severe] Theoretical

- Voriconazole is predicted to decrease the efficacy of clopidogrel. Avoid. [Severe] Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cobimetinib. [Moderate] Theoretical

- Cobimetinib is predicted to increase the exposure to antifungals, azoles (fluconazole, isavuconazole). [Moderate] Theoretical

- Cobimetinib is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole). Adjust dose. [Moderate] Theoretical

- Cobimetinib is predicted to increase the exposure to isavuconazole. Avoid or monitor side effects. [Severe] Study

- Cobimetinib is predicted to affect the exposure to voriconazole. Avoid. [Moderate] Theoretical
Antifungals, azoles

- Antifungals, azoles (fluconazole, isavuconazole, miconazole, posaconazole) are predicted to increase the exposure to 
cobimetinib. *Severe* Theoretical  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to 
cobimetinib. Avoid or monitor for toxicity. *Severe* Study  

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to 
colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4, p. 1120. *Severe* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to 
colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose, p. 1120. *Severe* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to 
corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). *Moderate* Theoretical  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to 
corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. *Severe* Study  

- Miconazole is predicted to increase the concentration of 
corticosteroids (methylprednisolone). Monitor and adjust dose. *Moderate* Theoretical  

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to 
coumarins. Monitor INR and adjust dose. *Moderate* Study  

- Fluconazole increases the anticoagulant effect of 
coumarins. Monitor INR and adjust dose. *Moderate* Study  

- Itraconazole potentially increases the anticoagulant effect of 
coumarins (warfarin). Monitor INR and adjust dose. *Severe* Anecdotal  

- Ketoconazole potentially increases the anticoagulant effect of 
coumarins (warfarin). Monitor INR and adjust dose. *Severe* Anecdotal  

- Miconazole greatly increases the anticoagulant effect of 
coumarins. MHRA advises avoid unless INR can be monitored closely; monitor for signs of bleeding. *Severe* Study  

- Voriconazole increases the anticoagulant effect of 
coumarins. Monitor INR and adjust dose. *Moderate* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to 
c绝. Avoid. *Moderate* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderate increase the exposure to 
crizotinib. Avoid. *Moderate* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to 
dabigatran. Avoid. *Severe* Study  

- Isovucnazol is predicted to increase the exposure to 
dabigatran. Avoid. *Severe* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to 
dabrafenib. Use with caution or avoid. *Moderate* Study  

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to slightly increase the exposure to 
darifenacin. *Moderate* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to 
darifenacin. Avoid. *Severe* Study  

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to 
dasatinib. *Severe* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to 
dasatinib. Avoid or adjust dose—consult product literature. *Severe* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very slightly increase the exposure to 
delamanid. *Severe* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) moderately increase the exposure to 
diazepam. Monitor and adjust dose. *Moderate* Study  

- Didanosine (buffered) decreases the exposure to antifungals, azoles (itraconazole, ketoconazole). Separate administration by 2 hours. *Severe* Study  

- Isovucnazol slightly increases the exposure to 
digoxin. Monitor and adjust dose. *Moderate* Study  

- Itraconazole is predicted to markedly increase the concentration of 
digoxin. Monitor and adjust dose. *Severe* Study  

- Ketoconazole is predicted to markedly increase the concentration of 
digoxin. *Severe* Study  

- Isovucnazol is predicted to increase the concentration of 
digoxin. *Severe* Study  

- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) increase the risk of QT-prolongation when given with 
domperidone. Avoid. *Severe* Study  

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to 
dopamine receptor agonists (bromocriptine). *Severe* Theoretical  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to dopamine receptor agonists (bromocriptine). *Severe* Study  

- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the concentration of dopamine receptor agonists (cabergoline). *Moderate* Anecdotal  

- Isovucnazol is predicted to increase the exposure to 
dopamine receptor agonists (pramipexole). Adjust dose. *Moderate* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to 
doravirine. *Mild* Study  

- Ketoconazole moderately increases the exposure to 
drospirenone. *Severe* Study  

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to 
dutasteride. *Mild* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to 
dutasteride. Monitor side effects and adjust dose. *Moderate* Theoretical  

- Itraconazole is predicted to slightly increase the exposure to 
edoxaban. *Severe* Theoretical  

- Ketoconazole slightly increases the exposure to 
edoxaban. Adjust edoxaban dose, p. 126. *Severe* Study  

- Efavirenz is predicted to decrease the exposure to 
isavuconazole. Avoid. *Severe* Theoretical  

- Efavirenz slightly decreases the exposure to 
itraconazole. Avoid and for 14 days after stopping efavirenz. *Moderate* Study  

- Efavirenz moderately decreases the exposure to ketoconazole. *Severe* Study  

- Efavirenz slightly decreases the exposure to posaconazole. Avoid. *Severe* Study  

- Efavirenz moderately decreases the exposure to 
voriconazole and voriconazole slightly increases the exposure to efavirenz. Adjust dose. *Severe* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to 
eliglustat. Avoid or adjust dose—consult product literature. *Severe* Study  

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to 
encorafenib. *Moderate* Study  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to 
encorafenib. Avoid or monitor. *Severe* Study  

- Enalapril is predicted to decrease the exposure to 
isavuconazole. Avoid. *Severe* Study  

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with 
ergomine. *Severe* Theoretical  

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with 
ergomine. Avoid. *Severe* Theoretical  

- Miconazole is predicted to increase the exposure to 
ergomine. Avoid. *Moderate* Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergotamine. **(Severe) Theoretical**

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergotamine. **(Avoid) (Severe) Theoretical**

- Posaconazole is predicted to increase the exposure to ergotamine. **(Avoid) (Moderate) Theoretical**

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. **(Moderate) Study**

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to erlotinib. **(Moderate) Theoretical**

- Posaconazole is predicted to increase the concentration of HIV-protease inhibitors. Use with caution and adjust dose. **(Moderate) Theoretical**

- Posaconazole is predicted to increase the exposure to HIV-protease inhibitors. **(Moderate) Study**

- HIV-protease inhibitors are predicted to affect the exposure to voriconazole and posaconazole potentially affects the exposure to HIV-protease inhibitors. **(Severe) Study** → Also see TABLE 9 p. 1377

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ibrutinib. Adjust ibritunib dose with moderate inhibitors of CYP3A4, p. 983. **(Severe) Study**

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to very markedly increase the exposure to ibritunib. Avoid potent inhibitors of CYP3A4 or adjust ibritunib dose, p. 983. **(Severe) Study**

- Idealisib is predicted to increase the exposure to isavuconazole. Avoid or monitor side effects. **(Severe) Study**

- Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to imatinib. **(Moderate) Theoretical**

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to isavuconazole and posaconazole. **(Moderate) Study**

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to imatinib. **(Moderate) Study**

- Imatinib is predicted to decrease the exposure to isavuconazole. **(Moderate) Study**

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 211. **(Severe) Theoretical**

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or tezacaftor with ivacaftor p. 295 with moderate inhibitors of CYP3A4. **(Severe) Study**

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or lumacaftor with ivacaftor p. 294 or tezacaftor with ivacaftor p. 295 with potent inhibitors of CYP3A4. **(Severe) Study**

- Lanthanum is predicted to decrease the absorption of ketoconazole. Separate administration by at least 2 hours. **(Severe) Theoretical**

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lapatinib. **(Moderate) Study** → Also see TABLE 9 p. 1377

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lapatinib. **(Moderate) Study** → Also see TABLE 9 p. 1377

- Letemovir slightly decreases the exposure to voriconazole. **(Moderate) Study**

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lomitapide. **(Avoid) (Moderate) Theoretical** → Also see TABLE 1 p. 1375

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to lomitapide. **(Avoid) (Severe) Study** → Also see TABLE 1 p. 1375

- Clotrimazole is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. **(Moderate) Theoretical**

- Lumacaftor is predicted to decrease the exposure to antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole). Avoid or monitor efficacy. **(Moderate) Theoretical**

- Lumacaftor is predicted to decrease the exposure to fluconazole. Adjust dose. **(Slid) Theoretical**

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. **(Moderate) Study**

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lurasidone. **(Avoid) (Severe) Study**

- Posaconazole moderately increases the exposure to lurasidone. **(Avoid) (Severe) Study**
Antifungals, azoles (continued)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to macitentan. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fluconazole. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to posaconazole. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to maraviroc. Adjust dose. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to fluconazole. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to maraviroc. Adjust dose. [Severe] Study
- Miconazole is predicted to increase the exposure to intravenous midazolam. Use with caution and adjust dose. [Moderate] Theoretical
- Miconazole is predicted to increase the exposure to oral midazolam. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to midostaurin. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to voriconazole. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to isavuconazole. [Severe] Study
- Mitotane is predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirtazapine. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mycophenolate. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to naldixicol. Adjust naldixicol dose and monitor side effects, p. 66. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to netupitant. [Moderate] Study
- Nevirapine is predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to isavuconazole. Avoid and for 14 days after stopping nevirapine. [Moderate] Study
- Nevirapine moderately decreases the exposure to ketoconazole. Avoid. [Severe] Study
- Nevirapine is predicted to decrease the exposure to voriconazole and voriconazole increases the exposure to nevirapine. Monitor and adjust dose. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nilotinib. [Moderate] Theoretical → Also see TABLE 9 p. 1377
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 1377
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nitidazolam. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nitisine. Adjust dose. [Moderate] Theoretical
- Fluconazole moderately increases the exposure to NSAIDs. (celecoxib). Adjust celecoxib dose, p. 1132. [Moderate] Study
- Voriconazole slightly increases the exposure to NSAIDs (diclofenac). Monitor and adjust dose. [Moderate] Study
- Voriconazole moderately increases the exposure to NSAIDs. (ibuprofen). Adjust dose. [Moderate] Study
- Fluconazole increases the exposure to NSAIDs. (parecoxib). Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. [Moderate] Study
- Miconazole is predicted to increase the exposure to opioids (alfentanil). Use with caution and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to opioids (methadone). Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1377
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 9 p. 1377
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to osimertinib. Avoid. [Severe] Study
- Fluconazole increases the exposure to osimertinib. Adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxycodone. Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxycodone. Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxfendazole. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxybutynin. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxybutynin. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxymorphone. Adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to paritaprevir. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to paritaprevir. Avoid or adjust paritaprevir dose, p. 992. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1377
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pazopanib. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 993. [Moderate] Study → Also see TABLE 9 p. 1377
Antifungals, azoles

Miconazole greatly increases the anticoagulant effect of phenindione. [Severe] Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 812. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 9 p. 1377

Miconazole is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Use with caution and adjust dose. [Severe] Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. [Moderate] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 813. [Severe] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pimozide. Avoid. [Severe] Study → Also see TABLE 9 p. 1377

Miconazole is predicted to increase the exposure to pimozide. Avoid. [Moderate] Theoretical

Pirogallol theoretically decreases the exposure to isavuconazole. Use with caution. [Theoretical]

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 994. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately decrease the exposure to piziquamol. [Bolt] Study

Proton pump inhibitors decrease the absorption of itraconazole. Administer itraconazole capsules with an acidic beverage, p. 597. [Moderate] Study

Proton pump inhibitors decrease the absorption of ketoconazole. Administer ketoconazole with an acidic beverage, p. 681. [Moderate] Study

Proton pump inhibitors decrease the absorption of posaconazole (oral suspension). Avoid. [Moderate] Study

Voriconazole increases the exposure to proton pump inhibitors (esomeprazole, omeprazole). Adjust dose. [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to quetiapine. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole, posaconazole) are predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study

Miconazole is predicted to increase the concentration of reboxetine. Use with caution and adjust dose. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to repaglinide. [Moderate] Study

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, miconazole, voriconazole) are predicted to increase the exposure to retinooids (alfatretinoin). Adjust alfatretinoin dose, p. 1362. [Moderate] Theoretical

Antifungals, azoles (fluconazole, ketoconazole, voriconazole) are predicted to increase the risk of tretinoin toxicity when given with retinooids (tretinoin). [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ribociclib. [Moderate] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 997. [Moderate] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, posaconazole) increase the concentration of rifabutin and rifabutin decreases the concentration of antifungals, azoles (itraconazole, posaconazole). Avoid. [Severe] Study

Fluconazole increases the risk of uveitis when given with rifabutin. Adjust dose. [Severe] Study

Rifabutin is predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Theoretical

Ketoconazole is predicted to decrease the concentration of rifabutin and rifabutin is predicted to decrease the concentration of ketoconazole. Avoid. [Severe] Theoretical

Miconazole is predicted to increase the concentration of rifabutin. Use with caution and adjust dose. [Moderate] Theoretical

Rifabutin decreases the concentration of voriconazole and voriconazole increases the concentration of rifabutin. Avoid or adjust voriconazole dose, p. 599. [Severe] Study

Rifampicin slightly decreases the exposure to fluconazole. Adjust dose. [Moderate] Study

Rifampicin is predicted to decrease the exposure to isavuconazole. Avoid. [Severe] Study

Rifampicin markedly decreases the exposure to itraconazole. Avoid and for 14 days after stopping rifampicin. [Moderate] Study

Rifampicin markedly decreases the exposure to ketoconazole and ketoconazole potentially decreases the exposure to rifampicin. Avoid. [Moderate] Study

Rifampicin is predicted to decrease the exposure to posaconazole. Avoid. [Moderate] Anecdotal

Rifampicin very markedly decreases the exposure to voriconazole. Avoid. [Moderate] Study

Itraconazole is predicted to increase the exposure to riociguat. Avoid. [Moderate] Study

Ketoconazole theoretically increases the exposure to riociguat. Avoid. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole) are predicted to moderately increase the exposure to rivaroxaban. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ruoxolitinib. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ruoxolitinib. Adjust dose and monitor side effects. [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to saxagliptin. [Mild] Study

www.getintopharma.com
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of sirolimus. Monitor and adjust dose. (Severe) Study

Miconazole is predicted to increase the concentration of sirolimus. Monitor and adjust dose. ( Moderate) Study

Oral sodium bicarbonate decreases the absorption of ketoconazole. ( Moderate) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to solifenacin. Adjust solifenacin p. 779 or tamsulosin with solifenacin p. 786 dose; avoid in hepatic and renal impairment. ( Severe) Study

Voriconazole is predicted to increase the exposure to SSRIs (citalopram). (Severe) Theoretical also see TABLE 9 p. 1377

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate inhibitors of CYP3A4, p. 821. ( Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose, p. 821. ( Severe) Study

St John's Wort is predicted to decrease the exposure to isavuconazole. Avoid. ( Severe) Theoretical

St John's Wort moderately decreases the exposure to voriconazole. Avoid. (Moderate) Study

Miconazole potentially increases the exposure to statins (atorvastatin). (Severe) Aneuradial

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. (Severe) Study also see TABLE 1 p. 1375

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. ( Severe) Study also see TABLE 1 p. 1375

Antifungals, azoles (fluconazole, miconazole) are predicted to increase the exposure to statins (fluvasatin). ( Severe) Theoretical also see TABLE 1 p. 1375

Isavuconazole is predicted to increase the exposure to statins (fluvasatin, rosuvastatin). ( Moderate) Theoretical

Miconazole is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 205. (Severe) Study also see TABLE 1 p. 1375

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to statins (simvastatin). Avoid. (Severe) Study also see TABLE 1 p. 1375

Isavuconazole is predicted to increase the exposure to sulfasalazine. ( Moderate) Theoretical

Antifungals, azoles (fluconazole, miconazole) are predicted to increase the exposure to sulfonyleurases. Use with caution and adjust dose. ( Moderate) Study

Voriconazole is predicted to increase the concentration of sulfonyleurases. Use with caution and adjust dose. ( Moderate) Theoretical also see TABLE 9 p. 1377

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to sunitinib. ( Moderate) Theoretical also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. ( Moderate) Study also see TABLE 9 p. 1377

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of tacrolimus. (Severe) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of taxanes (docetaxel). Use with caution and adjust dose. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. (Severe) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to taxanes (paclitaxel). ( Severe) Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of temsirolimus. ( Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of temsirolimus. Avoid. (Severe) Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. ( Severe) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. ( Severe) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe) Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) given with a potent CYP2C19 inhibitor are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. ( Moderate) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tofarodine. (Mega) Theoretical also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4, p. 669. ( Moderate) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4, p. 669. (Severe) Study

Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to topotecan. (Severe) Study

Isavuconazole is predicted to increase the exposure to topotecan. ( Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to toremifene. ( Moderate) Theoretical also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to trabectedin. Avoid or adjust dose. (Severe) Theoretical also see TABLE 1 p. 1375

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of trametinib. ( Moderate) Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to trazodone. ( Moderate) Theoretical

www.getintopharma.com
Antifungals, azoles – Antihistamines, non-sedating

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to **venoferanib**. [Severe] Theoretical
  - Also see Table 9 p. 1377
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to **venoferanib**. [Moderate] Study
  - Also see Table 9 p. 1377
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to **vinca alkaloids**. Use with caution and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (clofazimine, ketoconazole) are predicted to decrease the exposure to **vitamin D substances** (calciferol). [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to **vitamin D substances** (paricalcitol). [Moderate] Study
- Fluconazole slightly increases the exposure to **zidovudine**. [Moderate] Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to **zopiclone**. Adjust dose. [Severe] Theoretical
  - Also see Table 9 p. 1377
  - Also see Table I p. 1375
- **Antihistamines, non-sedating** [see Table 9 p. 1377 (QT-interval prolongation)]
  - acrivastine, azelastine, bilastine, cetirizine, desloratadine, fexofenadine, levocetirizine, loratadine, mizolastine, rupatadine
  - Since systemic absorption can follow topical application, the possibility of interactions with topical azelastine should be borne in mind.
  - Apple juice and orange juice decrease the exposure to fexofenadine.
- **Antacids** decrease the absorption of fexofenadine. Separate administration by 2 hours. [Mild] Study
- **Antiarrhythmics** (dronedarone) are predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Antiarrhythmics** (dronedarone) are predicted to increase the exposure to antihistamines, non-sedating (fexofenadine, mizolastine). [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- **Aprepitant** is predicted to increase the exposure to mizolastine. [Severe] Theoretical
- **Aprepitant** is predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Aprepitant** is predicted to increase the exposure to mizolastine. Avoid. [Moderate] Study
- **Aprepitant** is predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
  - Also see Table 9 p. 1377
- **Aprepitant** is predicted to increase the exposure to mizolastine. Avoid. [Moderate] Study
- **Aprepitant** is predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Aprepitant** is predicted to increase the exposure to mizolastine. Avoid. [Moderate] Study
  - Also see Table 9 p. 1377
- **Aprepitant** is predicted to increase the exposure to mizolastine. Avoid. [Moderate] Study
- **Aprepitant** is predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Aprepitant** is predicted to increase the exposure to mizolastine. Avoid. [Moderate] Study
- **Aprepitant** is predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Antihistamines, non-sedating** are predicted to decrease the effects of betahistine. [Moderate] Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to mizolastine. [Severe] Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Ceritinib** is predicted to increase the exposure to fexofenadine. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Crizotinib** is predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Eliglustat** is predicted to increase the exposure to fexofenadine. Adjust dose. [Moderate] Study
- **Grapefruit juice** slightly decreases the exposure to bilastine. Bilastine should be taken 1 hour before or 2 hours after grapefruit juice. [Moderate] Study
- **Grapefruit juice** increases the exposure to rupatadine. Avoid. [Moderate] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Idelalisib** is predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- **Idelalisib** is predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Lapatinib** is predicted to increase the exposure to fexofenadine. [Moderate] Theoretical
- **Leflunomide** is predicted to increase the concentration of fexofenadine. [Moderate] Study
- **Letermovir** is predicted to increase the concentration of fexofenadine. [Moderate] Theoretical
- **Macrolides** (clarithromycin) are predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Macrolides** (erythromycin) are predicted to increase the exposure to mizolastine. [Severe] Theoretical
- **Mirabegron** is predicted to increase the exposure to fexofenadine. [Mild] Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of antimuscarinic side-effects when given with antihistamines, non-sedating. Avoid. [Severe] Theoretical
- **Netupitant** is predicted to increase the exposure to mizolastine. [Severe] Theoretical
- **Netupitant** is predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to mizolastine. Avoid. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to rupatadine. Avoid. [Moderate] Study
- **Pibrentasvir** (with glecaprevir) is predicted to increase the exposure to fexofenadine. [Mild] Study
- **Pitolisant** is predicted to decrease the exposure to fexofenadine. [Mild] Theoretical
- **Rifampicin** is predicted to decrease the exposure to bilastine. [Moderate] Theoretical
- **Rifampicin** increases the clearance of fexofenadine. [Moderate] Study
- **Teriflunomide** is predicted to increase the exposure to fexofenadine. [Moderate] Study
- **Velpatasvir** is predicted to increase the exposure to fexofenadine. [Moderate] Study
- **Venoclax** is predicted to increase the exposure to fexofenadine. [Moderate] Theoretical
Antihistamines, sedating – Antimalarials

### General Information

**Antimalarials**
- **Mefloquine**
- **Pyrimethamine**
- **Antifungals, azoles**
- **Ciproheptadine**
- **Cyproheptadine**
- **Antihistamines, sedating**
- **Hydroxyzine**
- **Monoamine-oxidase A and B inhibitors, irreversible**
- **Antiepileptics**
- **Antiarrhythmics**
- **HIV-protease inhibitors**
- **Efavirenz**
- **H2 receptor antagonists**
- **Efavirenz**
- **Grapefruit juice**
- **Proguanil**
- **Quinine**
- **Digoxin**
- **Imatinib**
- **Aprepitant**
- **Mefloquine**
- **Chloroquine**
- **Piperaquine**

**ROUTE-SPECIFIC INFORMATION**

- Since systemic absorption can follow topical application of **ketotifen**, the possibility of interactions should be borne in mind.

- **Hydroxyzine** potentially increases the risk of overheating and dehydration when given with **antiepileptics (zonisamide)**.
- **Antihistamines, sedating** predicted to decrease the effects of **betahistine**.
- **Cyproheptadine** decreases the effects of **meprapone**.
- **Monoamine oxidase A and B inhibitors, reversible** are predicted to increase the risk of antimuscarinic side-effects when given with **antihistamines, sedating**.
- **Antihistamines, sedating** predicted to decrease the efficacy of **pitolisant**.
- **Cyproheptadine** potentially decreases the effects of **SSRIs**.
- **Antimalarials**
  - **Betahistine**
  - **Mefloquine**
  - **Pyrimethamine**

**PHARMACOLOGY**

**Piperaquine** has a long half-life; there is a potential for drug interaction to occur for up to 3 months after treatment has been stopped.

- **Chloroquine** is predicted to decrease the effects of **agalsidase**.
- **Antimalarials (chloroquine, primaquine)** are predicted to increase the risk of methaemoglobinemia when given with topical **anaesthetics, local (prilocaine)**.
- **Antacids** decrease the absorption of **chloroquine**.
- **Antacids** are predicted to decrease the absorption of **proguanil**.
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **artemether** (with lumefantrine).
- **Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **piperaquine**.
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **piperaquine**.
- **Antiepileptics** (**carbamazepine, phenobarbital, primidone**) are predicted to increase the risk of toxicity when given with **quinine**.
- **Pyrimethamine** increases the risk of haematological toxicity when given with **antiepileptics (fosphenytoin, phenytoin)**.
- **Pyrimethamine** is predicted to increase the risk of haematological toxicity when given with **antiepileptics (phenobarbital, primidone)**.
- **Antifungals, azoles** (**fluconazole, itraconazole, ketoconazole, posaconazole, voriconazole**) are predicted to increase the concentration of **piperaquine**.
- **Antifungals, azoles** (**fluconazole, itraconazole, posaconazole, voriconazole**) are predicted to increase the exposure to **mefloquine**.
- **Antifungals, azoles** (**ketoconazole**) increase the exposure to **mefloquine**.
- **Antimalarials (proguanil)** are predicted to increase the risk of side-effects when given with antimalarials (**pyrimethamine**).

**Aprepitant** is predicted to increase the concentration of **piperaquine**.
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**.
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **calcium channel blockers**.
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **piperaquine**.
- **Calcium salts (calcium carbonate)** decrease the absorption of **chloroquine**.
- **Chloroquine** decreases the efficacy of oral **cholera vaccine**.
- **Cyproheptadine** is predicted to increase the concentration of **piperaquine**.
- **Crizotinib** is predicted to increase the concentration of **piperaquine**.
- **Antimalarials (chloroquine, primaquine)** are predicted to increase the risk of methaemoglobinemia when given with **dapsone**.
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **digoxin**.
- **Quinine** increases the concentration of **digoxin**.
- **Piperaquine** is predicted to decrease the effects of **SSRIs**.
- **Chloroquine** increases the risk of **haematological toxicity** when given with **calcium channel blockers**.
- **Digoxin** is predicted to increase the risk of **haematological toxicity** when given with **calcium channel blockers**.
- **Imatinib** is predicted to increase the concentration of **piperaquine**.
- **Perfluorooctane sulfonate** decreases the effects of **SSRIs**.
- **Efavirenz** decreases the concentration of **artemether**.
- **Efavirenz** moderately decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **proguanil**.
- **Enzalutamide** is predicted to decrease the exposure to **artemether** (with lumefantrine).
- **Efavirenz** is predicted to decrease the concentration of **piperaquine**.
- **HIV-protease inhibitors** are predicted to decrease the concentration of **piperaquine**.
- **Efavirenz** decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **proguanil**.
- **Grapefruit juice** increases the exposure to **artemether**.
- **Grapefruit juice** is predicted to increase the concentration of **piperaquine**.
- **HIV-protease inhibitors** are predicted to increase the concentration of **piperaquine**.
- **HIV-protease inhibitors** are predicted to decrease the exposure to **proguanil**.
- **HIV-protease inhibitors** are predicted to affect the exposure to **quinine**.
- **HIV-protease inhibitors** are predicted to decrease the exposure to **atovaquone**.
- **Efavirenz** decreases the exposure to **artemether**.
- **Grapefruit juice** increases the exposure to **artemether**.
- **Grapefruit juice** is predicted to increase the concentration of **piperaquine**.
- **Imatinib** is predicted to increase the concentration of **piperaquine**.
- **Efavirenz** decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **proguanil**.
- **Efavirenz** decreases the exposure to **quinine**.
- **Efavirenz** slightly increases the exposure to **quinine**.
- **Efavirenz** moderately decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **artemether**.
- **Efavirenz** decreases the exposure to **artemether**.
- **Efavirenz** affects the exposure to **proguanil**.
- **Efavirenz** decreases the exposure to **quinine**.
- **Efavirenz** decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **proguanil**.
- **Efavirenz** decreases the exposure to **quinine**.
- **Efavirenz** slightly increases the exposure to **quinine**.
- **Efavirenz** moderately decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **artemether**.
- **Efavirenz** decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **proguanil**.
- **Efavirenz** decreases the exposure to **quinine**.
- **Efavirenz** slightly increases the exposure to **quinine**.
- **Efavirenz** moderately decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **artemether**.
- **Efavirenz** decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **proguanil**.
- **Efavirenz** decreases the exposure to **quinine**.
- **Efavirenz** slightly increases the exposure to **quinine**.
- **Efavirenz** moderately decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **artemether**.
- **Efavirenz** decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **proguanil**.
- **Efavirenz** decreases the exposure to **quinine**.
- **Efavirenz** slightly increases the exposure to **quinine**.
- **Efavirenz** moderately decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **artemether**.
- **Efavirenz** decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **proguanil**.
- **Efavirenz** decreases the exposure to **quinine**.
- **Efavirenz** slightly increases the exposure to **quinine**.
- **Efavirenz** moderately decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **artemether**.
- **Efavirenz** decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **proguanil**.
- **Efavirenz** decreases the exposure to **quinine**.
- **Efavirenz** slightly increases the exposure to **quinine**.
- **Efavirenz** moderately decreases the exposure to **atovaquone**.
- **Efavirenz** affects the exposure to **artemether**.
Metoclopramide decreases the concentration of atovaquone.
Avoid. [Moderate] Study

Mitotane is predicted to decrease the exposure to artemether (with lumefantrine). Avoid. [Severe] Study

Mitotane is predicted to decrease the concentration of piperacillin. Avoid. [Moderate] Theoretical

Netupitant is predicted to increase the concentration of piperacillin. [Severe] Theoretical

Pyrimethamine is predicted to increase the risk of side-effects when given with metoprolol. [Severe] Theoretical — Also see TABLE 15 p. 1378

Chloroquine is predicted to increase the risk of haematological toxicity when given with fenoprofen. Avoid. [Severe] Theoretical

Chloroquine decreases the efficacy of rabies vaccine. Avoid. [Moderate] Study

Rifabutin slightly decreases the exposure to atovaquone. Avoid. [Moderate] Study

Rifampicin is predicted to decrease the exposure to artemether (with lumefantrine). Avoid. [Severe] Study

Rifampicin moderately decreases the exposure to atovaquone and artemether. Avoid or monitor. [Moderate] Study

Rifampicin moderately decreases the exposure to mefloquine. [Severe] Study

Rifampicin is predicted to decrease the concentration of piperacillin. Avoid. [Moderate] Theoretical

Rifampicin decreases the exposure to quinine. [Severe] Study

St John’s Wort is predicted to decrease the concentration of piperacillin. Avoid. [Moderate] Theoretical

Pyrimethamine increases the risk of side-effects when given with sulphonamides. [Severe] Study — Also see TABLE 15 p. 1378

Tetracyclines (tetracycline) decrease the concentration of atovaquone. [Moderate] Study

Pyrimethamine increases the risk of side-effects when given with trimethoprim. [Severe] Study

Pyrimethamine is predicted to increase the risk of side-effects when given with zidovudine. [Severe] Theoretical — Also see TABLE 15 p. 1378

Antithymocyte immunoglobulin (rabbit) — see TABLE 9 p. 1377 (QT-interval prolongation)

Apalutamide is predicted to decrease the exposure to aldosterone antagonists (epilone). Avoid or monitor. [Moderate] Study

Apalutamide potentially decreases the exposure to antiepileptics (valproate). [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to apalutamide. [Hill] Study — Also see TABLE 9 p. 1377

Apalutamide slightly decreases the exposure to antihistamines, non-sedating (fenofenadine). [Hill] Study

Apalutamide is predicted to decrease the exposure to beta-blockers (salmetrol). Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to bosutinib. Avoid or monitor. [Moderate] Study — Also see TABLE 9 p. 1377

Apalutamide is predicted to decrease the exposure to buspirone. Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to calcium channel blockers (felodipine, lercanidipine). Avoid or monitor. [Moderate] Study

Clodigorel is predicted to increase the exposure to apalutamide. [Hill] Study

Cobicistat is predicted to increase the exposure to apalutamide. [Hill] Study

Apalutamide is predicted to decrease the exposure to colchicine. [Hill] Study

Apalutamide is predicted to decrease the exposure to corticosteroids (budesonide, fluticasone). Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to coumarins. Avoid or monitor. [Hill] Study

Apalutamide is predicted to decrease the exposure to dabigatran. [Hill] Study

Apalutamide is predicted to decrease the exposure to darifenacin. Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to dasatinib. Avoid or monitor. [Moderate] Study — Also see TABLE 9 p. 1377

Apalutamide is predicted to decrease the exposure to diazepam. Avoid or monitor. [Hill] Study

Apalutamide is predicted to decrease the exposure to digoxin. [Hill] Study

Apalutamide is predicted to decrease the exposure to everolimus. Avoid or monitor. [Moderate] Study

Fibrates (gemfibrozil) are predicted to increase the exposure to apalutamide. [Hill] Study

HIV-protease inhibitors are predicted to increase the exposure to apalutamide. [Hill] Study — Also see TABLE 9 p. 1377

Iadolisib is predicted to increase the exposure to apalutamide. [Hill] Study

Apalutamide is predicted to decrease the exposure to ivacaftor. Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to lomitapide. Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to maraviroc. Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to methotrexate. [Hill] Study

Apalutamide markedly decreases the exposure to midazolam. Avoid or monitor. [Severe] Study

Apalutamide is predicted to decrease the exposure to moclobemide. Avoid or monitor. [Hill] Study

Apalutamide is predicted to decrease the exposure to naloxegol. Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to opioids (alfentanil). Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, sildenafil, vardenafil). Avoid or monitor. [Moderate] Study — Also see TABLE 9 p. 1377

Apalutamide is predicted to decrease the exposure to proton pump inhibitors (lansoprazole, rabeprazole). Avoid or monitor. [Hill] Study

Apalutamide markedly decreases the exposure to proton pump inhibitors (omeprazole). Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to quetiapine. Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to sirolimus. Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to SSRIs (citalopram). Avoid or monitor. [Hill] Study — Also see TABLE 9 p. 1377

Apalutamide slightly decreases the exposure to statins (rosuvastatin). [Hill] Study

Apalutamide is predicted to decrease the exposure to statins (simvastatin). Avoid or monitor. [Moderate] Study

Apalutamide is predicted to decrease the exposure to tensirolimus. Avoid or monitor. [Moderate] Study

Apalutamide potentially decreases the exposure to thyroid hormones (levothyroxine). [Hill] Theoretical

Apalutamide is predicted to decrease the exposure to ticagrelor. Monitor and adjust dose. [Moderate] Study

Apalutamide is predicted to decrease the exposure to tolvaptan. Avoid or monitor. [Moderate] Study

Apixaban — see TABLE 3 p. 1375 (anticoagulant effects)

Antihyperglycemics (dronedarone) are predicted to increase the exposure to apixaban. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease
Apixaban (continued)

the exposure to apixaban. Use with caution or avoid. **Severe** Study

- **Antifungals, azoles (itraconazole)** are predicted to increase the exposure to apixaban. **Avoid.** **Severe** Study
- **Antifungals, azoles (ketoconazole)** slightly to moderately increase the exposure to apixaban. **Avoid.** **Severe** Study
- **Antifungals, azoles (voriconazole)** are predicted to increase the exposure to apixaban. **Avoid.** **Moderate** Theoretical
- **Calcium channel blockers (verapamil)** are predicted to increase the exposure to apixaban. **Moderate** Theoretical
- **Cobicistat** is predicted to increase the exposure to apixaban. **Avoid.** **Severe** Theoretical

**Enzalutamide** is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. **Severe** Study

**Macrolides (erythromycin)** are predicted to increase the exposure to apixaban. **Moderate** Theoretical

**Mitotane** is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. **Severe** Study

**Rifampicin** is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. **Severe** Study

**St John’s Wort** is predicted to decrease the exposure to apixaban. Use with caution or avoid. **Severe** Study

Aprepitant is predicted to increase the exposure to apixaban. **Avoid.** **Severe** Theoretical

**Apixaban** (continued)

Aprepitant is predicted to increase the exposure to antifungals, azoles (isavuconazole). **Moderate** Theoretical

Aprepitant is predicted to increase the exposure to antihistamines, non-selecting (mizolastine). **Severe** Theoretical

Aprepitant is predicted to increase the exposure to antihistamines, non-selecting (rupatadine). **Avoid.** **Moderate** Study

Aprepitant is predicted to increase the concentration of antimalarials (piperaquine). **Severe** Theoretical

Aprepitant is predicted to increase the exposure to axitinib. **Moderate** Theoretical

Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. **Mild** Theoretical

Aprepitant is predicted to increase the exposure to beta; agonists (salbutamol). **Moderate** Study

Bosentan is predicted to decrease the exposure to apreiptan. **Moderate** Study

Aprepitant is predicted to increase the exposure to bosutinib. **Avoid or adjust dose.** **Severe** Theoretical

Aprepitant is predicted to increase the exposure to buspirone. Use with caution and adjust dose. **Moderate** Study

Aprepitant is predicted to increase the exposure to cabozantinib. **Avoid.** **Moderate** Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to apreiptan and apreiptan is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). **Avoid.** **Mild** Study

Aprepitant is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Avoid.** **Moderate** Study

Aprepitant is predicted to increase the exposure to cariprazine. **Avoid.** **Severe** Study

Aprepitant is predicted to increase the exposure to ceritinib. **Avoid.** **Moderate** Theoretical

Aprepitant is predicted to increase the concentration of ciclosporin. **Avoid.** **Severe** Study

Cobicistat is predicted to markedly increase the exposure to apreiptan. **Avoid.** **Moderate** Study

Cobicistat is predicted to increase the exposure to cobimetinib. **Avoid.** **Severe** Theoretical

Aprepitant is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4, p. 1120. **Severe** Study

Aprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. **Severe** Study

Aprepitant is predicted to increase the exposure to oral corticosteroids (budesonide). **Avoid.** **Moderate** Study

Aprepitant moderately increases the exposure to corticosteroids (dexamethasone). Monitor and adjust dose. **Avoid.** **Moderate** Study

Aprepitant is predicted to increase the exposure to corticosteroids (fluticasone). **Avoid.** **Moderate** Study

Aprepitant is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. **Avoid.** **Moderate** Study

Aprepitant decreases the anticoagulant effect of coumarins. **Avoid.** **Severe** Study

Aprepitant is predicted to slightly increase the exposure to darifenacin. **Avoid.** **Severe** Study

Aprepitant is predicted to increase the exposure to dasatinib. **Avoid.** **Severe** Study

Aprepitant is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. **Severe** Theoretical

Aprepitant increases the risk of QT-prolongation when given with domperidone. **Avoid.** **Severe** Study

Aprepitant is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). **Severe** Theoretical

Aprepitant is predicted to increase the concentration of dopamine receptor agonists (cabergoline). **Avoid.** **Severe** Study

Aprepitant is predicted to moderately increase the exposure to dutasteride. **Mild** Study

Efavirenz is predicted to decrease the exposure to apreiptan. **Avoid.** **Moderate** Study
Aprepitant is predicted to increase the exposure to eletriptan. Avoid or adjust dose—consult product literature. [Severe] Study

Aprepitant is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Aprepitant is predicted to moderately increase the exposure to encorafenib. [Moderate] Study

Enzalutamide is predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] Study

Aprepitant is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Aprepitant is predicted to increase the risk of ergotism when given with ergonovine. [Severe] Theoretical

Aprepitant is predicted to increase the exposure to ergotamine. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to erlotinib. [Moderate] Study

Aprepitant is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. [Moderate] Study

Aprepitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study

Aprepitant is predicted to increase the exposure to fosoterodine. Adjust fosoterodine dose with moderate inhibitors of CYP3A4. [Moderate] Study

Aprepitant is predicted to increase the exposure to fexofenadine. Adjust fexofenadine dose, p. 352. [Moderate] Theoretical

HIV-protease inhibitors are predicted to markedly increase the exposure to aprepitant. [Moderate] Study

Aprepitant is predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal

Aprepitant is predicted to increase the exposure to ibritinib. Adjust ibritinib dose with moderate inhibitors of CYP3A4, p. 813. [Severe] Study

Idealixib is predicted to markedly increase the exposure to aprepitant. [Moderate] Study

Aprepitant is predicted to increase the exposure to imatinib. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to intravenous irinotecan. [Severe] Theoretical

Aprepitant is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 211. [Severe] Theoretical

Aprepitant is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. [Severe] Study

Aprepitant is predicted to increase the exposure to lapatinib. [Moderate] Study

Aprepitant is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical

Aprepitant is predicted to increase the exposure to lomitapide. Avoid. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to luridinsone. Adjust luridinsone dose, p. 396. [Moderate] Study

Macrolides (clarithromycin) are predicted to markedly increase the exposure to aprepitant. [Moderate] Study

Macrolides (erythromycin) are predicted to increase the exposure to aprepitant. [Moderate] Study

Aprepitant is predicted to increase the exposure to maraviroc. [Moderate] Study

Aprepitant is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study

Aprepitant is predicted to increase the exposure to midostaurin. [Moderate] Theoretical

Mitotane is predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] Study

Aprepitant is predicted to increase the exposure to nalorexol. Adjust nalorexol dose and monitor side effects, p. 65. [Moderate] Study

Nevirapine is predicted to decrease the exposure to aprepitant. [Moderate] Study

Aprepitant is predicted to increase the exposure to nilotinib. [Moderate] Theoretical

Aprepitant is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal

Aprepitant is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study

Aprepitant is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to oxybutynin. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical

Aprepitant is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study

Aprepitant is predicted to increase the exposure to ranolazine. [Severe] Study

Aprepitant is predicted to increase the exposure to ribociclib. [Moderate] Study

Rifampicin is predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] Study

Aprepitant is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to saxagliptin. [Moderate] Study

Aprepitant increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Aprepitant is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate inhibitors of CYP3A4, p. 812. [Moderate] Study

St John’s Wort is predicted to decrease the exposure to aprepitant. Avoid. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Study

Aprepitant is predicted to increase the exposure to statins (simvastatin). Use with caution and simvastatin dose, p. 205. [Severe] Study

Aprepitant is predicted to increase the exposure to sunitinib. [Moderate] Theoretical

Aprepitant is predicted to increase the concentration of tacrolimus. [Severe] Study

Aprepitant is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical

Aprepitant is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. [Severe] Study

Aprepitant given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1005. [Moderate] Study

Aprepitant is predicted to increase the exposure to tolterodine. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4, p. 669. [Moderate] Study

Aprepitant is predicted to increase the exposure to trazodone. [Moderate] Theoretical

www.getintopharma.com
Aprepitant (continued)

▶ Aprepitant decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe)

Anecdotal

▶ Aprepitant is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Severe) Study

▶ Aprepitant is predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical

▶ Aprepitant is predicted to increase the exposure to zopiclone. (Moderate) Study

Argatroban → see TABLE 3 p. 1375 (anticoagulant effects)

▶ Ranibizumab is predicted to increase the risk of bleeding events when given with argatroban. (Severe) Theoretical

Aripiprazole → see TABLE 8 p. 1376 (hypotension), TABLE 11 p. 1377 (CNS depressive effects)

▶ Antidepressants (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. (Moderate) Study → Also see TABLE 11 p. 1377

▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. (Moderate) Study

▶ Bupropion is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. (Moderate) Study

▶ Cinacalcet is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. (Moderate) Study

▶ Cocistat is predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. (Moderate) Study

▶ Aripiprazole is predicted to decrease the effects of dopamine receptor antagonists. (Moderate) Theoretical → Also see TABLE 8 p. 1376

▶ Enalapril is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. (Moderate) Study

▶ Aripiprazole is predicted to increase the risk of cardiovascular side-effects when given with tannic acid (deferiprone). (Severe) Theoretical

▶ Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with iron chelators (desferrioxamine). (Severe) Theoretical

▶ Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with iron chelators. (Severe) Theoretical

▶ Ascorbic acid is predicted to increase the effects of levodopa. Adjust dose. (Severe) Theoretical → Also see TABLE 8 p. 1376

▶ Asparaginase → see TABLE 1 p. 1375 (hepatotoxicity), TABLE 15 p. 1378 (myelosuppression)

▶ Asparaginase is predicted to increase the risk of hepatotoxicity when given with imatinib. (Severe) Theoretical → Also see TABLE 15 p. 1378

▶ Asparaginase affects the efficacy of methotrexate. (Severe)

Anecdotal → Also see TABLE 1 p. 1375 → Also see TABLE 15 p. 1378

▶ Asparaginase potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 5 to 24 hours before asparaginase, p. 933. (Severe)

Anecdotal → Also see TABLE 1 p. 1375 → Also see TABLE 15 p. 1378

Aspirin → see 4 p. 1375 (antiplatelet effects)

▶ Acetazolamide increases the risk of severe toxic reaction when given with aspirin (high-dose). (Severe) Study

▶ Antacids decreases the absorption of aspirin (high-dose). (Moderate) Study

▶ Aspirin (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). (Moderate) Study

▶ Aspirin (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with corticosteroids. (Moderate) Study

▶ Aspirin (high-dose) increases the risk of renal impairment when given with bisphosphonates (sodium clodronate). (Severe) Theoretical

▶ Corticosteroids are predicted to decrease the concentration of aspirin (high-dose) and aspirin (high-dose) increases the risk of gastrointestinal bleeding when given with corticosteroids. (Moderate) Study

▶ Aspirin (high-dose) increases the risk of renal impairment when given with dapomycin. (Moderate) Theoretical

▶ Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with aspirin (high-dose). (Severe) Theoretical

▶ Aspirin (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with iron chelators (deferasirox). (Severe) Theoretical

▶ Aspirin (high-dose) is predicted to increase the risk of toxicity when given with methotrexate. (Severe) Study

▶ Aspirin is predicted to increase the risk of gastrointestinal perforation when given with nicorandil. (Severe) Theoretical

▶ Aspirin (high-dose) potentially increases the exposure to pemetrexed. Use with caution or avoid. (Severe) Theoretical

▶ Aspirin (high-dose) increases the risk of acute renal failure when given with thiazide diuretics. (Severe) Theoretical

▶ Zidovudine increases the risk of haematological toxicity when given with aspirin (high-dose). (Severe) Study

Aralen

▶ Aralen is predicted to increase the risk of nephrotoxicity when given with intravenous aminoglycosides. Avoid. (Severe) Study

▶ Rifampicin decreases the exposure to aralen. (Moderate) Study

Azithromycin → see HIV-protease inhibitors

Atenolol → see beta blockers, selective

Atexozilumab → see monoclonal antibodies

Atomoxetine

▶ Amphetamines are predicted to increase the risk of side-effects when given with atomoxetine. (Severe) Theoretical

▶ Atomoxetine is predicted to increase the risk of cardiovascular side-effects when given with beta agonists (high-dose). (Moderate) Study

▶ Bupropion is predicted to markedly increase the exposure to atomoxetine. Adjust dose. (Severe) Study

▶ Cinacalcet is predicted to markedly increase the exposure to atomoxetine. Adjust dose. (Severe) Study

▶ Eliglustat is predicted to increase the exposure to atomoxetine. Adjust dose. (Moderate) Theoretical

▶ Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with atomoxetine. Avoid and for 2 weeks after stopping the MAOI. (Severe) Theoretical

▶ Panobasinostat is predicted to increase the exposure to atomoxetine. Monitor and adjust dose. (Severe) Theoretical

▶ SSRIs (fluoxetine, paroxetine) are predicted to markedly increase the exposure to atomoxetine. Adjust dose. (Severe) Study

▶ Terbutaline is predicted to markedly increase the exposure to atomoxetine. Adjust dose. (Severe) Study

www.getintopharma.com
Atorvastatin → see statins
Atovaquone → see antimalarials
Atracurium → see neuromuscular blocking drugs, non-depolarising
Atropine → see TABLE 10 p. 1377 (antimuscarinics)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Atropine increases the risk of severe hypertension when given with sympathomimetics, vasoconstrictor (phenylephrine). [Severe] Study

Avanafil → see phosphodiesterase type-5 inhibitors
Avelumab → see monoclonal antibodies
Axitinib → see TABLE 15 p. 1378 (myelosuppression)
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to axitinib. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to axitinib. [Moderate] Study

Aprepitant is predicted to increase the exposure to axitinib. [Moderate] Theoretical

Bosantan is predicted to decrease the exposure to axitinib. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to axitinib. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

Crizotinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1378

Efavirenz is predicted to decrease the exposure to axitinib. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to axitinib. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 1378

Imatinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1378

Macrolides (clarithromycin) are predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

Macrolides (erythromycin) are predicted to increase the exposure to axitinib. [Moderate] Theoretical

Netupitant is predicted to increase the exposure to axitinib. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to axitinib. [Moderate] Theoretical

Nilotinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1378

Axitinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical

Axitinib is predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

St John’s Wort is predicted to decrease the exposure to axitinib. [Moderate] Theoretical

Azeleotide is predicted to increase the exposure to axitinib. [Moderate] Theoretical

ACE inhibitors are predicted to increase the risk of anaemia and/or leucopenia when given with azathioprine. [Severe] Anecdotal

Allopurinol potentially increases the risk of haematological toxicity when given with azathioprine. Adjust azathioprine dose, p. 836. [Severe] Study

Azathioprine decreases the anticoagulant effect of coumarins. [Moderate] Study

Febuxostat is predicted to increase the exposure to azathioprine. Avoid. [Severe] Theoretical

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with azathioprine (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Azelastine is predicted to increase antihistamines, non-sedating

Azilsartan is predicted to increase angiotensin-1 receptor antagonists

Azithromycin is predicted to increase macrolides

Bacillus Calmette-Guérin vaccine is predicted to increase live vaccines

Baclofen is predicted to increase the risk of generalised infection (possibly life-threatening) when given with levodob. [Severe] Anecdotal → Also see TABLE 8 p. 1376

Balsalazide is predicted to increase the concentration of digoxin. [Moderate] Theoretical

Bambuterol is predicted to increase beta, agonists

Bacitracin is predicted to increase exposure to baricitinib. [Theoretical] Theoretical

Baricitinib is predicted to increase exposure to baricitinib. [Theoretical] Theoretical

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with baricitinib. Avoid. [Severe] Theoretical

Teriflunomide potentially increases the exposure to baricitinib. [Moderate] Theoretical

Basiliximab is predicted to increase monoclonal antibodies

Bazedoxifene is predicted to increase the exposure to baricitinib. [Moderate] Theoretical

Bedaquiline is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1377

Baclofen is predicted to increase the exposure to bedaquiline. [Mild] Theoretical → Also see TABLE 9 p. 1377

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bazedoxifene. [Moderate] Theoretical

rifampin is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 1 p. 1375

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 1 p. 1375

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1377

Aprepitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Bosantan is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Clonazepam is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

cyclosporine is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Etravirine is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 1377

Bedaquiline is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Etravirine is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study

Interactions | Appendix 1

A1
Bedaquiline – Beta blockers, selective

**BNF 78**

**Bedaquiline (continued)**

- **Ibalizumab** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. **[Mild] Study**
- **Iloperidone** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. **[Mild] Study**

- **Macrolides (erythromycin)** are predicted to increase the exposure to bedaquiline. Avoid prolonged use. **[Mild] Study**
  - Also see **TABLE 9** p. 1377
- **Macrolides (clarithromycin)** are predicted to increase the exposure to bedaquiline. Avoid prolonged use. **[Mild] Study**
  - Also see **TABLE 9** p. 1377

- **Mitotane** decreases the exposure to bedaquiline. Avoid. **[Severe] Study**
- **Netupitant** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. **[Mild] Study**
- **Nevirapine** is predicted to decrease the exposure to bedaquiline. Avoid. **[Severe] Study**
- **Nilotinib** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. **[Mild] Study**
  - Also see **TABLE 9** p. 1377
- **Rifampicin** decreases the exposure to bedaquiline. Avoid. **[Severe] Study**
- **St John’s Wort** is predicted to decrease the exposure to bedaquiline. Avoid. **[Severe] Study**

**Bee venom extract**

**GENERAL INFORMATION** Desensitising vaccines should be avoided in patients taking beta-blockers (adenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

**Belatacept**

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belatacept. Public Health England advises avoid (refer to Green Book). **[Severe] Theoretical**
- **Belimumab** → to monoclonal antibodies
- **Bendamustine** → to alkylating agents
- **Bendroflumethiazide** → to thiazide diuretics
- **Benperidol** → to see TABLE 8 p. 1376 (hypotension), **TABLE 11** p. 1377 (CNS depressant effects)
  - Also see **TABLE 8** p. 1376
- **Benperidol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. **[Moderate] Theoretical**
  - Also see **TABLE 8** p. 1376
- **Benperidol** is predicted to decrease the effects of **guanethidine**. **[Moderate] Theoretical**
  - Also see **TABLE 8** p. 1376
- **Benperidol** is predicted to decrease the effects of **levodopa**. **[Severe] Study**
  - Also see **TABLE 8** p. 1376
- **Benzydamine** → to see NSAIDs
- **Benzylenepinilic acid** → to see penicillins
- **Beta blockers, non-selective** → to see TABLE 8 p. 1376 (bradycardia), **TABLE 9** p. 1376 (C/F-interval prolongation)
  - Also see **TABLE 6** p. 1376

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application of levobunolol and timolol, the possibility of interactions should be borne in mind.

- **Beta blockers, non-selective** are predicted to increase the risk of bronchospasms when given with **aminophylline**. Avoid. **[Severe] Theoretical**
- **Antithrombosis (aminodarone, disopyramide, dronedarone, flecainide, lidocaine)** are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Use with caution or avoid. **[Severe] Study**
  - Also see **TABLE 6** p. 1376
  - Also see **TABLE 9** p. 1377
- **Antithrombosis (propafenone)** increase the risk of cardiovascular side-effects when given with propranolol. Use with caution or avoid. **[Severe] Study**
- **Antithrombosis (propafenone)** are predicted to increase the exposure to timolol and timolol is predicted to increase the risk of cardiodepression when given with **antithrombosis (propafenone)**. **[Severe] Aneucleate**
- **Antithrombosis (propafenone)** are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective (labetalol, levobunolol, nadolol, pindolol, sotalol). Use with caution or avoid. **[Severe] Study**

- **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. **[Moderate] Aneucleate**
  - Also see **TABLE 6** p. 1376
- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to **propranolol**. **[Moderate] Study**
- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to beta blockers, non-selective (carvedilol, labetalol). **[Moderate] Theoretical**
- **Antifungals, azoles** (itraconazole, ketoconazole) are predicted to increase the exposure to **nadolol**. **[Moderate] Study**
- **Antimalarials (mefloquine)** are predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. **[Severe] Theoretical**
- **Calcium channel blockers (diltiazem)** are predicted to increase the risk of cardiodepression when given with beta blockers, non-selective. **[Severe] Study**
  - Also see **TABLE 6** p. 1376
  - Also see **TABLE 8** p. 1376
- **Intravenous calcium channel blockers (verapamil)** increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. **[Severe] Study**
  - Also see **TABLE 6** p. 1376
  - Also see **TABLE 8** p. 1376
- **Oral calcium channel blockers (verapamil)** increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. **[Severe] Study**
  - Also see **TABLE 6** p. 1376
  - Also see **TABLE 8** p. 1376
- **Ciclosporin** is predicted to increase the exposure to **nadolol**. **[Moderate] Study**
- **Eliglustat** is predicted to increase the exposure to **propranolol**. Adjust dose. **[Moderate] Study**
- **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergometrine**. **[Severe] Study**
- **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with **ergotamine**. **[Severe] Study**
- **HIV-protase inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **nadolol**. **[Moderate] Study**
- **Beta blockers, non-selective** are predicted to increase the risk of bradycardia when given with **lanreotide**. **[Moderate] Theoretical**
- **Lapatinib** is predicted to increase the exposure to **nadolol**. **[Moderate] Study**
- **Macrolides** are predicted to increase the exposure to **nadolol**. **[Moderate] Study**
- **Propafenone** are predicted to increase the exposure to **nadolol**. **[Moderate] Study**
- **Mexiletine** potentially increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid or monitor. **[Severe] Theoretical**
- **Ranolazine** is predicted to increase the exposure to **nadolol**. **[Moderate] Study**
- **Rifampicin** moderately decreases the exposure to bedaquiline. **[Moderate] Study**
- **Rifapentine** decreases the exposure to **propranolol**. Monitor and adjust dose. **[Moderate] Study**
- **Propranolol** slightly to moderately increases the exposure to **rifazatran**. Adjust **rifazatran** dose and separate administration by at least 2 hours. **[Moderate] Study**
- **Sildenafil** (fluvoxamine) moderately increase the concentration of **propranolol**. **[Moderate] Study**
- **Beta blockers, non-selective** increase the risk of hypertension and bradycardia when given with **sympathomimetics, inotropic (dobutamine)**. **[Severe] Theoretical**
- **Beta blockers, non-selective** are predicted to increase the risk of hypertension and bradycardia when given with **sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine)**. **[Severe] Study**
- **Beta blockers, non-selective** are predicted to increase the risk of bronchospasms when given with theophylline. Avoid. **[Severe] Theoretical**
- **Vemurafenib** is predicted to increase the exposure to **nadolol**. **[Moderate] Study**

**Beta blockers, selective** → to see **TABLE 6** p. 1376 (bradycardia), **TABLE 8** p. 1376 (hypotension)
• Since systemic absorption can follow topical application of betaxolol, the possibility of interactions should be borne in mind.

• Orange juice greatly decreases the exposure to celiprolol.

• Abiraterone is predicted to increase the exposure to metoprolol. (Moderate) Study

• Beta blockers, selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. (Severe) Theoretical

• Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective. Use with caution or avoid. (Severe) Study → Also see TABLE 6 p. 1376

• Antiarrhythmics (propafenone) are predicted to increase the exposure to metoprolol. (Moderate) Study

• Antiarrhythmics (propafenone) are predicted to increase the exposure to nebivolol and nebivolol is predicted to increase the risk of cardiodepression when given with antiarrhythmics (propafenone). Avoid. (Severe) Theoretical

• Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective. (Moderate) Anecdotal → Also see TABLE 6 p. 1376

• Antiparkinsonians (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, selective (acebutolol, bisoprolol, metoprolol, esmolol). Use with caution or avoid. (Severe) Study

• Anticholinesterases, centrally acting are predicted to increase the risk of bradycardia when given with beta blockers, selective. (Moderate) Study → Also see TABLE 6 p. 1376

• Antiinflammatories (mefloquine) are predicted to increase the risk of bradycardia when given with beta blockers, selective. (Moderate) Study

• Bupropion is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study

• Calcium channel blockers (diltiazem) are predicted to increase the risk of cardiodepression when given with beta blockers, selective. (Severe) Study → Also see TABLE 6 p. 1376 → Also see TABLE 8 p. 1376

• Intravenous calcium channel blockers (verapamil) increase the risk of cardiovascular side-effects when given with beta blockers, selective. (Moderate) Study → Also see TABLE 6 p. 1376 → Also see TABLE 8 p. 1376

• Oral calcium channel blockers (verapamil) increase the risk of cardiovascular side-effects when given with beta blockers, selective. (Severe) Study → Also see TABLE 6 p. 1376 → Also see TABLE 8 p. 1376

• Cinacalcet is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study

• Duloxetine is predicted to increase the exposure to metoprolol. (Moderate) Study

• Eliglustat is predicted to increase the exposure to metoprolol. Adjust dose. (Moderate) Study

• Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. (Severe) Study

• Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. (Severe) Study

• Grapefruit juice greatly decreases the exposure to celiprolol. (Moderate) Study

• HIV- protease inhibitors (ritonavir) are predicted to increase the exposure to metoprolol. (Moderate) Study

• Beta blockers, selective are predicted to increase the risk of bradycardia when given with lanreotide. (Moderate) Theoretical

• Mexiletine potentially increases the risk of cardiovascular side-effects when given with beta blockers, selective. Avoid or monitor. (Severe) Theoretical

• Mirabegron is predicted to increase the exposure to metoprolol. (Moderate) Study

• Panobinostat is predicted to increase the exposure to metoprolol. Monitor and adjust dose. (Moderate) Theoretical

• Panobinostat is predicted to increase the exposure to nebivolol. Monitor and adjust dose. (Mild) Theoretical

• Rifampicin slightly decreases the exposure to beta blockers, selective (bisoprolol, metoprolol). (Mild) Study

• Rifampicin moderately decreases the exposure to celecoxib. (Moderate) Study

• Rolipram is predicted to moderately increase the exposure to metoprolol. (Severe) Study

• SSRIs (fluvastatin, paroxetine) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study

• Beta blockers, selective increase the risk of hypertension and bradycardia when given with sympathomimetics, isotropic (dobutamine). (Moderate) Theoretical

• Beta blockers, selective are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Severe) Study

• Terbinfine is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study

• Beta blockers, selective are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. (Severe) Theoretical

• Beta, agonists → see TABLE 17 p. 1379 (reduced serum potassium)

• Bambuterol - formoterol - indacaterol - olodaterol - salbutamol - salmeterol - terbutaline - vilanterol

• Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the exposure to salmeterol. Avoid. (Severe) Study

• Apalutamide is predicted to decrease the exposure to salmeterol. Avoid or monitor. (Moderate) Study

• Aprileptin is predicted to increase the exposure to salmeterol. (Moderate) Study

• Atorvastatin is predicted to increase the risk of cardiovascular side-effects when given with beta, agonists (high-dose). Avoid. (Severe) Study

• Cobicistat is predicted to increase the exposure to salmeterol. Avoid. (Severe) Study

• HIV-protease inhibitors are predicted to increase the exposure to salmeterol. Avoid. (Severe) Study

• Idecalisib is predicted to increase the exposure to salmeterol. Avoid. (Severe) Study

• Beta, agonists are predicted to increase the risk of glaucoma when given with ipratropium. (Moderate) Anecdotal

• Beta, agonists are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. (Severe) Theoretical

• Macrolides (clarithromycin) are predicted to increase the exposure to salmeterol. Avoid. (Severe) Study

• Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of cardiovascular side-effects when given with beta, agonists. (Moderate) Anecdotal

• Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of severe hypertension when given with beta, agonists. (Severe) Theoretical

• Netupitant is predicted to increase the exposure to salmeterol. (Moderate) Study

• Beta-histamine

• Antihistamines, non-sedating are predicted to decrease the effects of beta-histamine. (Moderate) Theoretical

• Antihistamines, sedating are predicted to decrease the effects of beta-histamine. (Moderate) Theoretical

• Betamethasone → see corticosteroids

• Betaxolol → see beta blockers, selective

• Bevacizumab → see monoclonal antibodies

• Bexarotene → see retinoids

• Bezlafibrate → see fibrates

• Bicalutamide

• Bicalutamide is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

• Bictegravir

• Antacids decrease the exposure to bictegravir. Separate administration by at least 2 hours. (Moderate) Study
Bictegravir

Interactions

- **Antituberculars** (rifampicin, isoniazid) are predicted to decrease the absorption of oral bictegravir. Separate administration by at least 2 hours. [Moderate] Study
- **Bleomycin** is predicted to decrease the absorption of oral bictegravir. Avoid oral for 2 hours before or 1 hour after bictegravir. [Moderate] Theoretical
- **Bleomycin** decreases the absorption of oral alkaline earth salts. Avoid oral for 2 hours before or 1 hour after bictegravir. Separate administration by at least 2 hours. [Moderate] Study
- **Bleomycin** is predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Study
- **Bleomycin** is predicted to decrease the absorption of oral Rashid. Separate administration by at least 2 hours. [Moderate] Study
- **Bleomycin** is predicted to decrease the absorption of oral alkaline earth salts. Avoid oral for 2 hours before or 1 hour after bictegravir. Separate administration by at least 2 hours. [Moderate] Study
- **Bleomycin** is predicted to increase the absorption of oral bictegravir. Avoid oral for 2 hours before or 1 hour after bictegravir. Separate administration by at least 2 hours. [Moderate] Study
- **Bleomycin** is predicted to decrease the absorption of oral bictegravir. Avoid oral for 2 hours before or 1 hour after bictegravir. Separate administration by at least 2 hours. [Moderate] Study
- **Bleomycin** is predicted to decrease the absorption of oral bictegravir. Avoid oral for 2 hours before or 1 hour after bictegravir. Separate administration by at least 2 hours. [Moderate] Study
- **Cobicistat** slightly increases the exposure to **bortezomib**.
  - Study
- **Enalaprilat** slightly decreases the exposure to **bortezomib**. Avoid. (Severe) Study
- HIV-protease inhibitors slightly increase the exposure to **bortezomib**. (Moderate) Study
- **Ilealitis** slightly increases the exposure to **bortezomib**. (Moderate) Study → Also see TABLE 15 p. 1378
- **Macrolides (clarithromycin)** slightly increase the exposure to **bortezomib**. (Moderate) Study
- **Mitotane** slightly decreases the exposure to **bortezomib**. Avoid. (Severe) Study → Also see TABLE 15 p. 1378
- **Rifampicin** slightly decreases the exposure to **bortezomib**. Avoid. (Severe) Study

**Bosentan**

- **Bosentan** is predicted to decrease the exposure to antiarrhythmics (dronedarone). (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) affect the exposure to **bosentan**. Avoid. (Severe) Study
- **Antifungals, azoles (fluconazole)** are predicted to increase the exposure to **bosentan**. Avoid. (Severe) Study
- **Antifungals, azoles (itraconazole)** are predicted to increase the exposure to **bosentan**. (Moderate) Theoretical
- **Antifungals, azoles (ketoconazole)** moderately increase the exposure to **bosentan**. (Severe) Study
- **Antifungals, azoles (voriconazole)** are predicted to increase the exposure to **bosentan**. Avoid. (Severe) Study
- **Bosentan** is predicted to decrease the exposure to antipiptan. (Moderate) Study
- **Bosentan** is predicted to decrease the exposure to arixtinib. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to bedaquiline. Avoid. (Severe) Study
- **Bosentan** is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical
- **Bosentan** is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- **Bosentan** is predicted to decrease the exposure to cabazitaxel. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine). Monitor and adjust dose. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to caripazine. Avoid. (Severe) Study
- **Cephalosporins (cefotibiprole)** are predicted to increase the exposure to **bosentan**. (Moderate) Theoretical
- **Bosentan** moderately decreases the exposure to ciclosporin and ciclosporin moderately increases the exposure to **bosentan**. Avoid. (Severe) Study
- **Bosentan** is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical
- **Bosentan** is predicted to decrease the exposure to cobimetinib. Avoid. (Severe) Theoretical
- **Bosentan** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Study
- **Bosentan** decreases the anticoagulant effect of **coumarins**. (Moderate) Study
- **Bosentan** is predicted to decrease the exposure to crizotinib. Avoid. (Severe) Theoretical
- **Bosentan** is predicted to decrease the exposure to dasatinib. Avoid. (Severe) Study
- **Bosentan** is predicted to decrease the exposure to desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical
- **Bosentan** decreases the exposure to dolutegravir. Adjust dose. (Severe) Study
- **Bosentan** is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose, p. 644. (Severe) Theoretical
- **Bosentan** is predicted to moderately decrease the exposure to elbasvir. Avoid. (Severe) Study
- **Bosentan** is predicted to decrease the exposure to eliglustat. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the concentration of elteligravir. Avoid. (Severe) Study
- **Enalaprilat** affects the exposure to bosentan. Avoid. (Severe) Study
- **Bosentan** is predicted to decrease the effects of ergotamine. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to erlotinib. (Severe) Theoretical
- **Bosentan** is predicted to decrease the effcacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical
- **Bosentan** is predicted to decrease the exposure to gefitinib. Avoid. (Severe) Study
- **Bosentan** is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- **Bosentan** is predicted to decrease the exposure to fosapirant. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to gliclazepir. Avoid. (Severe) Study
- **Bosentan** is predicted to markedly decrease the exposure to grazoprevir. Avoid. (Severe) Study
- **Bosentan** is predicted to decrease the concentration of guanfacine. Adjust dose. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to **bosentan**. (Severe) Study
- **Bosentan** is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal
- **Bosentan** is predicted to decrease the exposure to idelalisib. Avoid. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to imatinib. (Moderate) Study
- **Bosentan** is predicted to decrease the exposure to icatibant. (Severe) Theoretical
- **Bosentan** is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study
- **Leflunomide** is predicted to increase the exposure to **bosentan**. (Moderate) Study
- **Letermovir** is predicted to increase the concentration of **bosentan**. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical
- **Bosentan** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. (Moderate) Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to bosentan. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to maraviroc. Avoid. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the concentration of midazolam. Monitor and adjust dose. (Moderate) Theoretical
- **Mitotane** affects the exposure to **bosentan**. Avoid. (Severe) Study
- **Bosentan** is predicted to decrease the exposure to netupitant. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to nevirapine. Avoid. (Severe) Theoretical
- **Bosentan** is predicted to decrease the exposure to nilotinib. Avoid. (Severe) Theoretical
- **Bosentan** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal
- **Bosentan** is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- **Bosentan** decreases the exposure to opioids (methadone). Avoid. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to osimertinib. Avoid. (Moderate) Theoretical
- **Bosentan** is predicted to decrease the exposure to ospemifene. Avoid. (Moderate) Study

For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal.
Bosentan (continued)

- **Bosentan** is predicted to decrease the exposure to **paritaprevir** (with ritonavir and obitavir). Avoid. **Severe** Study
- **Bosentan** decreases the exposure to **phosphodiesterase type-5 inhibitors**. **Moderate** Study
- **Bosentan** is predicted to decrease the exposure to **pibrentasvir**. Avoid. **Severe** Study
- **Bosentan** is predicted to decrease the exposure to **quetiapine**. **Moderate** Study
- **Bosentan** is predicted to decrease the exposure to **ribozidovir**. Avoid. **Moderate** Study
- **rifampin** affects the exposure to **bosentan**. Avoid. **Severe** Study
- **Bosentan** is predicted to decrease the exposure to **rolapitant**. Avoid. **Severe** Study
- **Bosentan** is predicted to decrease the exposure to **ruuxolitinib**. Monitor and adjust dose. **Moderate** Theoretical
- **Bosentan** is predicted to decrease the concentration of **sirolimus** and **sirolimus** potentially increases the concentration of **bosentan**. Avoid. **Severe** Theoretical
- **st John’s Wort** is predicted to decrease the exposure to **bosentan**. Avoid. **Moderate** Theoretical
- **Bosentan** slightly decreases the exposure to **statins** (**simvastatin**). **Moderate** Study
- **Bosentan** moderately decreases the exposure to **statins** (**atorvastatin**). **Rigi** Study
- **Bosentan** increases the risk of hepatotoxicity when given with **sulfonilureas** (**glipizidamide**). Avoid. **Severe** Study
- **Bosentan** is predicted to decrease the concentration of **tacrolimus** and **taclorolimus** potentially increases the concentration of **bosentan**. Avoid. **Severe** Theoretical
- **Bosentan** is predicted to decrease the exposure to **taxanes** (**cabazitaxel**). Avoid. **Severe** Study
- **Bosentan** is predicted to decrease the concentration of **temsirolimus**. Avoid. **Severe** Theoretical
- **Teriflunomide** is predicted to increase the exposure to **bosentan**. **Moderate** Study
- **Bosentan** is predicted to decrease the exposure to **ticagrelor**. **Moderate** Study
- **Bosentan** is predicted to decrease the exposure to **tofacitinib**. **Moderate** Study
- **Bosentan** decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 794. **Severe** Aneodical
- **Bosentan** is predicted to decrease the exposure to **velpatasvir**. Avoid. **Moderate** Theoretical
- **Bosentan** is predicted to decrease the exposure to **venetoclax**. Avoid. **Severe** Study
- **Venetoclax** is predicted to increase the exposure to **bosentan**. **Moderate** Theoretical
- **Bosentan** is predicted to decrease the concentration of **voxilaprevir**. Avoid. **Severe** Theoretical

**Bosutinib** ➔ **Table** 15 p. 1378 (myositis suppression), **Table** 9 p. 1377

- **Antacids** are predicted to decrease the absorption of **bosutinib**. **Severe** Study
- **Bosutinib** should be taken at least 12 hours before **antacids**. **Severe** Theoretical
- **Antineoplastic drugs** (**dronedarone**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Theoretical ➔ Also see **Table** 9 p. 1377
- **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to very markedly decrease the exposure to **bosutinib**. Avoid. **Severe** Study
- **Antifungals**, **azole** (**fluconazole**, **itraconazole**, **posesaconazole**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Theoretical ➔ Also see **Table** 9 p. 1377
- **Antifungals**, **azole** (**itraconazole**, **ketocanozole**, **voriconazole**) are predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Study ➔ Also see **Table** 9 p. 1377
- **Apalutamid** is predicted to decrease the exposure to **bosutinib**. Avoid or monitor. **Moderate** Study ➔ Also see **Table** 9 p. 1377
- **Aprepitant** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Theoretical
- **Bosentan** is predicted to decrease the exposure to **bosutinib**. Avoid. **Severe** Theoretical
- **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Theoretical
- **Cobicistat** is predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Study
- **Bosutinib** is predicted to increase the risk of bleeding events when given with **coumarins**. **Severe** Theoretical
- **Crizotinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Theoretical ➔ Also see **Table** 15 p. 1378 ➔ Also see **Table** 9 p. 1377
- **Elavirenz** is predicted to decrease the exposure to **bosutinib**. Avoid. **Severe** Theoretical ➔ Also see **Table** 9 p. 1377
- **Enzalutamide** is predicted to very markedly decrease the exposure to **bosutinib**. Avoid. **Severe** Study
- **Etravirine** is predicted to decrease the exposure to **bosutinib**. **Severe** Theoretical
- **Fosaprepitant** is predicted to increase the exposure to **bosutinib**. **Severe** Theoretical
- **Grapefruit juice** is predicted to increase the exposure to **bosutinib**. **Severe** Theoretical
- **H2 receptor antagonists** are predicted to decrease the absorption of **bosutinib**. **Moderate** Theoretical
- **HIV-protase inhibitors** are predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Study ➔ Also see **Table** 9 p. 1377
- **Idelalisib** is predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Study ➔ Also see **Table** 15 p. 1378
- **Imatinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Theoretical ➔ Also see **Table** 15 p. 1378
- **Macrolides** (**clarithromycin**) are predicted to markedly increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Study ➔ Also see **Table** 9 p. 1377
- **Macrolides** (**erythromycin**) are predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Theoretical
- **Mitotane** is predicted to very markedly decrease the exposure to **bosutinib**. Avoid. **Severe** Study ➔ Also see **Table** 15 p. 1378
- **Modafinil** is predicted to decrease the exposure to **bosutinib**. Avoid. **Severe** Study
- **Netupitant** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Theoretical
- **Nevirapine** is predicted to decrease the exposure to **bosutinib**. Avoid. **Severe** Theoretical
- **Nilotinib** is predicted to increase the exposure to **bosutinib**. Avoid or adjust dose. **Severe** Theoretical ➔ Also see **Table** 15 p. 1378 ➔ Also see **Table** 9 p. 1377
- **Bosutinib** is predicted to increase the risk of bleeding events when given with **phenindione**. **Severe** Theoretical
- **Pitolisant** is predicted to decrease the exposure to **bosutinib**. **Severe** Theoretical
- **Proton pump inhibitors** are predicted to decrease the absorption of **bosutinib**. **Moderate** Study
- **rifampin** is predicted to very markedly decrease the exposure to **bosutinib**. **Severe** Study
- **St John’s Wort** is predicted to decrease the exposure to **bosutinib**. **Severe** Theoretical

**Botulinum toxin type A** ➔ **Table** 20 p. 1379 (neuromuscular blocking effects)

**Botulinum toxin type B** ➔ **Table** 20 p. 1379 (neuromuscular blocking effects)

**Bowel cleansing preparations**

**SEPARATION OF ADMINISTRATION** Other oral drugs should not be taken 1 hour before, or after, administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

Brentuximab vedotin → see monoclonal antibodies

Brigatinib

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to brigatinib. Adjust brigatinib dose, p. 971. (Severe) Study
- Bosentan is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- Cobicistat is predicted to increase the exposure to brigatinib. Adjust brigatinib dose, p. 971. (Severe) Study
- Brigatinib decreases the exposure to combined hormonal contraceptives. Use additional contraceptive precautions. (Severe) Theoretical
- Brigatinib potentially increases the concentration of dabigatran. (Moderate) Theoretical
- Brigatinib potentially increases the concentration of digoxin. (Moderate) Theoretical
- Efavirenz is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- Enalapril is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- Etravirine is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- HIV- protease inhibitors are predicted to increase the exposure to brigatinib. Adjust brigatinib dose, p. 971. (Severe) Study
- Idealab is predicted to increase the exposure to brigatinib. Adjust brigatinib dose, p. 971. (Severe) Study
- Macrolides (clarithromycin) are predicted to increase the exposure to brigatinib. Adjust brigatinib dose, p. 971. (Severe) Study
- Brigatinib potentially increases the concentration of methotrexate. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- Nevirapine is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- Brigatinib potentially decreases the concentration of opioids (alfentanil, fentanyl). Avoid. (Moderate) Theoretical
- Rifabutin is predicted to decrease the exposure to brigatinib. Avoid. (Moderate) Theoretical
- Rifampicin is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- Brigatinib potentially decreases the concentration of sirolimus. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to brigatinib. Avoid. (Severe) Study
- Brigatinib potentially decreases the concentration of tacrolimus. Avoid. (Moderate) Theoretical
- Brimonidine → see TABLE 6 p. 1376 (bradycardia), TABLE 8 p. 1376 (hypotension), TABLE 11 p. 1377 (CNS depressant effects)

Brinzolamide

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Brivaracetam → see antiepileptics
- Brodalumab → see monoclonal antibodies
- Bromfenac → see NSAIDs
- Bromocriptine → see dopamine receptor agonists
- Bucizine → see antihistamines, sedating
- Budesonide → see corticosteroids
- Bumetanide → see loop diuretics
- Bupivacaine → see anaesthetics, local
- Buprenorphine → see opioids
- Bupropion → see TABLE 13 p. 1378 (serotonin syndrome)
- Bupropion is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to bupropion. (Severe) Study
- Antiepileptics (valproate) increase the exposure to bupropion. (Severe) Study
- Antifungals, azoles (isavuconazole) slightly increase the exposure to bupropion. Adjust dose. (Moderate) Study
- Bupropion is predicted to moderately increase the exposure to ariperiprazole. Adjust ariperiprazole dose, p. 295. (Moderate) Study
- Bupropion is predicted to markedly increase the exposure to atorvastatin. Adjust dose. (Severe) Study
- Bupropion is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). (Moderate) Study
- Bupropion is predicted to slightly increase the exposure to darifenacin. (Mild) Study
- Bupropion increases the risk of side-effects when given with dopamine receptor agonists (amantadine). (Moderate) Study
- Efavirenz is predicted to decrease the exposure to bupropion. (Moderate) Study
- Bupropion is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- HIV-protease inhibitors (tritonavir) are predicted to decrease the exposure to bupropion. (Moderate) Study
- Bupropion increases the risk of side-effects when given with levodopa. (Moderate) Study
- Bupropion is predicted to increase the risk of intraoperative hypotension when given with linezolid. (Severe) Anebotol. Also see TABLE 13 p. 1378
- Methylthioninium chloride is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. (Severe) Theoretical → Also see TABLE 13 p. 1378
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of severe hypertension when given with bupropion. Avoid and for 14 days after stopping the MAOI. (Severe) Theoretical → Also see TABLE 13 p. 1378
- Monoamine-oxidase B inhibitors are predicted to increase the risk of severe hypertension when given with bupropion. Avoid. (Moderate) Theoretical → Also see TABLE 13 p. 1378
- Bupropion is predicted to decrease the efficacy of opioids (codeine). (Moderate) Theoretical
- Bupropion is predicted to decrease the efficacy of opioids (tramadol). (Severe) Study → Also see TABLE 13 p. 1378
- Bupropion is predicted to moderately increase the exposure to pipotilzam. Use with caution and adjust dose. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to bupropion. (Moderate) Study
- Bupropion is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study
- Bupropion is predicted to increase the exposure to SSRIs (dapoxetine). (Moderate) Theoretical → Also see TABLE 13 p. 1378
- Bupropion is predicted to decrease the efficacy of tamoxifen. Avoid. (Severe) Study
- Bupropion is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. (Severe) Study → Also see TABLE 13 p. 1378
- Bupropion is predicted to increase the exposure to voriconazole. Monitor and adjust dose. (Moderate) Study → Also see TABLE 13 p. 1378
- Bupropion → see TABLE 13 p. 1378 (serotonin syndrome)
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to bupropione. Use with caution and adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bupropione. Use with caution and adjust dose. (Severe) Study
- Antifungals, azoles (itraconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bupropione. Use with caution and adjust dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to bupropione. Adjust bupropione dose, p. 342. (Severe) Study

www.getintopharma.com
Buspirone (continued)
- Antifungals, azoles (miconazole) are predicted to increase the concentration of buspirone. Use with caution and adjust dose. [Moderate] Theoretical
- Apalutamide is predicted to decrease the exposure to buspirone. Avoid or monitor. [Moderate] Study
- Aprepitant is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
- Aprepitant is predicted to increase the exposure to buspirone. [Moderate] Theoretical
- Cabozantinib, ▶ Cobicistat, ▶ ▶ ▶ Aprepitant is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
- Antiarrhythmics ▶ ▶ ▶ ▶ Nilotinib ▶ ▶ ▶ ▶ ▶ Macrolides ▶ ▶ ▶ HIV-protease inhibitors slightly increase the exposure to cabozantinib. Avoid. [Moderate] Study
- Grapefruit juice is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical ▶ Also see TABLE 9 p. 1377
- Idelalisib slightly increases the exposure to cabozantinib. [Moderate] Study ▶ Also see TABLE 15 p. 1378
- Idelalisib is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical ▶ Also see TABLE 9 p. 1377
- Idelalisib is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical
- Mitotane moderately decreases the exposure to cabozantinib. Avoid. [Moderate] Study ▶ Also see TABLE 15 p. 1378
- Nevirapine is predicted to decrease the exposure to cabozantinib. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to cabozantinib. [Moderate] Theoretical
- HIV-protease inhibitors, irreversible ▶ HIV-protease inhibitors, irreversible
- Rifampicin moderately decreases the exposure to cabozantinib. Avoid. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to cabozantinib. [Moderate] Theoretical
- Theoretical Caffeine citrate
- Caffeine citrate decreases the efficacy of antiarrhythmics (adenosine). Separate administration by 24 hours. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study
- HIV-protease inhibitors (ritonavir) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study
- Nilotinib is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical ▶ Also see TABLE 9 p. 1377
- Cabozantinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Rifampicin moderately decreases the exposure to cabozantinib. Avoid. [Moderate] Study
- Caffeine citrate decreases the clearance of theophylline. [Moderate] Study
- Caffeine citrate decreases the clearance of theophylline. [Moderate] Study
- Calcitriol ▶ see vitamin D substances
- Calcium acetate ▶ see calcium salts
- Calcium carbonate ▶ see calcium salts
- Calcium channel blockers ▶ see TABLE 6 p. 1376 (bradycardia), TABLE 8 p. 1376 (hypotension)
- Amiodipine ▶ clevidine ▶ diltiazem ▶ felodipine ▶ lacidipine ▶ lercanidipine ▶ nicardipine ▶ nifedipine ▶ nimodipine ▶ verapamil
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to abemaciclib. [Moderate] Study
- Calcitriol is predicted to increase the exposure to abemaciclib. [Moderate] Study
- Verapamil is predicted to increase the exposure to abemaciclib. Separate administration by 12 hours. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 193. [Severe] Study ▶ Also see TABLE 8 p. 1376
Verapamil moderately increases the exposure to aliskiren. (Moderate) Study → Also see TABLE 8 p. 1376

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to alpha blockers (tamsulosin). (Moderate) Theoretical → Also see TABLE 13 p. 1376

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to alprazolam. (Severe) Study

Verapamil moderately increases the exposure to anthracyclines (doxorubicin). (Moderate) Study

Antiarhythmics (disopyramide) are predicted to increase the risk of cardiodepression when given with verapamil. (Severe) Theoretical

Antiarhythmics (dronedarone) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

Antiarhythmics (amiodarone) are predicted to increase the risk of cardiodepression when given with calcium channel blockers (diltiazem, verapamil). Avoid. (Severe) Theoretical → Also see TABLE 6 p. 1376

Calcium channel blockers (diltiazem, verapamil) increase the exposure to antiarhythmics (flecainide). (Severe) Anecdotal → Also see TABLE 6 p. 1376

Antiarhythmics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

Diltiazem increases the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). Avoid. (Severe) Anecdotal

Verapamil increases the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) are predicted to decrease the exposure to verapamil. (Severe) Anecdotal

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study

Calcium channel blockers (diltiazem, verapamil) potentially increase the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study

Verapamil increases the risk of cardiodepression when given with beta blockers, non-selective. (Severe) Study → Also see TABLE 6 p. 1376 → Also see TABLE 8 p. 1376

Intravenous verapamil increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. (Severe) Study → Also see TABLE 6 p. 1376 → Also see TABLE 8 p. 1376

Oral verapamil increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. (Severe) Study → Also see TABLE 6 p. 1376 → Also see TABLE 8 p. 1376

Verapamil is predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

Bosantan is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Theoretical

Bosantan is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). (Moderate) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bosutinib. Avoid or adjust dose. (Severe) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to caboazatinib. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study

Antifungals, azoles (posaconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Moderate) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antifungals, azoles (isavuconazole). (Moderate) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). (Severe) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antihistamines, non-sedating (triptamine). Avoid. (Moderate) Study

Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with calcium channel blockers. (Severe) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of antimalarials (piperperazine). (Severe) Theoretical

Aplutamide is predicted to decrease the exposure to calcium channel blockers (felodipine, lercanidipine). Avoid or monitor. (Moderate) Study

Verapamil is predicted to increase the exposure to apixaban. (Moderate) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to aprepitant and aprepitant is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Moderate) Study

Aprepitant is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to axitinib. (Moderate) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Theoretical

Diltiazem is predicted to increase the risk of cardiodepression when given with beta blockers, non-selective. (Severe) Study → Also see TABLE 6 p. 1376 → Also see TABLE 8 p. 1376

Intravenous verapamil increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. (Severe) Study → Also see TABLE 6 p. 1376 → Also see TABLE 8 p. 1376

Oral verapamil increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. (Severe) Study → Also see TABLE 6 p. 1376 → Also see TABLE 8 p. 1376

Verapamil is predicted to increase the exposure to bictegravir. Use with caution or avoid. (Moderate) Theoretical

Bosantan is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Theoretical

Bosantan is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). (Moderate) Theoretical
Calcium channel blockers (continued)

- Calcium channel blockers (diltiazem) are predicted to increase the exposure to calcium channel blockers (amlodipine). Monitor and adjust dose. (Moderate) Study → Also see TABLE 8 p. 1376
- Calcium channel blockers (verapamil) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study → Also see TABLE 8 p. 1376
- Calcium channel blockers (diltiazem) are predicted to increase the exposure to calcium channel blockers (felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study → Also see TABLE 8 p. 1376
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cariprazine. Avoid. (Severe) Study → Also see TABLE 8 p. 1376
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ceritinib. (Moderate) Theoretical Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of ciclosporin. (Severe) Study
- Ciclosporin moderately increases the exposure to lercanidipine. Use with caution or avoid. (Severe) Study
- Nicardipine increases the concentration of ciclosporin. (Severe) Study
- Ciclosporin is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Cobicistat is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study
- Cobicistat is predicted to markedly increase the exposure to lercanidipine. Avoid. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4, p. 1120. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study
- Crizotinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Dapamil increases the exposure to dabigatran. Adjust dabigatran dose, p. 136. (Severe) Study
- Intravenous dantrolene potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with calcium channel blockers (diltiazem, verapamil). Avoid. (Severe) Anecdotal Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to slightly increase the exposure to darifenacin. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dasatinib. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) increase the concentration of digoxin. Monitor and adjust dose. (Severe) Study → Also see TABLE 6 p. 1376
- Calcium channel blockers (diltiazem, verapamil) increase the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dopamine receptor antagonists (bromocriptine). (Severe) Theoretical Study → Also see TABLE 8 p. 1376
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of dopamine receptor antagonists (cabergoline). (Moderate) Anecdotal → Also see TABLE 8 p. 1376
- Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to dutasteride. (Mild) Study
- Verapamil is predicted to slightly increase the exposure to efavirenz. (Severe) Study
- Efavirenz is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Theoretical Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure toeliglustat. Avoid or adjust dose—consult product literature. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to encorafenib. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to calcium channel blockers (amlodipine, verapamil). (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergotamine. (Severe) Theoretical Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fexofenadine. Adjust fexofenadine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 777. (Mild) Study
- Verapamil is predicted to increase the exposure to fidocarbazone. Avoid. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fingolimod. Avoid. (Moderate) Theoretical Study → Also see TABLE 6 p. 1376
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to gefitinib. (Moderate) Theoretical Study
- Grapefruit juice very slightly increases the exposure to amloprofen. Avoid. (Mild) Study
- Grapefruit juice increases the exposure to calcium channel blockers (nifedipine, verapamil). Avoid. (Mild) Study
- Grapefruit juice increases the exposure to felodipine. Avoid. (Mild) Study
- Grapefruit juice is predicted to increase the exposure to lercanidipine. Avoid. (Mild) Study
- Grapefruit juice increases the exposure to nicardipine. Avoid. (Mild) Study
- Grazoprevir is predicted to increase the concentration of calcium channel blockers. (Moderate) Theoretical Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 352. (Moderate) Theoretical Study → Also see TABLE 8 p. 1376
- H₂ receptor antagonists (cimetidine) (high-dose) are predicted to increase the exposure to lercanidipine. (Moderate) Theoretical Study
- H₂ receptor antagonists (cimetidine) moderately increase the exposure to nifedipine. Monitor and adjust dose. (Severe) Study
- H₂ receptor antagonists (cimetidine) increase the exposure to verapamil. (Moderate) Study
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to calcium channel blockers (diltiazem, nimodipine). Monitor and adjust dose. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study
- HIV-protease inhibitors are predicted to markedly increase the exposure to lercanidipine. Avoid. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to irbutinib. Adjust irbutinib dose with moderate inhibitors of CYP3A4, p. 983. (Severe) Study
- Idelalisib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

www.getintopharma.com
Calcium channel blockers — Calcium channel blockers

- **Idelalisib** is predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). **(Severe) Study**
- **Idelalisib** is predicted to markedly increase the exposure to lercanidipine. **Avoid. (Severe) Study**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to imatinib. **(Moderate) Theoretical**
- **Imatinib** is predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. **(Moderate) Study**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to ivabradine. **Avoid. (Moderate) Study** → Also see **TABLE 6** p. 1376
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. **(Severe) Study**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to lapatinib. **(Moderate) Study**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the risk of neurotoxicity when given with lithium. **(Severe) Anecdotal**
- Calcium channel blockers (**amlodipine, lacidipine**) are predicted to increase the exposure to lomitapide. **Separate administration by 12 hours. (Moderate) Theoretical**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to lomustine. **Avoid. (Moderate) Theoretical**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to lurisdione. Adjust lurisdione dose, p. 398. **(Moderate) Study** → Also see **TABLE 8** p. 1376
- Macrolides (**clarithromycin**) are predicted to markedly increase the exposure to lercanidipine. **Avoid. (Severe) Study**
- **Macrolides (erythromycin)** are predicted to increase the exposure to diltiazem. **(Severe) Theoretical**
- Macrolides (**clarithromycin**) are predicted to increase the exposure to verapamil. **(Severe) Study**
- **Macrolides (erythromycin)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. **(Moderate) Study**
- **Macrolides (clarithromycin)** are predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, nifedipine, nimodipine**). Monitor and adjust dose. **(Moderate) Study**
- **Macrolides (clarithromycin)** are predicted to increase the exposure to calcium channel blockers (**diltiazem, verapamil**). **(Severe) Study**
- Intravenous magnesium potentially increases the risk of hypotension when given with calcium channel blockers (**amlodipine, clevidipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil**) (in pregnant women). **(Severe) Anecdotal**
- **Mexiletine** increases the risk of cardiovascular side-effects when given with diltiazem. Avoid or monitor. **(Severe) Theoretical**
- **Mexiletine** potentially increases the risk of cardiovascular side-effects when given with verapamil. Avoid or monitor. **(Severe) Theoretical**
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. **(Severe) Study**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to midostaurin. **(Moderate) Theoretical**
- **Mitotane** is predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine**). Monitor and adjust dose. **(Moderate) Study**
- **Monoclonal antibodies (tocilizumab)** are predicted to decrease the exposure to calcium channel blockers. Monitor and adjust dose. **(Moderate) Theoretical**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects. p. 65. **(Moderate) Study**
- **Netupitant** is predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. **(Moderate) Study**
- **Nevirapine** is predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. **(Moderate) Theoretical**
- **Nevirapine** is predicted to decrease the exposure to calcium channel blockers (**diltiazem, verapamil**). **(Moderate) Theoretical**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to nilotinib. **(Moderate) Theoretical**
- **Nilotinib** is predicted to increase the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine**). Monitor and adjust dose. **(Moderate) Study**
- **Verapamil** is predicted to increase the exposure to nintedanib. **(Moderate) Study**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. **(Moderate) Theoretical**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to opioids (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. **(Moderate) Study** → Also see **TABLE 6** p. 1376
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to pantoprazole. **(Moderate) Theoretical**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to pazopanib. **(Moderate) Theoretical**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (**avanafil**). Adjust avanafil dose, p. 812. **(Moderate) Theoretical** → Also see **TABLE 8** p. 1376
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (**sildenafil**). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. **(Moderate) Study** → Also see **TABLE 8** p. 1376
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (**tadalafil**). **(Severe) Theoretical** → Also see **TABLE 8** p. 1376
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to **givabril**. **(Moderate) Study** → Also see **TABLE 8** p. 1376
- **Verapamil** is predicted to increase the exposure to **fibratestest**. **(Moderate) Theoretical**
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **pimozide**. Avoid. **(Severe) Study** → Also see **TABLE 8** p. 1376
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to ranolazine. **(Severe) Study**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to ranibizumab. **(Moderate) Study**
- **Rifampicin** is predicted to decrease the exposure to calcium channel blockers (**amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine**). Monitor and adjust dose. **(Moderate) Study**
- **Rifampicin** greatly decreases the exposure to calcium channel blockers (**diltiazem, verapamil**). **(Severe) Study**
- **Rifampicin** moderately decreases the exposure to nifedipine. Avoid. **(Severe) Study**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to nortriptyline. **(Moderate) Theoretical**
- Calcium channel blockers (**diltiazem, verapamil**) are predicted to increase the exposure to saxagliptin. **(Mild) Study**
- Calcium channel blockers (**diltiazem, verapamil**) increase the concentration of sirolimus. Monitor and adjust dose. **(Moderate) Study**

Calcium channel blockers (continued)
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose with moderate inhibitors of CYP3A4, p. 821. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- St John's Wort is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Study
- Amlodipine slightly increases the exposure to simvastatin, p. 205. [MG] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 205. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to suntinib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of tacrolimus. [Severe] Study
- Nicardipine potentially increases the concentration of tacrolimus. Monitor concentration and adjust dose. [Severe] Anecdotal
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of temsirolimus. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) given with a potent CYP2C19 inhibitor are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 105. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolorodine, p. 689. [MG] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4, p. 669. [Moderate] Study
- Verapamil is predicted to increase the exposure to toptocan. [Severe] Study
- Verapamil is predicted to increase the concentration of trametinib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to trazodone. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to venooclax. Avoid or adjust dose—consult product literature. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to venooclax. Avoid or adjust dose—consult product literature. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Calcium chloride → see calcium salts
- Calcium gluconate → see calcium salts
- Calcium lactate → see calcium salts
- Calcium phosphate → see calcium salts
- Calcium salts
- Calcium acetate - calcium carbonate - calcium chloride - calcium gluconate - calcium lactate - calcium phosphate

**SEPARATION OF ADMINISTRATION** Calcium carbonate-containing antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.
- Oral calcium salts decrease the absorption of alkylating agents (estramustine). [Severe] Study
- Calcium carbonate decreases the absorption of antimalarials (chloroquine). Separate administration by at least 4 hours. [Moderate] Theoretical
- Calcium carbonate is predicted to decrease the absorption of antimalarials (proguanil). Separate administration by at least 2 hours. [Moderate] Study
- Oral calcium salts decrease the absorption of bisphosphonates (alendronic acid). Alendronic acid should be taken at least 30 minutes before calcium salts. [Moderate] Study
- Oral calcium salts are predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid calcium salts for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
- Oral calcium salts decrease the absorption of bisphosphonates (risendronate). Separate administration by at least 2 hours. [Moderate] Study
- Oral calcium salts decrease the absorption of bisphosphonates (sodium clodronate). Avoid calcium salts for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study
- Calcium carbonate increases the exposure to cannabis extract. Avoid. [Severe] Anecdotal
- Cephalosporins (ceftriaxone) increase the risk of cardiovascular respiratory arrest when given with calcium chloride. Avoid. [Severe] Anecdotal
- Oral calcium salts decrease the concentration of digoxin. Avoid. [Severe] Anecdotal
- Oral calcium salts decrease the absorption of dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after calcium salts. [Moderate] Study
- Oral calcium salts decrease the absorption of eltorblopag. Eltorblopag should be taken 2 hours before or 4 hours after calcium salts. [Severe] Study
- Calcium carbonate decreases the absorption of hydroxychloroquine. Separate administration by at least 4 hours. [Moderate] Study
- Calcium carbonate decreases the absorption of iron (oral). Calcium carbonate should be taken 1 hour before or 2 hours after iron (oral). [Moderate] Study
- Calcium carbonate is predicted to decrease the exposure to ledipasvir. Separate administration by 4 hours. [Moderate] Theoretical
- Calcium carbonate decreases the absorption of quinolones (ciprofloxacin). Separate administration by 2 hours. [Moderate] Study
- Calcium carbonate greatly decreases the exposure to raltegravir (high-dose). Avoid. [Severe] Study
- Calcium carbonate is predicted to decrease the exposure to rifampicin. Calcium carbonate should be taken 2 hours before or 4 hours after rifampirine. [Severe] Theoretical
- Calcium carbonate is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- Thiazide diuretics increase the risk of hypercalcaemia when given with calcium salts. [Severe] Anecdotal
- Oral calcium salts are predicted to decrease the absorption of thyroid hormones (levothyroxine). Separate administration by at least 4 hours. [Moderate] Anecdotal
- Calcium carbonate is predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Anecdotal
- Oral calcium salts decrease the absorption of zinc. [Moderate] Study

**TABLE 14** See Table 14 p. 1378 (antidiabetic drugs), Table 8 p. 1376 (hypotension)
- Rifampicin moderately decreases the exposure to canagliflozin. Adjust canagliflozin dose, p. 702. [Moderate] Study
- Canakinumab → see monoclonal antibodies
- Canesartan → see angiotensin-II receptor antagonists
- Cangrelor → see Table 4 p. 1375 (platelet effects)
- Cannabis extract → see Table 11 p. 1377 (CBD depressant effects)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure...
to **cannabis extract**. Avoid. **[Severe] Theoretical** → Also see TABLE 11 p. 1377

- **Antifungals, azoles** *(itraconazole, ketoconazole, voriconazole)* are predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. **[Moderate] Theoretical**
- **Cobicistat** is predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. **[Moderate] Theoretical**
- **Enzalutamide** is predicted to decrease the exposure to **cannabis extract**. Avoid. **[Severe] Theoretical**
- **HIV-protease inhibitors** are predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. **[Moderate] Theoretical**
- **Idealisib** is predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. **[Moderate] Theoretical**
- **Macrolides (clarithromycin)** are predicted to increase the exposure to **cannabis extract**. Use with caution and adjust dose. **[Moderate] Theoretical**
- **Mitoctane** is predicted to decrease the exposure to **cannabis extract**. Avoid. **[Severe] Theoretical**
- **Rifampicin** is predicted to increase the exposure to **cannabis extract**. Avoid. **[Severe] Theoretical**
- **Capreomycin** → see TABLE 15 p. 1378 (myelosuppression)
- **Allopurinol** is predicted to decrease the effects of **capreomycin**. Avoid. **[Severe] Study**
- **Capreomycin** increases the concentration of **antiepileptics** *(fosphenytoin, phenytoin)*. **[Severe] Anecdotal**
- **Capreomycin** increases the effects of **coumarins**. Monitor INR and adjust dose. **[Moderate] Theoretical**
- **Folates** are predicted to increase the risk of toxicity when given with **capreomycin**. **[Severe] Anecdotal**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **capreomycin**. Public Health England advises avoid (refer to Green Book). **[Severe] Theoretical**
- **Metronidazole** is predicted to increase the risk of capreomycin toxicity when given with **capreomycin**. **[Severe] Theoretical**
- **Capreomycin** → see TABLE 2 p. 1375 (nephrotoxicity), TABLE 19 p. 1379 *(ototoxicity)*
- **Captopril** → see ACE inhibitors
- **Carbamazepine** → see antiepileptics

**Carbenapens**
- erapenem - imipenem - meropenem
- **Carbenapens** decrease the concentration of **antiepileptics** *(valproate)*. Avoid. **[Severe] Anecdotal**
- **Ganciclovir** is predicted to increase the risk of seizures when given with **imipenem**. Avoid. **[Severe] Anecdotal**
- **Valganciclovir** is predicted to increase the risk of seizures when given with **imipenem**. Avoid. **[Severe] Anecdotal**
- **Carbipoda**
  - **Iron (oral)** is predicted to decrease the exposure to **carbipoda**. **[Moderate] Theoretical**
- **Carbimazole** → see TABLE 15 p. 1378 (myelosuppression)
- **Carbimazole** affects the concentration of **digoxin**. Monitor and adjust dose. **[Moderate] Theoretical**
- **Carbimazole** decreases the effects of **metyparone**. Avoid. **[Moderate] Theoretical**
- **Carboplatin** → see platinum compounds
- **Carfilzomib** → see TABLE 15 p. 1378 (myelosuppression)
- **Cariprazine** → see TABLE 8 p. 1376 (hypotension), TABLE 11 p. 1377 (CNS depressant effects)
- **Antihyrtuthyphic (dronedarone)** are predicted to increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **cariprazine**. Avoid. **[Severe] Theoretical** → Also see TABLE 11 p. 1377
- **Antifungals, azoles (fluconazole, itraconazole, ketoconazole, posaconazole)** are predicted to increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Aprepitant** is predicted to increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Bosantan** is predicted to decrease the exposure to **cariprazine**. Avoid. **[Severe] Theoretical**
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **cariprazine**. Avoid. **[Severe] Study** → Also see TABLE 8 p. 1376
- **Cobicistat** is predicted to moderately increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Crizotinib** is predicted to increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Efavirenz** is predicted to decrease the exposure to **cariprazine**. Avoid. **[Severe] Theoretical**
- **Enzalutamide** is predicted to decrease the exposure to **cariprazine**. Avoid. **[Severe] Theoretical**
- **Grapefruit juice** is predicted to increase the exposure to **cariprazine**. Avoid. **[Moderate] Study**
- **HIV-protease inhibitors** are predicted to moderately increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Idealisib** is predicted to moderately increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Imatinib** is predicted to increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Mitoctane** is predicted to decrease the exposure to **cariprazine**. Avoid. **[Severe] Theoretical**
- **Netupitant** is predicted to increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Nevirapine** is predicted to decrease the exposure to **cariprazine**. Avoid. **[Severe] Theoretical**
- **Nilotinib** is predicted to increase the exposure to **cariprazine**. Avoid. **[Severe] Study**
- **Rifampicin** is predicted to decrease the exposure to **cariprazine**. Avoid. **[Severe] Theoretical**
- **St John’s Wort** is predicted to decrease the exposure to **cariprazine**. Avoid. **[Severe] Theoretical**
- **Carmustine** → see alkylating agents
- **Carvedilol** → see beta blockers, non-selective

**Caspofungin**
- **Antiepileptics (carbamazepine, fosphenytoin, phenytoin)** are predicted to decrease the concentration of **caspofungin**. Adjust **caspofungin** dose, p. 592. **[Moderate] Theoretical**
- **Ciclosporin** slightly increases the exposure to **caspofungin**. **[Severe] Study**
- **Corticosteroids (dexamethasone)** are predicted to decrease the concentration of **caspofungin**. Adjust **caspofungin** dose, p. 592. **[Moderate] Theoretical**
- **Efavirenz** is predicted to decrease the concentration of **caspofungin**. Adjust dose. **[Moderate] Study**
- **Nevirapine** is predicted to decrease the concentration of **caspofungin**. Adjust dose. **[Moderate] Theoretical**
- **Rifampicin** decreases the concentration of **caspofungin**. Adjust **caspofungin** dose, p. 592. **[Moderate] Study**
- **Cefadroxil** → see cephalosporins
- **Cefadroxil** → see cephalosporins
- **Cefalexin** → see cephalosporins
- **Cefixime** → see cephalosporins
- **Cefotaxime** → see cephalosporins
- **Cefradine** → see cephalosporins
- **Ceftaroline** → see cephalosporins
- **Ceftazidime** → see cephalosporins
- **Ceftobiprole** → see cephalosporins
- **Ceftolozane** → see cephalosporins
- **Ceftoxime** → see cephalosporins
- **Cefuroxime** → see cephalosporins
- **Celecoxib** → see NSAIDs
- **Celiprolol** → see beta blockers, selective
- **Cefepime** → see cephalosporins
INTERACTIONS

Ceritinib

▶ Ceritinib is predicted to increase the exposure to bosentan. (Moderate) Theoretical

▶ Ceritinib potentially increases the risk of bleeding events when given with coumarins. (Severe) Anecdotal

▶ Ceritinib is predicted to increase the concentration ofstatins. (Moderate) Theoretical

▶ Ceritinib is predicted to increase the exposure to calcium channel blockers. (Moderate) Theoretical

▶ Ceritinib is predicted to increase the concentration of sufonylureas (glibenclamide). (Moderate) Theoretical

▶ Teriflunomide is predicted to increase the exposure to cefaclocil. (Moderate) Study

Ceritinib → see TABLE 15 p. 1377 (myelosuppression), TABLE 9 p. 1377 (QT-interval prolongation)

Ceritinib is predicted to increase the exposure to aliskiren. (Moderate) Theoretical

▶ Antacids are predicted to decrease the absorption of ceritinib. Separate administration by 2 hours. (Moderate) Theoretical

▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 9 p. 1377

▶ Antiepileptics (clobazam, lamotrigine, phenytoin, primidone) are predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 9 p. 1377

▶ Cefuroxime is predicted to decrease the exposure to ceritinib. (Severe) Study

▶ Ceftriaxone is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 973. (Severe) Study → Also see TABLE 9 p. 1377

▶ Idealisib is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 973. (Severe) Study → Also see TABLE 15 p. 1378

▶ Imatinib is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 15 p. 1378

▶ Lapatinib is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 9 p. 1377

▶ Ceritinib is predicted to predict the exposure to loperamide. (Moderate) Theoretical

▶ Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 9 p. 1377

▶ Macrolides (clarithromycin) are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 973. (Severe) Study → Also see TABLE 9 p. 1377

▶ Mitotane is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study → Also see TABLE 15 p. 1378

▶ Neckiptan is predicted to increase the exposure to ceritinib. (Moderate) Theoretical

▶ Nilotinib is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 15 p. 1378 → Also see TABLE 9 p. 1377

▶ Ceritinib is predicted to increase the exposure to NSAIDs: (celecoxib, diclofenac). Adjust dose. (Moderate) Theoretical

▶ Ceritinib is predicted to increase the exposure to opioids (alfentanil, fentanyl). Avoid. (Severe) Theoretical

▶ Ceritinib is predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 1377

▶ Proton pump inhibitors are predicted to decrease the absorption of ceritinib. (Moderate) Theoretical

▶ Ranolazine is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 15 p. 1378

▶ Rifampicin is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study

▶ Ceritinib is predicted to increase the exposure to sirolimus. Avoid. (Severe) Theoretical

▶ St John’s Wort is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Theoretical

▶ Ceritinib is predicted to increase the exposure to sulfonylureas (gliclazide). Adjust dose. (Moderate) Theoretical

▶ Ceritinib is predicted to increase the exposure to taxanes (paclitaxel). (Moderate) Theoretical → Also see TABLE 15 p. 1378

▶ Ceritinib is predicted to increase the exposure to tacrolimus. Avoid. (Severe) Theoretical

▶ Ceritinib is predicted to increase the exposure to topotecan. (Moderate) Theoretical → Also see TABLE 15 p. 1378

▶ Ceroticumab pegol is predicted to decrease the exposure to ceritinib. Study

▶ Cetirizine is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Theoretical

▶ Cetuximab is predicted to decrease the exposure to ceritinib. Study

Cefuroxime

ROUTE-SPECIFIC INFORMATION

Interactions do not generally apply to topical use of cefuroxime unless specified.

▶ Cefuroxime is predicted to affect the efficacy of ceritinib. Avoid or adjust ceritinib dose. (Moderate) Theoretical

ROUTE-SPECIFIC INFORMATION

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
Antiepileptics (phenobarbital, primidone) decrease the concentration of ciclosporin. [Moderate] Study

Intravenous ciclosporin increases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (topiramate, phenytoin) affect the concentration of intravenous ciclosporin. Monitor concentration and adjust dose. [Severe] Study

Ciclosporin potentially increases the anticoagulant effect of coumarins. [Moderate] Anecdotal

Ciclosporin is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical

Ciclosporin decreases the efficacy of intravenous iron (injectable). [Moderate] Anecdotal

Ciclosporin decreases the efficacy of oral iron (oral). [Moderate] Theoretical

Ciclosporin is predicted to increase the exposure to sulfonylureas. [Severe] Study

Ciclosporin increases the concentration of tacrolimus. [Severe] Study

Chlordiazepoxide ➔ see TABLE 11 p. 1377 (CNS depressant effects)

Chlordiazepoxide affects the concentration of antiepileptics (topiramate, phenytoin). [Severe] Study

Rifampicin is predicted to decrease the exposure to ciclosporin. [Moderate] Theoretical

Chloroquine ➔ see antimalarials

Chlorothiazide ➔ see thiazide diuretics

Chlorphenamene ➔ see antihistamines, sedating

Chlorpromazine ➔ see phenothiazines

Chloraldehyde ➔ see thiazide diuretics

Chlorothiazide is predicted to increase the concentration of ciclosporin. [Severe] Study

Chlorothiazide affects the concentration of ciclosporin. [Severe] Study

Chlorothiazide increases the concentration of tacrolimus. [Severe] Study

Chlorothiazide increases the efficacy of oral cholestyramine. [Moderate] Study

Hydroxychloroquine is predicted to decrease the efficacy of oral cholestyramine. [Moderate] Theoretical

Cholic acid

Antacids are predicted to decrease the absorption of cholic acid. Separate administration by 5 hours. [Mild] Theoretical

Antiepileptics (phenobarbital) decrease the effects of cholic acid. Avoid. [Moderate] Study

Ciclosporin affects the concentration of cholic acid. Avoid. [Moderate] Study

Ciclosporin affects the concentration of cholic acid. [Moderate] Study

Cholic acid

Ciclosporin is predicted to increase the concentration of cholic acid. [Severe] Study

Ciclosporin is predicted to increase the concentration of cholic acid. [Severe] Study

Cholecalciferol is predicted to decrease the concentration of cholecalciferol. [Moderate] Study

Ciclesonide ➔ see corticosteroids

Ciclosporin ➔ see TABLE 2 p. 1375 (nephrotoxicity), TABLE 16 p. 1379 (increased serum potassium)

Pomelo juice is predicted to increase ciclosporin exposure, and grape juice is predicted to decrease ciclosporin exposure.

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Ciclosporin is predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study

Ciclosporin markedly increases the exposure to aliskiren. Avoid. [Severe] Study ➔ Also see TABLE 16 p. 1379

Ciclosporin moderately increases the exposure to ambrisantan. Adjust ambrisantan dose, p. 184. [Moderate] Study

Ciclosporin increases the concentration of anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone). [Severe] Study

Antiarhythmics (amiodarone) increase the concentration of ciclosporin. Monitor concentration and adjust dose. [Severe] Study

Antiarhythmics (dronedarone) are predicted to increase the concentration of ciclosporin. [Severe] Study

Antiarhythmics (flecainide, propafenone, sotalol, flecainide, propafenone, sotalol) decrease the concentration of ciclosporin. [Severe] Study

Antiepileptics (oxcarbazepine) decrease the concentration of ciclosporin. [Severe] Anecdotal

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the concentration of ciclosporin. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the concentration of ciclosporin. [Severe] Study

Antifungals, azoles (miconazole) increase the concentration of ciclosporin. Monitor and adjust dose. [Severe] Anecdotal

Aprepitant is predicted to increase the concentration of ciclosporin. [Severe] Study

Ciclosporin is predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study

Ciclosporin is predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical

Bosentan moderately decreases the exposure to ciclosporin and ciclosporin moderately increases the exposure to bosentan. Avoid. [Severe] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of ciclosporin. [Severe] Study

Calcium channel blockers (nicardipine) increase the concentration of ciclosporin. [Severe] Study

Ciclosporin moderately increases the exposure to calcium channel blockers (verapamil). Use with caution or avoid. [Severe] Study

Ciclosporin slightly increases the exposure to caspofungin. [Severe] Study

Ciclosporin is predicted to increase the exposure to cyclosporin. Avoid. [Severe] Theoretical

Ciclosporin is predicted to affect the efficacy of cyclosporin. [Severe] Study

Ciclosporin affects the concentration of cyclosporin. Avoid. [Moderate] Study

Ciclosporin increases the concentration of cyclosporin. [Severe] Study

Ciclosporin increases the exposure to colchicine. Avoid or adjust colchicine dose, p. 1126. [Severe] Study

Ciclosporin is predicted to increase the concentration of cyclosporin. [Severe] Study

Ciclosporin is predicted to increase the exposure to dabigatran. Avoid. [Severe] Theoretical

Ciclosporin is predicted to increase the risk of rhabdomyolysis when given with dapoxetine. [Severe] Theoretical

Ciclosporin is predicted to increase the exposure to darilfenacin. AVOID. [Moderate] Theoretical

Ciclosporin increases the concentration of digoxin. Monitor and adjust dose. [Severe] Theoretical

Ciclosporin slightly increases the exposure to edoxaban. Adjust edoxaban dose, p. 126. [Severe] Study

Ciclosporin decreases the exposure to eltrombopag. Monitor and adjust dose. [Moderate] Study

Ciclosporin decreases the exposure to etoricoxib. Monitor and adjust dose. [Severe] Study

Ciclosporin decreases the exposure to efavirenz. Decreases the concentration of ciclosporin. Monitor concentration and adjust dose. [Moderate] Study

Ciclosporin decreases the exposure to enzalutamide. Decreases the concentration of ciclosporin. [Severe] Study

Ciclosporin is predicted to increase the exposure to erlotinib. [Moderate] Theoretical

Ciclosporin increases the exposure to etoposide. Monitor and adjust dose. [Severe] Study

Ciclosporin moderately increases the exposure to everolimus. Avoid or adjust dose. [Severe] Study

Ciclosporin moderately increases the exposure to ezetimibe and ezetimibe slightly increases the exposure to ciclosporin. [Moderate] Study

Fibates (bezafibrate) are predicted to increase the risk of nephrotoxicity when given with ciclosporin. [Severe] Theoretical

Fibates (fenofibrate) increase the risk of nephrotoxicity when given with ciclosporin. [Severe] Study

Ciclosporin is predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study

Ciclosporin increases the exposure to glecaprevir. Avoid or monitor. [Severe] Study

Grapefruit juice increases the concentration of ciclosporin. Avoid. [Severe] Study

Anecdotal

Theoretical

Moderate

Severe
Ciclosporin – Cilostazol

Ciclosporin (continued)

- Ciclosporin greatly increases the exposure to rapamycin. Avoid. (Severe) Study
- H₂ receptor antagonists (cimetidine) increase the concentration of ciclosporin. (Moderate) Study
- HIV-protease inhibitors increase the concentration of ciclosporin. (Severe) Study
- Idelalisib increases the concentration of ciclosporin. (Severe) Study
- Imatinib is predicted to increase the concentration of ciclosporin. (Severe) Study
- Lanthamide is predicted to decrease the absorption of oral ciclosporin. Adjust dose. (Severe) Theoretical
- Letermovir increases the exposure to ciclosporin and ciclosporin increases the exposure to letermovir. Monitor and adjust letermovir dose, p. 636. (Severe) Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with ciclosporin. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- Ciclosporin is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical
- Lumacaftor is predicted to decrease the exposure to ciclosporin. Avoid. (Severe) Theoretical
- Macrolides (clarithromycin) increase the concentration of ciclosporin. (Severe) Study
- Macrolides (erythromycin) are predicted to increase the concentration of ciclosporin. (Severe) Study
- Monoclonal antibodies (blinatumomab) are predicted to transiently increase the exposure to ciclosporin. Monitor and adjust dose. (Moderate) Theoretical
- Monoclonal antibodies (sarilumab) potentially affect the exposure to ciclosporin. Monitor and adjust dose. (Moderate) Theoretical
- Netupitant is predicted to increase the concentration of ciclosporin. (Severe) Study
- Nevirapine is predicted to decrease the concentration of ciclosporin. (Moderate) Study
- Nitotinib is predicted to increase the concentration of ciclosporin. (Severe) Study
- Ciclosporin is predicted to increase the concentration of nintedanib. (Moderate) Study
- Ciclosporin decreases the concentration of nintedanib. (Severe) Study
- Octreotide decreases the concentration of ciclosporin. Adjust ciclosporin dose, p. 838. (Severe) AneCotadal
- Palbociclib is predicted to increase the exposure to ciclosporin. Adjust dose. (Moderate) Theoretical
- Ciclosporin is predicted to increase the exposure to panobinostat. Adjust dose. (Moderate) Theoretical
- Pasireotide is predicted to decrease the absorption of oral ciclosporin. Adjust dose. (Severe) Theoretical
- Pitolisant is predicted to decrease the exposure to ciclosporin. Avoid. (Severe) Theoretical
- Ciclosporin is predicted to increase the concentration of ranolazine and ranolazine is predicted to increase the concentration of ciclosporin. (Moderate) Theoretical
- Ciclosporin moderately increases the exposure to repaglinide. (Moderate) Study
- Ribociclib is predicted to increase the exposure to ciclosporin. Use with caution and adjust dose. (Moderate) Theoretical
- Rifampicin decreases the concentration of ciclosporin. (Severe) Study
- Ciclosporin very markedly increases the exposure to rifaximin. (Severe) Study
- Ciclosporin very markedly increases the exposure to riociguat. (Moderate) Theoretical
- Rufaparib is predicted to increase the exposure to ciclosporin. Monitor and adjust dose. (Moderate) Study
- Ciclosporin moderately increases the exposure to sirolimus. Separate administration by 4 hours. (Severe) Study
- St John's Wort decreases the concentration of ciclosporin. Avoid. (Moderate) Study
- Ciclosporin very markedly increases the exposure to statins (atorvastatin). Avoid or adjust atorvastatin dose, p. 202. (Severe) Study
- Ciclosporin moderately increases the exposure to statins (fluvastatin). (Severe) Study
- Ciclosporin markedly very markedly increases the exposure to statins (pravastatin). Adjust dose. (Severe) Study
- Ciclosporin markedly increases the exposure to statins (rosuvastatin, simvastatin). Avoid. (Severe) Study
- Ciclosporin increases the concentration of tacrolimus. Avoid. (Severe) Study → Also see TABLE 2 p. 1375 → Also see TABLE 16 p. 1379
- Ciclosporin is predicted to increase the exposure to tenofovir alafenamide. (Moderate) Theoretical
- Ciclosporin is predicted to increase the exposure to tenofovir disoproxil. (Moderate) Theoretical → Also see TABLE 2 p. 1375
- Ciclosporin is predicted to increase the exposure to ticagrelor. Use with caution or avoid. (Severe) Study
- Ciclosporin increases the exposure to tofacitinib. Avoid. (Severe) Study
- Ciclosporin is predicted to increase the exposure to topotecan. (Severe) Study
- Ciclosporin is predicted to increase the concentration of tramebulin. (Moderate) Theoretical
- Ursodeoxycholic acid affects the concentration of ciclosporin. Use with caution and adjust dose. (Severe) AneCotadal
- Ciclosporin is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical
- Vitamin E supplements affect the exposure to ciclosporin. (Moderate) Study
- Ciclosporin increases the concentration of voxilaprevir. Avoid. (Severe) Study
- Cidofovir → See TABLE 2 p. 1375 (nephrotoxicity)
- Cilostazol → See TABLE 4 p. 1375 (antiplatelet effects)

GENERAL INFORMATION
Concurrent use with 2 or more antiplatelets or anticoagulants is contra-indicated.

- Antiplatelets (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the effects of cilostazol. (Moderate) Theoretical
- Antifungals, azoles (fluconazole) are predicted to increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. (Moderate) Study
- Antifungals, azoles (miconazole) are predicted to increase the exposure to cilostazol. Use with caution and adjust dose. (Moderate) Theoretical
- Cobimetapart is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. (Moderate) Study
- Enzalutamide is predicted to alter the effects of cilostazol. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. (Moderate) Study
- Idelalisib is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. (Moderate) Study
- Cilostazol is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical
- Macroolides (clarithromycin) are predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. (Moderate) Study
- Macroolides (erythromycin) slightly increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. (Moderate) Study
- Mitotane is predicted to alter the effects of cilostazol. (Moderate) Theoretical
- Moclobemide is predicted to increase the exposure to cilostazol. (Moderate) Theoretical
- Proton pump inhibitors (esomeprazole) are predicted to increase the exposure to cilostazol. (Moderate) Theoretical
### Cimetidine

**FOOD AND LIFESTYLE** Dose adjustment might be necessary if smoking started or stopped during treatment.

### **Interactions**

**Cladribine**

- **Separation of administration:** Oral cladribine might affect the absorption of concurrently administered drugs—consider separating administration by at least 3 hours.

- **Antiepileptics (carbamazepine)** are predicted to increase the risk of haematological toxicity when given with oral cladribine.

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

**Clarithromycin**

- **Clarithromycin** is predicted to increase the concentration of cladribine. (Severe) Study

**Clofazimine**

- **Clofazimine** potentially increases the risk of generalised infection (possibly life-threatening) when given with clofarabine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

**Clofarabine**

- **Clofarabine** potentially increases the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

**Clonazepam**

- **Clonazepam** potentially increases the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

**Clomipramine**

- **Clomipramine** potentially increases the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

**Clobazam**

- **Clobazam** potentially decreases the concentration of ropinirole. (Moderate) Study

**CLOPIDOGREL**

- **CLOPIDOGREL** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clomethiazole**

- **Clomethiazole** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clopenthixol**

- **Clopenthixol** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clopindipine**

- **Clopindipine** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clopitan**

- **Clopitan** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clotiapine**

- **Clotiapine** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clonazepam**

- **Clonazepam** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clonazepam**

- **Clonazepam** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Cloonoxazol**

- **Cloonoxazol** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clexane**

- **Clexane** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clexane**

- **Clexane** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clexane**

- **Clexane** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clexane**

- **Clexane** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clexane**

- **Clexane** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clexane**

- **Clexane** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clexane**

- **Clexane** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clexane**

- **Clexane** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study

**Clexane**

- **Clexane** potentially increases the risk of QT-prolongation when given with bedaquiline. (Severe) Study
Clidipogrel (continued)

- **Antifungals, azoles (voriconazole)** are predicted to decrease the efficacy of clidipogrel. Avoid. (Moderate) Study
- **Clidipogrel** is predicted to increase the exposure to apilimide. (Moderate) Study
- **Clidipogrel** is predicted to increase the exposure to dabrafenib. (Moderate) Theoretical
- **Clidipogrel** is predicted to very markedly increase the exposure to dasabuvir. Avoid. (Severe) Study
- **Addison et al.** moderately increases the exposure to enzalutamide. Avoid or adjust enzalutamide dose, p. 947. (Severe) Study
- **Grapefruit juice** markedly decreases the exposure to clidipogrel. (Severe) Study
- **Modemide** is predicted to decrease the efficacy of clidipogrel. Avoid. (Moderate) Study
- **Clidipogrel** is predicted to moderately increase the exposure to montelukast. (Moderate) Study
- **Clidipogrel** increases the exposure to pioglitazone. Monitor blood glucose and adjust dose. (Severe) Study
- **Probenecid increases the exposure to (esomeprazole, omeprazole)** are predicted to decrease the efficacy of clidipogrel. Avoid. (Moderate) Study
- **Clidipogrel** increases the exposure to repaglinide. Avoid. (Moderate) Study
- **Clidipogrel** is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1262. (Moderate) Theoretical
- **Clidipogrel** is predicted to increase the exposure to selexipag. Adjust dose. (Moderate) Study
- **SSRIs (fluvoxamine)** are predicted to decrease the efficacy of clidipogrel. Avoid. (Severe) Theoretical → Also see TABLE 4 p. 1375
- **Clidipogrel** increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 204. (Moderate) Study
- **Clidipogrel** is predicted to increase the concentration of taxanes (paclitaxel). (Severe) Anecdotal
- **Clotrimazole** is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole). Adjust dose, p. 1376. Avoid or monitor side effects. (Severe) Study
- **Clodipine** is predicted to increase the effects of dopamine receptor antagonists. Avoid. (Moderate) Theoretical → Also see TABLE 2 p. 1376
- **Clonazepam** is predicted to decrease the effects of alprazolam. (Moderate) Study
- **Clonazepam increases the concentration of clozapine. Monitor side effects and adjust dose. (Severe) Study
- **Clozapine** is predicted to increase the concentration of levodopa. (Severe) Theoretical → Also see TABLE 8 p. 1376
- **Enalapril** is predicted to increase the exposure to clozapine. (Moderate) Theoretical
- **Iron chelators (deferasirox)** are predicted to increase the exposure to clozapine. Avoid. (Moderate) Theoretical
- **Leflunomide** is predicted to decrease the exposure to clozapine. (Moderate) Theoretical → Also see TABLE 15 p. 1376
- **Lurasidone** is predicted to increase the exposure to clozapine. (Moderate) Theoretical
- **Mirtazapine** is predicted to increase the exposure to clozapine. (Moderate) Theoretical
- **Rifampicin** decreases the exposure to clozapine. (Severe) Anecdotal
- **SSRIs (fluvoxamine)** increase the concentration of clozapine. Monitor side effects and adjust dose. (Severe) Study
- **Teriflunomide** is predicted to decrease the exposure to clozapine. (Moderate) Theoretical

**Clidipogrel** is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose, p. 967. (Severe) Study
- **Clidipogrel** is predicted to markedly increase the exposure to abidol. (Severe) Study
- **Clidipogrel** increases the exposure to almotriptan. (Moderate) Study
- **Clidipogrel** is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. (Moderate) Study
- **Clidipogrel** is predicted to increase the exposure to alfuzosin (doxazosin). (Moderate) Study
- **Clidipogrel** moderately increases the exposure to alprazolam. Avoid. (Moderate) Study
- **Clidipogrel** potentially increases the concentration of antiarrhythmics (amiodarone, disopyramide, flecainide, lidocaine). (Severe) Theoretical
- **Clidipogrel** very markedly increases the exposure to antiarrhythmics (dronedarone). Avoid. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. (Moderate) Study
- **Clidipogrel** is predicted to affect the exposure to antimuscarinics (paclitaxel). (Severe) Anecdotal
- **Clidipogrel** is predicted to decrease the exposure to anthimastatines, non-sedating (mizolastine). Avoid. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to antimalarials (halofantrine). Avoid. (Severe) Study
- **Clidipogrel** is predicted to decrease the exposure to antimalarials (piperquine). (Severe) Theoretical
- **Clidipogrel** is predicted to increase the exposure to apilimide, azoles (fluconazole, posaconazole). Avoid or monitor side effects. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole). Adjust dose, p. 1376. Avoid or monitor side effects. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole). Adjust dose, p. 1376. Avoid or monitor side effects. (Severe) Study
- **Clidipogrel** is predicted to increase the concentration of antimuscarinics (oxitremorin). Avoid. (Severe) Theoretical
- **Clidipogrel** is predicted to increase the concentration of anthimastatines, non-sedating (mizolastine). Avoid. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to antimalarials (halofantrine). Avoid. (Severe) Study
- **Clidipogrel** is predicted to increase the concentration of antimalarials (piperquine). (Severe) Theoretical
- **Clidipogrel** is predicted to increase the exposure to apilimide, azoles (fluconazole, posaconazole). Avoid or monitor side effects. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. (Moderate) Study
- **Clidipogrel** is predicted to affect the exposure to antimuscarinics (paclitaxel). (Severe) Anecdotal
- **Clidipogrel** is predicted to decrease the exposure to anthimastatines, non-sedating (mizolastine). Avoid. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to antimalarials (halofantrine). Avoid. (Severe) Study
- **Clidipogrel** is predicted to decrease the exposure to antimalarials (halofantrine). Avoid. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to beta agonists (salmeterol). Avoid. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Study
- **Clidipogrel** is predicted to increase the exposure to beta agonists (salmeterol). Avoid. (Severe) Study
- **Clidipogrel** significantly increases the exposure to bortezomib. (Moderate) Study
- **Clidipogrel** is predicted to decrease the exposure to bosutinib. Avoid or adjust dose. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to bosutinib. Adjust bosutinib dose, p. 971. (Severe) Study
- **Clidipogrel** is predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 342. (Severe) Study

www.getintopharma.com
Cobicistat is predicted to increase the exposure to cabozantinib.  
(Moderate) Study

Cobicistat is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

Cobicistat is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study

Cobicistat is predicted to markedly increase the exposure to calcium channel blockers (fercandipine). Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. (Moderate) Theoretical

Cobicistat is predicted to moderately increase the exposure to cariprazine. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 973. (Severe) Study

Cobicistat increases the concentration of ciclosporin. (Severe) Study

Cobicistat is predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study

Cobicistat is predicted to markedly increase the exposure to colchicine. Avoid or monitor for toxicity. (Severe) Study

Cobicistat is predicted to increase the exposure to colchicine. Avoid or adjust inhibitors of CYP3A4 or adjust colchicine dose, p. 1120. (Severe) Study

Cobicistat is predicted to increase the concentration of combined hormonal contraceptives. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). (Moderate) Theoretical

Cobicistat is predicted to increase the exposure to corticosteroids (budesonide, fusidic acid, ciclosporin, deflazacort, dexamethasone, fluorouracil, itraconazole, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. (Severe) Study

Cobicistat is predicted to moderately increase the exposure to crizotinib. Avoid. (Moderate) Study

Cobicistat is predicted to increase the exposure to dabigatran. Avoid. (Severe) Theoretical

Cobicistat is predicted to increase the exposure to dabrafenib. Use with caution or avoid. (Moderate) Study

Cobicistat is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. (Severe) Study

Cobicistat is predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study

Cobicistat very slightly increases the exposure to delamanid. (Severe) Study

Cobicistat increases the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study

Cobicistat increases the exposure to dopamine receptor agonists ( bromocriptine). (Severe) Study

Cobicistat is predicted to increase the concentration of dopamine receptor agonists (cabergoline). (Moderate) Anecdotal

Cobicistat is predicted to increase the exposure to doravirine. (Severe) Study

Cobicistat is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. (Moderate) Theoretical

Cobicistat is predicted to increase the exposure to edoxaban. Avoid. (Severe) Theoretical

Efavirenz is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Cobicistat is predicted to markedly increase the exposure to eletriptan. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study

Cobicistat is predicted to increase the exposure to encorafenib. Avoid or monitor. (Severe) Study

Enzalutamide is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Cobicistat is predicted to increase the risk of ergotism when given with ergometrine. Avoid. (Severe) Theoretical

Cobicistat is predicted to increase the risk of ergotism when given with ergotamine. Avoid. (Severe) Theoretical

Cobicistat is predicted to slightly increase the exposure to eletriptan. Use with caution and adjust dose. (Moderate) Study

Cobicistat is predicted to increase the exposure to esetemate. Adjust dose. (Moderate) Study

Cobicistat is predicted to increase the concentration of everolimus. Avoid. (Severe) Study

Cobicistat is predicted to moderately increase the exposure to fosaprepitant. (Moderate) Theoretical

Cobicistat is predicted to increase the exposure to gefitinib. (Moderate) Study

Cobicistat potentially increases the exposure to glecaprevir. (Moderate) Theoretical

Cobicistat is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 352. (Moderate) Study

Cobicistat is predicted to very markedly increase the exposure to ibritinib. Avoid potent inhibitors of CYP3A4 or adjust ibritinib dose, p. 983. (Severe) Study

Cobicistat is predicted to increase the exposure to imatinib. (Moderate) Study

Cobicistat is predicted to increase the risk of toxicity when given with irinotecan. Avoid. (Moderate) Study

Cobicistat is predicted to increase the exposure to irinotecan. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 292 or lumacaftor with ivacaftor p. 294 or tezacaftor with ivacaftor p. 296 dose with potent inhibitors of CYP3A4. (Severe) Study

Cobicistat is predicted to increase the exposure to lapatinib. Avoid. (Moderate) Study

Cobicistat is predicted to markedly increase the exposure to lomiptamide. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to luramidine. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to macitentan. (Moderate) Study

Cobicistat markedly increases the exposure to maraviroc. Refer to specialist literature. (Severe) Study

Cobicistat potentially increases the exposure to mexiletine. (Severe) Theoretical

Cobicistat is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. (Severe) Study

Cobicistat is predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. (Severe) Study

Cobicistat is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 781. (Moderate) Study

Cobicistat is predicted to increase the exposure to mitrazapine. (Moderate) Study

Mitotane is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Cobicistat is predicted to increase the exposure to modafinil. (Mild) Theoretical

Cobicistat is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. (Severe) Theoretical

Cobicistat is predicted to markedly increase the exposure to naloxegol. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to netupitant. (Moderate) Study

Nevirapine is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Cobicistat is predicted to moderately increase the exposure to nilotinib. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to nitirizine. Adjust dose. (Moderate) Theoretical
Cobicistat – Cobicistat

Cobicistat is predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Study

Cobicistat is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodeone, sufentanil). Monitor and adjust dose. (Severe) Study

Cobicistat is predicted to increase the exposure to ospemifene. Avoid in poor CYP2C9 metabolisers. (Moderate) Study

Cobicistat is predicted to increase the exposure to oxybutynin. (Mild) Study

Cobicistat is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 992. (Severe) Study

Cobicistat is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 936. (Moderate) Study

Cobicistat is predicted to increase the exposure to paritaprevir. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 993. (Moderate) Study

Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to pimozide. Avoid. (Severe) Study

Cobicistat is predicted to moderately increase the exposure to praziquantel. (Mild) Study

Cobicistat is predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to ranolazine. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to reboxetine. Avoid. (Moderate) Study

Cobicistat is predicted to increase the exposure to regorafenib. Avoid. (Moderate) Study

Cobicistat is predicted to increase the exposure to regorafenib. Avoid. (Moderate) Study

Cobicistat is predicted to increase the exposure to repaglinide. (Moderate) Study

Cobicistat is predicted to increase the exposure to retinoids (all-transretinoic). Adjust all-transretinoic dose, p. 1262. (Moderate) Study

Cobicistat is predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 997. (Moderate) Study

Rifabutin decreases the concentration of cobicistat and cobicistat increases the exposure to rifabutin. Avoid or adjust dose. (Severe) Study

Rifampicin is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Cobicistat is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study

Cobicistat is predicted to increase the exposure to rivaroxaban. Avoid. (Severe) Theoretical

Cobicistat is predicted to increase the exposure to roxanol. Adjust dose and monitor side effects. (Moderate) Study

Cobicistat is predicted to increase the exposure to saxagliptin. (Moderate) Study

Cobicistat is predicted to increase the concentration of sirolimus. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to solifenacin. Adjust solifenacin p. 779 or tamsulosin with solifenacin p. 786 dose; avoid in hepatic and renal impairment. (Severe) Study

Cobicistat is predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose, p. 821. (Severe) Study

St John’s Wort is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Cobicistat is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. (Severe) Study

Cobicistat is predicted to increase the exposure to statins (simvastatin). Avoid. (Severe) Study

Cobicistat is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. (Moderate) Study

Cobicistat is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

Cobicistat is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. (Severe) Study

Cobicistat is predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. (Severe) Study

Cobicistat is predicted to increase the exposure to taxanes (paclitaxel). Avoid or moderate dose. (Severe) Theoretical

Cobicistat is predicted to increase the exposure to tezacafor. Adjust tezacafor with ivacafor p. 296 dose with potent inhibitors of CYP3A4. (Severe) Study

Cobicistat is predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Cobicistat is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4. p. 660 (Severe) Study

Cobicistat is predicted to increase the exposure to toremifene. (Moderate) Theoretical

Cobicistat is predicted to increase the exposure to trabectedin. Avoid or adjust dose. (Severe) Theoretical

Cobicistat is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. (Moderate) Study

Cobicistat is predicted to slightly increase the exposure to tricyclic antidepressants. (Mild) Study

Cobicistat is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study

Cobicistat is predicted to increase the exposure to vemurafenib. (Severe) Theoretical

Cobicistat is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Severe) Study

Cobicistat is predicted to increase the exposure to venlafaxine. (Moderate) Study

Cobicistat is predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical

Cobicistat is predicted to increase the exposure to vitamin D substances (paricalcitol). (Moderate) Study

Cobicistat is predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Theoretical

Cobimetinib

Antiarrhythmics (dronedarone) are predicted to increase the exposure to cobimetinib. (Severe) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobimetinib. Avoid. (Severe) Theoretical

Antifungals, azoles (fluconazole, isavuconazole, miconazole, posaconazole) are predicted to increase the exposure to cobimetinib. (Severe) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. (Severe) Study

Apremilast is predicted to increase the exposure to cobimetinib. (Severe) Theoretical

Bosentan is predicted to increase the exposure to cobimetinib. Avoid. (Severe) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cobimetinib. (Severe) Theoretical

Cobicistat is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. (Severe) Study

Crizotinib is predicted to increase the exposure to cobimetinib. (Severe) Theoretical

Efavirenz is predicted to decrease the exposure to cobimetinib. Avoid. (Severe) Theoretical

</table>
Combined hormonal contraceptives (continued)
- Combined hormonal contraceptives increase the concentration of clozapine. Monitor side effects and adjust dose. [Severe] Study
- Cobicistat is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Study
- Combined hormonal contraceptives (containing ethinylestradiol) increase the risk of increased ALT concentrations when given with dasabuvir. Avoid. [Severe] Study
- Combined hormonal contraceptives are predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. [Moderate] Study
- Efavirenz is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Study
- Encorafenib is predicted to affect the exposure to combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Study
- Combined hormonal contraceptives slightly increase the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Study
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with metyrapone. Avoid. [Severe] Study
- HIV-protease inhibitors (atazanavir) (unboosted) increase the exposure to combined hormonal contraceptives. Adjust dose. [Severe] Study
- HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal
- Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with lenalidomide. Avoid. [Severe] Theoretical
- Oral combined hormonal contraceptives slightly increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Study
- Combined hormonal contraceptives are predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical
- Lumacaftor is predicted to decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. [Severe] Theoretical
- Combined hormonal contraceptives are predicted to increase the exposure to melatonin. [Moderate] Theoretical
- Combined hormonal contraceptives decrease the effects of metformin. Avoid. [Moderate] Theoretical
- Modafinil is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Study
- Combined hormonal contraceptives slightly increase the exposure to monoamine-oxidase B inhibitors (rasagiline). [Moderate] Study
- Combined hormonal contraceptives increase the exposure to monoamine-oxidase B inhibitors (selegiline). Avoid. [Severe] Study
- Monoclonal antibodies (sarilumab) potentially decrease the exposure to combined hormonal contraceptives. [Severe] Theoretical
- Nevirapine is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Study
- NSAIs (etoricoxib) slightly increase the exposure to combined hormonal contraceptives. [Moderate] Study
- Combined hormonal contraceptives potentially oppose the effects of ospemifene. Avoid. [Severe] Theoretical
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with paritaprevir (with ritonavir andombitasvir). Avoid. [Severe] Study
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with pivrentavir. Avoid. [Severe] Study
- Combined hormonal contraceptives are predicted to increase the exposure to pirfenidone. Use with caution and adjust dose. [Moderate] Study
- Pitolisant is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical
- Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with pomalidomide. Avoid. [Severe] Theoretical
- Combined hormonal contraceptives potentially oppose the effects of raloxifene. Avoid. [Severe] Theoretical
- Rifabutin is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Study
- Rifampicin is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Study
- Combined hormonal contraceptives are predicted to increase the exposure to roflumilast. [Moderate] Theoretical
- St John’s Wort decreases the efficacy of combined hormonal contraceptives. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal
- Sugammadex is predicted to decrease the exposure to oral combined hormonal contraceptives. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
- Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with thalidomide. Avoid. [Severe] Study
- Combined hormonal contraceptives are predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- Combined hormonal contraceptives increase the exposure to tizanidine. Avoid. [Moderate] Study
- Uloprast is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with voxtalaprevir (with sofosbuvir andvelpatavir). Avoid. [Severe] Study
- Combined hormonal contraceptives are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. [Moderate] Theoretical

Corticosteroids — see TABLE 17 p. 1379 (reduced serum potassium)
- beclometasone - betamethasone - budesonide - ciclesonide - deflazacort - dexamethasone - fludrocortisone - fluticasone - hydrocortisone - methylprednisolone - mometasone - prednisolone - triamcinolone
- Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified.
- With intravitreal use of dexamethasone in adults: caution with concurrent administration of anticoagulant or antiplatelet drugs—increased risk of haemorrhagic events.
- Antacids are predicted to decrease the absorption of deflazacort. Separate administration by 2 hours. [Moderate] Theoretical
- Antacids decrease the absorption of dexamethasone. [Moderate] Study
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fluticasone. [Unknown] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- Antifungals, azoles (miconazole) are predicted to increase the concentration of methylprednisolone. Monitor and adjust dose. [Moderate] Theoretical
- Antifungals, azoles, antibiotics (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Severe] Study
- Idelalisib is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Moderate] Theoretical
- Imatinib is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study
- Corticosteroids are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). [Severe] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with corticosteroids (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Lumacaftor is predicted to decrease the exposure to methylprednisolone. Adjust dose. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to beclometasone (risk with beclometasone is likely to be lower than with other corticosteroids). [Moderate] Theoretical
- Macrolides (erythromycin) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study
- Macrolides (erythromycin) are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. [Moderate] Study
- Corticosteroids are predicted to decrease the efficacy of mifamurtide. Avoid. [Severe] Theoretical
- Mifepristone is predicted to decrease the efficacy of corticosteroids. Use with caution and adjust dose. [Moderate] Theoretical
- Mitotane is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. [Severe] Study
- Mitotane is predicted to decrease the exposure to fluticasone. [Unknown] Theoretical
- Corticosteroids (betamethasone, deflazacort, dexamethasone, hydrocortisone, methylprednisolone, prednisolone) are predicted to decrease the efficacy of monoclonal antibodies (atezolizumab, ipilimumab, nivolumab, pembrolizumab). Use with caution or avoid. [Severe] Theoretical
- Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate] Theoretical
- Corticosteroids are predicted to decrease the risk of immunosuppression when given with monoclonal antibodies (dinutuximab). Avoid except in life-threatening situations. [Severe] Study
- Netupitant is predicted to increase the exposure to oral budesonide. [Moderate] Study
- Netupitant is predicted to increase the exposure to dexamethasone. Adjust dose. [Moderate] Study
- Netupitant is predicted to increase the exposure to fluticasone. [Moderate] Study
- Netupitant is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study
- Corticosteroids are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Severe] Anecdotal
- Corticosteroids increase the risk of gastrointestinal perforation when given with nicardipine. [Severe] Anecdotal
- Nilotinib is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. [Moderate] Study
- NSAIDs increase the risk of gastrointestinal bleeding when given with corticosteroids. [Severe] Study
- Corticosteroids are predicted to increase the effects of phenindione. [Moderate] Anecdotal
Corticosteroids – Coumarins

**FOOD AND LIFESTYLE** The effects of coumarins can be reduced or abolished by vitamin K, including that found in health foods, food supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control. Pomegranate juice is predicted to increase the INR in response to acenocumarol and warfarin.

- **Alcohol (beverage)** in those who drink heavily potentially decreases the anticoagulant effect of coumarins. (Severe) Study
- **Antiepileptics (carbamazepine)** decrease the effects of coumarins. Monitor and adjust dose. (Severe) Study
- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to alter the anticoagulant effect of coumarins. (Moderate) Anecdotal
- **Antifungals, azoles (fluconazole)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Moderate) Study
- **Antifungals, azoles (itraconazole)** potentially increase the anticoagulant effect of coumarins. (Severe) Anecdotal
- **Antifungals, azoles (ketocanazole)** potentially increase the anticoagulant effect of warfarin. Monitor INR and adjust dose. (Severe) Anecdotal
- **Antifungals, azoles (miconazole)** greatly increase the anticoagulant effect of coumarins. MHRA advises avoid unless INR can be monitored closely; monitor for signs of bleeding. (Severe) Study
- **Antifungals, azoles (voriconazole)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Moderate) Study
- **Apalutamide** is predicted to decrease the exposure to coumarins. Avoid or monitor. (Mild) Study
- **Aprepitant** decreases the anticoagulant effect of coumarins. (Moderate) Study
- **Axitinib** is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- **Azbathioprine** decreases the anticoagulant effect of coumarins. (Moderate) Study
- **Bosentan** decreases the anticoagulant effect of coumarins. (Moderate) Study
- **Bosutinib** is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- **Cabozantinib** is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- **Capeciticabine** increases the effects of coumarins. Monitor INR and adjust dose. (Moderate) Anecdotal
- **Cephalosporins (ceftiriazone)** potentially increase the risk of bleeding events when given with coumarins. (Severe) Anecdotal
- **Ceritinib** is predicted to increase the exposure to warfarin. Avoid. (Severe) Theoretical
- **Chloramphenicol** potentially increases the anticoagulant effect of coumarins. (Moderate) Anecdotal
- **Corticosteroids** are predicted to increase the effects of coumarins. (Moderate) Study
- **Cranberry juice** potentially increases the anticoagulant effect of warfarin. Avoid. (Severe) Anecdotal
- **Crizotinib** is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- **Dabrafenib** is predicted to decrease the anticoagulant effect of coumarins. (Severe) Theoretical
- **Danazol** potentially increases the anticoagulant effect of coumarins. (Severe) Anecdotal
- **Dasatinib** is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- **Disulfiram** increases the anticoagulant effect of coumarins. (Moderate) Study
- **Efavirenz** is predicted to affect the concentration of coumarins. Adjust dose. (Moderate) Theoretical
- **Elvitegravir** is predicted to decrease the anticoagulant effect of coumarins. (Moderate) Theoretical
- **Enteral feeds** (vitamin-K containing) potentially decrease the anticoagulant effect of coumarins. (Severe) Anecdotal
- **Enalaprilat** potentially decreases the exposure to coumarins. Avoid or adjust dose and monitor INR. (Severe) Study
- **Erlotinib** increases the anticoagulant effect of coumarins. (Severe) Anecdotal
- **Etravirine** increases the anticoagulant effect of coumarins. (Moderate) Theoretical
- **Fibrates** are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe) Study
- **Fluvastatin** increases the anticoagulant effect of coumarins. (Severe) Anecdotal
- **Fosaprepitant** is predicted to decrease the anticoagulant effect of coumarins. (Moderate) Theoretical
- **Gefitinib** is predicted to increase the anticoagulant effect of coumarins. (Severe) Anecdotal
- **Glucagon** increases the anticoagulant effect of warfarin. (Severe) Study
- **Glucosamine** potentially decreases the anticoagulant effect of acenocumarol. (Moderate) Anecdotal
- **Glucosamine** potentially increases the anticoagulant effect of warfarin. Avoid. (Moderate) Anecdotal
- **Griseofulvin** potentially decreases the anticoagulant effect of coumarins. (Moderate) Anecdotal
- **H2 receptor antagonists (cimetidine)** increase the anticoagulant effect of coumarins. (Severe) Study
- **HIV-protease inhibitors** (ritonavir) potentially decrease the anticoagulant effect of coumarins. Avoid. (Severe) Anecdotal
- **HIV-protease inhibitors** (atazanavir) are predicted to affect the anticoagulant effect of coumarins. (Moderate) Anecdotal
- **HIV-protease inhibitors** (lopinavir) potentially decrease the anticoagulant effect of coumarins. Avoid. (Severe) Anecdotal
- **HIV-protease inhibitors** (ritonavir) are predicted to affect the anticoagulant effect of coumarins. (Moderate) Anecdotal
- **HIV-protease inhibitors** (atazanavir) potentially decrease the anticoagulant effect of coumarins. Avoid. (Severe) Anecdotal
- **HIV-protease inhibitors** (lopinavir) are predicted to affect the anticoagulant effect of coumarins. (Moderate) Anecdotal
- **Imatinib** is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- **Ivermectin** potentially increases the anticoagulant effect of coumarins. (Severe) Anecdotal
- **Lapatinib** is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- **Leflunomide** increases the anticoagulant effect of coumarins. (Severe) Anecdotal
- **Leflunomide** increases the anticoagulant effect of coumarins. (Severe) Anecdotal
- **Letermovir** is predicted to decrease the concentration of warfarin. Monitor and adjust dose. (Moderate) Theoretical
- **Lomitapide** increases the exposure to warfarin. Monitor INR and adjust dose. (Severe) Study
- **Macrolides (clarithromycin, erythromycin)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe) Anecdotal
- **Mecaptepinur** decreases the anticoagulant effect of coumarins. (Moderate) Anecdotal
- **Metronidazole** increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe) Study
- **Mesnexine** potentially affects the exposure to warfarin. Avoid. (Unknown) Theoretical
Interactions

### Crizotinib

**Crizotinib** is predicted to increase the exposure to **abemaciclib.** Avoid. (Moderate) Study

**Crizotinib** is predicted to increase the exposure to **aldosterone antagonists (eplerenone).** Adjust eplerenone dose, p. 493. (Severe) Study

**Crizotinib** is predicted to increase the exposure to alpha blockers (tamsulosin). (Moderate) Theoretical

**Crizotinib** is predicted to increase the exposure to **alprazolam.** Avoid. (Moderate) Study

**Crizotinib** is predicted to increase the exposure to **antihistamines, non-sedating (rupatadine).** Avoid. (Moderate) Study

**Crizotinib** is predicted to increase the concentration of **antimalarials (piperazine).** (Severe) Theoretical

**Crizotinib** is predicted to increase the exposure to **axitinib.** Avoid. (Moderate) Theoretical

**Crizotinib** is predicted to increase the exposure to **bedaquiline.** Avoid prolonged use. (Severe) Theoretical

**Crizotinib** is predicted to increase the exposure to **bosutinib.** Avoid or adjust dose. (Severe) Theoretical

**Crizotinib** is predicted to increase the exposure to **buspirone.** Use with caution and adjust dose. (Moderate) Study

**Crizotinib** is predicted to increase the exposure to **cabozantinib.** (Moderate) Theoretical

**Crizotinib** is predicted to increase the exposure to **calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine).** Monitor and adjust dose. (Moderate) Study

**Crizotinib** is predicted to increase the exposure to **cariprazine.** Avoid. (Severe) Study

**Crizotinib** is predicted to increase the exposure to **ceritinib.** Avoid. (Moderate) Study

**Crizotinib** is predicted to increase the concentration of **cilostazol.** (Severe) Study

**Cobicistat** is predicted to moderately increase the exposure to **crizotinib.** Avoid. (Moderate) Study
Crizotinib is predicted to increase the exposure to cabazitaxel.

Crizotinib is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4, p. 1200 (Severe) Study.

Crizotinib is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study.

Crizotinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical.

Crizotinib is predicted to slightly increase the exposure to darifenacin. (Moderate) Study.

Crizotinib is predicted to increase the exposure to eltrombopag. Avoid or adjust dose—consult product literature. (Severe) Study.

Crizotinib is predicted to moderately increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study.

Crizotinib is predicted to moderately increase the exposure to encorafenib. (Moderate) Study → Also see TABLE 9 p. 1377.

Crizotinib is predicted to markedly decrease the exposure to ergolines. (Severe) Theoretical.

Crizotinib is predicted to increase the risk of ergotism when given with ergotamine. (Severe) Theoretical.

Crizotinib is predicted to increase the exposure to erlotinib. (Moderate) Theoretical.

Crizotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study → Also see TABLE 9 p. 1377.

Crizotinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 777. (Mild) Study.

Crizotinib is predicted to increase the exposure to gefitinib. Avoid. (Severe) Theoretical → Also see TABLE 15 p. 1378.

Crizotinib potentially decreases the exposure to glecaprevir. Avoid. (Severe) Theoretical.

Grapefruit juice is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 352. (Moderate) Theoretical.

Crizotinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose. (Mild) Study.

HIV-protease inhibitors are predicted to moderately increase the exposure to crizotinib. Avoid. (Moderate) Study → Also see TABLE 9 p. 1377.

Crizotinib is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4, p. 983. (Severe) Study → Also see TABLE 15 p. 1378.

Idelalisib is predicted to moderately increase the exposure to crizotinib. Avoid. (Moderate) Study → Also see TABLE 15 p. 1378.

Crizotinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 211. (Severe) Theoretical → Also see TABLE 6 p. 1376.

Crizotinib is predicted to increase the exposure to ivacaftor. Adjust ivacaftor or tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study.

Crizotinib is predicted to increase the exposure to lapatinib. (Moderate) Study → Also see TABLE 9 p. 1377.

Crizotinib is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical.

Crizotinib is predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. (Moderate) Study.

Macrolides (clarithromycin) are predicted to moderately increase the exposure to crizotinib. Avoid. (Moderate) Study → Also see TABLE 9 p. 1377.

Crizotinib is predicted to increase the exposure to midostaurin. Monitor side effects and adjust dose. (Severe) Study.

Crizotinib is predicted to increase the exposure to midostaurin. (Moderate) Theoretical.

Mitotane is predicted to markedly decrease the exposure to crizotinib. Avoid. (Severe) Study → Also see TABLE 15 p. 1378.

Crizotinib is predicted to increase the exposure to naxolone. Adjust naxolone dose and monitor side effects, p. 65. (Moderate) Study.

Nevirapine is predicted to decrease the exposure to crizotinib. Avoid. (Severe) Theoretical.

Crizotinib is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Theoretical → Also see TABLE 15 p. 1378.

Crizotinib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study → Also see TABLE 6 p. 1376.

Crizotinib is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical → Also see TABLE 6 p. 1376.

Crizotinib is predicted to increase the exposure to oxycodone. (Mild) Theoretical.

Crizotinib is predicted to increase the exposure to pazopanib. (Moderate) Theoretical → Also see TABLE 15 p. 1378 → Also see TABLE 9 p. 1377.

Crizotinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical.

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 812. (Moderate) Theoretical.

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 811. (Moderate) Study → Also see TABLE 9 p. 1377.

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). (Severe) Theoretical.

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. (Severe) Theoretical → Also see TABLE 9 p. 1377.

Crizotinib potentially decreases the exposure to pioglitazone. Avoid. (Severe) Theoretical.

Crizotinib is predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 1377.

Pitolisant is predicted to decrease the exposure to crizotinib. Avoid. (Severe) Theoretical.

Crizotinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study.

Crizotinib is predicted to increase the exposure to ranolazine. (Severe) Study → Also see TABLE 9 p. 1377.

Crizotinib is predicted to increase the exposure to ribociclib. (Moderate) Study → Also see TABLE 9 p. 1377.

Rifampicin is predicted to markedly decrease the exposure to crizotinib. Avoid. (Severe) Study.

Crizotinib is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical → Also see TABLE 15 p. 1378.

Crizotinib is predicted to increase the exposure to saxagliptin. (Mild) Study.

Crizotinib increases the concentration of sirolimus. Monitor and adjust dose. (Moderate) Study.

Crizotinib is predicted to increase the exposure to 555RIs (dapoxetine). Adjust dapoxetine dose with moderate inhibitors of CYP3A4, p. 821. (Moderate) Theoretical.

St John’s Wort is predicted to decrease the exposure to crizotinib. Avoid. (Severe) Theoretical.

Crizotinib is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. (Severe) Study.

Crizotinib is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 205. (Severe) Study.

Crizotinib is predicted to increase the exposure to sunitinib. (Moderate) Theoretical → Also see TABLE 15 p. 1378 → Also see TABLE 9 p. 1377.

Crizotinib is predicted to increase the concentration of tacrolimus. (Severe) Study.

Also see TABLE 9 p. 1377.
Cyclosporin
Calcium channel blockers
Brigatinib

Antifungals, azoles

Antiepileptics

Live vaccines

Cytarabine decreases the concentration of flucytosine. Avoid. [Severe] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cytarabine. Public Health England advises avoid (refer to Green Book). [Severe] Study

Cyproheptadine → see antihistamines, sedating

Cyclophosphamide → see alkylating agents

Cycloserine

Cycloserine increases the risk of CNS toxicity when given with isoniazid. Monitor and adjust dose. [Moderate] Study

Cytochrome P450 (CYP3A4) is predicted to increase the exposure to dabigatran. [Moderate] Study

Dabrafenib is predicted to increase the exposure to dabigatran. [Moderate] Study

Dabrafenib increases the exposure to dabigatran. Use with caution and adjust dose. [Severe] Theoretical

Dabrafenib is predicted to increase the exposure to dabigatran. Avoid. [Moderate] Study

Dabrafenib is predicted to decrease the exposure to dabigatran. Use with caution or avoid. [Moderate] Study

Dabrafenib is predicted to decrease the anticoagulant effect of coumarins. [Severe] Theoretical

Dabrafenib is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose. [Severe] Theoretical

Dabrafenib is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical

Clobopirdrel is predicted to increase the exposure to dabrafenib. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study

Dabrafenib is predicted to decrease the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study

Fibrates (gemfibrozil) are predicted to increase the exposure to dabrafenib. [Moderate] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study

Dabrafenib decreases the exposure to midazolam. Monitor and adjust dose. [Moderate] Study

Mitotane is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 1378

Rifampicin is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical

Dacarbazine → see alkylating agents

Dactinomycin

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dactinomycin. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
### Dairy products

- **Dairy products** are predicted to decrease the absorption of eltroambog, Eltroambog should be taken 2 hours before or 4 hours after dairy products, **Severe** Theoretical
- **Dairy products** decrease the exposure to tetracyclines (demeclocycline, oxytetracycline, tetracycline). Avoid, **Moderate** Theoretical Study

### Dalteparin

- Dalteparin → see low molecular-weight heparins

### Danaparoid

- Danaparoid → see TABLE 3 p. 1375 (anticoagulant effects)
- **Fibrates** is predicted to increase the risk of bleeding events when given with danaparoid. **Severe** Theoretical Study

### Danazol

- Danazol moderately increases the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. **Severe** Theoretical Study
- Danazol increases the concentration of ciclosporin. **Severe** Theoretical Study
- Danazol potentially increases the anticoagulant effect of coumarins. **Anecdotal**
- Danazol is predicted to increase the risk of rhabdomyolysis when given with statins (atorvastatin). **Severe** Theoretical Study
- Danazol increases the risk of rhabdomyolysis when given with statins (simvastatin). Avoid, **Severe** Anecdotal

### Dapsone

- Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe** Theoretical
- Dapsone is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. **Severe** Theoretical
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe** Theoretical
- Antimalarials (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe** Theoretical
- Nitrate are predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe** Theoretical
- Nitrofurantoin is predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe** Theoretical
- Paracetamol is predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe** Theoretical
- Rifabutin decreases the exposure to dapsone. **Moderate** Study
- Rifampicin decreases the exposure to dapsone. **Moderate** Study
- Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe** Theoretical
- Sulfonamides are predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe** Theoretical
- Dapsone increases the exposure to trimethoprim and trimethoprim increases the exposure to dapsone. **Severe** Study

### Daptomycin

- **Aspirin** (high-dose) increases the risk of renal impairment when given with daptomycin. **Moderate** Theoretical
- Ciclosporin is predicted to increase the risk of rhabdomyolysis when given with daptomycin. **Severe** Theoretical
- Fibrates are predicted to increase the risk of rhabdomyolysis when given with daptomycin. **Severe** Theoretical
- **NSAIDs** increase the risk of renal impairment when given with daptomycin. **Moderate** Theoretical
- **Statins** are predicted to increase the risk of rhabdomyolysis when given with daptomycin. **Severe** Theoretical
- Daratumumab → see monoclonal antibodies
- Darbepoetin alfa → see TABLE 5 p. 1375 (thromboembolism), TABLE 16 p. 1379 (increased serum potassium)
- Darifenacin → see TABLE 10 p. 1377 (antimuscarinics)
- Antiarrhythmics (dronedarone) are predicted to slightly increase the exposure to darifenacin. **Moderate** Study
- Darifenacin is predicted to increase the concentration of antiarrhythmics (flecainide). **Moderate** Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to darifenacin. **Moderate** Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to slightly increase the exposure to darifenacin. **Moderate** Study
- Antifungals, azoles (itraconazole, ketocazole, voriconazole) are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. **Severe** Study
- Apalutamide is predicted to decrease the exposure to darifenacin. Avoid or monitor. **Moderate** Study
- Aprepitant is predicted to slightly increase the exposure to darifenacin. **Moderate** Study
- Bupropion is predicted to slightly increase the exposure to darifenacin. **Mild** Study
- Calcium channel blockers (diltiazem, verapamip) are predicted to slightly increase the exposure to darifenacin. **Moderate** Study
- Ciclosporin is predicted to increase the exposure to darifenacin. Avoid. **Moderate** Theoretical
- Cinacalcet is predicted to slightly increase the exposure to darifenacin. **Mild** Study
- Cobicistat is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. **Severe** Study
- Crizotinib is predicted to slightly increase the exposure to darifenacin. **Mild** Study
- Enzalutamide is predicted to decrease the exposure to darifenacin. **Moderate** Theoretical
- Grapefruit juice is predicted to increase the exposure to darifenacin. **Moderate** Study
- HIV-protease inhibitors are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. **Severe** Study
- Idelalisib is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. **Severe** Study
- Imatinib is predicted to slightly increase the exposure to darifenacin. **Moderate** Study
- Macrolides (clarithromycin) are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. **Severe** Study
- Macrolides (erythromycin) are predicted to slightly increase the exposure to darifenacin. **Moderate** Study
- Milotane is predicted to decrease the exposure to darifenacin. **Moderate** Theoretical
- Netupitant is predicted to slightly increase the exposure to darifenacin. **Moderate** Study
- Nilotinib is predicted to slightly increase the exposure to darifenacin. **Moderate** Study
- Rifampicin is predicted to decrease the exposure to darifenacin. **Moderate** Study
- Rifaximin is predicted to slightly increase the exposure to darifenacin. **Mild** Study
- St John’s Wort is predicted to decrease the exposure to darifenacin. **Moderate** Theoretical
- Terbinafine is predicted to slightly increase the exposure to darifenacin. **Mild** Study
- Darifenacin is predicted to increase the exposure to tricyclic antidepressants. **Moderate** Theoretical → Also see TABLE 10 p. 1377

### Dasabuvir

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dasabuvir. Avoid. **Severe** Theoretical
- Clopidogrel is predicted to very markedly increase the exposure to dasabuvir. Avoid. **Severe** Study

---

**TABLE 1**

- Dairy products. Use with caution or avoid.

**TABLE 4**

- Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with dapsone. **Severe** Theoretical

**TABLE 5**

- Anecdotal

**TABLE 8**

- **Darifenacin** is predicted to markedly to very markedly increase the exposure to darifenacin. **Mild** Study

**TABLE 10**

- **Darifenacin** is predicted to slightly increase the exposure to darifenacin. **Mild** Study
**Dasabuvir – Desogestrel 1441**

- **Combined hormonal contraceptives** (containing ethinyl estradiol) increase the risk of increased ALT concentrations when given with dasabuvir. Avoid. [Severe] Study
- **Efavirenz** increases the risk of increased ALT concentrations when given with dasabuvir. Avoid. [Severe] Study
- **Enzalutamide** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- **Etravirine** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- **Fibates** (gemfibrozil) are predicted to very markedly increase the exposure to dasabuvir. Avoid. [Severe] Study
- **Dasabuvir** (with omibitasvir, paritaprevir, and ritonavir) decreases the concentration of HIV-protease inhibitors (darunavir). Avoid or adjust dose. [Moderate] Study
- **Dasabuvir** (with omibitasvir, paritaprevir, and ritonavir) decreases the concentration of loop diuretics (furosemide). Adjust dose. [Moderate] Study
- **Mitotane** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- **Nevirapine** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- **Dasabuvir** increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 204. [Moderate] Study

**Dasabuvir**

- → [See Table 15 p. 1378 (myelosuppression), Table 9 p. 1377 (QT-interval prolongation), Table 4 p. 1373 (antipatelet effects)]
- **Antacids** decrease the absorption of dasabuvir. Separate administration by at least 2 hours. [Moderate] Study
- **Antihyperthrmics (dronedarone)** are predicted to increase the exposure to dasabuvir. [Severe] Study → Also see Table 9 p. 1377
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to dasabuvir. Avoid. [Severe] Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to dasabuvir. [Severe] Study → Also see Table 9 p. 1377
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to dasabuvir. Avoid or adjust dose—consult product literature. [Severe] Study → Also see Table 9 p. 1377
- **Apalutamide** is predicted to decrease the exposure to dasabuvir. Avoid or monitor. [Moderate] Study → Also see Table 9 p. 1377
- **Aprepitant** is predicted to increase the exposure to dasabuvir. [Severe] Study
- **Bosentan** is predicted to decrease the exposure to dasabuvir. [Severe] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to dasabuvir. [Severe] Study
- **Cobicistat** is predicted to markedly increase the exposure to dasabuvir. Avoid or adjust dose—consult product literature. [Severe] Study
- **Dasabuvir** is predicted to increase the risk of bleeding events when given with **coumarins**. [Severe] Theoretical
- **Crixotinib** is predicted to increase the exposure to dasabuvir. [Severe] Study → Also see Table 15 p. 1378 – Also see Table 9 p. 1377
- **Efavirenz** is predicted to decrease the exposure to dasabuvir. [Severe] Study → Also see Table 9 p. 1377
- **Enzalutamide** is predicted to markedly decrease the exposure to dasabuvir. Avoid. [Severe] Study
- **Grapefruit juice** is predicted to increase the exposure to dasabuvir. Avoid. [Moderate] Theoretical
- **H2 receptor antagonists** are predicted to decrease the exposure to dasabuvir. Avoid. [Moderate] Study
- **HIV-protease inhibitors** are predicted to markedly increase the exposure to dasabuvir. Avoid or adjust dose—consult product literature. [Severe] Study → Also see Table 9 p. 1377
- **Idelalisib** is predicted to markedly increase the exposure to dasabuvir. Avoid or adjust dose—consult product literature. [Severe] Study → Also see Table 15 p. 1378
- **Imatinib** is predicted to increase the exposure to dasabuvir. [Severe] Study → Also see Table 15 p. 1378
- **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to dasabuvir. Avoid or adjust dose—consult product literature. [Severe] Study → Also see Table 9 p. 1377
- **Macrolides (erythromycin)** are predicted to increase the exposure to dasabuvir. [Severe] Study → Also see Table 9 p. 1377
- **Mitotane** is predicted to markedly decrease the exposure to dasabuvir. Avoid. [Severe] Study → Also see Table 15 p. 1378
- **Netupitant** is predicted to increase the exposure to dasabuvir. [Severe] Study
- **Nevirapine** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to dasabuvir. [Severe] Study → Also see Table 15 p. 1378 – Also see Table 9 p. 1377
- **Dasabuvir** is predicted to increase the risk of bleeding events when given with **phenindione**. [Severe] Theoretical
- **Pitolisant** is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- **Proton pump inhibitors** are predicted to slightly to moderately decrease the exposure to dasabuvir. Avoid. [Severe] Study
- **Rifampicin** is predicted to markedly decrease the exposure to dasabuvir. [Severe] Study
- **Study**
- **St John’s Wort** is predicted to increase the exposure to dasabuvir. [Severe] Study
- **Dasabuvir** is predicted to increase the exposure to statins (simvastatin). [Moderate] Theoretical
- **Dasuquin** → see anticholinergics
- **Decitabine** → see Table 15 p. 1378 (myelosuppression)
- **Deferasirox** → see iron chelators
- **Deferiprone** → see Table 15 p. 1378 (myelosuppression)
- **Antacids (aluminium hydroxide)** are predicted to decrease the absorption of deferiprone. Avoid. [Moderate] Theoretical
- **Ascorbic acid** is predicted to increase the risk of cardiovascular side-effects when given with deferiprone. [Severe] Theoretical
- **Deflazacort** → see corticosteroids
- **Delamanid** → see Table 9 p. 1377 (QT-interval prolongation)
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** very slightly increase the exposure to delamanid. [Severe] Study
- **Cobicistat** very slightly increases the exposure to delamanid. [Severe] Study
- **Enzalutamide** is predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- **HIV-protease inhibitors** very slightly increase the exposure to delamanid. [Severe] Study → Also see Table 9 p. 1377
- **Idelalisib** very slightly increases the exposure to delamanid. [Severe] Study
- **Mitotane** is predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- **Macrolides (clarithromycin)** very slightly increase the exposure to delamanid. [Severe] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to slightly decrease the exposure to delamanid. [Severe] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to delamanid. Avoid. [Moderate] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** very slightly decrease the exposure to delamanid. [Severe] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to delamanid. [Severe] Study → Also see Table 9 p. 1377
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to slightly decrease the exposure to delamanid. [Severe] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly increase the exposure to delamanid. Avoid. [Moderate] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** very slightly increase the exposure to delamanid. [Severe] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to delamanid. [Severe] Study → Also see Table 9 p. 1377
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to slightly decrease the exposure to delamanid. [Severe] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to delamanid. [Severe] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** very slightly increase the exposure to delamanid. [Severe] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to delamanid. [Severe] Study → Also see Table 9 p. 1377
- **Antiepileptics (lamotrigine)** are predicted to increase the risk of hyponatraemia when given with delamanid. [Severe] Theoretical
- **Loperamide** greatly increases the absorption of oral **desmopressin** (and possibly sublingual). [Moderate] Study
- **Phenothiazines (chlorpromazine)** are predicted to increase the risk of hyponatraemia when given with desmopressin. [Severe] Theoretical
- **Desogestrel**
- **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, Interactions p. 794. [Severe] Theoretical

www.getintopharma.com
Didanosine → see TABLE 1 p. 1375 (hepatotoxicity), TABLE 12 p. 1378 (peripheral neuropathy)

**ROUTE-SPECIFIC INFORMATION**
Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.

- Allopurinol moderately increases the exposure to didanosine. Avoid. (Severe) Study
- Didanosine (buffered) decreases the exposure to antifungals, azoles (itraconazole, ketoconazole). Separate administration by 2 hours. (Severe) Study → Also see TABLE 1 p. 1375
- Febuxostat is predicted to increase the exposure to didanosine. (Severe) Theoretical
- Ganciclovir is predicted to increase the exposure to didanosine. (Moderate) Study
- HIV-protease inhibitors (tipranavir) decrease the exposure to didanosine. Separate administration by 2 hours. (Moderate) Study
- Didanosine (buffered) decreases the exposure to HIV-protease inhibitors (atazanavir). Didanosine should be taken 2 hours after atazanavir. (Severe) Study
- Didanosine (buffered) is predicted to decrease the exposure to HIV-protease inhibitors (darunavir boosted with ritonavir). Didanosine should be taken 1 hour before or 2 hours after darunavir. (Moderate) Theoretical
- Hydroxyurea increases the risk of toxicity when given with didanosine. Avoid. (Severe) Study
- Isoniazid is predicted to increase the risk of peripheral neuropathy when given with didanosine. (Severe) Theoretical → Also see TABLE 1 p. 1375 – Also see TABLE 12 p. 1378
- Didanosine is predicted to increase the risk of pancreatitis when given with pentamidine. Avoid. (Severe) Study
- Didanosine (buffered) is predicted to greatly decrease the exposure to oral quinolones. Didanosine should be taken 2 hours after quinolones. (Moderate) Study
- Ribavirin is predicted to increase the exposure to didanosine. Avoid. (Severe) Study
- Didanosine increases the risk of toxicity when given with stavudine. Avoid. (Severe) Study → Also see TABLE 12 p. 1378
- Tenofovir disoproxil increases the risk of toxicity when given with didanosine. Avoid. (Severe) Study
- Valganciclovir is predicted to increase the exposure to didanosine. (Moderate) Study

**Digoxin** → see TABLE 6 p. 1376 (bradycardia)

**GENERAL INFORMATION**
Dugs that reduce serum potassium are predicted to increase the risk of digoxin toxicity, see TABLE 17 p. 1379.

- Acarbose decreases the concentration of digoxin. (Moderate) Study
- Aldosterone antagonists (eplerenone) very slightly increase the exposure to digoxin. (Mild) Study
- Aldosterone antagonists (spironolactone) increase the concentration of digoxin. Monitor and adjust dose. (Moderate) Study
- Aminoglycosides potentially increase the concentration of digoxin. Monitor and adjust dose. (Mild) Study
- Antacids decrease the absorption of digoxin. Separate administration by 2 hours. (Mild) Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust digoxin dose, p. 109. (Severe) Study → Also see TABLE 6 p. 1376
- Antiarrhythmics (propafenone) increase the concentration of digoxin. Monitor and adjust dose. (Moderate) Study
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. (Moderate) Anecdotall
- Antifungals, azoles (isavuconazole) slightly increase the exposure to digoxin. Monitor and adjust dose. (Moderate) Study
- Antifungals, azoles (itraconazole) are predicted to markedly increase the concentration of digoxin. Monitor and adjust dose. (Severe) Study
- Antimalarials (mefloquine) are predicted to increase the risk of bradycardia when given with digoxin. (Severe) Theoretical
Antimalarials (quinine) increase the concentration of digoxin. Monitor and adjust digoxin dose, p. 109. [Severe] Anecdotal

Aplutamide is predicted to decrease the exposure to digoxin. [Mild] Study

Balsalazide is predicted to decrease the concentration of digoxin. [Moderate] Theoretical

Brigatinib potentially increases the concentration of digoxin. [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study → Also see TABLE 6 p. 1376

Intravenous calcium salts increase the concentration of digoxin. Avoid. [Moderate] Anecdotal

Carbamazepine affects the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical

Ceritinib is predicted to increase the exposure to digoxin. [Severe] Study

Ciclosporin increases the concentration of digoxin. [Moderate] Theoretical

Cipralex is predicted to increase the exposure to digoxin. Avoid or adjust dose. [Moderate] Study

Ciclosporin increases the concentration of digoxin. [Severe] Study

Cisapride is predicted to increase the exposure to digoxin. [Severe] Study

Citalopram increases the concentration of digoxin. [Moderate] Theoretical

Citalopram increases the concentration of digoxin. [Moderate] Theoretical

Citalopram increases the concentration of digoxin. [Moderate] Theoretical

Citalopram increases the concentration of digoxin. [Moderate] Theoretical

Citalopram increases the concentration of digoxin. [Moderate] Theoretical

Citalopram increases the concentration of digoxin. [Moderate] Theoretical

Citalopram increases the concentration of digoxin. [Moderate] Theoretical

Citalopram increases the concentration of digoxin. [Moderate] Theoretical

Citalopram increases the concentration of digoxin. [Moderate] Theoretical
Dolutegravir (continued)

- **Efavirenz** decreases the exposure to dolutegravir. Adjust dose. (Severe) Study
- **Encorafenib** is predicted to increase the exposure to dolutegravir. (Moderate) Theoretical
- **Enzalutamide** decreases the exposure to dolutegravir. Adjust dose. (Severe) Study
- **Etravirine** moderately decreases the exposure to dolutegravir. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). (Severe) Study
- **HIV-protease inhibitors (fosamprenavir boosted with ritonavir)** slightly decrease the exposure to dolutegravir. Avoid if resistant to HIV-integrase inhibitors. (Severe) Study
- **HIV-protease inhibitors (tipranavir)** moderately decrease the exposure to dolutegravir. Refer to specialist literature. (Severe) Study
- **Iron (oral)** decreases the absorption of dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after iron (oral). (Moderate) Study
- **Dolutegravir** increases the exposure to **metformin**. Use with caution and adjust dose. (Severe) Study
- **Mitotane** decreases the exposure to dolutegravir. Adjust dose. (Severe) Study
- **Nevirapine** decreases the exposure to dolutegravir. Adjust dose. (Severe) Study
- **Rifampicin** decreases the exposure to dolutegravir. Adjust dose. (Severe) Study
- **St John’s Wort** decreases the exposure to dolutegravir. Adjust dose. (Severe) Study
- **Sucralfate** decreases the absorption of dolutegravir. (Moderate) Study

**Domperidone** → see **TABLE 9** p. 1377 (QT-interval prolongation)

- **Antiarrhythmics (dronedarone)** increase the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** increase the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- **Aprepitant** increases the risk of QT-prolongation when given with **domperidone**. Avoid. (Severe) Study
- **Domperidone is predicted to decrease the effects of dopamine receptor agonists.** Avoid. (Moderate) Theoretical → Also see **TABLE 9** p. 1377

- **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the concentration of **cablegrone.** (Moderate) Anecdotal

- **Aripiprazole** is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Asenapine** is predicted to decrease the effects of dopamine receptor agonists. Adjust dose. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Benzodiazepines** is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Bupropion** increases the risk of side-effects when given with **amantadine.** (Moderate) Study

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **bromocriptine.** (Severe) Theoretical → Also see **TABLE 8** p. 1376

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **cablegrone.** (Moderate) Anecdotal → Also see **TABLE 8** p. 1376

- **Clobazapine** is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see **TABLE 10** p. 1377

- **Cobicistat** increases the exposure to **bromocriptine.** (Severe) Study

- **Cobicistat** is predicted to increase the concentration of **cablegrone.** (Moderate) Anecdotal

- **Combined hormonal contraceptives** are predicted to increase the exposure to ropinirole. Adjust dose. (Moderate) Study

- **Crizotinib** is predicted to increase the exposure to **bromocriptine.** (Severe) Theoretical

- **Domperidone is predicted to increase the concentration of ropinirole.** Adjust dose. (Moderate) Study

- **Dolutegravir** is predicted to increase the exposure to pramipexole. Adjust dose. (Moderate) Study

- **Droperidol** is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (bromocriptine, cabela IR). (Moderate) Theoretical

- **Dopamine receptor agonists (cabela IR)** are predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine). Avoid. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Dopamine receptor agonists (cabela IR)** are predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Ergometrine** is predicted to increase the risk of ergotism when given with dopamine receptor agonists (cabela IR, pergolide). Avoid. (Moderate) Theoretical

**Dopamine receptor agonists** → see **TABLE 8** p. 1376 (hypotension), **TABLE 9** p. 1377 (QT-interval prolongation), **TABLE 10** p. 1377 (antimuscarnics)

- **Antimuscarnics**
  - **Dopamine receptor agonists** → see **TABLE 8** p. 1376 (hypotension), **TABLE 9** p. 1377 (QT-interval prolongation), **TABLE 10** p. 1377 (antimuscarnics)

- **Pramipexole** is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see **TABLE 9** p. 1377

- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to bromocriptine. (Severe) Theoretical

- **Antihypertensives** are predicted to increase the concentration of cabergoline. (Moderate) Anecdotal

- **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the exposure to bromocriptine. (Severe) Study

- **Aprepitant** is predicted to increase the exposure to bromocriptine. Adjust dose. (Moderate) Study

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** increase the exposure to bromocriptine. (Severe) Study

- **Aripiprazole** is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Asenapine** is predicted to decrease the effects of dopamine receptor agonists. Adjust dose. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Benzodiazepines** is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Bupropion** increases the risk of side-effects when given with **amantadine.** (Moderate) Study

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **bromocriptine.** (Severe) Theoretical → Also see **TABLE 8** p. 1376

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the concentration of **cablegrone.** (Moderate) Anecdotal → Also see **TABLE 8** p. 1376

- **Clobazapine** is predicted to decrease the effects of dopamine receptor agonists. (Moderate) Theoretical → Also see **TABLE 10** p. 1377

- **Cobicistat** increases the exposure to **bromocriptine.** (Severe) Study

- **Cobicistat** is predicted to increase the concentration of **cablegrone.** (Moderate) Anecdotal

- **Combined hormonal contraceptives** are predicted to increase the exposure to ropinirole. Adjust dose. (Moderate) Study

- **Crizotinib** is predicted to increase the exposure to **bromocriptine.** (Severe) Theoretical

- **Domperidone is predicted to increase the concentration of ropinirole.** Adjust dose. (Moderate) Study

- **Dolutegravir** is predicted to increase the exposure to pramipexole. Adjust dose. (Moderate) Study

- **Droperidol** is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (bromocriptine, cabergoline). (Moderate) Theoretical

- **Dopamine receptor agonists (cabergoline)** are predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine). Avoid. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Dopamine receptor agonists (cabergoline)** are predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Dopamine receptor agonists (cabergoline, pergolide)** Avoid. (Moderate) Theoretical

- **Dopamine receptor agonists (cabeline)** are predicted to increase the concentration of cabergoline. (Moderate) Anecdotal

- **Domperidone is predicted to increase the concentration of ropinirole.** Adjust dose. (Moderate) Study

- **Dolutegravir** is predicted to increase the exposure to pramipexole. Adjust dose. (Moderate) Study

- **Droperidol** is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (bromocriptine, cabergoline). (Moderate) Theoretical

- **Dopamine receptor agonists (cabergoline)** are predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine). Avoid. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Steady-state levelsresses** are predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. (Moderate) Theoretical → Also see **TABLE 8** p. 1376

- **Ergometrine** is predicted to increase the risk of ergotism when given with dopamine receptor agonists (cabergoline, pergolide). Avoid. (Moderate) Theoretical

**Food and Lifestyle** Dose adjustment might be necessary if smoking started or stopped during treatment with **ropinirole.**
Dopamine receptor agonists – Doravirine

- Ergotamine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical
- Ergotamine is predicted to increase the risk of ergotism when given with pergolide. [Moderate] Theoretical
- Flupentixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- Apomorphine is predicted to increase the risk of severe hypertension when given with granisetron. [Severe] Theoretical
- H₂ receptor antagonists (cimetidine) are predicted to increase the exposure to pramipexole. Adjust dose. [Moderate] Study
- Haloperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- HIV-protase inhibitors increase the exposure to bromocriptine. [Severe] Study
- HIV-protase inhibitors are predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- Hormone replacement therapy decreases the clearance of ropinirole. Monitor and adjust dose. [Moderate] Study
- Idealisib increases the exposure to bromocriptine. [Severe] Study
- Idealisib is predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- Imatinib is predicted to increase the exposure to bromocriptine. [Severe] Theoretical
- Imatinib is predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- Loxapine is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical
- Macrolides (clarithromycin) increase the exposure to bromocriptine. [Severe] Study
- Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of cabergoline. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to bromocriptine. [Severe] Theoretical
- Amantadine increases the risk of CNS toxicity when given with memantine. Use with caution or avoid. [Severe] Theoretical
- Memantine is predicted to increase the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). [Moderate] Theoretical
- Metoclopramide is predicted to decrease the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). Avoid. [Moderate] Study
- Mexiletine is predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
- Nilotinib is predicted to increase the exposure to bromocriptine. [Severe] Theoretical
- Nilotinib is predicted to increase the concentration of cabergoline. [Moderate] Anecdotal
- Olanzapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- Apomorphine increases the risk of severe hypotension when given with ondansetron. Avoid. [Severe] Study
- Paliperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- Apomorphine is predicted to increase the risk of severe hypotension when given with palonosetron. [Severe] Theoretical
- Phenothiazines are predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- Pimozide is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- Quetiapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- Quinolones (ciproxofloxacine) are predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
- Raloxifene is predicted to decrease the exposure to pramipexole. Adjust dose. [Moderate] Study
- Risperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- SSRIs (fluvoxamine) are predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
- Sulpiride is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- Cabergoline is predicted to increase the exposure to pramipexole. Adjust dose. [Moderate] Study
- Vandetanib is predicted to increase the exposure to pramipexole. Adjust dose. [Moderate] Study
- Zuclopenthixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to doravirine. Avoid. [Severe] Study
- Antiepileptics (oxcarbazepine) are predicted to decrease the exposure to doravirine. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to doravirine. [Moderate] Study
- Bosentan is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose, p. 644. [Severe] Theoretical
- Cobimetinib is predicted to increase the exposure to doravirine. [Moderate] Study
- Dabrafenib is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose, p. 644. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose, p. 644. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to doravirine. Avoid. [Severe] Study
- HIV-protase inhibitors are predicted to increase the exposure to doravirine. [Moderate] Study
- Idealisib is predicted to increase the exposure to doravirine. [Moderate] Study
- Lumacaftor is predicted to decrease the exposure to doravirine. Avoid. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to doravirine. [Moderate] Study
- Mitotane is predicted to decrease the exposure to doravirine. Avoid. [Severe] Study
- Modafinil is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose, p. 644. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose, p. 644. [Severe] Theoretical
- Rifabutin moderately decreases the exposure to doravirine. Adjust doravirine dose, p. 644. [Severe] Study
- Rifampicin is predicted to decrease the exposure to doravirine. Avoid. [Severe] Study
- Doravirine is predicted to decrease the exposure to sirolimus. Monitor sirolimus concentration and adjust dose, p. 840. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to doravirine. Avoid. [Severe] Theoretical
- Doravirine is predicted to decrease the exposure to tacrolimus. Monitor tacrolimus concentration and adjust dose, p. 841. [Moderate] Theoretical
- Telotristat ethyl is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose, p. 644. [Severe] Theoretical
**Dorzolamide**

**ROUTE-SPECIFIC INFORMATION**
Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

**Dosulepin** → see tricyclic antidepressants

**Dosaxipram**
- **Aminophylline** increases the risk of agitation when given with dosaxipram. (Moderate) Study
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the effects of dosaxipram. (Moderate) Theoretical
- **Theophylline** increases the risk of agitation when given with dosaxipram. (Moderate) Study
- **Doxazosin** → see alpha blockers
- **Doxepin** → see tricyclic antidepressants
- **Doxorubicin** → see anthracyclines
- **Doxycycline** → see tetracyclines
- **Doxylamine** → see antihistamines, sedating
- **Dronedarone** → see antiarrhythmics

**Dropiprodol** → see TABLE 8 p. 1376 (hypotension), TABLE 9 p. 1377 (QT-interval prolongation), TABLE 11 p. 1377 (CNS depressant effects)

**Dropiprodol** is predicted to decrease the effects of **dopamine receptor agonists**. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 1376 → Also see TABLE 9 p. 1377

**Dropiprodol** is predicted to decrease the effects of **guanethidine**. Monitor and adjust dose. (Moderate) Theoretical → Also see TABLE 8 p. 1376

**Dropiprodol** decreases the effects of **levodopa**. (Severe) Study → Also see TABLE 8 p. 1376

**Drospirenone** → see TABLE 16 p. 1379 (increased serum potassium)

**Antifungals, azoles** moderately increase the exposure to drospirenone. (Severe) Study

**Dulaglutide** → see TABLE 14 p. 1376 (anti-diabetic drugs)

**Duloxetine** → see TABLE 18 p. 1379 (hypotension), TABLE 13 p. 1378 (serotonin syndrome), TABLE 4 p. 1375 (antiplatelet effects)

- **Antiepileptics (phenytoin)** are predicted to decrease the exposure to duloxetine. (Moderate) Theoretical
- **Duloxetine is predicted to increase the exposure to beta blockers, selective (metoprolol).** (Moderate) Study
- **Duloxetine is predicted to increase the exposure to doxepin.** (Moderate) Theoretical

**Duloxetine** is predicted to decrease the exposure to duloxetine. (Moderate) Theoretical

**Duloxetine is predicted to increase the exposure to pitolisant.** Use with caution and adjust dose. (Moderate) Study

- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to duloxetine. Avoid. (Moderate) Theoretical
- **Rifampicin** is predicted to decrease the exposure to duloxetine. (Moderate) Theoretical

** SSRIs (fluvoxamine) markedly increase the exposure to duloxetine. Avoid. (Severe) Study → Also see TABLE 18 p. 1379 → Also see TABLE 13 p. 1378 → Also see TABLE 4 p. 1375

**Teriflunomide** is predicted to decrease the exposure to duloxetine. (Moderate) Theoretical

**Dulvalumab** → see monoclonal antibodies

**Durvalumab** → see monoclonal antibodies

**Dutasteride**
- **Antiarhythmic (dronedarone)** are predicted to moderately increase the exposure to dutasteride. (Mild) Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to moderately increase the exposure to dutasteride. (Mild) Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. (Moderate) Theoretical
- **Apruptin is predicted to moderately increase the exposure to dutasteride.** (Mild) Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to moderately increase the exposure to dutasteride. (Mild) Study
- **Cobicistat** is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. (Moderate) Theoretical
- **Crizotinib** is predicted to moderately increase the exposure to dutasteride. (Mild) Study

**HIV-protease inhibitors are predicted to increase the exposure to dutasteride.** Monitor side effects and adjust dose. (Moderate) Theoretical

**Idelalisib** is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. (Moderate) Theoretical

- **Imatinib** is predicted to moderately increase the exposure to dutasteride. (Mild) Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. (Moderate) Theoretical
- **Macrolides (erythromycin)** are predicted to moderately increase the exposure to dutasteride. (Mild) Study

**Netupitant** is predicted to moderately increase the exposure to dutasteride. (Mild) Study

**Nilotinib** is predicted to moderately increase the exposure to dutasteride. (Mild) Study

**Eculizumab** → see monoclonal antibodies

**Edoxaban** → see TABLE 3 p. 1375 (anticoagulant effects)
- **Antiarhythmic (amiodarone)** slightly increase the exposure to edoxaban. (Severe) Study
- **Antiarhythmic (dronedarone)** slightly increase the exposure to edoxaban. Adjust edoxaban dose, p. 126. (Severe) Study
- **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to edoxaban. (Moderate) Study
- **Antiepileptics (phenytoin)** are predicted to decrease the exposure to edoxaban. (Moderate) Theoretical
- **Antifungals, azoles (itraconazole)** are predicted to slightly increase the exposure to edoxaban. (Severe) Theoretical
- **Ceritinib** is predicted to increase the exposure to edoxaban. (Moderate) Theoretical
- **Ciclosporin slightly increases the exposure to edoxaban.** Adjust edoxaban dose, p. 126. (Severe) Study
- **Cobicistat is predicted to increase the exposure to edoxaban.** Avoid. (Severe) Study
- **Edoxaban is predicted to slightly increase the exposure to edoxaban.** (Moderate) Study
- **Edoxaban is predicted to slightly increase the exposure to edoxaban.** Adjust dose. (Moderate) Study
- **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to slightly increase the exposure to edoxaban. (Severe) Theoretical
- **Lapatinib** is predicted to slightly increase the exposure to edoxaban. (Severe) Theoretical
- **Macrolides (azithromycin, clarithromycin)** are predicted to slightly increase the exposure to edoxaban. (Severe) Theoretical
- **Macrolides (erythromycin)** slightly increase the exposure to edoxaban. Adjust edoxaban dose, p. 126. (Severe) Study
- **Mirabegron is predicted to increase the exposure to edoxaban.** (Mild) Theoretical
- **Paritaprevir (with ritonavir and obinutuzumab)** is predicted to increase the exposure to edoxaban. (Severe) Study
- **Pibrentasvir (with glecaprevir)** is predicted to increase the exposure to edoxaban. (Moderate) Study
- **Pitolisant is predicted to decrease the exposure to edoxaban.** (Mild) Theoretical
- **Ranolazine is predicted to slightly increase the exposure to edoxaban.** (Severe) Theoretical
- **Rifampicin** is predicted to decrease the exposure to edoxaban. (Moderate) Study
- **St John’s Wort is predicted to decrease the exposure to edoxaban.** (Moderate) Study
- **Velpatasvir is predicted to increase the exposure to edoxaban.** (Severe) Theoretical
- **Vemurafenib is predicted to slightly increase the exposure to edoxaban.** (Severe) Theoretical
- **Voxilaprevir (with sofosbuvir and velpatasvir)** is predicted to increase the concentration of edoxaban. Avoid. (Severe) Theoretical

**Efavirenz** → see TABLE 9 p. 1377 (QT-interval prolongation)

**Efavirenz is predicted to decrease the exposure to antiarhythmics (dronedarone).** (Severe) Theoretical → Also see TABLE 9 p. 1377
Efavirenz decreases the exposure to **dolutegravir**. Adjust dose. **Severe** Study

Efavirenz is predicted to decrease the exposure to **doravirine**. Avoid or adjust doravirine dose, p. 644. **Severe** Theoretical

Efavirenz is predicted to moderately decrease the exposure to efaviravir. Avoid. **Severe** Study

Efavirenz is predicted to decrease the exposure to **elgilustat**. **Moderate** Theoretical

Efavirenz is predicted to decrease the concentration of elvitegravir. Avoid. **Severe** Study

Efavirenz is predicted to decrease the effects of **ergotamine**. **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to **erlotinib**. **Severe** Theoretical

Efavirenz is predicted to decrease the efficacy of **etnogestrel**. For FSRH guidance, see Contraceptives, interactions p. 794. **Severe** Theoretical

Efavirenz is predicted to decrease the exposure to **etrafivirine**. Avoid. **Severe** Study

Efavirenz is predicted to decrease the concentration of everolimus. Avoid or adjust dose. **Severe** Study

Efavirenz is predicted to decrease the exposure to fosaprepitant. **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to gefitinib. Avoid. **Severe** Theoretical

Efavirenz is predicted to decrease the exposure to glecaprevir. Avoid. **Severe** Study

Efavirenz is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. **Severe** Study

Efavirenz is predicted to decrease the concentration of guanine. Adjust dose. **Moderate** Theoretical

Efavirenz decreases the exposure to **HIV-protease inhibitors**. Refer to specialist literature. **Severe** Study → Also see TABLE 9 p. 1377

Efavirenz is predicted to decrease the effects of **Hormone replacement therapy**. **Moderate** Anecdotal

Efavirenz is predicted to decrease the exposure to idelalisib. Avoid. **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to **Imatinib**. **Moderate** Study

Efavirenz is predicted to decrease the exposure to **Ivacatant**. **Severe** Theoretical

Efavirenz is predicted to decrease the exposure to **lapatinib**. Avoid. **Severe** Study → Also see TABLE 9 p. 1377

Efavirenz is predicted to decrease the concentration of letemovir. **Moderate** Theoretical

Efavirenz is predicted to decrease the efficacy of **levonordestrel**. For FSRH guidance, see Contraceptives, interactions p. 794. **Severe** Theoretical

Efavirenz is predicted to decrease the exposure to **Lurasidone**. Monitor and adjust dose. **Moderate** Theoretical

Efavirenz decreases the exposure to macrolides (clarithromycin). **Moderate** Study → Also see TABLE 9 p. 1377

Efavirenz decreases the exposure to maraviroc. Refer to specialist literature. **Severe** Theoretical

Efavirenz is predicted to alter the effects of **midazolam**. Avoid. **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to **netupitant**. **Moderate** Theoretical

Nevirapine decreases the concentration of **efavirenz**. Avoid. **Severe** Study

Efavirenz is predicted to decrease the exposure to **nitoxolinib**. Avoid. **Severe** Theoretical → Also see TABLE 9 p. 1377

Efavirenz is predicted to decrease the exposure to **noretinone**. For FSRH guidance, see Contraceptives, interactions p. 794. **Severe** Anecdotal

Efavirenz is predicted to decrease the exposure to **olaparib**. Avoid. **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to **omnitvasir**. Avoid. **Severe** Theoretical

Efavirenz decreases the exposure to opioids (methadone). Monitor and adjust dose. **Severe** Study → Also see TABLE 9 p. 1377

Efavirenz is predicted to decrease the exposure to **osimertinib**. **Moderate** Theoretical → Also see TABLE 9 p. 1377

Antiepileptics (carbamazepine) slightly decrease the exposure to efavirenz and efavirenz slightly decreases the exposure to antiepileptics (carbamazepine). **Severe** Study

Antiepileptics (fosphenytoin, phenytoin) slightly decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (fosphenytoin, phenytoin). **Severe** Theoretical

Antiepileptics (phenobarbital) are predicted to decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (phenobarbital). **Severe** Theoretical

Efavirenz is predicted to affect the efficacy of antiepileptics (primidone) and antiepileptics (primidine) are predicted to slightly decrease the exposure to efavirenz. **Severe** Theoretical

Efavirenz is predicted to decrease the exposure to antifungals, azoles (itraconazole). Avoid. For 14 days after stopping efavirenz. **Moderate** Study

Efavirenz slightly decreases the exposure to antifungals, azoles (itraconazole). Avoid. **Severe** Theoretical

Efavirenz moderately decreases the exposure to antifungals, azoles (ketocanazole). **Severe** Study

Efavirenz slightly decreases the exposure to antifungals, azoles (posaconazole). Avoid. **Moderate** Study

Efavirenz moderately decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) slightly increase the exposure to efavirenz. Adjust dose. **Severe** Study → Also see TABLE 9 p. 1377

Efavirenz decreases the concentration of antimalarial (artemether). **Severe** Study → Also see TABLE 9 p. 1377

Efavirenz moderately decreases the exposure to antimalarial (atovaquone). Avoid. **Moderate** Study

Efavirenz affects the exposure to antimalarial (proguanil). Avoid. **Moderate** Study

Efavirenz is predicted to decrease the exposure to aprepitant. **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to axitinib. **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to bedaquiline. Avoid. **Severe** Study → Also see TABLE 9 p. 1377

Efavirenz is predicted to decrease the exposure to bosutinib. Avoid. **Severe** Theoretical → Also see TABLE 9 p. 1377

Efavirenz is predicted to decrease the exposure to brigatinib. Avoid. **Severe** Study

Efavirenz is predicted to decrease the exposure to bruproprion. **Moderate** Study

Efavirenz is predicted to decrease the exposure to cabazitaxel. **Moderate** Theoretical → Also see TABLE 9 p. 1377

Efavirenz is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to cariprazine. Avoid. **Severe** Theoretical

Efavirenz is predicted to decrease the concentration of caspofungin. Adjust dose. **Moderate** Study

Efavirenz decreases the concentration of ciclosporin. Monitor concentration and adjust dose. **Moderate** Study

Efavirenz is predicted to decrease the exposure to cobicistat. **Severe** Theoretical

Efavirenz is predicted to decrease the exposure to cobimetinib. **Severe** Theoretical

Efavirenz is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. **Severe** Study

Efavirenz is predicted to affect the concentration of coumarins. Adjust dose. **Moderate** Theoretical

Efavirenz is predicted to decrease the exposure to crizotinib. Avoid. **Severe** Theoretical → Also see TABLE 9 p. 1377

Efavirenz increases the risk of increased ALT concentrations when given with dasabuvir. Avoid. **Severe** Study

Efavirenz is predicted to decrease the exposure to dasatinib. **Severe** Study → Also see TABLE 9 p. 1377

Efavirenz is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. **Severe** Theoretical

Antiepileptics (azoles) are predicted to decrease the exposure to efavirenz. **Severe** Theoretical

Antiepileptics (ergotamine, triptans) slightly decrease the exposure to efavirenz and efavirenz slightly decreases the exposure to antiepileptics (ergotamine, triptans). **Severe** Theoretical

Antiepileptics (methylphenidate, amphetamines) are predicted to decrease the exposure to efavirenz and efavirenz increases the risk of increased ALT concentrations when given with mianserin. Avoid. **Severe** Study

Antiepileptics (valproate) is predicted to alter the effects of efavirenz. **Severe** Study
Efavirenz (continued)  
▶ Efavirenz is predicted to decrease the exposure to osplmenfene.  
   Moderate Study
▶ Efavirenz is predicted to decrease the exposure to paritaprevir  
   (with ritonavir and ombitasvir). Avoid.  
   Severely Study
▶ Efavirenz is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors.  
   Moderate Theoretical — Also see TABLE 9 p. 1377
▶ Efavirenz is predicted to decrease the exposure to ribociclib.  
   Moderate Study — Also see TABLE 9 p. 1377
▶ Efavirenz slightly decreases the exposure to rilpivirine. Adjust dose.  
   Severely Study
▶ Rifampicin slightly decreases the exposure to efavirenz. Adjust dose.  
   Severely Theoretical
▶ Efavirenz is predicted to decrease the exposure to quetiapine.  
   Moderate Study
▶ Efavirenz is predicted to decrease the exposure to sirolimus.  
   Moderate and adjust dose.  
   Moderate Theoretical
▶ St John’s Wort is predicted to decrease the concentration of  
   atorvastatin.  
   Severe Study
▶ Efavirenz moderately decreases the exposure to statins  
   (atorvastatin).  
   Severe Study
▶ Efavirenz is predicted to decrease the concentration of  
   tacrolimus. Monitor and adjust dose.  
   Moderate Theoretical
▶ Efavirenz is predicted to decrease the exposure to taxanes  
   (cabazitaxel). Avoid.  
   Severe Study
▶ Efavirenz is predicted to decrease the concentration of  
   temsirolimus. Avoid.  
   Severe Theoretical
▶ Efavirenz is predicted to decrease the exposure to ticagrelor.  
   Moderate Theoretical
▶ Efavirenz is predicted to decrease the exposure to tofacitinib.  
   Moderate Study
▶ Efavirenz decreases the efficacy of ulipristal. For FSRH  
   guidance, see Contraceptives, interactions p. 794.  
   Severe Anecdotal
▶ Efavirenz is predicted to decrease the exposure to velpatasvir. Avoid.  
   Moderate Theoretical
▶ Efavirenz is predicted to decrease the exposure to venetoclax.  
   Severe Study
▶ Efavirenz is predicted to decrease the concentration of  
   voriparirev. Avoid.  
   Severe Theoretical

Elbasvir  
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,  
   phenytoin, primidone) are predicted to decrease the exposure  
   to elbasvir. Avoid.  
   Severe Study
▶ Bosantan is predicted to moderately decrease the exposure to  
   elbasvir. Avoid.  
   Severe Study
▶ Cabazitaxel is predicted to increase the concentration of  
   dabigatran.  
   Moderate Theoretical
▶ Efavirenz is predicted to moderately decrease the exposure  
   to elbasvir. Avoid.  
   Severe Study
▶ Enzalutamide is predicted to decrease the exposure to elbasvir.  
   Avoid.  
   Severe Study
▶ Etravirine is predicted to decrease the exposure to elbasvir.  
   Avoid.  
   Unknown Theoretical
▶ Mitotane is predicted to decrease the exposure to elbasvir.  
   Avoid.  
   Severe Study
▶ Modafinil is predicted to decrease the exposure to elbasvir.  
   Avoid.  
   Unknown Theoretical
▶ Nevirapine is predicted to moderately decrease the exposure  
   to elbasvir. Avoid.  
   Severe Study
▶ Rifampicin is predicted to decrease the exposure to elbasvir.  
   Avoid.  
   Severe Study
▶ St John’s Wort is predicted to moderately decrease the exposure  
   to elbasvir. Avoid.  
   Severe Study
▶ Elbasvir increases the exposure to statins (atorvastatin). Adjust  
   Moderate Study
▶ Elbasvir is predicted to increase the exposure to statins  
   Unknown Theoretical
▶ Elbasvir increases the exposure to statins (rosuvastatin). Adjust  
   rosuvastatin dose, p. 204.  
   Moderate Study
▶ Elbasvir is predicted to increase the exposure to statins  
   (simvastatin). Adjust simvastatin dose, p. 205.  
   Unknown Theoretical
▶ Elbasvir is predicted to increase the concentration of sunitinib.  
   Use with caution and adjust dose.  
   Moderate Theoretical
▶ Eletriptan  
   → see TABLE 13 p. 178 (serotonin syndrome)
▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole)  
   are predicted to markedly increase the exposure to eletriptan.  
   Avoid.  
   Severe Study
▶ Aprepitant is predicted to increase the exposure to eletriptan.  
   Moderate Study
▶ Cobicistat is predicted to markedly increase the exposure to  
   eletriptan. Avoid.  
   Severe Study
▶ Eletriptan increases the risk of vasovaginalismus when given  
   with ergotamine. Separate administration by 24 hours.  
   Severe Study
▶ HIV-protease inhibitors are predicted to markedly increase  
   the exposure to eletriptan. Avoid.  
   Severe Study
▶ Idelalisib is predicted to markedly increase the exposure to  
   eletriptan. Avoid.  
   Severe Study
▶ Macrolides (clarithromycin) are predicted to markedly increase  
   the exposure to eletriptan. Avoid.  
   Severe Study
▶ Macrolides (erythromycin) moderately increase the exposure  
   to eletriptan.  
   Moderate Study
▶ Netupitant is predicted to increase the exposure to eletriptan.  
   Moderate Study

Eliglustat  
▶ Abiraterone is predicted to increase the exposure to eliglustat.  
   Avoid or adjust dose—consult product literature.  
   Severe Study
▶ Eliglustat is predicted to increase the exposure to alicriken.  
   Adjust dose.  
   Moderate Study
▶ Antiarrhythmics (dronedarone, propafenone) are predicted  
   to increase the exposure to eliglustat. Avoid or adjust dose—  
   consult product literature.  
   Severe Study
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,  
   phenytoin, primidone) are predicted to decrease the exposure  
   to eliglustat. Avoid.  
   Severe Study
▶ Antifungals, azoles (fluconazole, itraconazole, ketoconazole,  
   posaconazole, voriconazole) are predicted to increase the exposure  
   to eliglustat. Avoid or adjust dose—consult product literature.  
   Severe Study
▶ Eliglustat is predicted to increase the exposure to antihistamines,  
   non-sedating (fexofenadine). Adjust dose.  
   Moderate Study
▶ Aprepitant is predicted to increase the exposure to eliglustat.  
   Avoid or adjust dose—consult product literature.  
   Severe Study
▶ Eliglustat is predicted to increase the exposure to atomoxetine.  
   Adjust dose.  
   Moderate Theoretical
▶ Antiarhythmics are predicted to increase the exposure to beta  
   blockers, non-selective (propranolol). Adjust dose.  
   Moderate Study
▶ Eliglustat is predicted to increase the exposure to beta blockers,  
   selective (metoprolol). Adjust dose.  
   Moderate Study
▶ Bosantan is predicted to decrease the exposure to eliglustat.  
   Moderate Theoretical
▶ Bupropion is predicted to increase the exposure to eliglustat.  
   Avoid or adjust dose—consult product literature.  
   Severe Study
▶ Calcium channel blockers (diltiazem, verapamil) are predicted  
   to increase the exposure to eliglustat. Avoid or adjust dose—  
   consult product literature.  
   Severe Study
▶ Cinacalcet is predicted to increase the exposure to eliglustat.  
   Avoid or adjust dose—consult product literature.  
   Severe Study
▶ Cobicistat is predicted to increase the exposure to eliglustat.  
   Avoid or adjust dose—consult product literature.  
   Severe Study
▶ Eliglustat is predicted to increase the exposure to colchicine.  
   Avoid or adjust colchicine dose, p. 1120.  
   Severe Theoretical
▶ Crizotinib is predicted to increase the exposure to eliglustat.  
   Avoid or adjust dose—consult product literature.  
   Severe Study
Eliglustat is predicted to increase the exposure to dacarbazine. Adjust dose. [Moderate] Study

Eliglustat increases the exposure to digoxin. Adjust dose. [Moderate] Study

Duloxetine is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Eliglustat is predicted to increase the exposure to edoxaban. Adjust dose. [Moderate] Study

Efavirenz is predicted to decrease the exposure to eliglustat. [Moderate] Theoretical

Enalapril is predicted to decrease the exposure to eliglustat. Avoid. [Severe] Study

Eliglustat is predicted to increase the exposure to everolimus. Adjust dose. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to eliglustat. Avoid. [Severe] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Idelalisib is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Imatinib is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Eliglustat is predicted to increase the exposure to loperamide. Adjust dose. [Moderate] Study

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Theoretical

Mirabegron is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Moclobemide is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Netupitant is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Nevirapine is predicted to decrease the exposure to eliglustat. [Moderate] Theoretical

Nilotinib is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Quinolones (ciprofloxacin) are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Rifampicin is predicted to decrease the exposure to eliglustat. Avoid. [Severe] Study

Eliglustat is predicted to increase the exposure to sirolimus. Adjust dose. [Moderate] Study

SSRIs (fluoxetine, paroxetine) are predicted to decrease the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

St John’s Wort is predicted to increase the exposure to eliglustat. Avoid. [Severe] Study

Eliglustat is predicted to increase the exposure to taxanes (paclitaxel). Adjust dose. [Moderate] Study

Terbinfine is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Eliglustat is predicted to increase the exposure to tolterodine. Adjust dose. [Moderate] Theoretical

Eliglustat is predicted to increase the exposure to topotecan. Adjust dose. [Moderate] Study

Eliglustat is predicted to increase the exposure to tricyclic antidepressants (nortriptyline). Adjust dose. [Moderate] Theoretical

Elotuzumab → see monoclonal antibodies

Elotrombopag

Antacids decrease the absorption of elotrombopag. Elotrombopag should be taken 2 hours before or 4 hours after antacids. [Severe] Study

Oral calcium salts decrease the absorption of elotrombopag. Elotrombopag should be taken 2 hours before or 4 hours after calcium salts. [Severe] Study

Ciclosporin decreases the exposure to elotrombopag. Monitor and adjust dose. [Moderate] Study

Dairy products are predicted to decrease the absorption of elotrombopag. Elotrombopag should be taken 2 hours before or 4 hours after dairy products. [Severe] Theoretical

Iron (oral) is predicted to decrease the absorption of elotrombopag. Elotrombopag should be taken 2 hours before or 4 hours after iron (oral). [Severe] Theoretical

Elotrombopag is predicted to increase the concentration of ivermectin. [Moderate] Study

Elotrombopag is predicted to increase the concentration of methotrexate. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to elotrombopag and elotrombopag is predicted to increase the concentration of rifampicin. [Moderate] Theoretical

Oral selenium is predicted to decrease the absorption of elotrombopag. Elotrombopag should be taken 2 hours before or 4 hours after selenium. [Severe] Theoretical

SSRIs (fluvoxamine) are predicted to increase the exposure to elotrombopag. [Moderate] Theoretical

Elotrombopag is predicted to increase the exposure to tenofovir alafenamide. [Moderate] Theoretical

Elotrombopag is predicted to increase the exposure to tenofovir disoproxil. [Moderate] Theoretical

Oral zinc is predicted to decrease the absorption of elotrombopag. Elotrombopag should be taken 2 hours before or 4 hours after zinc. [Severe] Theoretical

Elvitegravir

Antacids moderately decrease the exposure to elvitegravir. Separate administration by at least 4 hours. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

Boventan is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

Elvitegravir is predicted to decrease the anticoagulant effect of coumarins. [Moderate] Theoretical

Efavirenz is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

Enalapril is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

Elvitegravir markedly increases the exposure to grazoprevir. Avoid. [Severe] Study

HIV-protease inhibitors (atazanavir, lopinavir) (boosted with ritonavir) increase the concentration of elvitegravir. Refer to specialist literature. [Moderate] Study

Mometane is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

Elvitegravir is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

Empagliflozin → see TABLE 14 p. 1378 (antidiabetic drugs), TABLE 8 p. 1376 (hypotension)

Enalapril → see ACE inhibitors

Encorafenib → see TABLE 9 p. 1377 (QT-interval prolongation)

Antiarhythmics (dronedarone) are predicted to moderately increase the exposure to encorafenib. [Moderate] Study → Also see TABLE 9 p. 1377

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to encorafenib. [Severe] Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to encorafenib. [Moderate] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to encorafenib. Avoid or monitor. [Severe] Study → Also see TABLE 9 p. 1377

Aprepitant is predicted to moderately increase the exposure to encorafenib. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to encorafenib. [Moderate] Study

www.getintopharma.com
Encorafenib (continued)

- **Cobicistat** is predicted to increase the exposure to encorafenib. Avoid or monitor. [Severe] Study

- **Enteral feeds** is predicted to affect the exposure to combined hormonal contraceptives. [Severe] Theoretical

- **Crizotinib** is predicted to moderately increase the exposure to encorafenib. [Moderate] Study → Also see TABLE 9 p. 1377

- **Encorafenib** is predicted to increase the exposure to dolasetravir. [Moderate] Theoretical

- **Enteral feeds** is predicted to decrease the exposure to encorafenib. [Severe] Theoretical

- **Grapefruit juice** is predicted to increase the exposure to encorafenib. Avoid. [Moderate] Study

- **HIV-protease inhibitors** are predicted to increase the exposure to enteral feeds. Avoid or monitor. [Severe] Study → Also see TABLE 9 p. 1377

- **Idelalisib** is predicted to increase the exposure to enteral feeds. Avoid or monitor. [Severe] Study

- **Imatinib** is predicted to moderately increase the exposure to encorafenib. [Moderate] Study

- **Macrolides** (clarithromycin) are predicted to increase the exposure to encorafenib. Avoid or monitor. [Severe] Study → Also see TABLE 9 p. 1377

- **Mitotane** is predicted to decrease the exposure to enteral feeds. [Severe] Theoretical

- **Netupitant** is predicted to moderately increase the exposure to encorafenib. [Moderate] Study

- **Nilotinib** is predicted to moderately increase the exposure to encorafenib. [Moderate] Study → Also see TABLE 9 p. 1377

- **Encorafenib** is predicted to increase the exposure to raltegravir. [Moderate] Theoretical

- **Rifampicin** is predicted to decrease the exposure to encorafenib. [Severe] Theoretical

- **St John's Wort** is predicted to decrease the exposure to enteral feeds. [Severe] Theoretical

- **Enoxaparin** → see low molecular-weight heparins

- **Entacapone**
  - **Iron (oral)** is predicted to decrease the absorption of entacapone. Separate administration by at least 2 hours. [Moderate] Theoretical

- **Entacapone** increases the exposure to levodopa. Monitor side effects and adjust dose. [Moderate] Study

- **Entacapone** is predicted to increase the exposure to methyldopa. [Moderate] Theoretical

- **Entacapone** is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase A and B inhibitors. Irreversible. Avoid. [Severe] Theoretical

- **Entacapone** is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropics. [Moderate] Theoretical

- **Entacapone** is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] Study

- **Enteral feeds**
  - **Antacids (aluminium hydroxide)** increase the risk of blocked enteral or nasogastric tubes when given with enteral feeds. [Moderate] Study

- **Enteral feeds** decrease the absorption of antiepileptics (phenytoin). [Severe] Study

- **Enteral feeds** (vitamin-K containing) potentially decrease the anticoagulant effect of warfarin. [Severe] Anecdotal

- **Enteral feeds** (vitamin-K containing) potentially decrease the effects of phenindione. [Severe] Theoretical

- **Enteral feeds** decrease the exposure to quinolones (ciprofloxacin). [Moderate] Study

- **Sucralfate** increases the risk of blocked enteral or nasogastric tubes when given with enteral feeds. Separate administration by 1 hour. [Moderate] Study

- **Enteral feeds** decrease the exposure to theophylline. [Moderate] Study

---

**Encorafenib**

**Enzalutamide**

**GENERAL INFORMATION**

Caution with concurrent chemotherapy—safety and efficacy not established.

- **Encorafenib** is predicted to markedly decrease the exposure to abemaciclib. Avoid. [Severe] Study

- **Encorafenib** is predicted to decrease the exposure to abiraterone. Avoid. [Severe] Study

- **Encorafenib** is predicted to decrease the exposure to aldosterone antagonists (eplerenone). Avoid. [Moderate] Theoretical

- **Encorafenib** is predicted to decrease the exposure to alprazolam. Adjust dose. [Moderate] Theoretical

- **Encorafenib** is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Study

- **Encorafenib** is predicted to decrease the efficacy of antiarrhythmics (propafenone). [Moderate] Study

- **Encorafenib** is predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil). [Mild] Study

- **Encorafenib** is predicted to slightly decrease the exposure to antiarrhythmics (brivracetam). [Moderate] Theoretical

- **Encorafenib** is predicted to decrease the exposure to antiarrhythmics (-perampanel). Monitor and adjust dose. [Moderate] Study

- **Encorafenib** is predicted to decrease the exposure to antifungals, azoles (itraconazole). Avoid. [Severe] Study

- **Encorafenib** is predicted to decrease the exposure to antimalarials (artemether) (with lumefantrine). Avoid. [Severe] Study

- **Encorafenib** is predicted to decrease the concentration of antimalarials (piperaquine). Avoid. [Moderate] Theoretical

- **Encorafenib** is predicted to moderately decrease the exposure to apixaban. Use with caution and avoid. [Severe] Study

- **Encorafenib** moderately decreases the exposure to apremilast. Avoid. [Severe] Study

- **Encorafenib** is predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] Study

- **Encorafenib** is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. [Moderate] Study

- **Encorafenib** is predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

- **Encorafenib** decreases the exposure to bedaquiline. Avoid. [Severe] Study

- **Encorafenib** is predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Study

- **Encorafenib** slightly decreases the exposure to bortezomib. Avoid. [Severe] Study

- **Encorafenib** affects the exposure to bosentan. Avoid. [Severe] Study

- **Encorafenib** is predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study

- **Encorafenib** is predicted to decrease the exposure to brigitinib. Avoid. [Severe] Study

- **Encorafenib** is predicted to decrease the exposure to cabozantinib. Avoid. [Moderate] Study

- **Encorafenib** is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

- **Encorafenib** is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study

- **Encorafenib** is predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical

- **Encorafenib** is predicted to decrease the exposure to cariprazine. Avoid. [Severe] Theoretical

- **Encorafenib** is predicted to decrease the exposure to ceritinib. Avoid. [Severe] Study

- **Encorafenib** decreases the concentration of ciclosporin. [Severe] Study

- **Encorafenib** is predicted to alter the effects of cisplatin. [Moderate] Theoretical

- **Encorafenib** is predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. [Moderate] Study

---

www.getintopharma.com
Enzalutamide – Enzalutamide

- Enzalutamide decreases the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study
- Clodopigrol moderately increases the exposure to enzalutamide. Avoid or adjust enzalutamide dose, p. 947. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to clozapine. (Moderate) Theoretical
- Enzalutamide is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical
- Enzalutamide is predicted to markedly decrease the exposure to cobimetinib. Avoid. (Severe) Theoretical
- Enzalutamide is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to corticosteroids (fluticasone). (Unknown) Theoretical
- Enzalutamide potentially decreases the exposure to coumarins. Avoid or adjust dose and monitor INR. (Severe) Study
- Enzalutamide is predicted to markedly decrease the exposure to crizotinib. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to dabrafenib. Avoid. (Moderate) Theoretical
- Enzalutamide is predicted to decrease the exposure to dasatinib. Avoid. (Severe) Study
- Enzalutamide is predicted to markedly decrease the exposure to dasabuvir. Avoid. (Severe) Theoretical
- Enzalutamide is predicted to slightly decrease the exposure to delamanid. Avoid. (Moderate) Study
- Enzalutamide decreases the exposure to dolutegravir. Adjust dose. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to doravirine. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to eliglustat. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- Enzalutamide is predicted to decrease the exposure to encorafenib. (Severe) Theoretical
- Enzalutamide is predicted to decrease the effects of ergotamine. (Moderate) Theoretical
- Enzalutamide is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 979. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to esketamine. Adjust dose. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical
- Enzalutamide is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Enzalutamide moderately decreases the exposure to exemestane. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to fesoterodine. Avoid. (Moderate) Study
- Fibrates (gemfibrozil) moderately increase the exposure to enzalutamide. Avoid or adjust enzalutamide dose, p. 947. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to fingolimid. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to fosaprepitant. Avoid. (Moderate) Theoretical
- Enzalutamide is predicted to decrease the exposure to gefitinib. Avoid. (Severe) Study
- Enzalutamide is predicted to greatly decrease the concentration of glecaprevir. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to grazoprevir. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 352. (Moderate) Study
- Enzalutamide decreases the concentration of haloperidol. Adjust dose. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to ibritinib. Avoid or adjust ibritinib dose, p. 983. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to idelalisib. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to imatinib. Avoid. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to irinotecan. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to ivabradine. Adjust dose. (Moderate) Theoretical
- Enzalutamide is predicted to moderately to markedly decrease the exposure to ivacaftor. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to ixazomib. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to luridason. Avoid. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to macitentan. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to maraviroc. Adjust dose. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to midostaurin. Avoid. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to minodronic. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to mirtazapine. Adjust dose. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to montelukast. (Mild) Study
- Enzalutamide is predicted to markedly decrease the exposure to nalorex. Avoid. (Moderate) Study
- Enzalutamide is predicted to slightly decrease the exposure to nategraline. (Mild) Study
- Enzalutamide is predicted to decrease the exposure to netupitant. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to nevirapine. (Severe) Theoretical
- Enzalutamide is predicted to moderately decrease the exposure to nilotinib. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to nitisinone. Adjust dose. (Moderate) Theoretical
- Enzalutamide is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Enzalutamide is predicted to decrease the exposure to omacetaxine. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to orapidanetron. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to opioids (alfentanil, fentanyl). (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. (Moderate) Theoretical
- Enzalutamide decreases the exposure to opioids (methadone). Monitor and adjust dose. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to opioids (oxycodone). Monitor and adjust dose. (Moderate) Study
- Enzalutamide is predicted to moderately decrease the exposure to osimertinib. Avoid. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to osmipemifene. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to palbociclib. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to panobinostat. Avoid. (Moderate) Theoretical
- Enzalutamide is predicted to decrease the exposure to parataprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to pazopanib. Avoid. (Severe) Theoretical
Enzalutamide (continued)

- Enzalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avaniatl, tadafalati). Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenalati). [Moderate] Theoretical
- Enzalutamide is predicted to moderately to markedly decrease the exposure to pilorensalt. Avoid. [Severe] Study
- Enzalutamide is predicted to moderately to markedly decrease the exposure to pinitalsalt. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to ponatinsalt. Avoid. [Moderate] Theoretical
- Enzalutamide is predicted to markedly decrease the exposure to avpaqantisalt. Avoid. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to quetiapiatt. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to ranolatin. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to rilivprinsalt. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to rispriderone. Adjust dose. [Moderate] Study
- Enzalutamide is predicted to moderately decrease the exposure to repaglinsalt. Monitor blood glucose and adjust dose. [Moderate] Study
- Enzalutamide is predicted to markedly decrease the exposure to rjopibicinl. Avoid. [Severe] Study
- Enzalutamide markedly decreases the exposure to rilipivirin. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to riperidone. Adjust dose. [Moderate] Study
- Enzalutamide is predicted to moderately decrease the exposure to rivoaxobnan. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to roflumilastsalt. Avoid. [Moderate] Study
- Enzalutamide is predicted to markedly decrease the exposure to rolpatinet. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to sarafalinsalt. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to saxaglipint. [Moderate] Study
- Enzalutamide is predicted to decrease the concentration of simvastatin. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to suninib. Avoid or adjust suninib dose, p. 999. [Moderate] Study
- Enzalutamide decreases the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to taxanes (calbazaaxelax, pacizatxel). Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to taxanes (docetaxel). [Severe] Theoretical
- Enzalutamide is predicted to decrease the concentration of tamsiriolemus. Avoid. [Severe] Study
- Enzalutamide decreases the exposure to tacryclines (doxyclinet). Monitor and adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to tacrolimus. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the concentration of ticagrelor. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to tivoxain. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to tofavitin. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to tolvaptan. Use with caution or avoid depending on indication. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to toremifene. Adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to trabectedinl. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to markedly decrease the exposure to ulipristalt. Avoid and for 4 weeks after stopping ulipristal. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study
- Enzalutamide is predicted to moderately decrease the exposure to vepatansalt. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vinodines). [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to vismodogel. Avoid. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to vortoxtinet. Monitor and adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to zopiclon. Adjust dose. [Moderate] Study
- Ephedrine → see sympathomimetics, vasoconstrictor
- Epinrubacin → see anthraclyclines
- Epleronone → see aldosterone antagonists
- Epotin alfa → see TABLE 5 p. 1375 (thromboembolism), TABLE 16 p. 1379 (increased serum potassium)

Ergometrine

- Antiarhythmics (dronedaron) are predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavucanazole, posaconazole) are predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- **Ergotamine** is predicted to increase the risk of elevated blood pressure when given with *ergometrine*. Avoid. [Severe] Theoretical
- **Grapefruit juice** is predicted to increase the exposure to *ergotamine*. [Severe] Theoretical
- HIV-protease inhibitors are predicted to increase the risk of ergotism when given with *ergotamine*. Avoid. [Severe] Theoretical
- **Idelalisib** is predicted to increase the risk of ergotism when given with *ergotamine*. Avoid. [Severe] Theoretical
- **Imatinib** is predicted to increase the risk of ergotism when given with *ergotamine*. [Severe] Theoretical
- **Ketamine** is predicted to increase the risk of elevated blood pressure when given with *ergotamine*. [Severe] Theoretical
- **Letermovir** is predicted to increase the concentration of *ergotamine*. Avoid. [Severe] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the risk of ergotism when given with *ergotamine*. Avoid. [Severe] Theoretical
- **Netupitant** is predicted to increase the risk of ergotism when given with *ergotamine*. [Severe] Theoretical
- **Nilotinib** is predicted to increase the risk of ergotism when given with *ergotamine*. [Severe] Theoretical
- Ergotamine potentially increases the risk of peripheral vasoconstriction when given with sympathomimetics, inotropic (dopamine). Avoid. [Severe] Anecdotal
- **Ergotamine** is predicted to increase the risk of peripheral vasoconstriction when given with sympathomimetics, vasoconstrictor (noradrenaline/norepinephrine). [Severe] Anecdotal

**Ergotamine**

- **Almotriptan** is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after almotriptan. [Severe] Theoretical
- **Antiarhythmics (dronedarone)** are predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Antiinflammatory, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- Antiinflammatory, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- Antiinflammatory, azoles (miconazole) are predicted to increase the exposure to ergotamine. Avoid. [Moderate] Theoretical
- Antiretroviral is predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- **Beta blockers, non-selective** are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. [Severe] Study
- **Beta blockers, selective** are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. [Severe] Study
- **Bosentan** is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- **Ceritinib** is predicted to increase the exposure to ergotamine. Avoid. [Severe] Theoretical
- **Cobicistat** is predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- **Crizotinib** is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- Ergotamine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical
- Ergotamine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (pergolide). [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- **Eliptiran** increases the risk of vasocostriction when given with ergotamine. Separate administration by 24 hours. [Severe] Study
- **Enzalutamide** is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- **Grapefruit juice** is predicted to increase the exposure to ergotamine. [Severe] Theoretical
- HIV-protease inhibitors are predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- **Idelalisib** is predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- **Imatinib** is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- **Letermovir** is predicted to increase the concentration of ergotamine. Avoid. [Severe] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical
- **Netupitant** is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- **Nilotinib** is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- **Mirtalbupin** is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- **Palbociclib** is predicted to increase the exposure to ergotamine. Adjust dose. [Moderate] Theoretical
- **Ribociclib (high-dose)** is predicted to increase the exposure to ergotamine. Avoid. [Moderate] Theoretical
- **Rifampin** is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- **RizatRIPTAN** is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after rizatRIPTAN. [Severe] Theoretical
- **Rucaparib** is predicted to increase the exposure to ergotamine. Monitor and adjust dose. [Moderate] Study
- **St John's Wort** is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- **Sumatriptan** increases the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after sumatriptan. [Severe] Study
- **Ticagrelor** is predicted to increase the exposure to ergotamine. Avoid. [Severe] Theoretical
- **Eribulin** see TABLE 15 p. 1378 (myelosuppression), TABLE 12 p. 1378 (peripheral neuropathy), TABLE 9 p. 1377 (Q1-Interval prolongation)

**Erlotinib**

- **FOD & LIFESTYLE** Dose adjustment may be necessary if smoking started or stopped during treatment.
- **Antacids** are predicted to decrease the absorption of erlotinib. Antacids should be taken 4 hours before or 2 hours after erlotinib. [Moderate] Theoretical
- **Antiarhythmics (amiodarone, dronedarone)** are predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 97% [Severe] Study
- **Antiinflammatory, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- **Antiinflammatory, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. [Moderate] Study
- **Aprepitant** is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with aspirin (high-dose). [Severe] Theoretical
Erlotinib (continued)

- **Ertapenem** → see carbapenems

**Ertugliflozin** → see tables 14 p. 1378 (antidiabetic drugs), table 8 p. 1376 (hypotension)

**Erythromycin** → see macrolides

**Escitalopram** → see SSRIs

**Esketamine** → see Table 8 p. 1376 (hypotension), table 11 p. 1377 (CNS depressant effects)

**Esketamine** is predicted to increase the risk of seizures when given with *aminophylline*. Avoid. **Severe** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *fosphenytoin*, *phenobarbital*, *phenytoin*, *primidone*) are predicted to decrease the exposure to *esketamine*. Adjust dose. **Moderate** Theoretical

**Antiepileptics** (*carbamazepine*, *eslicarbazepine*, *f***
- HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of etravirine. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical
- Modafinil is predicted to decrease the efficacy of etravirine. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical
- Nevirapine is predicted to decrease the efficacy of etravirine. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical
- Rifabutin is predicted to decrease the efficacy of etravirine. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical
- St John's Wort is predicted to decrease the efficacy of etravirine. MRHA advises avoid for FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical
- Sugammadex is predicted to decrease the efficacy of etravirine. Use additional contraceptive precautions. [Severe] Theoretical
- Ulipristal is predicted to decrease the efficacy of etravirine. Avoid. [Severe] Theoretical
- Etoposide — see TABLE 15 p. 1378 (myelosuppression)
  - Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of etravirine. Avoid. [Severe] Theoretical
  - Ciclosporin increases the exposure to etoposide. Monitor and adjust dose. [Severe] Study
  - Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etoposide. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
  - Netupitant slightly increases the exposure to etoposide. [Moderate] Study
- Etoricoxib — see NSAIDs
- Etravirine
  - Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to etravirine. Avoid. [Severe] theoretical
  - Etravirine decreases the exposure to antimalarials (artemether). [Moderate] Study
  - Etravirine is predicted to decrease the exposure to etravirine. Avoid. [Severe] theoretical
  - Bosentan is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study
  - Etravirine is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
  - Etravirine is predicted to decrease the exposure to brigatinib. Avoid. [Moderate] Theoretical
  - Etravirine increases the anticoagulant effect of coumarin. [Moderate] Theoretical
  - Etravirine is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
  - Etravirine moderately decreases the exposure to dolutegravir. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
  - Efavirenz is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study
  - Etravirine is predicted to decrease the exposure to elbasvir. Avoid. [Unknown] Theoretical
  - Enzalutamide is predicted to decrease the exposure to etravirine. Avoid. [Severe] Theoretical
  - Etravirine is predicted to decrease the exposure to etravirine. Avoid. [Severe] Theoretical
  - Etravirine is predicted to decrease the exposure to grazoprevir. Avoid. [High] Theoretical
  - HIV-protease inhibitors (tipranavir) decrease the exposure to etravirine. Avoid. [Severe] Study
  - Etravirine increases the exposure to HIV-protease inhibitors (fosamprenavir boosted with ritonavir). Refer to specialist literature. [Moderate] Study
  - Etravirine is predicted to decrease the exposure to letrozomib. [Moderate] Theoretical
  - Etravirine decreases the exposure to macrolides (clarithromycin) and macrolides (clarithromycin) slightly increase the exposure to etravirine. [Severe] Study
  - Etravirine (with a boosted protease inhibitor) increases the exposure to maraviroc. Avoid or adjust dose. [Moderate] Study
  - Mitotane is predicted to decrease the exposure to etravirine. Avoid. [Severe] Theoretical
  - Nevirapine is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study
  - Etravirine is predicted to decrease the exposure to ombrabant. Avoid. [Severe] Theoretical
  - Etravirine is predicted to decrease the exposure to paritaprevir. Avoid. [Severe] Theoretical
  - Etravirine moderately decreases the exposure to phosphodiesterase type-5 inhibitors. Adjust dose. [Moderate] Study
  - Rifabutin decreases the exposure to etravirine. [Moderate] Study
  - Rilpivirine is predicted to decrease the exposure to etravirine. Avoid. [Severe] Theoretical
  - Etravirine is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical
  - St John's Wort is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study
  - Everolimus — see TABLE 15 p. 1378 (myelosuppression)
    - Everolimus potentially increases the risk of angioedema when given with ACE inhibitors. [Severe] Anecdotal
    - Anti-arrhythmics (dronedarone) are predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
    - Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
    - Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
    - Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of everolimus. Avoid. [Severe] Study
    - Apalutamide is predicted to decrease the exposure to everolimus. Avoid or monitor. [Moderate] Study
    - Aprepitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
    - Bosentan is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
    - Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
    - Certitibib is predicted to increase the exposure to everolimus. [Moderate] Theoretical — Also see TABLE 15 p. 1378
    - Ciclosporin moderately increases the exposure to everolimus. Avoid or adjust dose. [Severe] Study
    - Cobicistat is predicted to increase the concentration of everolimus. Avoid. [Severe] Study
    - Crizotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study — Also see TABLE 15 p. 1378
    - Efavirenz is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
    - Eliglustat is predicted to increase the exposure to everolimus. Adjust dose. [Moderate] Study — Also see TABLE 15 p. 1378
    - Enzalutamide is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
    - Grapefruit juice is predicted to increase the exposure to everolimus. Avoid. [Severe] Theoretical
    - HIV-protease inhibitors are predicted to increase the concentration of everolimus. Avoid. [Severe] Study
    - Idelalisib is predicted to increase the concentration of everolimus. Avoid. [Severe] Study — Also see TABLE 15 p. 1378
    - Imatinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study — Also see TABLE 15 p. 1378
    - Lapatinib is predicted to increase the exposure to everolimus. [Moderate] Theoretical
    - Leteromivib is predicted to increase the concentration of everolimus. Monitor and adjust dose. [Severe] Study
    - Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
Everolimus (continued)
  ▶ Everolimus is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
  ▶ Lumacaftor is predicted to decrease the exposure to everolimus. Avoid. [Severe] Theoretical
  ▶ Macrolides (clarithromycin) are predicted to increase the concentration of everolimus. Avoid. [Severe] Study
  ▶ Macrolides (erythromycin) are predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
  ▶ Mirabegron is predicted to increase the exposure to everolimus. [Mild] Theoretical
  ▶ Mitotane is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study → also see TABLE 15 p. 1378
  ▶ Netupitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study
  ▶ Nevirapine is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
  ▶ Nilotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study → also see TABLE 15 p. 1378
  ▶ Palbociclib is predicted to increase the exposure to everolimus. Avoid or adjust dose. [Moderate] Theoretical
  ▶ Ribociclib is predicted to increase the exposure to everolimus. Avoid with caution and adjust dose. [Moderate] Theoretical
  ▶ Rifampicin is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
  ▶ St John’s Wort is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
  ▶ Velpatasvir is predicted to increase the exposure to everolimus. [Severe] Theoretical
  ▶ Venetoclax is predicted to increase the exposure to everolimus. Avoid or adjust dose. [Severe] Study
  ▶ Exemestane
    ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to exemestane. [Moderate] Study
    ▶ Enzalutamide moderately decreases the exposure to exemestane. [Moderate] Study
    ▶ Mitotane moderately decreases the exposure to exemestane. [Moderate] Study
    ▶ Rifampicin moderately decreases the exposure to exemestane. [Moderate] Study
    ▶ St John’s Wort is predicted to decrease the exposure to exemestane. [Moderate] Theoretical
  ▶ Exenatide → see TABLE 14 p. 1378 (antidiabetic drugs)
  ▶ Exenatide increases the concentration of fampiridine. [Severe] Theoretical
  ▶ Fexofenadine is predicted to increase the exposure to azelastine when given with fexofenadine. [Severe] Theoretical
  ▶ Fexofenadine, fexofenadine maleate and fexofenadine fumarate are predicted to increase the exposure to fexofenadine. [Severe] Theoretical
  ▶ Fexofenadine is predicted to decrease the exposure to fexofenadine. [Severe] Theoretical
  ▶ Felbinac → see NSAIDs
  ▶ Felodipine → see calcium channel blockers
  ▶ Fenofibrate → see fibrates
  ▶ Fentanyl → see opioids
  ▶ Ferric carboxymaltose → see iron (injectable)
  ▶ Ferric maltol → see iron (oral)
  ▶ Ferrous fumarate → see iron (oral)
  ▶ Ferrous gluconate → see iron (oral)
  ▶ Fosfoconazole, ketoconazole, voriconazole are predicted to moderately increase the exposure to fensoterodine. Adjust fensoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment, p. 777. [Mild] Study
  ▶ Fosphenytoin, phenytoin, primidone) are predicted to decrease the exposure to fensoterodine. Avoid. [Moderate] Study
  ▶ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fensoterodine. Adjust fensoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 777. [Mild] Study
  ▶ Cobicistat is predicted to moderately increase the exposure to fensoterodine. Adjust fensoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment, p. 777. [Severe] Study
  ▶ Critotinib is predicted to increase the exposure to fensoterodine. Adjust fensoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 777. [Mild] Study
  ▶ Enzalutamide is predicted to decrease the exposure to fensoterodine. Avoid. [Moderate] Study
  ▶ HIV-protase inhibitors are predicted to moderately increase the exposure to fensoterodine. Adjust fensoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment, p. 777. [Severe] Study
  ▶ Ivelalisib is predicted to moderately increase the exposure to fensoterodine. Adjust fensoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment, p. 777. [Severe] Study
  ▶ Imatinib is predicted to increase the exposure to fensoterodine. Adjust fensoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 777. [Mild] Study
  ▶ Macrolides (clarithromycin) are predicted to moderately increase the exposure to fensoterodine. Adjust fensoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment, p. 777. [Mild] Study
  ▶ Macrolides (erythromycin) are predicted to increase the exposure to fensoterodine. Adjust fensoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 777. [Mild] Study
  ▶ Mitotane is predicted to decrease the exposure to fensoterodine. Avoid. [Moderate] Study
  ▶ Netupitant is predicted to increase the exposure to fensoterodine. Adjust fensoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 777. [Mild] Study
  ▶ Nonsteroidal anti-inflammatory drugs (NSAIDs) see NSAIDs
  ▶ Opioids see opioids
  ▶ Piroxicam, celecoxib, meloxicam are predicted to increase the exposure to fensoterodine. Adjust fensoterodine dose with moderate inhibitors of CYP3A4, avoid in hepatic and renal impairment, p. 777. [Mild] Study
  ▶ Pimavanserin is predicted to moderately increase the exposure to fensoterodine. Adjust fensoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment, p. 777. [Severe] Study
  ▶ Prasugrel is predicted to increase the exposure to fensoterodine. Adjust fensoterodine dose with moderate inhibitors of CYP3A4, avoid in hepatic and renal impairment, p. 777. [Mild] Study
  ▶ Prasugrel is predicted to moderately increase the exposure to fensoterodine. Adjust fensoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment, p. 777. [Severe] Study
  ▶ Posaconazole is predicted to increase the exposure to fensoterodine. Adjust fensoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment, p. 777. [Mild] Study
  ▶ Primidone is predicted to decrease the exposure to fensoterodine. Avoid. [Moderate] Study
**Fibrate**

‑ **Antacids** slightly to moderately decrease the exposure to gemfibrozil. **Moderate** Study

‑ Gemfibrozil is predicted to increase the exposure to apalutamide. **Mild** Study

‑ Bezafibrate is predicted to increase the risk of nephrotoxicity when given with ciclosporin. **Severe** Theoretical

‑ Fenofibrate increases the risk of nephrotoxicity when given with ciclosporin. **Severe** Study

‑ Colestipol increases the risk of rhabdomyolysis when given with fenofibrate. **Severe** Anecdotal

‑ Fibrates are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. **Severe** Study

‑ Gemfibrozil is predicted to increase the exposure to dabrafenib. **Moderate** Theoretical

‑ Fibrates are predicted to increase the risk of rhabdomyolysis when given with daptomycin. **Severe** Theoretical

‑ Gemfibrozil is predicted to very markedly increase the exposure to dasabuvir. Avoid. **Severe** Study

‑ Gemfibrozil moderately increases the exposure to enzalutamide. Avoid or adjust enzalutamide dose, p. 947. **Severe** Study

‑ Fibrates are predicted to increase the risk of gallstones when given with ezetimibe. **Severe** Theoretical

‑ Fibrates are predicted to increase the risk of hypoglycaemia when given with insulin. **Moderate** Theoretical

‑ Gemfibrozil is predicted to increase the exposure to irinotecan. Avoid. **Moderate** Theoretical

‑ Gemfibrozil is predicted to increase the concentration of lertemovir. **Moderate** Study

‑ Gemfibrozil is predicted to moderately increase the exposure to montelukast. **Moderate** Study

‑ Fibrates are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. **Severe** Study

‑ Gemfibrozil increases the exposure to pioglitazone. Monitor blood glucose and adjust dose. **Severe** Study

‑ Gemfibrozil increases the exposure to repaglinide. Avoid. **Severe** Study

‑ Gemfibrozil is predicted to increase the exposure to retinoids (all-transretinoin). Adjust all-transretinoin dose, p. 1262. **Moderate** Theoretical

‑ Gemfibrozil increases the concentration of retinoids (bexarotene). Avoid. **Severe** Study

‑ Gemfibrozil increases the exposure to selexipag. Avoid. **Severe** Study

‑ Ciprofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin). Avoid or adjust dose. **Severe** Study

‑ Bezafibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, fluvastatin). **Severe** Study

‑ Fenofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, simvastatin). Adjust fenofibrate dose, p. 199. **Severe** Anecdotal

‑ Ciprofibrate increases the risk of rhabdomyolysis when given with statins (fluvastatin). **Severe** Study

‑ Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (fluvastatin). Adjust fenofibrate dose, p. 199. **Severe** Theoretical

‑ Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (pravastatin). Avoid. **Severe** Theoretical

‑ Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (pravastatin). Avoid. **Severe** Study

‑ Fenofibrate increases the risk of rhabdomyolysis when given with statins (rosuvastatin). Adjust fenofibrate and rosuvastatin doses, p. 199, p. 204. **Severe** Anecdotal

‑ Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (rosuvastatin). **Severe** Study

‑ Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with statins (simvastatin). Adjust simvastatin dose, p. 205. **Severe** Study

‑ Gemfibrozil increases the risk of rhabdomyolysis when given with statins. Avoid. **Severe** Anecdotal

‑ Fibrates are predicted to increase the risk of hypoglycaemia when given with sulfonylureas. **Moderate** Theoretical

‑ Gemfibrozil is predicted to increase the concentration of taxanes (paclitaxel). **Severe** Anecdotal

‑ Fibrates are predicted to decrease the efficacy of ursodeoxycholic acid. Avoid. **Severe** Theoretical

### Fidaxomicin

‑ Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study

‑ Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study

‑ Calcium channel blockers (verapamil) are predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study

‑ Ciclosporin is predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study

‑ HIV protease inhibitors (fopinavir, ritonavir, saquinavir) are predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study

‑ Lapatinib is predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study

‑ Macrolides are predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study

‑ Ranolazine is predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study

‑ Venlafaxine is predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study

‑ Fingolimod → see TABLE 6 p. 1376 (bradycardia), TABLE 9 p. 1377 (QT-interval prolongation)

‑ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fingolimod. **Moderate** Study

‑ Calcium channel blockers (diltiazem, verapamil) are predicted to decrease the exposure to fingolimod. **Moderate** Study

‑ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fingolimod. Public Health England advises avoid (refer to Green Book). **Severe** Theoretical

‑ Mitotane is predicted to decrease the exposure to fingolimod. **Moderate** Study

‑ Rifampicin is predicted to decrease the exposure to fingolimod. **Moderate** Study

‑ St John’s Wort is predicted to decrease the exposure to fingolimod. Avoid. **Moderate** Theoretical

### Flavoxide

‑ Flavoxide → see TABLE 10 p. 1377 (antimuscarinics)

### Flecainide

‑ Flecainide → see antiarrhythmics

### Fluociclovir

‑ Fluociclovir → see penicillins

### Fluociclovir

‑ Fluociclovir → see antifungals, azoles

### Fluociclovir

‑ Amphotericin increases the risk of toxicity when given with flucytosine. **Severe** Study

‑ Cytarabine decreases the concentration of fluocitoxine. Avoid. **Severe** Study

‑ Zidovudine increases the risk of haematological toxicity when given with fluocytosine. Monitor and adjust dose. **Severe** Theoretical

### Fludarabine

‑ Fludarabine → see TABLE 15 p. 1378 (myeloablation)

‑ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fludarabine. Public Health England advises avoid (refer to Green Book). **Severe** Theoretical

‑ Fludarabine increases the risk of pulmonary toxicity when given with pentostatin. Avoid. **Severe** Study → Also see TABLE 15 p. 1378

### Fludrocortisone

‑ Fludrocortisone → see corticosteroids

### Fluociclovir

**ROUTE-SPECIFIC INFORMATION**

‑ With intravitreal use in adults: caution with concurrent administration of anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage).

Interactions do not generally apply to corticosteroids used for topical action unless specified.
Fluorouracil is predicted to increase the risk of toxicity when given with fluorouracil. Avoid. [Moderate] Theoretical

Fluorouracil increases the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Monitor concentration and adjust dose. [Severe] Anecdotal

Fluorouracil increases the anticoagulant effect of coumarins. [Severe] Anecdotal

Folates (folic acid) are predicted to increase the risk of toxicity when given with fluorouracil. Avoid. [Severe] Theoretical

Folates (folic acid) are predicted to increase the risk of toxicity when given with fluorouracil. Monitor and adjust dose. [Severe] Theoretical

H₂-receptor antagonists (cimetidine) slightly increase the exposure to fluorouracil. [Severe] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fluorouracil. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

Methotrexate potentially increases the risk of severe skin reaction when given with topical fluorouracil. [Severe] Anecdotal

→ Also see TABLE 15 p. 1378

Metronidazole increases the risk of toxicity when given with fluorouracil. [Severe] Study

Fluoxetine → see SSRIs
Fluphenazine → see phenothiazines
Flurazepam → see Table 11 p. 1377 (CNS depressant effects)
Flupentixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical

Also see TABLE 8 p. 1376

Flupentixol decreases the risk of toxicity when given with fluorouracil. [Severe] Study

Flupentixol decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical

Fluphenazine decreases the risk of toxicity when given with fluorouracil. [Severe] Study

Fluphenazine is predicted to decrease the concentration of guanfacine. [Moderate] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the exposure to fosaprepitant. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical

Fosaprepitant is predicted to increase the concentration of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical

Efavirenz is predicted to decrease the exposure to fosaprepitant. [Moderate] Theoretical

Enzalutamide is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the anticoagulant effect of coumarins. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical

Fosaprepitant is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical

Fosaprepitant is predicted to increase the concentration of guanfacine. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Antifungals, azoles (posaconazole) are predicted to increase the exposure to fosaprepitant. [Moderate] Study

Bosentan is predicted to decrease the exposure to fosaprepitant. [Moderate] Theoretical

Fosaprepitant is predicted to increase the exposure to bosutinib. [Severe] Theoretical

Cobicistat is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Study

Fosaprepitant is predicted to decrease the anticoagulant effect of coumarins. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical

Fosaprepitant is predicted to increase the concentration of guanfacine. [Moderate] Theoretical

Fosaprepitant is predicted to slightly increase the exposure to ibrutinib. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Fosaprepitant is predicted to increase the exposure to intravenous irinotecan. [Severe] Theoretical

Fosaprepitant is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical

Fosaprepitant is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Fosaprepitant slightly increases the exposure to midazolam. [Moderate] Study

Midazolam is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical

Fosaprepitant is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal

Fosaprepitant is predicted to increase the exposure to pioglitazone. Avoid. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical

Fosaprepitant decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal

Fosaprepitant is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical

Foscarnet → see Table 2 p. 1373 (nephrotoxicity)
Foscarnet increases the risk of hypocalcaemia when given with pentamidine. [Severe] Anecdotal

Fosinopril → see ACE inhibitors
Fosphenytoin → see antiepileptics
Frovatriptan → see TABLE 13 p. 1378 (serotonin syndrome)
Frovatriptan – Glecaprevir 1459

- SSRI (fluvoxamine) increase the concentration of frovatriptan.
  - Severe Study → Also see TABLE 13 p. 1378
- Fulvestrant → see TABLE 5 p. 1375 (thromboembolism)
- Furosemide → see loop diuretics
- Fusidic acid
  - ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use unless specified.
  - Fusidic acid increases the risk of rhabdomyolysis when given with statins. Avoid. Severe Anecdotal
- Gabapentin → see antiepileptics
- Galantamine → see anticholinesterases, centrally acting
- Ganciclovir → see TABLE 15 p. 1378 (myelosuppression), TABLE 2 p. 1375 (nephrotoxicity)
  - ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
  - Ganciclovir is predicted to increase the risk of seizures when given with carbapenems (imipenem). Avoid. Severe Anecdotal
  - Ganciclovir is predicted to increase the exposure to didanosine. Moderate Study
- Leflunomide is predicted to increase the exposure to ganciclovir. Moderate Theoretical → Also see TABLE 15 p. 1378
- Mycophenolate is predicted to increase the risk of haematological toxicity when given with ganciclovir. Moderate Theoretical → Also see TABLE 15 p. 1378
- Teriflunomide is predicted to increase the exposure to ganciclovir. Moderate Study
- Gefitinib → see TABLE 15 p. 1378 (myelosuppression)
  - Antacids are predicted to slightly decrease the exposure to gefitinib. Moderate Theoretical
  - Antiarrhythmics (dronedarone) are predicted to increase the exposure to gefitinib. Moderate theoretical
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to gefitinib. Avoid. Severe Study
  - Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to gefitinib. Moderate Theoretical
  - Antihypertensives (diltiazem, verapamil) are predicted to increase the exposure to gefitinib. Severe Anecdotal
- Gefitinib is predicted to increase the exposure to gefitinib. Severe Study
  - Enalapril is predicted to decrease the exposure to gefitinib. Severe Study
  - H₂ receptor antagonists are predicted to slightly to moderately decrease the exposure to gefitinib. Moderate Study
- HIV-protease inhibitors are predicted to increase the exposure to gefitinib. Moderate Study → Also see TABLE 15 p. 1378
- Imitinib is predicted to increase the exposure to gefitinib. Moderate Theoretical → Also see TABLE 15 p. 1378
- Macrolides (clarithromycin) are predicted to increase the exposure to gefitinib. Moderate Study
- Macrolides (erythromycin) are predicted to increase the exposure to gefitinib. Moderate Theoretical
- Mitotane is predicted to decrease the exposure to gefitinib. Avoid. Severe Study → Also see TABLE 15 p. 1378
- Mitomycin is predicted to increase the exposure to gefitinib. Moderate Theoretical
- Nevirapine is predicted to decrease the exposure to gefitinib. Avoid. Severe Theoretical
  - Nilotinib is predicted to increase the exposure to gefitinib. Moderate Theoretical → Also see TABLE 15 p. 1378
- Gefitinib is predicted to increase the risk of bleeding events when given with phenindione. Severe Theoretical
  - Proton pump inhibitors are predicted to decrease the exposure to gefitinib. Severe Theoretical
- Rifampicin is predicted to decrease the exposure to gefitinib. Avoid. Severe Study
- St John's Wort is predicted to decrease the exposure to gefitinib. Avoid. Severe Theoretical
- Gemcitabine → see TABLE 15 p. 1378 (myelosuppression)
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with gemcitabine. Public Health England advises avoid (refer to Green Book). Severe Theoretical
- Gemfibrozil → see fibrates
- Gentamicin → see aminoglycosides

Glecaprevir

- Antiarrhythmics (dronedarone) potentially increase the exposure to glecaprevir. Moderate Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to glecaprevir. Avoid. Severe Study
- Antiepileptics (eslicarbazepine, oxcarbazepine) potentially decrease the exposure to glecaprevir. Severe Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) potentially increase the exposure to glecaprevir. Moderate Theoretical
- Combination hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with glecaprevir. Avoid. Severe Study
- Crizotinib potentially decreases the exposure to glecaprevir. Avoid. Severe Theoretical
- Glecaprevir (with pibrentasvir) increases the exposure to dabigatran. Avoid. Moderate Study
- Glecaprevir (with pibrentasvir) increases the exposure to digoxin. Moderate Theoretical
- Efavirenz is predicted to decrease the exposure to glecaprevir. Avoid. (Severe) Study
- Enalapril is predicted to greatly decrease the concentration of glecaprevir. Avoid. Severe Study
- HIV-protease inhibitors (atazanavir, darunavir, lopinavir) (boosted with ritonavir) increase the exposure to glecaprevir. Avoid. Severe Study
- HIV-protease inhibitors (ritonavir) increase the exposure to glecaprevir. Avoid. Severe Study
- Lumacaftor potentially decreases the exposure to glecaprevir. Avoid. Severe Theoretical
- Mitotane is predicted to greatly decrease the concentration of glecaprevir. Avoid. Severe Study
- Nevirapine is predicted to decrease the exposure to glecaprevir. Avoid. Severe Study
- Rifampicin markedly affects the exposure to glecaprevir. Avoid. Severe Study
- St John's Wort markedly affects the exposure to glecaprevir. Avoid. Severe Study
- Mitotane is predicted to decrease the exposure to glecaprevir. Avoid. Severe Study
- Glecaprevir (with pibrentasvir) markedly increases the exposure to statins (atorvastatin). Avoid. Severe Study
- Glecaprevir (with pibrentasvir) markedly increases the exposure to statins (fluvastatin). Severe Study
- Glecaprevir (with pibrentasvir) increases the exposure to statins (pravastatin). Use with caution and adjust pravastatin dose. Moderate Study
- Glecaprevir (with pibrentasvir) increases the exposure to statins (rosuvastatin). Use with caution and adjust rosuvastatin dose, p. 204. Moderate Study
- Glecaprevir (with pibrentasvir) increases the exposure to statins (simvastatin). Avoid. Moderate Study

Grapefruit juice – Guanethidine

Grapefruit juice is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to ribociclib. Avoid. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to saxagliptin. [Moderate] Theoretical

Grapefruit juice increases the concentration of sirolimus. [Moderate] Study

Grapefruit juice moderately increases the exposure to SSRIs. (sertraline). Avoid. [Moderate] Study

Grapefruit juice increases the exposure to statins (atorvastatin). Avoid. [Severe] Study

Grapefruit juice increases the exposure to statins (simvastatin). Avoid. [Moderate] Study

Grapefruit juice greatly increases the concentration of temsirolimus. Use with caution or avoid. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to tezacaftor. Avoid. [Severe] Study

Grapefruit juice moderately increases the exposure to ticagrelor. [Moderate] Study

Grapefruit juice increases the exposure to tolvaptan. Avoid. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to venetoclax. Avoid. [Severe] Theoretical

Grass pollen extract

General information

Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

Grazoprevir

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidione) are predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study

Bosantan is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study

Grazoprevir is predicted to markedly decrease the concentration of calcium channel blockers. [Moderate] Theoretical

Ciclosporin greatly increases the exposure to grazoprevir. Avoid. [Severe] Study

Cobicistat is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study

Efavirenz is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study

Elvitegravir markedly increases the exposure to grazoprevir. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study

Estravirine is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study

HIV-protease inhibitors are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study

Idelalisib is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study

Macrolides (clarithromycin) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study

Mitotane is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study

Modafinil is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study

Nevirapine is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study

Rifampicin is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study

St John’s Wort is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study

Grazoprevir is predicted to increase the exposure to statins (atorvastatin). Adjust atorvastatin dose, p. 202. [Moderate] Study

Grazoprevir is predicted to increase the exposure to statins (fluvastatin). Adjust fluvastatin dose, p. 203. [Unknown] Theoretical

Grazoprevir increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 204. [Moderate] Study

Grazoprevir is predicted to increase the exposure to statins (simvastatin). Adjust simvastatin dose, p. 205. [Unknown] Theoretical

Grazoprevir is predicted to increase the concentration of simtubin. Use with caution and adjust dose. [Moderate] Theoretical

Grazoprevir increases the exposure to tacrolimus. [Moderate] Study

Griseofulvin

ROUTE-SPECIFIC INFORMATION

Interactions do not generally apply to topical use unless specified.

Alcohol (beverage) potentially causes a disulfiram-like reaction when given with griseofulvin. [Moderate] Anecdotal

Antiepileptics (phenobarbital, primidione) decrease the effects of griseofulvin. [Moderate] Study

Griseofulvin potentially decreases the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal

Griseofulvin potentially decreases the anticoagulant effect of coumarins. [Moderate] Anecdotal

Griseofulvin potentially decreases the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal

Griseofulvin potentially decreases the efficacy of oral levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal

Griseofulvin potentially decreases the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal

Guanethidine → see TABLE 8 p. 1376 (Hypotension)

Amfetamines (dexamfetamine) decrease the effects of guanethidine. [Severe] Study

Benperidol is predicted to decrease the effects of guanethidine. [Moderate] Theoretical → Also see TABLE 8 p. 1376

 Droperidol is predicted to decrease the effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 1376

 Haloperidol is predicted to decrease the antihypertensive effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 1376

Monoamine-oxidase A and B inhibitors, irreversible are predicted to decrease the antihypertensive effects of guanethidine. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 1376

Phenothiazines are predicted to decrease the antihypertensive effects of guanethidine. [Moderate] Theoretical → Also see TABLE 8 p. 1376

Guanethidine is predicted to increase the effects of sympathomimetics, inotropic (dopamine). [Severe] Theoretical

Guanethidine is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] Study

Guanethidine increases the effects of sympathomimetics, vasoconstrictor (metaraminol). [Severe] Anecdotal

Guanethidine increases the effects of sympathomimetics, vasoconstrictor (phenylephrine). [Severe] Study

Tricyclic antidepressants are predicted to decrease the antihypertensive effects of guanethidine. [Moderate] Study → Also see TABLE 8 p. 1376
Guanfacine → see TABLE 8 p. 1376 (hypotension), TABLE 11 p. 1377 (CNS depressant effects)

- Antiarrhythmics (dronedarone) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Guanfacine increases the concentration of antiepileptics (valproate). Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Bosentan is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical → Also see TABLE 8 p. 1376
- Chloramphenicol is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Cimetidine is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Crizotinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Efavirenz is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- Enalapril is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Study
- Fosaprepitant is predicted to increase the concentration of guanfacine. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to guanfacine. Avoid. [Moderate] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Study
- Idelalisib is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Study
- Imatinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Study
- Macrolides (erythromycin) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Guanfacine is predicted to increase the concentration of ranitidine. [Moderate] Theoretical
- Mitotane is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Study
- Netupitant is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Nilotinib is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Rifampicin is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- Guselkumab → see monoclonal antibodies

**H₂ receptor antagonists**

- Cimetidine decreases the clearance of albendazole. [Moderate] Study
- Cimetidine increases the concentration of aminophylline. Adjust dose. [Severe] Study
- Cimetidine slightly increases the exposure to anthracyclines (epirubicin). Avoid. [Moderate] Study
- Cimetidine increases the exposure to antiarrhythmics (amiodarone). [Moderate] Study
- Cimetidine slightly increases the exposure to antiarrhythmics (flecainide). Monitor and adjust dose. [Mild] Study
- Cimetidine increases the exposure to antiarrhythmics (lidocaine). Monitor and adjust dose. [Moderate] Study
- Cimetidine is predicted to increase the exposure to antiepileptics (propafenone). Monitor and adjust dose. [Moderate] Theoretical
- Cimetidine transiently increases the concentration of antiepileptics (carbamazepine). Monitor concentration and adjust dose. [Moderate] Study
- Cimetidine increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (itraconazole). Administer itraconazole capsules with an acidic beverage. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (ketoconazole). Administer ketoconazole with an acidic beverage. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the exposure to antifungals, azoles (posaconazole). Avoid use of posaconazole oral suspension. [Moderate] Study
- Cimetidine decreases the clearance of antimalarials (chloroquine). [Moderate] Study
- Cimetidine slightly increases the exposure to antimalarials (quinine). [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the absorption of bosutinib. [Moderate] Theoretical
- Cimetidine slightly increases the exposure to calcium channel blockers (diltiazem, nimodipine). Monitor and adjust dose. [Moderate] Study
- Cimetidine is predicted to slightly increase the exposure to calcium channel blockers (verapamil). [Moderate] Study
- Cimetidine increases the exposure to calcium channel blockers (nifedipine), Monitor and adjust dose. [Severe] Study
- Cimetidine increases the exposure to calcium channel blockers (lindalipine). [Moderate] Theoretical
- Cimetidine is predicted to slightly increase the exposure to capcetabine. [Severe] Theoretical
- H₂ receptor antagonists are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical
- Cimetidine increases the concentration of ciclosporin. [Mild] Study
- Cimetidine increases the concentration of coumarins. [Severe] Study
- Cimetidine increases the exposure to dopamine receptor agonists (pramipexole). Adjust dose. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the absorption of dipyridamole (immediate release tablets). [Moderate] Theoretical
- Cimetidine is predicted to increase the exposure to erlotinib. Erlotinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate] Study
- Cimetidine increases the concentration of fampridine. Avoid. [Severe] Theoretical
- Cimetidine slightly increases the exposure to fluorouracil. [Severe] Study
- H₂ receptor antagonists are predicted to slightly to moderately decrease the exposure to gefitinib. [Moderate] Study
- H₂ receptor antagonists decrease the exposure to HIV-protease inhibitors (atazanavir). Monitor and adjust dose. [Moderate] Study
- Cimetidine is predicted to decrease the clearance of hydroxychloroquine. [Moderate] Theoretical
- H₂ receptor antagonists are predicted to decrease the absorption of lapatinib. Avoid. [Moderate] Theoretical
- H₂ receptor antagonists are predicted to decrease the exposure to ledipasvir. Adjust dose. See ledipasvir with sofosbuvir p. 628. [Moderate] Study
- **Leflunomide** is predicted to increase the exposure to H₂ receptor antagonists (cimetidine, famotidine). [Moderate] Theoretical
- H₂ receptor antagonists (cimetidine, ranitidine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Cimetidine slightly increases the exposure to macrolides (erythromycin). [Moderate] Study
- Cimetidine increases the concentration of mebendazole. [Moderate] Study
- Cimetidine increases the exposure to mirtazapine. Monitor and adjust dose. [Moderate] Study
- Cimetidine increases the exposure to moclobemide. Adjust moclomemide dose, p. 362. [Mild] Study
- H₂ receptor antagonists are predicted to decrease the absorption of nilotinib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after nilotinib. [Mild] Theoretical
- Cimetidine increases the concentration of opioids (alfentanil). Use with caution and adjust dose. [Severe] Study
- Cimetidine increases the exposure to opioids (fentanyl). [Moderate] Study
  - H₂ receptor antagonists are predicted to decrease the exposure to pazopanib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after pazopanib. [Moderate] Theoretical
- Cimetidine increases the exposure to phenindione. [Severe] Anecdotal
- Cimetidine moderately increases the exposure to praziquantel. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the exposure to rifampicin. H₂ receptor antagonists should be taken 12 hours before or 4 hours after rifampicin. [Severe] Study
- Cimetidine slightly increases the exposure to roflumilast. [Moderate] Study
- H₂ receptor antagonists potentially decrease the exposure to sofosbuvir. Adjust dose, see ledipasvir with sofosbuvir p. 628, sofosbuvir with velpatasvir p. 629, and sofosbuvir with velpatasvir and voxilaprevir p. 630. [Moderate] Study
- Cimetidine slightly increases the exposure to SSRIs (citalopram, escitalopram). Adjust dose. [Moderate] Study
- Cimetidine slightly increases the exposure to SSRIs (paroxetine, sertraline). [Moderate] Study
- Cimetidine is predicted to increase the risk of toxicity when given with tegafur. [Severe] Theoretical
- Teriflunomide is predicted to increase the exposure to H₂ receptor antagonists (cimetidine, famotidine). [Moderate] Study
- Cimetidine increases the concentration of theophylline. Adjust dose. [Severe] Study
- Cimetidine increases the exposure to tricyclic antidepressants. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the concentration of velpasvir. Adjust dose, see sofosbuvir with velpatasvir p. 629. [Moderate] Study
- Cimetidine slightly increases the exposure to venlafaxine. [Mild] Study
- Cimetidine slightly increases the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. [Mild] Study

### Haloperidol

See Table 8 p. 1376 (hypotension), Table 9 p. 1377 (QT-interval prolongation), Table 11 p. 1377 (CNS depressant effects), Table 10 p. 1377 (antimuscarinic).

#### Food and Lifestyle

Dose adjustment might be necessary if smoking started or stopped during treatment.

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of haloperidol. Adjust dose. [Moderate] Study
  - Also see Table 11 p. 1377
- **Haloperidol** potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
- **Antifungals, azoles (itraconazole)** increase the concentration of haloperidol. [Moderate] Study
- **Haloperidol** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
  - Also see Table 8 p. 1376
  - Also see Table 9 p. 1377
  - Also see Table 10 p. 1377

- **Enzalutamide** decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
- **Haloperidol** potentially opposes the effects of glyceral phenylbutyrate. [Moderate] Theoretical
- **Haloperidol** is predicted to decrease the antihypertensive effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical
  - Also see Table 8 p. 1376
- **HIV-protease inhibitors (ritonavir)** are predicted to increase the exposure to haloperidol. [Severe] Theoretical
- **Haloperidol** decreases the effects of levodopa. [Severe] Study
  - Also see Table 8 p. 1376
- **Mitotane** decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
- **Rifampicin** decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
- **Haloperidol** potentially decreases the effects of sodium phenylbutyrate. [Moderate] Anecdotal
- **SSRIs** (fluoxetine) increase the concentration of haloperidol. Adjust dose. [Moderate] Anecdotal
- **SSRIs** (fluoxetine) increase the concentration of haloperidol. Adjust dose. [Moderate] Anecdotal
- **Venlafaxine** slightly increases the exposure to haloperidol. [Severe] Study
  - Also see Table 9 p. 1377
  - Also see Table 11 p. 1377

#### Heparin (unfractionated)

See Table 16 p. 1379 (increased serum potassium), Table 3 p. 1375 (anticoagulant effects).

- **Ranolazine** increases the risk of bleeding events when given with heparin (unfractionated). [Severe] Theoretical

#### Hepatitis B immunoglobulin

See immunoglobulins

**HIV-protease inhibitors** — see Table 9 p. 1377 (QT-interval prolongation)

- atazanavir - darunavir - fosamprenavir - lopinavir - ritonavir - saquinavir - tipranavir

Caution on concurrent use of atazanavir, lopinavir with ritonavir, and ritonavir with drugs that prolong the PR interval.

Concurrent use of saquinavir with drugs that prolong the PR interval is contra-indicated.

Caution on concurrent use of tipranavir with drugs that increase risk of bleeding.

**Tipranavir** slightly decreases the exposure to abacavir. Avoid. [Severe] Study

**HIV-protease inhibitors** are predicted to increase the exposure to abacavir. Adjust or avoid abacavir dose, p. 967. [Severe] Study

**HIV-protease inhibitors** (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to alfatinib. Separate administration by 1 hour. [Moderate] Study

**Ritonavir** is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical

**Ritonavir** decreases the exposure to abiraterone. [Moderate] Study

**HIV-protease inhibitors** are predicted to markedly increase the exposure to aldosterone antagonists (spironolactone). Avoid. [Severe] Study

**HIV-protease inhibitors** (ritonavir, saquinavir) are predicted to increase the exposure to aliskiren. [Moderate] Theoretical

**HIV-protease inhibitors** increase the exposure to almotriptan. [Mild] Study

**HIV-protease inhibitors** are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study

**HIV-protease inhibitors** are predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study

**HIV-protease inhibitors** moderately increase the exposure to alprazolam. Avoid. [Mild] Study

**HIV-protease inhibitors** (ritonavir, tipranavir) are predicted to increase the exposure to amifetamine. [Severe] Theoretical

**Ritonavir** decreases the exposure to aminophylline. Adjust dose. [Moderate] Study

**Ritonavir** is predicted to decrease the exposure to anaesthetics, local (ropivacaine). [Mild] Theoretical

**Antacids** are predicted to decrease the absorption of atazanavir. Atazanavir should be taken 2 hours before or 1 hour after antacids. [Severe] Theoretical
HIV-protease inhibitors (continued)

- **Antacids** are predicted to decrease the absorption of tipranavir. Separate administration by 2 hours. **Moderate** Study

- HIV-protease inhibitors are predicted to increase the exposure to antiretrovirals (amprenavir). Avoid. **Severe** Theoretical → Also see TABLE 9 p. 1377

- HIV-protease inhibitors are predicted to increase the exposure to antiretrovirals (disopyramide). **Severe** Theoretical → Also see TABLE 9 p. 1377

- HIV-protease inhibitors very markedly increase the exposure to antiretrovirals (dronedarone). Avoid. **Severe** Study → Also see TABLE 9 p. 1377

- Ritonavir is predicted to increase the exposure to antiretrovirals (flecainide). Avoid or monitor side effects. **Severe** Theoretical

- HIV-protease inhibitors are predicted to increase the exposure to antiretrovirals (lidoceaine). Avoid. **Severe** Study

- HIV-protease inhibitors are predicted to increase the exposure to antiretrovirals (propafenone). Monitor and adjust dose. **Severe** Study

- HIV-protease inhibitors are predicted to increase the exposure to antiretrovirals (rifampicin) and antiretrovirals (rifapentine). **Severe** Theoretical

- HIV-protease inhibitors are predicted to affect the exposure to antiretrovirals (fosphenytoin, phenytoin) and antiepileptics (phenobarbital, primidone) decrease the concentration of HIV-protease inhibitors. **Severe** Theoretical

- Ritonavir slightly decreases the exposure to antiepileptics (lamotrigine). **Severe** Study

- HIV-protease inhibitors are predicted to very slightly increase the exposure to antiepileptics (perampanel). **Mild** Study

- HIV-protease inhibitors are predicted to affect the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of HIV-protease inhibitors. **Severe** Theoretical

- Ritonavir is predicted to decrease the concentration of antiepileptics (valproate). **Severe** Anadotal

- Antifungals, azoles (fluconazole) slightly increase the exposure to antiretrovirals (tipranavir). Avoid or adjust dose. **Moderate** Study

- Antifungals, azoles (micazosine) are predicted to increase the concentration of HIV-protease inhibitors. Use with caution and adjust dose. **Moderate** Theoretical

- Antifungals, azoles (posaconazole) are predicted to increase the exposure to HIV-protease inhibitors. **Moderate** Study

- HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (itraconazole). Avoid or monitor side effects. **Severe** Study

- HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (fluconazole). Use with caution and adjust dose. **Severe** Study

- HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (ketoconazole). Use with caution and adjust dose. **Moderate** Study

- Antifungals, azoles (voriconazole) potentially affect the exposure to HIV-protease inhibitors. **Severe** Study → Also see TABLE 9 p. 1377

- HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) potentially affect the exposure to antifungals, azoles (ketoconazole). Use with caution and adjust dose. **Moderate** Study

- HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (itraconazole). Avoid. **Moderate** Study

- HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (ketoconazole). Use with caution and adjust dose. **Moderate** Study

- HIV-protease inhibitors are predicted to affect the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) potentially affect the exposure to HIV-protease inhibitors. **Severe** Study → Also see TABLE 9 p. 1377

- HIV-protease inhibitors are predicted to increase the exposure to antifungals, azoles (itraconazole). Avoid. **Moderate** Study

- HIV-protease inhibitors are predicted to affect the exposure to antimalarials (quinine). **Severe** Study → Also see TABLE 9 p. 1377

- HIV-protease inhibitors are predicted to increase the exposure to apalutamide. **Mild** Study → Also see TABLE 9 p. 1377

- Ritonavir is predicted to increase the exposure to apixaban. **Avoid.** **Severe** Theoretical

- HIV-protease inhibitors are predicted to markedly increase the exposure to aprepitant. **Moderate** Study

- HIV-protease inhibitors are predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. **Moderate** Study

- HIV-protease inhibitors are predicted to increase the exposure to aripiprazole. **Avoid.** **Severe** Study

- HIV-protease inhibitors are predicted to increase the exposure to axitinib. Avoid or adjust dose. **Moderate** Study

- HIV-protease inhibitors are predicted to increase the exposure to bedaquiline. Avoid prolonged use. **Avoid.** **Mild** Study → Also see TABLE 9 p. 1377

- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to bictegravir. Use with caution or avoid. **Moderate** Theoretical

- HIV-protease inhibitors slightly increase the exposure to bortezomib. **Moderate** Study

- HIV-protease inhibitors are predicted to increase the exposure to bosentan. **Severe** Study

- HIV-protease inhibitors are predicted to markedly increase the exposure to bosutinib. Avoid or adjust dose. **Severe** Study → Also see TABLE 9 p. 1377

- HIV-protease inhibitors are predicted to increase the exposure to brigatinib. Adjust brigatinib dose, p. 971. **Severe** Study

- Ritonavir is predicted to decrease the exposure to bupropion. **Moderate** Study

- HIV-protease inhibitors are predicted to increase the exposure to bupirone. Adjust bupirone dose, p. 342. **Severe** Study

- HIV-protease inhibitors slightly increase the exposure to cabozantinib. **Moderate** Study → Also see TABLE 9 p. 1377

- Ritonavir is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. **Moderate** Study

- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Moderate** Study

- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). **Severe** Study

- HIV-protease inhibitors are predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. **Severe** Study

- HIV-protease inhibitors are predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. **Moderate** Theoretical

- HIV-protease inhibitors are predicted to moderately increase the exposure to cariprazine. Avoid. **Severe** Study

- HIV-protease inhibitors are predicted to increase the exposure to ceritinib. Avoid or adjust dose. p. 973. **Severe** Study → Also see TABLE 9 p. 1377

- HIV-protease inhibitors increase the concentration of ciclosporin. **Severe** Study

- HIV-protease inhibitors are predicted to moderately increase the exposure to clofarabine. Adjust clofarabine dose, p. 232. **Moderate** Study

- HIV-protease inhibitors are predicted to moderately increase the exposure to ciraparib. **Moderate** Study

- HIV-protease inhibitors are predicted to moderately increase the exposure to clofarabine. **Moderate** Study

- HIV-protease inhibitors are predicted to moderate increase the exposure to coibemel. **Moderate** Study

- HIV-protease inhibitors are predicted to markedly increase the exposure to coibemel. **Moderate** Study

- HIV-protease inhibitors are predicted to affect the exposure to cotropamine. **Avoid.** **Moderate** Study
HIV-protease inhibitors are predicted to increase the exposure to colchicine. Avoid potent inhibitors of CYP3A4 or adjust colchicine dose, p. 1120. (Severe) Study

Atazanavir (unboosted) increases the exposure to combined hormonal contraceptives. Adjust dose. (Severe) Study

Ritonavir is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). Moderate Theoretical

HIV-protease inhibitors are predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. (Severe) Study

HIV-protease inhibitors are predicted to affect the anticoagulant effect of coumarins. (Moderate) Study

HIV-protease inhibitors are predicted to moderately increase the exposure to crizotinib. Avoid. Moderate Theoretical

HIV-protease inhibitors are predicted to increase the exposure to dabrafenib. Use with caution or avoid. Moderate Study

HIV-protease inhibitors are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. (Severe) Study

Dasabuvir (with ombrutdin, paritaprevir, and ritonavir) decreases the concentration of darunavir. Avoid or adjust dose. (Moderate) Study

HIV-protease inhibitors are predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study → Also see TABLE 9 p. 1377

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to delamanid. (Severe) Study → Also see TABLE 9 p. 1377

Ritonavir is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical

Ritonavir is predicted to increase the exposure to diazepam. Avoid. (Moderate) Theoretical

Didanosine (buffered) decreases the exposure to atazanavir. Didanosine should be taken 2 hours after atazanavir, p. 648, p. 656. (Severe) Study

Didanosine (buffered) is predicted to decrease the exposure to darunavir (boosted with ritonavir). Didanosine should be taken 1 hour before or 2 hours after darunavir. (Moderate) Theoretical

Tipranavir decreases the exposure to didanosine. Separate administration by 2 hours. (Moderate) Study

Ritonavir increases the concentration of digoxin. Adjust dose and monitor concentration. (Severe) Study

Fosamprenavir (boosted with ritonavir) slightly decreases the exposure to dolutegravir. Avoid if resistant to HIV-integrase inhibitors. (Severe) Study

Tipranavir moderately decreases the exposure to dolutegravir. Refer to specialist literature. (Severe) Study

HIV-protease inhibitors increase the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study

HIV-protease inhibitors increase the exposure to dopamine receptor agonists (bromocriptine). (Severe) Study

HIV-protease inhibitors are predicted to increase the concentration of dopamine receptor agonists (cabergoline). (Moderate) Anecdotal

HIV-protease inhibitors are predicted to increase the exposure to doravirine. (Mild) Study

Ritonavir is predicted to decrease the exposure to duloxetine. (Moderate) Theoretical

HIV-protease inhibitors are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. (Moderate) Theoretical

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to slightly increase the exposure to edoxaban. Severe Theoretical

Efavirenz decreases the exposure to HIV-protease inhibitors. Refer to specialist literature. (Severe) Study → Also see TABLE 9 p. 1377

HIV-protease inhibitors are predicted to markedly increase the exposure to eletriptan. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Study

HIV-protease inhibitors (atazanavir, lopinavir) (boosted with ritonavir) increase the concentration of elvitegravir. Refer to specialist literature. (Moderate) Study

HIV-protease inhibitors are predicted to increase the exposure to encorafenib. Avoid or monitor. (Severe) Study → Also see TABLE 9 p. 1377

HIV-protease inhibitors are predicted to increase the risk of ergotism when given with ergotamine. Avoid. (Severe) Theoretical

HIV-protease inhibitors are predicted to increase the risk of ergotism when given with ergotamine. Avoid. (Severe) Theoretical

HIV-protease inhibitors are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. (Moderate) Study

HIV-protease inhibitors are predicted to increase the exposure to esктematine. Adjust dose. (Moderate) Study

Ritonavir is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical

Etravirine increases the exposure to fosaprepavir (boosted with ritonavir). Refer to specialist literature. (Moderate) Study

Tipranavir decreases the exposure to etravirine. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to increase the concentration of everolimus. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose with potent inhibitors of CYP3A4; avoid in hepatic and renal impairment, p. 777. (Severe) Study

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

Ritonavir is predicted to increase the exposure to flurazepam. Avoid. (Moderate) Theoretical

HIV-protease inhibitors are predicted to increase the exposure to fosaprepitant. (Moderate) Theoretical

HIV-protease inhibitors are predicted to increase the exposure to gefitinib. (Moderate) Study

HIV-protease inhibitors (atazanavir, darunavir, lopinavir) (boosted with ritonavir) increase the exposure to glecaprevir. Avoid. (Severe) Study

Ritonavir increases the exposure to glecaprevir. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to grazoprevir. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to grazoprevir. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to markedly increase the exposure to grazoprevir. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to markedly increase the exposure to grazoprevir. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to grazoprevir. Avoid. (Severe) Study

Ritonavir is predicted to increase the exposure to haloperidol. (Severe) Theoretical

Ritonavir is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

HIV-protease inhibitors are predicted to very markedly increase the exposure to ibritinib. Avoid potent inhibitors of CYP3A4 or adjust ibritinib dose, p. 983. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to imatinib. (Moderate) Study

HIV-protease inhibitors are predicted to increase the risk of toxicity when given with irinotecan. Avoid. (Moderate) Study

Ritonavir is predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. (Moderate) Theoretical

www.getintopharma.com
HIV-protease inhibitors (continued)

- **HIV-protease inhibitors** are predicted to increase the exposure to *inabradine*. Avoid. **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *ivaclacafor*. Adjust ivaclacafor, p. 293 or lumacafor with ivaclacafor p. 294 or tezacafor with ivaclacafor p. 295 dose with potent inhibitors of CYP3A4. **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *lapatinib*. Avoid. **(Moderate)** Study → Also see TABLE 9 p. 1377
- **Tipranavir (boosted with ritonavir)** is predicted to decrease the exposure to *ledipasvir*. Avoid. **(Severe)** Theoretical
- **HIV-protease inhibitors** (atazanavir, ritonavir) are predicted to increase the concentration of *intermeneron*. **(Moderate)** Study
- **Ritonavir** is predicted to decrease the concentration of *intermeneron*. **(Moderate)** Study
- **Ritonavir** is predicted to decrease the efficacy of *levonordestrol*. For FSRH guidance, see Contraceptives, interactions p. 794. **(Theoretical)**
- **HIV-protease inhibitors** are predicted to markedly increase the exposure to *lopinavir, ritonavir.* **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *lurasidone*. Avoid. **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *lomipadate*. Avoid. **(Severe)** Study
- **Atazanavir** is predicted to increase the exposure to macrolides (clarithromycin). Adjust dose in renal impairment. **(Severe)** Study
- **Ritonavir** increases the exposure to macrolides (clarithromycin). Adjust dose in renal impairment. **(Severe)** Study
- **Tipranavir (boosted with ritonavir)** increases the exposure to macrolides (clarithromycin) and macrolides (clarithromycin) increase the exposure to tipranavir (boosted with ritonavir). Monitor; adjust dose in renal impairment. **(Severe)** Study
- **HIV-protease inhibitors** (darunavir, fosamprenavir, lopinavir) (boosted with ritonavir) are predicted to increase the exposure to macrolides (clarithromycin). Adjust dose in renal impairment. **(Severe)** Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, tipranavir) are predicted to increase the exposure to macrolides (clarithromycin). **(Severe)** Theoretical
- **Darunavir (boosted with ritonavir)** markedly increases the exposure to *maraviroc*. Refer to specialist literature. **(Severe)** Study
- **Maraviroc** potentially decreases the exposure to fosamprenavir and fosamprenavir potentially decreases the exposure to *maraviroc*. Avoid. **(Severe)** Study
- **HIV-protease inhibitors** (atazanavir, saquinavir) moderately to markedly increase the exposure to *maraviroc*. Refer to specialist literature. **(Severe)** Study
- **Ritonavir (boosted with ritonavir)** moderately increases the exposure to *maraviroc*. Refer to specialist literature. **(Severe)** Study
- **Ritonavir** is predicted to decrease the exposure to *melatonin*. **(Moderate)** Theoretical
- **Ritonavir** is predicted to increase the clearance of *mexiteline*. Monitor and adjust dose. **(Moderate)** Study
- **HIV-protease inhibitors** are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. **(Severe)** Study
- **HIV-protease inhibitors** are predicted to very markedly increase the exposure to *midostaurin*. Avoid or monitor for toxicity. **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *mirabegron*. Adjust mirabegron dose in hepatic and renal impairment, p. 781. **(Moderate)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *mirtazapine*. **(Moderate)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *modafinil*. **(Theoretical)**
- **HIV-protease inhibitors** (lopinavir, ritonavir, saquinavir) are predicted to increase the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. **(Severe)** Theoretical
- **HIV-protease inhibitors** are predicted to markedly increase the exposure to *naltrexol*. Avoid. **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *netupitant*. Avoid or adjust. **(Moderate)** Study
- **Nevirapine** decreases the exposure to HIV-protease inhibitors. For FSRH guidance, see Contraceptives, interactions p. 794. **(Severe)** Theoretical
- **HIV-protease inhibitors** are predicted to moderately increase the exposure to *nilotinib*. Avoid. **(Severe)** Study → Also see TABLE 9 p. 1377
- **HIV-protease inhibitors** (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to *nintedanib*. **(Moderate)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *nitisineone*. Adjust dose. **(Moderate)** Theoretical
- **Ritonavir** is predicted to decrease the efficacy of *norgestrel*. For FSRH guidance, see Contraceptives, interactions p. 794. **(Severe)** Theoretical
- **Ritonavir** is predicted to decrease the exposure to *olanzapine*. Monitor and adjust dose. **(Moderate)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *olaparib*. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose, p. 1006. **(Moderate)** Study
- **Ombitasvir** (in fixed-dose combination with dasabuvir) decreases the concentration of *darunavir*. Avoid or adjust dose. **(Moderate)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. **(Severe)** Study
- **HIV-protease inhibitors** (boosted with ritonavir) are predicted to decrease the exposure to opioids (methadone). **(Moderate)** Study → Also see TABLE 9 p. 1377
- **Ritonavir** is predicted to decrease the concentration of *opioids (morphine)*. **(Moderate)** Theoretical
- **Ritonavir** increases the risk of CNS toxicity when given with opioids (pethidine). **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *oxepifene*. Avoid in poor CYP2C9 metabolisers. **(Moderate)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *palbociclib*. Avoid or adjust palbociclib dose, p. 992. **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *panobinostat*. Adjust panobinostat dose; in hepatic impairment avoid, p. 936. **(Moderate)** Study → Also see TABLE 9 p. 1377
- **Atazanavir (boosted with ritonavir)** markedly increases the exposure to *paritaprevir*. Avoid or give unboosted. **(Moderate)** Study
- **Darunavir (boosted with ritonavir)** slightly decreases the exposure to *paritaprevir*. Avoid or give unboosted. **(Moderate)** Study
- **HIV-protease inhibitors** (fosamprenavir, tipranavir) (boosted with ritonavir) are predicted to increase the exposure to *paritaprevir*. Avoid. **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *panobinostat*. Adjust panobinostat dose; in hepatic impairment avoid, p. 936. **(Moderate)** Study → Also see TABLE 9 p. 1377
- **Atazanavir (boosted with ritonavir)** markedly increases the exposure to *paritaprevir*. Avoid or give unboosted. **(Moderate)** Study
- **Darunavir (boosted with ritonavir)** slightly decreases the exposure to *paritaprevir*. Avoid or give unboosted. **(Moderate)** Study
- **HIV-protease inhibitors** (fosamprenavir, tipranavir) (boosted with ritonavir) are predicted to increase the exposure to *paritaprevir*. Avoid. **(Severe)** Study
- **Lopinavir (boosted with ritonavir)** moderately to markedly increases the exposure to *paritaprevir*. Avoid. **(Severe)** Study
- **Saquinavir** is predicted to increase the exposure to *paritaprevir* (in fixed-dose combination). Avoid. **(Severe)** Study
- **HIV-protease inhibitors** are predicted to increase the exposure to *pazopanib*. Avoid or adjust pazopanib dose, p. 993. **(Moderate)** Study → Also see TABLE 9 p. 1377
- **HIV-protease inhibitors** are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. **(Severe)** Study → Also see TABLE 9 p. 1377
HIV-protease inhibitors are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 813. (Severe) Study → Also see TABLE 9 p. 1377.

HIV-protease inhibitors are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. (Severe) Study

HIV-protease inhibitors (atazanavir, lopinavir) (boosted with ritonavir) increase the exposure to pibrentasvir. Avoid. (Severe) Study

Tipranavir potentially increases the exposure to pibrentasvir. (Severe) Theoretical

Saquinavir is predicted to increase the exposure to pibrentasvir. (Moderate) Theoretical

HIV-protease inhibitors are predicted to increase the exposure to pimozide. Avoid. (Severe) Study → Also see TABLE 9 p. 1377

Ritonavir is predicted to decrease the exposure to pimozide. (Moderate) Theoretical

HIV-protease inhibitors are predicted to slightly increase the exposure to praziquantel. (Weak) Study

Proton pump inhibitors decrease the exposure to atazanavir. Avoid or adjust dose. (Severe) Study

Proton pump inhibitors increase the exposure to saquinavir. Avoid. (Severe) Study

Tipranavir decreases the exposure to proton pump inhibitors. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Atazanavir increases the exposure to raltegravir (high-dose). Avoid. (Moderate) Study

Darunavir increases the risk of rash when given with raltegravir. (Moderate) Study

Fosamprenavir (boosted with ritonavir) decreases the exposure to raltegravir and raltegravir decreases the exposure to fosamprenavir (boosted with ritonavir). Avoid. (Severe) Study

Tipranavir (boosted with ritonavir) is predicted to decrease the exposure to raltegravir (high-dose). Avoid. (Moderate) Study

HIV-protease inhibitors are predicted to increase the exposure to ranolazine. Avoid. (Severe) Study → Also see TABLE 9 p. 1377

HIV-protease inhibitors are predicted to increase the exposure to reboxetine. Avoid. (Moderate) Study

HIV-protease inhibitors are predicted to increase the exposure to regorafenib. Avoid. (Moderate) Study

HIV-protease inhibitors are predicted to increase the exposure to regapline. (Moderate) Study

HIV-protease inhibitors are predicted to increase the exposure to regorafenib (alternate). Adjust altiretinoin dose, p. 1262. (Moderate) Theoretical

HIV-protease inhibitors are predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 997. (Moderate) Study → Also see TABLE 9 p. 1377

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) (boosted with ritonavir) increase the exposure to rifabutin. Monitor and adjust dose. (Severe) Study

Ritonavir markedly increases the exposure to rifabutin. Avoid or adjust dose. (Severe) Study

Rifampicin is predicted to moderately to markedly decrease the exposure to HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir). Avoid. (Severe) Study

Rifampicin slightly decreases the exposure to ritonavir. Avoid. (Severe) Study

Rifampicin is predicted to decrease the exposure to tipranavir. Avoid. (Severe) Study

Ritonavir is predicted to increase the exposure to riociguat. Avoid. (Moderate) Theoretical

HIV-protease inhibitors are predicted to increase the exposure to risedronate. Adjust dose. (Moderate) Study → Also see TABLE 9 p. 1377

Ritonavir moderately increases the exposure to rivaroxaban. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to rivolumibin. Adjust dose and monitor side effects. (Moderate) Study

HIV-protease inhibitors are predicted to increase the exposure to saxagliptin. (Moderate) Study

HIV-protease inhibitors are predicted to increase the concentration of sirolimus. Avoid. (Severe) Study

Tipranavir is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical

HIV-protease inhibitors are predicted to increase the exposure to soflufenac. Adjust soflufenac p. 779 or tamsuloxin with soflufenac p. 786 dose; avoid in hepatic and renal impairment. (Severe) Study

HIV-protease inhibitors are predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose, p. 821. (Severe) Study

St John’s Wort is predicted to decrease the exposure to HIV-protease inhibitors. Avoid. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. (Severe) Study

HIV-protease inhibitors slightly to moderately increase the exposure to statins (rosuvastatin). Avoid or adjust dose. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to statins (simvastatin). Avoid. (Severe) Study

HIV-protease inhibitors are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. (Moderate) Study → Also see TABLE 9 p. 1377

HIV-protease inhibitors are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to taxanes (cabazitaxel). Avoid. (Severe) Study

HIV-protease inhibitors are predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to taxanes (paclitaxel). (Severe) Theoretical

HIV-protease inhibitors are predicted to increase the concentration of temsirolimus. Avoid. (Severe) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, lopinavir) increase the exposure to tenofovir alafenamide. Avoid or adjust dose. (Moderate) Study

Tipranavir is predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, lopinavir) are predicted to increase the risk of renal impairment when given with tenofovir disoproxil. (Severe) Anecdotal

HIV-protease inhibitors are predicted to increase the exposure to tezacaftor. Avoid or adjust dose of p. 295 with potent inhibitors of CYP3A4. (Severe) Study

Ritonavir is predicted to decrease the exposure to theophylline. Adjust dose. (Moderate) Study

Ritonavir decreases the concentration of thyroid hormones (levothyroxine). MHRA advises monitor TSH for at least one month after starting or stopping ritonavir. (Moderate) Anecdotal

HIV-protease inhibitors are predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe) Study

Ritonavir moderately decreases the exposure to tizanidine. (Mild) Study

HIV-protease inhibitors are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 105. (Moderate) Study

HIV-protease inhibitors are predicted to increase the exposure to tolerodine. Avoid. (Severe) Study → Also see TABLE 9 p. 1377

HIV-protease inhibitors are predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with potent inhibitors of CYP3A4, p. 666. (Severe) Study

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to topotecan. (Severe) Study

HIV-protease inhibitors are predicted to increase the exposure to toremifene. (Moderate) Theoretical → Also see TABLE 9 p. 1377

HIV-protease inhibitors are predicted to increase the exposure to trabectedin. Avoid or adjust dose. (Severe) Theoretical
HIV-protease inhibitors (continued)

▶ HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the concentration of trametinib. (Moderate) Theoretical Study

▶ HIV-protease inhibitors are predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. (Moderate) Study

▶ HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to tricyclic antidepressants. (Moderate) Theoretical Study

▶ HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study

▶ Ritonavir decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

Tipranavir is predicted to increase the exposure to velpatasvir. (Severe) Theoretical

▶ HIV-protease inhibitors are predicted to increase the exposure to vemurafenib. (Severe) Theoretical Also see TABLE 9 p. 1377

▶ HIV-protease inhibitors are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Severe) Study

▶ HIV-protease inhibitors are predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical Also see TABLE 9 p. 1377

▶ HIV-protease inhibitors are predicted to increase the exposure to vitamin D substances (paricalcitol). (Moderate) Study

▶ Atazanavir (boosted with ritonavir) increases the concentration of voriconazole. Avoid. (Severe) Study

▶ Lopinavir (boosted with ritonavir) is predicted to increase the concentration of voriconazole. Avoid. (Severe) Theoretical

▶ Tipranavir (boosted with ritonavir) is predicted to increase the concentration of voriconazole. (Severe) Theoretical

▶ Tipranavir slightly decreases the exposure to zidovudine.

Avoid. (Moderate) Study

▶ HIV-protease inhibitors are predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Theoretical

Hormone replacement therapy

▶ Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

▶ Hormone replacement therapy is predicted to alter the exposure to antiepileptics (lamotrigine). (Moderate) Theoretical

▶ Aprepitant is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

▶ Bosantan is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

▶ Hormone replacement therapy decreases the clearance of dopamine receptor agonists (ropinirole). Monitor and adjust dose. (Moderate) Study

▶ Evirenz is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

▶ Fosaprepitant is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

▶ HIV-protease inhibitors (ritonavir) are predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

▶ Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with lenalidomide. (Severe) Theoretical

▶ Modafinil is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

▶ Hormone replacement therapy is predicted to increase the exposure to monoamine-oxidase B inhibitors (selegiline). Avoid. (Moderate) Study

▶ Nevirapine is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

▶ NSAI.D. (etoricoxib) slightly increase the exposure to hormone replacement therapy. (Moderate) Study

▶ Hormone replacement therapy potentially opposes the effects of espomiphene. Avoid. (Severe) Theoretical

▶ Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with pomalidomide. (Severe) Theoretical

▶ Hormone replacement therapy potentially opposes the effects of raloxifene. Avoid. (Severe) Theoretical

▶ Rifabutin is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

▶ Rifampicin is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

▶ St John's Wort is predicted to decrease the efficacy of hormone replacement therapy. (Moderate) Theoretical

▶ Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with thalidomide. (Severe) Theoretical

▶ Oral hormone replacement therapy is predicted to decrease the effects of thyroid hormones. (Moderate) Theoretical

Hydralazine see see TABLE 8 p. 1376 (hypotension)

▶ Diazoxide increases the risk of severe hypotension when given with hydralazine. (Severe) Study Also see TABLE 8 p. 1376

▶ Hydrochlorothiazide see thiazide diuretics

▶ Hydrocortisone see corticosteroids

▶ Hydroflumethiazide see thiazide diuretics

▶ Hydromorphone see opioids

▶ Hydroxy-carbamazepine see TABLE 15 p. 1378 (myelosuppression)

▶ Hydroxy-carbamazepine increases the risk of toxicity when given with vigabatrin. Avoid. (Severe) Study

▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with hydroxy-carbamazepine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

▶ Hydroxy-carbamazepine increases the risk of toxicity when given with stavudine. Avoid. (Severe) Study

▶ Hydroxychloroquine

▶ Hydroxychloroquine is predicted to decrease the effects of agalasise. (Moderate) Theoretical

▶ Antacids decrease the absorption of hydroxychloroquine. Separate administration by at least 4 hours. (Moderate) Study

▶ Calcium salts (calcium carbonate) decrease the absorption of hydroxychloroquine. Separate administration by at least 4 hours. (Moderate) Study

▶ Hydroxychloroquine is predicted to decrease the efficacy of oral cholera vaccine. (Moderate) Theoretical

▶ H1 receptor antagonists (cimetidine) are predicted to decrease the clearance of hydroxychloroquine. (Moderate) Theoretical

▶ Lanthanum is predicted to decrease the absorption of hydroxychloroquine. Separate administration by at least 2 hours. (Moderate) Theoretical

▶ Hydroxychloroquine is predicted to decrease the exposure to famotidine. Avoid simultaneous administration. (Severe) Theoretical

▶ Hydroxychloroquine is predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. (Severe) Theoretical

▶ Hydroxychloroquine is predicted to decrease efficacy rabies vaccine. (Moderate) Theoretical

▶ Hydroxychloroquine is predicted to decrease efficacy of oral cholera vaccine. (Moderate) Theoretical

▶ Hydroxychloroquine is predicted to decrease efficacy of oral cholera vaccine. (Moderate) Theoretical

▶ Hydrazine see antihistamines, sedating

▶ Hypoglycaemic agents see TABLE 10 p. 1377 (antimuscarinics)

▶ Ibrutinib see TABLE 15 p. 1378 (myelosuppression), TABLE 4 p. 1375 (antiplatelet effects)

FOOD AND LIFESTYLE Avoid food or drink containing bitter (Seville) oranges as they are predicted to increase the exposure to ibrutinib.

▶ Antiarrhythmics (amiodarone) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose, p. 983. (Severe) Theoretical

▶ Antiarrhythmics (dronedarone) are predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose with moderate inhibitors of CYP3A4, p. 983. (Severe) Study

▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ibrutinib. Avoid or adjust ibrutinib dose, p. 983. (Severe) Study

▶ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ibrutinib. Adjust
Idelalisib is predicted to increase the exposure to antiarrhythmics (amiodarone). Avoid. (Moderate) Theoretical
Idelalisib is predicted to very markedly increase the exposure to antiarrhythmics (dronedarone). Avoid. (Severe) Study
Idelalisib is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. (Severe) Study
Idelalisib is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. (Moderate) Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to idelalisib. Avoid. (Severe) Study
Idelalisib is predicted to very slightly increase the exposure to antiepileptics (perampanel). (Mild) Study
Idelalisib is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. (Severe) Study
Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (micolazine). Avoid. (Severe) Study
Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. (Moderate) Study
Idelalisib is predicted to increase the concentration of antimalarials (piperazine). (Severe) Theoretical
Idelalisib is predicted to increase the exposure to apalutamide. (Mild) Study
Idelalisib is predicted to markedly increase the exposure to aprapentin. (Moderate) Study
Idelalisib is predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose. p. 975. (Moderate) Study
Idelalisib is predicted to increase the exposure to atraxinib. Adjust arixtratinib dose or avoid. (Moderate) Study → Also see TABLE 15 p. 1378
Idelalisib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. (Mild) Study
Idelalisib is predicted to increase the exposure to beta, agonists (salmeterol). Avoid. (Severe) Study
Idelalisib slightly increases the exposure to bortezomib. (Moderate) Study → Also see TABLE 15 p. 1378
Idelalisib is predicted to decrease the exposure to bosutinib. Avoid or adjust dose. (Severe) Study → Also see TABLE 15 p. 1378
Idelalisib is predicted to increase the exposure to brigitanib. Adjust brigitanib dose, p. 971. (Severe) Study
Idelalisib is predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 340. (Severe) Study
Idelalisib slightly increases the exposure to cabozantinib. (Moderate) Study → Also see TABLE 15 p. 1378
Idelalisib is predicted to increase the exposure to calcium channel blockers (amiodipine, felodipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study
Idelalisib is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). (Severe) Study
Idelalisib is predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. (Severe) Study
Idelalisib is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. (Moderate) Theoretical
Idelalisib is predicted to moderately increase the exposure to cariprazine. Avoid. (Severe) Study
Idelalisib is predicted to increase the exposure to certinib. Avoid or adjust certinib dose, p. 973. (Severe) Study → Also see TABLE 15 p. 1378
Idelalisib increases the concentration of ciclosporin. (Severe) Study
Idelalisib is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. (Moderate) Study
Idelalisib is predicted to moderately increase the exposure to cinacalcet. Adjust dose. (Moderate) Study
Idelalisib is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. (Severe) Study
Idelalisib is predicted to increase the exposure to colchicine. Avoid potential inhibitors of CYP3A4 or adjust colchicine dose, p. 1120. (Severe) Study
Idelalisib (continued)

> Idelalisib is predicted to increase the exposure to corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). (Moderate) Theoretical

> Idelalisib is predicted to increase the exposure to corticosteroids (betamethasone, budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects. (Severe) Study

> Idelalisib is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. (Severe) Study

> Idelalisib is predicted to markedly to very markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. (Severe) Study → Also see TABLE 15 p. 1378

> Idelalisib is predicted to very slightly increase the exposure to delamanid. (Severe) Study

> Idelalisib increases the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study

> Idelalisib increases the exposure to dopamine receptor agonists (bromocriptine). (Severe) Study

> Idelalisib is predicted to increase the concentration of dopamine receptor agonists (cabergoline). (Moderate) Anecdotal

> Idelalisib is predicted to increase the exposure to doravirine. (Moderate) Study

> Idelalisib is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. (Moderate) Theoretical

> Idelalisib increases the exposure to ergotamine. Avoid. (Severe) Study

> Enzalutamide is predicted to decrease the exposure to idelalisib. Avoid. (Severe) Study

> Idelalisib is predicted to increase the risk of ergotism when given with ergotamine. Avoid. (Severe) Study

> Idelalisib is predicted to increase the risk of ergotism when given with ergotamine. Avoid. (Severe) Theoretical

> Idelalisib is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. (Moderate) Study

> Idelalisib is predicted to increase the exposure to esteketamine. (Moderate) Study

> Idelalisib is predicted to increase the concentration of everolimus. Avoid. (Severe) Study → Also see TABLE 15 p. 1378

> Idelalisib is predicted to moderately increase the exposure to fosprofant. (Moderate) Theoretical

> Idelalisib is predicted to increase the exposure to gefitinib. (Moderate) Study → Also see TABLE 15 p. 1378

> Idelalisib is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. (Severe) Study

> Idelalisib is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 352. (Moderate) Study

> Idelalisib is predicted to increase the exposure to ibutrintinib dose, p. 983. (Severe) Study → Also see TABLE 15 p. 1378

> Idelalisib is predicted to increase the exposure to imatinib. (Moderate) Study → Also see TABLE 15 p. 1378

> Idelalisib is predicted to increase the risk of toxicity when given with irinotecan. Avoid. (Moderate) Study → Also see TABLE 15 p. 1378

> Idelalisib is predicted to increase the exposure to ivabradine. Avoid. (Severe) Study

> Idelalisib is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or lumacaftor with ivacaftor p. 294 or tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. (Severe) Study

> Idelalisib is predicted to increase the exposure to lapatinib. Avoid. (Moderate) Study

> Idelalisib is predicted to markedly to very markedly increase the exposure to lomitapide. Avoid. (Severe) Study

> Idelalisib is predicted to increase the exposure to luridazine. Avoid. (Severe) Study

> Idelalisib is predicted to increase the exposure to macitentan. (Moderate) Study

> Idelalisib markedly increases the exposure to maraviroc. Adjust dose. (Severe) Theoretical

> Idelalisib is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. (Severe) Study

> Idelalisib is predicted to very markedly increase the exposure to midostaurin. Avoid or monitor for toxicity. (Severe) Study

> Idelalisib is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 781. (Moderate) Study

> Idelalisib is predicted to increase the exposure to mirtazapine. (Moderate) Study

> Mitotane is predicted to decrease the exposure to idelalisib. Avoid. (Severe) Study → Also see TABLE 15 p. 1378

> Idelalisib is predicted to increase the exposure to modafinil. (Mild) Theoretical

> Idelalisib is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. (Severe) Theoretical → Also see TABLE 15 p. 1378

> Idelalisib is predicted to markedly increase the exposure to naloxegol. Avoid. (Severe) Study

> Idelalisib is predicted to increase the exposure to netupitant. (Moderate) Study

> Nevirapine is predicted to decrease the exposure to idelalisib. Avoid. (Moderate) Theoretical

> Idelalisib is predicted to moderately increase the exposure to nilotinib. Avoid. (Severe) Study → Also see TABLE 15 p. 1378

> Idelalisib is predicted to increase the exposure to nitrosimine. Adjust dose. (Moderate) Theoretical

> Idelalisib is predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Study → Also see TABLE 15 p. 1378

> Idelalisib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. (Severe) Study

> Idelalisib is predicted to increase the exposure to opioids (methadone). (Severe) Theoretical

> Idelalisib is predicted to increase the exposure to ospeimifen. Avoid in poor CYP2C9 metabolisers. (Moderate) Study

> Idelalisib is predicted to increase the exposure to oxbutynin. (Mild) Study

> Idelalisib is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 992. (Severe) Study

> Idelalisib is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 936. (Moderate) Study → Also see TABLE 15 p. 1378

> Paritaprevir is predicted to increase the exposure to idelalisib. Avoid. (Severe) Study

> Idelalisib is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 993. (Moderate) Study → Also see TABLE 15 p. 1378

> Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avancan, vardenafin). Avoid. (Severe) Study

> Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (siludafin). Avoid potent inhibitors of CYP3A4 or adjust siludafin dose, p. 811. (Severe) Study

> Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. (Severe) Study

> Idelalisib is predicted to increase the exposure to pimozide. Avoid. (Severe) Study
Idelalisib is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 994. [Moderate] Study

Idelalisib is predicted to moderately increase the exposure to praziquantel. [Severe] Study

Idelalisib is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study

Idelalisib is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study → Also see TABLE 15 p. 1378

Idelalisib is predicted to increase the exposure to repaglinide. [Moderate] Study

Idelalisib is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1262. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 991. [Moderate] Study

Rifampin is predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

Idelalisib is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study → Also see TABLE 15 p. 1378

Idelalisib is predicted to increase the exposure to saxagliptin. [Moderate] Study

Idelalisib is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to solifenacin. Adjust solifenacin p. 779 or ramulosin with solifenacin p. 786 dose; avoid in hepatic and renal impairment. [Severe] Study

Idelalisib is predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid potent inhibitors of CYP3A4 or adjust dapoxetine dose, p. 821. [Severe] Study

St John’s Wort is predicted to decrease the exposure to idelalisib. Avoid. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study

Idelalisib is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study

Idelalisib is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. [Moderate] Study → Also see TABLE 15 p. 1378

Idelalisib is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study → Also see TABLE 15 p. 1378

Idelalisib is predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 1378

Idelalisib is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical → Also see TABLE 15 p. 1378

Idelalisib is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 1378

Idelalisib is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 292 dose with potent inhibitors of CYP3A4. [Severe] Study

Idelalisib is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. [Moderate] Study

Idelalisib is predicted to increase the exposure to tolfatan. Manufacturer advises caution or adjust tolfatan dose with potent inhibitors of CYP3A4, p. 669. [Severe] Study

Idelalisib is predicted to increase the exposure to toremifene. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 1378

Idelalisib is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. [Moderate] Study

Idelalisib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study

Idelalisib is predicted to increase the exposure to vemurafenib. [Severe] Theoretical

Idelalisib is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. [Severe] Study

Idelalisib is predicted to increase the exposure to venlafaxine. [Moderate] Study

Idelalisib is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 15 p. 1378

Idelalisib is predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study

Idelalisib is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical

Ifosfamide → see alkylating agents

Iloprost → see TABLE 4 p. 1375 (antiplatelet effects)

Imatinib → see TABLE 15 p. 1378 (myelosuppression)

Imatinib is predicted to increase the exposure to abemaciclib. [Moderate] Study

Imatinib is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 193. [Severe] Study

Imatinib is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical

Imatinib is predicted to increase the exposure to alprazolam. [Severe] Study

Imatinib is predicted to increase the exposure to antiarrhythmics (dronedrone). [Severe] Theoretical

Imatinib is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose.

Imatinib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical

Imatinib is predicted to increase the exposure to antihistamines, non-sedating (fupatadine). Avoid. [Moderate] Study

Imatinib is predicted to increase the concentration of antimarialars (piperacarone). [Severe] Theoretical

Aprepitant is predicted to increase the exposure to imatinib. [Moderate] Theoretical

Asparaginase is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical → Also see TABLE 15 p. 1378

Imatinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1378

Imatinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [HIV] Theoretical

Bosentan is predicted to decrease the exposure to imatinib. [Moderate] Study

Imatinib is predicted to increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 1378

Imatinib is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study

Imatinib is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical → Also see TABLE 15 p. 1378

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to imatinib. [Moderate] Theoretical

Imatinib is predicted to increase the exposure to calcium channel blockers (amiodipine, felodipine, laclidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
Imatinib (continued)

- **Imatinib** is predicted to increase the exposure to **cariprazine**. Avoid. **Severe** Study
- **Imatinib** is predicted to increase the exposure to **ceritinib**. **Moderate** Theoretical  
  Also see **TABLE 15** p. 1378
- **Imatinib** is predicted to increase the concentration of **cilostazol**. **Severe** Study
- **Cobicistat** is predicted to increase the exposure to **imatinib**. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **cobimetinib**. **Severe** Theoretical
- **Imatinib** is predicted to increase the exposure to **colchicine**. Adjust **colchicine** dose with moderate inhibitors of CYP3A4, p. 1200. **Severe** Study
- **Imatinib** is predicted to increase the exposure to the corticosteroids (methylprednisolone). Monitor and adjust dose. **Moderate** Study
- **Imatinib** is predicted to increase the risk of bleeding events when given with **coumarins**. **Severe** Theoretical
- **Crizotinib** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. **Severe** Theoretical  
  Also see **TABLE 15** p. 1378
- **Imatinib** is predicted to slightly increase the exposure to **darifenacin**. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **dasatinib**. **Severe** Study  
  Also see **TABLE 15** p. 1378
- **Imatinib** increases the risk of QT-prolongation when given with **domperidone**. Avoid. **Severe** Study
- **Imatinib** is predicted to increase the exposure to **dopamine receptor agonists** (**bromocriptine**). **Severe** Theoretical
- **Imatinib** is predicted to increase the concentration of **dopamine receptor agonists** (**cabergoline**). **Moderate** Aneodal
- **Imatinib** is predicted to moderately increase the exposure to **dutasteride**. **Mild** Study
- **Efavirenz** is predicted to decrease the exposure to **imatinib**. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **erlotinib**. Avoid or adjust dose—consult product literature. **Severe** Study
- **Imatinib** is predicted to moderately increase the exposure to **encorafenib**. **Moderate** Study
- **Enzalutamide** is predicted to decrease the exposure to **imatinib**. Avoid. **Moderate** Study
- **Imatinib** is predicted to increase the risk of ergotism when given with **ergometrine**. **Severe** Theoretical
- **Imatinib** is predicted to increase the risk of ergotism when given with **ergotamine**. **Severe** Theoretical
- **Imatinib** is predicted to increase the exposure to **erlotinib**. **Moderate** Theoretical
- **Imatinib** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. **Moderate** Study  
  Also see **TABLE 15** p. 1378
- **Imatinib** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 777. **Mild** Study
- **Imatinib** is predicted to increase the exposure to **gefitinib**. **Moderate** Theoretical  
  Also see **TABLE 15** p. 1378
- **Grapefruit juice** is predicted to increase the exposure to **imatinib**. **Moderate** Theoretical
- **Imatinib** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 352. **Moderate** Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to **imatinib**. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **ibrutinib**. Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4, p. 983. **Severe** Study  
  Also see **TABLE 15** p. 1378
- **Imatinib** is predicted to increase the exposure to **ibrutinib**. **Moderate** Study  
  Also see **TABLE 15** p. 1378
- **Imatinib** is predicted to increase the exposure to **ivabradine**. Adjust **ivabradine** dose, p. 211. **Severe** Theoretical
- **Imatinib** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose, p. 293 or **tezacaftor** with **ivacaftor** p. 295 dose with moderate inhibitors of CYP3A4. **Severe** Study
- **Imatinib** is predicted to increase the exposure to **lapatinib**. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **lomitapide**. Avoid. **Moderate** Theoretical
- **Imatinib** is predicted to increase the exposure to **lurasidone**. Adjust **lurasidone** dose, p. 396. **Moderate** Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to **imatinib**. **Moderate** Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to **imatinib**. **Moderate** Theoretical
- **Imatinib** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. **Severe** Study
- **Imatinib** is predicted to increase the exposure to **midostaurin**. **Moderate** Theoretical
- **Mirtazapine** is predicted to decrease the exposure to **imatinib**. Avoid. **Moderate** Study  
  Also see **TABLE 15** p. 1378
- **Imatinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects, p. 65. **Moderate** Study
- **Netupitant** is predicted to increase the exposure to **imatinib**. **Moderate** Theoretical
- **Nevirapine** is predicted to decrease the exposure to **imatinib**. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **olaparib**. Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose, p. 1005. **Moderate** Theoretical  
  Also see **TABLE 15** p. 1378
- **Imatinib** is predicted to increase the exposure to **opioids** (**alfentanil, buprenorphine, fentanyl, oxycodone**). Monitor and adjust dose. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **opioids** (**methadone, sufentanil**). **Moderate** Theoretical
- **Imatinib** is predicted to increase the exposure to **oxybutynin**. **Mild** Theoretical
- **Imatinib** increases the risk of hepatotoxicity when given with **paracetamol**. **Severe** Aneodal
- **Imatinib** is predicted to increase the exposure to **pazopanib**. **Moderate** Theoretical  
  Also see **TABLE 15** p. 1378
- **Pegaspargase** is predicted to increase the risk of hepatotoxicity when given with **imatinib**. **Severe** Theoretical  
  Also see **TABLE 15** p. 1378
- **Imatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. **Severe** Theoretical
- **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**avanafil**). Adjust **avanafil** dose, p. 812. **Moderate** Theoretical
- **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**sildenafil**). Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 812. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**tadalafil**). **Severe** Theoretical
- **Imatinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors** (**vardenafil**). Adjust dose. **Severe** Theoretical
- **Imatinib** is predicted to increase the exposure to **pimozide**. Avoid. **Severe** Theoretical
- **Imatinib** is predicted to increase the exposure to **quetiapine**. Avoid. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **ranolazine**. **Severe** Study
- **Imatinib** is predicted to increase the exposure to **riboxicillic**. **Moderate** Study
- **Rifampicin** is predicted to decrease the exposure to **imatinib**. Avoid. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **roxolitinib**. **Moderate** Theoretical  
  Also see **TABLE 15** p. 1378
- **Imatinib** is predicted to increase the exposure to **saxagliptin**. **Mild** Study
- **Imatinib** increases the concentration of **sirolimus**. Monitor and adjust dose. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **SSRIs (dapoxetine)**. Adjust **dapoxetine** dose with moderate inhibitors of CYP3A4, p. 821. **Moderate** Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **imatinib**. **Moderate** Study
- **Imatinib** is predicted to increase the exposure to **statins** (**atorvastatin**). Monitor and adjust dose. **Severe** Study

---

**TABLE 15** p. 1378

**BNF 78**
Imatinib – Iron (oral) 1473

- Iron (oral) is used to treat iron deficiency anemia. It can also be used for other conditions as directed by your healthcare provider.

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to irinotecan. Avoid. (Severe) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. (Moderate) Study

- Aprepitant is predicted to increase the exposure to intravenous irinotecan. (Severe) Theoretical

- Cobimetinib is predicted to increase the risk of toxicity when given with irinotecan. Avoid. (Moderate) Study

- Enzalutamide is predicted to decrease the exposure to irinotecan. Avoid. (Severe) Study

- Fibrates (gemfibrozil) are predicted to increase the exposure to irinotecan. Avoid. (Moderate) Theoretical

- Fosaprepitant is predicted to increase the exposure to irinotecan. Avoid. (Moderate) Theoretical

- HIV-protease inhibitors are predicted to increase the risk of toxicity when given with irinotecan. Avoid. (Moderate) Study

- Idelalisib is predicted to increase the risk of toxicity when given with irinotecan. Avoid. (Moderate) Study → Also see TABLE 15 p. 1378

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with irinotecan. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

- Macrolides (clarithromycin) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. (Moderate) Study

- Mitotane is predicted to decrease the exposure to irinotecan. Avoid. (Severe) Study → Also see TABLE 15 p. 1378

- Netupitant is predicted to increase the exposure to irinotecan. (Moderate) Study

- Irinotecan is predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. (Moderate) Theoretical

- Piriton is predicted to decrease the exposure to irinotecan. (Mild) Theoretical

- Rifampicin is predicted to decrease the exposure to irinotecan. Avoid. (Severe) Study

- Rolipram is predicted to increase the exposure to irinotecan. Avoid or monitor. (Moderate) Study

- St John’s Wort slightly decreases the exposure to irinotecan. Avoid. (Severe) Study

- Irinotecan is predicted to increase the risk of prolonged neuromuscular blockade when given with suxamethonium. (Moderate) Theoretical

- Iron (injectable)
  - Ferric carboxymaltose • iron dextran • iron isomaltoside 1000 • iron sucrose

- Chloramphenicol decreases the efficacy of intravenous iron (injectable). (Moderate) Anecdotal

- Iron (oral)
  - Ferric maltol • ferrous fumarate • ferrous gluconate • ferrous sulfate • sodium ferederate

- Antacids decrease the absorption of iron (oral). Iron (oral) should be taken 1 hour before or 2 hours after antacids. (Moderate) Study

- Iron (oral) decreases the exposure to bicitravir. Bicitravir should be taken 2 hours before iron (oral). (Moderate) Study

- Iron (oral) is predicted to decrease the absorption of oral biphosphonates (ibandronic acid). Avoid iron (oral) for at least 6 hours before or 1 hour after ibandronic acid. (Moderate) Theoretical

- Iron (oral) decreases the absorption of biphosphonates (risendronate). Separate administration by at least 2 hours. (Moderate) Study

- Iron (oral) decreases the absorption of biphosphonates (sodium clodronate). Avoid iron (oral) for 4 hours before or 1 hour after sodium clodronate. (Moderate) Study

- Calcium salts (calcium carbonate) decrease the absorption of iron (oral). Calcium carbonate should be taken 1 hour before or 2 hours after iron (oral). (Moderate) Study

- Iron (oral) is predicted to decrease the exposure to carbipoda. (Moderate) Theoretical

- Imatinib is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 205. (Severe) Study

- Irinotecan is predicted to increase the exposure to sunitinib. (Moderate) Theoretical → Also see TABLE 15 p. 1378

- Irinotecan is predicted to increase the concentration of temsirolimus. (Moderate) Theoretical → Also see TABLE 15 p. 1378

- Irinotecan is predicted to increase the exposure to taxanes (cabazitaxel). (Moderate) Theoretical → Also see TABLE 15 p. 1378

- Irinotecan is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

- Irinotecan is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4. (Severe) Study

- Irinotecan is predicted to increase the exposure to trazodone. (Moderate) Theoretical

- Irinotecan is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

- Irinotecan is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Severe) Study

- Irinotecan is predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical → Also see TABLE 15 p. 1378

- Irinotecan is predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Study

- Immidapril → see ACE inhibitors

- Imipenem → see carbapenems

- Imipramine → see tricyclic antidepressants

- Immunoglobulins
  - Anti-β (Rh) immunoglobulin • antithymocyte immunoglobulin (rabbit) • hepatitis B immunoglobulin • normal immunoglobulin • rabbies immunoglobulin • tetanus immunoglobulin • varicella-zoster immunoglobulin

- Immunoglobulins are predicted to alter the effects of monoclonal antibodies (dinituximab). Avoid. (Severe) Theoretical

- Indacaterol → see β agonists

- Indapamide → see thiazide diuretics

- Indometacin → see NSAIDs

- Indoramin → see alpha blockers

- Influnexab → see monoclonal antibodies

- Influenza vaccine (live) → see live vaccines

- Inotersen → see TABLE 4 p. 1375 (antiplatelet effects)

- Inotuzumab ozogamicin → see monoclonal antibodies

- Insulins → see TABLE 14 p. 1378 (antidiabetic drugs)

- Fibrates are predicted to increase the risk of hypoglycaemia when given with insulins. (Moderate) Theoretical

- Interferon alfa → see interferons

- Interferon beta → see interferons

- Interferons → see TABLE 15 p. 1378 (myelosuppression)

- Interferon alfa - interferon beta - peginterferon alfa

- Interferons are predicted to slightly increase the exposure to aminophylline. Adjust dose. (Moderate) Theoretical

- Interferon alfa is predicted to increase the risk of peripheral neuropathy when given with telbivudine. Avoid. (Severe) Theoretical

- Peginterferon alfa increases the risk of peripheral neuropathy when given with telbivudine. Avoid. (Severe) Study

- Interferons slightly increase the exposure to theophylline. Adjust dose. (Moderate) Study

- Ipilimumab → see monoclonal antibodies

- Ipratropium → see TABLE 10 p. 1377 (antisialcarcinics)

- Beta, agonists are predicted to increase the risk of glaucoma when given with ipratropium. (Moderate) Anecdotal

- Irbesartan → see angiotensin-II receptor antagonists

- Irinotecan → see TABLE 15 p. 1378 (myelosuppression)
Iron (oral) — Ivabradine

Iron (oral) (continued)

Iron (oral) decreases the efficacy of iron (oral).
- **Chloramphenicol** decreases the efficacy of iron (oral).
  - **Moderate** Theoretical

Iron (oral) decreases the absorption of dolutegravir.
- **Dolutegravir** should be taken 2 hours before or 6 hours after iron (oral).
  - **Moderate** Study

Iron (oral) is predicted to decrease the absorption of eltrobrogol. Eltrobrogol should be taken 2 hours before or 4 hours after iron (oral).
- **Severe** Theoretical

Iron (oral) is predicted to decrease the absorption of entacapone. Separate administration by at least 2 hours.
- **Moderate** Theoretical

Iron (oral) decreases the absorption of levodopa.
- **Moderate** Study

Iron (oral) decreases the effects of methyldopa.
- **Moderate** Study

Iron (oral) is predicted to decrease the absorption of penicillamine. Separate administration by at least 2 hours.
- **Mild** Study

Iron (oral) decreases the exposure to quinolones. Separate administration by at least 2 hours.
- **Moderate** Study

Iron (oral) decreases the absorption of tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron (oral).
- **Moderate** Study

Iron (oral) decreases the absorption of thyroid hormones (levothyroxine). Separate administration by at least 4 hours.
- **Moderate** Study

Trientine potentially decreases the absorption of iron (oral).
- **Moderate** Theoretical

Zinc is predicted to decrease the efficacy of iron (oral) and iron (oral) is predicted to decrease the efficacy of zinc.
- **Moderate** Study

Iron chelators
desferrioxan, desferrioxamine, desferroxamine.

> **Deferasirox** is predicted to increase the exposure to aminophylline. Avoid, **Moderate** Theoretical

Antacids (aluminium hydroxide) are predicted to decrease the exposure to deferasirox. Avoid, **Moderate** Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose.
- **Moderate** Theoretical

Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with desferrioxamine. **Severe** Theoretical

Aspirin (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with deferasirox. **Severe** Theoretical

Bisphosphonates are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. **Severe** Theoretical

Deferasirox is predicted to increase the exposure to clozapine.
- Avoid, **Moderate** Theoretical

Corticosteroids are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. **Severe** Theoretical

HIV- protease inhibitors (ritonavir) are predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose.
- **Moderate** Theoretical

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with desferrioxamine.
- Avoid, **Severe** Theoretical

NSAIDs are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox.
- **Severe** Theoretical

Deferasirox moderately increases the exposure to repaglinide.
- Avoid, **Moderate** Study

Rifampicin is predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose.
- **Moderate** Study

Deferasirox is predicted to increase the exposure to selexipag. Adjust dose.
- **Moderate** Study

Deferasirox increases the exposure to theophylline. Avoid.
- **Moderate** Study

Deferasirox is predicted to increase the exposure to tizanidine.
- **Moderate** Theoretical

Iron dextran → see iron (injectable)

Iron isomaltoside 1000 → see iron (injectable)

Iron sucrose → see iron (injectable)

Isavuconazole → see antifungals, azoles

Isocarboxazid → see monoamine-oxidase A and B inhibitors, irreversible

Isoflurane → see volatile halogenated anaesthetics

Isomethaphene → see sympathomimetics, vasconstrictor

Isoniazid → see TABLE 1. p. 1375 (hepatotoxicity), TABLE 12 p. 1378 (peripheral neuropathy)

FOOD AND LIFESTYLE
Avoid tyramine-rich foods (such as mature cheeses, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines) or histamine-rich foods (such as very mature cheese or fish from the scromboid family (e.g. tuna, mackerel, salmon)), as tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

> Isoniazid is predicted to affect the clearance of aminophylline.
- **Severe** Theoretical

Isoniazid markedly increases the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) increase the risk of hepatotoxicity when given with isoniazid. Monitor concentration and adjust dose.
- **Severe** Study → Also see TABLE 1 p. 1375

Isoniazid increases the concentration of antiepileptics (fosphenytoin, phenytoin). **Moderate** Study → Also see TABLE 12 p. 1378

Cycloserine increases the risk of CNS toxicity when given with isoniazid. Monitor and adjust dose.
- **Moderate** Study

Isoniazid is predicted to increase the risk of peripheral neuropathy when given with didanosine.
- **Severe** Theoretical → Also see TABLE 1 p. 1375 → Also see TABLE 12 p. 1378

Isoniazid increases the risk of optic neuropathy when given with ethambutol.
- **Severe** Anecdotal

Isoniazid decreases the effects of levodopa.
- **Moderate** Study

Isoniazid is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. **Unknown** Theoretical → Also see TABLE 1 p. 1375

Isoniazid is predicted to increase the risk of peripheral neuropathy when given with stavudine.
- **Severe** Theoretical → Also see TABLE 12 p. 1378

Isoniazid is predicted to affect the clearance of theophylline.
- **Severe** Anecdotal

Isoniazid potentially increases the risk of nephrotoxicity when given with volatile halogenated anaesthetics (methoxyflurane).
- Avoid, **Severe** Theoretical

Isosorbide dinitrate → see nitrates

Isosorbide mononitrate → see nitrates

Isotretinoin → see retinoids

Itracnozole → see antifungals, azoles

Ivabradine → see TABLE 6 p. 1376 (bradycardia), TABLE 9 p. 1377 (QT-interval prolongation)

> Antiarrhythmics (dronedarone) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 211. **Severe** Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose.
- **Moderate** Theoretical

Antifungals, azoles (Fluconazole, Isavuconazole, Posaconazole) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 211. **Severe** Theoretical

Antifungals, azoles (Itraconazole, Ketoconazole, Voriconazole) are predicted to increase the exposure to ivabradine.
- Avoid, **Severe** Study

Aprepitant is predicted to increase the exposure to ivabradine.
- Adjust ivabradine dose, p. 211. **Severe** Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivabradine.
- Avoid, **Moderate** Study → Also see TABLE 6 p. 1376

Cobicistat is predicted to increase the exposure to ivabradine.
- Avoid, **Severe** Study

Crizotinib is predicted to increase the exposure to ivabradine.
- Adjust ivabradine dose, p. 211. **Severe** Theoretical → Also see TABLE 6 p. 1376
Ivacaftor

**FOOD AND LIFESTYLE** Avoid bitter (Seville) oranges as they are predicted to increase the exposure to ivacaftor.

**Antirrhynthmics (dronedaron)** are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. [Study](#)

**Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately to markedly decrease the exposure to ivacaftor. Avoid. [Study](#)

**Antifungals, azoles (itraconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. [Study](#)

**Apalutamide** is predicted to decrease the exposure to ivacaftor. Avoid with monitor. [Moderate](#)

**Aprepitant** is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. [Study](#)

**Bosentan** is predicted to decrease the exposure to ivacaftor. [Study](#)

**Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. [Moderate](#)

**Cobicistat** is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or lumacaftor with ivacaftor p. 294 or tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. [Study](#)

**Ivacaftor** is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or lumacaftor with ivacaftor p. 294 or tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. [Severe](#)

**Netupitant** is predicted to increase the exposure to ivacaftor. Adjust ivacaftor p. 293 or lumacaftor with ivacaftor p. 294 or tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. [Severe](#)

**St John's Wort** is predicted to decrease the exposure to ivacaftor. [Severe](#)

**Mitotane** is predicted to decrease the exposure to ivacaftor. Adjust dose. [Severe](#)

**Mitotane** increases the exposure to ivacaftor. Adjust dose. [Severe](#)

**Ivermectin** potentially increases the anticoagulant effect of coumarins. [Severe](#)

**Levamisole** increases the exposure to ivermectin. [Moderate](#)

**Ivazoxim**

**Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ivazoxim. Avoid. [Severe](#)

**Levamisole** increases the exposure to ivazoxim. [Moderate](#)

**St John's Wort** is predicted to decrease the exposure to ivazoxim. [Severe](#)

**Ivazoxim**

**Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ivazoxim. Avoid. [Severe](#)

**Levamisole** increases the exposure to ivazoxim. [Moderate](#)

**St John's Wort** is predicted to decrease the exposure to ivazoxim. [Severe](#)

**Ivazoxim**

**Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ivazoxim. Avoid. [Severe](#)

**Levamisole** increases the exposure to ivazoxim. [Moderate](#)

**St John's Wort** is predicted to decrease the exposure to ivazoxim. [Severe](#)

**Ivazoxim**

**Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ivazoxim. Avoid. [Severe](#)

**Levamisole** increases the exposure to ivazoxim. [Moderate](#)

**St John's Wort** is predicted to decrease the exposure to ivazoxim. [Severe](#)
Lamivudine – Laronidase

Lamivudine (continued)

- Zidovudine increases the risk of toxicity when given with lamivudine. Severe Anecdotal

Lamotrigine → see antiepileptics

Lanreotide

- Beta blockers, non-selective are predicted to increase the risk of bradycardia when given with lanreotide. (Moderate) Theoretical
- Beta blockers, selective are predicted to increase the risk of bradycardia when given with lanreotide. (Moderate) Theoretical
- Lanreotide is predicted to decrease the absorption of oral ciclosporin. Adjust dose. (Severe) Theoretical

Lansoprazole → see proton pump inhibitors

Lanthanum

- Lanthanum is predicted to decrease the absorption of antifungals, azoles (ketoconazole). Separate administration by at least 2 hours. (Moderate) Theoretical
- Lanthanum is predicted to decrease the absorption of antimalarials (chloroquine). Separate administration by at least 2 hours. (Moderate) Theoretical
- Lanthanum is predicted to decrease the absorption of hydroxychloroquine. Separate administration by at least 2 hours. (Moderate) Theoretical
- Lanthanum moderately decreases the exposure to quinolones. Quinolones should be taken 2 hours before or 4 hours after lanthanum. (Moderate) Study
- Lanthanum is predicted to decrease the absorption of tetracyclines. Separate administration by 2 hours. (Moderate) Theoretical
- Lanthanum decreases the absorption of thyroid hormones. Separate administration by 2 hours. (Moderate) Study
- Lanthanum is predicted to decrease the absorption to apatinib. Separate administration by 12 hours. (Moderate) Study
- Lanthanum is predicted to increase the exposure to aliskiren. (Anecdotal) Theoretical
- Lanthanum is predicted to decrease the absorption of rilpamib. Separate administration by 12 hours. (Moderate) Theoretical
- Lanthanum is predicted to increase the absorption of antihistamines, non-sedating (fexofenadine).
- Antacids are predicted to decrease the absorption of lapatinib. Avoid. (Moderate) Theoretical
- Antiarhythmics (dronedarone) are predicted to increase the exposure to lapatinib. (Moderate) Study → Also see TABLE 9 p. 1377
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the absorption to lapatinib. Avoid. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lapatinib. (Moderate) Study → Also see TABLE 9 p. 1377
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lapatinib. Avoid. (Moderate) Study → Also see TABLE 9 p. 1377
- Lapatinib is predicted to increase the exposure to aripiprazol. (Anecdotal) Theoretical
- Aprepitant is predicted to increase the exposure to lapatinib. (Moderate) Study
- Lapatinib is predicted to increase the exposure to beta blockers, non-selective (nadolol). (Moderate) Study
- Lapatinib is predicted to increase the exposure to bictegravir. Use with caution or avoid. (Severe) Theoretical
- Bosentan is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lapatinib. (Moderate) Study
- Lapatinib is predicted to increase the exposure to ceritinib. (Moderate) Theoretical → Also see TABLE 9 p. 1377
- Cobicistat is predicted to increase the exposure to lapatinib. Avoid. (Moderate) Study
- Lapatinib is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1220. (Moderate) Theoretical
- Lapatinib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical
- Crizotinib is predicted to increase the exposure to lapatinib. (Moderate) Study → Also see TABLE 9 p. 1377
- Lapatinib is predicted to increase the exposure to dabigatran. (Severe) Theoretical
- Lapatinib is predicted to increase the exposure to digoxin. (Moderate) Theoretical
- Lapatinib is predicted to slightly increase the exposure to edoxaban. (Severe) Theoretical
- Efavirenz is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study → Also see TABLE 9 p. 1377
- Enzalutamide is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study
- Lapatinib is predicted to increase the exposure to erlotinib. (Moderate) Theoretical
- Lapatinib is predicted to increase the exposure to everolimus. (Moderate) Theoretical
- Lapatinib is predicted to increase the exposure to fidaxomimon. Avoid. (Moderate) Study
- Grapefruit juice is predicted to increase the exposure to lapatinib. Avoid. (Moderate) Theoretical
- H1-receptor antagonists are predicted to decrease the absorption of lapatinib. Avoid. (Moderate) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to lapatinib. Avoid. (Moderate) Study → Also see TABLE 9 p. 1377
- Idelalisib is predicted to increase the exposure to lapatinib. Avoid. (Moderate) Study
- Imatinib is predicted to increase the exposure to lapatinib. (Anecdotal) Study
- Lapatinib is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical
- Lapatinib is predicted to increase the exposure to loperamide. (Moderate) Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to lapatinib. Avoid. (Moderate) Study → Also see TABLE 9 p. 1377
- Macrolides (erythromycin) are predicted to increase the exposure to lapatinib. Avoid. (Moderate) Study
- Mitotane is predicted to increase the exposure to lapatinib. Avoid. (Severe) Study
- Netupitant is predicted to increase the exposure to lapatinib. (Moderate) Study
- Nevirapine is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study
- Nilotinib is predicted to increase the exposure to lapatinib. (Moderate) Study → Also see TABLE 9 p. 1377
- Lapatinib is predicted to increase the exposure to nintedanib. (Anecdotal) Study
- Lapatinib is predicted to increase the exposure to panobinostat. Adjust dose. (Moderate) Theoretical → Also see TABLE 9 p. 1377
- Lapatinib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- Lapatinib is predicted to increase the exposure to pitavastatin. (Moderate) Theoretical
- Pitolisant is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study
- Laronidase
- Aliskiren is predicted to increase the exposure to topotecan. (Severe) Study
- Laronidase is predicted to increase the exposure to trametinib. (Moderate) Theoretical
- Laronidase is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. (Severe) Theoretical
- Hydroxychloroquine are predicted to decrease the exposure to laronidase. Avoid simultaneous administration. (Severe) Theoretical

www.getintopharma.com
Ledipasvir

- **Acids** are predicted to decrease the exposure to ledipasvir.
- Separate administration by 4 hours. ([Moderate] Theoretical)
- **Ledipasvir** is predicted to increase the risk of severe bradycardia or heart block when given with antiarrhythmics (amiodarone).
  - Refer to specialist literature. ([Severe] Anecdotal)
- Antiepileptics (**carbamazepine**) are predicted to decrease the exposure to ledipasvir. Avoid. ([Severe] Study)
- Antiepileptics (**fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone**) are predicted to decrease the exposure to ledipasvir. Avoid. ([Severe] Theoretical)
- **Calcium salts** (calcium carbonate) are predicted to decrease the exposure to ledipasvir. Separate administration by 4 hours. ([Moderate] Theoretical)
- **Ledipasvir** is predicted to increase the exposure to dabigatran. ([Moderate] Theoretical)
- **H₂ receptor antagonists** are predicted to decrease the exposure to ledipasvir. Adjust dose, see ledipasvir with sofosbuvir p. 628. ([Moderate] Study)
- HIV-protease inhibitors (**tipranavir** boosted with ritonavir) are predicted to decrease the exposure to ledipasvir. Avoid. ([Severe] Theoretical)
- Proton pump inhibitors are predicted to decrease the exposure to ledipasvir. Adjust dose, see ledipasvir with sofosbuvir p. 628. ([Moderate] Theoretical)
- Rifabutin is predicted to decrease the exposure to ledipasvir. Avoid. ([Severe] Theoretical)
- Rifampicin is predicted to decrease the exposure to ledipasvir. Avoid. ([Severe] Study)
- **St John’s Wort** is predicted to decrease the exposure to ledipasvir. Avoid. ([Severe] Study)
- **Ledipasvir** is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). Monitor and adjust dose. ([Moderate] Theoretical)
- **Ledipasvir** is predicted to increase the exposure to statins (rosuvastatin). Avoid. ([Severe] Theoretical)
- **Ledipasvir** (with sofosbuvir) slightly increases the exposure to tenofovir disoproxil. ([Moderate] Study)

**PHARMACOLOGY**

**Leflunomide**

- Is predicted to increase the exposure to adefovir. ([Moderate] Theoretical)
- **Leflunomide** is predicted to decrease the exposure to alogelamine. ([Moderate] Theoretical)
- **Leflunomide** decreases the exposure to aminophylline. Adjust dose. ([Moderate] Study)
- **Leflunomide** is predicted to decrease the exposure to antihistamines, non-sedating (fexofenadine). ([Moderate] Study)
- **Leflunomide** is predicted to increase the exposure to anthracyclines (daunorubicin, doxorubicin, mitoxantrone). ([Moderate] Theoretical) → Also see TABLE 15 p. 1378
- **Leflunomide** is predicted to increase the exposure to anxiolytics (buspirone). ([Moderate] Theoretical) → Also see TABLE 15 p. 1378
- **Leflunomide** is predicted to increase the exposure to barbiturines. ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to bosentan. ([Moderate] Study)
- **Leflunomide** is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. ([Moderate] Study)
- **Leflunomide** is predicted to increase the exposure to cephalexin (cefaclor). ([Moderate] Theoretical)
- **Leflunomide** is predicted to decrease the exposure to clozapine. ([Moderate] Theoretical) → Also see TABLE 15 p. 1378
- **Leflunomide** increases the antiplatelet effect of coumarins. ([Severe] Anecdotal)
- **Leflunomide** is predicted to decrease the exposure to duloxetine. ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to ganciclovir. ([Moderate] Theoretical) → Also see TABLE 15 p. 1378

- **Leflunomide** is predicted to increase the exposure to H₂ receptor antagonists (cimetidine, famotidine). ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the concentration of interferon. ([Moderate] Study)
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with leflunomide. Public Health England advises avoid (refer to Green Book). ([Severe] Theoretical)
- **Leflunomide** is predicted to increase the exposure to loop diuretics (**fuosimide**). ([Moderate] Theoretical)
- **Leflunomide** is predicted to decrease the exposure to melatonin. ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to methotrexate. ([Moderate] Theoretical) → Also see TABLE 11 p. 1375 → Also see TABLE 15 p. 1378
- **Leflunomide** is predicted to increase the clearance of mefloquine. Monitor and adjust dose. ([Moderate] Study)
- **Leflunomide** is predicted to increase the exposure to montelukast. ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to nateglinide. ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to NSAIDs (indometacin, ketoprofen). ([Moderate] Theoretical)
- **Leflunomide** is predicted to decrease the exposure to omeprazole. Monitor and adjust dose. ([Moderate] Study) → Also see TABLE 15 p. 1378
- **Leflunomide** is predicted to increase the exposure to oseltamivir. ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to penicillins (beta-lactam). ([Moderate] Study)
- **Leflunomide** is predicted to increase the exposure to pioglitazone. ([Moderate] Study)
- **Leflunomide** is predicted to decrease the exposure to piritidrone. ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to quinolones (ciprofloxacin). ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to repaglinide. ([Moderate] Study)
- **Leflunomide** is predicted to increase the exposure to rifampicin. ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to selexipag. Adjust dose. ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). ([Moderate] Study) → Also see TABLE 1 p. 1375
- **Leflunomide** is predicted to increase the exposure to statins (rosuvastatin). Adjust dose. ([Moderate] Study) → Also see TABLE 1 p. 1375
- **Leflunomide** is predicted to increase the exposure to sufiaslazine. ([Moderate] Study) → Also see TABLE 1 p. 1375 → Also see TABLE 15 p. 1378
- **Leflunomide** is predicted to increase the exposure to sulfonylureas (glibenclamide). ([Moderate] Study)
- **Leflunomide** is predicted to increase the concentration of taxanes (paclitaxel). ([Severe] Anecdotal) → Also see TABLE 15 p. 1378
- **Leflunomide** is predicted to increase the exposure to tolenovir alafenamide. ([Moderate] Theoretical)
- **Leflunomide** is predicted to increase the exposure to tolenovir disoproxil. ([Moderate] Theoretical)
- **Leflunomide** is predicted to decrease the exposure to theophylline. Adjust dose. ([Moderate] Study)
- **Leflunomide** moderately decreases the exposure to tizanidine. ([Mild] Study)
- **Leflunomide** is predicted to increase the exposure to topotecan. ([Moderate] Study) → Also see TABLE 15 p. 1378
- **Leflunomide** is predicted to increase the exposure to zidovudine. ([Moderate] Theoretical) → Also see TABLE 15 p. 1378

**Lenalidomide**

- See TABLE 1 p. 1375 (hepatotoxicity), TABLE 15 p. 1378
- **Myelosuppression**, **(TABLE 5) p. 1375 (thromboembolism)**
- **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with lenalidomide. Avoid. ([Severe] Theoretical)
### Interactions

**Lenalidomide** (continued)

- **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with lenalidomide.  
  (Severe) Theoretical

**Levatinib** → see TABLE 9 (QT-interval prolongation)

**Lercanidipine** → see calcium channel blockers

**Letermovir**

- **Letermovir** is predicted to increase the concentration of antiretrovirals (amiodarone).  
  (Moderate) Theoretical

- **Antiepileptics (carbamazepine, phenobarbital, primidone)** are predicted to decrease the concentration of leterminov.  
  (Moderate) Theoretical

- **Letermovir** is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of leterminov.  
  (Moderate) Theoretical

- **Letermovir** slightly decreases the exposure to antifungals, azoles (voriconazole).  
  (Moderate) Study

- **Letermovir** is predicted to increase the concentration of antihistamines, non-sedating (fexofenadine).  
  (Moderate) Theoretical

- **Letermovir** is predicted to increase the concentration of bosentan.  
  (Moderate) Theoretical

- **Letermovir** increases the exposure to ciclosporin and ciclosporin increases the exposure to leterminov.  
  Monitor and adjust leterminov dose, p. 639.  
  (Severe) Study

- **Letermovir** is predicted to decrease the concentration of coumarins (warfarin).  
  Monitor and adjust dose.  
  (Moderate) Theoretical

- **Efavirenz** is predicted to decrease the concentration of leterminov.  
  (Moderate) Theoretical

- **Eflornithine** is predicted to increase the concentration of theophylline.  
  (Moderate) Theoretical

- **Erlotinib** is predicted to decrease the concentration of leterminov.  
  (Moderate) Study

- **Etoposide** is predicted to increase the concentration of ergotamine.  
  Avoid, (Severe) Theoretical

- **Etravirine** is predicted to decrease the exposure to leterminov.  
  (Moderate) Theoretical

- **Letermovir** is predicted to increase the concentration of levodopa.  
  Monitor and adjust dose.  
  (Severe) Study

- **Fibrates** are predicted to increase the concentration of levodopa.  
  Avoid, (Severe) Theoretical

- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the concentration of levodopa.  
  (Moderate) Study

- **Letermovir** slightly to moderately increases the exposure to levodopa.  
  Monitor and adjust dose.  
  (Moderate) Study

- **Modafinil** is predicted to decrease the concentration of leterminov.  
  (Moderate) Theoretical

- **Letermovir** is predicted to increase the exposure to opioids (alfentanil, fentanyl).  
  Monitor and adjust dose.  
  (Moderate) Study

- **Letermovir** is predicted to increase the concentration of pimozide.  
  Avoid, (Severe) Theoretical

- **Letermovir** is predicted to increase the concentration of repaglinide.  
  Avoid, (Moderate) Theoretical

- **Rifaximin** is predicted to decrease the concentration of leterminov.  
  (Moderate) Theoretical

- **Rifampicin** is predicted to affect the concentration of leterminov.  
  (Severe) Theoretical

- **Letermovir** moderately increases the exposure to sirolimus.  
  Monitor and adjust dose.  
  (Severe) Study

- **St John’s Wort** is predicted to decrease the concentration of leterminov.  
  (Moderate) Theoretical

- **Letermovir** moderately increases the exposure to statins (atorvastatin).  
  (Severe) Study

- **Letermovir** is predicted to increase the exposure to statins (fluvastatin).  
  Monitor and adjust dose.  
  (Moderate) Theoretical

- **Letermovir** is predicted to increase the exposure to statins (pravastatin).  
  Avoid or adjust dose.  
  (Moderate) Theoretical

- **Letermovir** is predicted to increase the exposure to statins (resovastatin, simvastatin).  
  Avoid, (Severe) Study

- **Letermovir** is predicted to increase the concentration of sulfonyleureas (glibenclamide).  
  (Moderate) Theoretical

- **Letermovir** moderately increases the exposure to tacrolimus.  
  Monitor and adjust dose.  
  (Severe) Study

- **Teriflunomide** is predicted to increase the concentration of leterminov.  
  (Moderate) Study

**Levamisole**

- **Albendazole** slightly decreases the exposure to levamisole.  
  Levamisole moderately decreases the exposure to albendazole.  
  (Moderate) Study

- **Alcohol (beverage)** potentially causes a disulfiram-like reaction when given with levamisole.  
  (Moderate) Study

- **Levamisole increases the exposure to ivermectin.**  
  (Moderate) Study

**Levetiracetam** → see antiepileptics

**Levoduonol** → see beta blockers, non-selective

**Levobupivacaine** → see anaesthetics, local

**Levocetirizine** → see antihistamines, non-sedating

**Levodopa** → see TABLE 8 p. 1376 (hypotension)

**General information** Drugs with antimuscarinic effects might reduce the absorption of levodopa, see TABLE 10 p. 1377.

- **Amisulpride** is predicted to decrease the effects of levodopa.  
  Avoid, (Severe) Theoretical

- **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of levodopa.  
  (Moderate) Study

- **Atorvastatin** decreases the effects of levodopa.  
  (Severe) Theoretical → Also see TABLE 8 p. 1376

- **Asetrapine** is predicted to decrease the effects of levodopa.  
  Adjust dose.  
  (Severe) Theoretical → Also see TABLE 8 p. 1376

- **Baclofen** is predicted to increase the risk of side-effects when given with levodopa.  
  (Severe) Anaesthetic → Also see TABLE 8 p. 1376

- **Benperidol** is predicted to decrease the effects of levodopa.  
  (Severe) Study → Also see TABLE 8 p. 1376

- **Buproprion** increases the risk of side-effects when given with levodopa.  
  (Moderate) Study

- **Clonazepam** is predicted to decrease the effects of levodopa.  
  (Severe) Theoretical

- **Fluoxetine** decreases the effects of levodopa.  
  (Severe) Theoretical → Also see TABLE 8 p. 1376

- **Entacapone** increases the exposure to levodopa.  
  Monitor side effects and adjust dose.  
  (Moderate) Study

- **Flupentixol** decreases the effects of levodopa, Avoid or monitor worsening parkinsonian symptoms.  
  (Severe) Theoretical → Also see TABLE 8 p. 1376

- **Haloperidol** decreases the effects of levodopa.  
  (Severe) Study → Also see TABLE 8 p. 1376

- **Iron (oral)** decreases the absorption of levodopa.  
  (Moderate) Study

- **Isoniazid** decreases the effects of levodopa.  
  (Moderate) Study

- **Levodopa** is predicted to increase the risk of elevated blood pressure when given with linezolid.  
  Avoid, (Severe) Theoretical

- **Loxapine** is predicted to decrease the effects of levodopa.  
  (Severe) Theoretical → Also see TABLE 8 p. 1376

- **Lurasidone** is predicted to decrease the effects of levodopa.  
  (Severe) Theoretical → Also see TABLE 8 p. 1376

- **Memantine** is predicted to increase the effects of levodopa.  
  (Moderate) Theoretical

- **Metoclopramide** decreases the effects of levodopa.  
  Avoid, (Moderate) Study

- **Levodopa increases the risk of side-effects when given with moclobemide.**  
  (Moderate) Study

- **Levodopa** increases the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible.  
  Avoid and for 14 days after stopping the MAOIs.  
  (Severe) Study → Also see TABLE 8 p. 1376

- **Monoamine-oxidase B inhibitors** are predicted to increase the effects of levodopa.  
  Adjust dose.  
  (Mild) Study → Also see TABLE 8 p. 1376

**TABLE 9**

p. 1377 (QT-interval prolongation)
Levodopa decreases the effects of levodopa. Avoid or monitor worsening Parkinsonian symptoms. [Severe] Anecdotal → Also see TABLE 8 p. 1376

Opicapone increases the exposure to levodopa. Adjust dose. [Moderate] Study

Paliperidone is predicted to decrease the effects of levodopa. [Severe] Theoretical → Also see TABLE 8 p. 1376

Phenothiazines decrease the effects of levodopa. Avoid or monitor worsening Parkinsonian symptoms. [Severe] Study → Also see TABLE 8 p. 1376

Pimozide decreases the effects of levodopa. [Severe] Theoretical → Also see TABLE 8 p. 1376

Quetiapine decreases the effects of levodopa. [Severe] Anecdotal → Also see TABLE 8 p. 1376

Risperidone is predicted to decrease the effects of levodopa. Avoid or adjust dose. [Severe] Anecdotal → Also see TABLE 8 p. 1376

Sulpiride is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1376

Tetrazenazine is predicted to decrease the effects of levodopa. Use with caution or avoid. [Moderate] Theoretical

Tocapline increases the exposure to levodopa. Monitor and adjust dose. [Moderate] Study

Tryptophan greatly decreases the concentration of levodopa. [Moderate] Study

Zuclopenthixol is predicted to decrease the effects of levodopa. Avoid or monitor worsening Parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 1376

Levodopa

Lisdexamfetamine

Reboxetine

Monoamine-oxidase B inhibitors

St John’s Wort is predicted to decrease the efficacy of levodopa. MRHA advises avoid. For FSRH guidance, see Table 8 p. 1376

Sugammadex is predicted to decrease the exposure to levodopa. Use additional contraceptive precautions. [Severe] Theoretical

Ulipristal is predicted to decrease the efficacy of levonorgestrel. Avoid. [Severe] Theoretical

Levethyroxine → see thyroid hormones

Lidocaine → see antiarrhythmics

Linaclotide → see TABLE 14 p. 1378 (antidiabetic drugs)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to linaclotide. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to linaclotide. [Moderate] Study

Linaclotide is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Mitotane is predicted to decrease the exposure to linaclotide. [Moderate] Study

Rifampicin is predicted to decrease the exposure to linaclotide. [Moderate] Study

Linezolid → see TABLE 15 p. 1378 (myelosuppression), TABLE 13 p. 1378 (serotonin syndrome)

**FOOD AND LIFESTYLE** Patients taking linezolid should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

**Beta, agonists** are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical

Bupropion is predicted to increase the risk of intraoperative hypertension when given with linezolid. [Severe] Anecdotal → Also see TABLE 13 p. 1378

Buspirone is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1378

Levodopa is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical

Macrolides (clarithromycin) increase the exposure to linezolid. [Moderate] Anecdotal

Methylphenidate is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical

Moclobemide is predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping moclobemide. [Severe] Theoretical → Also see TABLE 13 p. 1378

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping moclobemide. [Severe] Theoretical → Also see TABLE 13 p. 1378

Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping rasagiline. [Severe] Theoretical → Also see TABLE 13 p. 1378

Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 1378

Reboxetine is predicted to increase the risk of a hypertensive crisis when given with linezolid. Avoid. [Severe] Theoretical

Rifampicin slightly decreases the exposure to linezolid. [Moderate] Study

Sympathomimetics, inotropic are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical

Sympathomimetics, vasoconstrictor (adrenaline/epinephrine, ephedrine, isometheptene, noradrenaline/norepinephrine, phenylephrine) are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical

Sympathomimetics, vasoconstrictor (pseudoephedrine) increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Study

Liothyronine → see thyroid hormones

Liraglutide → see TABLE 14 p. 1378 (antidiabetic drugs)

Lisdexamfetamine → see amphetamines

Lisinopril → see ACE inhibitors
Lithium → see TABLE 13 p. 1378 (serotonin syndrome), TABLE 9 p. 1377 (QT-interval prolongation)

- **ACE inhibitors** are predicted to increase the concentration of lithium. Monitor and adjust dose. [Severe] Anecdotal
- **Acetazolamide** alters the concentration of lithium. [Severe] Anecdotal
- Aldosterone antagonists (eplerenone) potentially increase the concentration of lithium. Avoid. [Moderate] Theoretical
- Aldosterone antagonists (spironolactone) potentially increase the concentration of lithium. [Moderate] Study of
- **Aminophylline** is predicted to decrease the concentration of lithium. [Moderate] Theoretical
- Angiotensin-II receptor antagonists potentially increase the concentration of lithium. Monitor concentration and adjust dose. [Severe] Anecdotal
- Antiepileptics (carbamazepine, oxcarbazepine) are predicted to increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal
- **Calcitonin (salmon)** decreases the concentration of lithium. Monitor concentration and adjust dose. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal
- **Loop diuretics** increase the concentration of lithium. Monitor and adjust dose. [Severe] Study
- Methyldopa increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal
- **Mexiteline** potentially affects the exposure to lithium. Avoid. [Unknown] Theoretical
- NSAIDs increase the concentration of lithium. Monitor and adjust dose. [Severe] Study
- Phenothiazines potentially increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → also see TABLE 9 p. 1377
- Potassium-sparing diuretics (triatriperen) potentially increase the clearance of lithium. [Moderate] Study
- **Quetiapine** potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal
- **Risperidone** potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → also see TABLE 9 p. 1377
- **Sodium bicarbonate** decreases the concentration of lithium. [Severe] Anecdotal
- **Sulphide** potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → also see TABLE 9 p. 1377
- **Theophylline** is predicted to decrease the concentration of lithium. Monitor concentration and adjust dose. [Moderate] Anecdotal
- Thiadiazide diuretics increase the concentration of lithium. Avoid or monitor concentration. [Severe] Anecdotal → also see TABLE 13 p. 1378 → also see TABLE 9 p. 1377
- Zuclopenthixol potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → also see TABLE 9 p. 1377

**Live vaccines**

- Bacillus Calmette-Guérin vaccine - influenza vaccine (live) - measles, mumps and rubella vaccine, live - rotavirus vaccine - typhoid vaccine, oral - varicella-zoster vaccine - yellow fever vaccine, live

**General information**

Oral typhoid vaccine is inactivated by concurrent administration of antibacterials or antimalarials; antibacterials should be avoided for 5 days before and after oral typhoid vaccination; mefloquine should be avoided for at least 12 hours before or after oral typhoid vaccination; for other antimalarials oral typhoid vaccine vaccination should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which can be given concurrently).

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylating agents. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anthracyclines. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with azathioprine (high-dose). Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with baricitinib. Avoid. [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belatacept. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with bevacizumab. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with clofarabine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cyclophosphamide. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cladribine. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dactinomycin. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dimethyl fumarate. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with everolimus. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with everolimus. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

web.getintopharma.com
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fenogliptin. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fludarabine. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fluorouracil. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with gemcitabine. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with hydroxychloroquine. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with irinotecan. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with lomitapide. Avoid. (Refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with lomefloxacin. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mercaptopurine (high-dose). Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with methotrexate (high-dose). Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mitomycin. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with pemetrexed. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with platino compounds. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with procarbazine. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with raltitrexed. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with sirolimus. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with streptozocin. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tacrolium. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with taxanes (docetaxel, paclitaxel). Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tegafur. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with temsirolimus. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tegafur. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tioguanine. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tocilizumab. Public Health England advises avoid (refer to Green Book).  
Live vaccines potentially increase the risk of generalised infection (possibly life-threatening) when given with tofacitinib. Avoid. (Severe) Theoretical  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with trebolectin. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with trastuzumab. Public Health England advises avoid (refer to Green Book).  
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with vinca alkaloids. Public Health England advises avoid (refer to Green Book).  
Lixisenatide  see TABLE 1 p. 1378 (antidiabetic drugs)  
Separation of administration Some orally administered drugs should be taken at least 1 hour before, or 4 hours after, lixisenatide injection.  

calories Lofepzamine see triyclic antidepressant  
Lofexidine see TABLE 8 p. 1376 (hypotension), TABLE 9 p. 1377 (QT interval prolongation), TABLE 11 p. 1377 (CN depressant effects)  
Lomitapide see TABLE 1 p. 1375 (hepatotoxicity)  
Food and lifestyle Bitter (Seville) orange is predicted to increase the exposure to lomitapide; separate administration by 12 hours.  
Alprazolam is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
Antiarhythmic (amiodarone) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
Antineoplastics (carbamazepine, fosphenytoin, phenobarbital, phenytin, primidone) are predicted to decrease the exposure to lomitapide. Monitor and adjust dose. (Moderate) Theoretical also see TABLE 1 p. 1375  
Antifungals, azoles ( clotrimazole) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study also see TABLE 1 p. 1375  
Apalutamide is predicted to decrease the exposure to lomitapide. Avoid or monitor. (Moderate) Study
Lomitapide (continued)  
- **Aprepitant** is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical  
- **Bicalutamide** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Calcium channel blockers (amlodipine, lacidipine)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical  
- **Ciclosporin** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Clocostazol** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Cobicistat** is predicted to markedly increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Ciclosporin** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Ciclosporin** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to lomitapide. Avoid. (Severe) Study  
- **Oral combined hormonal contraceptives** slightly increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Lomitapide** increases the exposure to coumarins (warfarin). Monitor INR and adjust dose. (Severe) Study  
- **Crizotinib** is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical  
- **Enzalutamide** is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. (Moderate) Theoretical  
- **Everolimus** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Fosaprepitant** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Grapefruit juice** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **H₂ receptor antagonists (cimetidine, ranitidine)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **HIV-protease inhibitors** are predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study  
- **Idelalisib** is predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study  
- **Imatinib** is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical  
- **Isoniazid** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Unknown) Theoretical → Also see TABLE 1 p. 1375  
- **Ivacaftor** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Lapatinib** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Linagliptin** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Macrolides (azithromycin)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study  
- **Macrolides (erythromycin)** are predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical  
- **Mecobalamin** is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. (Moderate) Theoretical  
- **Netupitant** is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical  
- **Nilotinib** is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical  
- **Pazopanib** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Peppermint oil** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Propiverine** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Ranolazine** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Rifampicin** is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. (Moderate) Theoretical  
- **SSRIs (fluvoxamine)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Unknown) Theoretical  
- **SSRIs (fluoxetine)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Lomitapide increases the exposure to statins (atorvastatin).** Adjust lomitapide dose or separate administration by 12 hours. p. 207. (MID) Study → Also see TABLE 1 p. 1375  
- **Lomitapide increases the exposure to statins (simvastatin).** Monitor and adjust simvastatin dose. p. 205. (Moderate) Study → Also see TABLE 1 p. 1375  
- **Tacrolimus** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Ticagrelor** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Tolvaptan** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical  
- **Lomustine** → see alkylating agents  
- **Loop diuretics** → see TABLE 18 p. 1379 (hypotension), TABLE 8 p. 1376 (hypotension), TABLE 19 p. 1379 (ototoxicity), TABLE 17 p. 1379 (reduced serum potassium)  
  - lumisetron - furosemide - torasemide  
- **Aliksiren** slightly decreases the exposure to furosemide. (Moderate) Study → Also see TABLE 8 p. 1376  
- **Loop diuretics** increase the risk of nephrotoxicity when given with **aminoglycosides**. Avoid. (Moderate) Study → Also see TABLE 19 p. 1379  
- **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of furosemide. (Moderate) Study  
- **Intravenous furosemide** potentially increases the risk of sweating, variable blood pressure, and tachycardia when given after **chloral hydrate**. (Moderate) Anecdotal  
- **Dasabuvir** (with ombitasvir, paritaprevir, and ritonavir) increases the concentration of furosemide. Adjust dose. (Moderate) Study  
- **Leflunomide** is predicted to increase the exposure to furosemide. (Moderate) Theoretical  
- **Loop diuretics** increase the concentration of lithium. Monitor and adjust dose. (Severe) Study  
- **Paritaprevir** (with ritonavir and ombitasvir) is predicted to increase the exposure to furosemide. Adjust dose. (Moderate) Theoretical  
- **Reboxetine** is predicted to increase the risk of hypokalaemia when given with **loop diuretics**. (Moderate) Theoretical  
- **Teriflunomide** is predicted to increase the exposure to furosemide. (Moderate) Study  
- **Loperamide**  
  - **Antiarhythmics (dronedarone)** are predicted to increase the exposure to loperamide. (Severe) Theoretical  
  - **Ceritinib** is predicted to increase the exposure to loperamide. (Moderate) Theoretical  
  - **Loperamide greatly increases the absorption of oral desmopressin** (and possibly sublingual). (Moderate) Study  
  - **Eligulstat** is predicted to increase the exposure to loperamide. Adjust dose. (Moderate) Study  
  - **Lapatinib** is predicted to increase the exposure to loperamide. (Moderate) Theoretical  
  - **Mirabegron** is predicted to increase the exposure to loperamide. (MID) Theoretical  
  - **Opicapone** is predicted to increase the exposure to loperamide. Avoid. (Moderate) Study  
  - **Paritaprevir** (with ritonavir and ombitasvir) is predicted to increase the exposure to loperamide. (Moderate) Study  
  - **Pibrentasvir** (with glecaprevir) is predicted to increase the exposure to loperamide. (MID) Theoretical  
  - **Velpatasvir** is predicted to increase the exposure to loperamide. (Severe) Theoretical  
- **Lopinavir** → see HIV-protease inhibitors  
- **Loprazolam** → see TABLE 11 p. 1377 (CNS depressant effects)  
- **Loratadine** → see antihistamines, non-sedating
Lorazepam — Macitentan 1483

**Lorazepam** see Table 11 p. 1377 (CNS depressant effects)

- **Rifampicin** increases the clearance of lorazepam. [Moderate] Study

**Lormetazepam** see Table 11 p. 1377 (CNS depressant effects)

- **Lumacaftor** increases the clearance of lormetazepam. [Moderate] Study

**Low molecular-weight heparins** see Table 16 p. 1379 (increased serum potassium), Table 3 p. 1375 (anticoagulant effects)

- **Dalteparin** - enoxaparin - tinzaparin

- **Ranibizumab** increases the risk of bleeding events when given with low molecular-weight heparins. [Severe] Theoretical

**Loxapine** see Table 8 p. 1376 (hypotension), Table 11 p. 1377 (CNS depressant effects), Table 10 p. 1377 (antimuscarinics)

- **Combined hormonal contraceptives** are predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical

- **Loratadine** is predicted to decrease the effects of **levodopa**.

- **Midazolam** is predicted to decrease the exposure to **lumacaftor**. [Moderate] Theoretical — also see Table 8 p. 1376

- **Mexiteline** is predicted to increase the exposure to lopinavir. Avoid. [Unknown] Theoretical

- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to lopinavir. Avoid. [Unknown] Theoretical

- **Sulfisoxazole (fluvanoxamine)** are predicted to increase the exposure to lopinavir. Avoid. [Unknown] Theoretical

**Lumacaftor**

- **Lumacaftor** is predicted to decrease the exposure to antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to antifungals, azoles (fluconazole). Adjust dose, [Minor] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole). Avoid or monitor efficacy. [Moderate] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to ciclosporin. Avoid. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to corticosteroids (methylprednisolone). Adjust dose. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to doravirine. Avoid. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to everolimus. Avoid. [Severe] Theoretical

- **Lumacaftor** potentially decreases the exposure to glicaprevir. Avoid. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the efficacy of levonorgestrel. Use additional contraceptive precautions. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to macrolides (clarithromycin, erythromycin). [Moderate] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to midazolam. Avoid. [Severe] Theoretical

- **Lumacaftor** potentially decreases the exposure to pibrentasvir. Avoid. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to rifabutin. Adjust dose, [Moderate] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to sirolimus. Avoid. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to tacrolimus. Avoid. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the exposure to temsirolimus. Avoid. [Severe] Theoretical

- **Lumacaftor** is predicted to decrease the efficacy of ulipristal. Use additional contraceptive precautions. [Severe] Theoretical

**Lumefantrine** see antimalarials

**Lurasidone** see Table 8 p. 1376 (hypotension), Table 11 p. 1377 (CNS depressant effects)

- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. [Moderate] Study

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study — also see Table 11 p. 1377

- **Antifungals, azoles (fluconazole, itraconazole)** are predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. [Moderate] Study

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

- **Apalutamide** is predicted to decrease the exposure to lurasidone. Avoid or monitor. [Moderate] Study

- **Aprepitant** is predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. [Moderate] Study

- **Bosentan** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. [Moderate] Study — also see Table 8 p. 1376

- **Cobicistat** is predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

- **Crizotinib** is predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. [Moderate] Study

- **Efavirenz** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical

- **Enzalutamide** is predicted to decrease the exposure to lurasidone. Avoid. [Severe] Study

- **Grapefruit juice** is predicted to increase the exposure to lurasidone. Avoid. [Severe] Theoretical

- **HIV protease inhibitors** are predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

- **Idelalisib** is predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

- **Imatinib** is predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. [Moderate] Study

- **Lurasidone** is predicted to decrease the effects of levodopa. [Severe] Theoretical — also see Table 8 p. 1376

- **Macrolides (clarithromycin)** are predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

- **Macrolides (erythromycin)** are predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. [Moderate] Study

- **Mitotane** is predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. [Moderate] Study

- **Nevirapine** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical

- **Nilotinib** is predicted to increase the exposure to lurasidone. Adjust lurasidone dose, p. 398. [Moderate] Study

- **Rifampicin** is predicted to decrease the exposure to lurasidone. Avoid. [Severe] Study

- **St John’s Wort** is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. [Moderate] Theoretical

**Lymecycline** see tetracyclines

**Macitentan**

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to macitentan. Avoid. [Severe] Study

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to macitentan. [Moderate] Study

- **Cobicistat** is predicted to increase the exposure to macitentan. [Moderate] Study

- **Enalaprilam** is predicted to decrease the exposure to macitentan. Avoid. [Severe] Study

- **HIV protease inhibitors** are predicted to increase the exposure to macitentan. [Moderate] Study

- **Itraconazole** is predicted to increase the exposure to macitentan. [Moderate] Study

- **Loratadine** is predicted to decrease the exposure to macitentan. Avoid. [Severe] Study

www.getintopharma.com
Macrolides → see TABLE 9 p. 1377 (QT-interval prolongation)

azithromycin ▶ clarithromycin ▶ erythromycin

▶ Interactions do not generally apply to topical use of azithromycin unless specified.

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

▶ Clarithromycin is predicted to increase the exposure to abemaciclib. Avoid or adjust abemaciclib dose. p. 967. [Severe] Study

Erythromycin is predicted to increase the exposure to abemaciclib. [Moderate] Study

▶ Macrolides are predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study

Clarithromycin is predicted to markedly increase the exposure to aldososterone antagonists (eplerenone). Avoid. [Severe] Study

▶ Erythromycin is predicted to increase the exposure to aldososterone antagonists (eplerenone). Adjust eplerenone dose, p. 133. [Severe] Study

Azithromycin is predicted to increase the exposure to aliskiren. [Moderate] Theoretical

▶ Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to aliskiren. [Moderate] Study

Clarithromycin increases the exposure to amlodipine. [Moderate] Theoretical

▶ Clarithromycin is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study

Clarithromycin is predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study

▶ Erythromycin is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical

Clarithromycin moderately increases the exposure to alfuzosin. [Severe] Study

▶ Erythromycin is predicted to increase the exposure to alfuzosin. [Severe] Study

Azithromycin is predicted to increase the exposure to amlodipine. [Severe] Study

▶ Azithromycin is predicted to increase the exposure to amlodipine. [Severe] Study

Clarithromycin is predicted to increase the exposure to amlodipine. Adjust dose. [Moderate] Theoretical

▶ Amlodipine is predicted to increase the exposure to erythromycin. Adjust dose. [Severe] Study

Clarithromycin very markedly increases the exposure to antihistamines (dronedarone). Avoid. [Severe] Study → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to moderately increase the exposure to antihistamines (dronedarone). Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1377

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to antihistamines (lidocaine). [Moderate] Theoretical

▶ Clarithromycin is predicted to increase the exposure to antihistamines (propafenone). Monitor and adjust dose. [Severe] Study

Erythromycin is predicted to increase the exposure to antihistamines (propafenone). Monitor and adjust dose. [Moderate] Study

▶ Clarithromycin is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study

Clarithromycin slightly increases the concentration of antiepileptics (carbamazepine). Monitor concentration and adjust dose. [Severe] Study

Erythromycin markedly increases the concentration of antiepileptics (carbamazepine). Monitor concentration and adjust dose. [Severe] Study

▶ Clarithromycin is predicted to markedly increase the exposure to antiepileptics (perampanel). [Mild] Study

Clarithromycin is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. [Severe] Study

Erythromycin is predicted to increase the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical

▶ Clarithromycin is predicted to increase the exposure to antibiotics, azoles (itraconazole). Avoid. [Severe] Theoretical

Clarithromycin is predicted to increase the exposure to anitihistamines, non-sedating (mizolastine). Avoid. [Severe] Study

Erythromycin is predicted to increase the exposure to anitihistamines, non-sedating (mizolastine). [Severe] Theoretical

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to antihistamines, non-sedating (rupatadine). Avoid. [Moderate] Study

Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of antimalarials (piperazine). [Severe] Theoretical

Clarithromycin is predicted to increase the exposure to apalutamide. [Mild] Study → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to increase the exposure to apixaban. [Moderate] Theoretical

Clarithromycin is predicted to markedly increase the exposure to aprepitant. [Moderate] Study

Erythromycin is predicted to increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. [Moderate] Study

Clarithromycin is predicted to increase the exposure to axitinib. Avoid or adjust dose. [Moderate] Study

Erythromycin is predicted to increase the exposure to axitinib. [Moderate] Theoretical

▶ Clarithromycin is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 1377

Erythromycin is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1377

Macrolides are predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study

Clarithromycin is predicted to increase the exposure to beta blockers, non-selective (nadolol). Avoid. [Severe] Study

Macrolides are predicted to increase the exposure to bicitravir. Use with caution or avoid. [Moderate] Theoretical

Clarithromycin slightly increases the exposure to bortezomib. [Moderate] Study

▶ Clarithromycin is predicted to increase the exposure to bosentan. [Moderate] Theoretical

Clarithromycin is predicted to markedly increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Study → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1377

Clarithromycin is predicted to increase the exposure to brigitinib. Adjust brigitinib dose, p. 971. [Severe] Study

Clarithromycin is predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 342. [Severe] Study

Erythromycin is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study

Clarithromycin slightly increases the exposure to cabozantinib. [Moderate] Study → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to increase the exposure to cabozantinib. [Mild] Theoretical → Also see TABLE 9 p. 1377

Erythromycin is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

▶ Erythromycin is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Clarithromycin is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Avoid. [Severe] Study
Erythromycin is predicted to increase the exposure to calcium channel blockers (verapamil). Study

Clarithromycin is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. Moderate

Clarithromycin is predicted to moderately increase the exposure to caripazine. Avoid. Study

Erythromycin is predicted to increase the exposure to caripazine. Avoid. Study

Clarithromycin is predicted to increase the exposure to clarithromycin. Avoid or adjust dose. Moderate

Erythromycin is predicted to increase the exposure to clarithromycin. Avoid or adjust dose. Moderate

Clarithromycin increases the concentration of ciclosporin. Study

Erythromycin is predicted to increase the concentration of ciclosporin. Study

Clarithromycin is predicted to moderately increase the exposure to clobetasol. Adjust clobetasol dose. Moderate

Erythromycin slightly increases the exposure to clobetasol. Adjust clobetasol dose. Moderate

Clarithromycin is predicted to moderately increase the exposure to cromakalim. Adjust dose. Moderate

Erythromycin potentially increases the risk of toxicity when given with clonazepam. Severe Anecdotal

Clarithromycin is predicted to markedly increase the exposure to coformycin. Avoid or monitor. Severe

Azithromycin is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. Severe

Clarithromycin is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose. Severe

Erythromycin is predicted to increase the exposure to corticosteroids (beclomethasone) (risk with beclomethasone is likely to be lower than with other corticosteroids). Moderate

Clarithromycin is predicted to increase the exposure to corticosteroids (budesonide, ciclesonide, deflazacort, dexamethasone, fludrocortisone, fluticasone, hydrocortisone, methylprednisolone, mometasone, prednisolone, triamcinolone). Avoid or monitor side effects.

Clarithromycin is predicted to increase the exposure to prednisolone. Monitor and adjust dose. Moderate

Erythromycin is predicted to moderately increase the exposure to cortisol (hydrocortisone). Severe

Clarithromycin is predicted to moderately increase the exposure to cortisone. Avoid or adjust dose—consult product literature. Moderate

Clarithromycin is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. Moderate

Erythromycin is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. Moderate

Macrolides (erythromycin, clarithromycin) increase the anticoagulant effect of coumarin. Monitor INR and adjust dose. Severe Anecdotal

Clarithromycin is predicted to moderately increase the exposure to crizotinib. Avoid. Moderate Study → Also see TABLE 9 p. 1377

Macrolides are predicted to increase the exposure to dabigatran. Moderate Theoretical

Clarithromycin is predicted to increase the exposure to dabrafenib. Use with caution or avoid. Moderate

Clarithromycin is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. Study

Erythromycin is predicted to slightly increase the exposure to darifenacin. Moderate

Clarithromycin is predicted to markedly increase the exposure to dasatinib. Avoid or adjust dose—consult product literature. Study → Also see TABLE 9 p. 1377

Erythromycin is predicted to increase the exposure to dasatinib. Severe Study → Also see TABLE 9 p. 1377

Clarithromycin very slightly increases the exposure to delamamine. Severe Study → Also see TABLE 9 p. 1377

Macrolides increase the concentration of digoxin. Severe

Macrolides (clarithromycin, erythromycin) increase the risk of QT-prolongation when given with domperidone. Avoid. Severe

Clarithromycin increases the exposure to dopamine receptor agonists (bromocriptine). Severe

Erythromycin is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). Severe

Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of dopamine receptor agonists (cabergoline). Avoid. Severe

Clarithromycin is predicted to increase the exposure to doravirine. Midi Study

Clarithromycin is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. Moderate

Erythromycin is predicted to moderately increase the exposure to dutasteride. Midi

Erythromycin slightly increases the exposure to edoxaban. Adjust edoxaban dose. Midi

Macrolides (azithromycin, clarithromycin) are predicted to slightly increase the exposure to edoxaban. Severe

Efavirenz decreases the exposure to clarithromycin. Moderate

Clarithromycin is predicted to markedly increase the exposure to elatinan. Avoid. Study

Erythromycin moderately increases the exposure to elatinan. Avoid. Moderate Study

Clarithromycin is predicted to increase the exposure to enzalutam. Avoid or monitor. Severe Study → Also see TABLE 9 p. 1377

Clarithromycin is predicted to moderately increase the exposure to enzalutam. Avoid or monitor. Moderate Study → Also see TABLE 9 p. 1377

Clarithromycin is predicted to increase the risk of ergotism when given with ergometrine. Avoid. Severe

Erythromycin is predicted to increase the risk of ergotism when given with ergometrine. Severe

Clarithromycin is predicted to increase the risk of ergotism when given with ergotamine. Avoid. Severe

Erythromycin is predicted to increase the risk of ergotism when given with ergotamine. Severe

Erythromycin is predicted to slightly increase the exposure to ergotamine. Use with caution and adjust dose. Moderate

Clarithromycin is predicted to increase the exposure to erlotinib. Avoid or monitor. Severe Study → Also see TABLE 9 p. 1377

Clarithromycin is predicted to moderately increase the exposure to erlotinib. Avoid or monitor. Severe Study

Clarithromycin is predicted to increase the exposure to erlotinib. Avoid or monitor. Severe Study

Clarithromycin is predicted to moderately increase the exposure to erlotinib. Avoid or monitor. Severe Study

Clarithromycin is predicted to increase the exposure to erlotinib. Avoid or monitor. Severe Study

Etravirine decreases the exposure to clarithromycin and clarithromycin slightly increases the exposure to etravirine. Severe

Clarithromycin is predicted to increase the concentration of everolimus. Avoid. Severe

Erythromycin is predicted to increase the concentration of everolimus. Avoid or adjust dose. Moderate

Clarithromycin is predicted to moderately increase the exposure to fosaprepitant. Avoid. Moderate

Clarithromycin is predicted to increase the exposure to gefitinib. Moderate

Clarithromycin is predicted to increase the exposure to gefitinib. Moderate

Erythromycin is predicted to increase the exposure to gefitinib. Moderate

 BN 78

Macrolides – Macrolides 1485
Macrolides (continued)

- Clarithromycin is predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [Severe] Study
- Clarithromycin is predicted to increase the exposure to **guanfacine**. Adjust guanfacine dose, p. 352. [Moderate] Study
- Erythromycin is predicted to increase the concentration of **guanfacine**. Adjust guanfacine dose, p. 352. [Moderate] Theoretical
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to **erythromycin**. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, tipranavir) are predicted to increase the exposure to clarithromycin. Adjust dose in renal impairment. [Severe] Study
- HIV-protease inhibitors (ritonavir) increase the exposure to clarithromycin. Adjust dose in renal impairment. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, tipranavir) are predicted to increase the exposure to clarithromycin. [Severe] Study
- Clarithromycin is predicted to increase the exposure to HIV-protease inhibitors (saquinavir) and HIV-protease inhibitors (saquinavir) increase the exposure to clarithromycin. Avoid. [Severe] Study ⇒ Also see TABLE 9 p. 1377
- Erythromycin is predicted to increase the exposure to HIV-protease inhibitors (saquinavir). Avoid. [Severe] Theoretical ⇒ Also see TABLE 9 p. 1377
- Clarithromycin is predicted to very markedly increase the exposure to **ibrutinib**. Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to **ibrutinib**. Adjust ibrutinib dose, p. 983. [Severe] Study
- Clarithromycin is predicted to increase the exposure to **ivabradine**. Adjust ibrutinib dose with moderate inhibitors of CYP3A4. **Severe** Study
- Clarithromycin is predicted to increase the exposure to **imatinib**. [Moderate] Theoretical
- Clarithromycin is predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to **ivabradine**. Adjust ibrutinib dose with moderate inhibitors of CYP3A4 or adjust ibrutinib dose, p. 983. [Severe] Study
- Clarithromycin is predicted to increase the exposure to **ivacaftor**. Adjust ivacaftor, p. 293 or lumacaftor with ivacaftor p. 294 or tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. **Severe** Study
- Erythromycin is predicted to increase the exposure to ivacaftor. Adjust ivacaftor, p. 293 or tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. [Severe] Study
- Clarithromycin is predicted to increase the exposure to **lapiatinib**. Avoid. [Moderate] Study ⇒ Also see TABLE 9 p. 1377
- Erythromycin is predicted to increase the exposure to **lapiatinib**. Avoid. [Moderate] Study
- Clarithromycin is predicted to increase the concentration of **lertromivir**. [Moderate] Study
- Clarithromycin increases the exposure to **linezolid**. [Moderate] Aneodal
- Azithromycin is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical
- Clarithromycin is predicted to markedly increase the exposure to **lomitapide**. Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical
- Lumacaftor is predicted to decrease the exposure to macrolides (clarithromycin, erythromycin). [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to **lurasidone**. Adjust lurasidone dose, p. 398. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to **macitentan**. [Moderate] Study
- Clarithromycin is predicted to markedly increase the exposure to **maraviroc**. Adjust dose. [Severe] Study
- Clarithromycin is predicted to markedly to very markedly increase the exposure to **midazolam**. Avoid or adjust dose. [Severe] Study
- Erythromycin is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. [Severe] Study
- Clarithromycin is predicted to very markedly increase the exposure to **midostaurin**. Avoid or monitor for toxicity. [Severe] Study
- Clarithromycin is predicted to increase the exposure to midostaurin. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to **mirabegron**. Adjust mirabegron dose in hepatic and renal impairment, p. 781. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to **mirzapapine**. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to monolocular antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical
- Clarithromycin is predicted to markedly increase the exposure to **naloxegol**. Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to **netupitant**. [Moderate] Study
- Nevirapine decreases the exposure to clarithromycin. [Moderate] Study
- Clarithromycin is predicted to moderately increase the exposure to **nilotinib**. Avoid. [Severe] Study ⇒ Also see TABLE 9 p. 1377
- Erythromycin is predicted to increase the exposure to nilotinib. [Moderate] Theoretical ⇒ Also see TABLE 9 p. 1377
- Clarithromycin is predicted to markedly increase the exposure to **nintedanib**. [Moderate] Study
- Erythromycin and **mirabegron** are predicted to increase the exposure to **nitidine**. [Moderate] Study
- Macrolides are predicted to increase the exposure to **nitidine**. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to **nitisinone**. Adjust dose. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to **olaparib**. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. [Moderate] Study
- Erythromycin is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. [Moderate] Theoretical
- Erythromycin is predicted to increase the exposure to opioids (alpetan, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to opioids (alpetan, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study
- Clarithromycin is predicted to increase the concentration of opioids (methadone). [Severe] Theoretical ⇒ Also see TABLE 9 p. 1377
- Erythromycin is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical ⇒ Also see TABLE 9 p. 1377
- Clarithromycin is predicted to increase the exposure to **esopenine**. Avoid in poor CYP2C9 metabolisers. [Moderate] Study
- Clarithromycin is predicted to markedly increase the exposure to **oxybutynin**. [High] Study
- Erythromycin is predicted to increase the exposure to oxybutynin. [High] Theoretical
- Clarithromycin is predicted to increase the exposure to **palbociclib**. Avoid or adjust palbociclib dose, p. 992. [Severe] Study
- Clarithromycin is predicted to increase the exposure to **panobinostat**. Adjust panobinostat dose; in hepatic
Macrolides

Erythromycin

Clarithromycin

Macrolides

impairment avoid, p. 936. [Moderate] Study → Also see TABLE 9 p. 1377

▶ Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see TABLE 9 p. 1377

▶ Clarithromycin is predicted to increase the exposure to paritaprevir. Avoid. [Severe] Study

▶ Erythromycin is predicted to increase the exposure to paritaprevir. [Moderate] Theoretical

▶ Clarithromycin is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 993. [Moderate] Study → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to increase the exposure to pazopanib. [Moderate] Theoretical → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avananfl). Adjust avananfl dose, p. 812. [Moderate] Theoretical

▶ Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avananfl, vardenafili). Avoid. [Severe] Study → Also see TABLE 9 p. 1377

▶ Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avananfl, sildenafil). Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 813. [Severe] Study → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avananfl, tadalafil). Monitor or adjust tadalafil dose with moderate inhibitors of CYP3A4, p. 813. [Moderate] Study → Also see TABLE 9 p. 1377

▶ Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical

▶ Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical

▶ Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafili). Avoid. [Severe] Study

▶ Erythromycin is predicted to increase the exposure to pibrentasvir. [Moderate] Theoretical

▶ Clarithromycin is predicted to increase the exposure to pimozone. Avoid. [Severe] Study → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to increase the exposure to pimozone. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1377

▶ Clarithromycin is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 994. [Moderate] Study

▶ Clarithromycin is predicted to moderately increase the exposure to praziquantel. [Mild] Study

▶ Clarithromycin is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study

▶ Erythromycin is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study

▶ Clarithromycin is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 1377

▶ Clarithromycin is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study

▶ Clarithromycin is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study

▶ Clarithromycin is predicted to increase the exposure to repaglinide. [Moderate] Study

▶ Clarithromycin is predicted to increase the exposure to retinoids (altretinoin). Adjust altretinoin dose, p. 1262. [Moderate] Theoretical

▶ Clarithromycin is predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 997. [Moderate] Study → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to increase the exposure to ribociclib. [Moderate] Study → Also see TABLE 9 p. 1377

▶ Azithromycin increases the risk of neutropenia when given with rifabutin. [Severe] Study

▶ Clarithromycin increases the risk of uveitis when given with rifabutin. Adjust dose. [Severe] Study

▶ Erythromycin is predicted to increase the risk of uveitis when given with rifabutin. Adjust dose. [Severe] Theoretical

▶ Rifampicin decreases the concentration of clarithromycin. [Severe] Study

▶ Clarithromycin is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1377

▶ Clarithromycin is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study

▶ Erythromycin is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical

▶ Clarithromycin is predicted to increase the exposure to saxagliptin. [Moderate] Study

▶ Erythromycin is predicted to increase the exposure to saxagliptin. [Mild] Study

▶ Clarithromycin is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

▶ Clarithromycin increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

▶ Clarithromycin is predicted to moderately increase the exposure to SSRIs (dapsone). Avoid potent inhibitors of CYP3A4 or adjust dapsone dose, p. 821. [Severe] Study

▶ Erythromycin is predicted to increase the exposure to SSRIs (dapsone). Adjust dapsone dose with moderate inhibitors of CYP3A4, p. 821. [Moderate] Theoretical

▶ Clarithromycin is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor (rhabdomyolysis, [Severe] Study

▶ Erythromycin is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Study

▶ Clarithromycin moderately increases the exposure to statins (pravastatin). [Severe] Study

▶ Erythromycin is predicted to increase the exposure to statins (pravastatin). [Severe] Study

▶ Clarithromycin is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study

▶ Erythromycin is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 205. [Severe] Study

▶ Clarithromycin is predicted to slightly increase the exposure to sulfonylureas. [Moderate] Theoretical

▶ Clarithromycin is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. [Moderate] Study → Also see TABLE 9 p. 1377

▶ Erythromycin is predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 9 p. 1377

▶ Clarithromycin is predicted to increase the exposure to sunitinib. [Severe] Theoretical

▶ Clarithromycin is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study

▶ Erythromycin is predicted to increase the concentration of tacrolimus. [Severe] Study

▶ Clarithromycin is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study

▶ Erythromycin is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical

▶ Clarithromycin is predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study

▶ Clarithromycin is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical

▶ Clarithromycin is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

▶ Erythromycin is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

▶ Clarithromycin is predicted to increase the exposure to tezacafor. Adjust tezacafor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. [Severe] Study

▶ Erythromycin is predicted to increase the exposure to tezacafor. Adjust tezacafor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. [Severe] Study

▶ Erythromycin decreases the clearance of theophylline and theophylline potentially decreases the clearance of erthyromycin. Adjust dose. [Severe] Study
Macrolides (continued)

- Macrolides (azithromycin, clarithromycin) are predicted to increase the exposure to theophylline. Adjust dose. (Moderate Anecdotal)
- Azithromycin is predicted to increase the exposure to ticagrelor. Use with caution or avoid. (Severe Study)
- Clarithromycin is predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe Study)
- Clarithromycin is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose. p. 105. (Moderate Study)
- Erythromycin given with a potent CYP3A4 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate Study)
- Clarithromycin is predicted to increase the exposure to tolerodine. Avoid. (Severe Study) → Also see TABLE 9 p. 1377
- Erythromycin is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with high inhibitors of CYP3A4, p. 669. (Severe Study)
- Erythromycin is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4, p. 669. (Moderate Study)
- Macrolides are predicted to increase the exposure to topotecan. (Severe Study)
- Clarithromycin is predicted to increase the exposure to toremifene. (Moderate) Theoretical → Also see TABLE 9 p. 1377
- Clarithromycin is predicted to increase the exposure to troleandomycin. Avoid or adjust dose. (Severe Theoretical)
- Macrolides are predicted to increase the concentration of trametinib. (Theoretical Methodological)
- Clarithromycin is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. (Severe Study)
- Erythromycin is predicted to increase the exposure to trazodone. (Severe) Theoretical
- Clarithromycin is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe Study)
- Erythromycin is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate Study)
- Clarithromycin is predicted to increase the exposure to vemurafenib. (Severe) Theoretical → Also see TABLE 9 p. 1377
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Moderate Study)
- Clarithromycin is predicted to increase the exposure to venlafaxine. (Moderate Study) → Also see TABLE 9 p. 1377
- Clarithromycin is predicted to increase the exposure to venlafaxine. (Moderate) Study → Also see TABLE 9 p. 1377
- Clarithromycin is predicted to increase the exposure to vitamin D substances (paricalcitol). (Moderate Study)
- Clarithromycin decreases the absorption of zidovudine. Separate administration by at least 2 hours. (Moderate Study)
- Clarithromycin is predicted to increase the exposure to zopiclone. Adjust dose. (Moderate Theoretical)
- Erythromycin is predicted to increase the exposure to zopiclone. Adjust dose. (Moderate Study)

- Magnesium
  - Oral magnesium decreases the absorption of bisphosphonates (alendronic acid). Alendronic acid should be taken at least 30 minutes before magnesium. (Moderate Study)
  - Oral magnesium is predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid magnesium for at least 6 hours before or 1 hour after ibandronic acid. (Moderate Theoretical)
  - Oral magnesium decreases the absorption of bisphosphonates (risendronate). Separate administration by at least 2 hours. (Moderate Study)
  - Oral magnesium decreases the absorption of bisphosphonates (sodium clodronate). Avoid magnesium for 2 hours before or 1 hour after sodium clodronate. (Moderate Study)
  - Intravenous magnesium potentially increases the risk of hypotension when given with calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil) (in pregnant women). (Severe) Anecdotal
  - Intravenous magnesium increases the effects of neuromuscular blocking drugs, non-depolarising. (Moderate Study)
  - Intravenous magnesium is predicted to increase the effects of suxamethonium. (Moderate Study)
  - Magnesium carbonate → see antacids
  - Magnesium trisilicate → see antacids

- Maraviroc
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to maraviroc. Adjust dose. (Severe Study)
  - Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to maraviroc. Adjust dose. (Severe Study)
  - Apalutamide is predicted to decrease the exposure to maraviroc. Avoid. (Moderate Study)
  - Aprepitant is predicted to increase the exposure to maraviroc. (Moderate Study)
  - Bosentan is predicted to decrease the exposure to maraviroc. Adjust dose. (Severe Study)
  - Bicalutamide is predicted to decrease the exposure to maraviroc. (Severe Study)
  - Cobicistat markedly increases the exposure to maraviroc. Refer to specialist literature. (Severe Study)
  - Efavirenz decreases the exposure to maraviroc. Refer to specialist literature. (Severe) Theoretical
  - Enalaprilat is predicted to decrease the exposure to maraviroc. Adjust dose. (Severe Study)
  - Etravirine (with a boosted protease inhibitor) increases the exposure to maraviroc. Avoid or adjust dose. (Moderate Study)
  - HIV-protease inhibitors (atazanavir, saquinavir) moderately to markedly increase the exposure to maraviroc. Refer to specialist literature. (Severe Study)
  - HIV-protease inhibitors (darunavir boosted with ritonavir) markedly increase the exposure to maraviroc. Refer to specialist literature. (Severe Study)
  - HIV-protease inhibitors (lopinavir boosted with ritonavir) moderately increase the exposure to maraviroc. Refer to specialist literature. (Severe Study)
  - HIV-protease inhibitors (ritonavir) markedly increase the exposure to maraviroc. Refer to specialist literature. (Severe Study)
  - Maraviroc potentially decreases the exposure to HIV-protease inhibitors (fosamprenavir) and HIV-protease inhibitors (fosamprenavir) potentially decrease the exposure to maraviroc. Avoid. (Severe) Study
  - Idealisib markedly increases the exposure to maraviroc. Adjust dose. (Severe Theoretical)
  - Macrolides (clarithromycin) are predicted to markedly increase the exposure to maraviroc. Adjust dose. (Severe) Study
  - Mitotane is predicted to decrease the exposure to maraviroc. Adjust dose. (Severe Study)
  - Netupitant is predicted to increase the exposure to maraviroc. (Moderate Study)
  - Rifampicin is predicted to decrease the exposure to maraviroc. Adjust dose. (Severe Study)
  - St John’s Wort is predicted to decrease the exposure to maraviroc. Avoid. (Severe Theoretical)

- Measles, mumps and rubella vaccine, live → see live vaccines
- Mefenamic acid → see NSAIDs
- Mefloquine → see antimalarials
- Melatonin → see TABLE 11 p. 1377 (CN5 depressant effects)
  - Antiepileptics (phenytoin) are predicted to decrease the exposure to melatonin. (Moderate Theoretical)
  - Combined hormonal contraceptives are predicted to increase the exposure to melatonin. (Moderate) Theoretical
  - HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to melatonin. (Moderate) Theoretical

> **Methadone** → see opioids
Methotrexate (continued)

- Teriflunomide is predicted to increase the exposure to methotrexate. [Moderate] Study
- Methotrexate decreases the clearance of theophylline. [Moderate] Study
- Trimethoprim is predicted to increase the risk of side-effects when given with methotrexate. Avoid. [Severe] Theoretical → Also see TABLE 2 p. 1375

Methoxyflurane → see volatile halogenated anaesthetics
Methyleneblue → see TABLE 8 p. 1376 (hyperpension)
Entacapone is predicted to increase the exposure to methyleneblue. [Moderate] Theoretical
Iron (oral) decreases the effects of methyleneblue. [Moderate] Study
Methyldopa is predicted to increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal
Monoamine-oxidase A and B inhibitors, irreversible are predicted to alter the antihypertensive effects of methyleneblue. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1376

Methylphenidate
- Methylphenidate is predicted to decrease the effects of apراقlonidine. Avoid. [Severe] Theoretical
- Methylphenidate is predicted to increase the risk of elevated blood pressure when given with finеzolоid. Avoid. [Severe] Theoretical
- Methylphenidate is predicted to increase the risk of a hypertensive crisis when given with moclobemide. [Severe] Theoretical
- Methylphenidate is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- Monoamine-oxidase B inhibitors (расагилин, selegilinе) are predicted to increase the risk of a hypertensive crisis when given with methylphenidate. Avoid. [Severe] Theoretical
- Methylphenidate increases the risk of dyskinesias when given with paliperidоn. [Severe] Theoretical
- Рisperidоnе increases the risk of dyskinesias when given with methylphenidate. [Severe] Anecdotal
Methylпrednisолоnе → see corticosteroids
Methyliпhонium chloride → see TABLE 13 p. 1378 (serotonin syndrome)
- Methyliпhоnium chloride is predicted to increase the risk of severe hypertension when given with бропиопоn. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1378

Metoclopamidе
- Metoclopamidе is predicted to increase the risk of methaemoglobinemia when given with topical anаesthetic, local (прилокаине). Avoid. [Severe] Theoretical
- Metoclopamidе potentially decreases the absorption of antifungаls, azoles (posасозолеnе) (oral suspension). [Moderate] Study
- Metoclopamidе decreases the concentration of antimalarials (атоваquоне). Avoid. [Moderate] Study
- Metoclopamidе is predicted to decrease the effects of dopamine receptor agonists (апорономine, bromocriptine, cabergолине, pergolоdе, pramipеxоlе, ropinitоlе, roгitоlinе). Avoid. [Moderate] Study
- Metoclopamidе decreases the effects of levодоpа. Avoid. [Moderate] Study
- Metoclopamidе is predicted to increase the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical
- Metoclopamidе increases the effects of суxаметониум. [Moderate] Study
- Metopazоnе → see thiaide diuretics
- Metoprolоl → see β blockers, selective
- Metronidazole → see TABLE 12 p. 1378 (peripheral neuropathy)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Alcohol (beverage) potentially causes a disulfiram-like reaction when given with metronidazole. Avoid for at least 48 hours stopping treatment. [Moderate] Study
- Metronidazole increases the risk of toxicity when given with alkylating agents (busulfan). [Severe] Study
- Antiepileptics (phenobarbital, primidоnе) are predicted to decrease the exposure to метронидазоlе. [Moderate] Study
- Metronidazole is predicted to increase the risk of capetеcitabine toxicity when given with capetеcitabine. [Severe] Theoretical
- Metronidazole increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate] Study
- Disуlфiram increases the risk of acute psychoses when given with metronidazole. [Severe] Study → Also see TABLE 12 p. 1378
- Metronidazole increases the risk of toxicity when given with fluorоuracil. [Severe] Study

Метyroпаnе
- Antiepileptics (фосфоnеtоn, phenobarbital, phenytoin, primidoне) are predicted to decrease the effects of metyroпаnе. Avoid. [Moderate] Study
- Antihistamines, sedating (cypроheptаdine) decrease the effects of metyroпаnе. Avoid. [Moderate] Theoretical
- Carbimazоlе decreases the effects of metyroпаnе. Avoid. [Moderate] Theoretical
- Combined hormonal contraceptives decrease the effects of metyroпаnе. Avoid. [Moderate] Study
- Phenothiazines (chlorопроmазине) decrease the effects of metyroпаnе. Avoid. [Moderate] Theoretical
- Propylthiоurаcil is predicted to decrease the effects of metyroпаnе. Avoid. [Moderate] Theoretical
- Tricyclic antidepressants (amитрiptилине) decrease the effects of метрошеnеpаnе. Avoid. [Moderate] Theoretical

Мексилеnе

FOOD AND LIFESTYLE Dose adjustment might be necessary if smoking started or stopped during treatment.
- Mексилеnе is predicted to increase the exposure to agомелатине. [Moderate] Study
- Мексилеnе is predicted to increase the exposure to амитрiptилине. Adjust dose. [Moderate] Theoretical
- Мексилеnе is predicted to increase the exposure to anагрелиде. [Moderate] Theoretical
- Мексилеnе increases the risk of torsade de pointsеnеs when given with аntiarhythmics. Avoid. [Severe] Theoretical
- Antiepileptics (phenytoin) are predicted to increase the clearance of mexilenе. Monitor and adjust dose. [Moderate] Study
- Мексилеnе potentially increases the risk of cardiovascular side-effects when given with β blockers, non-selective. Avoid or monitor. [Severe] Theoretical
- Мексилеnе potentially increases the risk of cardiovascular side-effects when given with β blockers, selective. Avoid or monitor. [Severe] Theoretical
- Бропиопоn is predicted to increase the exposure to mексилеnе. [Moderate] Study
- Мексилеnе increases the risk of cardiovascular side-effects when given with calcium channel blockers (dilitаzеm). Avoid or monitor. [Severe] Theoretical
- Мексилеnе potentially increases the risk of cardiovascular side-effects when given with calcium channel blockers (verаnамиl). Avoid or monitor. [Severe] Theoretical
- Cinаcаlеt is predicted to increase the exposure to mексилеnе. [Moderate] Study
- Мексилеnе increases the concentration of clozаpine. Monitor side effects and adjust dose. [Moderate] Study
- Cobicistаt potentially increases the exposure to mексилеnе. [Severe] Theoretical
- Мексилеnе potentially affects the exposure to coumarins (warfarin). Avoid. [Unknown] Theoretical
- Мексилеnе is predicted to increase the exposure to dopamine receptor agonists (ropinirolе). Adjust dose. [Moderate] Study
- Мексилеnе slightly increases the exposure to etrorитinib. Monitor side effects and adjust dose. [Moderate] Study
- HIV-protease inhibitors (ритонавиr) are predicted to increase the clearance of mексилеnе. Monitor and adjust dose. [Moderate] Study
- Лефлуноде is predicted to increase the clearance of mexilenе. Monitor and adjust dose. [Moderate] Study
- Мексилеnе potentially affects the exposure to lithium. Avoid. [Unknown] Theoretical
- Мексилеnе is predicted to increase the exposure to lоxаpine. Avoid. [Unknown] Theoretical

www.getintopharma.com
Mexiteline is predicted to increase the exposure to melatonin. (Moderate) Theoretical

Mexiteline is predicted to affect the exposure to metformin. (Unknown) Theoretical

Mexiteline slightly increases the exposure to monoamine-oxidase B inhibitors (rasagline). (Moderate) Study

Mexiteline is predicted to increase the exposure to olanzapine. Adjust dose. (Moderate) Anecdotal

Opioids potentially decrease the absorption of oral mexiteline. (Moderate) Study

Mexiteline is predicted to increase the exposure to pirenidone. Use with caution and adjust dose. (Moderate) Study

Rifampicin is predicted to increase the clearance of mexiteline. Monitor and adjust dose. (Moderate) Study

Mexiteline is predicted to increase the exposure to riluzole. (Moderate) Theoretical

Mexiteline is predicted to increase the exposure to romifidine. (Moderate) Theoretical

SSRIs (fluoxetine, fluvoxamine, paroxetine) are predicted to increase the exposure to mexiteline. (Moderate) Study

Terbinafine is predicted to increase the exposure to mexiteline. (Moderate) Study

Terflunomide is predicted to increase the clearance of mexiteline. Monitor and adjust dose. (Moderate) Study

Mexiteline is predicted to increase the exposure to theophylline. Monitor and adjust dose. (Moderate) Theoretical

Mexiteline increases the exposure to tizanidine. Avoid. (Moderate) Study

Mexiteline is predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. (Moderate) Theoretical

Mianserin → see TABLE 13 p. 1378 (serotonin syndrome, TABLE 11 p. 1377 (CNS depressant effects)

Antiepileptics (carbamazepine) markedly decrease the exposure to mianserin. Adjust dose. (Moderate) Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to mianserin. (Moderate) Study → Also see TABLE 11 p. 1377

Mianserin is predicted to increase the risk of toxicity when given with moclobemide. Avoid and for 1 week after stopping mianserin. (Search) Theoretical → Also see TABLE 13 p. 1378

Mianserin is predicted to increase the risk of toxicity when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. (Search) Theoretical. → Also see TABLE 13 p. 1378

Mianserin is predicted to decrease the efficacy of pitolisant. (Search) Theoretical

Mianserin decreases the effects of sympatheaminetics, vasoconstrictor (ephedrine). (Search) Anecdotal

Micafungin → see TABLE 13 p. 1375 (hepatotoxicity)

Micafungin slightly increases the exposure to amphotericin. Avoid or monitor toxicity. (Search) Study

Miconazole → see antifungals, azoles

Midazolam → see TABLE 11 p. 1377 (CNS depressant effects)

Antiepileptics (dronedarone) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Search) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Search) Study → Also see TABLE 11 p. 1377

Antifungals, azoles (flucnazole, itraconazole, posaconazole, voriconazole) are predicted to increase the exposure to midazolam. Avoid or adjust dose. (Search) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. (Search) Study

Antifungals, azoles (miconazole) are predicted to increase the exposure to intravenous midazolam. Use with caution and adjust dose. (Search) Theoretical

Antifungals, azoles (miconazole) are predicted to increase the exposure to oral midazolam. Avoid. (Search) Theoretical

Apalutamide markedly decreases the exposure to midazolam. Avoid or monitor. (Search) Study

Aprepitant is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Search) Study

Boventan is predicted to decrease the concentration of midazolam. Monitor and adjust dose. (Search) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Search) Study

Cobicistat is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. (Search) Study

Crizotinib is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Search) Study

Dabrafenib decreases the exposure to midazolam. Monitor and adjust dose. (Search) Study

Eflavirenz is predicted to alter the effects of midazolam. Avoid. (Search) Theoretical

Enzalutamide is predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Search) Study

Fosaprepitant slightly increases the exposure to midazolam. (Search) Study

IV-protase inhibitors are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. (Search) Study

Idelalisib is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. (Search) Study

Imatinib is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Search) Study

Leteimovir slightly to moderately increases the exposure to midazolam. Monitor and adjust dose. (Search) Study

Lumacaftor is predicted to decrease the exposure to midazolam. Avoid. (Search) Theoretical

Macrolides (clarithromycin) are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust dose. (Search) Study

Macrolides (erythromycin) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Search) Study

Mexiletine is predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Search) Study

Midostaurin is predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Search) Study

Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Search) Theoretical

Netupitant is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Search) Study

Nevirapine decreases the concentration of midazolam. Monitor and adjust dose. (Search) Study

Nilotinib is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Search) Study

Palbociclib increases the exposure to midazolam. (Search) Study

Ribociclib moderately increases the exposure to midazolam. Avoid. (Search) Study

Rifampicin is predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Search) Study

Rucaparib slightly increases the exposure to midazolam. Monitor and adjust dose. (Search) Study

St John’s Wort moderately decreases the exposure to midazolam. Monitor and adjust dose. (Search) Study

Telotristat ethyl decreases the exposure to midazolam. (Search) Study

Midodrine → see sympathominetics, vasoconstrictor

Midostaurin

Antiarrhythmics (dronedarone) are predicted to increase the exposure to midostaurin. (Search) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midostaurin. Avoid. (Search) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to midostaurin. Avoid or monitor for toxicity. (Search) Theoretical

Aprepitant is predicted to increase the exposure to midostaurin. (Search) Theoretical
1492 Midostaurin — Mitotane

BNF 78

Midostaurin (continued)
▶ Calcium channel blockers (diltiazem, verapamil) are predicted to
increase the exposure to midostaurin. o Theoretical
▶ Cobicistat is predicted to very markedly increase the exposure
to midostaurin. Avoid or monitor for toxicity. r Study
▶ Crizotinib is predicted to increase the exposure to midostaurin.

▶
▶
▶

o Theoretical
▶
▶

Enzalutamide is predicted to decrease the exposure to
midostaurin. Avoid. r Study
HIV-protease inhibitors are predicted to very markedly increase
the exposure to midostaurin. Avoid or monitor for toxicity.

▶

Theoretical

Minocycline → see tetracyclines
Minoxidil → see TABLE 8 p. 1376 (hypotension)
ROUTE-SPECIFIC INFORMATION Since systemic absorption can
follow topical application, the possibility of interactions
should be borne in mind.
Mirabegron
▶ Mirabegron is predicted to increase the exposure to aliskiren.
n Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
predicted to increase the exposure to mirabegron. Adjust
mirabegron dose in hepatic and renal impairment, p. 781.
o Study

▶
▶

Mirabegron is predicted to increase the exposure to
antihistamines, non-sedating (fexofenadine). n Theoretical
Mirabegron is predicted to increase the exposure to beta
blockers, selective (metoprolol). o Study
Cobicistat is predicted to increase the exposure to mirabegron.
Adjust mirabegron dose in hepatic and renal impairment,
p. 781. o Study

▶

Mirabegron is predicted to increase the exposure to colchicine.
n Theoretical

▶
▶
▶

Mirabegron is predicted to increase the exposure to
dabigatran. r Theoretical
Mirabegron slightly increases the exposure to digoxin. Monitor
concentration and adjust dose. r Study
Mirabegron is predicted to increase the exposure to edoxaban.
n Theoretical

Mirabegron is predicted to increase the exposure to taxanes
(paclitaxel). n Theoretical
Mirabegron is predicted to increase the exposure to topotecan.
n Theoretical

Mirtazapine → see TABLE 13 p. 1378 (serotonin syndrome), TABLE 11
p. 1377 (CNS depressant effects)
▶

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to mirtazapine. Adjust dose. o Study → Also see TABLE 11
p. 1377

Rifampicin is predicted to decrease the exposure to
midostaurin. Avoid. r Study
▶ St John’s Wort is predicted to decrease the exposure to
midostaurin. Avoid. r Theoretical
Mifamurtide
▶ Ciclosporin is predicted to decrease the efﬁcacy of
mifamurtide. Avoid. r Theoretical
▶ Corticosteroids are predicted to decrease the efﬁcacy of
mifamurtide. Avoid. r Theoretical
▶ NSAIDs (high-dose) are predicted to decrease the efﬁcacy of
mifamurtide. Avoid. r Theoretical
▶ Pimecrolimus is predicted to decrease the efﬁcacy of
mifamurtide. Avoid. r Theoretical
▶ Sirolimus is predicted to decrease the efﬁcacy of mifamurtide.
Avoid. r Theoretical
▶ Tacrolimus is predicted to affect the efﬁcacy of mifamurtide.
Avoid. r Theoretical
Mifepristone
▶ Mifepristone is predicted to decrease the efﬁcacy of
corticosteroids. Use with caution and adjust dose. o

▶

Mirabegron is predicted to increase the exposure to
loperamide. n Theoretical
Macrolides (clarithromycin) are predicted to increase the
exposure to mirabegron. Adjust mirabegron dose in hepatic
and renal impairment, p. 781. o Study
Mirabegron is predicted to increase the exposure to sirolimus.
n Theoretical

Mitotane is predicted to decrease the exposure to antifungals, azoles (inaconazole). Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to antimalarials (artemether) (with lumefantrine). Avoid. [Severe] Study
 Mitotane is predicted to decrease the concentration of antimalarials (piperazine). Avoid. [Moderate] Theoretical
 Mitotane is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. [Severe] Study
 Mitotane moderately decreases the exposure to aripiprazole. Avoid. [Severe] Study
 Mitotane is predicted to markedly decrease the exposure to aripiprazole. Avoid. [Moderate] Study
 Mitotane is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 39. [Moderate] Study
 Mitotane is predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 1378
 Mitotane decreases the exposure to bedaquiline. Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to bicalutamide. Avoid. [Severe] Study → Also see TABLE 15 p. 1378
 Mitotane affects the exposure to bosentan. Avoid. [Severe] Study
 Mitotane is predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study → Also see TABLE 15 p. 1378
 Mitotane is predicted to decrease the exposure to brigatinib. Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. [Severe] Study
 Mitotane moderately decreases the exposure to cabozantinib. Avoid. [Severe] Study → Also see TABLE 15 p. 1378
 Mitotane is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine). Monitor and adjust dose. [Moderate]
 Mitotane is predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical
 Mitotane is predicted to decrease the exposure to cariprazine. Avoid. [Severe] Theoretical
 Mitotane is predicted to decrease the exposure to ceritinib. Avoid. [Severe] Study → Also see TABLE 15 p. 1378
 Mitotane decreases the concentration of ciclosporin. [Severe] Study
 Mitotane is predicted to alter the effects of cilostazol. [Moderate] Theoretical
 Mitotane is predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. [Moderate] Study
 Mitotane decreases the exposure to clomethiazole. Monitor and adjust dose. [Moderate] Study
 Mitotane is predicted to decrease the exposure to clomipramine. Monitor and adjust dose. [Moderate] Study
 Mitotane is predicted to decrease the exposure to colchicine. Monitor and adjust dose. [Moderate] Study
 Mitotane is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fluocortolone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. [Moderate] Study
 Mitotane is predicted to decrease the exposure to corticosteroids (fluticasone). [Unknown] Theoretical
 Mitotane is predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study → Also see TABLE 15 p. 1378
 Mitotane is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical → Also see TABLE 15 p. 1378
 Mitotane is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
 Mitotane is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
 Mitotane is predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study → Also see TABLE 15 p. 1378
 Mitotane is predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
 Mitotane decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
 Mitotane is predicted to decrease the exposure to doravirine. Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to elbasvir. Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to eligulstat. Avoid. [Severe] Study
 Mitotane is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
 Mitotane is predicted to decrease the exposure to encorafenib. [Moderate] Theoretical
 Mitotane is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
 Mitotane is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 979. [Severe] Study
 Mitotane is predicted to decrease the exposure to esketamine. Adjust dose. [Moderate] Theoretical
 Mitotane is predicted to decrease the exposure to everolimus. Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 1378
 Mitotane moderately decreases the exposure to exemestane. [Moderate] Study
 Mitotane is predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
 Mitotane is predicted to decrease the exposure to fingolimod. [Moderate] Study
 Mitotane is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
 Mitotane is predicted to decrease the exposure to gefitinib. Avoid. [Moderate] Study → Also see TABLE 15 p. 1378
 Mitotane is predicted to greatly decrease the concentration of glecaprevir. Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
 Mitotane is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 352. [Moderate] Study
 Mitotane decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
 Mitotane is predicted to decrease the exposure to ibrutinib. Avoid or adjust ibrutinib dose, p. 983. [Severe] Study → Also see TABLE 15 p. 1378
 Mitotane is predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study → Also see TABLE 15 p. 1378
 Mitotane is predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study → Also see TABLE 15 p. 1378
 Mitotane is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study → Also see TABLE 15 p. 1378
 Mitotane is predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical
 Mitotane is predicted to moderately to markedly decrease the exposure to ivacaftor. Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to ixazomib. Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to linagliptin. [Moderate] Study
 Mitotane is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. [Moderate] Theoretical
 Mitotane is predicted to decrease the exposure to lurasiadone. Avoid. [Moderate] Study
 Mitotane is predicted to decrease the exposure to macitentan. Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study
 Mitotane is predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
 Mitotane is predicted to decrease the exposure to midostaurin. Avoid. [Severe] Study
 Mitotane is predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study
 Mitotane is predicted to decrease the exposure to montelukast. [Mild] Study
Mitotane (continued)

- Mitotane is predicted to markedly decrease the exposure to naloxegol. Avoid. (Moderate) Study
- Mitotane is predicted to slightly decrease the exposure to digoxine. (Blind) Study
- Mitotane is predicted to decrease the exposure to netupitant. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to nevirapine. (Severe) Theoretical
- Mitotane is predicted to moderately decrease the exposure to nitinib. Avoid. (Severe) Study → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to ritinidine. Adjust dose. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to omibatrasib. Avoid. (Severe) Theoretical
- Mitotane is predicted to decrease the exposure to ondasertnon. (Moderate) Study
- Mitotane is predicted to decrease the exposure to opioids (alfentanil, fentanyl). Monitor and adjust dose. (Moderate) Theoretical
- Mitotane decreases the exposure to opioids (methadone). Monitor and adjust dose. (Severe) Study
- Mitotane is predicted to decrease the exposure to oxiseline. Avoid. (Moderate) Study
- Mitotane is predicted to moderately decrease the exposure to osimertinib. Avoid. (Moderate) Study
- Mitotane is predicted to moderately decrease the exposure to pazopanib. Avoid. (Severe) Study → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to palbociclib. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. (Severe) Study
- Mitotane is predicted to decrease the exposure to panobinostat. Avoid. (Moderate) Theoretical → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to paritaprevir (with ritonavir and omibatrasib). Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to pazopanib. Avoid. (Severe) Theoretical → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalaflil). Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to pizolins. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to ponatinib. Avoid. (Moderate) Theoretical
- Mitotane is predicted to moderately decrease the exposure to praziquantel. Avoid. (Moderate) Study
- Mitotane is predicted to decrease the exposure to quetiapine. (Moderate) Study
- Mitotane is predicted to decrease the exposure to ranolazine. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to reboxetine. (Moderate) Aneodotnal
- Mitotane is predicted to decrease the exposure to regorafenib. Avoid. (Moderate) Study → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. (Moderate) Study
- Mitotane is predicted to markedly decrease the exposure to ribociclib. Avoid. (Severe) Study
- Mitotane markedly decreases the exposure to ritipiravine. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to risperidone. Adjust dose. (Moderate) Study
- Mitotane is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. (Severe) Study
- Mitotane is predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study
- Mitotane is predicted to markedly decrease the exposure to rolapitant. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Study → Also see TABLE 15 p. 1378
- Mitotane is predicted to moderately decrease the exposure to saxaglupin. (Moderate) Study
- Mitotane is predicted to decrease the concentration of sirolimus. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to solifenacin. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to sorafenib. (Moderate) Theoretical → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to statins (simvastatin). Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. p. 999. (Moderate) Study → Also see TABLE 15 p. 1378
- Mitotane decreases the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study
- Mitotane is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. (Severe) Study → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to taxanes (docetaxel). (Severe) Theoretical → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Study → Also see TABLE 15 p. 1378
- Mitotane decreases the exposure to tetracyclines (doxycycline). Monitor and adjust dose. (Moderate) Study
- Mitotane is predicted to decrease the exposure to tezacaftor. Avoid. (Severe) Theoretical
- Mitotane is predicted to markedly decrease the exposure to ticagrelor. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to tivozanib. (Severe) Study
- Mitotane is predicted to decrease the exposure to tofacitinib. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to tolvapatan. Use with caution or avoid depending on indication. (Severe) Study
- Mitotane is predicted to decrease the exposure to toremifene. Adjust dose. (Moderate) Study
- Mitotane is predicted to decrease the exposure to trabectedin. Avoid. (Severe) Theoretical → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study
- Mitotane is predicted to moderately decrease the exposure to velpatasavir. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to vemurafenib. Avoid. (Severe) Theoretical
- Mitotane is predicted to decrease the exposure to venetoclax. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindeine). Avoid. (Moderate) Study → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. (Moderate) Theoretical → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to vinca alkaloids (vinorelbine). Use with caution or avoid. (Severe) Theoretical → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the exposure to vismodegib. Avoid. (Moderate) Theoretical → Also see TABLE 15 p. 1378
- Mitotane is predicted to decrease the concentration of vorinostatin. Monitor and adjust dose. (Moderate) Study
- Mitotane is predicted to decrease the concentration of v oralaprevir. Avoid. (Severe) Study
- Mitotane is predicted to decrease the exposure to zopiclone. Adjust dose. (Moderate) Study
- Mitoxantrone → see anthracyclines
- Mivacurium → see neuromuscular blocking drugs, non-depolarising
- Mizolastine → see antihistamines, non-sedating
Moclobemide: Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich foods such as mature cheese, salami, pickled herring, Bovril®, Oxo®️, Marmite®️️ or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines.

- Moclobemide is predicted to increase the risk of a hypertensive crisis when given with amfetamines. Avoid. (Severe) Theoretical
- Amapalutamide is predicted to increase the exposure to moclobemide. Avoid or monitor. (MOD) Study
- Moclobemide is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. (Severe) Theoretical
- Moclobemide is predicted to increase the exposure to clonazepam. Adjust dose. (Moderate) Theoretical
- Moclobemide is predicted to decrease the efficacy of clodipogrel. Avoid. (Moderate) Study
- Moclobemide is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Theoretical
- H₂ receptor antagonists (cimetidine) increase the exposure to moclobemide. Adjust moclobemide dose, p. 362. (MOD) Study
- Levodopa increases the risk of side-effects when given with moclobemide. (Moderate) Study
- Moclobemide is predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping moclobemide. (Severe) Theoretical
- Methylphenidate is predicted to increase the risk of a hypertensive crisis when given with moclobemide. (Severe) Theoretical
- Mianserin is predicted to increase the risk of toxicity when given with moclobemide. Avoid and for 1 week after stopping mianserin. (Severe) Theoretical
- Moclobemide is predicted to increase the effects of monoamine-oxidase B inhibitors (rasagiline, selegiline). Avoid. (Severe) Theoretical
- Moclobemide is predicted to increase the risk of side-effects when given with monoamine-oxidase B inhibitors (safinamide). Avoid and for 1 week after stopping safinamide. (Severe) Theoretical
- Opicapone is predicted to increase the risk of elevated blood pressure when given with moclobemide. Avoid. (Severe) Theoretical
- Moclobemide increases the risk of side-effects when given with phenothiazines (leomepromazine). (Moderate) Study
- Reboxetine is predicted to increase the risk of a hypertensive crisis when given with moclobemide. Avoid. (Severe) Theoretical
- Moclobemide moderately increases the exposure to ritazmethan. Avoid. (Moderate) Study
- Moclobemide moderately increases the exposure to sumatriptan. Avoid. (Moderate) Study
- Moclobemide is predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasconstrictor (ephedrine, isomethephene, phenylephrine, pseudoephedrine). Avoid. (Severe) Study
- Tricyclic antidepressants are predicted to increase the risk of severe toxic reaction when given with moclobemide. Avoid. (Severe) Theoretical
- Moclobemide slightly increases the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. (Moderate) Study
- Modafinil
  - Antiepileptics (carbamazepine, phenobarbital, primidone) are predicted to decrease the exposure to modafinil. (Mild) Theoretical
  - Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to modafinil and modafinil is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to modafinil. (Mild) Theoretical
- Modafinil is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical
- Cobicistat is predicted to increase the exposure to modafinil. Avoid. (Severe) Theoretical
- Modafinil is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Study
- Modafinil is predicted to increase the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical
- Modafinil is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose, p. 644. (Severe) Theoretical
- Modafinil is predicted to decrease the exposure to elbasvir. Avoid. (Unknown) Theoretical
- Modafinil is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical
- Modafinil is predicted to increase the exposure to grazoprevir. Avoid. (Severe) Theoretical
- HIV- protease inhibitors are predicted to increase the exposure to modafinil. (Mild) Theoretical
- Modafinil is predicted to decrease the effects of hormone replacement therapy, (Moderate) Anecdotal
- Idelalisib is predicted to increase the exposure to modafinil. (Mild) Theoretical
- Modafinil is predicted to decrease the concentration of ketorolac. (Moderate) Theoretical
- Modafinil is predicted to decrease the efficacy of levonorogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to modafinil. (Mild) Theoretical
- Modafinil is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal
- Rifampicin is predicted to decrease the exposure to modafinil. (Moderate) Theoretical
- Modafinil is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical
- Modafinil decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal
- Modafinil is predicted to decrease the exposure to velpatasvir. Avoid. (Severe) Theoretical
- Modafinil is predicted to decrease the concentration of voxilaprevir. Avoid. (Severe) Theoretical
- Mometasone: see corticosteroids

Moclobemide — Monoamine-oxidase A and B inhibitors, irreversible

Table 8 p. 1376 (hypotension), Table 13 p. 1378 (serotonin syndrome)

Isocarboxazid - phenelzine - tranylcypromine

Food and Lifestyle

Potentially life-threatening hypertensive crisis can develop in those taking MAOIs who eat tyramine-rich food (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite®️️ or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines). Avoid tyramine-rich or dopa-rich food or drinks with, or for 2 to 3 weeks after stopping, the MAOI.

- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the effects of alpha blockers (indomarin). Avoid. (Severe) Theoretical
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with amfetamines. Avoid and for 14 days after stopping the MAOI. (Severe) Anecdotal
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of severe toxic reaction when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. (Severe) Theoretical
Monoamine-oxidase A and B inhibitors, irreversible (continued)

- **Antiepileptics** *(phenobarbital, primidone)* are predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. **(Severe)** Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of antimuscarinic side-effects when given with *antihistamines, non-sedating*. Avoid. **(Severe)** Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of antimuscarinic side-effects when given with *antihistamines, sedating*. Avoid. **(Severe)** Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of side-effects when given with *Nefopam*. Avoid and for 2 weeks after stopping the MAOI. **(Severe)** Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of cardiovascular side-effects when given with *beta, agonists*. **(Moderate)** Anecdotal
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of severe hypotension when given with *Buspirone*. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical → Also see TABLE 8 p. 1376
- **Entacapone** is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. **(Severe)** Anecdotal → Also see TABLE 13 p. 1378
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the effects of *Doxapram*. **(Moderate)**
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to decrease the antihypertensive effects of *guanethidine*. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical → Also see TABLE 8 p. 1376
- **Levodopa** increases the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. **(Severe)** Study → Also see TABLE 13 p. 1378
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of side-effects when given with *linezolid*. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical → Also see TABLE 8 p. 1376
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to alter the antihypertensive effects of *methyl dopa*. Avoid. **(Severe)** Theoretical → Also see TABLE 8 p. 1376
- **Methylphenidate** is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical
- **Mianserin** is predicted to increase the risk of toxicity when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical → Also see TABLE 13 p. 1378
- **Monoamine-oxidase B inhibitors (rasagline, selegiline)** are predicted to increase the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical → Also see TABLE 8 p. 1376 → Also see TABLE 13 p. 1378
- **Monoamine-oxidase B inhibitors (safinamide)** are predicted to increase the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 1 week after stopping safinamide. **(Severe)** Theoretical → Also see TABLE 13 p. 1378
- **Nefopam** is predicted to increase the risk of serious elevations in blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. **(Severe)** Theoretical
- **Opioids** are predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. **(Severe)** Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of the syndrome when given with *beta, agonists*. **(Severe)** Theoretical → Also see TABLE 13 p. 1378
- **Phenoxybenzamine** is predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. And for 14 days after stopping the MAOI. **(Severe)** Theoretical
- **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. **(Severe)** Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to *rizatriptan*. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical → Also see TABLE 8 p. 1376
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to *sumatriptan*. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of hypertensive crisis when given with *sympathomimetics, inotropic*. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with *sympathomimetics, vasoconstrictor*. Avoid. And for 14 days after stopping the MAOI. **(Severe)** Study
- **Tetrabenazine** is predicted to increase the risk of CNS toxicity when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical
- **Tolcapone** is predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. Avoid. **(Severe)** Theoretical
- **Tricyclic antidepressants** are predicted to increase the risk of severe toxic reaction when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. **(Severe)** Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to *zolmitriptan*. Avoid. **(Severe)** Theoretical
- **Monoamine-oxidase B inhibitors** are predicted to increase the effect of *rasagline, selegiline* (bradycardia), **(Severe)** TABLE 6 p. 1376 (hypotension), **(Severe)** TABLE 13 p. 1378 (serotonin syndrome)

rasagline - selegiline

**FOOD AND LIFESTYLE** Hypertension is predicted to occur when high-dose selegiline is taken with tyramine-rich foods (such as mature cheese, salami, pickled herring, *Bovril®, Oxo®, Marmite®* or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- **Monoamine-oxidase B inhibitors (rasagline, selegiline)** are predicted to increase the risk of severe hypertension when given with *amfetamines*. Avoid. **(Severe)** Theoretical → Also see TABLE 13 p. 1378
- **Safinamide** is predicted to increase the risk of severe hypertension when given with *amfetamines*. **(Severe)** Theoretical → Also see TABLE 13 p. 1378
- **Monoamine-oxidase B inhibitors (rasagline, selegiline)** are predicted to increase the risk of severe hypertension when given with *beta, agonists*. Avoid. **(Severe)** Theoretical
- **Safinamide** is predicted to increase the risk of severe hypertension when given with *beta, agonists*. **(Severe)** Theoretical → Also see TABLE 13 p. 1378
- **Combined hormonal contraceptives slightly increase the exposure to rasagline. **(Moderate)** Study
- **Combined hormonal contraceptives increase the exposure to selegiline. Avoid. **(Severe)** Study
Hormone replacement therapy is predicted to increase the exposure to selegiline. Avoid. [Moderate: Study]

Monoamine-oxidase B inhibitors are predicted to increase the effects of levodopa. Adjust dose. [Mild: Study] → Also see TABLE 8 p. 1376.

Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. [Severe: Theoretical] → Also see TABLE 13 p. 1378.

Safinamide is predicted to increase the risk of side-effects when given with linezolid. Avoid and for 1 week after stopping safinamide. [Severe: Theoretical] → Also see TABLE 13 p. 1378.

Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of a hypertensive crisis when given with methylphenidate. Avoid. [Severe: Theoretical]

Mexiteline slightly increases the exposure to rasagiline. [Moderate: Study]

Moclobemide is predicted to increase the effects of monoamine-oxidase B inhibitors (rasagiline, selegiline). Avoid. [Severe: Theoretical] → Also see TABLE 13 p. 1378.

Moclobemide is predicted to increase the risk of side-effects when given with safinamide. Avoid and for 1 week after stopping safinamide. [Severe: Theoretical] → Also see TABLE 13 p. 1378.

Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. [Severe: Theoretical] → Also see TABLE 8 p. 1376 → Also see TABLE 13 p. 1378.

Safinamide is predicted to increase the risk of side-effects when given with linezolid. Avoid and for 1 week after stopping safinamide. [Severe: Theoretical] → Also see TABLE 13 p. 1378.

Rasagiline is predicted to increase the risk of side-effects when given with opioids (pethidine). Avoid and for 14 days after stopping rasagiline. [Severe: Theoretical] → Also see TABLE 13 p. 1378.

Safinamide is predicted to increase the risk of side-effects when given with opioids (pethidine). Avoid and for 1 week after stopping safinamide. [Severe: Theoretical] → Also see TABLE 13 p. 1378.

Selelgiline increases the risk of side-effects when given with opioids (pethidine). Avoid. [Severe: Anecdotal] → Also see TABLE 13 p. 1378.

Quinolones (ciprofloxacin) slightly increase the exposure to rasagiline. [Moderate: Study]

Reboxetine is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, reversible. Avoid and for 14 days after stopping reboxetine. [Severe: Theoretical] → Also see TABLE 13 p. 1378.

Monoamine-oxidase B inhibitors are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, inotropic. Avoid. [Severe: Anecdotal]

Monoamine-oxidase B inhibitors are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor. Avoid. [Severe: Anecdotal]

Monovalent antibodies → see TABLE 15 p. 1378 (myelosuppression), TABLE 12 p. 1378 (peripheral neuropathy), TABLE 9 p. 1377 (QT-interval prolongation), TABLE 4 p. 1375 (antiplaquelet effects)

adalimumab, alemtuzumab, atezolizumab, avadelumab, basiliximab, belimumab, bevacizumab, binatumab, brentuximab vedotin, brodalumab, canakinumab, certolizumab pegol, cetuximab, daratumumab, dinutuzumab, dupilumab, durvalumab, eculizumab, elotuzumab, golimumab, guselukimab, infliximab, inotuzumab ozogamicin, ipilimumab, ixekizumab, natalizumab, necitumumab, nivolumab, obinutuzumab, ocrolizumab, olaratumab, panitumumab, pembrolizumab, pertuzumab, ramucirumab, rituximab, sarilumab, secukinumab, siuximizum, tildrakizumab, tocilizumab, trastuzumab, trastuzumab emtansine, ustekinumab, vedolizumab

Abatacept is predicted to increase the risk of generalised infection (possibly life-threatening) when given with golimumab. Avoid. [Severe: Theoretical]

Tocilizumab is predicted to increase the exposure to abatacept. Monitor and adjust dose. [Moderate: Theoretical]

Blinatumumab is predicted to transiently increase the exposure to aminophylline. Monitor and adjust dose. [Moderate: Theoretical]

Sarilumab potentially affects the exposure to aminophylline. Monitor and adjust dose. [Moderate: Theoretical]

Tocilizumab is predicted to decrease the exposure to aminophylline. Monitor and adjust dose. [Moderate: Theoretical]

Anakinra is predicted to increase the risk of generalised infection (possibly life-threatening) when given with golimumab. Avoid. [Severe: Theoretical]

Anthracyclines are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (trastuzumab, trastuzumab emtansine). Avoid. [Severe: Theoretical] → Also see TABLE 15 p. 1378.

Antihypertensives (dronedarone) increase the risk of neutropenia when given with brentuximab vedotin. Monitor and adjust dose. [Severe: Theoretical]

Antiepileptics (carbamazepine) are predicted to decrease the effects of brentuximab vedotin. [Severe: Theoretical]

Tocilizumab is predicted to decrease the exposure to antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Moderate: Theoretical]

Antifungals, azoles (itraconazole, ketoconazole) increase the risk of neutropenia when given with brentuximab vedotin. Monitor and adjust dose. [Severe: Study]

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to trastuzumab emtansine. Avoid. [Severe: Theoretical]

Brentuximab vedotin increases the risk of pulmonary toxicity when given with bleomycin. Avoid. [Severe: Study] → Also see TABLE 15 p. 1378.

Tocilizumab is predicted to decrease the exposure to calcium channel blockers. Monitor and adjust dose. [Moderate: Theoretical]

Blinatumumab is predicted to transiently increase the exposure to ciclosporin. Monitor and adjust dose. [Moderate: Theoretical]

Sarilumab potentially affects the exposure to ciclosporin. Monitor and adjust dose. [Severe: Theoretical]

Tocilizumab is predicted to decrease the exposure to ciclosporin. Monitor and adjust dose. [Moderate: Theoretical]

Cobicistat is predicted to increase the exposure to trastuzumab emtansine. Avoid. [Severe: Theoretical]

Sarilumab potentially decreases the exposure to combined hormonal contraceptives. [Severe: Theoretical]

Corticosteroids are predicted to increase the risk of immunosuppression when given with dinutuzumab. Avoid except in life-threatening situations. [Severe: Theoretical]

Corticosteroids (betamethasone, deflazacort, dexamethasone, hydrocortisone, methylprednisolone, prednisolone) are predicted to decrease the efficacy of monoclonal antibodies (atezolizumab, ipilimumab, nivolumab, pembrolizumab). Use with caution or avoid. [Severe: Theoretical]

Tocilizumab is predicted to decrease the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate: Theoretical]

Blinatumumab is predicted to transiently increase the exposure to coumarins (warfarin). Monitor and adjust dose. [Severe: Theoretical]

Sarilumab potentially affects the exposure to coumarins (warfarin). Monitor and adjust dose. [Moderate: Theoretical]

Tocilizumab is predicted to decrease the exposure to coumarins (warfarin). Monitor and adjust dose. [Moderate: Theoretical]

Tocilizumab is predicted to decrease the exposure to diazepam. Monitor and adjust dose. [Moderate: Theoretical]

HIV- protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the risk of neutropenia when given with brentuximab vedotin. Monitor and adjust dose. [Severe: Study]

HIV- protease inhibitors are predicted to increase the exposure to trastuzumab emtansine. Avoid. [Severe: Theoretical]

Idelalisib is predicted to increase the exposure to trastuzumab emtansine. Avoid. [Severe: Theoretical] → Also see TABLE 15 p. 1378.

Immunoglobulins are predicted to alter the effects of dinutuzumab. Avoid. [Severe: Theoretical]

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with monoclonal antibodies. Public Health England advises avoid (refer to Green Book). [Severe: Theoretical]
Monoclonal antibodies (continued)

- **Macrolides (clarithromycin)** increase the risk of neutropenia when given with brentuximab vedotin. Monitor and adjust dose. (Severe) Theoretical

- **Macrolides (erythromycin)** may increase the exposure to trastuzumab emtansine. Avoid. (Severe) Theoretical

- **Tocilizumab** is predicted to decrease the exposure to midazolam. Monitor and adjust dose. (Moderate) Theoretical

- **Rifampicin** decreases the effects of brentuximab vedotin. (Severe) Study

- **Sarilumab** potentially affects the exposure to sirolimus. Monitor and adjust dose. (Moderate) Theoretical

- **Sarilumab** is predicted to decrease the exposure to statins (atorvastatin, simvastatin). Monitor and adjust dose. (Moderate) Study

- **Tocilizumab** is predicted to decrease the exposure to statins (atorvastatin, simvastatin). Monitor and adjust dose. (Moderate) Study

- **Sarilumab** potentially affects the exposure to tacrolimus. Monitor and adjust dose. (Moderate) Theoretical

- **Blinatumomab** is predicted to transiently increase the exposure to theophylline. Monitor and adjust dose. (Moderate) Theoretical

- **Sarilumab** potentially affects the exposure to theophylline. Monitor and adjust dose. (Moderate) Theoretical

- **Tocilizumab** is predicted to decrease the exposure to theophylline. Monitor and adjust dose. (Moderate) Theoretical

**Montelukast**

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly increase the exposure to montelukast. (Severe) Study

- **Clopidogrel** is predicted to moderately increase the exposure to montelukast. (Moderate) Study

- **Enzalutamide** is predicted to decrease the exposure to montelukast. (Mild) Study

- **Fibrate (gemfibrozil)** are predicted to moderately increase the exposure to montelukast. (Moderate) Study

- **Leflunomide** is predicted to increase the exposure to montelukast. (Moderate) Theoretical

- **Teriflunomide** is predicted to decrease the effects of montelukast. (Moderate) Theoretical

- **Methotrexate** is predicted to increase the risk of haematological toxicity when given with amfetamines. (Severe) Theoretical

- **Naltrexone**

  - **GENERAL INFORMATION** Discontinue treatment 1 week before anticipated use of opioids; if emergency analgesia is required during treatment, an increased dose of opioid analgesic might be necessary (monitor for opioid intoxication).

- **Nalmefene** is predicted to decrease the efficacy of opioids. Avoid. (Severe) Theoretical

**Naloxegol**

- **Antiarhythms (dronedarone)** are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to naloxegol. Avoid. (Moderate) Study

- **Antifungals, azoles (itraconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

- **Cobicistat** is predicted to markedly increase the exposure to naloxegol. Avoid. (Severe) Study

- **Crizotinib** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

- **Enzalutamide** is predicted to markedly decrease the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

- **Grapefruit juice** is predicted to increase the exposure to naloxegol. Avoid. (Severe) Study

- **HIV-protease inhibitors** are predicted to markedly increase the exposure to naloxegol. Avoid. (Severe) Study

- **Idealisib** is predicted to markedly increase the exposure to naloxegol. Avoid. (Severe) Study

- **Imatinib** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

- **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to naloxegol. Avoid. (Severe) Study

- **Macrolides (erythromycin)** are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

- **Mefloquine** is predicted to markedly decrease the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

- **Nexavar** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

- **Nilotinib** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

- **Valacyclovir** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 65. (Moderate) Study

**Naloxone**

- **GENERAL INFORMATION** Avoid concurrent use of opioids.

**Nandrolone**

- **Nandrolone** is predicted to increase the anticoagulant effect of coumarins. Monitor and adjust dose. (Severe) Theoretical

- **Mycophenolate** is predicted to increase the risk of haematological toxicity when given with valganciclovir. (Moderate) Theoretical → Also see TABLE 15 p. 1378

- **Nabumetone** → see NSAIDs

- **Nadolol** → see beta blockers, non-selective

- **Naltrexone**

  - **GENERAL INFORMATION** Avoid concurrent use of opioids.
Nandrolone is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. [Severe] Theoretical

Naproxen  → see NSAIDs

Naratiprant  → see TABLE 13 p. 1378 (serotonin syndrome)

Naratiprant is predicted to increase the risk of vasodilation when given with ergotamine. Separate administration by 24 hours. [Severe] Theoretical

Natalizumab  → see monoclonal antibodies

Nateglinide  → see TABLE 14 p. 1378 (antidiabetic drugs)

Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to nateglinide. [Mild] Study

Enalaprilat is predicted to slightly decrease the exposure to nateglinide. [Mild] Study

Leflunomide is predicted to increase the exposure to nateglinide. [Moderate] Theoretical

Miotane is predicted to slightly decrease the exposure to nateglinide. [Mild] Study

Rifampicin is predicted to slightly decrease the exposure to nateglinide. [Mild] Study

Teriflunomide is predicted to increase the exposure to nateglinide. [Moderate] Theoretical

Nebivolol  → see beta blockers, selective

Nectumumab  → see monoclonal antibodies

Nefopam  → see TABLE 10 p. 1377 (anxiolytics/narcotics)

Nefopam is predicted to increase the risk of serious elevations in blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

Neolarabine  → see TABLE 15 p. 1378 (myelosuppression)

Neomycin  → see TABLE 2 p. 1375 (nephrotoxicity), TABLE 19 p. 1379 (toxicity), TABLE 20 p. 1379 (neuromuscular blocking effects)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Neomycin decreases the absorption of digoxin. [Moderate] Study

Neomycin moderately decreases the exposure to sorafenib. [Moderate] Study

Neostigmine  → see TABLE 6 p. 1376 (brady/cardia)

Aminoglycosides are predicted to decrease the effects of neostigmine. [Moderate] Theoretical

Nepafenac  → see NSAIDs

Netupitant  → see TABLE 13 p. 1378 (serotonin syndrome)

Netupitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Netupitant is predicted to increase the exposure to beta2 agonists (salmeterol). [Moderate] Study

Bosentan is predicted to decrease the exposure to netupitant. [Moderate] Theoretical

Netupitant is predicted to increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Theoretical

Netupitant is predicted to increase the exposure to buspirone. Avoid or adjust dose. [Moderate] Study

Netupitant is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical

Netupitant is predicted to increase the exposure to calcium channel blockers (lamotrigine, felodipine, nifedipine, nimodipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Netupitant is predicted to increase the exposure to cariprazine. Avoid. [Severe] Study

Netupitant is predicted to increase the exposure to ceritinib. [Moderate] Theoretical

Netupitant is predicted to increase the concentration of ciclosporin. [Severe] Study

Cobicistat is predicted to increase the exposure to netupitant. [Moderate] Study

Netupitant is predicted to increase the exposure to cobimetinib. [Severe] Theoretical

Netupitant is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4, p. 1120. [Severe] Study

Netupitant is predicted to increase the exposure to oral corticosteroids (budesonide). [Moderate] Study

Netupitant is predicted to increase the exposure to corticosteroids (dexamethasone). Adjust dose. [Moderate] Study

Netupitant is predicted to increase the exposure to corticosteroids (fluticasone). [Moderate] Study

Netupitant is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study

Netupitant is predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Netupitant is predicted to increase the exposure to dasatinib. [Severe] Study

Netupitant increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study

Netupitant is predicted to increase the exposure to dopamine receptor agonists (bromocriptine). [Severe] Theoretical

Netupitant is predicted to increase the concentration of dopamine receptor agonists (cabergoline). [Moderate] Anecdotal

Netupitant is predicted to moderately increase the exposure to dutasteride. [Mild] Study

Efavirenz is predicted to decrease the exposure to netupitant. [Moderate] Theoretical

Netupitant is predicted to increase the exposure to elotristat. [Moderate] Study

Netupitant is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. [Severe] Study

Netupitant is predicted to moderately increase the exposure to encorafenib. [Moderate] Study

Enalaprilat is predicted to decrease the exposure to netupitant. Avoid. [Severe] Study

Netupitant is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Netupitant is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Netupitant is predicted to increase the exposure to erlotinib. [Moderate] Theoretical

Netupitant slightly increases the exposure to etoposide. [Mild] Study

Netupitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study

Netupitant is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose with moderate inhibitors of CYP3A4 in hepatic and renal impairment, p. 777. [Mild] Study
Netupitant is predicted to increase the exposure to gefitinib. (Moderate) Theoretical

Netupitant is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 352. (Moderate) Theoretical

Netupitant is predicted to increase the concentration of prilosec. Avoid prilosec dose, p. 159. (Severe) Theoretical

Netupitant is predicted to increase the exposure to irinotecan. (Moderate) Study

Netupitant is predicted to increase the exposure to lapatinib. (Moderate) Study

Netupitant is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to nilotinib. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study

Netupitant is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical

Netupitant is predicted to increase the exposure to oxybutynin. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to pazopanib. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 812. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. (Moderate) Study

Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). (Severe) Theoretical

Netupitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. (Severe) Theoretical

Netupitant is predicted to increase the exposure to pimozide. Avoid. (Severe) Theoretical

Netupitant is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Netupitant is predicted to increase the exposure to ranolazine. (Severe) Study

Netupitant is predicted to increase the exposure to ribociclib. (Moderate) Study

Rifampicin is predicted to decrease the exposure to netupitant. Avoid. (Severe) Study

Netupitant is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to saxagliptin. (Mild) Study

Netupitant increases the concentration of sirolimus. Monitor and adjust dose. (Severe) Study

Netupitant is predicted to increase the exposure to SSRIs. (dapoxetine). Adjust dapoxetine dose with moderate inhibitors of CYP3A4, p. 821. (Moderate) Theoretical

St John’s Wort is predicted to decrease the exposure to netupitant. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. (Severe) Study

Netupitant is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 205. (Severe) Study

Netupitant is predicted to increase the exposure to sunifatinib. (Moderate) Theoretical

Netupitant is predicted to increase the concentration of tacrolimus. (Severe) Study

Netupitant is predicted to increase the exposure to taxanes (cabazitaxel). (Moderate) Theoretical

Netupitant is predicted to increase the concentration of temsirolimus. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to tezacafator. Adjust tezacafator with ivacafar p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study

Netupitant is predicted to increase the concentration of tensirolimus. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Netupitant is predicted to increase the exposure to tolterodine. (Mild) Theoretical

Netupitant is predicted to increase the exposure to tolvaptan. Manufacturer advises caution or adjust tolvaptan dose with moderate inhibitors of CYP3A4, p. 666. (Moderate) Study

Netupitant is predicted to increase the exposure to trazodone. (Moderate) Theoretical

Netupitant is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

Netupitant is predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. (Severe) Study

Netupitant is predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical

Netupitant is predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Study

Neuromuscular blocking drugs, non-depolarising → see TABLE 6 p. 1376 (bradycardia), TABLE 20 p. 1379 (neuromuscular blocking effects)

atrocurium - cisatracurium - mivacurium - pancuronium - rocuronium

Anticholinesterases, centrally acting are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. (Moderate) Theoretical → Also see TABLE 6 p. 1376

Antiepileptics (carbamazepine) are predicted to decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium). Monitor and adjust dose. (Moderate) Study

Antiepileptics (fosphenytoin, phenytoin) decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium). (Moderate) Study

Clindamycin increases the effects of neuromuscular blocking drugs, non-depolarising. (Severe) Anecdotal

Corticosteroids are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. (Severe) Anecdotal
Neuromuscular blocking drugs, non-depolarising — Nevirapine

- Nevirapine is predicted to decrease the exposure to antifungals, azoles (fluconazole) slightly to moderately increase the exposure to nevirapine. Monitor and adjust dose. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to antifungals, azoles (itraconazole), azoles (ketoconazole). Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to azoles (itraconazole), azoles (ketoconazole). Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to bedaquiline. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to cariprazine. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the effect of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical
- Nevirapine is predicted to decrease the efficacy of magnesium. Theoretical
- Nevirapine is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Nevirapine is predicted to decrease the exposure to dasabuvir. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to dasatinib. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical
- Nevirapine decreases the exposure to doravirine. Adjust dose. (Severe) Study
- Nevirapine is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study
- Nevirapine is predicted to decrease the exposure to eliglustat. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the concentration of elvitegravir. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to fosaprepitant. (Moderate) Theoretical
- Nevirapine is predicted to decrease the exposure to gefitinib. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to glecaprevir. Avoid. (Severe) Study
- Nevirapine is predicted to markedly decrease the exposure to grazoprevir. Avoid. (Severe) Study
- Nevirapine is predicted to decrease the concentration of guanfacine. Adjust dose. (Moderate) Theoretical
- Nevirapine decreases the exposure to HIV-protease inhibitors. Refer to specialist literature. (Moderate) Study
- Nevirapine is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal
- Nevirapine is predicted to decrease the exposure to idelalisib. Avoid. (Moderate) Theoretical
- Nevirapine is predicted to decrease the exposure to imatinib. Avoid. (Moderate) Study
- Nevirapine is predicted to decrease the exposure to ivacaftor. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to lapatinib. Avoid. (Severe) Study
- Nevirapine is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. (Moderate) Theoretical
- Nevirapine decreases the exposure to macrolides (clarithromycin). (Moderate) Study
- Nevirapine decreases the concentration of midazolam. Monitor and adjust dose. (Moderate) Study
- Mitotane is predicted to decrease the exposure to nevirapine. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to netupitant. (Moderate) Theoretical
- Nevirapine is predicted to decrease the exposure to nilotinib. Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal
- Nevirapine is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
Nevirapine (continued)

Nevirapine is predicted to decrease the exposure to omibitasvir. Avoid. [Moderate] Theoretical

Nevirapine decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study

Nevirapine is predicted to decrease the exposure to osimertinib. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to ospemifene. [Moderate] Study

Nevirapine is predicted to decrease the exposure to paritaprevir (with ritonavir and omibitasvir). Avoid. [Severe] Study

Nevirapine is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to ribociclib. [Severe] Study

Nevirapine is predicted to decrease the exposure to rolapitant. Avoid. [Severe] Study

Nevirapine is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical

Nevirapine is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Moderate] Theoretical

St John’s Wort is predicted to decrease the concentration of nevirapine. Avoid. [Severe] Theoretical

Nevirapine slightly decreases the exposure to statins (atorvastatin). [Mild] Study

Nevirapine moderately decreases the exposure to statins (simvastatin). [Moderate] Study

Nevirapine is predicted to decrease the concentration of tacrolimus. Monitor and adjust dose. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study

Nevirapine is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to tofacitinib. [Moderate] Study

Nevirapine decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal

Nevirapine is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to venoclax. Avoid. [Severe] Study

Nevirapine is predicted to decrease the concentration of vorapaxir. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the concentration of zidovudine. Refer to specialist literature. [Severe] Theoretical

Nicardipine → see calcium channel blockers

Nicorandil → see TABLE 8 p. 1376 (hypotension)

Aspirin is predicted to increase the risk of gastrointestinal perforation when given with nicorandil. [Severe] Theoretical

Corticosteroids increase the risk of gastrointestinal perforation when given with nicorandil. [Severe] Anecdotal

Nicorandil is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. [Severe] Theoretical

Nicorandil is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1376

Nicotinic acid → see TABLE 3 p. 1375 (anticoagulant effects)

Nicotinic acid is predicted to increase the risk of rhabdomyolysis when given with statins. [Severe] Theoretical

Nifedipine → see calcium channel blockers

Nilotinib → see TABLE 15 p. 1378 (myelosuppression), TABLE 9 p. 1377 (QT-interval prolongation)

Nilotinib is predicted to increase the exposure to abemaciclib. [Moderate] Study

Nilotinib is predicted to increase the exposure to aldosterone antagonists (epileron). Adjust epileron dose, p. 193. [Severe] Study

Nilotinib is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical

Nilotinib is predicted to increase the exposure to alprazolam. [Severe] Study

Antacids is predicted to decrease the absorption of nilotinib. Separate administration by at least 2 hours. [Moderate] Theoretical

Nilotinib is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to nilotinib. [Moderate] Theoretical → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 1377

Nilotinib is predicted to increase the exposure to antituberculars, non-sedating (rifampicin). [Severe] Study

Nilotinib is predicted to increase the exposure to antituberculars, non-sedating (rupatadine). Avoid. [Moderate] Study

Nilotinib is predicted to increase the concentration of antimarials (piperazine). [Severe] Theoretical

Aprepitant is predicted to increase the exposure to nilotinib. [Moderate] Theoretical

Nilotinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1378

Nilotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1377

Bosentan is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical

Nilotinib is predicted to increase the exposure to bosutinib. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 1378

Nilotinib is predicted to increase the exposure to buprionate.

Use with caution and adjust dose. [Moderate] Study

Nilotinib is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical → Also see TABLE 15 p. 1378 → Also see TABLE 9 p. 1377

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to nilotinib. [Moderate] Theoretical

Nilotinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Nilotinib is predicted to increase the exposure to cariprazine. Avoid. [Severe] Study

Nilotinib is predicted to increase the exposure to ceritinib. [Moderate] Theoretical → Also see TABLE 15 p. 1378 → Also see TABLE 9 p. 1377

Nilotinib is predicted to increase the concentration of ciclosporin. [Severe] Study

Cobicistat is predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study

Nilotinib is predicted to increase the exposure to cobimetinib. [Severe] Theoretical

Nilotinib is predicted to increase the exposure to colchicine. Adjust colchicine dose with moderate inhibitors of CYP3A4, p. 120. [Severe] Study

Nilotinib is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study

Nilotinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical

Nilotinib is predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Nilotinib is predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 15 p. 1378 → Also see TABLE 9 p. 1377
Nilotinib increases the risk of QT prolongation when given with **dopamine receptor agonists (bromocriptine).** Avoid. [Severe] Study

- **Nilotinib** is predicted to increase the exposure to dopamine receptor agonists (cabergoline). [Moderate] Acetadote
- **Nilotinib** is predicted to moderately decrease the exposure to **duasteride.** [Mild] Study
- **Efavirenz** is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to **eplerenone.** Avoid or adjust dose—consult product literature. [Severe] Study
- **Nilotinib** is predicted to moderately decrease the exposure to **encorafenib.** [Moderate] Study → Also see TABLE 9 p. 1377
- **Enalapril** is predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study

**Nilotinib** is predicted to increase the risk of ergotism when given with **ergotamine.** [Severe] Theoretical

- **Nilotinib** is predicted to increase the exposure to **erlotinib.** [Moderate] Theoretical
- **Nilotinib** is predicted to increase the concentration of **everolimus.** Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 1378
- **Nilotinib** is predicted to increase the exposure to **fesoterodine.** Adjust **fesoterodine** dose with moderate inhibitors of CYP3A4, p. 983. [Severe] Study → Also see TABLE 15 p. 1378
- **Nilotinib** is predicted to increase the exposure to **ibrutinib.** Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4, p. 983. [Severe] Study → Also see TABLE 15 p. 1378
- **Idealisib** is predicted to moderately increase the exposure to **nilotinib.** Avoid. [Severe] Study → Also see TABLE 9 p. 1377
- **Nilotinib** is predicted to increase the exposure to **ibrutinib.** Adjust **ibrutinib** dose with moderate inhibitors of CYP3A4, p. 983. [Severe] Study → Also see TABLE 15 p. 1378
- **Idealisib** is predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 1377
- **Nilotinib** is predicted to increase the exposure to **ibandronate.** Adjust **ibandronate** dose, p. 211. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to **icavacaptor.** Adjust **icavacaptor** p. 293 or **tezacaftor with ivacaftor** p. 295 dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to **lappatinib.** [Moderate] Study → Also see TABLE 9 p. 1377
- **Nilotinib** is predicted to increase the exposure to **lomitapide.** Avoid. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to **lorazepam.** Avoid. [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 1377
- **Macrolides (erythromycin)** are predicted to increase the exposure to nilotinib. [Moderate] Theoretical → Also see TABLE 9 p. 1377
- **Nilotinib** is predicted to decrease the exposure to **midazolam.** Monitor side effects and adjust dose. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to **midostaurin.** [Moderate] Theoretical
- **Mitottane** is predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 15 p. 1378
- **Nilotinib** is predicted to increase the exposure to **naloxegol.** Adjust **naloxegol** dose and monitor side effects, p. 65. [Moderate] Study
- **Netupitant** is predicted to increase the exposure to nilotinib. [Moderate] Theoretical
- **Nevirapine** is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical

- **Nilotinib** is predicted to increase the exposure to **olaparib.** Avoid moderate inhibitors of CYP3A4 or adjust **olaparib** dose, p. 1005. [Moderate] Theoretical → Also see TABLE 15 p. 1378
- **Nilotinib** is predicted to increase the exposure to **opioids (alfentanil, buprenorphine, fentanyl, oxycodone).** Monitor and adjust dose. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to **opioids (methadone, sufentanil).** [Moderate] Theoretical → Also see TABLE 9 p. 1377
- **Nilotinib** is predicted to increase the exposure to **oxybutynin.** [Mild] Theoretical
- **Nilotinib** is predicted to increase the exposure to **pazopanib.** [Moderate] Theoretical → Also see TABLE 15 p. 1378 → Also see TABLE 9 p. 1377
- **Nilotinib** is predicted to increase the risk of bleeding events when given with **phenindione.** [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (avanaflif).** Adjust **avanaflif** dose, p. 812. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (sildenafil).** Monitor or adjust **sildenafil** dose with moderate inhibitors of CYP3A4, p. 813. [Moderate] Study → Also see TABLE 9 p. 1377
- **Nilotinib** is predicted to increase the exposure to **phosphodiesterase type-5 inhibitors (vardenif).** Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1377
- **Nilotinib** is predicted to increase the exposure to **pimozide.** Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1377
- **Prilocain** is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to **quetiapine.** Avoid. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to **ranolazine.** Avoid. [Severe] Study → Also see TABLE 9 p. 1377
- **Rifampicin** is predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to **rubicon.** [Moderate] Study → Also see TABLE 9 p. 1377
- **Nilotinib** is predicted to increase the exposure to **saxagliptin.** [Mild] Study
- **Nilotinib** increases the concentration of **sirolimus.** Monitor and adjust dose. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to **SSRIs (dopoxetin).** Adjust **dopoxetin** dose with moderate inhibitors of CYP3A4, p. 821. [Moderate] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to **statins (atorvastatin).** Monitor and adjust dose. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to **statins (simvastatin).** Use with caution and adjust **simvastatin** dose, p. 206. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to **sunitinib.** [Moderate] Theoretical → Also see TABLE 15 p. 1378 → Also see TABLE 9 p. 1377
- **Nilotinib** is predicted to increase the concentration of **tacrolimus.** [Severe] Theoretical
- **Nilotinib** is predicted to increase the exposure to **taxanes (cabazitaxel).** [Moderate] Theoretical → Also see TABLE 15 p. 1378
- **Nilotinib** is predicted to increase the concentration of **tepsirostrum.** [Moderate] Theoretical → Also see TABLE 15 p. 1378
- **Nilotinib** is predicted to increase the exposure to **tezacaftor.** Adjust **tezacaftor with ivacaftor** p. 295 dose with moderate inhibitors of CYP3A4. [Severe] Study
- **Nilotinib** given with a potent CYP3A4 inhibitor is predicted to increase the exposure to **tofacitinib.** Adjust **tofacitinib** dose, p. 1105. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to **tolerodine.** [Mild] Theoretical → Also see TABLE 9 p. 1377
Nilotinib (continued)

- Nitrates are predicted to increase the risk of methaemoglobinaemia when given with dipson. Severe
- Theoretical

- Nitrates potentially increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. Severe
- Study → Also see TABLE 8 p. 1376

Nitrazepam → see TABLE 11 p. 1377 (CNS depressant effects)

- Rifampicin increases the clearance of nitrazepam. Moderate Study

- Nitrofurantoin → see TABLE 12 p. 1378 (peripheral neuropathy)

- Nitrofurantoin is predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. Severe Theoretical

- Antacids (magnesium trisilicate) decrease the absorption of nitrofurantoin. Moderate Study

- Nitrofurantoin is predicted to increase the risk of methaemoglobinaemia when given with dipson. Severe
- Theoretical

- Nitrous oxide → see TABLE B p. 1376 (hypotension), TABLE 11 p. 1377 (CNS depressant effects)

- Nitrous oxide potentially increases the risk of methotrexate toxicity when given with methotrexate. Avoid. Severe Study

- Nivolumab → see monoclonal antibodies

- Nizatidine → see H₂ receptor antagonists

- Noradrenaline/norepinephrine → see sympathomimetics, vasoconstrictor

Norethisterone

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- Aprepitant is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- Bosantan is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- Efavirenz is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- Fosaprepitant is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- Gabeefulvin potentially decreases the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- Mifepristone potentially increases the risk of methotrexate toxicity when given with methotrexate. Avoid. Severe Study

- Modafinil is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- Nevirapine is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- Rifabutin is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- Rifampicin is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- St John’s Wort is predicted to decrease the efficacy of norethisterone. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 794. Severe Anecdotal

- Sugammadex is predicted to decrease the exposure to norethisterone. Use additional contraceptive precautions. Severe Theoretical

- Ulipristal is predicted to decrease the efficacy of norethisterone. Avoid. Severe Theoretical

NSAIDs → see TABLE 18 p. 1379 (hypotension), TABLE 2 p. 1375 (nephrotoxicity), TABLE 16 p. 1379 (increased serum potassium), TABLE 4 p. 1375 (antiplatelet effects)
aceclofenac • benzydamine • bromfenac • celecoxib • dexibuprofen • dexketoprofen • diclofenac • etodolac • etoricoxib • flurbiprofen • ibuprofen • indometacin • ketoprofen • ketorolac • mefenamic acid • meloxicam • nabumetone • naproxen • nepafenac • parecoxib • piroxicam • sulindac • tenoxicam • tiaprofenic acid • tolprofen acid

- Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
- Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Celecoxib is predicted to increase the exposure to antiarhythmics (flecainide, propafenone). Monitor and adjust dose. (Moderate) Theoretical
- Antifungals, azoles (flucanazole) moderately increase the exposure to celecoxib. Adjust celecoxib dose, p. 1132. (Moderate) Study
- Antifungals, azoles (voriconazole) moderately increase the exposure to ibuprofen. Adjust dose. (Moderate) Study
- NSAIDs are predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). (Moderate) Study
- NSAIDs are predicted to increase the risk of renal impairment when given with bisphosphonates (sodium clodronate). Severe Theoretical
- Ceritinib is predicted to increase the exposure to NSAIAs (celecoxib, diclofenac). Adjust dose. (Moderate) Theoretical
- Ciclesonin increases the concentration of diclofenac. Severe Study → Also see TABLE 2 p. 1375 → Also see TABLE 16 p. 1379
- Etoricoxib slightly increases the exposure to combined hormonal contraceptives. (Moderate) Study
- NSAIDs increase the risk of gastrointestinal bleeding when given with corticosteroids. (Severe) Study
- NSAIDs increase the risk of renal impairment when given with daptomycin. (Moderate) Theoretical
- Indometacin increases the concentration of digoxin. Severe
- Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with NSAIAs. Severe Theoretical
- Etoricoxib slightly increases the exposure to hormone replacement therapy. (Moderate) Study
- NSAIDs are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). Severe Theoretical
- Leflunomide is predicted to increase the exposure to NSAIAs (indomethacin, ketoprofen). (Moderate) Theoretical
- NSAIDs increase the concentration of lithium. Monitor and adjust dose. (Severe) Study
- NSAIDs are predicted to increase the risk of toxicity when given with methotrexate. Severe Study → Also see TABLE 2 p. 1375
- NSAIDs (high-dose) are predicted to decrease the efficacy of mifamurtide. Avoid. (Severe) Theoretical
- Nicardipin is predicted to increase the risk of gastrointestinal perforation when given with NSAIAs. Severe Theoretical
- NSAIDs are predicted to increase the exposure to pemetrexed. Use with caution or avoid. (Severe) Theoretical → Also see TABLE 2 p. 1375
- NSAIDs potentially increase the risk of seizures when given with quinolones. Severe Theoretical
- Regorafenib is predicted to increase the exposure to mefenamic acid. Avoid. (Moderate) Theoretical → Also see TABLE 4 p. 1377
- Rifampicin moderately decreases the exposure to NSAIAs (celecoxib, diclofenac, etoricoxib). Moderate Study
- Teriflunomide is predicted to increase the exposure to NSAIAs (indomethacin, ketoprofen). (Moderate) Theoretical
- NSAIDs increase the risk of acute renal failure when given with thiazide diuretics. (Severe) Theoretical → Also see TABLE 18 p. 1379
- Zidovudine increases the possibility of interactions should be borne in mind.

Obeticholic acid
- Obeticholic acid decreases the anticoagulant effect of coumarins (warfarin). (Severe) Study
- Obeticholic acid is predicted to increase the exposure to theophylline. (Severe) Theoretical
- Obeticholic acid is predicted to increase the exposure to tizanidine. (Severe) Theoretical

Oblinutuzumab → see monoclonal antibodies
Ocrelizumab → see monoclonal antibodies
Octreotide
- Octreotide decreases the absorption of oral ciclosporin. Adjust ciclosporin dose, p. 838. (Severe) Anecdotal
- Octreotide (short-acting) decreases the exposure to telotristat ethyl. Telotristat ethyl should be taken at least 30 minutes before octreotide. (Moderate) Study
- Ofoxacin → see quinolones
Olanzapine → see TABLE 8 p. 1376 (hypotension), TABLE 15 p. 1378

FOOD AND LIFESTYLE. Dose adjustment might be necessary if smoking started or stopped during treatment.
- Antiarrhythmics (carbamazepine) potentially decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- Antiarrhythmics (phenytoin) are predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- Olanzapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 1376
- HIV-protective inhibitors (ritonavir) are predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- Leflunomide is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study → Also see TABLE 15 p. 1378
- Olanzapine decreases the effects of levodopa. Avoid or monitor worsening parkinsonism symptoms. (Severe) Anecdotal → Also see TABLE 8 p. 1376
- Mesiletine is predicted to increase the exposure to olanzapine. Adjust dose. (Moderate) Anecdotal
- Quinolones (ciprofloxacin) are predicted to increase the exposure to olanzapine. Adjust dose. (Moderate) Anecdotal
- Rifampicin is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- SSSi (fluvoxamine) moderately increase the exposure to olanzapine. Adjust dose. (Severe) Anecdotal
- Teriflunomide is predicted to decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- Olaparib → see TABLE 15 p. 1378 (myelosuppression)

FOOD AND LIFESTYLE. Bitter (Seville) orange is predicted to increase the exposure to olaparib.
- Antiarrhythmics (dronedaron) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Theoretical
- Antiarrhythmics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Antifungals, azoles (flucanazole, isavuconazole, posaconazole) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Study
- Aprepitant is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Theoretical
- Bosentan is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Theoretical

www.getintopharma.com
Olaparib (continued)

- **Cobicistat** is predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Study
- **Cyclosporine** is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Theoretical → Also see TABLE 15 p. 1378
- **Efavirenz** is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- **Enalapril** is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- **Grapefruit juice** is predicted to increase the exposure to olaparib. Avoid. (Moderate) Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Study
- **Idelalisib** is predicted to increase the exposure to olaparib. Avoid potent inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Study
- **Midazolam** is predicted to increase the exposure to olaparib. Avoid. (Moderate) Theoretical
- **Nevirapine** is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- **Nilotinib** is predicted to increase the exposure to olaparib. Avoid moderate inhibitors of CYP3A4 or adjust olaparib dose, p. 1005. (Moderate) Theoretical → Also see TABLE 15 p. 1378
- **Rifampicin** is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical
- **St John's Wort** is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical

**Olaratubam** → see monoclonal antibodies

**Olicesmatan** → see angiotensin-II receptor antagonists

**Olefaltorol** → see beta, agonists

**Olsalazine** → see TABLE 15 p. 1378 (myelosuppression)

**Ombitasvir**

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin)** are predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical
- **Efavirenz** is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical
- **Enalapril** is predicted to decrease the exposure to ombitasvir. Avoid. (Moderate) Theoretical
- **St John's Wort** is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical

**Ombitasvir (in fixed-dose combination with dasabuvir)** decreases the concentration of HIV-protease inhibitors (daunavir). Avoid or adjust dose. (Moderate) Study

**Ondansetron** is predicted to decrease the exposure to ombitasvir. Avoid. (Severe) Theoretical

**Omega-3-acid ethyl esters** → see TABLE 3 p. 1375 (anticoagulant effects)

**Omeprazole** → see proton pump inhibitors

**Ondansetron** → see TABLE 13 p. 1378 (serotonin syndrome), TABLE 9 p. 1377 (QT-interval prolongation)

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ondansetron. (Moderate) Study

- **Dopamine receptor agonists (apomorphine)** increase the risk of severe hypotension when given with ondansetron. Avoid. (Severe) Study → Also see TABLE 9 p. 1377

- **Enzalutamide** is predicted to decrease the exposure to ondansetron. (Moderate) Study

- **Mitotane** is predicted to decrease the exposure to ondansetron. (Moderate) Study

- **Rifampicin** is predicted to decrease the exposure to ondansetron. (Moderate) Study

**Opicapone**

- **Opicapone** increases the exposure to levodopa. Adjust dose. (Moderate) Study

- **Opicapone** is predicted to increase the exposure to loperamide. Avoid. (Moderate) Study

- **Opicapone** is predicted to increase the risk of elevated blood pressure when given with moclobemide. Avoid. (Severe) Theoretical

- **Opicapone** is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. (Severe) Theoretical

- **Opicapone** is predicted to increase the exposure to montelukast. Avoid. (Moderate) Study

- **Opicapone** is predicted to increase the exposure to pioglitazone. Avoid. (Moderate) Study

- **Opicapone** is predicted to increase the exposure to repaglinide. Avoid. (Moderate) Study

- **Opicapone** is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic. (Severe) Theoretical

- **Opicapone** is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Severe) Theoretical

**Opioids** → see TABLE 6 p. 1376 (bradycardia), TABLE 13 p. 1378 (serotonin syndrome), TABLE 9 p. 1377 (QT-interval prolongation), TABLE 11 p. 1377 (CNS depressant effects)

- **alfentanil**
- **buprenorphine**
- **codeine**
- **diamorphine**
- **dihydrocodeine**
- **diphenoxylate**
- **dipipanone**
- **fentanyl**
- **hydromorphone**
- **meptazinol**
- **methadone**
- **morphine**
- **oxycodone**
- **papaveretum**
- **pentazocine**
- **pethidine**
- **remifentanil**
- **sufentanil**
- **tapentadol**
- **tramadol**

- **Alcohol (beverage)** causes rapid release of opioids (hydromorphone, morphine) (from extended-release preparations). Avoid. (Severe) Study → Also see TABLE 11 p. 1377

- **Antiarrhythmics (amiodarone)** are predicted to increase the concentration of fentanyl. (Moderate) Theoretical → Also see TABLE 6 p. 1376

- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study

- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical → Also see TABLE 9 p. 1377

- **Antiepileptics (carbamazepine)** decrease the concentration of tramadol. Adjust dose. (Severe) Study

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. (Moderate) Study

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the exposure to methadone. Monitor and adjust dose. (Severe) Study → Also see TABLE 11 p. 1377

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to opioids (alfentanil, fentanyl). (Moderate) Study → Also see TABLE 11 p. 1377

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to oxycodone. Monitor and adjust dose. (Moderate) Study → Also see TABLE 11 p. 1377

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to methadone. Adjust dose. (Severe) Theoretical → Also see TABLE 9 p. 1377
Opioids

- **Antifungals, azoles** (miconazole) are predicted to increase the exposure to alfentanil. Use with caution and adjust dose. (Moderate) Theoretical
- **Antifungals, azoles** (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to alfentanil. Monitor and adjust dose. (Moderate) Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to alfentanil. Monitor and adjust dose. (Severe) Study
- **Antifungals, azoles** (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical → Also see TABLE 9 p. 1377
- **Apatamidine** is predicted to decrease the exposure to alfentanil. Avoid or monitor. (Moderate) Study
- **Aprepitant** is predicted to increase the exposure to alfentanil, buprenorphine, fentanyl, oxycodone. Monitor and adjust dose. (Moderate) Study
- **Bictegravir** is predicted to increase the exposure to methadone. (Moderate) Theoretical
- **Bosentan** decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study
- **Brigatinib** potentially decreases the concentration of opioids (alfentanil, fentanyl). Avoid. (Moderate) Theoretical
- **Bupropion** is predicted to decrease the efficacy of codeine. (Moderate) Theoretical
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical → Also see TABLE 6 p. 1376
- **Cationic amphiphiles** (ritonavir) are predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical → Also see TABLE 6 p. 1376
- **Cen痫ib** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Avoid. (Severe) Theoretical
- **Cinacalcet** is predicted to decrease the efficacy of tramadol. (Severe) Study
- **Cobicistat** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. (Severe) Study
- **Crizotinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study
- **Crizotinib** is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical → Also see TABLE 6 p. 1376
- **Efavirenz** decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study → Also see TABLE 9 p. 1377
- **Enalapril** is predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. (Moderate) Theoretical
- **Enalapril** decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study
- **Enalapril** is predicted to decrease the exposure to opioids (alfentanil, fentanyl). (Moderate) Study
- **Enalapril** is predicted to decrease the exposure to oxycodone. Monitor and adjust dose. (Moderate) Study
- **H₂ receptor antagonists** (cimetidine) increase the concentration of alfentanil. Use with caution and adjust dose. (Severe) Study
- **H₂ receptor antagonists** (cimetidine) increase the exposure to fentanyl. (Moderate) Study
- **HIV-protease inhibitors** (boosted with ritonavir) are predicted to decrease the exposure to methadone. (Moderate) Study → Also see TABLE 9 p. 1377
- **HIV-protease inhibitors** (ritonavir) are predicted to decrease the concentration of morphine. (Moderate) Theoretical
- **HIV-protease inhibitors** (ritonavir) increase the risk of CNS toxicity when given with pethidine. Avoid. (Severe) Study
- **HIV-protease inhibitors** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. (Severe) Study
- **Idelalisib** is predicted to increase the exposure to methadone. (Severe) Theoretical
- **Idelalisib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. (Severe) Study
- **Imatinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study
- **Imatinib** is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical
- **Letemodir** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Monitor and adjust dose. (Moderate) Study
- **Macrolides (clarithromycin)** are predicted to increase the concentration of methadone. (Severe) Theoretical → Also see TABLE 9 p. 1377
- **Macrolides (erythromycin)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical → Also see TABLE 9 p. 1377
- **Opioids potentially decrease the absorption of oral methylxanthine.** (Moderate) Study
- **Mitotane** is predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. (Moderate) Theoretical
- **Mitotane** decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study
- **Mitotane** is predicted to decrease the exposure to opioids (alfentanil, fentanyl). (Moderate) Study
- **Mitotane** is predicted to decrease the exposure to oxycodone. Monitor and adjust dose. (Moderate) Study
- **Mitotane** is predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. (Severe) Study → Also see TABLE 13 p. 1378
- **Monoamine-oxidase B inhibitors** (rasagiline) are predicted to increase the risk of side-effects when given with pethidine. Avoid and for 14 days after stopping rasagiline. (Severe) Theoretical → Also see TABLE 13 p. 1378
- **Monoamine-oxidase B inhibitors** (safinamide) are predicted to increase the risk of side-effects when given with pethidine. Avoid and for 1 week after stopping safinamide. (Severe) Theoretical → Also see TABLE 13 p. 1378
- **Monoamine-oxidase B inhibitors** (rasagiline) increase the risk of side-effects when given with pethidine. Avoid. (Severe) Theoretical → Also see TABLE 13 p. 1378
- **Mao inhibitors** (methylphenidate) are predicted to increase the concentration of alfentanil. (Moderate) Theoretical → Also see TABLE 9 p. 1377
- **Naloxone** is predicted to decrease the efficacy of opioids. Avoid. (Severe) Theoretical
- **Netupitant** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study
- **Netupitant** is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical
- **Netupitant** decreases the exposure to methadone. Monitor and adjust dose. (Severe) Study
- **Nilotinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study
- **Nilotinib** is predicted to increase the exposure to opioids (methadone, sufentanil). (Moderate) Theoretical
- **Opioids (buprenorphine)** are predicted to increase the risk of opiate withdrawal when given with opioids (alfentanil). (Severe) Theoretical → Also see TABLE 11 p. 1377
- **Opioids (pentazocine)** are predicted to increase the risk of opiate withdrawal when given with opioids (alfentanil, codeine, diamorphine, dihydrocodeine, dipropionate, fentanyl, hydromorphone, meptazinol, methadone, morphine, oxycodone, pethidine). Avoid. (Severe) Theoretical
Opioids (continued) papaveretum.  [Severe] Theoretical  →  Also see TABLE 13 p. 1378  →  Also see TABLE 11 p. 1377

Opioids (buprenorphine) are predicted to increase the risk of opiate withdrawal when given with opioids (codeine, diamorphine, dihydrocodeine, dipipanone, fentanyl, hydromorphone, meptazinol, methadone, morphine, oxycodeone, papaveretum, pentazocine, pethidine, remifentanil, sufentanil, tapentadol, tramadol).  [Severe] Theoretical  →  Also see TABLE 11 p. 1377

Opioids (pentazocine) are predicted to increase the risk of opiate withdrawal when given with opioids (pethidine, remifentanil, tapentadol, tramadol).  [Severe] Theoretical  →  Also see TABLE 11 p. 1377

Opioids (pentazocine) are predicted to increase the risk of opiate withdrawal when given with opioids (sufentanil).  [Severe] Theoretical  →  Also see TABLE 11 p. 1377

Palbociclib is predicted to increase the exposure to opioids (alfentanil, fentanyl).  [Moderate] Theoretical  →  Adjust dose.  [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to buprenorphine.  Monitor and adjust dose.  [Moderate] Theoretical

Rifampicin decreases the exposure to methadone.  Monitor and adjust dose.  [Severe] Study

Rifampicin is predicted to decrease the exposure to opioids (alfentanil, fentanyl).  [Moderate] Study

Rifampicin is predicted to decrease the exposure to opioids (codeine, morphine).  [Moderate] Study

Rifampicin is predicted to decrease the exposure to oxycodeone.  Monitor and adjust dose.  [Moderate] Study

Ruxpar becomes predicted to increase the exposure to opioids (alfentanil, fentanyl).  Monitor and adjust dose.  [Moderate] Study

SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of codeine.  [Moderate] Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of tramadol.  [Severe] Study  →  Also see TABLE 13 p. 1378

St John’s Wort moderately decreases the exposure to oxycodeone.  Adjust dose.  [Moderate] Study

Terbinafine is predicted to decrease the efficacy of codeine.  [Moderate] Theoretical

Terbinafine is predicted to decrease the efficacy of tramadol.  [Severe] Study

Oxaliplatin → see platinum compounds

Oxcarbazepine → see TABLE 11 p. 1377 (CNS depressant effects)

Oxybuprocaine → see anaesthetics, local

Oxybutynin → see TABLE 10 p. 1377 (antimuscarinics)

Orlistat

SEPARATION OF ADMINISTRATION Orlistat might affect the absorption of concurrently administered drugs—consider separating administration. Particular care should be taken with antiepileptics, antiretrovirals, and drugs that have a narrow therapeutic index.

Orphenadrine → see TABLE 10 p. 1377 (antimuscarinics)

Oxelamivir

Leflunomide is predicted to increase the exposure to oxelamivir.  [Moderate] Theoretical

Teriflunomide is predicted to increase the exposure to oxelamivir.  [Moderate] Study

Osimertinib → see TABLE 9 p. 1377 (CYP prodrug metabolism and P-gp efflux)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to osimertinib.  [Moderate] Study

Bosantan is predicted to decrease the exposure to osimertinib.  [Moderate] Theoretical

Efavirenz is predicted to decrease the exposure to osimertinib.  [Moderate] Theoretical

Enzalutamide is predicted to moderately decrease the exposure to osimertinib.  [Moderate] Study

Mitotane is predicted to moderately decrease the exposure to osimertinib.  [Severe] Theoretical

Rifaximin is predicted to decrease the exposure to osimertinib.  [Moderate] Study

St John’s Wort is predicted to decrease the exposure to osimertinib.  [Moderate] Theoretical

Osimertinib slightly increases the exposure to statins (lovastatin).  [Moderate] Study

Osimertinib is predicted to increase the exposure to osemifene.  [Moderate] Study

Antifungals, azoles (fluconazole) increase the exposure to osemifene.  Use with caution or avoid.  [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to osemifene.  Avoid in poor CYp2C9 metabolisers.  [Moderate] Study

Bosantan is predicted to decrease the exposure to osemifene.  [Moderate] Study

Cobicistat is predicted to increase the exposure to osemifene.  Avoid in poor CYp2C9 metabolisers.  [Moderate] Study

Combined hormonal contraceptives potentially oppose the effects of osemifene.  Avoid.  [Severe] Theoretical

Efavirenz is predicted to decrease the exposure to osemifene.  [Moderate] Study

Enzalutamide is predicted to moderately decrease the exposure to osemifene.  [Moderate] Study

HIV-protease inhibitors are predicted to increase the exposure to osemifene.  Avoid in poor CYp2C9 metabolisers.  [Moderate] Study

Macrolides (clarithromycin) are predicted to increase the exposure to osemifene.  Avoid in poor CYp2C9 metabolisers.  [Moderate] Study

Mitotane is predicted to moderately decrease the exposure to osemifene.  [Moderate] Study

 Nevirapine is predicted to decrease the exposure to osemifene.  [Moderate] Study

Rifaximin is predicted to decrease the exposure to osemifene.  [Moderate] Study

St John’s Wort is predicted to decrease the exposure to osemifene.  [Moderate] Study

Oxalacetate see platinum compounds

Oxcarbazepine → see antiepileptics

Oxybutynin see antimuscarinics

Oxybuprocaine → see anaesthetics, local

Oxybutynin see TABLE 10 p. 1377 (antimuscarinics)

Antiarhythmics (dronedarone) are predicted to increase the exposure to oxybutynin.  [Moderate] Theoretical

Oxybutynin potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide).  Avoid in children.  [Severe] Theoretical

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, posaconazole) are predicted to increase the exposure to oxybutynin.  [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxybutynin.  [Moderate] Study

Aprelant is predicted to increase the exposure to oxybutynin.  [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to oxybutynin.  [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to oxybutynin.  [Moderate] Study

Crizotinib is predicted to increase the exposure to oxybutynin.  [Moderate] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to oxybutynin.  [Moderate] Study

Imatinib is predicted to increase the exposure to oxybutynin.  [Moderate] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to oxybutynin.  [Moderate] Study
Paliperidone is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study

Rifampicin is predicted to decrease the exposure to paliperidone. Monitor and adjust dose. [Severe] Study

St John's Wort is predicted to decrease the exposure to paliperidone. [Severe] Theoretical

Palonosetron is predicted to decrease the exposure to paliperidone. [Severe] Theoretical

Dopamine receptor agonists (apomorphine) are predicted to increase the risk of severe hypotension when given with palonosetron. [Severe] Theoretical

Pamidronate is predicted to increase the exposure to bisphosphonates

Pancreatin is predicted to decrease the effects of acarbose. Avoid. [Moderate] Theoretical

Pancuronium is predicted to increase neuromuscular blocking drugs, non-depolarising

Panitumumab is predicted to monoclonal antibodies

Panobinostat is predicted to increase the exposure to enzalutamide. Adjust dose. [Moderate] Theoretical

Enzalutamide is predicted to decrease the exposure to panobinostat. Adjust dose; in hepatic impairment avoid, [Severe] Study

Panobinostat is predicted to increase the exposure to beta blockers, selective (metoprolol). Monitor and adjust dose. [Moderate] Theoretical

Panobinostat is predicted to increase the exposure to beta blockers, selective (nебивол). Monitor and adjust dose. [Mild] Theoretical

Calcium channel blockers (verapamil) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

Ciclosporin is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

Panobinostat is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Theoretical

Panobinostat is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 936. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 936. [Moderate] Study

Idelalisib is predicted to increase the exposure to enzalutamide. Adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to panobinostat. Adjust dose. [Severe] Study

Idelalisib is predicted to decrease the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to beta blockers, selective (metoprolol). Monitor and adjust dose. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to beta blockers, selective (nебивол). Monitor and adjust dose. [Mild] Theoretical

Calcium channel blockers (verapamil) are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

Ciclosporin is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical

Panobinostat is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Theoretical

Panobinostat is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 936. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical

HIV-protease inhibitors are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 936. [Moderate] Study

Idelalisib is predicted to decrease the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 936. [Moderate] Study
Panobinostat is predicted to increase the exposure to paritaprevir. Adjust dose. [Moderate] Theoretical

Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to ritonavir. Avoid. [Severe] Theoretical

Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to edoxaban. [Severe] Study

Efavirenz is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study

Enalapril is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study

Panobinostat (in fixed-dose combination) decreases the anticoagulant effect of coumarins (warfarin). Monitor INR and adjust dose. [Severe] Anecdotal

Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to dabigatran. [Study]

Paritaprevir (with ritonavir and ombitasvir) increases the exposure to digoxin. Monitor and adjust digoxin dose, p. 109. [Moderate] Study

Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to edoxaban. [Severe] Study

Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to thyroid hormones (levothyroxine). Monitor and adjust dose. [Moderate] Theoretical

Table 9
Paritaprevir is predicted to decrease the exposure to pazopanib. Avoid. (Severe) Theoretical

Pazopanib is predicted to affect the exposure to statins (atorvastatin). (Moderate) Anecdotal

Pazopanib is predicted to affect the exposure to statins (pravastatin, rosuvastatin, simvastatin). (Moderate) Theoretical

Pegasparagse is predicted to increase the risk of hepatotoxicity when given with imatinib. (Severe) Theoretical → Also see TABLE 15 p. 1378

Pegasparagse affects the efficacy of methotrexate. (Severe) Anecdotal → Also see TABLE 15 p. 1375 → Also see TABLE 15 p. 1378

Pegasparagse potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before pegaspargase. (Severe) Anecdotal → Also see TABLE 15 p. 1375 → Also see TABLE 15 p. 1378

Peginferon alfa → see interferons

Peginferon beta-1a → see TABLE 15 p. 1378 (myelosuppression)

Pembrolizumab → see monoclonal antibodies

Pemetrexed → see TABLE 15 p. 1378 (myelosuppression), TABLE 2 p. 1375 (nephrotoxicity)

Antimalarials (pyrimethamine) are predicted to increase the risk of side-effects when given with pemetrexed. (Severe) Theoretical → Also see TABLE 15 p. 1376

Asparin (high-dose) potentially increases the exposure to pemetrexed. Use with caution or avoid. (Severe) Theoretical

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with pemetrexed. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

NSAIDs are predicted to increase the exposure to pemetrexed. Use with caution or avoid. (Severe) Theoretical → Also see TABLE 2 p. 1375

Penicillamine → see TABLE 2 p. 1375 (nephrotoxicity)

Antacids decrease the absorption of penicillamine. Separate administration by 2 hours. (Mild) Study

Antimalarials (chloroquine) are predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. (Severe) Theoretical

Penicillamine potentially decreases the concentration of digoxin. Separate administration by 2 hours. (Severe) Anecdotal

Hydroxychloroquine is predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. (Severe) Theoretical

Iron (oral) is predicted to decrease the absorption of penicillamine. Separate administration by at least 2 hours. (Mild) Study

Sodium aurothiomalate potentially increases the risk of side-effects when given with penicillamine (in those who have had previous adverse reactions to gold). Avoid. (Severe) Study

Zinc is predicted to decrease the absorption of penicillamine. (Mild) Theoretical

Penicillins → see TABLE 1 p. 1375 (hepatotoxicity)

• Ampicillin, ampicillin, benzylpenicillin, flucloxacillin, penicillin, penicillin, penicillin, penicillin, penicillin, penicillin

• Alloxdin increases the risk of skin rash when given with penicillins (ampicillin, ampicillin). (Moderate) Study

• Antiepileptics (valproate) increase the risk of side-effects when given with penicillamin. Avoid. (Severe) Anecdotal

• Penicillins potentially alter the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe) Anecdotal

• Leflunomide is predicted to increase the exposure to benzylpenicillin. (Moderate) Theoretical

• Penicillins are predicted to increase the risk of toxicity when given with methotrexate. (Severe) Anecdotal → Also see TABLE 1 p. 1378

• Piperacillin increases the effects of neuromuscular blocking drugs, non-depolarising. (Moderate) Study

• Paracetamol potentially increases the risk of high anion gap metabolic acidosis when given with flucloxacillin. (Severe) Theoretical → Also see TABLE 1 p. 1375

• Penicillins are predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical

• Rifampicin is predicted to decrease the exposure to pazopanib. Avoid. (Severe) Theoretical

• Pazopanib is predicted to affect the exposure to statins (atorvastatin). (Moderate) Anecdotal

• Pazopanib is predicted to affect the exposure to statins (pravastatin, rosuvastatin, simvastatin). (Moderate) Theoretical

• Pegasparagse → see TABLE 1 p. 1375 (hepatotoxicity), TABLE 15 p. 1378 (myelosuppression)

Paracetamol potentially increases the risk of high anion gap metabolic acidosis when given with flucloxacillin. (Severe) Theoretical → Also see TABLE 1 p. 1375

Penicillins are predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical

Penicillamine → see TABLE 2 p. 1375 (nephrotoxicity)

Antacids decrease the absorption of penicillamine. Separate administration by 2 hours. (Mild) Study

Antimalarials (chloroquine) are predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. (Severe) Theoretical

Penicillamine potentially decreases the concentration of digoxin. Separate administration by 2 hours. (Severe) Anecdotal

Hydroxychloroquine is predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. (Severe) Theoretical

Iron (oral) is predicted to decrease the absorption of penicillamine. Separate administration by at least 2 hours. (Mild) Study

Sodium aurothiomalate potentially increases the risk of side-effects when given with penicillamine (in those who have had previous adverse reactions to gold). Avoid. (Severe) Study

Zinc is predicted to decrease the absorption of penicillamine. (Mild) Theoretical

Penicillins → see TABLE 1 p. 1375 (hepatotoxicity)

amoxicillin, ampicillin, benzylpenicillin, flucloxacillin, penicillin, penicillin, penicillin, penicillin, penicillin

Alloxdin increases the risk of skin rash when given with penicillins (amoxicillin, ampicillin). (Moderate) Study

Antiepileptics (valproate) increase the risk of side-effects when given with penicillamin. Avoid. (Severe) Anecdotal

Penicillins potentially alter the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe) Anecdotal

Leflunomide is predicted to increase the exposure to benzylpenicillin. (Moderate) Theoretical

Penicillins are predicted to increase the risk of toxicity when given with methotrexate. (Severe) Anecdotal → Also see TABLE 1 p. 1378

Piperacillin increases the effects of neuromuscular blocking drugs, non-depolarising. (Moderate) Study

Paracetamol potentially increases the risk of high anion gap metabolic acidosis when given with flucloxacillin. (Severe) Theoretical → Also see TABLE 1 p. 1375

Penicillins are predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical

Rifampicin is predicted to decrease the exposure to pazopanib. Avoid. (Severe) Theoretical

Pazopanib is predicted to affect the exposure to statins (atorvastatin). (Moderate) Anecdotal

Pazopanib is predicted to affect the exposure to statins (pravastatin, rosuvastatin, simvastatin). (Moderate) Theoretical

Pegasparagse → see TABLE 1 p. 1375 (hepatotoxicity), TABLE 15 p. 1378 (myelosuppression)

Paracetamol potentially increases the risk of hepatotoxicity when given with imatinib. (Severe) Theoretical → Also see TABLE 15 p. 1378

Pegasparagse affects the efficacy of methotrexate. (Severe) Anecdotal → Also see TABLE 15 p. 1375 → Also see TABLE 15 p. 1378

Pegasparagse potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before pegaspargase. (Severe) Anecdotal → Also see TABLE 1 p. 1375 → Also see TABLE 15 p. 1378
Penicillins – Phenothiazines

**Penicillins (continued)**
- Piperacillin increases the effects of saxmethonium. [Moderate]
  - Study
- Teriflunomide is predicted to increase the exposure to benzylpenicillin. [Moderate]
  - Study

**Penicillins**
- See [TABLE 9](https://www.getintopharma.com/pdfs/BNF78/Table9.pdf) (QT-interval prolongation), [TABLE 15 p. 1378](https://www.getintopharma.com/pdfs/BNF78/Table15.pdf) (myelosuppression), [TABLE 2 p. 1375](https://www.getintopharma.com/pdfs/BNF78/Table2.pdf) (nephrotoxicity)
- Didanosine is predicted to increase the risk of pancreatitis when given with pentamidine. Avoid. [Severe]
  - Study
- Fludarabine increases the risk of hypocalcaemia when given with pentamidine. [Severe]
  - Anecdotal
  - Also see [TABLE 2 p. 1375](https://www.getintopharma.com/pdfs/BNF78/Table2.pdf)

**Pentazocine**
-» see opioids

**Pentostatin**
- See [TABLE 15 p. 1378](https://www.getintopharma.com/pdfs/BNF78/Table15.pdf) (myelosuppression), [TABLE 5 p. 1375](https://www.getintopharma.com/pdfs/BNF78/Table5.pdf) (thromboembolism)
- Aldizing agents (cyclophosphamide) (high-dose) increase the risk of toxicity when given with pentostatin. Avoid. [Severe]
  - Anecdotal
  - Also see [TABLE 15 p. 1378](https://www.getintopharma.com/pdfs/BNF78/Table15.pdf) → Also see [TABLE 5 p. 1375](https://www.getintopharma.com/pdfs/BNF78/Table5.pdf)

**Pentoxifylline**
- Pentoxifylline is predicted to increase the concentration of aminohippurate. Use with caution or avoid. [Severe]
  - Theoretical
- Quinolones (ciprofloxacin) very slightly increase the exposure to pentoxifylline. [Moderate]
  - Study
- Pentoxifylline increases the concentration of theophylline. Monitor and adjust dose. [Severe]
  - Study
  - Also see [TABLE 15 p. 1378](https://www.getintopharma.com/pdfs/BNF78/Table15.pdf)

**Peppermint oil**
- Peppermint oil is predicted to increase the exposure to lomitaipide. Separate administration by 12 hours. [Moderate]
  - Theoretical

**Perampanel**
- See antiepileptics

**Perazine**
- See dopamine receptor agonists

**Pericyazine**
- See phenothiazines

**Perindopril**
- See ACE inhibitors

**Pertuzumab**
- See monoclonal antibodies

**Pethidine**
- See opioids

**Phenelzine**
- See monoamine-oxidase A and B inhibitors, irreversible

**Phenindione**
- See [TABLE 3 p. 1375](https://www.getintopharma.com/pdfs/BNF78/Table3.pdf) (anticoagulant effects)

**FOOD AND LIFESTYLE**

The effects of phenindione can be reduced or abolished by vitamin K, including that found in foods, foot supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control.

- Antiarrhythmics (propafenone) are predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. [Moderate]
  - Theoretical
- Antifungals, azoles (miconazole) greatly increase the anticoagulant effect of phenindione. [Severe]
  - Theoretical
- Axitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Bosutinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Cabozantinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Cephalexins (ceftiraxone) potentially increase the risk of bleeding events when given with phenindione. [Severe]
  - Anecdotal
- Corticosteroids are predicted to increase the effects of phenindione. [Moderate]
  - Anecdotal
- Crizotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Dasatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Disulfiram is predicted to increase the anticoagulant effect of phenindione. [Severe]
  - Theoretical
- Enteral feeds (vitamin-K containing) potentially decrease the effects of phenindione. [Severe]
  - Theoretical
- Erlotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Fibrates are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe]
  - Study
- Gefitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- H1 receptor antagonists (cimetidine) increase the exposure to phenindione. [Severe]
  - Theoretical
- Imatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Lapatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Nandrolone is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. [Severe]
  - Theoretical
- Nilotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Oxymetholone increases the anticoagulant effect of phenindione. [Severe]
  - Anecdotal
- Paracetalol is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Penicillins are predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Pentoxifylline is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Ranibizumab is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Regorafenib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Ruxolitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Sorafenib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Statins (rosuvastatin) are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe]
  - Theoretical
- Sunitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical
- Vandetanib is predicted to increase the risk of bleeding events when given with phenindione. [Severe]
  - Theoretical

**Phenobarbital**
- See antiepileptics

**Phenothiazines**
- See [TABLE 8 p. 1376](https://www.getintopharma.com/pdfs/BNF78/Table8.pdf) (hypotension), [TABLE 9 p. 1377](https://www.getintopharma.com/pdfs/BNF78/Table9.pdf) (QT-interval prolongation), [TABLE 11 p. 1377](https://www.getintopharma.com/pdfs/BNF78/Table11.pdf) (CNS depressant effects), [TABLE 10 p. 1377](https://www.getintopharma.com/pdfs/BNF78/Table10.pdf) (antimuscarinic)

- Chlorpromazine, fluphenazine, levomepromazine, pericyazine, prochlorperazine, promazine, trifluoperazine

**FOOD AND LIFESTYLE**

Chlorpromazine and fluphenazine dose adjustment might be necessary if smoking started or stopped during treatment.

- Phenothiazines are predicted to decrease the effects of amfetamines and amphetamine. They are predicted to decrease the effects of phenothiazines. [Moderate]
  - Study
- Antacids decrease the absorption of phenothiazines. [Moderate]
  - Anecdotal
- Chlorpromazine decreases the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) decrease the concentration of chlorpromazine. [Moderate]
  - Study
  - Also see [TABLE 11 p. 1377](https://www.getintopharma.com/pdfs/BNF78/Table11.pdf)
- Chlorpromazine is predicted to increase the risk of hypotension when given with desmopressin. [Severe]
  - Theoretical
- Phenothiazines are predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate]
  - Theoretical
  - Also see [TABLE 8 p. 1376](https://www.getintopharma.com/pdfs/BNF78/Table8.pdf) → Also see [TABLE 9 p. 1377](https://www.getintopharma.com/pdfs/BNF78/Table9.pdf) → Also see [TABLE 10 p. 1377](https://www.getintopharma.com/pdfs/BNF78/Table10.pdf)
- Phenothiazines are predicted to decrease the antihypertensive effects of guanethidine. [Moderate]
  - Theoretical
  - Also see [TABLE 8 p. 1376](https://www.getintopharma.com/pdfs/BNF78/Table8.pdf)
- Phenothiazines decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. [Severe]
  - Study
  - Also see [TABLE 8 p. 1376](https://www.getintopharma.com/pdfs/BNF78/Table8.pdf)
- Phenothiazines potentially increase the risk of neurotoxicity when given with lithium. [Severe]
  - Anecdotal
  - Also see [TABLE 9 p. 1377](https://www.getintopharma.com/pdfs/BNF78/Table9.pdf)
- Chlorpromazine decreases the effects of metyrapone. Avoid. [Moderate]
  - Theoretical
Phenothiazines – Phosphodiesterase type-5 inhibitors 1513

Aprepitant is predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. [Moderate] Study

Aprepitant is predicted to increase the exposure to tadafalif. [Severe] Theoretical

Aprepitant is predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical

Bosentan decreases the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to vardenafil. Adjust vardenafil dose, p. 812. [Moderate] Theoretical → Also see TABLE 8 p. 1376

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tadafalif. [Severe] Theoretical → Also see TABLE 8 p. 1376

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to vardenafil. Adjust vardenafil dose, p. 812. [Moderate] Theoretical → Also see TABLE 8 p. 1376

Calcium channel blockers are predicted to increase the exposure to tadafalif. [Severe] Theoretical → Also see TABLE 8 p. 1376

Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study

Cobicistat is predicted to increase the exposure to tadafalif. [Severe] Theoretical → Also see TABLE 9 p. 1377

Cobicistat is predicted to increase the exposure to vardenafil. Avoid. [Severe] Study

Crizotinib is predicted to increase the exposure to avanafil. Adjust avanafil dose, p. 812. [Moderate] Theoretical

Crizotinib is predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. [Moderate] Study → Also see TABLE 9 p. 1377

Crizotinib is predicted to increase the exposure to tadafalif. [Severe] Theoretical

Crizotinib is predicted to increase the exposure to tadafalif. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1377

Eflavirenz is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Theoretical → Also see TABLE 9 p. 1377

Enzalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). [Moderate] Theoretical

Efavirenz moderately decreases the exposure to phosphodiesterase type-5 inhibitors. Adjust dose. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to phosphodiesterase type-5 inhibitors. Use with caution or avoid. [Moderate] Study

HIV-protease inhibitors are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 9 p. 1377

HIV-protease inhibitors are predicted to increase the exposure to sildenafil. Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 813. [Severe] Study → Also see TABLE 9 p. 1377

HIV-protease inhibitors are predicted to increase the exposure to tadafalif. Use with caution or avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to sildenafil. Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 813. [Severe] Study

Idelalisib is predicted to increase the exposure to tadafalif. Use with caution or avoid. [Severe] Study

Imatinib is predicted to increase the exposure to avanafil. Adjust avanafil dose, p. 812. [Moderate] Theoretical

Imatinib is predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. [Moderate] Study

α-Blockers cause significant hypotensive effects when given with phosphodiesterase type-5 inhibitors. Patients should be stabilised on first drug then second drug should be added at the lowest recommended dose. [Severe] Study → Also see TABLE 8 p. 1376

Antiarrhythmics (dronedarone) are predicted to increase the exposure to sildenafil. Adjust avanafil dose, p. 812. [Moderate] Theoretical

Antiarrhythmics (dronedarone) are predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. [Moderate] Study → Also see TABLE 9 p. 1377

Antiarrhythmics (dronedarone) are predicted to increase the exposure to tadafalif. [Severe] Theoretical

Antiarrhythmics (dronedarone) are predicted to increase the exposure to vardenafil. Adjust dose. [Severe] Theoretical → Also see TABLE 9 p. 1377

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadafalif). Avoid. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to avanafil. Adjust avanafil dose, p. 812. [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. [Moderate] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to tadafalif. [Severe] Theoretical

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to vardenafil. Use caution or avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to sildenafil. Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 813. [Severe] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tadafalif. [Severe] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vardenafil. Use caution or avoid. [Severe] Study

Antifungals, azoles (micronazole) are predicted to increase the exposure to sildenafil. Use with caution and adjust dose. [Severe] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 9 p. 1377

Apalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, sildenafil, vardenafil). Avoid or monitor. [Moderate] Study → Also see TABLE 9 p. 1377

Aprepitant is predicted to increase the exposure to avanafil. Adjust avanafil dose, p. 812. [Moderate] Theoretical

Moclobemide increases the risk of side-effects when given with levomepromazine. [Moderate] Study

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of neuroleptic malignant syndrome when given with phenothiazines. [Severe] Theoretical → Also see TABLE 8 p. 1376

Phenothiazines are predicted to increase the exposure to sildenafil. [Extensive] Study

Phenothiazines are predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. [Moderate] Study → Also see TABLE 8 p. 1376

Phenothiazines are predicted to increase the exposure to sildenafil. Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 813. [Severe] Study

Phenothiazines are predicted to increase the exposure to sildenafil. Use with caution or avoid. [Severe] Study

Phenothiazines are predicted to increase the exposure to sildenafil. Theoretical

Phenothiazines are predicted to increase the exposure to sildenafil. Adjust dose, p. 812. [Moderate] Theoretical

Phenothiazines are predicted to increase the exposure to sildenafil. Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 813. [Severe] Study

Phenothiazines are predicted to increase the exposure to sildenafil. Theoretical

Phenothiazines are predicted to increase the exposure to sildenafil. Avoid. [Severe] Study

Phenothiazines are predicted to increase the exposure to sildenafil. Theoretical

Phenothiazines are predicted to increase the exposure to sildenafil. Theoretical

Phenothiazines are predicted to increase the exposure to sildenafil. Avoid. [Severe] Study

Phenothiazines are predicted to increase the exposure to sildenafil. Theoretical
Phosphodiesterase type-5 inhibitors (continued)

- **Imatinib** is predicted to increase the exposure to tadalafil. Avoid. 

  - **Severe** Theoretical

- Imatinib is predicted to increase the exposure to vardenafil.

  - Adjust dose. 

  - **Severe** Theoretical

- Macrolides (clarithromycin) are predicted to increase the exposure to sildenafil. Avoid potent inhibitors of CYP3A4 or adjust sildenafil dose, p. 813. 

  - **Severe** Study 

  - Also see TABLE 9 p. 1377

- Macrolides (erythromycin) are predicted to increase the exposure to avanafil. Adjust avanafil dose, p. 812. 

  - **Moderate** Theoretical

- Macrolides (erythromycin) are predicted to increase the exposure to vardenafil. Adjust dose. 

  - **Severe** Theoretical 

  - Also see TABLE 8 p. 1376

- Mitotane is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil). Avoid. 

  - **Severe** Study

- Mitotane is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). 

  - **Moderate** Theoretical

- Netupitant is predicted to increase the exposure to avanafil. Adjust avanafil dose, p. 812. 

  - **Moderate** Theoretical

- Netupitant is predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. 

  - **Moderate** Study 

  - Also see TABLE 9 p. 1377

- Nitrofurantoin is predicted to increase the exposure to tadalafil. Adjust dose. 

  - **Severe** Theoretical

- Nitrofurantoin is predicted to increase the exposure to vardenafil. 

  - **Severe** Theoretical

- Nevirapine is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. 

  - **Moderate** Theoretical

- Nicorandil is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. 

  - Avoid. 

  - **Severe** Study 

  - Also see TABLE 9 p. 1377

- Nitrofurantoin is predicted to increase the exposure to avanafil. 

  - Adjust avanafil dose, p. 812. 

  - **Moderate** Theoretical

- Nitrofurantoin is predicted to increase the exposure to sildenafil. Monitor or adjust sildenafil dose with moderate inhibitors of CYP3A4, p. 813. 

  - **Moderate** Study 

  - Also see TABLE 9 p. 1377

- Nitrofurantoin is predicted to increase the exposure to tadalafil. 

  - **Severe** Theoretical

- Nitrofurantoin is predicted to increase the exposure to vardenafil. 

  - Adjust dose. 

  - **Severe** Theoretical 

  - Also see TABLE 8 p. 1376

- Ribociclib is predicted to increase the exposure to sildenafil. 

  - **Moderate** Theoretical 

  - Also see TABLE 9 p. 1377

- Rifampicin is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalafil). 

  - Avoid. 

  - **Severe** Study

- Rifampicin is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). 

  - **Moderate** Theoretical

- Riociguat is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. 

  - Avoid. 

  - **Severe** Theoretical 

  - Also see TABLE 8 p. 1376

- Phosphodiesterase type-5 inhibitors are predicted to increase the risk of hypotension when given with sapropterin. 

  - **Moderate** Theoretical 

  - Also see TABLE 8 p. 1376

- St John's Wort is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. 

  - **Moderate** Theoretical

Pibrentasvir

- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to aliskiren. 

  - **Moderate** Study

- Antiarrhythmics (amiodarone) are predicted to increase the exposure to pibrentasvir. 

  - **Moderate** Theoretical

- Antiarrhythmics (dronedarone) potentially increase the exposure to pibrentasvir. 

  - **Moderate** Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately to markedly decrease the exposure to pibrentasvir. 

  - Avoid. 

  - **Severe** Study

- Antiepileptics (eslicarbazepine, oxcarbazepine) potentially decrease the exposure to pibrentasvir. 

  - Avoid. 

  - **Severe** Theoretical

- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to pibrentasvir. 

  - **Moderate** Theoretical

- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). 

  - Avoid. 

  - **Moderate** Study

- Bosentan is predicted to decrease the exposure to pibrentasvir.

  - Avoid. 

  - **Severe** Study

- Calcium channel blockers (verapamil) are predicted to increase the exposure to pibrentasvir. 

  - **Moderate** Theoretical

- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to colchicine. 

  - **Moderate** Study

- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to digoxin. 

  - **Moderate** Study

- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to edoxaban. 

  - **Moderate** Study

- Efavirenz is predicted to decrease the exposure to pibrentasvir. 

  - Avoid. 

  - **Severe** Study

- Enalaprilat is predicted to moderately to markedly decrease the exposure to pibrentasvir. 

  - Avoid. 

  - **Severe** Study

- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to everolimus. 

  - **Moderate** Study

- HIV-protease inhibitors (atazanavir, lopinavir) (boosted with ritonavir) increase the exposure to pibrentasvir. 

  - Avoid. 

  - **Severe** Study

- HIV-protease inhibitors (ritonavir) potentially increase the exposure to pibrentasvir. 

  - **Severe** Theoretical

- HIV-protease inhibitors (saquinavir) are predicted to increase the exposure to pibrentasvir. 

  - **Moderate** Theoretical

- Lapatinib is predicted to increase the exposure to pibrentasvir. 

  - **Theoretical**

- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to lopinavir. 

  - **Moderate** Study

- Lumacaftor potentially decreases the exposure to pibrentasvir. 

  - Avoid. 

  - **Theoretical**

- Macrolides are predicted to increase the exposure to pibrentasvir. 

  - Avoid. 

  - **Severe** Study

- Mitotane is predicted to moderately to markedly decrease the exposure to pibrentasvir. 

  - Avoid. 

  - **Severe** Study

- Nevirapine is predicted to decrease the exposure to pibrentasvir. 

  - Avoid. 

  - **Severe** Study

- Ranolazine is predicted to increase the exposure to pibrentasvir. 

  - **Moderate** Study

- Rifampicin is predicted to decrease the exposure to pibrentasvir. 

  - Avoid. 

  - **Severe** Study

- St John's Wort is predicted to decrease the exposure to pibrentasvir. 

  - Avoid. 

  - **Severe** Study

- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to stanno (atorvastatin). 

  - Avoid. 

  - **Severe** Study

- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to statins (fluvastatin). 

  - **Moderate** Theoretical

- Pibrentasvir (with glecaprevir) increases the exposure to statins (pravastatin). 

  - Use with caution and adjust pravastatin dose. 

  - **Moderate** Study
Pibrentasvir – Pitolisant

**Pibrentasvir** (with glecaprevir) increases the exposure to statins (rosuvastatin). Use with caution and adjust rosuvastatin dose, p. 204. (Moderate) Study

**Pibrentasvir** (with glecaprevir) increases the exposure to statins (simvastatin). Avoid. (Moderate) Study

**Pibrentasvir** (with glecaprevir) slightly increases the exposure to tacrolimus. Monitor and adjust dose. (Mild) Study

**Pibrentasvir** (with glecaprevir) is predicted to increase the exposure to taxanes (paclitaxel). (Moderate) Study

**Pibrentasvir** (with glecaprevir) is predicted to increase the exposure to topotecan. (Moderate) Study

**Vemurafenib** is predicted to increase the exposure to pibrentasvir. (Moderate) Theoretical

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

**Pimecrolimus**
- **Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical pimecrolimus. (Moderate) Study

**Pimecrolimus** is predicted to decrease the efficacy of mifamurtide. Avoid. (Severe) Theoretical

**Pimozone** → see **TABLE 8** p. 1376 (hypotension), **TABLE 9** p. 1377 (QT-interval prolongation), **TABLE 11** p. 1377 (CNS depressant effects), **TABLE 10** p. 1377 (antimuscarnics)

**Antiepileptics**
- **Antihistamines, sedating** are predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical → Also see **TABLE 9** p. 1377

**Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical → Also see **TABLE 9** p. 1377

**Antifungals, azoles (fluconazole, itasucronazole, posaconazole)** are predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical → Also see **TABLE 9** p. 1377

**Ciclosporin**
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical → Also see **TABLE 8** p. 1376

**Clobazam** is predicted to increase the exposure to pimozone. Avoid. (Severe) Study

**Crisantropin** is predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical

**Pimozone** is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see **TABLE 8** p. 1376 → Also see **TABLE 9** p. 1377 → Also see **TABLE 10** p. 1377

**Fosaprepitant** is predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical

**Grapefruit juice** increases the exposure to pimozone. Avoid. (Severe) Theoretical

**HIV protease inhibitors** are predicted to increase the exposure to pimozone. Avoid. (Severe) Study → Also see **TABLE 9** p. 1377

**Idelalisib** is predicted to increase the exposure to pimozone. Avoid. (Severe) Study

**Imatinib** is predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical

**Leteomorfin** is predicted to increase the concentration of pimozone. Avoid. (Severe) Theoretical

**Pimozone** decreases the effects of levodopa. (Severe) Theoretical → Also see **TABLE 8** p. 1376

**Macrolides** (clarithromycin) are predicted to increase the exposure to pimozone. Avoid. (Severe) Study → Also see **TABLE 9** p. 1377

**Macrolides** (erythromycin) are predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical → Also see **TABLE 9** p. 1377

**Netupitant** is predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical

**Nilotinib** is predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical → Also see **TABLE 9** p. 1377

**Palbociclib** is predicted to increase the exposure to pimozone. Adjust dose. (Moderate) Theoretical

**Panobinostat** is predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical → Also see **TABLE 9** p. 1377

**Pitolisant** is predicted to decrease the exposure to pimozone. Avoid. (Severe) Theoretical

**Ribociclib** (high-dose) is predicted to increase the exposure to pimozone. Avoid. (Moderate) Theoretical → Also see **TABLE 9** p. 1377

**Rolapitant** is predicted to increase the exposure to pimozone. (Severe) Study

**Rucaparib** is predicted to increase the exposure to pimozone. Monitor and adjust dose. (Moderate) Study

**Pindolol** → see beta blockers, non-selective

**Pioglitazone** potentially decreases the exposure to antifungals, azoles (itraconazole). Use with caution or avoid. (Moderate) Theoretical

**Clopigogrel** increases the exposure to pioglitazone. Monitor blood glucose and adjust dose. (Severe) Study

**Fibrate (gemfibrozil)** increase the exposure to pioglitazone. Monitor blood glucose and adjust dose. (Severe) Study

**Leflunomide** is predicted to increase the exposure to pioglitazone. (Moderate) Study

**Oticapone** is predicted to increase the exposure to pioglitazone. (Moderate) Study

**Pioglitazone** decreases the exposure to pioglitazone. (Severe) Study

**Teriflunomide** is predicted to decrease the exposure to pioglitazone. (Moderate) Study

**Piperacillin** → see penicillins

**Piperazine** → see antimalarials

**Pirfenidone**

**FOOD AND LIFESTYLE** Smoking increases pirfenidone clearance; patients should be encouraged to stop smoking before and during treatment with pirfenidone.

- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to pirfenidone. (Moderate) Theoretical

- **Combined hormonal contraceptives** are predicted to increase the exposure to pirfenidone. Use with caution and adjust dose. (Moderate) Study

**HIV protease inhibitors** (ritonavir) are predicted to decrease the exposure to pirfenidone. (Moderate) Theoretical

**Leflunomide** is predicted to decrease the exposure to pirfenidone. (Moderate) Theoretical

- **SSRIs (fluvoxamine)** are predicted to moderately increase the exposure to pirfenidone. Avoid. (Moderate) Study

**Teriflunomide** is predicted to decrease the exposure to pirfenidone. (Moderate) Theoretical

**Piroxicam** → see NSAIDs

**Pitolisant**
- **Pitolisant** is predicted to decrease the exposure to aliskiren. (Mild) Theoretical

**Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to pitolisant. (Moderate) Study

**Pitolisant** is predicted to decrease the exposure to antihistamines, non-sedating (fexofenadine). (Mild) Theoretical

**Antihistamines, sedating** are predicted to decrease the efficacy of pitolisant. (Moderate) Theoretical

**Pitolisant** is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical

**Bupropion** is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. (Moderate) Study

**Pitolisant** is predicted to decrease the exposure to ciclosporin. Avoid. (Severe) Theoretical
Pitolisant (continued)

- Cinnarizine is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to colchicine. [Hard] Theoretical
- Pitolisant is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to coumarins (warfarin). [Hard] Theoretical
- Pitolisant is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to dabigatran. [Hard] Theoretical
- Pitolisant is predicted to decrease the exposure to dasatinib. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to digoxin. [Hard] Theoretical
- Duloxetine is predicted to increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to efavirenz. [Hard] Theoretical
- Enzalutamide is predicted to moderately decrease the exposure to pitolisant. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to everolimus. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to irinotecan. [Hard] Theoretical
- Pitolisant is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to loperamide. [Hard] Theoretical
- Pitolisant is predicted to increase the exposure to metformin. [Hard] Theoretical
- Mianserin is predicted to decrease the efficacy of pitolisant. [Moderate] Theoretical
- Mirtazapine is predicted to decrease the efficacy of pitolisant. [Moderate] Theoretical
- Mitotane is predicted to moderately decrease the exposure to pitolisant. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to paracetamol. [Hard] Theoretical
- Pitolisant is predicted to decrease the exposure to pimozide. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to repaglinide. [Hard] Theoretical
- Rifampicin is predicted to moderately decrease the exposure to pitolisant. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to sirolimus. Avoid. [Severe] Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to topotecan. Avoid. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to temsirolimus. Avoid. [Severe] Theoretical
- Terbinafine is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to topotecan. [Hard] Theoretical
- Tricyclic antidepressants are predicted to decrease the efficacy of pitolisant. [Hard] Theoretical

- Venlafaxine is predicted to increase the exposure to pitolisant. Use with caution and adjust dose. [Hard] Theoretical
- Pivmecillinam → see penicillins
- Pixintrone → see antracyclines
- Pizotifen → see antihistamines, sedating
- Platinum compounds → see TABLE 15 p. 1378 (myelosuppression), TABLE 2 p. 1378 (neutropenia), TABLE 19 p. 1379 (ototoxicity), TABLE 12 p. 1378 (peripheral neuropathy)
- Carboplatin - cisplatin - oxaliplatin
- Cisplatin increases the risk of pulmonary toxicity when given with bleomycin. [Severe] Study → Also see TABLE 15 p. 1378
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with platinum compounds. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Polyoxymyxins → see TABLE 2 p. 1375 (neurotoxicity), TABLE 20 p. 1379 (neuromuscular blocking effects)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Polyostyrene sulfonate

SEPARATION OF ADMINISTRATION Manufacturers advise take other drugs at least 3 hours before or after calcium- or sodium-polyostyrene sulfonate; a 6-hour separation should be considered in gastroparesis.

- Antacids increase the risk of metabolic alkalosis when given with polyostyrene sulfonate. [Severe] Anecdotal

Pomalidomide → see TABLE 15 p. 1378 (myelosuppression), TABLE 5 p. 1375 (thromboembolism)

- Combined hormonal contraceptives are predicted to increase the risk of venous thromboembolism when given with pomalidomide. Avoid. [Severe] Theoretical
- Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with pomalidomide. [Severe] Theoretical
- Quinolones (ciprofloxacin) are predicted to increase the exposure to pomalidomide. Adjust pomalidomide dose, p. 961. [Moderate] Theoretical
- Pomalidomide, (itraconazole, ketoconazole, voriconazole) are predicted to decrease the exposure to pomalidomide. Adjust pomalidomide dose, p. 961. [Moderate] Study

- Antipiepletics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to pomalidomide. Avoid. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to pomalidomide. Monitor and adjust pomalidomide dose, p. 994. [Moderate] Study
- Cobrincistat is predicted to slightly increase the exposure to pomalidomide. Monitor and adjust pomalidomide dose, p. 994. [Moderate] Study
- Ponatinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to ponatinib. [Moderate] Theoretical
- HIV-protease inhibitors are predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 994. [Moderate] Study
- Idelalisib is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 994. [Moderate] Study
- Macrolides (clarithromycin) are predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 994. [Moderate] Study
- Mitotane is predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical
- Ponatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to ponatinib. Avoid. [Severe] Theoretical
Posaconazole → see antifungals, azoles
Potassium aminobenzoate → see TABLE 16 p. 1379 (increased serum potassium)
  » Potassium aminobenzoate increases the concentration of methotrexate. (Moderate) Theoretical
  » Potassium aminobenzoate is predicted to affect the efficacy of sulfonamides. Avoid. (Severe) Theoretical
Potassium canrenoate → see TABLE 16 p. 1379 (increased serum potassium)
Potassium chloride → see TABLE 16 p. 1379 (increased serum potassium)
Potassium citrate
  » Potassium citrate is predicted to decrease the efficacy of methenamine. Avoid. (Moderate) Theoretical
  » Potassium citrate increases the risk of side-effects when given with primidone. Avoid. (Moderate) Theoretical
Potassium-sparing diuretics → see TABLE 18 p. 1379 (hypotension), TABLE 16 p. 1379 (increased serum potassium)
milrinone - triamterene
  » Triamterene potentially increases the clearance of lithium. (Moderate) Study
Pramipexole → see dopamine receptor agonists
Prasugrel
  → see statins
Praziquantel
  » Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to praziquantel. Avoid. (Moderate) Study
  » Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to praziquantel. (Mild) Study
  » Antimalarials (chloroquine) moderately decrease the exposure to praziquantel. Use with caution and adjust dose. (Moderate) Study
  » Cocystis is predicted to moderately increase the exposure to praziquantel. (Mild) Study
  » Corticosteroids (dexamethasone) increase the exposure to praziquantel. (Moderate) Study
  » Enalaprilat is predicted to markedly decrease the exposure to praziquantel. Avoid. (Moderate) Study
  » Grapefruit juice is predicted to increase the exposure to praziquantel. (Moderate) Study
  » H₂ receptor antagonists (cimetidine) moderately increase the exposure to praziquantel. (Mild) Study
  » HIV-protease inhibitors are predicted to moderately increase the exposure to praziquantel. (Mild) Study
  » Idealisil is predicted to moderately increase the exposure to praziquantel. (Mild) Study
  » Macrolides (clarithromycin) are predicted to moderately increase the exposure to praziquantel. (Mild) Study
  » Mitotane is predicted to markedly decrease the exposure to praziquantel. (Mild) Study
  » Rifampicin is predicted to markedly decrease the exposure to praziquantel. Avoid. (Moderate) Study
Prazosin → see alpha blockers
Prednisolone → see corticosteroids
Pregabalin → see antiepileptics
Prilocaine → see anaesthetics, local
Primaquine → see antimalarials
Primidone → see antiepileptics
Procarbazine → see TABLE 15 p. 1378 (myelosuppression), TABLE 13 p. 1378 (serotonin syndrome)
  » Alcohol (beverage) potentially causes a disulfiram-like reaction when given with procarbazine. (Moderate) Anecdotal
  » Antiepileptics (carbamazepine, phenobarbital, phenytoin, primidone) are predicted to increase the risk of hypersensitivity reactions when given with procarbazine. (Severe) Anecdotal
  » Antiepileptics (fosphenytoin) are predicted to increase the risk of hypersensitivity when given with procarbazine. (Severe) Anecdotal
  » Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with procarbazine. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
Procyclidine → see phenothiazines
Procyclophosphamide → see TABLE 10 p. 1377 (antimuscarnics)
  » SSRIs (paroxetine) slightly increase the exposure to procyclidine. Monitor and adjust dose. (Moderate) Study
Propafenone → see antiarrhythmics
Propargylamine → see TABLE 13 p. 1377 (antimuscarnics)
Propiverine → see TABLE 10 p. 1377 (antimuscarnics)
  » Propiverine is predicted to increase the exposure to lomiptapide. Separate administration by 12 hours. (Moderate) Theoretical
Propofol → see TABLE 8 p. 1376 (hypotension), TABLE 11 p. 1377 (CNS depressant effects)
  » Antiepileptics (valproate) potentially increase the concentration of propofol. Adjust dose. (Severe) Theoretical
Propionol → see beta blockers, non-selective
Propylthiouracil → see TABLE 15 p. 1378 (myelosuppression)
  » Propylthiouracil is predicted to decrease the effects of metryrapone. Avoid. (Moderate) Theoretical
Proton pump inhibitors
esomeprazole - lansoprazole - omeprazole - pantoprazole - rabeprazole
  » Antifungals, azoles (voriconazole) increase the exposure to proton pump inhibitors (esomeprazole, omeprazole). Adjust dose. (Moderate) Study
  » Proton pump inhibitors decrease the absorption of antifungals, azoles (itraconazole). Administer itraconazole capsules with an acidic beverage. (Moderate) Study
  » Proton pump inhibitors decrease the absorption of antifungals, azoles (ketoconazole). Administer ketoconazole with an acidic beverage. (Moderate) Study
  » Proton pump inhibitors decrease the absorption of antifungals, azoles (posaconazole) (oral suspension). Avoid. (Moderate) Study
  » Apalutamide markedly decreases the exposure to omeprazole. Avoid or monitor. (Moderate) Study
  » Apalutamide is predicted to decrease the exposure to proton pump inhibitors (lansoprazole, rabeprazole). Avoid or monitor. (Mild) Study
  » Proton pump inhibitors are predicted to decrease the absorption of bosutinib. (Moderate) Study
  » Proton pump inhibitors are predicted to decrease the absorption of ceritinib. (Moderate) Theoretical
  » Esomeprazole is predicted to increase the exposure to ceritinib. (Moderate) Theoretical
  » Omeprazole is predicted to increase the exposure to cilostazol. Adjust cilostazol dose, p. 232. (Moderate) Study
  » Proton pump inhibitors (esomeprazole, omeprazole) potentially increase the exposure to cilobazam. Adjust dose. (Moderate) Theoretical
  » Proton pump inhibitors (esomeprazole, omeprazole) are predicted to decrease the efficacy of clonipidine. Avoid. (Moderate) Study
  » Proton pump inhibitors are predicted to slightly to moderately decrease the exposure to dasatinib. Avoid. (Severe) Study
  » Proton pump inhibitors are predicted to decrease the absorption of dipyridamole (immediate release tablets). (Moderate) Theoretical
  » Proton pump inhibitors are predicted to slightly decrease the exposure to erlotinib. Avoid. (Moderate) Study
  » Proton pump inhibitors are predicted to decrease the exposure to gefitinib. (Severe) Theoretical
  » HIV-protease inhibitors (tipranavir) decrease the exposure to proton pump inhibitors. Avoid. (Severe) Study
  » Proton pump inhibitors decrease the exposure to HIV-protease inhibitors (atazanavir). Avoid or adjust dose. (Severe) Study
Proton pump inhibitors (continued)

- Proton pump inhibitors increase the exposure to HIV-protease inhibitors (saquinavir). Avoid. (Severe) Study
- Proton pump inhibitors are predicted to decrease the exposure to ledipasvir. Adjust dose, see ledipasvir with sofosbuvir p. 628. (Moderate) Theoretical
- Proton pump inhibitors decrease the clearance of methotrexate (high-dose). Use with caution or avoid. (Severe) Study
- Proton pump inhibitors are predicted to decrease the exposure to pazopanib. Avoid or administer concurrently without food. (Moderate) Study
- Proton pump inhibitors are predicted to decrease the exposure to ripilivirine. Avoid. (Severe) Study
- Proton pump inhibitors potentially decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with velpatasvir p. 629, and sofosbuvir with velpatasvir and voxilaprevir p. 630. (Moderate) Study
- Esomeprazole is predicted to slightly to moderately increase the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. (Severe) Study
- Omeprazole slightly to moderately increases the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. (Severe) Study
- Proton pump inhibitors are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir p. 629. (Moderate) Study
- Proton pump inhibitors are predicted to decrease the exposure to voxilaprevir. Adjust dose, see sofosbuvir with velpatasvir and voxilaprevir p. 630. (Moderate) Study
- Pseudoephedrine → see anaesthetics, local
- Quinazinamide
  - Allopurinol is predicted to increase the risk of hyperuricaemia when given with pyrazinamide. (Moderate) Theoretical
- Pyridostigmine → see TABLE 6 p. 1376 (bradycardia)
- Aminoglycosides are predicted to decrease the effects of pyridostigmine. (Moderate) Theoretical
- Pyrimethamine → see antimalarials
- Quetiapine → see TABLE 8 p. 9 1376 (hypotension), TABLE 11 p. 1377 (CNS depressant effects)
- Antiarthrythmics (dronedarone) are predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to quetiapine. (Moderate) Study → Also see TABLE 11 p. 1377
- Antiepileptics (valproate) potentially increase the risk of neuropenia when given with quetiapine. (Moderate) Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study
- Apalutamide is predicted to decrease the exposure to quetiapine. Avoid or monitor. (Moderate) Study
- Apraciptan is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study
- Bosentan is predicted to decrease the exposure to quetiapine. (Moderate) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study → Also see TABLE 8 p. 9 1376
- Cobicistat is predicted to increase the exposure to quetiapine. Avoid. (Severe) Study
- Crizotinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study
- Quetiapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 9 1376
- Efavirenz is predicted to decrease the exposure to quetiapine. (Moderate) Study
- Enalapril is predicted to decrease the exposure to quetiapine. (Moderate) Study
- Grapefruit juice is predicted to increase the exposure to quetiapine. Avoid. (Severe) Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study
- Idelelisib is predicted to increase the exposure to quetiapine. Avoid. (Severe) Study
- Imatinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study
- Quetiapine decreases the effects of levodopa. (Severe) Anecdotal → Also see TABLE 8 p. 1376
- Quetiapine potentially increases the risk of neurotoxicity when given with lithium. (Severe) Anecdotal
- Macrolides (clarithromycin) are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study
- Macrolides (erythromycin) are predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study
- Mitotane is predicted to decrease the exposure to quetiapine. (Moderate) Study
- Netupitant is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study
- Nilotinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study
- Ribociclib (high-dose) is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Theoretical
- Rifampicin is predicted to decrease the exposure to quetiapine. (Moderate) Study
- St John’s Wort is predicted to decrease the exposure to quetiapine. (Moderate) Study
- Quinagolide → see dopamine receptor agonists
- Quinapril → see ACE inhibitors
- Quinine → see antimalarials
- Quinolones → see TABLE 9 p. 9 1377 (QT-interval prolongation)

  - Ciprofloxacin - levofloxacin - moxifloxacin - ofloxacin
  - Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
  - Interactions do not generally apply to topical use of moxifloxacin unless specified.
  - Ciprofloxacin is predicted to increase the exposure to agomelatine. (Moderate) Study
  - Ciprofloxacin is predicted to increase the exposure to aminophylline. Adjust dose. (Moderate) Theoretical
  - Ciprofloxacin is predicted to increase the exposure to anagrelide. (Moderate) Theoretical
  - Antacids decrease the absorption of quinolones. Quinolones should be taken 2 hours before or 4 hours after antacids. (Moderate) Study
  - Ciprofloxacin slightly increases the exposure to antiarrhythmics (lidocaine). (High) Study
  - Ciprofloxacin affects the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Study
  - Calcium salts (calcium carbonate) decrease the absorption of ciprofloxacin. Separate administration by 2 hours. (Moderate) Study
  - Ciprofloxacin increases the concentration of clozapine. Monitor side effects and adjust dose. (Severe) Study
  - Quinolones increase the anticoagulant effect of coumarins. (Severe) Anecdotal
  - Didanosine (buffered) is predicted to greatly decrease the exposure to oral quinolones. Didanosine should be taken 2 hours after quinolones. (Moderate) Study
  - Ciprofloxacin is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. (Moderate) Study
  - Ciprofloxacin is predicted to increase the exposure to duloxetine. Avoid. (Moderate) Theoretical
  - Ciprofloxacin is predicted to increase the exposure to eliglustat. Avoid or adjust dose—consult product literature. (Severe) Theoretical
  - Enteral feeds decrease the exposure to ciprofloxacin. (Moderate) Study
  - Ciprofloxacin slightly increases the exposure to erlotinib. Monitor side effects and adjust dose. (Moderate) Study
  - Ciprofloxacin is predicted to increase the exposure to ibrutinib. Adjust ibrutinib dose, p. 983. (Severe) Theoretical

www.getintopharma.com
Quinolones – Ranolazine

Interactions | Appendix 1

- Iron (oral) decreases the exposure to quinolones. Separate administration by at least 2 hours. Moderate Study
- Lanthanum moderately decreases the exposure to quinolones. Quinolones should be taken 2 hours before or 4 hours after lanthanum. Moderate Study
- Leflunomide is predicted to increase the exposure to ciprofloxacin. Moderate Theoretical
- Ciprofloxacin is predicted to increase the exposure to cloxacillin. Avoid. Unknown Theoretical
- Ciprofloxacin is predicted to increase the exposure to methotrexate. Severe Anecdotal
- Ciprofloxacin slightly increases the exposure to monoamine-oxidase B inhibitors (rasagiline). Moderate Study
- NSAIDs potentially increase the risk of seizures when given with quinolones. Severe Theoretical
- Ciprofloxacin is predicted to increase the exposure to olanzapine. Adjust dose. Moderate Anecdotal
- Ciprofloxacin very slightly increases the exposure to pentoxyfylline. Moderate Study
- Ciprofloxacin is predicted to increase the exposure to pirfenidone. Use with caution and adjust dose. Moderate Study
- Ciprofloxacin is predicted to increase the exposure to pomalidomide. Adjust pomalidomide dose, p. 961. Moderate Theoretical
- Ciprofloxacin is predicted to increase the exposure to rifuzole. Moderate Theoretical
- Ciprofloxacin is predicted to increase the exposure to tolvaptan. Use with caution and adjust tolvaptan dose, p. 669. Moderate Theoretical
- Zinc is predicted to decrease the exposure to quinolones. Separate administration by 2 hours. Moderate Study
- Ciprofloxacin is predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. Moderate Theoretical
- Rabeprazole → see proton pump inhibitors
- Rabies immunoglobulin → see immunoglobulins
- Rabies vaccine
  - Antimalarial (chloroquine) decrease the efficacy of rabies vaccine. Avoid. Moderate Study
  - Hydroxychloroquine is predicted to decrease efficacy of rabies vaccine. Moderate Theoretical
- Raloxifene → see Table 5 p. 1375 (thromboembolism)
  - Combined hormonal contraceptives potentially oppose the effects of raloxifene. Avoid. Severe Theoretical
  - Hormone replacement therapy potentially opposes the effects of raloxifene. Avoid. Severe Theoretical
- Raltegravir
  - Antacids slightly decrease the exposure to raltegravir. Avoid. Moderate Study
  - Antiepileptics (carbamazepine) are predicted to affect the exposure to raltegravir. Moderate Theoretical
  - Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to affect the exposure to raltegravir. Use with caution or avoid. Moderate Theoretical
  - Calcium salts (calcium carbonate) greatly decrease the exposure to raltegravir (high-dose). Avoid. Severe Study
  - Encorafenib is predicted to increase the exposure to raltegravir. Moderate Theoretical
  - HIV-protease inhibitors (atazanavir) increase the exposure to raltegravir (high-dose). Avoid. Moderate Study
  - HIV-protease inhibitors (darunavir) increase the risk of rash when given with raltegravir. Moderate Study
  - HIV-protease inhibitors (fosamprenavir) (boosted with ritonavir) decrease the exposure to raltegravir and raltegravir decreases the exposure to HIV-protease inhibitors (fosamprenavir) (boosted with ritonavir). Avoid. Severe Study
  - HIV-protease inhibitors (tritapevir boosted with ritonavir) are predicted to decrease the exposure to raltegravir (high-dose). Avoid. Moderate Study
  - Rifampicin slightly decreases the exposure to raltegravir. Avoid or adjust dose—consult product literature. Moderate Study
- Raltitrexed → see Table 15 p. 1378 (myelosuppression)
- Folates are predicted to alter the effects of raltitrexed. Avoid. Moderate Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with raltitrexed. Public Health England advises avoid (refer to Green Book). Severe Theoretical
- Ramipril → see ACE inhibitors
- Ramucirumab → see monoclonal antibodies
- Ranibizumab
  - Ranibizumab is predicted to increase the risk of bleeding events when given with argatroban. Severe Theoretical
  - Ranibizumab is predicted to increase the risk of bleeding events when given with bivalirudin. Moderate Theoretical
  - Ranibizumab increases the risk of bleeding events when given with coumarins. Severe Theoretical
  - Ranibizumab is predicted to increase the risk of bleeding events when given with danaparoid. Severe Theoretical
  - Ranibizumab increases the risk of bleeding events when given with heparin (unfractionated). Severe Theoretical
  - Ranibizumab increases the risk of bleeding events when given with low molecular-weight heparins. Severe Theoretical
  - Ranibizumab is predicted to increase the risk of bleeding events when given with phenindione. Severe Theoretical
- Ranitidine → see H₂ receptor antagonists
- Ranolazine → see Table 9 p. 1377 (QT-interval prolongation)
- Ranolazine is predicted to increase the exposure to aefatinib. Separate administration by 12 hours. Moderate Study
- Ranolazine is predicted to increase the exposure to aliskiren. Moderate Theoretical
- Antiarhythmics (dronedarone) are predicted to increase the exposure to ranolazine. Severe Study → Also see Table 9 p. 1377
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ranolazine. Avoid. Severe Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ranolazine. Severe Study → Also see Table 9 p. 1377
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ranolazine. Severe Study → Also see Table 9 p. 1377
- Aprepitant is predicted to increase the exposure to ranolazine. Severe Study
- Ranolazine is predicted to increase the exposure to beta blockers, non-selective (nadolol). Moderate Study
- Ranolazine is predicted to increase the exposure to bictegravir. Use with caution or avoid. Moderate Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ranolazine. Severe Study
- Ranolazine is predicted to increase the exposure to ceritinib. Moderate Theoretical → Also see Table 9 p. 1377
- Ciclosporin is predicted to increase the concentration of ranolazine and ranolazine is predicted to increase the concentration of ciclosporin. Moderate Theoretical
- Cobimetinib is predicted to increase the exposure to ranolazine. Severe Study → Also see Table 9 p. 1377
- Ranolazine is predicted to increase the exposure to dabigatran. Severe Theoretical
- Ranolazine increases the concentration of digoxin. Moderate Study
1520 Ranolazine — Repaglinide
Ranolazine (continued)
▶ Ranolazine is predicted to increase the exposure to dopamine
receptor agonists (pramipexole). Adjust dose. o Study
▶ Ranolazine is predicted to slightly increase the exposure to
edoxaban. r Theoretical
▶ Enzalutamide is predicted to decrease the exposure to
ranolazine. Avoid. r Study
▶ Ranolazine is predicted to increase the exposure to erlotinib.
o Theoretical
▶
▶
▶
▶
▶

Ranolazine is predicted to increase the exposure to
fidaxomicin. Avoid. o Study
Grapefruit juice is predicted to increase the concentration of
ranolazine. Avoid. r Theoretical
HIV-protease inhibitors are predicted to increase the exposure
to ranolazine. Avoid. r Study → Also see TABLE 9 p. 1377
Idelalisib is predicted to increase the exposure to ranolazine.
Avoid. r Study
Imatinib is predicted to increase the exposure to ranolazine.

BNF 78

▶

Idelalisib is predicted to increase the exposure to reboxetine.
Avoid. o Study
Reboxetine is predicted to increase the risk of a hypertensive
crisis when given with linezolid. Avoid. r Theoretical
▶ Reboxetine is predicted to increase the risk of hypokalaemia
when given with loop diuretics. o Theoretical
▶ Macrolides (clarithromycin) are predicted to increase the
exposure to reboxetine. Avoid. o Study
▶ Mitotane is predicted to decrease the exposure to reboxetine.
▶

o Anecdotal
▶
▶

▶

▶

r Study

o Anecdotal

▶

Ranolazine is predicted to increase the exposure to lomitapide.
Separate administration by 12 hours. o Theoretical
▶ Macrolides (clarithromycin) are predicted to increase the
exposure to ranolazine. Avoid. r Study → Also see TABLE 9

Interactions | Appendix 1

A1

▶

Reboxetine is predicted to increase the risk of hypokalaemia
when given with thiazide diuretics. o Anecdotal
Regorafenib → see TABLE 15 p. 1378 (myelosuppression), TABLE 4

p. 1377

p. 1375 (antiplatelet effects)

Macrolides (erythromycin) are predicted to increase the
exposure to ranolazine. r Study → Also see TABLE 9 p. 1377
▶ Mitotane is predicted to decrease the exposure to ranolazine.
Avoid. r Study
▶ Netupitant is predicted to increase the exposure to ranolazine.
▶

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to regorafenib. Avoid. o Study
▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
predicted to increase the exposure to regorafenib. Avoid.
▶

r Study
▶
▶

o Study

Nilotinib is predicted to increase the exposure to ranolazine.
r Study → Also see TABLE 9 p. 1377
Ranolazine is predicted to increase the exposure to nintedanib.

TABLE 9 p. 1377

▶

Ranolazine is predicted to increase the exposure to
pibrentasvir. o Theoretical
Rifampicin is predicted to decrease the exposure to ranolazine.
Avoid. r Study
St John’s Wort is predicted to decrease the exposure to
ranolazine. Avoid. r Study
Ranolazine is predicted to increase the exposure to statins
(atorvastatin). o Theoretical
Ranolazine slightly increases the exposure to statins
(simvastatin). Adjust simvastatin dose, p. 205. o Study
Ranolazine increases the concentration of tacrolimus. Adjust
dose. r Anecdotal
Ranolazine is predicted to increase the exposure to ticagrelor.
Use with caution or avoid. r Study
Ranolazine is predicted to increase the exposure to topotecan.
r Study

▶

Ranolazine is predicted to increase the concentration of
trametinib. o Theoretical
Ranolazine is predicted to increase the exposure to venetoclax.
Avoid or monitor for toxicity. r Theoretical
Rasagiline → see monoamine-oxidase B inhibitors
Reboxetine
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to reboxetine. o Anecdotal
▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
predicted to increase the exposure to reboxetine. Avoid.
▶

o Study

▶

Antifungals, azoles (miconazole) are predicted to increase the
concentration of reboxetine. Use with caution and adjust dose.
o Theoretical

▶
▶
▶

Reboxetine is predicted to increase the risk of a hypertensive
crisis when given with moclobemide. Avoid. r Theoretical
Reboxetine is predicted to increase the risk of a hypertensive
crisis when given with monoamine-oxidase A and B inhibitors,
irreversible. Avoid. r Theoretical
Reboxetine is predicted to increase the risk of a hypertensive
crisis when given with monoamine-oxidase B inhibitors
(rasagiline, selegiline). Avoid. r Theoretical
Rifampicin is predicted to decrease the exposure to reboxetine.

Regorafenib is predicted to increase the risk of bleeding events
when given with phenindione. r Theoretical
▶ Rifampicin is predicted to decrease the exposure to
regorafenib. Avoid. o Study
▶ Regorafenib is predicted to increase the exposure to statins
(atorvastatin, fluvastatin, rosuvastatin). o Study
▶ Regorafenib is predicted to increase the exposure to
sulfasalazine. o Study → Also see TABLE 15 p. 1378
▶ Regorafenib is predicted to increase the exposure to topotecan.
o Study → Also see TABLE 15 p. 1378
Remifentanil → see opioids
Repaglinide → see TABLE 14 p. 1378 (antidiabetic drugs)
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to repaglinide. Monitor blood glucose and adjust dose.
o Study
▶

Cobicistat is predicted to increase the exposure to reboxetine.
Avoid. o Study
Enzalutamide is predicted to decrease the exposure to
reboxetine. o Anecdotal
HIV-protease inhibitors are predicted to increase the exposure
to reboxetine. Avoid. o Study

Cobicistat is predicted to increase the exposure to regorafenib.
Avoid. o Study
Regorafenib is predicted to increase the risk of bleeding events
when given with coumarins. r Study
Enzalutamide is predicted to decrease the exposure to
regorafenib. Avoid. o Study
Grapefruit juice is predicted to increase the exposure to
regorafenib. Avoid. o Theoretical
HIV-protease inhibitors are predicted to increase the exposure
to regorafenib. Avoid. o Study
Idelalisib is predicted to increase the exposure to regorafenib.
Avoid. o Study → Also see TABLE 15 p. 1378
Macrolides (clarithromycin) are predicted to increase the
exposure to regorafenib. Avoid. o Study
Regorafenib is predicted to increase the exposure to
methotrexate. o Theoretical → Also see TABLE 15 p. 1378
Mitotane is predicted to decrease the exposure to regorafenib.
Avoid. o Study → Also see TABLE 15 p. 1378
Regorafenib is predicted to increase the exposure to NSAIDs
(mefenamic acid). Avoid. o Theoretical → Also see TABLE 4

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
predicted to increase the exposure to repaglinide. o
Study

▶

Ciclosporin moderately increases the exposure to repaglinide.
o Study

▶

Clopidogrel increases the exposure to repaglinide. Avoid.

Cobicistat is predicted to increase the exposure to repaglinide. [Moderate] Study

Enalaprilat is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study

Fibrates (gemfibrozil) increase the exposure to repaglinide. Avoid. [Severe] Study

HIV-protease inhibitors are predicted to increase the exposure to repaglinide. [Moderate] Study

Idelalisib is predicted to increase the exposure to repaglinide. [Moderate] Study

Iron chelators (deferasirox) moderately increase the exposure to repaglinide. Avoid. [Moderate] Study

Leflunomide is predicted to increase the exposure to repaglinide. Avoid. [Moderate] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to repaglinide. Avoid. [Moderate] Study

Mitotane is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study

Opicapone is predicted to decrease the exposure to repaglinide. [Moderate] Study

Pitolisant is predicted to decrease the exposure to repaglinide. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to repaglinide. [Moderate] Study

Teriflunomide is predicted to increase the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study

Trimetrexate moderately increases the exposure to repaglinide. Avoid or monitor blood glucose. [Moderate] Study

Venetoclax is predicted to increase the exposure to repaglinide. [Moderate] Theoretical

Retigabine — see antiepileptics

Retinoids — see TABLE 5 p. 1375 (thromboembolism)

Acitretin, adapalene, altretinoin, bexarotene, isotretinoin, tazarotene, tretinoin

Avoid concomitant use of keratolytics in patients taking acitretin and isotretinoin. Since systemic absorption can follow topical application of isotretinoin and tretinoin, the possibility of interactions should be borne in mind.

Alcohol (beverage) potentially increases the concentration of acitretin. Avoid and for 2 months after stopping acitretin. [Moderate] Study

Antiarhythmics (amiodarone) are predicted to increase the exposure to altretinoin. Adjust altretinoin dose, p. 1262. [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, miconazole, posaconazole) are predicted to increase the exposure to altretinoin. Adjust altretinoin dose, p. 1262. [Moderate] Theoretical

Antifungals, azoles (fluconazole, ketoconazole, voriconazole) are predicted to predict the risk of tretinoin toxicity when given with tretinoin. [Moderate] Study

Ciclosporin is predicted to increase the exposure to altretinoin. Adjust altretinoin dose, p. 1262. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to altretinoin. Adjust altretinoin dose, p. 1262. [Moderate] Theoretical

Fibrates (gemfibrozil) are predicted to increase the exposure to altretinoin. Adjust altretinoin dose, p. 1262. [Moderate] Theoretical

Fibrates (gemfibrozil) increase the concentration of bexarotene. Avoid. [Severe] Study

HIV-protease inhibitors are predicted to increase the exposure to altretinoin. Adjust altretinoin dose, p. 1262. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to altretinoin. Adjust altretinoin dose, p. 1262. [Moderate] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to altretinoin. Adjust altretinoin dose, p. 1262. [Moderate] Theoretical

Acitretin is predicted to increase the concentration of methotrexate. Avoid. [Moderate] Anecdotal

Retinoids (acitretin, altretinoin, isotretinoin, tretinoin) increase the risk of benign intracranial hypertension when given with tetracyclines. Avoid. [Severe] Anecdotal

Bexarotene is predicted to increase the risk of toxicity when given with vitamin A. Adjust dose. [Moderate] Theoretical

Retinoids (acitretin, altretinoin, isotretinoin) are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Theoretical

Tretinoin is predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Study

Ribavirin is predicted to increase the exposure to didanosine. Avoid. [Severe] Study

Ribavirin increases the risk of toxicity when given with stavudine. Avoid. [Severe] Study

Ribavirin increases the risk of anaemia and/or leucopenia when given with zidovudine. Avoid. [Severe] Study

Ribociclib — see TABLE 9 p. 1377 (QT-interval prolongation)

Food and lifestyle

Avoid concomitant use of pomegranate or pomegranate juice as it is predicted to increase ribociclib exposure.

Ribociclib (high-dose) is predicted to increase the exposure to alpha blockers (alfuzosin). Avoid. [Moderate] Theoretical

Antiarhythmics (dronedarone) are predicted to increase the exposure to ribociclib. [Moderate] Study → Also see TABLE 9 p. 1377

Ribociclib (high-dose) is predicted to increase the exposure to antiarhythmics (amiodarone). Avoid. [Moderate] Theoretical → Also see TABLE 9 p. 1377

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ribociclib. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to ribociclib. [Moderate] Study → Also see TABLE 9 p. 1377

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 997. [Moderate] Study → Also see TABLE 9 p. 1377

Aprepitant is predicted to increase the exposure to ribociclib. [Moderate] Study

Bosentan is predicted to decrease the exposure to ribociclib. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ribociclib. [Moderate] Study

Ribociclib is predicted to increase the exposure to ciclosporin. Use with caution and adjust dose. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 997. [Moderate] Study

Crizotinib is predicted to increase the exposure to ribociclib. [Moderate] Study → Also see TABLE 9 p. 1377

Ribociclib is predicted to increase the exposure to digoxin. [Moderate] Theoretical

Efavirenz is predicted to decrease the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 997. [Moderate] Study

Ribociclib is predicted to increase the exposure to everolimus. Use with caution and adjust dose. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to ribociclib. Avoid. [Moderate] Theoretical

Food and lifestyle

Ribociclib (high-dose) is predicted to increase the exposure to ergotamine. Avoid. [Moderate] Theoretical

Ribociclib is predicted to increase the exposure to everolimus. Use with caution and adjust dose. [Moderate] Theoretical

Ribociclib is predicted to increase the exposure to ribociclib. Avoid or adjust ribociclib dose, p. 997. [Moderate] Study

Macrolides (clarithromycin) are predicted to increase the exposure to ribociclib. Avoid. [Moderate] Study

Macrolides (erythromycin) are predicted to increase the exposure to ribociclib. [Moderate] Study → Also see TABLE 9 p. 1377

www.getintopharma.com
Ribociclib (continued)

- **Ribociclib** is predicted to increase the exposure to metformin. (Moderate) Theoretical

- **Ribociclib** is predicted to markedly decrease the exposure to rifabutin. Avoid. (Moderate) Study

- **Mitotane** is predicted to markedly decrease the exposure to rifabutin. Avoid. (Severe) Study

- **Netupitant** is predicted to increase the exposure to ribociclib. (Moderate) Study

- **Nevirapine** is predicted to decrease the exposure to ribociclib. (Moderate) Study

- **Nilotinib** is predicted to increase the exposure to ribociclib. (Moderate) Study → Also see TABLE 9 p. 1377

- **Ribociclib** is predicted to increase the exposure to opioids (alfentanil, fentanyl). Use with caution and adjust dose. (Moderate) Theoretical

- **Ribociclib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid. (Moderate) Theoretical → Also see TABLE 9 p. 1377

- **Ribociclib** (high-dose) is predicted to increase the exposure to pimodendrene. Avoid. (Moderate) Theoretical → Also see TABLE 9 p. 1377

- **Ribociclib** (high-dose) is predicted to increase the exposure to sirolimus. Use with caution and adjust dose. (Moderate) Theoretical

- **St John’s Wort** is predicted to decrease the exposure to ribociclib. Avoid. (Severe) Study

- **Ribociclib** is predicted to increase the exposure to statins (lovastatin, rosuvastatin). (Moderate) Theoretical

- **Ribociclib** is predicted to increase the exposure to statins (simvastatin). Avoid. (Moderate) Theoretical

- **Ribociclib** is predicted to increase the exposure to tacrolimus. Use with caution and adjust dose. (Moderate) Theoretical

### Rifabutin

**GENERAL INFORMATION**  Although some manufacturers class rifabutin as a potent inducer of CYP3A4, clinical data suggests it is potentially a weak inducer, and therefore the BNF does not extrapolate the interactions of potent CYP3A4 inducers to rifabutin. For those who wish to err on the side of caution, see the interactions of rifampicin but bear in mind other mechanisms might be involved.

- **Antifungals, azoles** (*fluconazole*) increase the risk of uveitis when given with rifabutin. Adjust dose. (Severe) Study

- **Antifungals, azoles** (*itraconazole, posaconazole*) increase the concentration of rifabutin and rifabutin decreases the concentration of antifungals, azoles (*itraconazole, posaconazole*). Avoid. (Severe) Study

- **Antifungals, azoles** (*ketoconazole*) are predicted to increase the concentration of rifabutin and rifabutin is predicted to decrease the concentration of antifungals, azoles (*ketoconazole*). Avoid. (Severe) Theoretical

- **Antifungals, azoles** (*miconazole*) are predicted to increase the concentration of rifabutin. Use with caution and adjust dose. (Moderate) Theoretical

- **Rifabutin** is predicted to decrease the exposure to antifungals, azoles (*itraconazole*). Avoid, (Severe) Theoretical

- **Rifabutin** decreases the concentration of antifungals, azoles (*voriconazole*) and antifungals, azoles (*voriconazole*) increase the concentration of rifabutin. Avoid or adjust voriconazole dose. p. 599. (Severe) Study

- **Rifabutin** slightly decreases the exposure to atorvastatin (*atorvastatin*). Avoid. (Moderate) Study

- **Rifabutin** slightly decreases the exposure to bictegravir. Avoid. (Moderate) Study

- **Rifabutin** is predicted to decrease the exposure to brigitinib. Avoid. (Moderate) Theoretical

- **Rifabutin** decreases the concentration of cobicistat and cobicistat increases the exposure to rifabutin. Avoid or adjust dose. (Severe) Study

- **Rifabutin** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Study

- **Rifabutin** decreases the exposure to dapson. (Moderate) Study

- **Rifabutin** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical

- **Rifabutin** moderately decreases the exposure to doravirine. Adjust doravirine dose. p. 644. (Severe) Study

- **Efavirenz** slightly decreases the exposure to rifabutin. Adjust dose. (Severe) Study

- **Rifabutin** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical

- **Rifabutin** decreases the exposure to estradiol. (Moderate) Study

- **HIV-protease inhibitors** (*atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir*) (boosted with ritonavir) increase the exposure to rifabutin. Monitor and adjust dose. (Severe) Study

- **HIV-protease inhibitors** (*ritonavir*) markedly increase the exposure to rifabutin. Avoid or adjust dose. (Severe) Study

- **Rifabutin** is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

- **Rifabutin** is predicted to decrease the exposure to ledipasvir. Avoid. (Severe) Theoretical

- **Rifabutin** is predicted to decrease the concentration of lertemovir. (Moderate) Theoretical

- **Rifabutin** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical

- **Lumacaftor** is predicted to decrease the exposure to rifabutin. Adjust dose. (Moderate) Theoretical

- **Macrolides** (*azithromycin*) increase the risk of neutropenia when given with rifabutin. (Severe) Study

- **Macrolides** (*clarithromycin*) increase the risk of uveitis when given with rifabutin. Adjust dose. (Severe) Study

- **Macrolides** (*erythromycin*) are predicted to increase the risk of uveitis when given with rifabutin. Adjust dose. (Severe) Theoretical

- **Rifabutin** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

- **Rifabutin** slightly decreases the exposure to rifapentine. Adjust dose. (Severe) Study

- **Rifabutin** is predicted to decrease the exposure to rolipram. Avoid. (Moderate) Theoretical

- **Rifabutin** is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical

- **Rifabutin** is predicted to decrease the exposure to tenofovir alafenamide. Avoid. (Moderate) Theoretical

- **Rifabutin** is predicted to decrease the exposure to tezacaftor. Avoid. (Severe) Theoretical

- **Rifabutin** decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

- **Rifabutin** is predicted to decrease the concentration of voxpilavir. Avoid. (Severe) Theoretical

### Rifampicin

- **Rifampicin** is predicted to markedly decrease the exposure to abemaciclib. Avoid. (Severe) Study

- **Rifampicin** is predicted to decrease the exposure to abiraterone. Avoid. (Severe) Study

- **Rifampicin** is predicted to decrease the exposure to afatinib. (Moderate) Study

- **Rifampicin** is predicted to decrease the exposure to agomelatin. (Moderate) Theoretical

- **Rifampicin** is predicted to decrease the exposure to aldosterone antagonists (*eplerenone*). Avoid. (Moderate) Theoretical

- **Rifampicin** decreases the exposure to aliskiren. (Moderate) Study

- **Rifampicin** is predicted to decrease the exposure to alprazolam. Adjust dose. (Moderate) Theoretical

- **Rifampicin** transiently increases the exposure to ambrisentan. (Moderate) Study

- **Rifampicin** decreases the exposure to aminophylline. Adjust dose. (Moderate) Study

- **Rifampicin** is predicted to decrease the exposure to anesthetics, local (*ropivacaine*). (Moderate) Theoretical

- **Antacids** decrease the absorption of rifampicin. Rifampicin should be taken 1 hour before anesthetics. (Moderate) Study

---

www.getintopharma.com
**Rifampicin** is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. (Severe) Study

**Rifampicin** is predicted to decrease the efficacy of antiarrhythmics (propafenone). (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil). (Minor) Study

**Antiarrhythmics** (phenobarbital, primidone) are predicted to decrease the exposure to **rifampicin** and **rifampicin** is predicted to decrease the exposure to antiarrhythmics (phenobarbital, primidone). Use with caution and adjust dose. (Moderate) Study

**Rifampicin** slightly decreases the exposure to antiarrhythmics (brivaracetam). Adjust dose. (Moderate) Study

**Rifampicin** decreases the concentration of **fosphenytoin, phenytoin**. Use with caution and adjust dose. (Moderate) Study

**Rifampicin** markedly increases the clearance of **lamotrigine**. Adjust lamotrigine dose, p. 318. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to antiarrhythmics (pramipexole). Monitor and adjust dose. (Moderate) Study

**Rifampicin** slightly decreases the exposure to antifungals, azoles (fluconazole). Adjust dose. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to antifungals, azoles (econazole). Avoid. (Severe) Study

**Rifampicin** markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid and for 14 days after stopping rifampicin. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to antifungals, azoles (posaconazole). Avoid. (Moderate) Anegetical

**Rifampicin** markedly decreases the exposure to antifungals, azoles (voriconazole). Avoid. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to antihistamines, non-sedating (bilastine). (Moderate) Theoretical

**Rifampicin** increases the clearance of antihistamines, non-sedating (fexofenadine). (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to antimalarials (artemether) with lumefantrine. Avoid. (Severe) Study

**Rifampicin** moderately decreases the exposure to antimalarials (artemether) and antimalarials (atovaquone) slightly increase the exposure to rifampicin. Avoid. (Moderate) Study

**Rifampicin** moderately decreases the exposure to antimalarials (mefloquine). (Severe) Study

**Rifampicin** is predicted to decrease the concentration of antimalarials (piperaquine). Avoid. (Moderate) Theoretical

**Rifampicin** decreases the exposure to antimalarials (quinine). (Severe) Study

**Rifampicin** is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. (Severe) Study

**Rifampicin** moderately decreases the exposure to apremilast. Avoid. (Severe) Study

**Rifampicin** is predicted to markedly decrease the exposure to aprepitant. Avoid. (Moderate) Study

**Rifampicin** is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 394. (Moderate) Study

**Rifampicin** decreases the exposure to ataluren. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to azithromycin. Avoid or adjust dose. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to bazedoxifene. (Moderate) Theoretical

**Rifampicin** decreases the exposure to bedaquiline. Avoid. (Severe) Study

**Rifampicin** moderately decreases the exposure to beta blockers, non-selective (carvedilol). (Moderate) Study

**Rifampicin** decreases the exposure to beta blockers, non-selective (propranolol). Monitor and adjust dose. (Moderate) Study

**Rifampicin** slightly decreases the exposure to beta blockers, selective (bisoprolol, metoprolol). (Minor) Study

**Rifampicin** moderately decreases the exposure to beta blockers, selective (cefliperol). (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to bictegravir. Avoid. (Moderate) Study

**Rifampicin** slightly decreases the exposure to bortezomib. Avoid. (Severe) Study

**Rifampicin** affects the exposure to bosentan. Avoid. (Severe) Study

**Rifampicin** is predicted to very markedly decrease the exposure to bosutinib. Avoid. (Severe) Study

**Rifampicin** is predicted to decrease the exposure to brigitinib. Avoid. (Severe) Study

**Rifampicin** is predicted to decrease the exposure to bupropion. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. (Severe) Study

**Rifampicin** moderately decreases the exposure to cabozantinib. Avoid. (Moderate) Study

**Rifampicin** is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine). Avoid. (Severe) Study

**Rifampicin** moderately decreases the exposure to canagliflozin. Adjust canagliflozin dose, p. 702. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to cannabis extract. Avoid. (Severe) Theoretical

**Rifampicin** is predicted to decrease the exposure to cariprazine. Avoid. (Severe) Theoretical

**Rifampicin** decreases the concentration of caspofungin. Adjust caspofungin dose, p. 392. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study

**Rifampicin** decreases the concentration of chloramphenicol. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to chlor Diazepoxide. (Moderate) Theoretical

**Rifampicin** decreases the concentration of ciclosporin. (Severe) Study

**Rifampicin** is predicted to alter the effects of cilostazol. (Moderate) Theoretical

**Rifampicin** is predicted to decrease the exposure to cinacalcet. Monitor and adjust dose. (Moderate) Study

**Rifampicin** decreases the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study

**Rifampicin** decreases the exposure to clozapine. (Severe) Anegetical

**Rifampicin** is predicted to decrease the exposure to cobimetinib. Avoid. (Severe) Theoretical

**Rifampicin** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSHR guidance, see Contraceptives, interactions p. 794. (Severe) Study

**Rifampicin** is predicted to decrease the exposure to corticosteroids (budesonide, deflazacort, dexamethasone, fludrocortisone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone). Monitor and adjust dose. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to corticosteroids (fluticasone). (Unknown) Theoretical

**Rifampicin** decreases the anticoagulant effect of coumarins. (Severe) Study

**Rifampicin** is predicted to markedly decrease the exposure to crizotinib. Avoid. (Severe) Study

**Rifampicin** is predicted to decrease the exposure to dabigatran. Avoid. (Severe) Study

**Rifampicin** is predicted to decrease the exposure to dabrafenib. Avoid. (Severe) Study

**Rifampicin** decreases the exposure to dapsona. (Moderate) Study

**Rifampicin** is predicted to decrease the exposure to darifenacin. (Moderate) Theoretical
Rifampicin is predicted to decrease the exposure to dasabuvir. Avoid. (Severe) Theoretical

Rifampicin is predicted to markedly decrease the exposure to desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical

Rifampicin is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical

Rifampicin moderately decreases the exposure to diazepam. Avoid. (Moderate) Study

Rifampicin decreases the concentration of digoxin. (Moderate) Study

Rifampicin decreases the exposure to doxycycline. Adjust dose. (Severe) Study

Rifampicin is predicted to decrease the exposure to efavirenz. Adjust dose. (Severe) Study

Rifampicin is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study

Rifampicin is predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical

Rifampicin is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study

Rifampicin moderately decreases the exposure to exemestane. (Moderate) Study

Rifampicin is predicted to decrease the exposure to fexofenadine. Avoid. (Moderate) Study

Rifampicin is predicted to decrease the exposure to fingolimod. (Moderate) Study

Rifampicin is predicted to decrease the exposure to fosaprepitant. Avoid. (Moderate) Theoretical

Rifampicin is predicted to decrease the exposure to gefitinib. Avoid. (Severe) Study

Rifampicin markedly affects the exposure to glecaprevir. Avoid. (Severe) Study

Rifampicin is predicted to decrease the exposure to grazoprevir. Avoid. (Severe) Study

Rifampicin is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 352. (Moderate) Study

Rifampicin decreases the concentration of haloperidol. Adjust dose. (Moderate) Study

Rifampicin is predicted to moderately to markedly decrease the exposure to HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir). Avoid. (Severe) Study

Rifampicin slightly decreases the exposure to HIV-protease inhibitors (ritonavir). (Severe) Study

Rifampicin is predicted to decrease the exposure to HIV-protease inhibitors (tipranavir). Avoid. (Severe) Study

Rifampicin is predicted to decrease the effects of hormone replacement therapy. (Moderate) Aneccotal

Rifampicin is predicted to decrease the exposure to ibritinib. Avoid or adjust ibritinib dose, p. 983. (Severe) Study

Rifampicin is predicted to decrease the exposure to idelalisib. Avoid. (Severe) Study

Rifampicin is predicted to decrease the exposure to imatinib. Avoid. (Moderate) Study

Rifampicin is predicted to decrease the exposure to irinotecan. Avoid. (Severe) Study

Rifampicin is predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. (Moderate) Study

Rifampicin is predicted to decrease the exposure to ivabradine. Adjust dose. (Moderate) Theoretical

Rifampicin is predicted to affect the concentration of lenvatinib. (Severe) Study

Rifampicin is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Theoretical

Rifampicin is predicted to decrease the exposure to linaclotide. (Moderate) Study

Rifampicin slightly decreases the exposure to linezolid. (Moderate) Study

Rifampicin is predicted to decrease the exposure to lorazepam. Monitor and adjust dose. (Moderate) Theoretical

Rifampicin increases the clearance of lorazepam. (Moderate) Study

Rifampicin is predicted to decrease the exposure to luradoline. Avoid. (Moderate) Study

Rifampicin is predicted to decrease the exposure to macitentan. Avoid. (Severe) Study

Rifampicin decreases the concentration of macrolides (clarithromycin). (Severe) Study

Rifampicin is predicted to decrease the exposure to maraviroc. Adjust dose. (Severe) Study

Rifampicin is predicted to decrease the exposure to melatonin. Monitor and adjust dose. (Moderate) Theoretical

Rifampicin is predicted to increase the clearance of mexiteline. Monitor and adjust dose. (Moderate) Study

Rifampicin is predicted to decrease the exposure to midostaurin. Avoid. (Severe) Study

Rifampicin is predicted to decrease the exposure to mirtazapine. Adjust dose. (Moderate) Study

Rifampicin is predicted to decrease the exposure to modafinil. (Moderate) Theoretical

Rifampicin decreases the effects of monoclonal antibodies (brentuximab vedotin). (Severe) Study

Rifampicin is predicted to decrease the exposure to mycophenolate. Monitor and adjust dose. (Severe) Study

Rifampicin is predicted to markedly decrease the exposure to naloxegol. Avoid. (Moderate) Study

Rifampicin is predicted to slightly decrease the exposure to nelargine. Adjust dose. (Moderate) Study

Rifampicin is predicted to decrease the exposure to nelitamib. Avoid. (Severe) Study

Rifampicin decreases the concentration of nelitamib. Avoid. (Severe) Study

Rifampicin is predicted to moderately decrease the exposure to nelitamib. Avoid. (Severe) Study

Rifampicin is predicted to decrease the exposure to nintedanib. (Moderate) Study
Rifampicin – Rifampicin 1525

**Rifampicin** is predicted to decrease the exposure to **nisitidine**. Adjust dose. [Moderate] Theoretical Study

**Rifampicin** increases the clearance of **nitrazepam**, [Moderate] Study

**Rifampicin** is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal

**Rifampicin** moderately decreases the exposure to **NSAIDs**. (celecoxib, diclofenac, etoricoxib). [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to **olanzapine**. Monitor and adjust dose. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to **omacetaxine**. Avoid. [Moderate] Theoretical Study

**Rifampicin** is predicted to decrease the exposure to **ombitasvir**. Avoid. [Severe] Theoretical Study

**Rifampicin** is predicted to decrease the exposure to **ondansetron**. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to opioids (afentanil, fentanyl). [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. [Moderate] Theoretical Study

**Rifampicin** decreases the exposure to opioids (codeine, morphine). [Moderate] Study

**Rifampicin** decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study

**Rifampicin** is predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study

**Rifampicin** is predicted to moderately decrease the exposure to osoprenine. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to **paliperidone**. Monitor and adjust dose. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to **panobinostat**. Avoid. [Moderate] Theoretical Study

**Rifampicin** decreases the exposure to **paracetamol**. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to paraprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to pazopanib. Avoid. [Severe] Theoretical Study

**Rifampicin** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalaflil). Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors ( sildenafil, vardenafl). [Moderate] Theoretical Study

**Rifampicin** is predicted to decrease the exposure to **pitirrimycin**. Monitor and adjust dose. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to pioglitazone. Monitor and adjust dose. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to pirfenidone. Avoid. [Moderate] Theoretical Study

**Rifampicin** is predicted to moderately decrease the exposure to pitholant. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to potolinib. Avoid. [Moderate] Theoretical Study

**Rifampicin** is predicted to decrease the exposure to **praziquantel**. Avoid. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to quetiapine. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to **raltegravir**. Avoid or adjust dose—consult product literature. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to reboxetine. [Anecdotal] Study

**Rifampicin** is predicted to decrease the exposure to regorafenib. Avoid. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to **repaglinide**. Monitor blood glucose and adjust dose. [Moderate] Study

**Rifampicin** is predicted to markedly decrease the exposure to **rifociclib**. Avoid. [Severe] Study

**Rifampicin** markedly decreases the exposure to **rilpivirine**. Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to **risperidone**. Adjust dose. [Moderate] Study

**Rifampicin** is predicted to moderately decrease the exposure to **rivaroxaban**. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to **rosfumilast**. Avoid. [Moderate] Study

**Rifampicin** is predicted to markedly decrease the exposure to **rolapitant**. Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to **roxulitinib**. Monitor and adjust dose. [Moderate] Study

**Rifampicin** is predicted to moderately decrease the exposure to **saxagliptin**. [Moderate] Study

**Rifampicin** moderately decreases the exposure to the active metabolite of **selexipag**. Adjust dose. [Moderate] Study

**Rifampicin** is predicted to decrease the concentration of **sirolimus**. Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to **sofosbuvir**. Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to **sulfinpyrazone**. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to **sunitinib**. Avoid or adjust sunitinib dose, p. 999. [Moderate] Study

**Rifampicin** decreases the concentration of **tacrolimus**. Monitor and adjust dose. [Severe] Study

**Rifampicin** markedly decreases the exposure to **tamoxifen**. [Unknown] Study

**Rifampicin** is predicted to decrease the exposure to **taxanes** (docetaxel, paclitaxel). Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to taxanes (docetaxel). [Severe] Theoretical Study

**Rifampicin** is predicted to decrease the concentration of **teivofovir alafenamide**. Avoid. [Moderate] Theoretical Study

**Rifampicin** decreases the exposure to **terbinafine**. Adjust dose. [Moderate] Study

**Teriflunomide** is predicted to increase the exposure to rifampicin. [Moderate] Theoretical Study

**Rifampicin** decreases the exposure to **tetracyclines** (doxycycline). Monitor and adjust dose. [Moderate] Study

**Rifampicin** is predicted to decrease the exposure to tezacaftor. Avoid. [Severe] Theoretical Study

**Rifampicin** is predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study

**Rifampicin** is predicted to markedly decrease the exposure to **ticagrelor**. Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to **tivozanib**. [Severe] Study

**Rifampicin** moderately decreases the exposure to **tizanidine**. [Mild] Study

**Rifampicin** is predicted to decrease the exposure to **tobaficitinib**. Avoid. [Severe] Study

**Rifampicin** is predicted to decrease the exposure to **tolvaptan**. Use with caution or avoid depending on indication. [Severe] Study

www.getintopharma.com
Rifampicin — Ritonavir

Rifampicin (continued)
- **Rifampicin** is predicted to decrease the exposure to toremifene. Adjust dose. (Moderate Study)
- **Rifampicin** is predicted to decrease the exposure to telaprevir. Avoid. (Severe) Theoretical
- **Rifampicin** decreases the exposure to trimethoprim. (Moderate) Study
- **Rifampicin** decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal
- **Rifampicin** is predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study
- **Rifampicin** is predicted to moderately decrease the exposure to velpatavir. Avoid. (Severe) Study
- **Rifampicin** is predicted to decrease the exposure to vemurafenib. Avoid. (Severe) Theoretical
- **Rifampicin** is predicted to decrease the exposure to venetoclax. Avoid. (Severe) Study
- **Rifampicin** is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vinidines). (Severe) Theoretical
- **Rifampicin** is predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. (Severe) Theoretical
- **Rifampicin** is predicted to decrease the exposure to vinca alkaloids (vinorelbine). Use with caution or avoid. (Severe) Theoretical
- **Rifampicin** is predicted to decrease the exposure to vismodegib. Avoid. (Moderate) Theoretical
- **Rifampicin** potentially increases the risk of nephrotoxicity when given with volatile halogenated anaesthetics (methoxyflurane). Avoid. (Severe) Theoretical
- **Rifampicin** is predicted to decrease the exposure to voriprazir. Monitor and adjust dose. (Moderate) Study
- **Rifampicin** is predicted to decrease the concentration of voluluaprevir. Avoid. (Severe) Study
- **Rifampicin** moderately decreases the exposure to zolpidem. (Moderate) Study
- **Rifampicin** is predicted to decrease the exposure to zopiclone. Adjust dose. (Moderate) Study

**Rifaximin**
- **Rifaximin** very markedly increases the exposure to rifaximin. (Severe) Study

**Rilpivirine**
- **Antacids** are predicted to decrease the exposure to rilpivirine. Antacids should be taken 2 hours before or 4 hours after rilpivirine. (Severe) Theoretical
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to rilpivirine. Avoid. (Severe) Study
- **Antiepileptics** (oxcarbazepine) are predicted to decrease the concentration of rilpivirine. Avoid. (Severe) Theoretical
- **Bozantan** is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
- **Calcium salts** (calcium carbonate) are predicted to slightly decrease the exposure to rilpivirine. Calcium carbonate should be taken 2 hours before or 4 hours after rilpivirine. (Severe) Theoretical
- **Corticosteroids** (dexamethasone) are predicted to decrease the concentration of rilpivirine. Avoid multiple-dose dexamethasone. (Severe) Theoretical
- **Efavirenz** is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
- **Enzalutamide** markedly decreases the exposure to rilpivirine. Avoid. (Severe) Study
- **Estravirine** is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
- **H₂ receptor antagonists** are predicted to decrease the exposure to rilpivirine. H₂ receptor antagonists should be taken 12 hours before or 4 hours after rilpivirine. (Severe) Study
- **Mitotane** markedly decreases the exposure to rilpivirine. Avoid. (Severe) Study
- **Nevirapine** is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical
- **Proton pump inhibitors** are predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Study
- **Rifabutin** slightly decreases the exposure to rilpivirine. Adjust dose. (Severe) Study
- **Rifampicin** markedly decreases the exposure to rilpivirine. Avoid. (Severe) Study
- **St John’s Wort** is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical

**Riluzole**
- **FOOD AND LIFESTYLE** Charcoal-grilled foods are predicted to decrease the exposure to riluzole.
- **Mexiletine** is predicted to increase the exposure to riluzole. (Moderate) Theoretical
- **Quinolones** (ciprofloxacin) are predicted to increase the exposure to riluzole. (Moderate) Theoretical
- **SSRIs** (fluvoxamine) are predicted to increase the exposure to riluzole. (Moderate) Theoretical

**Riociguat**
- **Study** see TABLE 8 p. 1376 (hypotension)
- **Antacids** slightly decrease the exposure to riociguat. Antacids should be taken 2 hours before or 1 hour after riociguat. (Mild) Study
- **Antifungals, azoles** (itraconazole) are predicted to increase the exposure to riociguat. Avoid. (Moderate) Study
- **Antifungals, azoles** (ketonazole) moderately increase the exposure to riociguat. Avoid. (Moderate) Study
- **Ciclosporin** is predicted to increase the exposure to riociguat. (Moderate) Theoretical
- **HIV-protease inhibitors** (ritonavir) are predicted to increase the exposure to riociguat. Avoid. (Moderate) Theoretical
- **Riociguat** is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. (Severe) Theoretical — Also see TABLE 8 p. 1376

**Risedronate** see bisphosphonates

**Risperidone** see TABLE 8 p. 1376 (hypotension), TABLE 9 p. 1377 (QT-interval prolongation), TABLE 11 p. 1377 (CNS depressant effects)
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to risperidone. Adjust dose. (Moderate) Study — Also see TABLE 11 p. 1377
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study — Also see TABLE 9 p. 1377
- **Buropipron** is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study
- **Cinacalcet** is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study
- **Cobicistat** is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study
- **Risperidone** is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical — Also see TABLE 8 p. 1376 — Also see TABLE 8 p. 1377
- **Enalaprilat** is predicted to decrease the exposure to risperidone. Adjust dose. (Moderate) Study
- **HIV-protease inhibitors** are predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study — Also see TABLE 9 p. 1377
- **Idelalisib** is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study
- **Risperidone** is predicted to decrease the effects of levodopa. Avoid or adjust dose. (Severe) Anecdotal — Also see TABLE 8 p. 1376
- **Risperidone** potentially increases the risk of neurotoxicity when given with lithium. (Severe) Anecdotal — Also see TABLE 9 p. 1377
- **Macrolides** (clarithromycin) are predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study — Also see TABLE 9 p. 1377
- **Risperidone** increases the risk of dyskinesias when given with methylphenidate. (Severe) Anecdotal
- **Mitotane** is predicted to decrease the exposure to risperidone. Adjust dose. (Moderate) Study
- **Rifampicin** is predicted to decrease the exposure to risperidone. Adjust dose. (Moderate) Study
- **SSRIs** (fluvoxamine, paroxetine) are predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study
- **Terbinafine** is predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study
- **Ritonavir** see HIV-protease inhibitors
Rituximab → see monoclonal antibodies

Rivaroxaban → see TABLE 3 p. 1375 (anticoagulant effects)

- Antiarrhythmics (dronedarone) are predicted to increase the exposure to rivaroxaban. Avoid. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to moderately increase the exposure to rivaroxaban. Avoid. (Severe) Study
- Ciclosporin is predicted to increase the exposure to rivaroxaban. Avoid. (Severe) Theoretical
- Enalapril is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. (Severe) Study
- HIV-protease inhibitors (ritonavir) moderately increase the exposure to rivaroxaban. Avoid. (Severe) Study
- Mitotane is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. (Severe) Study
- Rifampicin is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. (Severe) Study
- Rivastigmine → see anticholinesterases, centrally acting
- Rizatriptan → see TABLE 3 p. 1378 (serotonin syndrome)
- Beta blockers, non-selective (propranolol) slightly to moderately increase the exposure to rizatriptan. Adjust rizatriptan dose and separate administration by at least 2 hours. (Moderate) Study
- Rizatriptan is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotone should be taken at least 24 hours before or 6 hours after rizatriptan. (Severe) Theoretical
- Moclobemide moderately increases the exposure to rizatriptan. Avoid. (Severe) Study → Also see TABLE 3 p. 1378
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the exposure to rizatriptan. Avoid and for 14 days after stopping the MAOI. (Severe) Theoretical → Also see TABLE 3 p. 1378
- Recuronium → see neuromuscular blocking drugs, non-depolarising
- Aminophylline is predicted to slightly increase the exposure to roflumilast. Avoid. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study
- Combined hormonal contraceptives are predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study
- Enalapril is predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study
- Ity receptor antagonists (cimetidine) slightly increase the exposure to roflumilast. (Moderate) Study
- Mexiletine is predicted to increase the exposure to roflumilast. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to roflumilast. (Moderate) Study
- Quinolones (ciprofloxacin) are predicted to increase the exposure to roflumilast. (Moderate) Theoretical
- Rifampicin is predicted to decrease the exposure to roflumilast. Avoid. (Moderate) Study
- SSRI (fluvoxamine) are predicted to increase the exposure to roflumilast. (Moderate) Study
- Theophylline is predicted to slightly increase the exposure to roflumilast. (Moderate) Theoretical
- Rolipitant is predicted to moderately increase the exposure to beta blockers, selective (metoprolol). (Severe) Study
- Bosentan is predicted to decrease the exposure to rolipitant. Avoid. (Severe) Study
- Rolipitant is predicted to increase the exposure to colchicine. (Moderate) Study
- Rolipitant is predicted to increase the exposure to dabigatran. (Moderate) Study
- Rolipitant slightly increases the exposure to digoxin. (Moderate) Study
- Efavirenz is predicted to decrease the exposure to rolipitant. Avoid. (Severe) Study
- Enalapril is predicted to markedly decrease the exposure to rolipitant. Avoid. (Severe) Study
- Rolipitant is predicted to increase the exposure to irinotecan. Avoid or monitor. (Moderate) Study
- Rolipitant is predicted to increase the exposure to methotrexate. Avoid or monitor. (Moderate) Study
- Mitotane is predicted to markedly decrease the exposure to rolipitant. Avoid. (Severe) Study
- Nevirapine is predicted to decrease the exposure to rolipitant. Avoid. (Severe) Study
- Rolipitant is predicted to increase the exposure to pimozone. (Severe) Study
- Rifabutin is predicted to decrease the exposure to rolipitant. Avoid. (Moderate) Theoretical
- Rifampicin is predicted to markedly decrease the exposure to rolipitant. Avoid. (Severe) Study
- St John's Wort is predicted to decrease the exposure to rolipitant. Avoid. (Severe) Study
- Rolipitant is predicted to increase the exposure to statins (rosuvastatin). Monitor and adjust dose. (Severe) Study
- Rolipitant increases the exposure to sulfasalazine. (Severe) Study
- Rolipitant is predicted to increase the exposure to tamoxifen. (Severe) Study
- Rolipitant is predicted to increase the exposure to topotecan. Avoid or monitor. (Moderate) Study
- Rapinol→ see dopamine receptor antagonists
- Ropivacaine → see anaesthetics, local
- Rosuvastatin → see statins
- Rotavirus vaccine → see live vaccines
- Rotigotine → see dopamine receptor antagonists
- Rucaparib
  - Rucaparib is predicted to increase the exposure to aminophylline. Monitor and adjust dose. (Moderate) Study
  - Rucaparib is predicted to increase the exposure to antiepileptics (phenytoin). Monitor and adjust dose. (Moderate) Study
  - Rucaparib is predicted to increase the exposure to ciclosporin. Monitor and adjust dose. (Moderate) Study
  - Rucaparib slightly increases the exposure to coumarins (warfarin). Monitor and adjust dose. (Severe) Study
  - Rucaparib is predicted to increase the exposure to ergotamine. Monitor and adjust dose. (Moderate) Study
  - Rucaparib slightly increases the exposure to midazolam. Monitor and adjust dose. (Severe) Study
  - Rucaparib is predicted to increase the exposure to opioids (alfentanil, fentanyl). Monitor and adjust dose. (Moderate) Study
  - Rucaparib is predicted to increase the exposure to pimozone. Monitor and adjust dose. (Moderate) Study
  - Rucaparib is predicted to increase the exposure to sirolimus. Monitor and adjust dose. (Moderate) Study
  - Rucaparib is predicted to increase the exposure to tacrolimus. Monitor and adjust dose. (Moderate) Study
  - Rucaparib is predicted to increase the exposure to theophylline. Monitor and adjust dose. (Moderate) Study
  - Rucaparib is predicted to increase the exposure to tizanidine. Monitor and adjust dose. (Moderate) Study
  - Rufinamide → see antiepileptics
  - Rufatadine → see antihistamines, non-sedating
- Ruxolitinib → see TABLE 15 p. 1378 (myelosuppression)
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Study

www.getintopharma.com
Ruxolitinib (continued)

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
- Aprepitant is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- Bosentan is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
- Cobicistat is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- Enzalutamide is predicted to increase the exposure to ruxolitinib. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to ruxolitinib. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to ruxolitinib. [Moderate] Study
- Macrolides (erythromycin) are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- Mitotane is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
- Nitupitant is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- Nevirapine is predicted to increase the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical
- Nilotinib is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- Ruxolitinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Review
- Selecipag is predicted to increase the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Study
- Statins are predicted to increase the exposure to ruxolitinib. Adjust dose. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical
- Saxagliptin is predicted to moderately decrease the exposure to saxagliptin. [Moderate] Theoretical
- Selexipag is predicted to increase the exposure to selexipag. [Unknown] Theoretical
- Teriflunomide is predicted to increase the exposure to selexipag. Adjust dose. [Moderate] Study
- Silver sulfadiazine is predicted to inactivate enzymatic debridng agents—concurrent use might not be appropriate.

Selenium

ROUTE-SPECIFIC INFORMATION Interactions do not generally apply to topical use unless specified.

- Oral selenium is predicted to decrease the absorption of eltrombopag. Etaibromopag should be taken 2 hours before or 4 hours after selenium. [Severe] Theoretical

Selexipag

- Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the exposure to the active metabolite of selexipag. Adjust dose. [Moderate] Study
- Antiepileptics (valproate) are predicted to increase the exposure to selexipag. [Unknown] Theoretical
- Iron chelators (deferasirox) are predicted to increase the exposure to selexipag. Adjust dose. [Moderate] Study
- Leflunomide is predicted to increase the exposure to selexipag. Adjust dose. [Moderate] Theoretical
- Mitotane is predicted to moderately decrease the exposure to selexipag. Adjust dose. [Moderate] Study
- Sildenafil is predicted to increase the exposure to selexipag. Adjust dose. [Moderate] Study
- Silver sulfadiazine is predicted to inactivate enzymatic debridng agents—concurrent use might not be appropriate.

Simvastatin → see statins
Sirolimus

- Antiarrhythmics (amiodarone) are predicted to increase the concentration of sirolimus. Avoid. [Severe] Anecdotal
- Antiarrhythmics (dronedarone) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Anti-epileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- Apalutamid is predicted to decrease the exposure to sirolimus. Avoid or monitor. [Moderate] Study
- Aprepitant increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Bosentan is predicted to decrease the concentration of sirolimus and sirolimus potentially increases the concentration of bosentan. Avoid. [Severe] Theoretical
- Brigitinib potentially decreases the concentration of sirolimus. Avoid. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Ceritinib is predicted to increase the exposure to sirolimus. Avoid. [Severe] Theoretical
- Sirolimus is predicted to affect the efficacy of chenodeoxycholic acid. Monitor and adjust dose. [Moderate] Theoretical
- Ciclosporin moderately increases the exposure to sirolimus. Separate administration by 4 hours. [Severe] Study
- Cobicistat is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- Crizotinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Doravirine is predicted to decrease the exposure to sirolimus. Monitor sirolimus concentration and adjust dose, p. 846
- Efamolizumab is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Erliglustat is predicted to increase the exposure to sirolimus. Adjust dose. [Moderate] Study
- Enalaprilat is predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study
- Grapefruit juice increases the concentration of sirolimus. Avoid. [Severe] Study
- HIV-protease inhibitors are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- Idealisib is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- Imatinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Lapatinib is predicted to increase the exposure to sirolimus. [Moderate] Theoretical
- Leteremor moderately increases the exposure to sirolimus. Monitor and adjust dose. [Severe] Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with sirolimus. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical
- Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the concentration of sirolimus. Avoid. [Severe] Study
- Macrolides (erythromycin) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Sirolimus is predicted to decrease the efficacy of mifamurtide. Avoid. [Severe] Theoretical
- Mirabegron is predicted to increase the exposure to sirolimus. [Med] Theoretical
- Mitotane is predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study
- Monoclonal antibodies (sarilumab) potentially affect the exposure to sirolimus. Monitor and adjust dose. [Moderate] Theoretical
- Netupitant increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Nevirapine is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Moderate] Theoretical
- Nilotinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Palbociclib is predicted to increase the exposure to sirolimus. Adjust dose. [Moderate] Theoretical
- Pibrentasvir (with glecaprevir) is predicted to increase the exposure to sirolimus. [Moderate] Study
- Pitolisant is predicted to decrease the exposure to sirolimus. Avoid. [Severe] Theoretical
- Ribociclib is predicted to increase the exposure to sirolimus. Use with caution and adjust dose. [Moderate] Theoretical
- Rifampicin is predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study
- Rucaparib is predicted to increase the exposure to sirolimus. Monitor and adjust dose. [Moderate] Study
- St John’s Wort is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Severe] Theoretical
- Sirolimus is predicted to decrease the concentration of tacrolimus and tacrolimus increases the exposure to sirolimus. [Severe] Study
- Velpatasvir is predicted to increase the exposure to sirolimus. [Moderate] Study
- Venetoclax is predicted to increase the exposure to sirolimus. Avoid or adjust dose. [Severe] Study

Sodium aurothiomalate

- ACE inhibitors are predicted to increase the risk of hypersensitivity when given with sodium aurothiomalate. Avoid. [Severe] Anecdotal
- Sodium aurothiomalate potentially increases the risk of side-effects when given with penicillamine (in those who have had previous adverse reactions to gold). Avoid. [Severe] Study

Sodium bicarbonate

ROUTE-SPECIFIC INFORMATION

Interactions do not generally apply to topical use unless specified.

- Oral sodium bicarbonate decreases the absorption of antifungals, azoles (ketoconazole). Avoid. [Moderate] Study
- Sodium bicarbonate decreases the concentration of lithium. Avoid. [Severe] Anecdotal
- Sodium bicarbonate is predicted to decrease the efficacy of methenamine. Avoid. [Moderate] Theoretical
- Sodium citrate is predicted to decrease the efficacy of methenamine. Avoid. [Moderate] Theoretical
- Sodium citrate is predicted to increase the risk of side-effects when given with sucralfate. Avoid. [Moderate] Theoretical
- Sodium clodronate → see bisphosphonates
- Sodium feredate → see iron (oral)
- Sodium nitroprusside → see TABLE 8 p. 1376 (hypotension)
- Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Theoretical
- Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with dapsone. [Severe] Theoretical
- Sodium oxybate → see TABLE 8 p. 1376 (hypotension), TABLE 11 p. 1377 (CNS depressant effects)
- Antibiotics (valproate) increase the exposure to sodium oxybate. Adjust sodium oxybate dose, p. 491. [Moderate] Study
- Sodium phenylbutyrate
  - Antibiotics (valproate) potentially decrease the effects of sodium phenylbutyrate. Avoid. [Moderate] Anecdotal
  - Corticosteroids potentially decrease the effects of sodium phenylbutyrate. Avoid. [Moderate] Anecdotal
  - Haloperidol potentially decreases the effects of sodium phenylbutyrate. Avoid. [Moderate] Anecdotal
- Sodium picosulfate → see TABLE 18 p. 1379 (hyponatraemia)
Sodium stibogluconate

- Sodium stibogluconate increases the risk of cardiovascular side-effects when given with amphotericin. Separate administration by 14 days. (Severe) Study

Sofosbuvir

- Sofosbuvir is predicted to increase the risk of severe bradycardia or heart block when given with antithyroid drugs (amiodarone). Refer to specialist literature. (Severe) Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Study
- Antiepileptics (fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical
- H₂ receptor antagonists potentially decrease the exposure to sofosbuvir. Adjust dose, see ledipasvir with sofosbuvir p. 628, sofosbuvir with velpatasvir p. 629, and sofosbuvir with velpatasvir and voxilaprevir p. 630. (Moderate) Study
- HIV-protecte inhibitors (tipranavir) are predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical
- Proton pump inhibitors potentially decrease the exposure to sofosbuvir. Adjust dose, see ledipasvir with sofosbuvir p. 628, sofosbuvir with velpatasvir p. 629, and sofosbuvir with velpatasvir and voxilaprevir p. 630. (Moderate) Study
- Rifabutin is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical
- Modafinil is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical
- Sodium stibogluconate

Solifenacin → see TABLE 10 p. 1377 (antimuscarinics)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to solifenacin. Adjust solifenacin p. 779 or tamsulosin with solifenacin p. 786 dose; avoid in hepatic and renal impairment. (Severe) Study
- Cobicistat is predicted to increase the exposure to solifenacin. Adjust solifenacin p. 779 or tamsulosin with solifenacin p. 786 dose; avoid in hepatic and renal impairment. (Severe) Study
- Enalapril is predicted to decrease the exposure to solifenacin. (Moderate) Theoretical
- Enalapril is predicted to decrease the exposure to solifenacin. Adjust solifenacin p. 779 or tamsulosin with solifenacin p. 786 dose; avoid in hepatic and renal impairment. (Severe) Study
- Idelalisib is predicted to increase the exposure to solifenacin. Adjust solifenacin p. 779 or tamsulosin with solifenacin p. 786 dose; avoid in hepatic and renal impairment. (Severe) Study
- Macrolides (clarithromycin) are predicted to increase the exposure to solifenacin. Adjust solifenacin p. 779 or tamsulosin with solifenacin p. 786 dose; avoid in hepatic and renal impairment. (Severe) Study
- Mitotane is predicted to decrease the exposure to solifenacin. (Moderate) Theoretical
- Rifampicin is predicted to decrease the exposure to solifenacin. (Moderate) Theoretical
- Somatostatin

Corticosteroids are predicted to decrease the effects of somatropin. (Moderate) Theoretical

Sorafenib → see TABLE 15 p. 1378 (myelosuppression), TABLE 9 p. 1377 (QT-interval prolongation)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sorafenib. (Moderate) Theoretical
- Sorafenib increases the anticoagulant effect of coumarins. (Severe) Anecdotal
- Enalapril is predicted to decrease the exposure to sorafenib. (Moderate) Theoretical
- Mitotane is predicted to decrease the exposure to sorafenib. (Moderate) Theoretical → Also see TABLE 15 p. 1378
- Neomycin moderately decreases the exposure to sorafenib. (Moderate) Study
- Sorafenib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to sorafenib. (Moderate) Theoretical
- Sotalol → see beta blockers, non-selective
- Spironolactone → see aldosterone antagonists

SSRIs → see TABLE 18 p. 1379 (hyponatraemia), TABLE 13 p. 1378 (serotonin syndrome), TABLE 9 p. 1377 (QT-interval prolongation), TABLE 4 p. 1375 (antiplalet effects)

citalopram - dapoxetine - escitalopram - fluoxetine - fluvoxamine - paroxetine - sertraline

- Fluvoxamine very markedly increases the exposure to agomelatine. Avoid. (Severe) Study
- Fluvoxamine moderately increases the exposure to alprazolam. Adjust dose. (Moderate) Study
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to amfetamines. (Severe) Theoretical → Also see TABLE 13 p. 1378
- Fluvoxamine moderately to markedly increases the exposure to aminophylline. Avoid. (Severe) Study
- Fluvoxamine decreases the clearance of anaethetics, local (ropivacaine). Avoid prolonged use. (Moderate) Study
- Fluvoxamine is predicted to increase the exposure to anagrelide. (Moderate) Theoretical → Also see TABLE 4 p. 1375
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4, p. 821. (Moderate) Theoretical
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to SSRIs (citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline). (Severe) Theoretical → Also see TABLE 9 p. 1377
- Fluvoxamine is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. (Moderate) Study
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. (Moderate) Study
- Fluvoxamine is predicted to increase the concentration of paroxetine. (Moderate) Study
- Sertraline potentially increases the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Anecdotal
- SSRIs (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiarrhythmics (propafenone, phenytoin). Monitor and adjust dose. (Severe) Anecdotal
- Antifungals, azoles (fluconazole, itraconazole, voriconazole) are predicted to increase the exposure to fluconazole. Adjust dose with moderate inhibitors of CYP3A4, p. 821. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketocnazole, voriconazole) are predicted to increase the exposure to fluconazole. Avoid moderate inhibitors of CYP3A4 or adjust dapoxetine dose, p. 821. (Severe) Study
- Antifungals, azoles (voriconazole) are predicted to increase the exposure to citalopram. (Severe) Theoretical → Also see TABLE 9 p. 1377
- Antihistamines, sedating (cyproheptadine) potentially decrease the effects of SSRIs. (Moderate) Anecdotal
- Apalutamide is predicted to decrease the exposure to citalopram. Avoid or monitor. (Moderate) Study → Also see TABLE 9 p. 1377
- Aprepitant is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose with moderate inhibitors of CYP3A4, p. 821. (Moderate) Theoretical
- Aripiprazole is predicted to increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. (Moderate) Study
- Fluvoxamine increases the exposure to asenapine. (Moderate) Study
- Paroxetine moderately increases the exposure to asenapine. (Moderate) Study
- SSRIs (fluoxetine, paroxetine) are predicted to markedly increase the exposure to atomoxetine. Adjust dose. (Severe) Study

www.getintopharma.com
Fluvoxamine is predicted to increase the concentration of beta blockers, non-selective (propranolol). Moderate Study

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). Moderate Study

Buproprion is predicted to increase the exposure to dapoxtine. Moderate Theoretical

Fluvoxamine markedly decreases the clearance of caffeine citrate. Monitor and adjust dose. Severe Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dapoxtine. Adjust dapoxtine dose with moderate inhibitors of CYP3A4, p. 821. Moderate Theoretical

SSRIs (fluoxetine, fluvoxamine) are predicted to increase the exposure to clozapin. Adjust clozapin dose, p. 232. Moderate Theoretical

SSRIs (fluoxetine, fluvoxamine) are predicted to decrease the efficacy of clonidine. Avoid. Moderate Theoretical

Fluvoxamine is predicted to increase the efficacy of clonidine. Monitor side effects and adjust dose. Moderate Study

Cobicistat is predicted to moderately increase the exposure to dapoxtine. Avoid potent inhibitors of CYP3A4 or adjust dapoxtine dose, p. 821. Moderate Study

Crisitinib is predicted to increase the exposure to dapoxtine. Adjust dapoxtine dose with moderate inhibitors of CYP3A4, p. 821. Moderate Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to slightly increase the exposure to darifenacin. Mild Study

Fluvoxamine moderately increases the exposure to diazepam. Moderate Study

Fluvoxamine is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. Moderate Study

Fluvoxamine markedly increases the exposure to duloxetine. Avoid. Severe Study Also see TABLE 13 p. 1578

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to eliglutzat. Avoid or adjust dose—consult product literature. Severe Study

Fluvoxamine is predicted to increase the exposure to eltrobrogop. Moderate Theoretical

Fluvoxamine is predicted to increase the exposure to erlotinib. Monitor side effects and adjust dose. Moderate Theoretical

Fluvoxamine increases the concentration of frovatriptan. Moderate Theoretical Also see TABLE 18 p. 1379

Grapefruit juice moderately increases the exposure to sertraline. Avoid. Moderate Study

H₂ receptor antagonists (cimetidine) slightly increase the exposure to SSRIs (cilastropam, escalopram). Adjust dose. Moderate Study

H₂ receptor antagonists (cimetidine) slightly increase the exposure to SSRIs (paroxetine, sertraline). Moderate Study

Fluoxetine increases the concentration of haloperidol. Adjust dose. Moderate Aneotal

HIV-protease inhibitors are predicted to moderately increase the exposure to dapoxtine. Avoid potent inhibitors of CYP3A4 or adjust dapoxtine dose, p. 821. Severe Study

Idelalisib is predicted to moderately increase the exposure to dapoxtine. Avoid potent inhibitors of CYP3A4 or adjust dapoxtine dose, p. 821. Severe Study

Imatinib is predicted to increase the exposure to dapoxtine. Adjust dapoxtine dose with moderate inhibitors of CYP3A4, p. 821. Moderate Theoretical

Fluoxetine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Unknown Theoretical

Fluvoxamine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate Theoretical

Fluvoxamine is predicted to increase the exposure to loxapine. Avoid. Unknown Theoretical

Macrolides (clarithromycin) are predicted to moderately increase the exposure to dapoxtine. Avoid potent inhibitors of CYP3A4 or adjust dapoxtine dose, p. 821. Severe Study

Macrolides (erythromycin) are predicted to increase the exposure to dapoxtine. Adjust dapoxtine dose with moderate inhibitors of CYP3A4, p. 821. Moderate Theoretical

Fluvoxamine very markedly increases the exposure to melatonin. Avoid. Severe Study

SSRIs (fluoxetine, fluvoxamine, paroxetine) are predicted to increase the exposure to melatonin. Moderate Study

Netupitant is predicted to increase the exposure to dapoxtine. Adjust dapoxtine dose with moderate inhibitors of CYP3A4, p. 821. Moderate Theoretical

SSRIs potentially increase the risk of prolonged neuromuscular blockade when given with neuromuscular blocking drugs, non-depolarising (mivacurium). Unknown Theoretical

Nilotinib is predicted to increase the exposure to dapoxtine. Adjust dapoxtine dose with moderate inhibitors of CYP3A4, p. 821. Moderate Theoretical

Fluvoxamine moderately increases the exposure to olanzapin. Adjust dose. Severe Aneotal

Paroxetine slightly increases the exposure to procyclidine. Monitor and adjust dose. Moderate Study

Proton pump inhibitors (omeprazole) are predicted to slightly to moderately increase the exposure to SSRIs (cilastropam, escalopram). Monitor and adjust dose. Moderate Study

Fluvoxamine is predicted to increase the exposure to pomalidomide. Adjust pomalidomide dose, p. 941. Moderate Study

Fluvoxamine is predicted to increase the exposure to pipenzylline. Moderate Theoretical

Fluvoxamine is predicted to moderately increase the exposure to pirenidone. Avoid. Moderate Study

SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. Moderate Study

Fluvoxamine moderately increases the exposure to pomalidomide. Adjust pomalidomide dose, p. 961. Moderate Study

Paroxetine increases the efficacy of opioids (codeine). Moderate Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of opioids (tramadol). Moderate Theoretical

Fluvoxamine is predicted to increase the exposure to pentoxifylline. Moderate Theoretical

Fluvoxamine is predicted to moderately increase the exposure to piropenidone. Avoid. Moderate Study

Fluvoxamine is predicted to moderately increase the exposure to pitolisant. (fluoxetine, paroxetine) are predicted to decrease the exposure to SSRIs (cilastropam, escalopram). Monitor and adjust dose. Moderate Study

Fluvoxamine is predicted to increase the exposure to riluzole. Moderate Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to risperidone. Adjust dose. Moderate Study

Fluvoxamine is predicted to increase the exposure to roflumilast. Moderate Study

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to SSRIs (cilastropam, escalopram). Monitor and adjust dose. Severe Theoretical

Proton pump inhibitors (omeprazole) slightly to moderately increase the exposure to SSRIs (cilastropam, escalopram). Moderate Study

Fluvoxamine is predicted to increase the exposure to suxamethonium. Unknown Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of tamoxifen. Avoid. Severe Study

Terbinafine is predicted to increase the exposure to fluoxetine. Adjust dose. Moderate Theoretical

Terbinafine moderately increases the exposure to paroxetine. Moderate Study

Terbinafine is predicted to increase the exposure to SSRIs (cilastropam, escalopram, dalopram, escinopram). Adjust dose. Moderate Study

Fluvoxamine very markedly increases the exposure to tiadinol. Avoid. Severe Study

SSRIs (fluoxetine, fluvoxamine) given with a moderate CYP3A4 inhibitor are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. Moderate Study
SSRIs (continued)

- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 18 p. 1379 → Also see TABLE 13 p. 1378
- Fluoxetine increases the exposure to tricyclic antidepressants (amitryptiline, imipramine). Adjust dose. [Severe] Study → Also see TABLE 18 p. 1379 → Also see TABLE 13 p. 1378
- Fluvoxamine markedly increases the exposure to tricyclic antidepressants (clomipramine). Adjust dose. [Severe] Study → Also see TABLE 18 p. 1379 → Also see TABLE 13 p. 1378
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study → Also see TABLE 13 p. 1378 → Also see TABLE 4 p. 1375
- Fluvoxamine is predicted to increase the exposure to midazolam. Adjust midazolam dose, p. 482. [Severe] Theoretical → Also see TABLE 13 p. 1378

St John’s Wort

- St John’s Wort is predicted to decrease the exposure to abacavir. [Severe] Study
- St John’s Wort is predicted to decrease the concentration of aripiprazole (dronedarone). Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to sertraline (dronedarone). Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to antiepileptics (brivaracetam). [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to antiepileptics (carbamazepine). Monitor and adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin). Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to antidepressants (perampanel). Monitor and adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to antifungals, azoles (voriconazole). Avoid. [Moderate] Study
- St John’s Wort is predicted to decrease the concentration of antiarrhythmics (piperaquarine). Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to apixaban. Use with caution or avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to aripiprazole. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to aripiprazole. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to axitinib. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to bosentan. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to brigitinib. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the concentration of aminophylline. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to cariprazine. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to cisapride. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the concentration of ciclosporin. Avoid. [Moderate] Study
- St John’s Wort is predicted to alter the effects of clozapine. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to conivaptan. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the efficacy of combined hormonal contraceptives. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Anecdotal
- St John’s Wort is predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to dasatinib. [Severe] Study
- St John’s Wort is predicted to decrease the efficacy of desogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical
- St John’s Wort is predicted to decrease the concentration of digitoxin. Avoid. [Severe] Anecdotal
- St John’s Wort is predicted to decrease the exposure to dolutegravir. Adjust dose. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to doravirine. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to edoxaban. [Moderate] Study
- St John’s Wort is predicted to decrease the concentration of efavirenz. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to moderately decrease the exposure to elabavir. Avoid. [Severe] Study
- St John’s Wort is predicted to increase the exposure to eliglustat. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to escorafiban. [Severe] Theoretical
- St John’s Wort is predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- St John’s Wort is predicted to decrease the efficacy of etonogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 794. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to exemestane. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to fosoterodine. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to fingolimod. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to glecaprevir. Avoid. [Severe] Study
- St John’s Wort is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
St John’s Wort – Statins 1533

- St John’s Wort is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to HIV-protease inhibitors. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the efficacy of hormone replacement therapy. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to ibritinib. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to idelalisib. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to imatinib. [Moderate] Study
- St John’s Wort slightly decreases the exposure to irinotecan. Avoid. [Severe] Study
- St John’s Wort decreases the exposure to ivabradine. Avoid. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to ivacaftor. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the concentration of letro Mizol. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the efficacy of levonorgestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p.794. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to lurazidone. Monitor and adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to macitentan. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to macrolides. Avoid. [Severe] Theoretical
- St John’s Wort moderately decreases the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to midostaurin. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to nalo norgel. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to netupitant. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the concentration of noretisterone. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to nintedanib. [Moderate] Study
- St John’s Wort is predicted to decrease the efficacy of norethisterone. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p.794. [Severe] Anecdotal
- St John’s Wort is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Anecdotal
- St John’s Wort is predicted to decrease the exposure to ombitasvir. Avoid. [Severe] Theoretical
- St John’s Wort decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study → Also see TABLE 13 p.1378
- St John’s Wort moderately decreases the exposure to opioids (oxycodeone). Adjust dose. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to osimertinib. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to os pamemfene. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to paliperidone. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to phosphodiesterase type 5 inhibitors. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to pi brentasvir. Avoid. [Severe] Study
- St John’s Wort slightly decreases the exposure to pioglitazone. [Mild] Study
- St John’s Wort is predicted to decrease the exposure to pitolisant. Monitor and adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to ponatinib. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to quetiapine. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to ribociclib. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to rolapitant. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to roxilutinib. Monitor and adjust dose. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- St John’s Wort slightly decreases the exposure to statins (atorvastatin). [Mild] Study
- St John’s Wort moderately decreases the exposure to statins (simvastatin). [Moderate] Study
- St John’s Wort decreases the concentration of tacrolimus. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to tenofovir alafenamide. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to tezacaftar. Avoid. [Severe] Theoretical
- St John’s Wort potentially decreases the exposure to theophylline. [Severe] Anecdotal
- St John’s Wort is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to ti vozanib. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to tofacitinib. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to tolvaptan. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to topotecan. [Severe] Theoretical
- St John’s Wort decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p.794. [Severe] Anecdotal
- St John’s Wort is predicted to decrease the exposure to vapatasvir. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- St John’s Wort is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- St John’s Wort slightly to moderately increases the exposure to aliskiren. [Moderate] Study
- Antacids moderately decrease the absorption of rosuvastatin. Separate administration by 2 hours. [Moderate] Study
- Antiarrhythmics (amiodarone) are predicted to increase the risk of rhabdomyolysis when given with atorvastatin. Monitor and adjust dose. [Moderate] Theoretical
- Antiarrhythmics (amiodarone) are predicted to increase the exposure to fluvastatin. [Severe] Theoretical
- Antiarrhythmics (amiodarone) increase the risk of rhabdomyolysis when given with simvastatin. Adjust simvastatin dose, p.205. [Severe] Study

Study p. 794.
Ciclosporin markedly to very markedly increases the exposure to pravastatin. Adjust dose. [Severe] Study

Ciclosporin markedly increases the exposure to statins (rosuvastatin, simvastatin). Avoid. [Severe] Study

Clopaprogrel increases the exposure to rosuvastatin. Adjust rosvastatin dose, p. 204. [Moderate] Study

Cobicistat is predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study

Cobicistat is predicted to increase the exposure to simvastatin. Avoid. [Severe] Study

Colchicine increases the risk of rhabdomyolysis when given with statins. [Severe] Anecdotal

Statins (fluvastatin, rosuvastatin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study

Crizotinib is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. [Severe] Study

Crizotinib is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 205. [Severe] Study

Danazol is predicted to increase the risk of rhabdomyolysis when given with atorvastatin. [Severe] Theoretical

Danazol increases the risk of rhabdomyolysis when given with simvastatin. Avoid. [Severe] Anecdotal

Statins are predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical

Dasabuvir increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 204. [Moderate] Study

Dasatinib is predicted to increase the exposure to simvastatin. [Moderate] Theoretical

Efavirenz slightly decreases the exposure to atorvastatin. [Mild] Study

Efavirenz moderately decreases the exposure to simvastatin. [Moderate] Study

Efavirenz is predicted to increase the exposure to atorvastatin. Adjust atorvastatin dose, p. 202. [Moderate] Study

Elbasvir is predicted to increase the exposure to fluvastatin. Adjust fluvastatin dose, p. 203. [Unknown] Theoretical

Elbasvir increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 204. [Moderate] Study

Elbasvir is predicted to increase the exposure to simvastatin. Adjust simvastatin dose, p. 205. [Unknown] Theoretical

Eltrombopag is predicted to increase the exposure to statins. Monitor and adjust dose. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to simvastatin. [Severe] Study

Ezetimibe potentially increases the risk of rhabdomyolysis when given with statins. [Severe] Anecdotal

Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with pravastatin. Avoid. [Severe] Study

Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with rosvastatin. Adjust rosvastatin dose, p. 204. [Unknown] Theoretical

Fibrates (bezafibrate, ciprofibrate) increase the risk of rhabdomyolysis when given with simvastatin. Adjust simvasatin dose, p. 205. [Unknown] Theoretical

Fibrates (ciprofibrate) increase the risk of rhabdomyolysis when given with atorvastatin. Avoid or adjust dose. [Severe] Study

Fibrates (ciprofibrate) increase the risk of rhabdomyolysis when given with fluvastatin. [Severe] Study

Fibrates (fenofibrate) are predicted to increase the risk of rhabdomyolysis when given with fluvastatin. Adjust fenofibrate dose, p. 199. [Severe] Theoretical

Fibrates (fenofibrate) are predicted to increase the risk of rhabdomyolysis when given with pravastatin. Avoid. [Severe] Theoretical

Fibrates (fenofibrate) increase the risk of rhabdomyolysis when given with rosuvastatin. Adjust fenofibrate and rosuvastatin doses, p. 199, p. 204. [Severe] Anecdotal

Fibrates (gemfibrozil) increase the risk of rhabdomyolysis when given with statins. Avoid. [Severe] Anecdotal

Fibrates (bezafibrate) increase the risk of rhabdomyolysis when given with statins (atorvastatin, fluvastatin). [Severe] Study
Fibrates (fenofibrate) increase the risk of rhabdomyolysis when given with statins (atorvastatin, simvastatin). Adjust fenofibrate dose, p. 199. (Severe) Anecdotal.
Fusidic acid increases the risk of rhabdomyolysis when given with statins. Avoid. (Severe) Anecdotal.
Glecaprevir (with pibrentasvir) marked increases the exposure to atorvastatin. Avoid. (Severe) Study
Glecaprevir (with pibrentasvir) is predicted to increase the exposure to flavuvastatin. (Moderate) Theoretical
Glecaprevir (with pibrentasvir) increases the exposure to pravastatin. Use with caution and adjust pravastatin dose, p. 201. (Moderate) Study
Glecaprevir (with pibrentasvir) increases the exposure to rosuvastatin. Use with caution and adjust rosuvastatin dose, p. 204. (Moderate) Study
Grapefruit juice increases the exposure to atorvastatin. (Moderate) Study
Grapefruit juice increases the exposure to simvastatin. Avoid. (Severe) Study
Grazoprevir increases the exposure to atorvastatin. Adjust atorvastatin dose, p. 202. (Moderate) Study
Grazoprevir is predicted to increase the exposure to flavuvastatin. Adjust flavuvastatin dose, p. 203. (Unknown) Theoretical
Grazoprevir increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 204. (Moderate) Study
Grazoprevir is predicted to increase the exposure to simvastatin. Adjust simvastatin dose, p. 205. (Unknown) Theoretical
HIV- protease inhibitors are predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. (Severe) Study
HIV-protease inhibitors slightly to moderately increase the exposure to rosuvastatin. Avoid or adjust dose. (Severe) Study
HIV-protease inhibitors are predicted to increase the exposure to simvastatin. Avoid. (Severe) Study
Idelalisib is predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. (Severe) Study
Idelalisib is predicted to increase the exposure to simvastatin. Avoid. (Severe) Study
Imatinib is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. (Severe) Study
Imatinib is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 205. (Severe) Study
Ledipasvir is predicted to increase the exposure to rosuvastatin. Avoid. (Severe) Theoretical
Ledipasvir is predicted to increase the exposure to statins (atorvastatin, flavuvastatin, pravastatin, simvastatin). Monitor and adjust dose. (Moderate) Theoretical
Leflunomide is predicted to increase the exposure to rosuvastatin. Adjust dose. (Moderate) Study → Also see TABLE 1 p. 1375
Leflunomide is predicted to increase the exposure to statins (atorvastatin, flavuvastatin, pravastatin, simvastatin). (Moderate) Study → Also see TABLE 1 p. 1375
Letermovir moderately increases the exposure to atorvastatin. Avoid or adjust atorvastatin dose, p. 202. (Severe) Study
Letermovir is predicted to increase the exposure to flavuvastatin. Monitor and adjust dose. (Moderate) Theoretical
Letermovir is predicted to increase the exposure to pravastatin. Avoid or adjust dose. (Moderate) Theoretical
Letermovir is predicted to increase the exposure to statins (rosuvastatin, simvastatin). Avoid. (Severe) Study
Lomitapide increases the exposure to atorvastatin. Adjust lomitapide dose or separate administration by 12 hours, p. 207. (Moderate) Study → Also see TABLE 1 p. 1375
Lomitapide increases the exposure to simvastatin. Monitor and adjust simvastatin dose, p. 205. (Moderate) Study → Also see TABLE 1 p. 1375
Macrolides (clarithromycin) are predicted to increase the exposure to pravastatin. (Severe) Study
Macrolides (clarithromycin) are predicted to increase the exposure to simvastatin. Avoid. (Severe) Study
Macrolides (erythromycin) are predicted to increase the exposure to atorvastatin. Monitor and adjust dose. (Severe) Study
Macrolides (erythromycin) are predicted to increase the exposure to pravastatin. (Severe) Study
Macrolides (erythromycin) are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 205. (Severe) Study
Mitotane is predicted to decrease the exposure to simvastatin. (Severe) Study
Monoclonal antibodies (carilumab) are predicted to decrease the exposure to statins (atorvastatin, simvastatin). (Moderate) Study
Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to statins (atorvastatin, simvastatin). Monitor and adjust dose. (Moderate) Study
Netupitant is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. (Severe) Study
Netupitant is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 205. (Severe) Study
Nevirapine slightly decreases the exposure to atorvastatin. (Unknown) Study
Nevirapine moderately decreases the exposure to simvastatin. (Moderate) Study
Nicotinic acid is predicted to increase the risk of rhabdomyolysis when given with statins. (Severe) Theoretical
Nilotinib is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. (Severe) Study
Nilotinib is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 205. (Severe) Study
Osimertinib slightly increases the exposure to rosuvastatin. (Moderate) Study
Paritaprevir (in fixed-dose combination) is predicted to increase the risk of rhabdomyolysis when given with atorvastatin. Avoid. (Severe) Theoretical
Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to flavuvastatin. Avoid. (Moderate) Theoretical
Paritaprevir (with ritonavir and ombitasvir) increases the exposure to pravastatin. Adjust pravastatin dose, p. 203. (Moderate) Study
Paritaprevir (with ritonavir and ombitasvir) slightly to moderately increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 204. (Moderate) Study
Paritaprevir (in fixed-dose combination) is predicted to increase the risk of rhabdomyolysis when given with simvastatin. Avoid. (Severe) Theoretical
Pazopanib is predicted to affect the exposure to atorvastatin. (Moderate) Anecdotal
Pazopanib is predicted to affect the exposure to statins (pravastatin, rosuvastatin, simvastatin). (Moderate) Theoretical
Rosuvastatin is predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. (Severe) Theoretical
Pibrentasvir (with glecaprevir) markedly increases the exposure to atorvastatin. Avoid. (Severe) Study
Pibrentasvir (with glecaprevir) is predicted to increase the exposure to flavuvastatin. (Moderate) Theoretical
Pibrentasvir (with glecaprevir) is predicted to increase the exposure to rosuvastatin. Use with caution and adjust rosuvastatin dose, p. 204. (Moderate) Study
Pibrentasvir (with glecaprevir) increases the exposure to simvastatin. Avoid. (Moderate) Study
Ranolazine is predicted to increase the exposure to atorvastatin. (Moderate) Theoretical
Ranolazine slightly increases the exposure to simvastatin. Adjust simvastatin dose, p. 205. (Moderate) Study
**Statin** interactions

- **Regorafenib** is predicted to increase the exposure to statins (atorvastatin, fluvastatin, rosuvastatin). [Moderate] Study
- **Ribociclib** (high-dose) is predicted to increase the exposure to simvastatin. Avoid. [Theoretical]
- **Ribociclib** is predicted to increase the exposure to statins (pravastatin, rosuvastatin). [Moderate] Study
- **Rifampicin** markedly decreases the exposure to atorvastatin. Atorvastatin should be taken at the same time as rifampicin, p. 202, 582. [Moderate] Study
- **Rifampicin** moderately decreases the exposure to fluvastatin. Monitor and adjust dose. [Moderate] Study
- **Rifampicin** very markedly decreases the exposure to simvastatin. [Severe] Study
- **Rolapitant** is predicted to increase the exposure to atorvastatin, fluvastatin, rosuvastatin. Avoid. [Moderate] Study
- **Sacubitril** is predicted to increase the exposure to statins. [Severe] Study
- **St John's Wort** slightly decreases the exposure to atorvastatin. [Moderate] Study
- **St John's Wort** moderately decreases the exposure to simvastatin. [Moderate] Study
- **Fluvastatin** slightly increases the exposure to sulfonyleureas (glibenclamide). [Mild] Study
- **Tedizolid** is predicted to increase the exposure to statins (atorvastatin, fluvastatin, rosuvastatin). Avoid. [Moderate] Study
- **Teriflunomide** moderately increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 204. [Moderate] Study
- **Teriflunomide** is predicted to increase the exposure to statins (atorvastatin, fluvastatin, pravastatin, simvastatin). [Moderate] Study
- **Ticagrelor** slightly increases the exposure to simvastatin. Adjust simvastatin dose, p. 205. [Moderate] Study
- **Tivozanib** is predicted to decrease the exposure to rosvastatin. Avoid. [Moderate] Study
- **Velpatasvir** is predicted to increase the exposure to atorvastatin. Avoid. [Severe] Study
- **Velpatasvir** increases the exposure to rosuvastatin. Adjust rosvastatin dose and monitor side effects, p. 204. [Severe] Study
- **Velpatasvir** is predicted to increase the exposure to simvastatin. Monitor side effects and adjust dose. [Severe] Theoretical
- **Venetoclax** is predicted to increase the exposure to atorvastatin. [Moderate] Study
- **Venetoclax** is predicted to increase the exposure to statins (fluvastatin, pravastatin, rosuvastatin, simvastatin). [Moderate] Theoretical
- **Voxilaprevir** is predicted to increase the exposure to atorvastatin. Avoid. [Moderate] Theoretical
- **Voxilaprevir** (with sofosbuvir and velpatasvir) moderately increases the exposure to pravastatin. Monitor and adjust pravastatin dose, p. 203. [Moderate] Study
- **Voxilaprevir** (with sofosbuvir and velpatasvir) markedly increases the exposure to rosvastatin. Avoid. [Severe] Study
- **Voxilaprevir** (with sofosbuvir and velpatasvir) is predicted to increase the exposure to statins (fluvastatin, simvastatin). Avoid. [Moderate] Theoretical

**Stavudine**

- See TABLE 12 (p. 1378 (peripheral neuropathy))
- **Didanosine** increases the risk of toxicity when given with stavudine. Avoid. [Severe] Study
- **Isoniazid** is predicted to increase the risk of peripheral neuropathy when given with stavudine. Avoid. [Severe] Study
- **Ribavirin** increases the risk of toxicity when given with stavudine. Avoid. [Severe] Study
- **Zidovudine** is predicted to decrease the efficacy of stavudine. Avoid. [Severe] Theoretical

**Streptokinase**

- See TABLE 3 (p. 1375 (anticoagulant effects))
- **Streptokinase** is predicted to increase the risk of anaemia.

**Streptozocin**

- See TABLE 1 (p. 1375 (hepatotoxicity)), TABLE 2 (p. 1375 (nephrotoxicity))
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with streptozocin. Public Health England advises avoid (refer to Green Book). [Severe] Theoretical

**Sucrafate**

- **Sucrafate** is predicted to decrease the exposure to bictegravir. Avoid. [Moderate] Theoretical
- **Sucrafate** potentially decreases the effects of coumarins (warfarin). Separate administration by 2 hours. [Moderate] Study
- **Sucrafate** decreases the absorption of digoxin. Separate administration by 2 hours. [Severe] Anecdotal
- **Sucrafate** decreases the absorption of dolasetron. Separate administration by 2 hours. [Moderate] Study
- **Sucrafate** increases the risk of blocked enteral or nasogastric tubes when given with enteral feeds. Separate administration by 1 hour. [Moderate] Study
- **Potassium citrate** increases the risk of side-effects when given with sucralfate. Avoid. [Moderate] Theoretical
- **Sucrafate** decreases the exposure to quinolones. Separate administration by 2 hours. [Moderate] Study
- **Sucrafate** potentially decreases the absorption of theophylline. Separate administration by at least 2 hours. [Moderate] Study
- **Sucrafate** decreases the absorption of thyroid hormones (levothyroxine). Separate administration by at least 4 hours. [Moderate] Study
- **Sucrafate** is predicted to decrease the absorption of tricyclic antidepressants. [Moderate] Study
- **Sufentanil** → see opioids
- **Sugammadex**
  - **Sugammadex** is predicted to decrease the exposure to oral combined hormonal contraceptives. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
  - **Sugammadex** is predicted to decrease the exposure to desogestrel. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
  - **Sugammadex** is predicted to decrease the efficacy of etonogestrel. Use additional contraceptive precautions. [Severe] Theoretical
  - **Sugammadex** is predicted to decrease the exposure to levonorgestrel. Use additional contraceptive precautions. [Severe] Theoretical
- **Sulfamethoxazole** → see sulfonamides
- **Sulfadiazine** → see sulfonamides
- **Sulfadimethoxine** → see sulfonamides
- **Sulfasalazine** → see sulfonamides
- **Sulfadiazine** → see sulfonamides
- **Sulfadimethoxine** → see sulfonamides
- **Sulfamethoxazole** → see sulfonamides
- **Sulfasalazine** (hepatotoxicity), TABLE 15 p. 1378 (myelosuppression)
  - **Antifungals, azoles (Isavuconazole)** are predicted to increase the exposure to sulfasalazine. [Moderate] Theoretical
- **Sulfasalazine** decreases the concentration of digoxin. [Moderate] Study
- **Sulfasalazine** is predicted to decrease the absorption of folates. [Moderate] Study
- **Leffunomide** is predicted to increase the exposure to sulfasalazine. [Moderate] Study → Also see TABLE 1 p. 1375 → Also see TABLE 15 p. 1378
- **Regorafenib** is predicted to increase the exposure to sulfasalazine. [Moderate] Study → Also see TABLE 15 p. 1378
- **Rolapitant** increases the exposure to sulfasalazine. [Severe] Study
- **Tedizolid** is predicted to increase the exposure to sulfasalazine. Avoid. [Moderate] Study
- **Teriflunomide** is predicted to increase the exposure to sulfasalazine. [Moderate] Study
**Sulphasalazine — Sunitinib 1537**

- **Velpatasvir** is predicted to increase the exposure to sulphasalazine. [Moderate] Theoretical
- **Venetoclax** is predicted to increase the exposure to sulphasalazine. [Moderate] Theoretical
- **Voxilaprevir** is predicted to increase the concentration of sulphasalazine. Avoid. [Severe] Theoretical

Sulfonamides → see TABLE 15 p. 1378 (myelosuppression)

sulfadiazine - sulfadizone - sulfamethoxazole

- **Sulfonamides** potentially increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Anecdotal
- **Sulfadiazine** is predicted to increase the concentration of antiepileptics (fosphenytoin). Monitor and adjust dose. [Moderate] Study
- **Sulfadiazine** increases the concentration of antiepileptics (phenytoin). Monitor and adjust dose. [Moderate] Study
- **Antimalarials (pyrimethamine)** increase the risk of side-effects when given with sulfonamides. [Severe] Study → Also see TABLE 15 p. 1378
- **Sulfadiazine** is predicted to increase the anticoagulant effect of coumarins. [Severe] Theoretical
- **Sulfamethoxazole** increases the anticoagulant effect of coumarins. [Severe] Study
- **Sulfonamides** are predicted to increase the risk of methaemoglobinemia when given with dapson. [Severe] Theoretical
- **Sulfonamides** are predicted to increase the exposure to methotrexate. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 15 p. 1378
- **Potassium aminobenzoate** is predicted to affect the efficacy of sulfonamides. Avoid. [Severe] Theoretical
- **Sulfonamides** are predicted to increase the exposure to sulfonylureas. [Moderate] Study
- **Sulfonamides** are predicted to increase the effects of thiopental. [Moderate] Theoretical

**Sulfonylureas** → see TABLE 14 p. 1378 (antidiabetic drugs)

- **Glibenclamide** - glipizide - glimepiride - gliclizide - tolbutamide
  - **Antihyperglycaemics (amidodarone)** are predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. [Moderate] Study
  - **Antifungals, azoles (fluconazole, miconazole)** are predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. [Moderate] Study
  - **Antifungals, azoles (voriconazole)** are predicted to increase the concentration of sulfonylureas. Use with caution and adjust dose. [Moderate] Study
  - **Bosentan** increases the risk of hepatotoxicity when given with glibenclamide. Avoid. [Severe] Study
  - **Cephalosporins (ceftriaxone)** are predicted to increase the concentration of glibenclamide. [Moderate] Theoretical
  - **Cefepine** is predicted to increase the exposure to glimepiride. [Moderate] Theoretical
  - **Chloramphenicol** is predicted to increase the exposure to sulfonylureas. [Severe] Study
  - **Fibrates** are predicted to increase the risk of hypoglycaemia when given with sulfonylureas. [Moderate] Theoretical
  - **Leflunomide** is predicted to increase the exposure to glibenclamide. [Moderate] Study
  - **Letermovir** is predicted to increase the concentration of glibenclamide. [Moderate] Theoretical
  - **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to sulfonylureas. [Moderate] Theoretical
  - **Rifampicin** is predicted to decrease the exposure to sulfonylureas. [Moderate] Study
  - **Statins (fluvastatin)** slightly increase the exposure to glibenclamide. [Mild] Study
  - **Sulfonamides** are predicted to increase the exposure to sulfonylureas. [Moderate] Study
  - **Teriflunomide** is predicted to increase the exposure to glibenclamide. [Moderate] Study
  - **Venetoclax** is predicted to increase the exposure to glibenclamide. [Moderate] Theoretical

Sulindac → see NSAIDs

**Sulpiride** → see TABLE 8 p. 1376 (hypotension), TABLE 9 p. 1377 (QT-interval prolongation), TABLE 11 p. 1377 (CNS depressant effects)
- **Antacids** decrease the absorption of sulpiride. Separate administration by 2 hours. [Moderate] Study
- **Sulpiride** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1376 → Also see TABLE 9 p. 1377
- **Sulpiride** is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1376
- **Sulpiride** potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 1377
- **Sucralfate** decreases the absorption of sulpiride. Separate administration by 2 hours. [Moderate] Study

**Sumatriptan** → see TABLE 13 p. 1378 (serotonin syndrome)
- **Sumatriptan** increases the risk of vasodistension when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after sumatriptan. [Severe] Study
- **Moclobemide** moderately increases the exposure to sumatriptan. Avoid. [Moderate] Study → Also see TABLE 13 p. 1378
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to sumatriptan. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1378

**Sunitinib** → see TABLE 15 p. 1378 (myelosuppression), TABLE 9 p. 1377 (QT-interval prolongation)
- **Antihymetics (dronedarone)** are predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 9 p. 1377
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. [Moderate] Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 9 p. 1377
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. [Moderate] Study → Also see TABLE 9 p. 1377
- **Aprepitant** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to sunitinib. [Moderate] Theoretical
- **Cobicistat** is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. [Moderate] Study
- **Sunitinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Crizotinib** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1378 → Also see TABLE 9 p. 1377
- **Elbasvir** is predicted to increase the concentration of sunitinib. Use with caution and adjust dose. [Moderate] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. [Moderate] Study
- **Grapefruit juice** is predicted to increase the exposure to sunitinib. Avoid. [Moderate] Theoretical
- **Grazoprevir** is predicted to increase the concentration of sunitinib. Use with caution and adjust dose. [Moderate] Theoretical
- **HIV-protase inhibitors** are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. [Moderate] Study → Also see TABLE 9 p. 1377
- **Idelalisib** is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. [Moderate] Study → Also see TABLE 15 p. 1378
- **Imatinib** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1378
- **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 999. [Moderate] Study → Also see TABLE 9 p. 1377
- **Macrolides (erythromycin)** are predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 9 p. 1377

www.getintopharma.com
Sunitinib — Sympathomimetics, vasoconstrictor

- **Opicapone** is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic. (Severe) Theoretical
- **Tolcapone** is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic. (Moderate) Theoretical

**Sympathomimetics, vasoconstrictor**
- adrenaline/epinephrine, -ephrine, -isometheptene, -metaraminol, -midodrine, -noradrenaline/norepinephrine, -phenylephrine, -pseudoephedrine, -xylometazoline

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- **Ephedrine** increases the risk of side-effects when given with aminophylline. Avoid in children. (Moderate) Study
- **Sympathomimetics, vasoconstrictor** are predicted to decrease the effects of apraclonidine. Avoid. (Severe) Theoretical
- **Atropine** increases the risk of severe hypertension when given with phenylephrine. (Severe) Study
- **Beta blockers, non-selective** are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Severe) Study
- **Beta blockers, selective** are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Severe) Study
- **Isometheptene** potentially increases the risk of side-effects when given with dopamine receptor agonists (bromocriptine). Avoid. (Severe) Anecdotal
- **Entacapone** is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Moderate) Study
- **Ergometrine** is predicted to increase the risk of peripheral vasoconstriction when given with noradrenaline/norepinephrine. (Severe) Anecdotal
- **Guanethidine** increases the effects of metaraminol. (Severe) Anecdotal
- **Guanethidine** increases the effects of phenylephrine. (Severe) Study
- **Guanethidine** is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Moderate) Study
- **Pseudoephedrine** increases the risk of elevated blood pressure when given with linezolid. Avoid. (Severe) Study
- **Sympathomimetics, vasoconstrictor (adrenaline/epinephrine, phenylephrine, isometheptene, noradrenaline/norepinephrine, phenylephrine) are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. (Severe) Theoretical
- **Mianserin** decreases the effects of ephedrine. (Severe) Anecdotal
- **Moclobemide** is predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor (ephedrine, isometheptene, phenylephrine, pseudoephedrine). Avoid. (Severe) Study
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor. Avoid and for 14 days after stopping the MAOI. (Severe) Study
- **Monoamine-oxidase B inhibitors** are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, inotropic. Avoid. (Severe) Anecdotal
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic. (Severe) Theoretical
- **Ephedrine** increases the risk of side-effects when given with theophylline. Avoid in children. (Moderate) Study
- **Tolcapone** is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Moderate) Theoretical
- **Tricyclic antidepressants** are predicted to decrease the effects of ephedrine. Avoid. (Severe) Study

**Sympathomimetics, inotropic**
- **dobutamine - dopamine**
- **Sympathomimetics, inotropic** are predicted to decrease the effects of apraclonidine. Avoid. (Severe) Theoretical
- **Beta blockers, non-selective** increase the risk of hypertension and bradycardia when given with dobutamine. (Severe) Theoretical
- **Beta blockers, selective** increase the risk of hypertension and bradycardia when given with dobutamine. (Moderate) Theoretical
- **Entacapone** is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic. (Moderate) Theoretical
- **Ergometrine** potentially increases the risk of peripheral vasoconstriction when given with dopamine. Avoid. (Severe) Anecdotal
- **Guanethidine** is predicted to increase the effects of dopamine. (Severe) Theoretical
- **Sympathomimetics, inotropic** are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. (Severe) Theoretical
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor. Avoid and for 14 days after stopping the MAOI. (Severe) Study
- **Monoamine-oxidase B inhibitors** are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, inotropic. Avoid. (Severe) Anecdotal

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
**Tricyclic antidepressants** increase the effects of sympathomimetics, vasoconstrictor

**Talcacitol** → see vitamin D substances

**Tacrolimus** → see TABLE 2 p. 1375 (nephrotoxicity), TABLE 16 p. 1379 (increased serum potassium)

- Pomelo and pomegranate juices might greatly increase the concentration of tacrolimus.
- Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

**Alcohol (beverage)** increases the risk of facial flushing and skin irritation when given with topical tacrolimus. (Moderate) Study

**Antirheumatics (amiodarone)** are predicted to increase the concentration of tacrolimus. (Severe) Study

**Antifungals, azoles** (fluconazole, itasuconazole, posaconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

**Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

**Antifungals, azoles** (miconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

**Aprepitant** is predicted to increase the concentration of tacrolimus. (Severe) Study

**Bosentan** is predicted to decrease the concentration of tacrolimus and tacrolimus potentially increases the concentration of bosentan. Avoid. (Severe) Theoretical

**Brigatinib** potentially decreases the concentration of tacrolimus. Avoid. (Moderate) Theoretical

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of tacrolimus. (Severe) Study

- Calcium channel blockers (nicardipine) potentially increase the concentration of tacrolimus. Monitor concentration and adjust dose. (Severe) Anecdotal

**Ceritinib** is predicted to increase the exposure to tacrolimus. Avoid. (Severe) Theoretical

**Chloramphenicol** increases the concentration of tacrolimus. (Severe) Study

**Ciclosporin** increases the concentration of tacrolimus. Avoid. (Severe) Study → Also see TABLE 2 p. 1375 → Also see TABLE 16 p. 1379

**Cobicistat** is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

**Crizotinib** is predicted to increase the concentration of tacrolimus. (Severe) Study

**Tacrolimus** is predicted to increase the exposure to dabigatran. Avoid. (Severe) Theoretical

**Danzol** potentially increases the concentration of tacrolimus. (Severe) Anecdotal

**Doravirine** is predicted to decrease the exposure to tacrolimus. Monitor tacrolimus concentration and adjust dose, p. 841. (Moderate) Theoretical

**Efavirenz** is predicted to decrease the concentration of tacrolimus. Monitor and adjust dose. (Moderate) Theoretical

**Enalapril** decreases the concentration of tacrolimus. Monitor and adjust dose. (Moderate) Theoretical

**Gliclazide** (with gliclazide) slightly increases the exposure to tacrolimus. Monitor and adjust dose. (Severe) Study

**Grapefruit juice** greatly increases the concentration of tacrolimus. Avoid. (Severe) Study

**Grazoprevir** increases the exposure to tacrolimus. (Moderate) Study

**HIV-protase inhibitors** are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

**Idelalisib** is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

**Imatinib** is predicted to increase the concentration of tacrolimus. (Severe) Study

**Letermovir** moderately increases the exposure to tacrolimus. Monitor and adjust dose. (Severe) Study

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tacrolimus. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical

**Tacrolimus** is predicted to increase the exposure to lonafacta. Separate administration by 12 hours. (Moderate) Theoretical

**Lumacaftor** is predicted to decrease the exposure to tacrolimus. Avoid. (Severe) Theoretical

**Macrolides** (clarithromycin) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

**Macrolides** (erythromycin) are predicted to increase the concentration of tacrolimus. (Severe) Study

**Tacrolimus** is predicted to affect the efficacy of mifamurtide. Avoid. (Severe) Theoretical

**Mitotane** decreases the concentration of tacrolimus. Monitor and adjust dose. (Severe) Theoretical

**Nilotinib** is predicted to increase the concentration of tacrolimus. (Severe) Study

**Palbociclib** is predicted to increase the exposure to tacrolimus. Adjust dose. (Moderate) Theoretical

**Ponatinib** (with ponatinib) slightly increases the exposure to tacrolimus. Monitor and adjust dose. (Severe) Study

**Ponatinib** is predicted to decrease the exposure to tacrolimus. Avoid. (Severe) Theoretical

**Ponilozan** increases the concentration of tacrolimus. Adjust dose. (Severe) Anecdotal

**Ranolazine** increases the concentration of tacrolimus. Adjust dose. (Severe) Theoretical

**Ranolazine** increases the concentration of tacrolimus. Adjust dose. (Severe) Theoretical

**Rucaparib** is predicted to increase the exposure to tacrolimus. Use with caution and adjust dose. (Moderate) Theoretical

**Ribociclib** is predicted to increase the exposure to tacrolimus. (Severe) Study

**Sirolimus** is predicted to decrease the concentration of tacrolimus and tacrolimus increases the exposure to sirolimus. (Severe) Study

**St John’s Wort** decreases the concentration of tacrolimus. Avoid. (Severe) Study

**Tacrolimus** increases the exposure to tofacitinib. Avoid. (Severe) Study

**Tacrolimus** potentially increases the risk of serotonin syndrome when given with venlafaxine. (Severe) Anecdotal

**Tadalafil** → see phosphodiesterase type-5 inhibitors

**Tamoxifen** → see TABLE 5 p. 1375 (stromboembrilism)

- Bupropion is predicted to decrease the efficacy of tamoxifen. Avoid. (Severe) Study

**Cinacalcet** is predicted to decrease the efficacy of tamoxifen. Avoid. (Severe) Study

**Tamoxifen** increases the anticoagulant effect of coumarins. (Severe) Study

**Rifaximin** markedly decreases the exposure to tamoxifen. (Unknown) Study

**Rolipram** is predicted to increase the exposure to tamoxifen. (Severe) Study

**Terbinafine** is predicted to decrease the efficacy of tamoxifen. Avoid. (Severe) Study

**Tamulosin** → see alpha blockers

**Taperadol** → see opioids

**Taxanes** → see TABLE 15 p. 1378 (myelosuppression), TABLE 12 p. 1378 (peripheral neuropathy)

- cabazitaxel · docetaxel · pacli taxel
### Table 15: Interactions

Public Health England advises avoid (refer to Green Book).
Methotrexate is predicted to increase the risk of toxicity when given with tegafur. **Severe** Theoretical

Telcoplanin

**GENERAL INFORMATION** If other nephrotoxic or neurotoxic drugs are given, monitor renal and auditory function on prolonged administration.

Telavancin → see Table 2 p. 1375 (nephrotoxicity), Table 19 p. 1379 (ototoxicity), Table 9 p. 1377 (QT interval prolongation)

Telbivudine

- Interferons (interferon alfa) are predicted to increase the risk of peripheral neuropathy when given with telbivudine. Avoid. **Severe** Theoretical
- Interferons (peginterferon alfa) increase the risk of peripheral neuropathy when given with telbivudine. Avoid. **Severe** Study

Telmisartan → see angiotensin-II receptor antagonists

Telotristat ethyl

- Telotristat ethyl is predicted to decrease the exposure to doravirine. Avoid or adjust doravirine dose, p. 644. **Severe** Theoretical
- Telotristat ethyl decreases the exposure to midazolam. **Moderate** Study
- Octreotide (short-acting) decreases the exposure to telotristat ethyl. Telotristat ethyl should be taken at least 30 minutes before octreotide. **Moderate** Study

Temazepam → see Table 11 p. 1377 (CNS depressant effects)

Temocillin → see penicillins

Temozolomide → see alkylating agents

Tensirolimus is predicted to decrease the concentration of temsirolimus. Avoid. **Severe** Study  
Also see Table 15 p. 1378

Tenofovir disoproxil is predicted to increase the concentration of tenofovir disoproxil. Avoid or adjust dose. **Moderate** Study  
Also see Table 2 p. 1375

Tenofvir alafenamide is predicted to increase the concentration of tenofvir alafenamide. **Moderate** Theoretical  
Also see Table 2

Tenovir is predicted to increase the concentration of tenofovir disoproxil. **Moderate** Theoretical

Tenecteplase → see Table 3 p. 1375 (anticoagulant effects)

Tenofvir alafenamide is predicted to increase the concentration of tenofovir alafenamide. **Moderate** Theoretical

Ciclosporin is predicted to increase the exposure to tenofovir alafenamide. **Moderate** Theoretical

Eltrombopag is predicted to increase the exposure to tenofovir alafenamide. **Moderate** Theoretical

HIV-protease inhibitors (atazanavir, darunavir, lopinavir) increase the risk of tenofovir alafenamide. Avoid or adjust dose. **Moderate** Study

Ritonavir is predicted to increase the concentration of tenofovir alafenamide. **Moderate** Theoretical

St John's Wort is predicted to decrease the concentration of temsirolimus. Avoid. **Severe** Theoretical

Terbinafine

- Terbinafine is predicted to markedly increase the exposure to alafenamide. **Avoid.** Theoretical
- Terbinafine is predicted to markedly increase the exposure to alafenamide. **Theoretical**  
Also see Table 2

Metisa lign is predicted to decrease the concentration of temsirolimus. Avoid. **Severe** Study  
Also see Table 15 p. 1378

Netupitant is predicted to increase the concentration of temsirolimus. **Moderate** Theoretical

Nevirapine is predicted to decrease the concentration of temsirolimus. Avoid. **Severe** Theoretical

Nilotinib is predicted to increase the concentration of temsirolimus. **Moderate** Theoretical  
Also see Table 15 p. 1378

Pitolisant is predicted to decrease the exposure to temsirolimus. Avoid. **Severe** Theoretical

Rifampicin is predicted to decrease the concentration of temsirolimus. Avoid. **Severe** Study

St John's Wort is predicted to decrease the concentration of temsirolimus. Avoid. **Severe** Theoretical

Tenoxicam → see NSAIDs

Terazosin is predicted to increase the exposure to tenofovir disoproxil. **Moderate** Theoretical

Also see Appendix 1

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Tobafinafine is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. **Moderate** Study

Tobafinafine is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 395. **Moderate** Study

Tobafinafine is predicted to markedly increase the exposure to atomoxetine. Adjust dose. **Severe** Study

Tobafinafine is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). **Moderate** Study

Terbinafine interactions
Terbinafine – Tetracyclines

**Terbinafine (continued)**

- **Terbinafine** is predicted to slightly increase the exposure to **darifenacin**. **[Rid] Study**
- **Terbinafine** is predicted to increase the exposure to **elaglufast**. Avoid or adjust dose—consult product literature. **[Severe] Study**
- **Terbinafine** is predicted to increase the exposure to **mesiloxine**. **[Moderate] Study**
- **Terbinafine** is predicted to decrease the efficacy of **opioids** **[codeine]**. **[Moderate] Theoretical**
- **Terbinafine** is predicted to decrease the efficacy of **opioids** **[tramadol]**. **[Severe] Study**
- **Terbinafine** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. **[Moderate] Study**
- **Rifampicin** decreases the exposure to **terbinafine**. Adjust dose. **[Moderate] Study**
- **Terbinafine** is predicted to increase the exposure to **risperidone**. Adjust dose. **[Moderate] Study**
- **Terbinafine** is predicted to increase the exposure to SSRIs (**citalopram**, **dapoxetine**, **escitalopram**, **fluvoxamine**, **sertraline**). **[Moderate] Study**
- **Terbinafine** is predicted to increase the exposure to **SSRIs** (**paroxetine**). **[Moderate] Study**
- **Terbinafine** is predicted to decrease the efficacy of **tamoxifen**. **[Moderate] Study**
- **Terbinafine** is predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. **[Severe] Study**
- **Terbinafine** is predicted to increase the exposure to **voroxetine**. Monitor and adjust dose. **[Moderate] Study**

Tertubalutine → see beta agonists

**Teriflunomide**

- **Teriflunomide** is predicted to increase the exposure to **adefovir**. **[Moderate] Study**
- **Teriflunomide** is predicted to decrease the exposure to **agomelatine**. **[Moderate] Theoretical**
- **Teriflunomide** decreases the exposure to **aminophylline**. Adjust dose. **[Moderate] Study**
- **Teriflunomide** is predicted to decrease the exposure to **anaesthetics, local** (**ropivacaine**). **[Moderate] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to **anthracyclines** (**daunorubicin**, **doxorubicin**, **mitoxantrone**). **[Moderate] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to **antihistamines, non-sedating** (**fexofenadine**). **[Moderate] Study**
- **Teriflunomide** potentially increases the exposure to **baricitinib**. **[Moderate] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to **bosentan**. **[Moderate] Study**
- **Teriflunomide** is predicted to moderately increase the clearance of **caffeine citrate**. Monitor and adjust dose. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **clozapine**. **[Moderate] Theoretical**
- **Teriflunomide** affects the anticoagulant effect of **coumarins**. **[Severe] Study**
- **Teriflunomide** is predicted to decrease the exposure to **duloxetine**. **[Moderate] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to **ganciclovir**. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **H2 receptor antagonists** (**cimetidine**, **famotidine**). **[Moderate] Study**
- **Teriflunomide** is predicted to increase the concentration of **intermivir**. **[Moderate] Study**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **teriflunomide**. **Public Health England advises avoid** (refer to **Green Book**). **[Severe] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to **loop diuretics** (**furosemide**). **[Moderate] Study**
- **Teriflunomide** is predicted to decrease the exposure to **melatonin**. **[Moderate] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to **methotrexate**. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the clearance of **mesiloxine**. Monitor and adjust dose. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **montelukast**. **[Moderate] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to **nateglinide**. **[Moderate] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to NSAID. **[Moderate] Study**
- **Teriflunomide** is predicted to decrease the exposure to **non-stereoidal anti-inflammatory drugs** (**NSAID**). **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **olanzapine**. Monitor and adjust dose. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **oseltamivir**. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **penicillins** (**benzylpenicillin**). **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **pioglitazone**. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **quinolones** (**ciprofloxacin**). **[Moderate] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to **rapaglinide**. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **rosuvastatin**. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **sulfasalazine**. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **sulfonylureas** (**glibenclamide**). **[Moderate] Study**
- **Teriflunomide** is predicted to increase the concentration of **taxanes** (**paclitaxel**). **[Severe] Anecdotal**
- **Teriflunomide** is predicted to increase the exposure to **tegafur**. **[Severe] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to **tenofovir alafenamide**. **[Moderate] Theoretical**
- **Teriflunomide** is predicted to increase the exposure to **tenofovir disoproxil**. **[Moderate] Theoretical**
- **Teriflunomide** is predicted to decrease the exposure to **theophylline**. Adjust dose. **[Moderate] Study**
- **Teriflunomide** moderately decreases the exposure to **tizanidine**. **[Rid] Study**
- **Teriflunomide** is predicted to increase the exposure to **topotecan**. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **trandolapril**. **[Severe] Study**
- **Teriflunomide** is predicted to increase the exposure to **tizanidine**. **[Rid] Study**
- **Teriflunomide** is predicted to increase the exposure to **topotecan**. **[Moderate] Study**
- **Teriflunomide** is predicted to increase the exposure to **tizanidine**. **[Rid] Study**

Tetanus immunoglobulin → see immunoglobulins

Tetrabenazine → see TABLE 9 p. 1377 (QT-interval prolongation)

Tetrabenazine is predicted to decrease the effects of **levodopa**. **Use with caution or avoid**. **[Moderate] Theoretical**

Tetrabenazine is predicted to increase the risk of CNS toxicity when given with **monoamine-oxidase A and B inhibitors**, **irreversible**. **Avoid and for 14 days after stopping the MAOI**. **[Severe] Theoretical**

**Tetracaine** → see anaesthetics, local

Tetracyclines → see tetracyclines

**ROUTE-SPECIFIC INFORMATION**  Interactions do not generally apply to topical use of **oxytetracycline** unless specified.

- **ACE inhibitors** (**quinapril**) (tablet) decrease the absorption of oral **tetracycline**. **Avoid**. **[Moderate] Study**
- **Antacids** decrease the absorption of **tetracyclines**. Separated administration by 2 to 3 hours. **[Moderate] Study**
- **Antiepileptics** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin, primidone**) decrease the exposure to **doxycycline**. **Monitor and adjust dose**. **[Moderate] Study** → Also see TABLE 1 p. 1375
**Tetracyclines – Theophylline**

- **Tetracyclines** decrease the concentration of antimalarials (atovaquone). (Moderate) Study
- **Calcium salts** (calcium carbonate) are predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. (Moderate) Theoretical
- **Tetracyclines** increase the risk of bleeding events when given with **coumarins**. (Moderate) Anecdotal
- **Dairy products** decrease the exposure to tetracyclines (demeclocycline, oxytetracycline, tetracycline). Avoid. (Moderate) Study
- **Enalapril** decreases the exposure to doxycycline. Monitor and adjust dose. (Moderate) Study
- **Iron** (oral) decreases the absorption of tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron (oral). (Moderate) Study
- **Kazeln** is predicted to decrease the absorption of tetracyclines. (Moderate) Theoretical
- **Lanthanum** is predicted to decrease the absorption of tetracyclines. Separate administration by 2 hours. (Moderate) Theoretical
- **Mitotane** decreases the exposure to doxycycline. Monitor and adjust dose. (Moderate) Study
- **Retinoids** (acitretin, alitretinoin, isotretinoin, tretinoin) increase the risk of benign intracranial hypertension when given with tetracyclines. Avoid. (Severe) Anecdotal
- **Rifampicin** decreases the exposure to doxycycline. Monitor and adjust dose. (Moderate) Study
- **Oral zinc** is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. (Moderate) Theoretical

### Tezacaftor

**FOOD AND LIFESTYLE**Avoid bitter (Seville) oranges as they are predicted to increase the exposure to tezacaftor.

- **Antiarhythmics** (dronedarone) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tezacaftor. Avoid. (Severe) Theoretical
- **Antifungals, azoles** (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. (Severe) Study
- **Aripiprazole** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study
- **Cobicistat** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. (Severe) Study
- **Ciritinib** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study
- **Enalapril** is predicted to decrease the exposure to tezacaftor. Avoid. (Severe) Theoretical
- **Grapefruit juice** is predicted to increase the exposure to tezacaftor. Avoid. (Severe) Study
- **HIV-protease inhibitors** are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. (Severe) Study
- **Idelalisib** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. (Severe) Study
- **Imatinib** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study
- **Macrolides** (clarithromycin) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. (Severe) Study
- **Macrolides** (erythromycin) are predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study
- **Mitotane** is predicted to decrease the exposure to tezacaftor. Avoid. (Severe) Theoretical
- **Netupitant** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study
- **Nilotinib** is predicted to increase the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study
- **Rifabutin** is predicted to increase the exposure to tezacaftor. Avoid. (Severe) Theoretical
- **Rifampicin** is predicted to decrease the exposure to tezacaftor. Avoid. (Severe) Theoretical
- **St John’s Wort** is predicted to decrease the exposure to tezacaftor. Avoid. (Severe) Theoretical

### Thalidomide

- **Thalidomide** is predicted to increase the concentration of theophylline when given with thalidomide. Avoid. (Severe) Theoretical
- **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with thalidomide. Avoid. (Severe) Theoretical

### Theophylline

- **Theophylline** decreases the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with potent inhibitors of CYP3A4. (Severe) Study
- **Theophylline** decreases the exposure to tezacaftor. Adjust tezacaftor with ivacaftor p. 295 dose with moderate inhibitors of CYP3A4. (Severe) Study
- **Theophylline** decreases clearance and increased doses of theophylline are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.

- **Acclovir** is predicted to increase the exposure to theophylline. Monitor and adjust dose. (Severe) Theoretical
- **Theophylline** decreases the efficacy of antiarrhythmics (adenosine). Separate administration by 24 hours. (Moderate) Study
- **Antiepileptics** (carbamazepine) potentially increase the clearance of theophylline and theophylline decreases the exposure to antiepileptics (carbamazepine). Adjust dose. (Moderate) Anecdotal
- **Antiepileptics** (fosphenytoin, phenytoin) are predicted to decrease the exposure to theophylline. Adjust dose. (Moderate) Study
- **Antiepileptics** (phenobarbital, primidone) are predicted to increase the clearance of theophylline. Adjust dose. (Moderate) Theoretical
- **Antiepileptics** (stiripentol) are predicted to increase the exposure to theophylline. Avoid. (Moderate) Theoretical
- **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. (Severe) Theoretical
- **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. (Severe) Theoretical
- **Caffeine citrate** decreases the clearance of theophylline. (Moderate) Study
- **Combined hormonal contraceptives** are predicted to increase the exposure to theophylline. Monitor and adjust dose. (Moderate) Study
- **Theophylline** increases the risk of agitation when given with doxapram. (Moderate) Study
- **Enteral feeds** decrease the exposure to theophylline. (Moderate) Study
- **Esketamine** is predicted to increase the risk of seizures when given with theophylline. Avoid. (Severe) Theoretical
- **H2 receptor antagonists** (cimetidine) increase the concentration of theophylline. Adjust dose. (Severe) Study
- **HIV-protease inhibitors** (ritonavir) are predicted to decrease the exposure to theophylline. Adjust dose. (Moderate) Study
- **Iron chelators** (deferasirox) increase the exposure to theophylline. Avoid. (Moderate) Study

**www.getintopharma.com**
Theophylline (continued)

- Isoniazid is predicted to affect the clearance of theophylline. [Severe] Anecdotal
- Lefunomide is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Anecdotal
- Theophylline is predicted to decrease the concentration of lithium. Monitor concentration and adjust dose. [Moderate] Anecdotal
- Macrolides (azithromycin, clarithromycin) are predicted to increase the exposure to theophylline. Adjust dose. [Moderate] Anecdotal
- Macrolides (erythromycin) decrease the clearance of theophylline and theophylline potentially decreases the clearance of macrolides (erythromycin). Adjust dose. [Severe] Study
- Methotrexate decreases the clearance of theophylline. [Moderate] Study
- Mexiletine is predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- Monoclonal antibodies (blinatumomab) are predicted to transiently increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- Monoclonal antibodies (sarilumab) potentially affect the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- Nefazodone (ciprofloxacin) are predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- Theophylline is predicted to slightly increase the exposure to roflumilast. Avoid. [Moderate] Theoretical
- Rucaparib is predicted to increase the exposure to theophylline. [Severe] Theoretical
- SSRI (fluvoxamine) moderately to markedly increase the exposure to theophylline. Avoid. [Severe] Study
- St John’s Wort potentially decreases the exposure to theophylline. [Severe] Anecdotal
- Sucralfate potentially decreases the absorption of theophylline. Separate administration by at least 2 hours. [Moderate] Study
- Sympathomimetics, vasoconstrictor (ephedrine) increase the risk of side-effects when given with theophylline. Avoid in children. [Moderate] Study
- Teriflunomide is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- Valaciclovir is predicted to increase the exposure to theophylline. [Severe] Theoretical

Thiazide diuretics

- Thiazide diuretics increase the risk of hypercalcaemia when given with vitamin D substances. [Moderate] Theoretical
- Thipental [see TABLE 8 p. 1376 (hypotension), TABLE 11 p. 1377 (CNS depressant effects)]
- Sulfonamides are predicted to increase the effects of thipental. [Moderate] Theoretical
- Tricyclic antidepressants increase the risk of cardiac arrhythmias and hypotension when given with thipental. [Moderate] Study [Also see TABLE 8 p. 1376]
- Thiotepa → see alkylating agents

Thyroid hormones

- levothyroxine - liothyronine

- Antacids are predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Anecdotal
- Antiarrhythmics (amiodarone) are predicted to increase the risk of thyroid dysfunction when given with thyroid hormones. Avoid. [Moderate] Study
- Antiarrhythmics (carbamazepine, fosphenytoin, phenytoin) are predicted to increase the risk of hypothyroidism when given with thyroid hormones. [Moderate] Study
- Antiarrhythmics (phenobarbital, primidone) are predicted to decrease the effects of thyroid hormones. [Moderate] Theoretical
- Apalutamide potentially decreases the exposure to levothyroxine. [Rid] Theoretical
- Oral calcium salts are predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Anecdotal
- Thyroid hormones are predicted to affect the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical
- HIV-protease inhibitors (ritonavir) decrease the concentration of levothyroxine. MHRA advises monitor TSH for at least one month after starting or stopping ritonavir. [Moderate] Anecdotal
- Oral hormone replacement therapy is predicted to decrease the effects of thyroid hormones. [Moderate] Theoretical
- Iron (oral) decreases the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Study
- Lanthanum decreases the absorption of thyroid hormones. Separate administration by 2 hours. [Moderate] Study
- Thyroid hormones are predicted to affect the absorption of thiopental. Monitor and adjust dose. [Moderate] Study
- Tricyclic antidepressants increase the risk of cardiac arrhythmias and hypotension when given with thipental. [Moderate] Study [Also see TABLE 8 p. 1376]
- Ticagrelor [see ticagrelor]

Tiagabine → see antiepileptics

Tiaiprofenic acid → see NSAIDs

Tibolone → see TABLE 5 p. 1375 (thromboembolism)

Ticagrelor → see TABLE 4 p. 1375 (antiplatelet effects)

- Antiarrhythmics (amiodarone) are predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- Antiarrhythmics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to ticagrelor.

- Avantant is predicted to decrease the exposure to ticagrelor. Monitor and adjust dose. [Moderate] Study
- Bosentan is predicted to decrease the exposure to ticagrelor. [Moderate] Theoretical
- Ciclosporin is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- Cobimetinib is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- Cobicistat is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- Cisplatin is predicted to decrease the exposure to ticagrelor. Monitor and adjust dose. [Moderate] Study
- Enalapril is predicted to decrease the exposure to ticagrelor. Avoid. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Fenofibrate is predicted to decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Fluticasone increases the concentration of digoxin. [Moderate] Study
- Fosphenytoin is predicted to decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Grapefruit juice moderately increases the exposure to ticagrelor. [Moderate] Study
- Lisinopril is predicted to decrease the exposure to ticagrelor. Monitor and adjust dose. [Moderate] Study
- Lipid lowering substances (atorvastatin, rosuvastatin) are predicted to decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Lisinopril is predicted to decrease the exposure to ticagrelor. Monitor and adjust dose. [Moderate] Study
- Mexiletine is predicted to increase the risk of hypokalaemia when given with thiazide diuretics. [Severe] Theoretical
- Mexiletine is predicted to increase the risk of hyperglycaemia when given with toremifene. [Severe] Theoretical
- Metolazone moderately increases the exposure to ticagrelor. [Moderate] Anecdotal
HIV-protease inhibitors are predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe) Study

Idelalisib is predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe) Study

Ticagrelor is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

Macrolides (azithromycin) are predicted to increase the exposure to ticagrelor. Use with caution or avoid. (Severe) Study

Macrolides (clarithromycin) are predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe) Study

Methotrexate is predicted to markedly decrease the exposure to ticagrelor. Avoid. (Severe) Study

Mexiletine is predicted to decrease the exposure to ticagrelor. Avoid. (Moderate) Study

Obeticholic acid is predicted to increase the exposure to tizanidine. (Severe) Theoretical

Quinolones (ciprofloxacin) increase the exposure to tizanidine. Avoid. (Moderate) Study

Rifaximin moderately decreases the exposure to tizanidine. (Moderate) Study

Rucaparib is predicted to increase the exposure to tizanidine. Monitor and adjust dose. (Moderate) Study

SSRIs (fluvoxamine) very markedly increase the exposure to tizanidine. Avoid. (Severe) Study

Teriflunomide moderately decreases the exposure to tizanidine. (Moderate) Study

Tobramycin → see aminoglycosides

Tolctazumab → see monoclonal antibodies

Tofacitinib

Antithrombin (dronedaron) given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Antiprotease inhibitors (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tofacitinib. Avoid. (Severe) Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Aprepitant given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Bosantan is predicted to decrease the exposure to tofacitinib. Avoid. (Moderate) Study

Calcium channel blockers (diltiazem, verapamil) given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Ciclosporin increases the exposure to tofacitinib. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Crisotinib given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Efavirenz is predicted to decrease the exposure to tofacitinib. Avoid. (Severe) Study

Enalapril is predicted to decrease the exposure to tofacitinib. Avoid. (Severe) Study

Enalaprilat is predicted to decrease the exposure to tofacitinib. Avoid. (Severe) Study

Ezetimibe is predicted to decrease the exposure to tofacitinib. Avoid. (Severe) Study

Idelalisib is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Imatinib given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Itraconazole, ketoconazole, voriconazole are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Live vaccines potentially increase the risk of generalised infection (possibly life-threatening) when given with tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Macrolides (clarithromycin) are predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Netupitant given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Nilotinib given with a potent CYP2C19 inhibitor is predicted to increase the exposure to tofacitinib. Adjust tofacitinib dose, p. 1105. (Moderate) Study

Rifampicin is predicted to decrease the exposure to tofacitinib. Avoid. (Severe) Study

Tofacitinib

A1
1546 Tofacitinib — Topotecan

BNF 78

Tofacitinib (continued)
▶ SSRIs (fluoxetine, fluvoxamine) given with a moderate CYP3A4
inhibitor are predicted to increase the exposure to tofacitinib.
Adjust tofacitinib dose, p. 1105. o Study
▶ St John’s Wort is predicted to decrease the exposure to
tofacitinib. o Study
▶ Tacrolimus increases the exposure to tofacitinib. Avoid. r
Study

Tolbutamide → see sulfonylureas
Tolcapone
▶ Tolcapone increases the exposure to levodopa. Monitor and
adjust dose. o Study
▶ Tolcapone is predicted to increase the effects of monoamineoxidase A and B inhibitors, irreversible. Avoid. r Theoretical
▶ Tolcapone is predicted to increase the risk of cardiovascular
side-effects when given with sympathomimetics, inotropic.

▶
▶

▶

▶

▶

o Theoretical
▶

Tolcapone is predicted to increase the effects of
sympathomimetics, vasoconstrictor (adrenaline/epinephrine,
noradrenaline/norepinephrine). o Theoretical
Tolfenamic acid → see NSAIDs
Tolterodine → see TABLE 9 p. 1377 (QT-interval prolongation), TABLE 10

▶
▶

r Study
▶

Interactions | Appendix 1

▶

Antiarrhythmics (dronedarone) are predicted to increase the
exposure to tolterodine. n Theoretical → Also see TABLE 9

▶

p. 1377

Antifungals, azoles (fluconazole, isavuconazole, posaconazole)
are predicted to increase the exposure to tolterodine. n
Theoretical → Also see TABLE 9 p. 1377
▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
predicted to increase the exposure to tolterodine. Avoid.
r Study → Also see TABLE 9 p. 1377
▶ Aprepitant is predicted to increase the exposure to tolterodine.
▶

▶

▶

▶

n Theoretical

▶
▶
▶
▶
▶
▶
▶

Calcium channel blockers (diltiazem, verapamil) are predicted to
increase the exposure to tolterodine. n Theoretical
Cobicistat is predicted to increase the exposure to tolterodine.
Avoid. r Study
Crizotinib is predicted to increase the exposure to tolterodine.
n Theoretical → Also see TABLE 9 p. 1377
Eliglustat is predicted to increase the exposure to tolterodine.
Adjust dose. o Theoretical
HIV-protease inhibitors are predicted to increase the exposure
to tolterodine. Avoid. r Study → Also see TABLE 9 p. 1377
Idelalisib is predicted to increase the exposure to tolterodine.
Avoid. r Study
Imatinib is predicted to increase the exposure to tolterodine.

▶

Macrolides (clarithromycin) are predicted to increase the
exposure to tolterodine. Avoid. r Study → Also see TABLE 9
Macrolides (erythromycin) are predicted to increase the
exposure to tolterodine. n Theoretical → Also see TABLE 9

Netupitant is predicted to increase the exposure to tolterodine.

▶

▶

▶

n Theoretical
▶

Nilotinib is predicted to increase the exposure to tolterodine.
n Theoretical → Also see TABLE 9 p. 1377
Tolvaptan → see TABLE 16 p. 1379 (increased serum potassium)
GENERAL INFORMATION Avoid concurrent use of drugs that
increase serum-sodium concentrations.
▶

Antiarrhythmics (dronedarone) are predicted to increase the
exposure to tolvaptan. Manufacturer advises caution or adjust
tolvaptan dose with moderate inhibitors of CYP3A4, p. 669.
o Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to tolvaptan. Use with caution or avoid depending on
indication. r Study
▶ Antifungals, azoles (fluconazole, isavuconazole, posaconazole)
are predicted to increase the exposure to tolvaptan.
Manufacturer advises caution or adjust tolvaptan dose with
moderate inhibitors of CYP3A4, p. 669. o Study
▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
predicted to increase the exposure to tolvaptan. Manufacturer
▶

Mitotane is predicted to decrease the exposure to tolvaptan.
Use with caution or avoid depending on indication. r
Study

▶

p. 1377
▶

Macrolides (erythromycin) are predicted to increase the
exposure to tolvaptan. Manufacturer advises caution or adjust
tolvaptan dose with moderate inhibitors of CYP3A4, p. 669.
o Study

▶

p. 1377
▶

HIV-protease inhibitors are predicted to increase the exposure
to tolvaptan. Manufacturer advises caution or adjust tolvaptan
dose with potent inhibitors of CYP3A4, p. 669. r Study
Idelalisib is predicted to increase the exposure to tolvaptan.
Manufacturer advises caution or adjust tolvaptan dose with
potent inhibitors of CYP3A4, p. 669. r Study
Imatinib is predicted to increase the exposure to tolvaptan.
Manufacturer advises caution or adjust tolvaptan dose with
moderate inhibitors of CYP3A4, p. 669. o Study
Tolvaptan is predicted to increase the exposure to lomitapide.
Separate administration by 12 hours. o Theoretical
Macrolides (clarithromycin) are predicted to increase the
exposure to tolvaptan. Manufacturer advises caution or adjust
tolvaptan dose with potent inhibitors of CYP3A4, p. 669. r
Study

▶

n Theoretical

▶

Grapefruit juice increases the exposure to tolvaptan. Avoid.
o Study

p. 1377 (antimuscarinics)

A1

advises caution or adjust tolvaptan dose with potent inhibitors
of CYP3A4, p. 669. r Study
Apalutamide is predicted to decrease the exposure to
tolvaptan. Avoid or monitor. o Study
Aprepitant is predicted to increase the exposure to tolvaptan.
Manufacturer advises caution or adjust tolvaptan dose with
moderate inhibitors of CYP3A4, p. 669. o Study
Calcium channel blockers (diltiazem, verapamil) are predicted to
increase the exposure to tolvaptan. Manufacturer advises
caution or adjust tolvaptan dose with moderate inhibitors of
CYP3A4, p. 669. o Study
Cobicistat is predicted to increase the exposure to tolvaptan.
Manufacturer advises caution or adjust tolvaptan dose with
potent inhibitors of CYP3A4, p. 669. r Study
Crizotinib is predicted to increase the exposure to tolvaptan.
Manufacturer advises caution or adjust tolvaptan dose with
moderate inhibitors of CYP3A4, p. 669. o Study
Tolvaptan increases the concentration of digoxin. n Study
Enzalutamide is predicted to decrease the exposure to
tolvaptan. Use with caution or avoid depending on indication.

Netupitant is predicted to increase the exposure to tolvaptan.
Manufacturer advises caution or adjust tolvaptan dose with
moderate inhibitors of CYP3A4, p. 669. o Study
Nilotinib is predicted to increase the exposure to tolvaptan.
Manufacturer advises caution or adjust tolvaptan dose with
moderate inhibitors of CYP3A4, p. 669. o Study
Quinolones (ciprofloxacin) are predicted to increase the
exposure to tolvaptan. Use with caution and adjust tolvaptan
dose, p. 669. o Theoretical
Rifampicin is predicted to decrease the exposure to tolvaptan.
Use with caution or avoid depending on indication. r
Study

▶

St John’s Wort is predicted to decrease the exposure to
tolvaptan. Avoid. o Theoretical
Topiramate → see antiepileptics
Topotecan → see TABLE 15 p. 1378 (myelosuppression)
▶ Antiarrhythmics (amiodarone, dronedarone) are predicted to
increase the exposure to topotecan. r Study
▶ Antiepileptics (fosphenytoin, phenytoin) increase the clearance
of topotecan. o Study
▶ Antifungals, azoles (isavuconazole) are predicted to increase the
exposure to topotecan. o Theoretical
▶ Antifungals, azoles (itraconazole, ketoconazole) are predicted to
increase the exposure to topotecan. r Study
▶ Calcium channel blockers (verapamil) are predicted to increase
the exposure to topotecan. r Study
▶ Ceritinib is predicted to increase the exposure to topotecan.
o Theoretical → Also see TABLE 15 p. 1378
▶ Ciclosporin is predicted to increase the exposure to topotecan.

Topotecan — Trazodone 1547

- **Eliglustat** is predicted to increase the exposure to topotecan. Adjust dose. (Moderate) Study
- **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to topotecan. (Severe) Study
- **Lapatinib** is predicted to increase the exposure to topotecan. (Severe) Study
- **Leflunomide** is predicted to increase the exposure to topotecan. (Moderate) Study Also see TABLE 15 p. 1378
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with topotecan. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- **Macrolides** are predicted to increase the exposure to topotecan. (Severe) Study
- **Mirabegron** is predicted to increase the exposure to topotecan. (Moderate) Study
- **Paritaprevir** (with ritonavir andombitasvir) is predicted to increase the exposure to topotecan. (Moderate) Study
- **Pibrentasvir** (with glecaprevir) is predicted to increase the exposure to topotecan. (Moderate) Study
- **Pitolisant** is predicted to decrease the exposure to topotecan. (Mild) Theoretical
- **Ranolazine** is predicted to increase the exposure to topotecan. (Severe) Study
- **Regorafenib** is predicted to increase the exposure to topotecan. (Moderate) Study Also see TABLE 15 p. 1378
- **Rolapitant** is predicted to increase the exposure to topotecan. Avoid or monitor. (Moderate) Study
- **St John’s Wort** is predicted to decrease the exposure to topotecan. (Severe) Theoretical
- **Tedizolid** is predicted to increase the exposure to topotecan. (Moderate) Study
- **Venetoclax** is predicted to increase the concentration of topotecan. (Moderate) Study
- **Vemurafenib** is predicted to increase the exposure to topotecan. (Severe) Study
- **Voxilaprevir** is predicted to increase the concentration of topotecan. (Moderate) Theoretical
- **Torasemide** → see loop diuretics
- **Toremifene** → see loop diuretics

(See interval prolongation)

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to toremifene. Adjust dose. (Moderate) Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to toremifene. Adjust dose. (Moderate) Study
- **Cobicistat** is predicted to increase the exposure to toremifene. Avoid or adjust dose. (Severe) Theoretical Also see TABLE 1 p. 1375
- **Enzalutamide** is predicted to decrease the exposure to toremifene. Avoid. (Severe) Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to toremifene. Avoid or adjust dose. (Severe) Theoretical
- **Idelalisib** is predicted to increase the exposure to toremifene. Avoid. (Severe) Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with toremifene. Public Health England advises avoid (refer to Green Book). (Severe) Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to toremifene. Avoid or adjust dose. (Severe) Theoretical
- **Mitoxantrone** is predicted to decrease the exposure to toremifene. Avoid. (Severe) Theoretical
- **Rifampicin** is predicted to decrease the exposure to toremifene. Avoid. (Severe) Theoretical
- **Tramadol** → see opioids

**Trametinib**

- **Antihypertensives (amiodarone, dronedarone)** are predicted to increase the concentration of trametinib. (Moderate) Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the concentration of trametinib. (Moderate) Theoretical
- **Calcium channel blockers (verapamil) are predicted to increase the concentration of trametinib. (Moderate) Theoretical
- **Ciclosporin** is predicted to increase the concentration of trametinib. (Moderate) Theoretical
- **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the concentration of trametinib. (Moderate) Theoretical
- **Ranolazine** is predicted to decrease the concentration of trametinib. (Moderate) Theoretical

- **Macrolides (clarithromycin)** are predicted to increase the exposure to toremifene. Avoid or adjust dose. (Severe) Theoretical
- **Mitoxantrone** is predicted to decrease the exposure to toremifene. Avoid. (Severe) Theoretical
- **Rifampicin** is predicted to decrease the exposure to toremifene. Avoid. (Severe) Theoretical

(A1)
Trazodone (continued)

**Imatinib** is predicted to increase the exposure to trazodone. (Moderate) Theoretical

**Macrolides (clarithromycin)** are predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. (Moderate) Study

**Macrolides (erythromycin)** are predicted to increase the exposure to trazodone. (Moderate) Theoretical

**Netupitant** is predicted to increase the exposure to trazodone. (Moderate) Theoretical

**Nilotinib** is predicted to increase the exposure to trazodone. (Moderate) Theoretical

**Tree pollen extract**

**General information** Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

**Tresufan** → see alkylating agents

**Tretinoin** → see retinoids

**Triamcinolone** → see corticosteroids

**Tramadol** → see potassium-sparing diuretics

**Tricyclic antidepressants**

**Tricyclic antidepressants** → see TABLE 18 p. 1379 (hypotension), TABLE 13 p. 1376 (serotonin syndrome), TABLE 9 p. 1377 (QT-interval prolongation), TABLE 10 p. 1377 (antimuscarinics)

**amitriptyline • clomipramine • dosulepin • doxepin • imipramine • lofepramine • nortriptyline • trimipramine**

**Tropicamide**

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions of topical doxepin should be borne in mind.

**Antiarrhythmics (dronedarone)** are predicted to increase the exposure to tricyclic antidepressants. Avoid. (Severe) Theoretical → Also see TABLE 9 p. 1377

**Antiarrhythmics (propafenone)** are predicted to increase the concentration of tricyclic antidepressants. (Moderate) Theoretical → Also see TABLE 10 p. 1377

**Antiepileptics (carbamazepine)** decrease the exposure to tricyclic antidepressants. Adjust dose. (Moderate) Study → Also see TABLE 16 p. 1376

**Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to tricyclic antidepressants. (Moderate) Study

**Tricyclic antidepressants** (clomipramine, imipramine) potentially increase the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. (Severe) Theoretical

**Bupropion** is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. (Severe) Study

**Cinacalcet** is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. (Severe) Study

**Tricyclic antidepressants** decrease the antihypertensive effects of clonidine. Monitor and adjust dose. (Moderate) Aneautal → Also see TABLE 8 p. 1376

**Cobicistat** is predicted to slightly increase the exposure to tricyclic antidepressants. (Small) Study

**Darifenacin** is predicted to increase the exposure to tricyclic antidepressants. (Moderate) Theoretical → Also see TABLE 10 p. 1377

**Eliglustat** is predicted to increase the exposure to nortriptyline. Adjust dose. (Moderate) Theoretical

**Tricyclic antidepressants** are predicted to decrease the antihypertensive effects of guanethidine. (Moderate) Study → Also see TABLE 8 p. 1376

**H₂ receptor antagonists (cimetidine)** increase the exposure to tricyclic antidepressants. (Moderate) Study

**HIV-protease inhibitors (ritonavir, tipranavir)** are predicted to increase the exposure to tricyclic antidepressants. (Moderate) Theoretical

**Tricyclic antidepressants** potentially increase the risk of neurotoxicity when given with lithium. (Severe) Aneautal → Also see TABLE 13 p. 1378 → Also see TABLE 9 p. 1377

**Amiodipine** decreases the effects of metyrapone. Avoid. (Moderate) Theoretical

**Tricyclic antidepressants** are predicted to increase the risk of severe toxic reaction when given with moclobemide. Avoid. (Severe) Theoretical → Also see TABLE 13 p. 1378

**Tricyclic antidepressants** are predicted to increase the risk of severe toxic reaction when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAO. (Severe) Theoretical → Also see TABLE 8 p. 1376 → Also see TABLE 13 p. 1378

**Tricyclic antidepressants** are predicted to decrease the effects of moxonidine. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 1376

**Tricyclic antidepressants** are predicted to decrease the efficacy of pitolisant. (Small) Theoretical

**SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. (Severe) Study → Also see TABLE 18 p. 1379 → Also see TABLE 13 p. 1378

**SSRIs (fluvoxamine)** markedly increase the exposure to clomipramine. Adjust dose. (Severe) Study → Also see TABLE 18 p. 1379 → Also see TABLE 13 p. 1378

**SSRIs (fluvoxamine)** increase the exposure to tricyclic antidepressants (amitriptyline, imipramine). Adjust dose. (Severe) Study → Also see TABLE 18 p. 1379 → Also see TABLE 13 p. 1378

**Sucralfate** is predicted to decrease the absorption of tricyclic antidepressants. (Moderate) Study

**Tricyclic antidepressants** increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine, phenylephrine). Avoid. (Severe) Study

**Tricyclic antidepressants** are predicted to decrease the effects of sympathomimetics, vasoconstrictor (ephedrine). Avoid. (Severe) Study

**Tricyclic antidepressants** are predicted to decrease the effects of dopamine receptor agonists. Avoid. (Severe) Study

**Tricyclic antidepressants** increase the risk of cardiac arrhythmias and hypotension when given with thiopental. (Moderate) Study → Also see TABLE 8 p. 1376

**Trientine**

**Trientine** potentially decreases the absorption of iron (oral). (Moderate) Theoretical

**Trientine** potentially decreases the absorption of zinc. (Moderate) Theoretical

**Trifluoperazine** → see phenothiazines

**Trimethaphenylid** → see TABLE 10 p. 1377 (antimuscarinics)

**Trimethoprim** → see TABLE 18 p. 1379 (hypotension), TABLE 2 p. 1375 (nephrotoxicity), TABLE 16 p. 1379 (increased serum potassium)

**Trimethoprim** increases the concentration of antiepileptics (fosphephenylvin, phenytoin). (Moderate) Study

**Antimalarials (pyrimethamine)** increase the risk of side-effects when given with trimethoprim. (Severe) Study

**Trimethoprim** is predicted to increase the anticoagulant effect of coumarins. (Severe) Study

**Dapsone** increases the exposure to trimethoprim and trimethoprim increases the exposure to dapsone. (Severe) Study

**Trimethoprim** increases the concentration of digoxin. (Moderate) Study

**Trimethoprim** is predicted to increase the exposure to dopamine receptor agonists (pramipexole), Adjust dose. (Moderate) Study

**Trimethoprim** slightly increases the exposure to lamivudine. (Small) Study

**Trimethoprim** is predicted to increase the risk of side-effects when given with methotrexate. Avoid. (Severe) Theoretical → Also see TABLE 2 p. 1375

**Trimethoprim** slightly increases the exposure to repaglinide. Avoid or monitor blood glucose. (Moderate) Study

**Rifampicin** decreases the exposure to trimethoprim. (Moderate) Study

**Trimethoprim** is predicted to decrease the efficacy of sapropterin. (Moderate) Theoretical

**Trimethoprim** → see TABLE 10 p. 1377 (antimuscarinics)
Trospium → see TABLE 10 p. 1377 (antimuscarinis)

Trosporane → see TABLE 13 p. 1378 (serotonin syndrome)

▸ Trosporane greatly decreases the concentration of levodopa. (Moderate) Study

▸ Trosporane increases the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible. (Severe) Anecdotal → Also see TABLE 13 p. 1378

Typhoid vaccine, oral → see live vaccines

Ulipristal

▸ Antihistamines (dronedaron) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

▸ Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) decrease the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Anecdotal

▸ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study

▸ Aprepitant decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ Bosantan decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

▸ Cobisistat is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study

▸ Ulipristal is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. (Severe) Theoretical

▸ Crizotinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

▸ Ulipristal is predicted to decrease the efficacy of desogestrel. Avoid. (Severe) Theoretical

▸ Efavirenz decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ Enalaprilat is predicted to markedly decrease the exposure to ulipristal. Avoid and for 4 weeks after stopping ulipristal. (Severe) Theoretical

▸ Ulipristal is predicted to decrease the efficacy of etonogestrel. Avoid. (Severe) Theoretical

▸ Fosaprepitant decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ Grapefruit juice is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

▸ Griseofulvin potentially decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study

▸ HIV-protease inhibitors (ritonavir) decrease the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ Idelalisib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study

▸ Imatinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

▸ Ulipristal is predicted to decrease the efficacy of levonorgestrel. Avoid. (Severe) Theoretical

▸ Lumacaftor is predicted to decrease the efficacy of ulipristal. Use additional contraceptive precautions. (Severe) Theoretical

▸ Macrolides (erythromycin) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

▸ Modafinil decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ Netupitant is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

▸ Nevirapine decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ Nilotinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

▸ Ulipristal is predicted to decrease the efficacy of norethisterone. Avoid. (Severe) Theoretical

▸ Rifabutin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ Rifampicin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

▸ St John's Wort decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 794. (Severe) Anecdotal

Umedilidium → see TABLE 10 p. 1377 (antimuscarinis)

Urokinase → see TABLE 3 p. 1375 (anticoagulant effects)

Ursodeoxycholic acid

▸ Antacids are predicted to decrease the absorption of ursodeoxycholic acid. Separate administration by 2 hours. (Moderate) Theoretical

▸ Ursodeoxycholic acid affects the concentration of ciclosporin. Use with caution and adjust dose. (Severe) Anecdotal

▸ Fibrates are predicted to decrease the efficacy of ursodeoxycholic acid. Avoid. (Severe) Theoretical

▸ Ustekinumab → see monoclonal antibodies

▸ Valaciclovir → see TABLE 2 p. 1375 (nephrotoxicity)

▸ Valaciclovir is predicted to increase the exposure to aminophylline. (Severe) Anecdotal

▸ Mycophenolate is predicted to increase the risk of haematological toxicity when given with valaciclovir. (Moderate) Theoretical

▸ Valaciclovir is predicted to increase the exposure to theophylline. (Severe) Theoretical

▸ Valganciclovir → see TABLE 15 p. 1378 (myelosuppression), TABLE 2 p. 1375 (nephrotoxicity)

▸ Valganciclovir is predicted to increase the risk of seizures when given with carbapenem (imipenem). Avoid. (Severe) Anecdotal

▸ Valganciclovir is predicted to increase the exposure to didanosine. (Moderate) Study

▸ Mycophenolate is predicted to increase the risk of haematological toxicity when given with valganciclovir. (Moderate) Theoretical

▸ Mycophenolate is predicted to increase the exposure to theophylline. (Severe) Theoretical

▸ Valganciclovir is predicted to increase the exposure to theophylline. (Severe) Theoretical

▸ Valproate → see antiepileptics

▸ Valtsartan → see angiotensin-II receptor antagonists

▸ Vancomycin → see TABLE 2 p. 1375 (nephrotoxicity), TABLE 19 p. 1379 (ototoxicity)

▸ Vandetanib → see TABLE 9 p. 1377 (QT-interval prolongation)

▸ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study

▸ Vandetanib is predicted to increase the risk of bleeding events when given with coumarins. (Severe) Theoretical

▸ Vandetanib slightly increases the exposure to digoxin. Monitor ECG and adjust dose. (Moderate) Study

▸ Vandetanib is predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust dose. (Moderate) Study

▸ Enalaprilat is predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study

▸ Vandetanib increases the exposure to metformin. Monitor and adjust dose. (Moderate) Study

▸ Mitotane is predicted to decrease the exposure to vandetanib. Avoid. (Moderate) Study

▸ Vandetanib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical
Vandetanib (continued)

- **Rifampicin** is predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study

 Vandetanib

- **Vardenafil** → see phosphodiesterase type-5 inhibitors

 Varicella-zoster immunoglobulin → see immunoglobulins

 Varicella-zoster vaccine → see live vaccines

 Vedolizumab → see monoclonal antibodies

 **Velpatasvir**

- **Velpatasvir** is predicted to increase the exposure to aliskiren. [Severe] Theoretical

- **Antacids** are predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Theoretical

- **Antihypertensives (ami洛dare) are predicted to increase the concentration of velpatasvir. Avoid or monitor. [Moderate] Theoretical

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study

- **Bosentan** is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical

- **Calcium salts (calcium carbonate) are predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Anecdotal

- **Velpatasvir** is predicted to increase the exposure to colchicine. [Severe] Theoretical

- **Velpatasvir** increases the exposure to dabigatran. Avoid. [Severe] Study

- **Velpatasvir** is predicted to increase the exposure to digoxin. [Severe] Study

- **Velpatasvir** is predicted to increase the exposure to edoxaban. [Severe] Theoretical

- **Efavirenz** is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical

- **Enzalutamide** is predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study

- **H2 receptor antagonists are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir p. 69. [Moderate] Study

- **HIV protease inhibitors (tipranavir) are predicted to increase the exposure to velpatasvir. [Severe] Theoretical

- **Velpatasvir** is predicted to increase the exposure to lopinavir. [Severe] Theoretical

- **Mirtazapine is predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study

- **Modafinil is predicted to decrease the exposure to velpatasvir. Avoid. [Severe] Theoretical

- **Nevirapine** is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical

- **Proton pump inhibitors are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir p. 69. [Moderate] Study

- **Rifampicin is predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study

- **Velpatasvir** is predicted to increase the exposure to sirolimus. [Severe] Theoretical

- **St John’s Wort is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical

- **Velpatasvir** is predicted to increase the exposure to statins (atorvastatin). Avoid. [Severe] Study

- **Velpatasvir** increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose and monitor side effects, p. 204. [Severe] Study

- **Velpatasvir** is predicted to increase the exposure to statins (simvastatin). Monitor side effects and adjust dose. [Severe] Theoretical

- **Velpatasvir** is predicted to increase the exposure to sulfasalazine. [Moderate] Theoretical

- **Velpatasvir** is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical

- **Velpatasvir** is predicted to increase the exposure to tenofovir disoproxil. [Severe] Study

- **Velpatasvir** is predicted to increase the exposure to topotecan. [Severe] Theoretical

- **Vemurafenib** → see Table 9 p. 1377 (QT-interval prolongation)

- **Vemurafenib** is predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study

- **Vemurafenib** is predicted to increase the exposure to aliskiren. Use with caution and adjust dose. [Moderate] Theoretical

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vemurafenib. [Severe] Theoretical → Also see Table 9 p. 1377

- **Vemurafenib is predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study

- **Vemurafenib is predicted to increase the exposure to bictegravir. Use with caution or avoid. [Moderate] Theoretical

- **Cobicistat is predicted to increase the exposure to vemurafenib. [Severe] Theoretical

- **Vemurafenib is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 120. [Severe] Theoretical

- **Vemurafenib increases the exposure to dabigatran. Use with caution and adjust dose. [Severe] Theoretical

- **Vemurafenib is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical

- **Enzalutamide is predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical

- **Vemurafenib is predicted to increase the exposure to erlotinib. [Moderate] Theoretical

- **Vemurafenib is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see Table 9 p. 1377

- **Idelalisib is predicted to increase the exposure to vemurafenib. [Severe] Theoretical

- **Macrolides (clarithromycin) are predicted to increase the exposure to vemurafenib. [Severe] Theoretical → Also see Table 9 p. 1377

- **Mitotane is predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Study

- **Vemurafenib is predicted to increase the exposure to nilotinib. [Moderate] Study

- **Vemurafenib is predicted to increase the exposure to panobinostat. Adjust dose. [Moderate] Theoretical → Also see Table 9 p. 1377

- **Vemurafenib is predicted to increase the exposure to pibrentasvir. [Moderate] Theoretical

- **Rifampicin is predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical

- **Vemurafenib is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study

- **Vemurafenib is predicted to increase the exposure to topotecan. [Severe] Study

- **Vemurafenib is predicted to increase the concentration of trametinib. [Moderate] Theoretical

- **Vemurafenib is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical

**Venetoclax**

*FOOD AND LIFESTYLE* Avoid Seville (bitter orange) and star fruit as they might increase the exposure to venetoclax.

- **Antihypertensives (ami洛dare) are predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical

- **Antihypertensives (dronedarone) are predicted to increase the exposure to venetoclax. Avoid or adjust dose—consult product literature. [Severe] Study

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study

Venetoclax – Vinca alkaloids 1551

Venetoclax is predicted to increase the exposure to sulfonylureas (glibenclamide). [Moderate] Theoretical

Venetoclax is predicted to increase the exposure to topotecan. [Moderate] Theoretical

Venetoclax is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical

Venlafaxine – see Table 1. p. 1378 (serotonin syndrome, Table 9 p. 1377 (QT-interval prolongation), Table 11 p. 1377 (CNS depressant effects), Table 4 p. 1375 (antiplatelet effects)

Antifungals, azoles (itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to venlafaxine. [Moderate] Study

Also see Table 9 p. 1377

Cobicistat is predicted to increase the exposure to venlafaxine. [Moderate] Study

Hy receptor antagonists (cimetidine) slightly increase the exposure to venlafaxine. [Mild] Study

Venlafaxine slightly increases the exposure to haloperidol. [Severe] Study → Also see Table 9 p. 1377 → Also see Table 11 p. 1377

HIV-protease inhibitors are predicted to increase the exposure to venlafaxine. [Moderate] Study → Also see Table 9 p. 1377

Idelalisib is predicted to increase the exposure to venlafaxine. [Moderate] Study

Macrolides (clarithromycin) are predicted to increase the exposure to venlafaxine. [Moderate] Study

Verapamil is predicted to increase the exposure to pitolisant. Use with caution and adjust dose. [Mild] Theoretical

Tacrolimus potentially increases the risk of serotonin syndrome when given with venlafaxine. [Severe] Anecdotal

Venetoclax is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical

Also see Table 9 p. 1377

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinflunine. Avoid. [Severe] Theoretical → Also see Table 12 p. 1378

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinorelbine. Use with caution or avoid. [Severe] Theoretical → Also see Table 12 p. 1378

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). [Severe] Theoretical → Also see Table 1 p. 1375 → Also see Table 12 p. 1378

Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see Table 1 p. 1375 → Also see Table 9 p. 1377

Antifungals, azoles (miconazole) are predicted to increase the concentration of vinca alkaloids. Use with caution and adjust dose. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical

Asparaginase potentially increases the risk of neurotoxicity when given with vincristine. Vincristine should be taken 5 to 24 hours before asparaginase. [Severe] Anecdotal → Also see Table 1 p. 1375 → Also see Table 15 p. 1378

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical

Cobicistat is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical

Fluconazole, itraconazole, ketoconazole, posaconazole, voriconazole potentially increase the risk of serotonin syndrome when given with venlafaxine. [Severe] Theoretical

Also see Appendix 1
### Vinca alkaloids – Vortioxetine

**Vinca alkaloids** (continued)

- **Crisantaspase** potentially increases the risk of neurotoxicity when given with vincristine. Vincristine should be taken 3 to 24 hours before crisantaspase. **(Severe) Anecdotal** → Also see TABLE 15. p. 1378

- **Crisantaspase** is predicted to increase the exposure to vinca alkaloids. **(Severe) Theoretical** → Also see TABLE 15. p. 1378

- **Enzalutamide** is predicted to decrease the exposure to vinca alkaloids. **(Severe) Theoretical** → Also see TABLE 9 p. 1377

- **Enzalutamide** is predicted to increase the exposure to vinca alkaloids. **(Severe) Theoretical** → Also see TABLE 15. p. 1378

- **Vismodegib** is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindeosine). **(Severe) Theoretical** → Also see TABLE 9 p. 1377

- **Enzalutamide** is predicted to decrease the exposure to vinflunine. Avoid. **(Severe) Theoretical**

- **Enzalutamide** is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. **(Severe) Theoretical**

- **Enzalutamide** is predicted to decrease the exposure to vinorelbine. Avoid. **(Severe) Theoretical**

- **HIV-protase inhibitors** are predicted to increase the exposure to vinca alkaloids. **(Severe) Theoretical** → Also see TABLE 9 p. 1377

- **Iralisib** is predicted to increase the exposure to vinca alkaloids. **(Severe) Theoretical** → Also see TABLE 15. p. 1378

- **Imatinib** is predicted to increase the exposure to vinca alkaloids. **(Severe) Theoretical** → Also see TABLE 15. p. 1378

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with vinca alkaloids. Public Health England advises avoid (refer to Green Book). **(Severe) Theoretical**

- **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to vinca alkaloids. **(Severe) Theoretical** → Also see TABLE 9 p. 1377

- **Mitotane** is predicted to decrease the exposure to vinflunine. Avoid. **(Severe) Theoretical** → Also see TABLE 15. p. 1378

- **Mitotane** is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. **(Severe) Theoretical** → Also see TABLE 15. p. 1378

- **Netupitant** is predicted to increase the exposure to vinca alkaloids. **(Severe) Theoretical**

- **Nilotinib** is predicted to increase the exposure to vinca alkaloids. **(Severe) Theoretical** → Also see TABLE 15. p. 1378 → Also see TABLE 9 p. 1377

- **Pegaspargase** potentially increases the risk of neurotoxicity when given with vincristine. Vincristine should be taken 3 to 24 hours before pegaspargase. **(Severe) Anecdotal** → Also see TABLE 1 p. 1375 → Also see TABLE 15. p. 1378

- **Rifampicin** is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindeosine). **(Severe) Theoretical**

- **Rifampicin** is predicted to decrease the exposure to vinflunine. Avoid. **(Severe) Theoretical**

- **Rifampicin** is predicted to decrease the exposure to vinorelbine. Avoid. **(Severe) Theoretical** → Also see TABLE 15. p. 1378

- **Vincristine** → see vinca alkaloids

- **Vindesine** → see vinca alkaloids

- **Vinorelbine** → see vinca alkaloids

- **Vismodegib** → see vinca alkaloids

- **Vismodegib** → see TABLE 15. p. 1378 (myelosuppression)

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vismodegib. Avoid. **(Moderate) Theoretical**

- **Enzalutamide** is predicted to decrease the exposure to vismodegib. Avoid. **(Moderate) Theoretical**

- **Mitotane** is predicted to decrease the exposure to vismodegib. Avoid. **(Moderate) Theoretical** → Also see TABLE 15. p. 1378

- **Rifampicin** is predicted to decrease the exposure to vismodegib. Avoid. **(Moderate) Theoretical**

- **St John’s Wort** is predicted to decrease the exposure to vismodegib. Avoid. **(Moderate) Theoretical**

- **Vitamin A**

  - **Retinoids (tretinoin)** are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Adjust dose. **(Moderate) Theoretical**

  - **Retinoids (tretinoin)** are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. **(Severe) Study**

- **Vitamin D substances**

  - **Alfacalcidol** - **calcipotriol** - **calcitriol** - **colecalciferol** - **dihydrotachysterol** - **ergocalciferol** - **paricalcitol** - **licalcalcitol**

- **ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions with topical calcitriol should be borne in mind.

- **Antiepileptics (carbamazepine)** are predicted to decrease the effects of vitamin D substances. **(Moderate) Study**

- **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of vitamin D substances. **(Moderate) Study**

- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the effects of vitamin D substances. **(Moderate) Theoretical**

- **Antifungals, azoles ( clotrimazole, ketoconazole)** are predicted to decrease the exposure to colecalciferol. **(Moderate) Theoretical**

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to paricalcitol. **(Moderate) Study**

- **Cobicistat** is predicted to increase the exposure to paricalcitol. **(Moderate) Study**

- **Vitamin D substances are predicted to increase the risk of toxicity when given with digoxin. **(Severe) Theoretical**

- **HIV-protase inhibitors are predicted to increase the exposure to paricalcitol. **(Moderate) Study**

- **Idelalisib** is predicted to increase the exposure to paricalcitol. **(Moderate) Study**

- **Macrolides (clarithromycin)** are predicted to increase the exposure to paricalcitol. **(Moderate) Study**

- **Vinca alkaloids** are predicted to increase the exposure to paricalcitol. **(Moderate) Study**

- **Thiazide diuretics increase the risk of hypercalcaemia when given with vitamin D substances. **(Moderate) Theoretical**

- **Vitamin E substances**

  - **alpha tocopherol** - **alpha tocopheryl acetate**

  - **Vitamin E substances affect the exposure to ciclosporin. **(Moderate) Study**

- **Volatile halogenated anaesthetics** → see TABLE 8. p. 1376

- **(Hypotension), TABLE 11 p. 1377 (CNS depressant effects)**

  - desflurane - isoflurane - methoxyflurane - sevoflurane

  - **Antiepileptics (phenobarbital, primidone)** potentially increase the risk of nephrotoxicity when given with methoxyflurane. Avoid. **(Severe) Theoretical** → Also see TABLE 11. p. 1377

  - **Isoniazid** potentially increases the risk of nephrotoxicity when given with methoxyflurane. Avoid. **(Severe) Theoretical**

  - **Rifampicin** potentially increases the risk of nephrotoxicity when given with methoxyflurane. Avoid. **(Severe) Theoretical**

- **Vincristine** → see TABLE 13 p. 1378 (serotonin syndrome), TABLE 4 p. 1375 (antiplatelet effects)

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. **(Moderate) Study**

- **Bupropion** is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. **(Moderate) Study** → Also see TABLE 13 p. 1378

- **Cinacalcet** is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. **(Moderate) Study**

- **Enzalutamide** is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. **(Moderate) Study**

- **Mitotane** is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. **(Moderate) Study**

- **St John’s Wort** is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. **(Moderate) Study**

- **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to vortioxetine. Monitor and adjust dose. **(Moderate) Study**
Voxilaprevir

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Study
- Antiepileptics (oxcarbazepine) are predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- Bosantan is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- Ciclosporin increases the concentration of voxilaprevir. Avoid. [Severe] Study
- Combined hormonal contraceptives (containing ethinylestradiol) are predicted to increase the risk of increased ALT concentrations when given with voxilaprevir (with sofosbuvir and velpatasvir). Avoid. [Severe] Study
- Voxilaprevir (with sofosbuvir and velpatasvir) increases the concentration of dabigatran. Avoid. [Severe] Study
- Voxilaprevir (with sofosbuvir and velpatasvir) is predicted to increase the exposure to digoxin. Monitor and adjust dose. [Severe] Theoretical
- Voxilaprevir (with sofosbuvir and velpatasvir) is predicted to increase the concentration of edoxaban. Avoid. [Severe] Theoretical
- Efavirenz is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- Enalaprilat is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Study
- HIV-protease inhibitors (atazanavir) boosted with ritonavir) increase the concentration of voxelaprevir. Avoid. [Severe] Study
- HIV-protease inhibitors (lopinavir) boosted with ritonavir) are predicted to increase the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- HIV-protease inhibitors (tipranavir) boosted with ritonavir) are predicted to increase the concentration of voxilaprevir. [Severe] Theoretical
- Mitotane is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Study
- Modafinil is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- Nevirapine is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- Proton pump inhibitors are predicted to decrease the exposure to voxilaprevir. Adjust dose, see sofosbuvir with velpatasvir and voxilaprevir p. 630. [Moderate] Study
- Rifabutin is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the concentration of voxilaprevir. Avoid. [Severe] Theoretical
- Voxilaprevir is predicted to increase the exposure to statins (atorvastatin). Avoid. [Moderate] Theoretical
- Voxilaprevir (with sofosbuvir and velpatasvir) is predicted to increase the exposure to statins (fluvasatin, simvasatin). Avoid. [Moderate] Theoretical
- Voxilaprevir (with sofosbuvir and velpatasvir) is predicted to increase the exposure to statins (pravastatin). Monitor and adjust pravastatin dose. [Moderate] Study
- Voxilaprevir (with sofosbuvir and velpatasvir) markedly increases the exposure to statins (rosuvastatin). Avoid. [Severe] Study
- Voxilaprevir is predicted to increase the concentration of sulfasalazine. Avoid. [Severe] Theoretical
- Voxilaprevir (with sofosbuvir and velpatasvir) potentially increases the concentration of tenofovir disoproxil. [Severe] Study
- Voxilaprevir is predicted to increase the concentration of topotecan. Avoid. [Severe] Theoretical
- Warfarin → see coumarins

Additional information

General information

- Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).
- Xipamide → see thiazide diuretics
- Xylometazoline → see sympathomimetics, vasoconstrictor

Yellow fever vaccine, live → see live vaccines

Zidovudine → see TABLE 15 p. 1378 (myelosuppression), TABLE 2 p. 1375 (nephrotoxicity)
- Antiepileptics (valproate) slightly increase the exposure to zidovudine. [Moderate] Study
- Antifungals, azoles (fluconazole) slightly increase the exposure to zidovudine. [Moderate] Study
- Antimalarials (pyrimethamine) are predicted to increase the risk of side-effects when given with zidovudine. [Severe] Theoretical → Also see TABLE 15 p. 1378
- Zidovudine increases the risk of haematological toxicity when given with aspirin (high-dose). [Severe] Study
- Zidovudine increases the risk of toxicity when given with lamivudine. [Severe] Aneocdal
- Leflunomide is predicted to increase the exposure to zidovudine. [Moderate] Theoretical → Also see TABLE 15 p. 1378
- Macrolides (clarithromycin) decrease the absorption of zidovudine. Separate administration by at least 2 hours. [Moderate] Study
- Nevirapine is predicted to decrease the concentration of zidovudine. Refer to specialist literature. [Severe] Theoretical
- Zidovudine increases the risk of haematological toxicity when given with NS-5AIs. [Severe] Study → Also see TABLE 2 p. 1375
- Ribavirin increases the risk of anaemia and/or leucopenia when given with zidovudine. Avoid. [Severe] Study
- Zidovudine is predicted to decrease the efficacy of stavudine. Avoid. [Severe] Theoretical
- Teriflunomide is predicted to increase the exposure to zidovudine. [Moderate] Theoretical

Zinc

ROUTE-SPECIFIC INFORMATION

- Interactions do not generally apply to topical use unless specified.

- Oral zinc decreases the absorption of oral bisphosphonates (alendronic acid). Zinc should be taken at least 30 minutes before alendronic acid. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid zinc for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
- Oral zinc decreases the absorption of oral bisphosphonates (risendronate). Separate administration by at least 2 hours. [Moderate] Study
- Oral zinc decreases the absorption of oral bisphosphonates (sodium clodronate). Avoid zinc for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study
- Oral calcium salts decrease the absorption of zinc. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of etorofibram. Etorofibram should be taken 2 hours before or 4 hours after zinc. [Severe] Theoretical
- Zinc is predicted to decrease the efficacy of iron (oral) and iron (oral) is predicted to decrease the efficacy of zinc. [Moderate] Study
- Zinc is predicted to decrease the absorption of penicillin. [Mild] Theoretical
- Zinc is predicted to decrease the exposure to quinolones. Separate administration by 2 hours. [Moderate] Study
- Oral zinc is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- Trientine potentially decreases the absorption of zinc. [Moderate] Theoretical
- Zoledronic acid → see bisphosphonates

Zolmitriptan → see TABLE 13 p. 1378 (serotonin syndrome)
- Combined hormonal contraceptives are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. [Moderate] Study
- H2 receptor antagonists (cimetidine) slightly increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. [Mild] Study

www.getintopharma.com
Zolmitriptan (continued)

- **Mexiteline** is predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. [Moderate] Theoretical
- **Moclubemide** slightly increases the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. [Moderate] Study → Also see TABLE 13 p. 1378
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to zolmitriptan. [Severe] Theoretical → Also see TABLE 13 p. 1378
- **Quinolones** (ciprofloxacin) are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. [Moderate] Theoretical
- **SSRI (fluvoxamine)** are predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 482. [Severe] Theoretical → Also see TABLE 13 p. 1378
- **Zopiclone** is predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Study
- **Zolpidem** is predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Theoretical
- **Crizotinib** is predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to zolmitriptan. Adjust dose. [Moderate] Study
- **HIV-protease inhibitors** are predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Theoretical
- **Idelalisib** is predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Theoretical
- **Imatinib** is predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Theoretical
- **Macrolides (erythromycin)** are predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Study
- **Mitotane** is predicted to decrease the exposure to zolmitriptan. Adjust dose. [Moderate] Study
- **Netupitant** is predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to zolmitriptan. Adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to zolmitriptan. Adjust dose. [Moderate] Study

Zuclopenthixol

- **Zuclopenthixol** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1376 → Also see TABLE 9 p. 1377
- **Zuclopenthixol** is predicted to decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 1376
- **Zuclopenthixol** potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 1377

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee's advice and endorsed ‘ACBS’ will normally not be investigated.

Information
General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)
All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements
For most enteral feeds and nutritional supplements, the main source of carbohydrate is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as ‘clinically lactose-free’ or ‘lactose-free’ by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of protein or amino acids are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of vitamins, minerals, and trace elements—the manufacturer’s product literature should be consulted for more detailed information. Feeds containing vitamin K may affect the INR in patients receiving warfarin. The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Nutritional values
Nutritional values of products vary with flavour and pack size—consult product literature.

Other conditions for which ACBS products can be prescribed
This is a list of clinical conditions for which the ACBS has approved toilet preparations.

Dermatitis, Eczema and Pruritus
Aveeno® Cream; Aveeno® Lotion; E45® Emollient Bath Oil; E45® Emollient Wash Cream

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)
Covermark® classic foundation and finishing powder; Dermacolor® Camouflage cream and fixing powder; Keromask® finishing powder and masking cream; Veil® Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded).

Disinfectants (antiseptics)
May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not if ordered for general hygienic purposes.

Dried mouth (xerostomia)
For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.

AS Saliva Orthana®, Biotène Oralbalance®, Glandosane®, Saliveze®
Photodermatoses (skin protection in)

*LA Roche-Posay Anthelios*® XL SPF 50+ cream; *Sunsense® Ultra* (Ego) SPF 50+; *Uvistat® Lipscreen* SPF 50, *Uvistat® Suncream* SPF 30 and 50

**Standard ACBS indications:** Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

Prices quoted in Appendix 2 are basic NHS net prices; for further information see Prices in BNF.

**Nutritional supplements for metabolic diseases**  
**Glutaric aciduria (type I)**  
**GA Gel®**  
Nutritional supplement for dietary management of type 1 glutaric aciduria in children 6 months–10 years.  
GEL, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 10 g, carbohydrate 10.5 g, fat trace, energy 539 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1575.  
**GA gel oral powder 24g sachets** (Vitaflo International Ltd)  
30 sachet (ACBS) - NHS indicative price = £233.35

**GAI Anamix® Infant**  
Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years.  
POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 15.1 g, carbohydrate 49.5 g, fat 25 g, fibre 5.5 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.  
**GAI Anamix Infant powder** (Nutricia Ltd)  
400 gram (ACBS) - NHS indicative price = £42.17

**XLYS, TRY Glutaridon®**  
Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements.  
POWDER, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g. To flavour unflavoured products, see Modjul Flavour System p. 1576.  
**XLYS TRY Glutaridon powder** (Nutricia Ltd)  
500 gram (ACBS) - NHS indicative price = £201.74

**Glycogen storage disease**  
**Corn flour and corn starch**  
For glycogen storage disease  
**Glycosade®**  
A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years.  
POWDER, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g.  
**Glycosade oral powder 60g sachets** (Vitaflo International Ltd)  
50 sachet (ACBS) - NHS indicative price = £122.64

**Homocystinuria or hypermethioninaemia**  
**HCU Anamix® Infant**  
Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years.  
POWDER, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 25 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.  
**HCU Anamix Infant powder** (Nutricia Ltd)  
400 gram (ACBS) - NHS indicative price = £42.17
**Nutritional supplements for metabolic diseases**

- **HCU cooler** 15
  - A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 5.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1575.

- **HCU Express** 15
  - A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 395 kJ (92 kcal)/150 mL, with vitamins, minerals, and trace elements. HCU orange cooler 15 liquid (Vitafoam International Ltd) 130 ml (ACBS) - NHS indicative price = £12.31

- **HCU Express** 20
  - A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/34 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1575.

- **HCU Express 20 oral powder 25g sachets** (Vitafoam International Ltd) 30 sachet (ACBS) - NHS indicative price = £66.17

- **HCU gel**
  - A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.3 g, fat 20 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1575.

- **HCU gel oral powder 24g sachets** (Vitafoam International Ltd) 30 sachet (ACBS) - NHS indicative price = £233.29

- **HCU Lophlex** LQ 20
  - A nutritional supplement for the dietary management of homocystinuria in children over 3 years. LIQUID, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8 g sachet, with vitamins, minerals, and trace elements. HCU Lophlex LQ 20 liquid (Nutricia Ltd) 125 ml (ACBS) - NHS indicative price = £17.39

- **HCU LV**
  - Nutritional supplement for the dietary management of hypermethioninaemia or vitamin B6 non-responsive homocystinuria in children over 8 years. POWDER, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8 g sachet, with vitamins, minerals, and trace elements. To flavour unflavoured products, see Modul Flavour System p. 1576.

- **HCU-LV oral powder 27.8g sachets tropical** (Nutricia Ltd) 30 sachet (ACBS) - NHS indicative price = £53.40

- **HCU-LV oral powder 27.8g sachets unflavoured** (Nutricia Ltd) 30 sachet (ACBS) - NHS indicative price = £53.40

- **XMET Homidon**
  - Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults. POWDER, protein equivalent (essential and non-essential amino acids, except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. To flavour unflavoured products, see Modul Flavour System p. 1576.

- **XMET Homidon powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £201.74

- **HCU Maxamum**
  - Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria. POWDER, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 54 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see Modul Flavour System p. 1576. Maxamum products are generally intended for use in children over 8 years.

- **HCU Maxamum powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £170.70

**Hyperlysinæmia**

- Nutritional supplement for the dietary management of hyperlysinæmia in children from birth to 3 years.

- **HYPER LYS Anamix® Infant**
  - Nutritional supplement for the dietary management of proven hyperlysinæmia in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.2 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

- **HYPER LYS Anamix Infant powder** (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £42.17

**Isovaleric acidaemia**

- Nutritional supplement for the dietary management of proven isovaleric acidaemia or other proven disorders of leucine metabolism in children from birth to 3 years.

- **IVA Anamix® Infant**
  - Nutritional supplement for the dietary management of proven isovaleric acidaemia or other proven disorders of leucine metabolism in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except leucine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.2 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

- **IVA Anamix Infant powder** (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £42.17

**Maple syrup urine disease**

- **MSUD Aid III®**
  - Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids. POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. To flavour unflavoured products, see Modul Flavour System p. 1576.

- **MSUD Aid III powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £201.74

- **MSUD Anamix® Infant**
  - Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.2 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

- **MSUD Anamix Infant powder** (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £42.17
Nutritional supplements for metabolic diseases

MSUD Anamix® Junior LQ
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years.
  - LIQUID, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 510 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

MSUD Anamix Junior LQ liquid (Nutricia Ltd)
- 125 mL (ACBS) - NHS indicative price = £9.78

MSUD cooler® 15
- Nutritional supplement for the dietary management of maple syrup urine disease in children 5 years and adults.

Methylmalonic or propionic acidaemia

MMA/PA Anamix® Infant
- Nutritional supplement for the dietary management of proven methylmalonic acidaemia or propionic acidaemia in children from birth.
  - POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

MSUD / PA Anamix infant powder (Nutricia Ltd)
- 400 gram (ACBS) - NHS indicative price = £42.17

XMTVI Asadon®
- Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults.
  - POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1586 kJ (362 kcal)/100 g. To flavour unflavoured products, see Modul flavoured system p. 1576.

XMTVI Asadon powder (Nutricia Ltd)
- 200 gram (ACBS) - NHS indicative price = £80.69

MMA/PA Maxamum®
- Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia. POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 59 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see Modul Flavour system p. 1576. Maxamum products are generally intended for use in children over 8 years.

MMA/PA Maxamum powder (Nutricia Ltd)
- 500 gram (ACBS) - NHS indicative price = £170.70

Other inborn errors of metabolism

Cystine500®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from 3 years.
  - POWDER, cystine 500 mg, carbohydrate 3.3 g, fat nil, energy 64 kJ (15 kcal)/4 g

Cystine500 oral powder sachets (Vitalfo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £59.28

DocOmega®
- Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth.
  - POWDER, protein (cows’ milk, soya) 100 mg, carbohydrate 5.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals

DocOmega oral powder 4g sachets (Vitalfo International Ltd)
- 50 sachet (ACBS) - NHS indicative price = £42.90

EAA® Supplement
- Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders in children over 3 years.
  - POWDER, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements.

EAA Supplement oral powder 12.5g sachets (Vitalfo International Ltd)
- 50 sachet (ACBS) - NHS indicative price = £223.68
Nutritional supplements for metabolic diseases

**Isoleucine50**
- Nutritional supplement for use in the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

**POWDER**, isoleucine 50 mg, carbohydrate 5.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

**Isoleucine50 oral powder 4g sachets** (Vitaflor International Ltd)
30 sachet (ACBS) - NHS indicative price = £59.28

**KeyOmega**
- Nutritional supplement for the dietary management of inborn errors of metabolism.

**POWDER**, protein (cows' milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g

**KeyOmega oral powder 4g sachets** (Vitaflor International Ltd)
30 sachet (ACBS) - NHS indicative price = £43.87

**Leucine100**
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

**POWDER**, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g

**Leucine100 oral powder sachets** (Vitaflor International Ltd)
30 sachet (ACBS) - NHS indicative price = £59.28

**Low protein drink**
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year.

**POWDER**, protein (cows' milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements.

Contains lactose.

Termed Milupa® L-p-drink by manufacturer.

**Milupa LP drink** (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £10.00

**Phenylalanine50**
- Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children over 6 months and adults.

**LIQUID**, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose.

**Phenylalanine50 oral powder sachets** (Vitaflor International Ltd)
30 sachet (ACBS) - NHS indicative price = £57.56

**ProZero**
- A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults.

**LIQUID**, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose.

**ProZero liquid** (Vitaflor International Ltd)
250 mL (ACBS) - NHS indicative price = £1.58 | 1000 mL (ACBS) - NHS indicative price = £6.31

**Tryptophan1000**
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

**POWDER**, tryptophan 1 g, carbohydrate 2.9 g, fat nil, energy 65 kJ (15 kcal)/4 g sachet.

**Tryptophan1000 oral powder 4g sachets** (Vitaflor International Ltd)
30 sachet (ACBS) - NHS indicative price = £5.42

**Valine50**
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

**POWDER**, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

**Valine50 oral powder 4g sachets** (Vitaflor International Ltd)
30 sachet (ACBS) - NHS indicative price = £59.28

**Phenylketonuria**

**Easiphen**
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years.

**LIQUID**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements.

**Easiphen liquid** (Nutricia Ltd)
250 ml (ACBS) - NHS indicative price = £10.46

**L-Tyrosine**
- Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations.

**POWDER**, L-tyrosine 20 g, carbohydrate 76.8 g, fat nil, energy 1612 kJ (379 kcal)/100 g.

**L-Tyrosine powder** (Nutricia Ltd)
100 gram (ACBS) - NHS indicative price = £23.76

**Lophlex**
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women.

**POWDER**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 355 kJ (91 kcal)/27.8 g sachet, with vitamins, minerals, and trace elements.

**Lophlex powder 27.8g sachets berry** (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £31.40

**Lophlex powder 27.8g sachets orange** (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £31.40

**Lophlex powder 27.8g sachets unflavoured** (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £31.40

**Loprofin**
- Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults.

LIQUID, protein (cows' milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 163 kJ (40 kcal)/100 mL.

**Loprofin PKU drink** (Nutricia Ltd)
200 mL (ACBS) - NHS indicative price = £0.81

**Loprofin Sno-Pro**
- Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure and other inborn errors of amino acid metabolism.

**LIQUID**, protein (cows' milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 275 kJ (65 kcal)/100 mL. Contains lactose.

**Loprofin SNO-PRO drink** (Nutricia Ltd)
200 mL (ACBS) - NHS indicative price = £1.35

**Phlexy-10**
- Nutritional supplement for the dietary management of phenylketonuria.

**CAPSULES**, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule.

**Phlexy-10 500mg capsules** (Nutricia Ltd)
200 capsule (ACBS) - NHS indicative price = £4.03

**TABLETS**, protein equivalent (essential and non-essential amino acids except phenylalanine) 833 mg tablet.

**Phlexy-10 tablets** (Nutricia Ltd)
75 tablet (ACBS) - NHS indicative price = £30.24

**DRINK MIX**, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.35 g, carbohydrate 8.8 g/20-g sachet.

**Phlexy-10 drink mix 20g sachets apple & blackcurrant** (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £139.28

**Phlexy-10 drink mix 20g sachets citrus burst** (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £139.28

**Phlexy-10 drink mix 20g sachets tropical surprise** (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £139.28
**Phlexy-Vits**

- For use as a vitamin and mineral component of restricted therapeutic diets in children over 11 years and adults with phenylketonuria and similar amino acid abnormalities.

**POWDER, vitamins, minerals, and trace elements**

**Phlexy-Vits powder 7g sachets** (Nutricia Ltd)
- 50 sachet (ACBS) - NHS indicative price = £77.23

**TABLETS, vitamins, minerals, and trace elements**

**Phlexy-Vits tablets** (Nutricia Ltd)
- 180 tablet (ACBS) - NHS indicative price = £88.51

**PK Aid 4**

- Nutritional supplement for the dietary management of phenylketonuria in children and adults.

**POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat 25 g, fibre 5.3 g, energy 1420 kJ (343 kcal)/100 g. To flavour unflavoured products, see Modjul Flavour System p. 1576.

**PK Aid 4 powder** (Nutricia Ltd)
- 500 gram (ACBS) - NHS indicative price = £155.07

**PKU Anamix Infant**

- Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years.

**POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 4.9 g, fat 25 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**PKU Anamix Infant powder** (Nutricia Ltd)
- 400 gram (ACBS) - NHS indicative price = £37.08

**PKU Anamix Junior**

- Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years.

**POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 11.5 g, fat 4.5 g, energy 566 kJ (135 mL)/36 g sachet, with vitamins, minerals, and trace elements.

**PKU Anamix Junior powder 36g sachets chocolate** (Nutricia Ltd)
- 30 sachet (ACBS) - NHS indicative price = £137.10

**PKU Anamix Junior powder 36g sachets neutral** (Nutricia Ltd)
- 30 sachet (ACBS) - NHS indicative price = £137.10

**PKU Anamix Junior powder 36g sachets berry** (Nutricia Ltd)
- 30 sachet (ACBS) - NHS indicative price = £137.10

**PKU Anamix Junior powder 36g sachets orange** (Nutricia Ltd)
- 30 sachet (ACBS) - NHS indicative price = £137.10

**PKU Anamix Junior LQ**

- Nutritional supplement for the dietary supplement of phenylketonuria in children 1–10 years.

**LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

**PKU Anamix Junior LQ liquid berry** (Nutricia Ltd)
- 125 mL (ACBS) - NHS indicative price = £6.08

**PKU Anamix Junior LQ liquid orange** (Nutricia Ltd)
- 125 mL (ACBS) - NHS indicative price = £6.08

**PKU cooler10**

- Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.

**LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.7 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements.

**PKU orange cooler 10 liquid** (Vitaflo International Ltd)
- 87 ml (ACBS) - NHS indicative price = £5.01

**PKU purple cooler 10 liquid** (Vitaflo International Ltd)
- 87 ml (ACBS) - NHS indicative price = £5.01

**PKU red cooler 10 liquid** (Vitaflo International Ltd)
- 87 ml (ACBS) - NHS indicative price = £5.01

**PKU white cooler 10 liquid** (Vitaflo International Ltd)
- 87 ml (ACBS) - NHS indicative price = £5.01

**PKU cooler15**

- Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.

**LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7 g, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements.

**PKU orange cooler 15 liquid** (Vitaflo International Ltd)
- 130 ml (ACBS) - NHS indicative price = £7.46

**PKU purple cooler 15 liquid** (Vitaflo International Ltd)
- 130 ml (ACBS) - NHS indicative price = £7.46

**PKU red cooler 15 liquid** (Vitaflo International Ltd)
- 130 ml (ACBS) - NHS indicative price = £7.46

**PKU white cooler 15 liquid** (Vitaflo International Ltd)
- 130 ml (ACBS) - NHS indicative price = £7.46

**PKU yellow cooler 15 liquid** (Vitaflo International Ltd)
- 130 ml (ACBS) - NHS indicative price = £7.46

**PKU cooler20**

- Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.

**LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 9.4 g, energy 517 kJ (124 kcal)/174-mL pouch, with vitamins, minerals, and trace elements.

**PKU orange cooler 20 liquid** (Vitaflo International Ltd)
- 174 ml (ACBS) - NHS indicative price = £10.02

**PKU purple cooler 20 liquid** (Vitaflo International Ltd)
- 174 ml (ACBS) - NHS indicative price = £10.02

**PKU red cooler 20 liquid** (Vitaflo International Ltd)
- 174 ml (ACBS) - NHS indicative price = £10.02

**PKU white cooler 20 liquid** (Vitaflo International Ltd)
- 174 ml (ACBS) - NHS indicative price = £10.02

**PKU yellow cooler 20 liquid** (Vitaflo International Ltd)
- 174 ml (ACBS) - NHS indicative price = £10.02

**PKU express15**

- Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years.

**POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 3.4 g, energy 310 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1575.

**PKU express 15 powder 25g sachets lemon** (Vitaflo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £219.69

**PKU express 15 powder 25g sachets orange** (Vitaflo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £219.69

**PKU express 15 powder 25g sachets tropical** (Vitaflo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £219.69

**PKU express 15 powder 25g sachets unflavoured** (Vitaflo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £219.69

**PKU express20**

- Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years.

**POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 4.7 g, energy 422 kJ (101 kcal)/54 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1575.

**PKU express 20 powder 34g sachets lemon** (Vitaflo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £283.83

**PKU express 20 powder 34g sachets orange** (Vitaflo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £283.83

**Nutritional supplements for metabolic diseases**

© Get into Pharma 2021
Nutritional supplement for the dietary management of proven phenylketonuria in children 6 months – 10 years (unflavoured), 1–10 years (flavoured).

**PKU Lophlex LQ 20**
- Nutritional supplement for the dietary management of phenylketonuria in children 6 months – 10 years (unflavoured), 1–10 years (flavoured).
- POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 250 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements. PKU Orange contains soya. To flavour unflavoured products, see FlavourPac p. 1575.

**PKU Lophlex LQ 10**
- Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women.
- LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 250 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements.

**PKU Lophlex LQ 10 liquid berry**
- Standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**PKU Lophlex LQ 10 liquid citrus**
- Standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**PKU Lophlex LQ 10 liquid orange**
- Standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**PKU Lophlex LQ 10 liquid orange tyrosinaemia**
- Nutritional supplement for the dietary management of tyrosinaemia type 1 (when nitisinone (NTBC) is used, see nitisinone p. 1067), type II, and type III, in children over 1 year.
- LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**PKU gel®**
- For use as part of the low-protein dietary management of phenylketonuria in children 6 months – 10 years (unflavoured), 1–10 years (flavoured).
- POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 10.3 g (unflavoured)/8.9 g (flavoured), fat less than 100 mg, energy 346 kJ (82 kcal)/322 kJ (76 kcal) (flavoured)/24 g, with vitamins, minerals, and trace elements. PKU Orange contains soya. To flavour unflavoured products, see FlavourPac p. 1575.

**PKU gel powder 24 sachets unflavoured**
- Nutritional supplement for the dietary management of proven phenylketonuria in children 6 months – 10 years (unflavoured), 1–10 years (flavoured).
- POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 10.3 g (unflavoured)/8.9 g (flavoured), fat less than 100 mg, energy 346 kJ (82 kcal)/322 kJ (76 kcal) (flavoured)/24 g, with vitamins, minerals, and trace elements. PKU Orange contains soya. To flavour unflavoured products, see FlavourPac p. 1575.
fat 500 mg, energy 393 kJ (92 kcal)/130 mL, with vitamins,
minerals, and trace elements.

**TYR orange cooler 15 liquid** (Vitaflo International Ltd)
130 ml (ACBS) - NHS indicative price = £12.31

**TYR red cooler 10 liquid** (Vitaflo International Ltd)
87 ml (ACBS) - NHS indicative price = £7.60

**TYR red cooler 15 liquid** (Vitaflo International Ltd)
130 ml (ACBS) - NHS indicative price = £12.31

**TYR red cooler 20 liquid** (Vitaflo International Ltd)
174 ml (ACBS) - NHS indicative price = £15.89

**TYR express15®**
Nutritional supplement for the dietary management of
tyrosinaemia in children over 8 years and adults.
 POWDER, protein equivalent (essential and non-essential amino
acids except tyrosine and phenylalanine) 15 g, carbohydrate
3.4 g, fat less than 100 mg, energy 310 kJ (74 kcal)/25 g, with
vitamins, minerals, and trace elements. To flavour unflavoured
products, see FlavourPac p. 1575.

**TYR express 15 oral powder 25g sachets** (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £362.37

**TYR express20®**
Nutritional supplement for the dietary management of
tyrosinaemia in children over 8 years.
 POWDER, protein equivalent (essential and non-essential amino
acids except tyrosine and phenylalanine) 20 g, carbohydrate
4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with
vitamins, minerals, and trace elements. To flavour unflavoured
products, see FlavourPac p. 1575.

**TYR express 20 oral powder 34g sachets** (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £468.17

**TYR Gel®**
Nutritional supplement for the dietary management of
tyrosinaemia in children 1–10 years.
 GEL, protein equivalent (essential and non-essential amino
acids except tyrosine and phenylalanine) 10 g, carbohydrate
10.3 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with
vitamins, minerals, and trace elements. To flavour unflavoured
products, see FlavourPac p. 1575.

**TYR gel oral powder 24g sachets** (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £233.29

**TYR Lophlex® LQ 20**
Nutritional supplement for the dietary management of
tyrosinaemia in children over 4 years and adults, including
pregnant women (in conjunction with standard folic acid
supplementation).
 LIQUID, protein equivalent (essential and non-essential amino
acids except phenylalanine and tyrosine) 20 g, carbohydrate
8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ
(120 kcal)/125 mL, with vitamins, minerals, and trace elements.

**TYR Lophlex LQ 20 liquid** (Nutricia Ltd)
125 ml (ACBS) - NHS indicative price = £17.39

**XPHEN TYR Tyrosidon**
Nutritional supplement for the management of tyrosinaemia in
children and adults where plasma-methionine concentrations
are normal.
 POWDER, protein equivalent (essential and non-essential amino
acids except phenylalanine and tyrosine) 77 g, carbohydrate
4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. To flavour
unflavoured products, see Modjul Flavour System p. 1576.

**XPHEN TYR Tyrosidon Free AA Mix powder** (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £201.74

**XPTM Tyrosidon®**
Nutritional supplement for the dietary management of
 tyrosinaemia type I in children and adults where plasma-
methionine concentrations are above normal.
 POWDER, protein equivalent (essential and non-essential amino
acids except methionine, phenylalanine, and tyrosine) 77 g,
carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. To
flavour unflavoured products, see Modjul Flavour System
p. 1576.
Appendix 3
Cautionary and advisory labels for dispensed medicines

Guidance for cautionary and advisory labels
Medicinal forms within BNF publications include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients and carers when necessary. Counselling needs to be related to the age, experience, background, and understanding of the individual patient or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks (e.g. driving or work), any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discoloration of urine or stool by a medicine should also be mentioned.

For some medicines there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

Original packs
Most preparations are dispensed in unbroken original packs that include the further advice for the patient in the form of patient information leaflets. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels
In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed 'NCL' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as 'Discard... days after opening' and 'Do not use after... ', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the BNF these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is a useful precaution for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed. The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings
For BNF 61 (March 2011), a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 51 and 35 no longer apply to any medicines in the BNF and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

Welsh labels
Comprehensive Welsh translations are available for each cautionary and advisory label.

Labels

1 Warning: This medicine may make you sleepy

Rhybudd: Gall y feddygyniaeth hon eich gwneud yn ysglyd

To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol

Rhybudd: Gall y feddygyniaeth hon eich gwneud yn ysglyd. Peidiwch â gyrru, defnyddio offer llaw neu beiriannau os yw hyn yn digwydd. Peidiwch ag yfed alcohol

To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.

In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk
and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient’s doctor.

Side-effects unrelated to drowsiness that may affect a patient’s ability to drive or operate machinery safely include blurred vision, dizziness, or nausea. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines.

Rhybudd: Gall y feddyginiaeth hon eich gwneud yn gysglyd. Peidiwch â gyrru, defnyddio offer llaw neu beiriannau os yw hyn yn digwydd

To be used on preparations containing monoamine-oxidase inhibitors; the warning to avoid alcohol and dealkoholised (low alcohol) drink is covered by the patient information leaflet.

Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol.

Rhybudd: Peidiwch ag yr yfed alcohol

To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine.

Peidiwch â chymryd meddyginiaetha camdreuliad 2 awr cyn cynnwys haearn neu sinc, 2 awr cyn neu ar ôl y feddyginiaeth hon

To be used with label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as gabapentin where the absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine.

Peidiwch â chymryd meddyginiaetha camdreuliad neu feddyginiaetha sy’n cynnwys haearn neu sinc, 2 awr cyn neu ar ôl y feddyginiaeth hon

To be used on preparations containing oloxacin and some other quinolones, doxycycline, tetracycline, minocycline, and penicillamine. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine.

Peidiwch â chymryd llæth, meddyginiaetha camdreuliad, neu feddyginiaeth sy’n cynnwys haearn neu sinc, 2 awr cyn neu ar ôl y feddyginiaeth hon

To be used on preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelate calcium, iron, magnesium, and zinc, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop.

Rhybudd: Peidiwch â stopio cymryd y feddyginiaeth hon, oni bai fod eich meddyg yn dweud wrthych am stopio

To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. antituberculous drugs). Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop.

Gadewch i doddi mewn dŵr haul, hyd yn oed ar ddiwrnod ddwrg. Nid yw hyn yn arwydd o ddawel.

Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

10 Warning: Read the additional information given with this medicine.

Rhybudd: Darllenwch y wybodaeth ychwanegol gyda’r feddyginiaeth hon

To be used particularly on preparations containing anticoagulants, lithium, and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given.

This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds.

Diogelwch eich croen rhag golau ddwrg. Nid oes beth sy’n wir iawn ar ddiwrnod ddwrg, oni bai eich bod yn cael cynhyrchion ddwrg.

To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

12 Do not take anything containing aspirin while taking this medicine.

Peidiwch â chymryd unrhyw beth sy yw cynnwys aspirin gyda’r feddyginiaeth hon

To be used on preparations containing anticoagulants, lithium, and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given.

Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking.

Gadewch i doddi mewn dwr ddwrg.

To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour your urine. This is harmless.

Gall y feddyginiaeth hon lliwio eich dŵr. Nid yw hyn yn arwydd o ddawel.

To be used on preparations that may cause the patient’s urine to turn an unusual colour. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).
15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine.
Rhybudd: Ffilmadyw. Ar ôl rhoi’r fedyddginiaeth ymlaen, cadwch yn glir o dan neu fflamau
To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening.
Rhewch y dabled i doddi dan eich tafod - peidiwch â caead wedi’i gau ym dynn. Gofynnwch am dabledi newydd 8 wythnos ar ôl ei hagor
To be used on glyceryl trinitrate tablets to remind the patient not to transfer the tablets to plastic or less suitable containers.

17 Do not take more than... in 24 hours
Peidwch â chmyrdd mwy na... mewn 24 awr
To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.
It may also be used on preparations for which no dose has been specified by the prescriber.

18 Do not take more than... in 24 hours. Also, do not take more than... in any one week.
Peidwch â chmyrdd mwy na... mewn 24 awr. Hefyd, peidwch â chmyrdd mwy na... mewn wythnos
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol.
Rhybudd: Bydd y fedyddginiaeth hon yn eich gweud neu ym gysglyd. Os ydych yn dal i deimlo y dyled wedi’i gwyrru, defnyddio offer laww neu bei niannau. Peidwch ag y fyd alcohol
To be used on preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night. On the rare occasions when hypnotics are prescribed for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an alternative to the label 2 wording (the choice being at the discretion of the pharmacist) for anxiotytics prescribed to be taken at night.
It is hoped that this wording will convey adequately the problem of residual morning sedation after taking ‘sleeping tablets’.

20 Take with or just after food, or a meal
Cymerwch gyda neu ar ôl bwyd
To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food. Patients should be advised that a small amount of food is sufficient.

21 Take 30 to 60 minutes before food
Cymerwch 30 i 60 munud cyn bwyd
To be used on some preparations whose absorption is thereby improved. Most oral antibacterials require label 23 instead (see below).

22 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
Cymerwch y fedyddginiaeth hon ar stumog wag. Mae hyn yn gofynnws awr cyn, neu 2 awr ar ôl bwyd
To be used on oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach.

23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
Cymerwch y fedyddginiaeth hon ar stumog wag. Mae hyn yn gofynnws awr cyn, neu 2 awr ar ôl bwyd
To be used on oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine
Bydd angen cni neu sugno’r fedyddginiaeth hon
To be used on preparations that should be sucked or chewed.
The pharmacist should use discretion as to which of these words is appropriate.

The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process. The principal stages of healing are: cleansing, removal of debris; granulation, vascularisation; epithelialisation. The ideal dressing for moist wound healing needs to ensure that the wound remains: moist with epithelialisation. The ideal dressing for moist wound healing is not appropriate (e.g. gangrenous toes associated with vascular disease). Advanced wound dressings are designed to control the environment for wound healing, for example to donate fluid (hydrogels), maintain hydration (hydrocolloids), or to absorb wound exudate (alginate, foams). Practices such as the use of irritant cleansers and desloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with lukewarm sterile sodium chloride 0.9% solution or water.

Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris.

There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see Buyers’ Guide: Advanced wound dressings (October 2008); NHS Purchasing and Supply Agency, Centre for Evidence-based Purchasing.

Prices quoted in Appendix 4 are basic NHS net prices; for further information see Prices in the BNF under How to use the BNF.

The table below gives suggestions for choices of primary dressing depending on the type of wound (a secondary dressing may be needed in some cases).

Basic wound contact dressings

Low adherence dressing

Low adherence dressings are used as interface layers under secondary absorbent dressings. Placed directly on the wound bed, non-absorbent, low adherence dressings are suitable for clean, granulating, lightly exuding wounds without necrosis, and protect the wound bed from direct contact with secondary dressings. Care must be taken to avoid granulation tissue growing into the weave of these dressings. Tulle dressings are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this is only partly successful and it may be necessary to change the

Note: In each section of this table the dressings are listed in order of increasing absorbency.

Some wound contact (primary) dressings require a secondary dressing.

### Knitted polyester primary dressing

**Atraman**

Non-adherent knitted polyester primary dressing impregnated with neutral triglycerides.

**Atraman dressing** (Paul Hartmann Ltd) 10cm × 20cm= £0.80, 20cm × 30cm= £2.20, 5cm × 5cm= £0.34, 7.5cm × 10cm= £0.35

**Knitted viscose primary dressing**

**N-A Dressing**

Warp knitted fabric manufactured from a bright viscose monofilament.

**N-A dressing** (Systagenix Wound Management Ltd) 19cm × 9.5cm= £0.67, 9.5cm × 9.5cm= £0.35

**N-A Ultra**

Warp knitted fabric manufactured from a bright viscose monofilament.

**N-A Ultra dressing** (Systagenix Wound Management Ltd) 19cm × 9.5cm= £0.64, 9.5cm × 9.5cm= £0.34

**Profore**

Warp knitted fabric manufactured from a bright viscose monofilament.

**Profore** (Smith & Nephew Healthcare Ltd) wound contact layer 14cm × 20cm= £0.33

**Tricotex**

Warp knitted fabric manufactured from a bright viscose monofilament.

**Tricotex dressing** (Smith & Nephew Healthcare Ltd) 9.5cm × 9.5cm= £0.35

**Paraffin Gauze Dressing**

**Cuticell**

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading.

**Cuticell** (BSN Medical Ltd) Classic dressing 10cm × 10cm= £0.30

**Jelonet**

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading.

**Jelonet** (Smith & Nephew Healthcare Ltd) dressing 10cm × 10cm= £0.42

**Neotulle**

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading.

**Neotulle** (Neomedic Ltd) dressing 10cm × 10cm= £0.29
Absorvent dressings
Perforated film absorvent dressings are suitable only for wounds with mild to moderate amounts of exudate; they are not appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate. Dressings with an absorbent cellulose or polymer wadding layer are suitable for use on moderately to heavily exuding wounds.

Absorbent cellulose dressing

CelluDress Absorbent Cellulose Dressing with Fluid Repellent Backing

CelluDress dressing (Medicareplus International Ltd) 10cm x 10cm= £0.19, 10cm x 15cm= £0.20, 10cm x 20cm= £0.22, 15cm x 20cm= £0.30, 20cm x 25cm= £0.40, 20cm x 30cm= £0.85

Eclipse Absorbent Cellulose Dressing with Fluid Repellent Backing

Eclipse (Advancis Medical) Boot dressing 60cm x 70cm= £13.88, dressing 15cm x 15cm= £0.98, 20cm x 30cm= £2.16, 60cm x 40cm= £8.21

Exu-Dry

Absorbent Cellulose Dressing with Fluid Repellent Backing

Exu-Dry dressing (Smith & Nephew Healthcare Ltd) 10cm x 15cm= £1.16, 15cm x 23cm= £2.36, 23cm x 38cm= £5.49

Mesorb

Cellulose wadding pad with gauze wound contact layer and non-woven repellent backing

Mesorb dressing (Molynex Health Care Ltd) 10cm x 10cm= £0.63, 10cm x 15cm= £0.62, 10cm x 20cm= £1.01, 15cm x 20cm= £1.44, 20cm x 25cm= £2.27, 20cm x 30cm= £2.57

Zetuvit E

Absorbent Cellulose Dressing with Fluid Repellent Backing; sterile or non-sterile

Zetuvit (Paul Hartmann Ltd) E non-sterile dressing 10cm x 10cm= £0.07, 10cm x 20cm= £0.09, 20cm x 20cm= £0.15, 20cm x 40cm= £0.28, sterile dressing 10cm x 10cm= £0.22, 10cm x 20cm= £0.25, 20cm x 20cm= £0.40, 20cm x 40cm= £1.12

Absorvent perforated dressing

Adpore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

Adpore dressing (Medicareplus International Ltd) 10cm x 10cm= £0.10, 10cm x 15cm= £0.16, 10cm x 20cm= £0.30, 10cm x 25cm= £0.34, 10cm x 30cm= £0.42, 10cm x 35cm= £0.50, 7cm x 8cm= £0.08

Cosmopore E

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

Cosmopore E dressing (Paul Hartmann Ltd) 10cm x 20cm= £0.46, 10cm x 25cm= £0.57, 10cm x 30cm= £0.69, 7cm x 7cm= £0.08, 6cm x 10cm= £0.18, 8cm x 15cm= £0.28

Cutiplast Steril

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

Cutiplast Steril dressing (Smith & Nephew Healthcare Ltd) 10cm x 20cm= £0.32, 10cm x 25cm= £0.33, 10cm x 30cm= £0.44, 8cm x 10cm= £0.11, 8cm x 15cm= £0.25

Leukomed

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

Leukomed dressing (BSN medical ltd) 10cm x 20cm= £0.44, 10cm x 25cm= £0.50, 10cm x 30cm= £0.64, 10cm x 35cm= £0.74, 7cm x 7cm= £0.09, 8cm x 10cm= £0.19, 8cm x 15cm= £0.33

Medipore + Pad

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

Medipore + Pads dressing (3M Health Care Ltd) 10cm x 10cm= £0.16, 10cm x 15cm= £0.25, 10cm x 20cm= £0.38, 10cm x 25cm= £0.46, 10cm x 35cm= £0.65, 5cm x 7.2cm= £0.08

Medisafe

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

Medisafe dressing (Neomedic Ltd) 6cm x 8cm= £0.08, 8cm x 10cm= £0.13, 8cm x 15cm= £0.23, 9cm x 15cm= £0.29, 9cm x 20cm= £0.34, 9cm x 25cm= £0.36

Mepore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

Mepore dressing (Molynex Health Care Ltd) 10cm x 11cm= £0.22, 11cm x 15cm= £0.36, 7cm x 8cm= £0.11, 9cm x 20cm= £0.44, 9cm x 25cm= £0.61, 9cm x 30cm= £0.70, 9cm x 35cm= £0.76

PremierPore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

PremierPore dressing (Sherwood) 10cm x 10cm= £0.12, 10cm x 15cm= £0.18, 10cm x 20cm= £0.32, 10cm x 25cm= £0.36, 10cm x 30cm= £0.45, 10cm x 35cm= £0.52, 5cm x 7cm= £0.05

Primapore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

Primapore dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm= £0.13, 10cm x 15cm= £0.20, 10cm x 20cm= £0.35, 10cm x 25cm= £0.40, 10cm x 30cm= £0.49, 10cm x 35cm= £0.58, 6cm x 7cm= £0.06

Softpore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

Softpore dressing (Richardson Healthcare Ltd) 10cm x 10cm= £0.45, 10cm x 25cm= £0.51, 10cm x 30cm= £0.64, 10cm x 35cm= £0.99, 6cm x 8.3cm= £0.18, 6cm x 10cm= £0.20, 8cm x 15cm= £0.34

Telfa Island

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive barrier.

Telfa Island dressing (H & R Healthcare Ltd) 10cm x 12.5cm= £0.27, 10cm x 20cm= £0.35, 10cm x 25cm= £0.45, 10cm x 35cm= £0.62, 5cm x 10cm= £0.08

Absorvent perforated plastic film faced dressing

Absopad

Low-adherence primary dressing consisting of 3 layers—perforated polyfilmy wound contact layer, absorbent cotton pad, and hydrophilic backing.

Absopad dressing (Medicareplus International Ltd) 10cm x 10cm= £0.13, 20cm x 10cm= £0.28

Askina Pad

Low-adherence primary dressing consisting of 3 layers—perforated polyfilmy wound contact layer, absorbent cotton pad, and hydrophilic backing.

Askina (Braun Medical Ltd) Pad dressing 10cm x 10cm= £0.21

Melolin

Low-adherence primary dressing consisting of 3 layers—perforated polyfilmy wound contact layer, absorbent cotton pad, and hydrophilic backing.

Melolin dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm= £0.28, 20cm x 10cm= £0.55, 5cm x 5cm= £0.17

Skintact

Low-adherence primary dressing consisting of 3 layers—perforated polyfilmy wound contact layer, absorbent cotton pad, and hydrophilic backing.

Skintact dressing (Robinson Healthcare) 10cm x 10cm= £0.17, 20cm x 10cm= £0.34, 5cm x 5cm= £0.10

Solvaline N

Low-adherence primary dressing consisting of 3 layers—perforated polyfilmy wound contact layer, absorbent cotton pad, and hydrophilic backing.

Solvaline N dressing (Lohmann & Rauscher) 10cm x 10cm= £0.18, 20cm x 10cm= £0.37, 5cm x 5cm= £0.10

Telfa

Low-adherence primary dressing consisting of 3 layers—perforated polyfilmy wound contact layer, absorbent cotton pad, and hydrophilic backing.

Telfa dressing (H & R Healthcare Ltd) 10cm x 7.5cm= £0.16, 15cm x 7.5cm= £0.18, 20cm x 7.5cm= £0.29, 7.5cm x 5cm= £0.12
Super absorbent cellulose and polymer primary dressing

**Curea P1**
Super absorbent cellulose and polymer primary dressing. 
*Curea P1 dressing* (Charles S. Bullen Stomacare Ltd) 10cm × 10cm square= £2.17, 10cm × 20cm rectangular= £3.67, 10cm × 30cm rectangular= £5.29, 12cm × 12cm square= £2.67, 20cm × 20cm square= £6.95, 20cm × 30cm rectangular= £10.11, 7.5cm × 7.5cm square= £1.73

**Curea P2**
Super absorbent cellulose and polymer primary dressing (non-adherent) 
*Curea P2 dressing* (Charles S. Bullen Stomacare Ltd) 10cm × 20cm rectangular= £4.53, 11cm × 11cm square= £2.49, 20cm × 20cm square= £7.88, 20cm × 30cm rectangular= £10.68

**Cutisorb Ultra**
Super absorbent cellulose and polymer primary dressing 
*Cutisorb Ultra dressing* (Bion Medical Ltd) 10cm × 10cm square= £2.13, 10cm × 20cm rectangular= £3.56, 20cm × 20cm square= £6.68, 20cm × 30cm rectangular= £10.06

**DryMax Extra**
Super absorbent cellulose and polymer primary dressing 
*DryMax Extra Soft dressing* (Essure Healthcare Ltd) 10cm × 10cm square= £0.87, 10cm × 20cm rectangular= £1.04, 20cm × 20cm square= £1.84, 20cm × 30cm rectangular= £2.33

**ELECT Superabsorber**
Super absorbent cellulose and polymer primary dressing

**Zetuvit Plus**
Super absorbent cellulose primary dressing 
*Zetuvit Plus dressing* (Paul Hartmann Ltd) 10cm × 10cm= £0.83, 10cm × 20cm= £1.15, 15cm × 20cm= £1.32, 20cm × 25cm= £1.80, 20cm × 40cm= £2.79

**Super absorbent hydroconductive dressing**

**Drawtex**
Super absorbent hydroconductive dressing with absorbent, cross-action structures of viscose, polyester and cotton

**Drawtex dressing** (Martindale Pharmaceuticals Ltd) 10cm × 1.3m= £16.00, 10cm × 10cm= £2.24, 10cm × 1m= £16.00, 15cm × 20cm= £6.00, 20cm × 1m= £25.00, 20cm × 20cm= £6.98, 5cm × 5cm= £0.95, 7.5cm × 1m= £13.50, 7.5cm × 7.5cm= £1.77

**Advanced wound dressings**
Advanced wound dressings can be used for both acute and chronic wounds. Categories for dressings in this section start with the least absorptive, moisture-donating hydrogel dressings, followed by increasingly more absorptive dressings. These dressings are classified according to their primary component; some dressings are comprised of several components.

**Hydrogel dressings**
Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbent dressing is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with laser therapy. Hydrogel sheets have a fixed structure and limited fluid-handling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

**Hydrogel application (amorphous)**

**ActiHeal Hydrogel**
Hydrogel containing guar gum and propylene glycol

**ActiHeal (Advanced Medical Solutions Ltd)** Hydrogel dressing= £1.41

**Aquaform**
Hydrogel containing modified starch copolymer

**Aquaform (Aspan Medical Europe Ltd)** Hydrogel dressing= £2.04

**Askina Gel**
Hydrogel containing modified starch and glycerol

**Askina (B.Braun Medical Ltd)** Gel dressing= £2.06

**Cutimed**
Hydrogel

**Cutimed (BSN medical Ltd)** Gel dressing= £3.10

**Flexigran**
Hydrogel containing modified starch and glycerol

**Flexigran (A1 Pharmaceuticals) Gel dressing= £1.90**

**granuGel**
Hydrogel containing carboxymethylcellulose, pectin and propylene glycol

**granuGel (Convatec Ltd) Hydrocolloid Gel dressing= £2.39**

**Intrasite Gel**
Hydrogel containing modified carmellose polymer and propylene glycol

**Intrasite (Smith & Nephew Healthcare Ltd) Gel dressing= £3.68**

**Nu-Gel**
Hydrogel containing alginate and propylene glycol

**Nu-Gel (Syagenex Wound Management Ltd) dressing= £2.11**

**Purilon Gel**
Hydrogel containing carboxymethylcellulose and calcium alginate

**Purilon (Coloplast Ltd) Gel dressing= £2.33**

**Hydrogel sheet dressings**

**ActiFormCool**
Hydrogel dressing

**ActiFormCool sheet (L&R Medical UK Ltd) 10cm × 10cm square= £2.71, 10cm × 15cm rectangular= £3.89, 20cm × 20cm square= £8.14, 5cm × 6.5cm rectangular= £1.84**

**Aquafo**
Hydrogel dressing

**Aquafo (Covidien (UK) Commercial ltd) sheet 7.5cm discs= £2.60**

**Coolie**
Hydrogel dressing (without adhesive border)

**Coolie (Zeroderma Ltd) sheet 7cm discs= £1.96**

**Gel FX**
Hydrogel dressing (without adhesive border)

**Gel FX sheet (Synergy Health (UK) Ltd) 10cm × 10cm square= £1.60, 15cm × 15cm square= £3.20**

**Geliperm**
Hydrogel sheets

**Geliperm (Geistlich 500 Ltd) sheet 10cm × 10cm square= £2.53**

**Hydrosorb**
Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film

**Hydrosorb sheet (Paul Hartmann Ltd) 10cm × 10cm square= £2.29, 20cm × 20cm square= £6.87, 5cm × 7.5cm rectangular= £1.60**

**Hydrosorb Comfort**
Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film (with adhesive border, waterproof)

**Hydrosorb Comfort sheet (Paul Hartmann Ltd) 12.5cm × 12.5cm square= £3.66, 4.5cm × 6.5cm rectangular= £1.90, 7.5cm × 10cm rectangular= £2.52**

**Intrasite Conformable**
Soft non-woven dressing impregnated with Intrasite® gel

**Intrasite Conformable dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm square= £1.85, 10cm × 20cm rectangular= £2.50, 10cm × 40cm rectangular= £4.47**

**Novogel**
Glycerol-based hydrogel sheets (standard or thin)

**Novogel sheet (Ford Medical Associates Ltd) 10cm × 10cm square= £3.18, 15cm × 20cm rectangular= £6.07, 20cm × 40cm rectangular= £11.56, 30cm × 30cm (0.15cm thickness) square= £12.71, (0.30cm thickness) square= £13.47, 5cm × 7.5cm rectangular= £1.99, 7.5cm diameter circular= £2.92**

**SanoSkin NET**
Hydrogel sheet (without adhesive border)

**SanoSkin (Ideal Medical Solutions Ltd) NET sheet 8.5cm × 12cm rectangular= £2.28**

**VacuNet**
Non-adherent, hydrogel coated polyester net dressing
Vapour-permeable films and membranes

VacuNet dressing (Proteus Healthcare Ltd) 10cm × 10cm square = £1.93, 10cm × 15cm rectangular = £2.86

Sodium hyaluronate dressings

The hydrating properties of sodium hyaluronate promote wound healing, and dressings can be applied directly to the wound, or to a primary dressing (a secondary dressing should also be applied). The iodine and potassium iodide in these dressings prevent the bacterial decay of sodium hyaluronate in the wound. Hydrolane® should be used with caution in thyroid disorders.

Hydrolane
Sodium hyaluronate 1.5%, potassium iodide 0.15%, iodine 0.1%, in a viscous solution

Vapour-permeable films and membranes

Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and a moist healing environment; transparent film dressings permit constant observation of the wound. Water vapour loss can occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers. Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginites or hydrogels; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

Non-woven fabric dressing with viscose-rayon pad.

Niko Fix
For intravenous and subcutaneous catheter sites

Niko (Unomedical Ltd) Fix dressing 7cm × 8.5cm = £0.20

Vapour-permeable Adhesive Film Dressing (Semi-permeable Adhesive Dressing)
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

Askina Derm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Askina Derm dressing (B.Braun Medical Ltd) 10cm × 12cm = £1.11, 10cm × 20cm = £2.12, 15cm × 20cm = £2.57, 20cm × 30cm = £4.59, 6cm × 7cm = £0.38

C-View
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

C-View dressing (Aspen Medical Europe Ltd) 10cm × 12cm = £1.03, 12cm × 12cm = £1.10, 15cm × 20cm = £2.38, 6cm × 7cm = £0.38

Dressfilm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Dressfilm (St Georges Medical Ltd) dressing 15cm × 20cm = £1.90

Hydrofilm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Hydrofilm dressing (Paul Hartmann Ltd) 10cm × 12.5cm = £0.43, 10cm × 15cm = £0.54, 10cm × 25cm = £0.83, 12cm × 25cm = £0.88, 15cm × 20cm = £0.99, 20cm × 30cm = £1.63, 6cm × 7cm = £0.23

Hypafix Transparent
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Leukomed T
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Leukomed T dressing (BSN medical Ltd) 10cm × 12.5cm = £1.05, 11cm × 14cm = £1.27, 15cm × 20cm = £2.44, 15cm × 25cm = £2.60, 7.2cm × 5cm = £0.39, 8cm × 10cm = £0.72

Mepitel Film
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Mepitel Film dressing (Mölnlycke Health Care Ltd) 10.5cm × 12cm = £1.32, 10.5cm × 25cm = £2.57, 15.5cm × 20cm = £3.26, 6.5cm × 7cm = £0.49

Mepore Film
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Mepore Film dressing (Smith & Nephew Healthcare Ltd) 10cm × 1m = £6.78, 5cm × 1m = £4.02

OpSite Flexigrid
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

OpSite Flexigrid dressing (Smith & Nephew Healthcare Ltd) 12cm × 12cm = £1.16, 15cm × 20cm = £2.93, 6cm × 7cm = £0.41

Polyskin II
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Kendall Film dressing (H & R Healthcare Ltd) 10cm × 12cm = £1.03, 10cm × 20cm = £2.04, 15cm × 20cm = £2.35, 20cm × 25cm = £4.11, 4cm × 4cm = £0.36, 6cm × 7cm = £0.40

ProtectFilm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

ProtectFilm dressing (Wallace, Cameron & Company Ltd) 10cm × 12cm = £0.20, 15cm × 20cm = £0.40, 6cm × 7cm = £0.11

Suprasorb F
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Suprasorb F dressing (Lohmann & Rauscher) 10cm × 12cm = £0.83, 15cm × 20cm = £2.58, 5cm × 7cm = £0.34

Tegaderm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Tegaderm Film dressing (3M Health Care Ltd) 12cm × 12cm = £1.11, 15cm × 20cm = £2.41, 6cm × 7cm = £0.39

Tegaderm diamond
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Tegaderm Diamond dressing (3M Health Care Ltd) 10cm × 12cm = £1.21, 6cm × 7cm = £0.45
Vellafilm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
Vellafilm dressing (Advancis Medical) 12cm × 12cm = £1.11, 12cm × 35cm = £2.77, 15cm × 20cm = £2.12

Vapour-permeable Adhesive Film Dressing with absorbent pad
Adpore Ultra
Film dressing with absorbent pad
Adpore Ultra dressing (Medicareus International Ltd) 10cm × 10cm = £0.14, 10cm × 15cm = £0.22, 10cm × 20cm = £0.33, 10cm × 25cm = £0.35, 10cm × 30cm = £0.52, 7cm × 8cm = £0.12

Vapour-permeable Adhesive Film Dressing with absorbent pad
Alldress
Film dressing with absorbent pad
Alldress dressing (Molyncke Health Care Ltd) 10cm × 10cm = £0.97, 15cm × 15cm = £2.11, 15cm × 20cm = £2.61

C-View Post-Op
Film dressing with absorbent pad
C-View Post-Op dressing (Aspen Medical Europe Ltd) 10cm × 12cm = £1.11, 10cm × 25cm = £1.61, 10cm × 35cm = £2.62, 6cm × 7cm = £0.40

Clearpore
Film dressing with absorbent pad
Clearpore dressing (Richards Healthcare Ltd) 10cm × 10cm = £0.20, 10cm × 15cm = £0.24, 10cm × 20cm = £0.36, 10cm × 25cm = £0.40, 10cm × 30cm = £0.65, 6cm × 10cm = £0.15, 6cm × 7cm = £0.12

Hydrofilm Plus
Film dressing with absorbent pad
Hydrofilm Plus dressing (Paul Hartmann Ltd) 10cm × 20cm = £0.47, 10cm × 25cm = £0.61, 10cm × 30cm = £0.70, 7.2cm × 5cm = £0.18, 9cm × 10cm = £0.28, 9cm × 15cm = £0.31

Leukomed T Plus
Film dressing with absorbent pad
Leukomed T Plus dressing (BSN medical Ltd) 10cm × 20cm = £1.38, 10cm × 25cm = £1.55, 10cm × 30cm = £2.60, 10cm × 35cm = £3.16, 7.2cm × 5cm = £0.28, 8cm × 10cm = £0.55, 8cm × 15cm = £0.83

Mepore Film & Pad
Film dressing with absorbent pad
Mepore Film & Pad dressing (Molyncke Health Care Ltd) 4cm × 5cm = £0.24, 5cm × 7cm = £0.25, 9cm × 10cm = £0.63, 9cm × 15cm = £0.92, 9cm × 20cm = £1.37, 9cm × 25cm = £1.51, 9cm × 30cm = £2.03, 9cm × 35cm = £2.52

Mepore Ultra
Film dressing with absorbent pad
Mepore Ultra dressing (Molyncke Health Care Ltd) 10cm × 11cm = £0.81, 11cm × 15cm = £1.19, 7cm × 8cm = £0.41, 9cm × 20cm = £1.52, 9cm × 25cm = £1.68, 9cm × 30cm = £2.77

OpSite Plus
Film dressing with absorbent pad
OpSite Plus dressing (Smith & Nephew Healthcare Ltd) 10cm × 12cm = £1.23, 10cm × 20cm = £2.07, 10cm × 35cm = £3.43, 6.5cm × 5cm = £0.33, 8.5cm × 9.5cm = £0.91

OpSite Post-op
Film dressing with absorbent pad
OpSite Post-op dressing (Smith & Nephew Healthcare Ltd) 10cm × 12cm = £1.21, 10cm × 20cm = £2.03, 10cm × 25cm = £2.56, 10cm × 30cm = £3.03, 10cm × 35cm = £3.37, 8.5cm × 15.5cm = £1.23, 8.5cm × 9.5cm = £0.89

Pharmapore-PU
Film dressing with absorbent pad
Pharmapore-PU dressing (Wallace, Cameron & Company Ltd) 10cm × 25cm = £0.38, 10cm × 30cm = £0.58, 8.5cm × 15.5cm = £0.20

PremierPore VP
Film dressing with absorbent pad
PremierPore VP dressing (Shermond) 10cm × 10cm = £0.16, 10cm × 15cm = £0.24, 10cm × 20cm = £0.36, 10cm × 25cm = £0.38, 10cm × 30cm = £0.57, 10cm × 35cm = £0.70, 5cm × 7cm = £0.13

Tegaderm
Film dressing with absorbent pad
Tegaderm + Pad dressing (3M Health Care Ltd) 5cm × 7cm = £0.26, 9cm × 10cm = £0.65, 9cm × 15cm = £0.96, 9cm × 20cm = £1.41, 9cm × 25cm = £1.58, 9cm × 35cm = £2.62

Tegaderm Absorbent Clear
Film dressing with clear acrylic polymer oval-shaped pad or rectangular-shaped pad
Tegaderm Absorbent Clear Acrylic dressing (3M Health Care Ltd) 11.1cm × 12.7cm oval = £4.14, 14.2cm × 15.8cm oval = £5.83, 14.9cm × 15.2cm rectangular = £8.73, 16.8cm × 19cm sacral = £10.45, 20cm × 20.3cm rectangular = £14.02, 7.6cm × 9.5cm oval = £3.20

Vapour-permeable transparent film dressing with adhesive foam border.

Central Gard
For intravenous and subcutaneous catheter sites
Central Gard dressing (Unomedical Ltd) 16cm × 7cm = £0.98, 16cm × 8.8cm = £1.07

East-V
For intravenous and subcutaneous catheter sites
East-V (Convatec Ltd) dressing 7cm × 7.5cm = £0.38

Vapour-permeable transparent, adhesive film dressing.

Hydrofilm I.V. Control
For intravenous and subcutaneous catheter sites
Hydrofilm (Paul Hartmann Ltd) I.V. Control dressing 7cm × 9cm = £0.31

Vapour-permeable, transparent, adhesive film dressing.

IV3000
For intravenous and subcutaneous catheter sites
IV3000 dressing (Smith & Nephew Healthcare Ltd) 10cm × 12cm = £1.44, 5cm × 6cm = £0.43, 6cm × 7cm = £0.57, 7cm × 9cm = £0.75, 9cm × 12cm = £1.49

Mepore IV
For intravenous and subcutaneous catheter sites
Mepore IV dressing (Molyncke Health Care Ltd) 10cm × 11cm = £1.09, 5cm × 5.5cm = £0.31, 8cm × 9cm = £0.40

Pharmapore-PU IV
For intravenous and subcutaneous catheter sites
Pharmapore-PU IV dressing (Wallace, Cameron & Company Ltd) 6cm × 7cm = £0.08, 7cm × 8.5cm = £0.07, 7cm × 9cm = £0.17

Tegaderm IV
For intravenous and subcutaneous catheter sites
Tegaderm IV Advanced dressing with securing tapes (3M Health Care Ltd) 10cm × 15.5cm = £1.67, 7cm × 8.5cm = £0.59

Soft polymer dressings
Dressings with soft polymer, often a soft silicone polymer, in a non-adherent or gently adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polymer dressing with an absorbent pad can be used. Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes. Soft polymer dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface. For silicone keloid dressings see under Specialised dressings.

Cellulose dressings
Sorbion Sachet Border
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope, with adhesive border
Cutimed Sorbion Sachet Border dressing (BSN medical Ltd) 10cm × 10cm square = £3.03, 15cm × 15cm square = £4.61, 25cm × 15cm rectangular = £7.18

Sorbion Sachet EXTRA
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope
Cutimed Sorbion Sachet Extra dressing (BSN medical Ltd) 10cm × 10cm= £2.31, 20cm × 20cm= £3.83, 20cm × 20cm= £7.19, 30cm × 20cm= £10.26, 5cm × 5cm= £1.49, 7.5cm × 7.5cm= £1.83

Sorbion Sachet Multi Star
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope
Cutimed Sorbion Sachet Multi Star dressing (BSN medical Ltd) 14cm × 14cm= £5.02, 8cm × 8cm= £3.07

Sorbion Sachet S Drainage
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (‘V’ shaped dressing)
Cutimed (BSN medical Ltd) Sorbion Sachet S drainage dressing 10cm × 10cm= £2.71

Suprasorb X
Biosynthetic cellulose fibre dressing
Suprasorb X dressing (Lohmann & Rauscher) 14cm × 20cm rectangular= £8.67, 2cm × 21cm rope= £6.74, 5cm × 5cm square= £2.10, 9cm × 9cm square= £4.38

With absorbent pad
Advazorb Border
Soft silicone wound contact dressing with polyurethane foam film backing and adhesive border
Advazorb Border dressing (Advacnis Medical) 10cm × 10cm= £2.12, 10cm × 20cm= £2.92, 20cm × 20cm= £4.28, 12.5cm × 12.5cm= £2.60, 15cm × 15cm= £3.17, 20cm × 20cm= £5.50, 7.5cm × 7.5cm= £1.20

Advazorb Border Lite
Soft silicone wound contact dressing with polyurethane foam film backing and adhesive border
Advazorb Border Lite dressing (Advacnis Medical) 10cm × 10cm= £1.90, 10cm × 20cm= £2.63, 10cm × 30cm= £3.86, 12.5cm × 12.5cm= £2.34, 15cm × 15cm= £2.86, 20cm × 20cm= £4.35, 7.5cm × 7.5cm= £1.08

Advazorb Siflix
Soft silicone wound contact dressing with polyurethane foam film backing
Advazorb Siflix dressing (Advacnis Medical) 10cm × 10cm= £1.86, 10cm × 20cm= £3.20, 12.5cm × 12.5cm= £2.61, 15cm × 15cm= £5.38, 20cm × 20cm= £5.02, 7.5cm × 7.5cm= £1.00

Advazorb Siflix Lite
Soft silicone wound contact dressing with polyurethane foam film backing
Advazorb Siflix Lite dressing (Advacnis Medical) 10cm × 10cm= £1.68, 10cm × 20cm= £2.88, 12.5cm × 12.5cm= £2.35, 15cm × 15cm= £3.04, 20cm × 20cm= £4.51, 7.5cm × 7.5cm= £0.90

Allevyn Gentle
Soft gel wound contact dressing with polyurethane foam film backing
Allevyn Gentle dressing (Smith & Nephew Healthcare Ltd) Heel dressing 23cm × 23.2cm= £9.90, dressing 10cm × 10cm= £2.25, 12.5cm × 12.5cm= £2.75, 17.5cm × 17.5cm= £5.43, 7.5cm × 7.5cm= £1.53

Allevyn Gentle Border
Silicone gel wound contact dressing, with polyurethane foam film backing
Allevyn Gentle Border dressing (Smith & Nephew Healthcare Ltd) Heel dressing 23cm × 23.2cm= £9.90, dressing 10cm × 10cm= £2.25, 12.5cm × 12.5cm= £2.75, 17.5cm × 17.5cm= £5.43, 7.5cm × 7.5cm= £1.53

Allevyn Gentle Border Lite
Silicone gel wound contact dressing, with polyurethane foam film backing
Allevyn Gentle Border Lite dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm= £2.22, 15cm × 15cm= £3.91, 5.5cm × 12cm= £1.90, 5cm × 5cm= £0.92, 8cm × 15cm= £3.52

Allevyn Life
Silicone wound contact dressing, with central mesh screen, polyurethane foam film backing and adhesive border
Allevyn Life dressing (Smith & Nephew Healthcare Ltd) 10.3cm × 10.3cm= £1.74, 12.9cm × 12.9cm= £2.55, 15.4cm × 15.4cm= £3.12, 21cm × 21cm= £6.14

Cutimed Siltec
Soft silicone wound contact dressing, with polyurethane foam film backing
Cutimed Siltec (BSN medical Ltd) Sacrum dressing 17.5cm × 17.5cm= £4.58, 23cm × 23cm= £6.25, dressing 10cm × 10cm= £2.28, 10cm × 20cm= £3.76, 15cm × 15cm= £4.25, 20cm × 20cm= £6.45, 5cm × 5cm= £1.22

Cutimed Siltec B
Soft silicone wound contact dressing, with polyurethane foam film backing, with adhesive border, for lightly to moderately exuding wounds
Cutimed Siltec B dressing (BSN medical Ltd) 12.5cm × 12.5cm= £2.32, 15cm × 15cm= £3.09, 17.5cm × 17.5cm= £4.99, 22.5cm × 22.5cm= £6.09, 7.5cm × 7.5cm= £1.36

Cutimed Siltec L
Soft silicone wound contact dressing, with polyurethane foam film backing, for lightly to moderately exuding wounds
Cutimed Siltec L dressing (BSN medical Ltd) 10cm × 10cm= £1.58, 15cm × 15cm= £3.48, 5cm × 5cm= £1.08

Eclipse Adherent
Soft silicone wound contact layer with absorbent pad and film backing
Eclipse Adherent dressing (Advacnis Medical) 10cm × 10cm= £3.01, 10cm × 20cm= £3.78, 15cm × 15cm= £5.03, 20cm × 30cm= £10.06, 17cm × 19cm sacral= £3.79, 22cm × 23cm sacral= £6.28

Flivasarb
Absorbent polymer dressing with non-adherent wound contact layer
Flivasarb Adhesive
Absorbent polymer dressing with non-adherent wound contact layer and adhesive border
Flivasarb Adhesive dressing (Lohmann & Rauscher) 12cm × 12cm square= £3.43, 15cm × 15cm square= £4.70

Mepilex
Absorbent soft silicone dressing with polyurethane foam film backing
Mepilex (Molnlycke Health Care Ltd) Heel dressing 13cm × 20cm= £5.50, 15cm × 22cm= £6.38, XT dressing 10cm × 11cm= £2.68, 11cm × 20cm= £4.43, 15cm × 16cm= £4.86, 20cm × 21cm= £7.34, dressing 5cm × 5cm= £1.22

Mepilex Border
Absorbent soft silicone dressing with polyurethane foam film backing and adhesive border
Mepilex Border (Molnlycke Health Care Ltd) Heel dressing 18.5cm × 24cm= £6.63, Sacrum dressing 18cm × 18cm= £4.85, 23cm × 23cm= £7.91, dressing 10cm × 12.5cm= £2.72, 10cm × 20cm= £3.72, 10cm × 30cm= £5.58, 15cm × 17.5cm= £4.18, 17cm × 20cm= £6.07

Mepilex Border Lite
Thin absorbent soft silicone dressing with polyurethane foam film backing and adhesive border
Mepilex Border Lite dressing (Molnlycke Health Care Ltd) 15cm × 15cm= £3.94, 4cm × 5cm= £0.92, 5cm × 12.5cm= £2.01, 7.5cm × 7.5cm= £1.35

Mepilex Lite
Thin absorbent soft silicone dressing with polyurethane foam film backing
Mepilex Lite dressing (Molnlycke Health Care Ltd) 10cm × 10cm= £2.17, 15cm × 15cm= £4.22, 20cm × 50cm= £6.66, 6cm × 8.5cm= £1.82

Mepilex Transfer
Soft silicone exudate transfer dressing
Mepilex Transfer dressing (Molnlycke Health Care Ltd) 10cm × 12cm= £3.54, 15cm × 20cm= £10.72, 20cm × 50cm= £21.39, 7.5cm × 8.5cm= £2.25

Sorbion Sana
Non-adherent polyethylene wound contact dressing with absorbent core
Cutimed Sorbion Sana Gentle dressing (BSN medical Ltd) 12cm × 12cm= £2.56, 12cm × 22cm= £4.61, 22cm × 22cm= £8.21, 8.5cm × 8.5cm= £2.04

Urgotul Duo
Non-adherent soft polymer wound contact dressing with absorbent pad
Urgotul Duo dressing (Urgo Ltd) 10cm × 12cm= £3.93, 15cm × 20cm= £9.13, 5cm × 10cm= £2.54
Without absorbent pad

Adaptic Touch
Non-adherent soft silicone wound contact dressing

Adaptic Touch dressing (Sysmec Wound Management Ltd) 12cm × 15cm = £4.65, 20cm × 32cm = £12.50, 5cm × 7.6cm = £1.13, 7.6cm × 11cm = £2.25

Askin SilNet
Soft silicone-coated wound contact dressing

Askin SilNet dressing (Braun Medical Ltd) 10cm × 18cm = £5.12, 20cm × 30cm = £12.53, 5cm × 7.5cm = £1.16, 7.5cm × 10cm = £2.35

Mepitel
Soft silicone, semi-transparent wound contact dressing

Mepitel dressing (Molnlycke Health Care Ltd) 12cm × 15cm = £5.65, 5cm × 7cm = £1.41, 8cm × 10cm = £2.82

Mepitel One
Soft silicone, thin, transparent wound contact dressing

Mepitel One dressing (Molnlycke Health Care Ltd) 13cm × 15cm = £4.98, 24cm × 27.5cm = £14.25, 6cm × 7cm = £1.22, 9cm × 10cm = £2.41

Physioteulle
Non-adherent soft polymer wound contact dressing

Physioteulle dressing (Coloplast Ltd) 10cm × 10cm = £2.32, 15cm × 20cm = £7.07

Silflex
Soft silicone-coated polyester wound contact dressing

Silflex dressing (Advancis Medical) 12cm × 15cm = £4.61, 20cm × 30cm = £11.88, 35cm × 60cm = £19.83, 5cm × 7cm = £1.12, 8cm × 10cm = £2.29

Silon-TSR
Soft silicone polymer wound contact dressing

Silon-TSR dressing (Bio Med Sciences) 13cm × 13cm = £3.52, 13cm × 25cm = £7.79, 28cm × 30cm = £7.37

Sorbion Contact
Non-adherent soft polymer wound contact dressing

Cutimed Sorbion Contact dressing (BSN medical Ltd) 10cm × 10cm = £2.04, 10cm × 20cm = £4.10, 20cm × 20cm = £7.18, 20cm × 30cm = £10.26, 7.5cm × 7.5cm = £1.53

Tegaderm Contact
Non-adherent soft polymer wound contact dressing

Tegaderm Contact dressing (3M Health Care Ltd) 20cm × 25cm = £10.94, 7.5cm × 10cm = £2.29

Urgotul
Non-adherent soft polymer wound contact dressing

Urgotul dressing (Urgo Ltd) 10cm × 10cm = £3.13, 10cm × 40cm = £10.53, 18cm × 15cm = £6.66, 15cm × 20cm = £8.86, 20cm × 30cm = £14.25, 5cm × 5cm = £1.57

Hydrocolloid dressings
Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehydration in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds: they are also suitable for promoting granulation. Hydrocolloid-fibre dressings made from modified carmellose fibres resemble alginate dressings; hydrocolloid-fibre dressings are more absorptive and suitable for moderately to heavily exuding wounds.

Hydrocolloid-fibre dressings

Aquacel
Soft non-woven pad containing hydrocolloid-fibres

Aquacel (Convatec Ltd) Ribbons dressing 1cm × 45cm = £1.89, 2cm × 45cm = £2.52, dressing 10cm × 10cm square = £2.49, 15cm × 15cm square = £4.68, 4cm × 10cm rectangular = £1.34, 4cm × 20cm rectangular = £1.97, 4cm × 30cm rectangular = £2.97, 5cm × 5cm square = £1.05

Aquacel Foam
Soft non-woven pad containing hydrocolloid-fibres with foam layer; with or without adhesive border

Aquacel Foam dressing (adhesive) (Convatec Ltd) 10cm × 10cm = £2.20, 12.5cm × 12.5cm = £2.72, 17.5cm × 17.5cm = £5.45, 19.8cm × 14cm heel = £5.57, 20cm × 16.9cm sacral = £5.00, 21cm × 21cm = £7.97, 25cm × 30cm = £10.32, 3cm × 8cm = £1.44, (non-adhesive) 10cm × 10cm = £2.60, 15cm × 15cm = £4.37, 15cm × 20cm = £5.97, 20cm × 20cm = £7.12

UrgoClean Pad
Pad, hydrocolloid fibres coated with soft-adherent lipocolloid wound contact layer

UrgoClean Pad dressing (Urgo Ltd) 10cm × 10cm square = £2.16, 20cm × 15cm rectangular = £4.06, 6cm × 6cm square = £0.97

UrgoClean Rope
Rope, non-woven rope containing hydrocolloid fibres

UrgoClean rope dressing (Urgo Ltd) 2.5cm × 40cm = £2.43, 5cm × 40cm = £3.21

Polyurethane matrix dressing

Cutinova Hydro
Polyurethane matrix with absorbent particles and waterproof polyurethane film

Cutinova Hydro dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm square = £2.61, 15cm × 20cm rectangular = £5.53, 5cm × 6cm rectangular = £1.30

With adhesive border

Biatain Super
Semi-permeable hydrocolloid dressing; without adhesive border

Biatain Super dressing (adhesive) (Coloplast Ltd) 10cm × 10cm square = £2.21, 12.5cm × 12.5cm square = £3.66, 12cm × 20cm rectangular = £3.67, 15cm × 15cm square = £4.41, 20cm × 20cm square = £6.87

Granuflex Border
Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film

Granuflex Border Dressing (Convatec Ltd) 10cm × 10cm square = £3.42, 10cm × 13cm triangular = £4.04, 15cm × 15cm square = £6.53, 15cm × 18cm triangular = £6.29, 6cm × 6cm square = £1.81

Hydrocoll Border
Hydrocolloid dressing with adhesive border and absorbent wound contact pad

Hydrocoll Border (bevelled edge) dressing (Paul Hartmann Ltd) 10cm × 10cm square = £2.46, 12cm × 18cm sacral = £3.69, 15cm × 15cm square = £4.63, 5cm × 5cm square = £1.03, 7.5cm × 7.5cm square = £1.69, 8cm × 12cm concave = £2.17

Tegaderm Hydrocolloid
Hydrocolloid dressing with adhesive border; normal or thin

Tegaderm Hydrocolloid (3M Health Care Ltd) Thin dressing 10cm × 12cm oval = £1.56, 13cm × 15cm oval = £2.92, dressing 10cm × 12cm oval = £2.34, 13cm × 15cm oval = £4.37, 17.1cm × 16.1cm sacral = £4.89

Ulltec Pro
Semi-permeable hydrocolloid dressing with adhesive border

Ulltec Pro dressing (adhesive) (Convalon (UK) Commercial Ltd) 15cm × 18cm sacral = £3.30, 19.5cm × 23cm sacral = £4.98, 21cm × 21cm square = £4.67

Without adhesive border

ActiveVeal Hydrocolloid
Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, with or without polyurethane foam later

ActiveVeal Hydrocolloid (Advanced Medical Solutions Ltd) dressing 10cm × 10cm square = £1.58, 15cm × 15cm square = £3.43, 15cm × 18cm sacral = £3.98, 5cm × 7.5cm rectangular = £0.78, foam backed dressing 10cm × 10cm square = £1.55, 15cm × 15cm square = £2.91, 15cm × 18cm sacral = £3.36, 5cm × 7.5cm rectangular = £0.97

Askin Biofilm Transparent
Semi-permeable, polyurethane film dressing with hydrocolloid adhesive

Askin Biofilm Transparent dressing (Braun Medical Ltd) 10cm × 10cm square = £1.10, 20cm × 20cm square = £3.25
Foam dressings

**Biatain Super**
Semi-permeable, hydrocolloid film dressing without adhesive border

**Biatain Super dressing (non-adhesive)** (Coloplast Ltd) 10cm x 10cm square = £2.21, 12.5cm x 12.5cm square = £3.66, 15cm x 20cm rectangular = £3.67, 15cm x 15cm square = £4.41, 20cm x 20cm square = £6.87

**Comfeel Plus Contour**
Hydrocolloid dressings containing carmellose sodium and calcium alginate

**Comfeel Plus Contour dressing** (Coloplast Ltd) 6cm x 8cm = £2.27, 9cm x 11cm = £3.93

**Comfeel Plus Pressure Relieving**
Hydrocolloid dressings containing carmellose sodium and calcium alginate

**Comfeel Plus Pressure Relief dressing** (Coloplast Ltd) 10cm diameter circular = £4.74, 15cm diameter circular = £7.14, 7cm diameter circular = £3.94

**Comfeel Plus Transparent**
Hydrocolloid dressings containing carmellose sodium and calcium alginate

**Comfeel Plus Transparent dressing** (Coloplast Ltd) 10cm x 10cm square = £1.31, 15cm x 15cm square = £3.41, 15cm x 20cm rectangular = £3.46, 20cm x 20cm square = £3.48, 5cm x 15cm rectangular = £1.62, 5cm x 25cm rectangular = £2.63, 5cm x 7cm rectangular = £0.68, 9cm x 14cm rectangular = £2.49, 9cm x 25cm rectangular = £3.53

**Comfeel Plus Ulcer**
Hydrocolloid dressings containing carmellose sodium and calcium alginate

**Comfeel Plus Dressing** (Coloplast Ltd) 10cm x 10cm square = £2.50, 20cm x 25cm square = £7.72, 4cm x 6cm rectangular = £0.98

**Duoderm Extra Thin**
Semi-permeable hydrocolloid dressing

**Duoderm Extra Thin dressing** (Convatec Ltd) 10cm x 10cm square = £1.36, 15cm x 15cm square = £2.93, 5cm x 10cm rectangular = £0.78, 7.5cm x 7.5cm square = £0.82, 9cm x 15cm rectangular = £1.81, 5cm x 25cm rectangular = £2.98, 9cm x 35cm rectangular = £4.05

**Duoderm Signal**
Semi-permeable hydrocolloid dressing with ‘Time to change’ indicator

**Duoderm Signal dressing** (Convatec Ltd) 10cm x 10cm square = £2.17, 11cm x 19cm oval = £3.33, 14cm x 14cm square = £3.81, 18.5cm x 19.5cm heel = £5.33, 20cm x 20cm square = £7.58, 22.5cm x 20cm sacral = £6.23

**Flexigran**
Semi-permeable hydrocolloid dressing without adhesive border; normal or thin

**Flexigran (A1 Pharmaceuticals)** Thin dressing 10cm x 10cm square = £1.08, dressing 10cm x 10cm square = £2.19

**Granuflex**
Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film

**Granuflex (modified) dressing** (Convatec Ltd) 10cm x 10cm square = £2.87, 15cm x 15cm square = £5.45, 15cm x 20cm rectangular = £5.90, 20cm x 20cm square = £8.20

**Hydrocol Basic**
Hydrocolloid dressing with absorbent wound contact pad

**Hydrocoll (Paul Hartmann Ltd)** Basic dressing 10cm x 10cm square = £2.50

**Hydrocoll Thin Film**
Thin hydrocolloid dressing with absorbent wound contact pad

**Hydrocoll Thin Film dressing** (Paul Hartmann Ltd) 10cm x 10cm square = £1.18, 15cm x 15cm square = £2.65, 7.5cm x 7.5cm square = £0.71

**Nu-Derm**
Semi-permeable hydrocolloid dressing (normal and thin)

**Nu-Derm dressing** (Syagenics Wound Management Ltd) 10cm x 10cm square = £1.57, 15cm x 15cm square = £3.21, 15cm x 18cm square = £4.49, 20cm x 20cm square = £6.41, 5cm x 5cm square = £0.86, 8cm x 12cm heel/elbow = £3.21, thin 10cm x 10cm square = £1.07

**Tegaderm Hydrocolloid**
Hydrocolloid dressing without adhesive border; normal and thin

**Tegaderm Hydrocolloid** (3M Health Care Ltd) Thin dressing 10cm x 10cm square = £1.57, dressing 10cm x 10cm square = £2.39

**Ultec Pro**
Semi-permeable hydrocolloid dressing; without adhesive border

**Ultec Pro dressing** (Covidien (UK) Commercial Ltd) 10cm x 10cm square = £2.28, 15cm x 15cm square = £4.44, 20cm x 20cm square = £6.69

**Foam dressings**
Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), with or without plastic film-backing, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisture-sensitive film backing with variable permeability dependent on the level of exudate. Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handling capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound. Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin. A foam dressing containing ibuprofen is available and may be useful for treating painful exuding wounds.

**Cavi-Care**
Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity

**Polyurethane Foam Dressing**

**Cutimed Cavity**

**Cutimed Cavity dressing** (BSN medical Ltd) 10cm x 10cm = £3.20, 15cm x 15cm = £4.81, 5cm x 6cm = £1.93

**Kendall**

**Kendall Foam dressing** (H & R Healthcare Ltd) 10cm x 10cm square = £1.06, 10cm x 20cm rectangular = £2.05, 12.5cm x 12.5cm square = £1.80, 15cm x 15cm square = £2.60, 20cm x 20cm square = £3.01, 5cm x 5cm square = £0.71, 7.5cm x 7.5cm square = £1.21, 8.5cm x 7.5cm rectangular (fenestrated) = £0.91

**Polyurethane Foam Film Dressing with Adhesive Border**

**ActivHeal Foam Adhesive**

**ActivHeal Foam Adhesive dressing** (Advanced Medical Solutions Ltd) 10cm x 10cm square = £1.63, 12.5cm x 12.5cm square = £1.68, 15cm x 15cm square = £2.15, 20cm x 20cm square = £4.50, 7.5cm x 7.5cm square = £1.18

**Allevyn Adhesive**

**Allevyn Adhesive dressing** (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £2.24, 12.5cm x 12.5cm square = £2.74, 12.5cm x 22.5cm rectangular = £4.27, 17.5cm x 17.5cm square = £5.41, 17cm x 17cm anatomically shaped sacral = £4.07, 22.5cm x 22.5cm square = £7.88, 22cm x 22cm anatomically shaped sacral = £5.86, 7.5cm x 7.5cm square = £1.53

**Biatain Adhesive**

**Biatain Adhesive dressing** (Coloplast Ltd) 10cm x 10cm square = £1.80, 12.5cm x 12.5cm square = £2.62, 17cm diameter contour = £5.09, 18cm x 18cm square = £5.29, 18cm x 28cm rectangular = £7.84, 19cm x 20cm heel = £5.29, 23cm x 23cm sacral = £4.53

**Biatain Silicone**

**Biatain Silicone dressing** (Coloplast Ltd) 10cm x 10cm = £2.18, 12.5cm x 12.5cm = £2.67, 15cm x 15cm = £3.96, 17.5cm x 17.5cm = £5.26, 7.5cm x 7.5cm = £1.48
### 1600 Advanced wound dressings

#### Kendall Island
**Kendall Foam Island dressing (H & R Healthcare Ltd)**
- 10cm x 10cm square = £1.54, 15cm x 15cm square = £2.90, 20cm x 20cm square = £5.46

**PermaFoam**
**PermaFoam dressing (adhesive)** (Paul Hartmann Ltd)
- 16.5cm x 18cm concave = £4.12, 18cm x 18cm sacral = £3.39, 22cm x 22cm sacral = £3.89

**PermaFoam Comfort**
**PermaFoam Comfort dressing (Paul Hartmann Ltd)**
- 10cm x 20cm rectangular = £3.43, 11cm x 11cm square = £2.17, 15cm x 15cm square = £3.55, 20cm x 20cm square = £5.15, 8cm x 8cm square = £1.14

**PolyMem**
**PolyMem dressing (Aspen Medical Europe Ltd) (adhesive)**
- 5cm x 5cm square = £0.52, 16.5cm x 20.5cm oval = £6.79, 18.4cm x 20cm sacral = £4.56, 5cm x 7.6cm oval = £1.16, 8.8cm x 12.7cm oval = £2.06

**Tegaderm Foam Adhesive**
**Tegaderm Foam dressing (adhesive)** (3M Health Care Ltd)
- 10cm x 11cm oval = £2.39, 13.9cm x 13.9cm circular (heel) = £4.25, 14.3cm x 14.3cm circular = £3.57, 14.3cm x 15.6cm oval = £4.28, 19cm x 22.2cm oval = £7.01, 6.9cm x 6.9cm soft cloth border = £1.72, 6.9cm x 7.6cm oval = £1.47

**Tielle**
**Tielle (Systagenix Wound Management Ltd) Lite dressing (11cm x 11cm square) = £2.30, dressing (15cm x 15cm square) = £3.92, 15cm x 20cm rectangular = £4.90, 18cm x 18cm square = £4.99, 7cm x 9cm rectangular = £1.29

**Tielle Lite**
**Tielle Lite dressing (Systagenix Wound Management Ltd)**
- 11cm x 11cm square = £2.30, dressing 15cm x 15cm square = £3.92, 15cm x 20cm rectangular = £4.90, 18cm x 18cm square = £4.99, 7cm x 9cm rectangular = £1.29

**Biatain -iBu Soft-Hold**
**Biatain-iBu Soft-Hold dressing (Coloplast Ltd)**
- 10cm x 12cm rectangular = £3.40, 10cm x 22.5cm rectangular = £5.34, 15cm x 15cm square = £5.34

**Biatain Non-Adhesive**
**Biatain Non-Adhesive dressing (Coloplast Ltd)**
- 10cm x 10cm square = £2.44, 10cm x 20cm rectangular = £4.03, 15cm x 15cm square = £4.50, 20cm x 20cm square = £6.68, 5cm x 7cm rectangular = £1.34

**Biatain Soft-Hold**
**Biatain Soft-Hold dressing (Coloplast Ltd)**
- 10cm x 10cm square = £2.65, 10cm x 20cm rectangular = £4.03, 15cm x 15cm square = £4.41, 5cm x 7cm rectangular = £1.34

**Kendall Plus**
**Kendall Foam Plus dressing (H & R Healthcare Ltd)**
- 10cm x 10cm square = £1.47, 10cm x 20cm rectangular = £2.69, 15cm x 15cm square = £3.38, 20cm x 20cm square = £4.04, 5cm x 5cm square = £0.82, 7.5cm x 7.5cm square = £1.42, 8.5cm x 7.5cm rectangular (fenestrated) = £1.24

**Kerraheel**
**Kerraheel (Crawford Healthcare Ltd) dressing 12cm x 20cm heel = £4.72

**Lyofoam Max**
**Lyofoam Max dressing (Mohlykke Health Care Ltd)**
- 10cm x 10cm square = £1.15, 10cm x 20cm rectangular = £2.03, 15cm x 15cm square = £2.16, 15cm x 20cm rectangular = £2.73, 20cm x 20cm square = £4.01, 7.5cm x 8.5cm rectangular = £1.10

**PermaFoam**
**PermaFoam (Paul Hartmann Ltd)**
- Cavity dressing 10cm x 10cm = £2.06, dressing (non-adhesive) 10cm x 10cm square = £2.17, 10cm x 20cm rectangular = £3.72, 15cm x 15cm square = £4.12, 20cm x 20cm square = £6.28, 6cm diameter circular = £1.12, 8cm x 8cm square (fenestrated) = £1.28

**PolyMem**
**PolyMem dressing (Aspen Medical Europe Ltd)**
- 7cm x 7cm square = £1.73, 9cm x 9cm square = £2.19, finger/toe size 1 = £2.52, 2 = £2.52, 3 = £2.52

**PolyMem**
**PolyMem dressing (Aspen Medical Europe Ltd)**
- 10cm x 10cm square = £0.98, 10cm x 20cm rectangular = £3.04, 12.5cm x 12.5cm square = £3.37, 12.5cm x 12.5cm square = £4.14, 15cm x 15cm square = £4.90, 20cm x 20cm square = £5.75, 7.5cm x 7.5cm square = £0.79

**Advazorb**
**Advazorb (Advancis Medical) Heel dressing 17cm x 21cm = £4.78, dressing 10cm x 10cm square = £1.09, 10cm x 20cm rectangular = £3.12, 12.5cm x 12.5cm square = £3.12, 12.5cm x 12.5cm square = £3.37, 15cm x 15cm square = £4.14, 15cm x 15cm square = £4.90, 20cm x 20cm square = £5.75, 7.5cm x 7.5cm square = £0.71

**Allevyn Non-Adhesive**
**Allevyn dressing (non-adhesive)** (Smith & Nephew Healthcare Ltd)
- 10.5cm x 13.5cm heel (cup shaped) = £5.24, 10cm x 10cm square = £2.56, 10cm x 20cm rectangular = £4.12, 20cm x 20cm square = £6.88, 5cm x 5cm square = £1.29

**Askina Foam**
**Askina (B.Braun Medical Ltd) Foam Cavity dressing 2.4cm x 40cm = £2.51, Foam dressing 10cm x 10cm square = £2.25, 10cm x 20cm rectangular = £3.55, 20cm x 20cm square = £5.93, Heel dressing 12cm x 20cm = £4.80

**Biatain -iBu Non-Adhesive**
**Biatain-iBu Non-Adhesive dressing (Coloplast Ltd)**
- 10cm x 12cm rectangular = £3.40, 10cm x 22.5cm rectangular = £5.34, 15cm x 15cm square = £5.34, 20cm x 20cm square = £9.09, 5cm x 7cm rectangular = £1.76

**Transorvent**
**Transorvent dressing (adhesive)** (B.Braun Medical Ltd)
- 10cm x 10cm square = £2.02, 15cm x 15cm square = £3.71, 20cm x 20cm square = £5.92, 5cm x 7cm rectangular = £1.07

**UrgoAbsorb dressing (Urgo)**
- 10cm x 10cm = £2.38, 15cm x 15cm = £4.20, 6cm x 6cm = £1.21, 12cm x 19cm heel = £4.80

**Alginate dressings**
Non-woven or fibrous, non-occlusive, alginate dressings, made from calcium alginate, or calcium sodium alginate, derived from brown seaweed, form a soft gel in contact with wound exudate. Alginate dressings are highly absorbent and suitable for use on exuding wounds, and for the promotion of autolytic debridement of debris in very moist wounds. Alginate dressings also act as a haemostatic, but caution is needed because blood clots can cause the dressing to adhere to the wound surface. Alginate dressings should not be used if bleeding is heavy and extreme caution is needed if used for
tumours with friable tissue. Alginate sheets are suitable for use as a wound contact dressing for moderately to heavily exuding wounds and can be layered into deep wounds; alginate rope can be used in sinuses and cavity wounds to improve absorption of exudate and prevent maceration. If the dressing does not have an adhesive border or integral adhesive plastic film backing, a secondary dressing will be required.

**ActivHeal Alginite**
Calcium sodium alginate dressing

**ActivHeal Alginite dressing (Advanced Medical Solutions Ltd)** 10cm x 10cm= £1.15, 10cm x 20cm= £2.83, 5cm x 5cm= £0.59

**ActivHeal Aquafiber**
Non-woven, calcium sodium alginate dressing

**ActivHeal Aquafiber (Advanced Medical Solutions Ltd)** Rope dressing 2cm x 42cm= £1.81, dressing 10cm x 10cm= £1.48, 15cm x 15cm= £2.79, 5cm x 5cm= £0.62

**Alginate M**
Calcium alginate fibre, non-woven dressing

**Alginate M (Smith & Nephew Healthcare Ltd)** Rope dressing 2cm x 20cm= £2.65, dressing 10cm x 10cm= £1.96, 15cm x 20cm= £5.27, 5cm x 5cm= £0.95

**Algosteril**
Calcium alginate dressing

**Algosteril (Smith & Nephew Healthcare Ltd)** Rope dressing 2g= £3.89, dressing 10cm x 10cm= £2.15, 10cm x 20cm= £3.64, 5cm x 5cm= £0.94

**Algipan**
Alginate and carboxymethylcellulose dressing, highly absorbent, gelling dressing

**Algipan (Coloplast Ltd)** 10cm x 10cm= £2.37, 15cm x 15cm= £4.50, 4cm x 4cm= £2.79, 5cm x 5cm= £1.00

**Cutimed Alginate**
Calcium alginate sodium dressing

**Cutimed Alginate dressing (BSN medical Ltd)** 10cm x 10cm= £1.61, 10cm x 20cm= £3.02, 5cm x 5cm= £0.77

**Kaltostat**
Calcium alginate fibre, non-woven dressing

**Kaltostat dressing (Convatec Ltd)** 10cm x 20cm= £4.19, 15cm x 25cm= £7.20, 2g= £3.93, 5cm x 5cm= £0.98, 7.5cm x 12cm= £2.13

**Kendall**
Calcium alginate dressing

**Kendall Calcium Alginate (H & R Healthcare Ltd)** Rope dressing 30cm= £2.89, 61cm= £5.07, 91cm= £5.46, dressing 10cm x 10cm= £1.52, 10cm x 14cm= £2.45, 10cm x 20cm= £2.96, 15cm x 25cm= £5.25, 30cm x 61cm= £27.56, 5cm x 5cm= £0.72

**Kendall Plus**
Calcium alginate dressing

**Kendall (H & R Healthcare Ltd)** Foam Plus dressing 10cm x 10cm square= £1.47

**Melgisorb**
Calcium sodium alginate fibre, highly absorbent, gelling dressing, non-woven

**Melgisorb (Molynex Health Care Ltd)** Cavity dressing 2.2cm x 32cm= £3.55, dressing 10cm x 10cm= £1.88, 10cm x 20cm= £3.52, 5cm x 5cm= £0.90

**Sorbalgon**
Calcium alginate dressing

**Sorbalgon (Paul Hartmann Ltd)** T dressing 2s= £3.56, dressing 10cm x 10cm= £1.74, 5cm x 5cm= £0.83

**Sorban Flat**
Calcium alginate fibre, highly absorbent, flat non-woven pads

**Sorban Flat dressing (Aspen Medical Europe Ltd)** 10cm x 10cm= £1.72, 10cm x 20cm= £3.22, 5cm x 5cm= £0.82

**Sorban Plus**
Alginate dressing bonded to a secondary absorbent viscose pad

**Sorban Plus dressing (Aspen Medical Europe Ltd)** 10cm x 15cm= £3.12, 10cm x 20cm= £3.98, 15cm x 20cm= £5.53, 7.5cm x 10cm= £1.77

**Sorban Ribbon**
Alginate dressing bonded to a secondary absorbent viscose pad

**Sorban (Aspen Medical Europe Ltd)** Ribbon dressing 40cm= £2.06

**Sorban Surgical Packing**
Alginate dressing bonded to a secondary absorbent viscose pad

**Sorban (Aspen Medical Europe Ltd)** Packing dressing 2g= £3.50

**Suprasorb A**
Calcium alginate dressing

**Suprasorb A (Lohmann & Rauscher) alginate dressing 10cm x 10cm= £1.26, 5cm x 5cm= £0.64, cavity dressing 2g= £2.34

**Tegaderm Alginate**
Calcium alginate dressing

**Tegaderm Alginate dressing (3M Health Care Ltd)** 10cm x 10cm= £1.73, 2cm x 3.4cm= £2.89, 5cm x 5cm= £0.82

**Urgosorb**
Alginate and carboxymethylcellulose dressing without adhesive border

**Urgosorb (Urgo Ltd)** Pad dressing 10cm x 10cm= £2.17, 10cm x 20cm= £3.97, 5cm x 5cm= £0.90, Rope dressing 30cm= £2.84

**Capillary-acting dressings**

**Vacutex**
Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer

**Vacutex dressing (Haddenham Healthcare Ltd)** 10cm x 10cm= £1.70, 10cm x 15cm= £2.29, 10cm x 20cm= £2.75, 5cm x 5cm= £0.96

**Odour absorbent dressings**
Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes. Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

**Aquasorb**
Activated charcoal and non-woven viscose rayon dressing

**Aquasorb (Aquasorb Ltd)** 10cm x 10cm= £2.97, 10cm x 20cm= £5.73

**CarboFLEX**
Dressing in 5 layers: wound-facing absorbent layer containing alginate and hydrocolloid; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer

**CarboFLEX dressing (Convatec Ltd)** 10cm x 10cm= £3.30, 15cm x 20cm= £7.50, 8cm x 15cm oval= £3.96

**Carbopad VC**
Activated charcoal non-absorbent dressing

**Carbopad VC dressing (Synergy Health (UK) Ltd)** 10cm x 10cm= £1.62, 10cm x 20cm= £2.19

**Clinisorb Odour Control Dressings**
Activated charcoal cloth enclosed in viscose rayon with outer polyamide coating

**Clinisorb dressing (CliniMed Ltd)** 10cm x 10cm= £1.94, 10cm x 20cm= £2.58, 15cm x 25cm= £4.15

**Antimicrobial dressings**

Spreading infection at the wound site requires treatment with systemic antibacterials. For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound surface but will not eliminate a spreading infection. Some dressings are designed to release
the antimicrobial into the wound, others act upon the bacteria after absorption from the wound. The amount of exudate present and the level of infection should be taken into account when selecting an antimicrobial dressing. Medical grade honey has antimicrobial and anti-inflammatory properties. Dressings impregnated with iodine can be used to treat clinically infected wounds. Dressings containing silver should be used only when clinical signs or symptoms of infection are present. Dressings containing other antimicrobials such as polihexanide (polyhexamethylene biguanide) or dialky Lacarbatamoyl chloride are available for use on infected wounds. Although hypersensitivity is unlikely with chlorhexidine impregnated tulle dressing, the antibacterial efficacy of these dressings has not been established.

**Honey dressings**

Medical grade honey has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound malodour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey. Dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey.

For *Activon Tulle*, where no size is stated by the prescriber the 5 cm size is to be supplied. *Medihoney*® Antimicrobial Wound Gel is not recommended for use in deep wounds or body cavities where removal of waxes may be difficult.

**Honey-based topical application**

*Activon Honey*
Medical grade manuka honey
*Activon* (Advancis Medical) Medical Grade Manuka Honey dressing= £2.77

*L-Mesitran SOFT ointment dressing*
Honey (medical grade) 40%
*L-Mesitran* (Aspen Medical Europe Ltd) SOFT ointment dressing= £3.62

*MANUKApli Honey*
Medical grade manuka honey
*MANNUKApli* (Manuka Medical Ltd) dressing= £5.90

*Medihoney Antimicrobial Medical Honey*
Medical grade, Leptospermum sp.
*Medihoney* (Derma Sciences Europe, Ltd) Antimicrobial Medical Honey dressing= £9.97

*Medihoney Antimicrobial Wound Gel*
Medical grade, Leptospermum sp. 80% in natural waxes and oils
*Medihoney* (Derma Sciences Europe, Ltd) Antimicrobial Wound Gel dressing= £4.05

*Melladerm Plus Honey*
Medical grade; Bulgarian (mountain flower) 45% in basis containing polyethylene glycol
*Melladerm* (SanoMed Manufacturing BV) Plus dressing= £8.50

*Sheet dressing* (Advancis Medical) 10cm x 10cm= £1.23, 10cm x 20cm= £2.38, 5cm x 5cm= £0.71

*Actilite Gauze dressing* (Advancis Medical) 10cm x 10cm= £2.25

**Algivon dressing**
Activon dressing (Advancis Medical) 10cm x 10cm= £4.25, 5cm x 5cm= £2.48

**Algivon Plus**
Reinforced calcium alginate dressing impregnated with medical grade manuka honey
Algivon Plus (Advancis Medical) Ribbon dressing 2.5cm x 20cm= £4.20, dressing 10cm x 10cm= £4.20, 5cm x 5cm= £2.45

**L-Mesitran Border**
Hydrogel, semi-permeable dressing impregnated with medical grade honey, with adhesive border
L-Mesitran (Aspen Medical Europe Ltd) Border sheet 10cm x 10cm square= £2.76

**L-Mesitran Hydro**
Hydrogel, semi-permeable dressing impregnated with medical grade honey, without adhesive border
L-Mesitran Hydro sheet (Aspen Medical Europe Ltd) 10cm x 10cm square= £2.65, 15cm x 20cm rectangular= £5.48

**L-Mesitran Net**
Hydrogel, non-adherent wound contact layer, without adhesive border
L-Mesitran Net sheet (Aspen Medical Europe Ltd) Net sheet 10cm x 10cm square= £2.55

**Medihoney Antimicrobial Honey Apinate**
Non-adherent calcium alginate dressing, impregnated with medical grade honey
Medihoney Antimicrobial Honey Apinate (Derma Sciences Europe, Ltd) dressing 10cm x 10cm square= £3.42, 5cm x 5cm square= £2.01, rope dressing 1.9cm x 30cm= £4.23

**Medihoney Antibacterial Honey Tulle**
Woven fabric impregnated with medical grade manuka honey
Medihoney (Derma Sciences Europe, Ltd) Tulle dressing 10cm x10cm= £3.00

**Medihoney Gel sheet**
Sodium alginate dressing impregnated with medical grade honey
Medihoney Gel Sheet dressing (Derma Sciences Europe, Ltd) 10cm x 10cm= £4.23, 5cm x 5cm= £1.76

**MelMax**
Acetate wound contact layer impregnated with buckwheat honey 75% in ointment basis

**Melladerm Plus Tulle**
Knitted viscose impregnated with medical grade honey (Bulgarian, mountain flower) 45% in a basis containing polyethylene glycol
Melladerm (SanoMed Manufacturing BV) Plus Tulle dressing 10cm x 10cm= £2.10

**Iodine dressings**
Cadexomer—iodine, like povidone–iodine, releases free iodine when exposed to wound exudate. The free iodine acts as an antiseptic on the wound surface, the cadexomer absorbs wound exudate and encourages de-sloughing. Two-component hydrogel dressings containing glucose oxidase and iodide ions generate a low level of free iodine in the presence of moisture and oxygen. Povidone–iodine fabric dressing is a knitted viscose dressing with povidone–iodine incorporated in a hydrophilic polyethylene glycol basis; this facilitates diffusion of the iodine into the wound and permits removal of the dressing by irrigation. The iodine has a wide spectrum of antimicrobial activity but it is rapidly deactivated by wound exudate. Systemic absorption of iodine may occur, particularly from large wounds or with prolonged use. *Iodoflex®* and *Iodosorb®* are used for the treatment of chronic exuding wounds; max. single application 50g, max. weekly application 150g; max. duration up to 3 months in any single course of treatment. They are contra-indicated in patients receiving lithium, in thyroid disorders, in pregnancy and breast feeding, and in children; they should be used with caution in patients with severe renal impairment or history of thyroid disorder.
**Iodozyme** is an antimicrobial dressing used for lightly to moderately exuding wounds. It is contra-indicated in thyroid disorders and in patients receiving lithium; it should be used with caution in children and in women who are pregnant or breast-feeding.

Oxyzyme is used for non-infected, dry to moderately exuding wounds. It is contra-indicated in thyroid disorders and in patients receiving lithium; it should be used with caution in children and in women who are pregnant or breast-feeding.

**Povidone-iodine Fabric Dressing** is used as a wound contact layer for abrasions and superficial burns. It is contra-indicated in patients with severe renal impairment and in women who are pregnant or breast-feeding; it should be used with caution in patients with thyroid disease and in children under 6 months.

**Iodoflex Paste**

Iodine 0.9% as cadexomer–iodine in a paste basis with gauze backing.

Iodoflex paste (Smith & Nephew Healthcare Ltd) dressing 5g = £4.23, 10g = £8.45, 17g = £13.39

**Iodosorb Ointment**

Iodine 0.9% as cadexomer–iodine in an ointment basis.

Iodosorb (Smith & Nephew Healthcare Ltd) ointment dressing= £9.25

**Iodosorb Powder**

Iodine 0.9% as cadexomer–iodine microbeads, 3-g sachet.

Iodosorb (Smith & Nephew Healthcare Ltd) powder dressing sachets= £1.98

**Povidone-iodine fabric dressing**

Inadine

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone–iodine ointment 10%

**Inadine dressing** (Systagenix Wound Management Ltd) 5cm x 5cm= £0.33, 9.5cm x 9.5cm= £0.49

**Silver dressings**

Antimicrobial dressings containing silver should be used only when infection is suspected as a result of clinical signs or symptoms (see also notes above). Silver ions exert an antimicrobial effect in the presence of wound exude; the volume of wound exude as well as the presence of infection should be considered when selecting a silver-containing dressing. Silver-impregnated dressings should not be used routinely for the management of uncomplicated ulcers. It is recommended that these dressings should not be used on acute wounds as there is some evidence to suggest they delay wound healing. Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discoloration. The use of silver sulfadiazine-impregnated dressings is contra-indicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment, sensitivity to sulfonamides, or G6PD deficiency. Large amounts of silver sulfadiazine applied topically may interact with other drugs—see Appendix 1 (sulfonamides).

**Alginate dressings**

**Algise Ag**

Calcium alginate dressing, with silver.

Algise Ag dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm= £4.27, 10cm x 20cm= £7.85, 2g= £5.90, 5cm x 5cm= £1.71

**Askina Calgitrol Ag**

Calcium alginate and silver alginate dressing with poyurethane foam backing.

Askina Calgitrol Ag dressing (B.Braun Medical Ltd) 10cm x 10cm square= £3.29, 15cm x 15cm square= £6.37, 20cm x 20cm square= £14.86

**Askina Calgitrol Thin**

Calcium alginate and silver alginate matrix, for use with absorptive secondary dressings.

**Askina Calgitrol Thin dressing** (B.Braun Medical Ltd) 10cm x 10cm square= £4.19, 15cm x 15cm square= £9.41, 20cm x 20cm square= £16.62, 5cm x 5cm square= £2.02

**Melgisor Ag**

Alginate and carboxymethylcellulose dressing, with ionic silver.

Melgisor Ag (Molynex Health Care Ltd) Cavity dressing 3cm x 4cm= £4.61, dressing 10cm x 10cm= £3.69, 15cm x 15cm= £7.82, 5cm x 5cm= £1.85

**Silvercel**

Alginate and carboxymethylcellulose dressing impregnated with silver.

Silvercel dressing (Systagenix Wound Management Ltd) 10cm x 20cm rectangular= £7.74, 11cm x 11cm square= £4.17, 2.5cm x 30.5cm rectangular= £4.49, 5cm x 5cm square= £1.69

**Silvercel Non-adherent**

Alginate and carboxymethylcellulose dressing with film wound contact layer, impregnated with silver.

Silvercel Non-Adherent (Systagenix Wound Management Ltd) cavity dressing 2.5cm x 30.5cm= £3.94, dressing 10cm x 20cm rectangular= £7.25, 11cm x 11cm square= £3.89, 5cm x 5cm square= £1.62

**Sorbsan Silver Flat**

Calcium alginate fibre, highly absorbent, flat non-woven pads, with silver.

Sorbsan Silver Flat dressing (Aspen Medical Europe Ltd) 10cm x 10cm= £4.00, 10cm x 20cm= £7.31, 5cm x 5cm= £1.58

**Sorbsan Silver Plus**

Calcium alginate dressing with absorbent backing, with silver.

Sorbsan Silver Plus dressing (Aspen Medical Europe Ltd) 10cm x 15cm= £5.60, 10cm x 20cm= £6.82, 15cm x 20cm= £9.15, 7.5cm x 10cm= £3.37

**Sorbsan Silver Ribbon**

With silver.

Sorbsan (Aspen Medical Europe Ltd) Silver Ribbon dressing 1g= £4.18

**Sorbsan Silver Surgical Packing**

With silver.

Sorbsan (Aspen Medical Europe Ltd) Silver Packing dressing 2g= £5.80

**Suprasorb A + Ag**

Calcium alginate dressing, with silver.

Suprasorb A + Ag (Lohmann & Rauscher) dressing 10cm x 10cm= £4.21, 10cm x 20cm= £7.78, 5cm x 5cm= £1.67, rope dressing 2g= £6.23

**Tegaderm Alginic Ag**

Calcium alginate and carboxymethylcellulose dressing, with silver.

Tegaderm Alginic Ag dressing (3M Health Care Ltd) 10cm x 10cm= £3.27, 3cm x 30cm= £3.73, 5cm x 5cm= £1.40

**Urgosorb Silver**

Alginate and carboxymethylcellulose dressing, impregnated with silver.

Urgosorb Silver (Urgo Ltd) Rope dressing 2.5cm x 30cm= £3.77, dressing 10cm x 10cm= £3.75, 10cm x 20cm= £7.06, 5cm x 5cm= £1.57

**Foam dressings**

**Acticoat Moisture Control**

Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer.

Acticoat Moisture Control dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm square= £17.23, 10cm x 20cm rectangular= £33.58, 5cm x 5cm square= £7.37

**Allelyn Ag**

Silver sulfadiazine impregnated polyurethane foam film dressing with or without adhesive border.

Allelyn Ag (Smith & Nephew Healthcare Ltd) Adhesive dressing 10cm x 10cm square= £5.65, 12.5cm x 12.5cm square= £7.42, 17.5cm x 17.5cm square= £14.27, 17cm x 17cm sacral= £11.14, 22cm x 22cm sacral= £14.93, 7.5cm x 7.5cm square= £3.59, Heel Non-
Adhesive dressing 10.5cm × 13.5cm = £11.05, Non-Adhesive dressing 10cm × 10cm square = £6.31, 15cm × 15cm square = £11.95, 20cm × 20cm square = £17.51, 5cm × 5cm square = £3.35

Biatain Ag
Silver impregnated polyurethane foam film dressing, with or without adhesive border

Biatain Ag (Coloplast Ltd) cavity dressing 5cm × 8cm = £4.13, dressing 10cm × 10cm square = £8.29, 10cm × 20cm rectangular = £15.24, 12.5cm × 12.5cm square = £9.48, 15cm × 15cm square = £16.64, 18cm × 18cm square = £19.93, 1cm × 20cm heelp = £18.77, 20cm × 20cm square = £23.47, 23cm × 23cm sacral = £19.94, 5cm × 7cm rectangular = £3.41

PolyMem Silver
Silver impregnated polyurethane foam film dressing, with or without adhesive border

PolyMem Silver (Aspen Medical Europe Ltd) WIC dressing 8cm × 8cm = £7.10, dressing 10.8cm × 10.8cm square = £8.93, 12.7cm × 8.8cm oval = £5.64, 17cm × 19cm rectangular = £17.89, 5cm × 7.5cm oval = £2.29

UrgoCell Silver
Non-adherent, polyurethane foam film dressing with silver in wound contact layer

UrgoCell Silver dressing (Urgo Ltd) 10cm × 10cm = £6.05, 15cm × 20cm = £11.08, 6cm × 6cm = £4.40

Hydrocolloid dressings

Aquacel Ag
Soft non-woven pad containing hydrocolloid fibres, (silver impregnated)

Aquacel Ag (Convatec Ltd) Ribbon dressing 1cm × 45cm = £3.17, 2cm × 45cm = £4.84, dressing 10cm × 10cm square = £4.81, 15cm × 15cm square = £9.06, 20cm × 30cm rectangular = £22.48, 4cm × 10cm rectangular = £2.93, 4cm × 20cm rectangular = £3.82, 4cm × 30cm rectangular = £5.72

Physiostrip Ag
Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine

Physiostrip (Coloplast Ltd) dressing 10cm × 10cm = £2.32

Low adherence dressing

Acticoat
Three-layer antimicrobial barrier dressing consisting of a polyester core between low adhesive silver-coated high density polyethylene mesh (for 3-day wear)

Acticoat dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm square = £8.79, 10cm × 20cm rectangular = £13.75, 20cm × 40cm rectangular = £47.04, 5cm × 5cm square = £3.60

Acticoat 7
Five-layer antimicrobial barrier dressing consisting of a polyester core between low adhesive silver-coated high density polyethylene mesh (for 7-day wear)

Acticoat 7 dressing (Smith & Nephew Healthcare Ltd) 10cm × 12.5cm rectangular = £18.64, 15cm × 15cm square = £33.51, 5cm × 5cm square = £6.26

Acticoat Flex 3
Conformable antimicrobial barrier dressing consisting of a polyester core between low adhesive silver-coated high density polyethylene mesh (for 3-day wear)

Acticoat Flex 3 dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm square = £8.89, 10cm × 20cm rectangular = £13.90, 20cm × 40cm rectangular = £47.56, 5cm × 5cm square = £3.64

Acticoat Flex 7
Conformable antimicrobial barrier dressing consisting of a polyester core between low adhesive silver-coated high density polyethylene mesh (for 7-day wear)

Acticoat Flex 7 dressing (Smith & Nephew Healthcare Ltd) 10cm × 12.5cm rectangular = £18.85, 15cm × 15cm square = £33.89, 5cm × 5cm square = £6.33

Atrauman Ag
Non-adherent polyamide fabric impregnated with silver and neutral triglycerides

Atrauman Ag dressing (Paul Hartmann Ltd) 10cm × 10cm = £1.28, 10cm × 20cm = £2.51, 5cm × 5cm = £0.53

Soft polymer dressings

Allevyn Ag Gentle
Soft polymer wound contact dressing, with silver sulfadiazine impregnated polyurethane foam layer, with or without adhesive border

Allevyn Ag Gentle (Smith & Nephew Healthcare Ltd) Border dressing 10cm × 10cm = £6.53, 12.5cm × 12.5cm = £8.40, 17.5cm × 17.5cm = £16.00, 7.5cm × 7.5cm = £4.35, dressing 10cm × 10cm = £6.34, 10cm × 20cm = £10.48, 15cm × 15cm = £11.80, 20cm × 20cm = £17.48, 5cm × 5cm = £3.40

Mepilex Ag
Soft silicone wound contact dressing with polyurethane foam backing, with silver, with or without adhesive border

Mepilex (Molnlycke Health Care Ltd) Ag dressing 10cm × 10cm = £6.21, 10cm × 20cm = £10.24, 15cm × 15cm = £11.53, 20cm × 20cm = £17.03, 20cm × 50cm = £64.13, Border Ag dressing 10cm × 12.5cm = £6.25, 10cm × 20cm = £9.10, 10cm × 30cm = £13.68, 15cm × 17.5cm = £11.48, 17cm × 20cm = £14.87, 7.5cm × 7.5cm = £3.46, Border Sacrum Ag dressing 18cm × 18cm = £12.00, 20cm × 20cm = £14.59, 23cm × 23cm = £19.17, Heel Ag dressing 13cm × 20cm = £12.97, 15cm × 22cm = £14.53

Urgotol Silver
Non-adherent soft polymer wound contact dressing, with silver

Urgotol Silver dressing (Urgo Ltd) 10cm × 12cm = £3.64, 15cm × 20cm = £9.91

With charcoal

Actisorb Silver 220
Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve

Actisorb Silver 220 dressing (Sytagenix Wound Management Ltd) 10.5cm × 10.5cm = £2.60, 10.5cm × 19cm = £4.73, 6.5cm × 9.5cm = £1.66

Other antimicrobials

Cutimed Siltec Sorbact
Polyurethane foam dressing with acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border

Cutimed Siltec Sorbact dressing (BSN medical Ltd) 12.5cm × 12.5cm = £6.62, 15cm × 15cm = £8.20, 17.5cm × 17.5cm = £11.47, 22.5cm × 22.5cm = £17.45, 7.5cm × 7.5cm = £2.58, 17.5cm × 17.5cm sacral = £8.29, 23cm × 23cm sacral = £12.46

Cutimed Sorbact
Low adherence acetate tissue impregnated with dialkylcarbamoyl chloride; dressing pad, swabs, round swabs or ribbon gauze, cotton

Cutimed Sorbact (BSN medical Ltd) Ribbon dressing 2cm × 50cm = £2.14, 5cm × 200cm = £9.16, Round swab 3cm = £3.39, dressing pad 10cm × 10cm = £5.65, 10cm × 20cm = £8.81, 7cm × 9cm = £3.61, swab 4cm × 6cm = £1.69, 7cm × 9cm = £2.82

Cutimed Sorbact Gel
Hydrogel dressing impregnated with dialkylcarbamoyl chloride

Cutimed Sorbact Gel dressing (BSN medical Ltd) 7.5cm × 15cm rectangular = £4.60, 7.5cm × 7.5cm square = £2.72

Cutimed Sorbact Hydroactive
Non-adhesive gel dressing with hydropolymer matrix and acetate fabric coated with dialkylcarbamoyl chloride

Cutimed Sorbact Hydroactive dressing (BSN medical Ltd) 14cm × 14cm = £5.51, 14cm × 24cm = £8.63, 19cm × 19cm = £10.38, 24cm × 24cm = £15.73, 7cm × 8.5cm = £3.78

Cutimed Sorbact Hydroactive B
Gel dressing with hydropolymer matrix and acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border

Cutimed Sorbact Hydroactive B dressing (BSN medical Ltd) 10cm × 10cm = £7.38, 10cm × 20cm = £11.66, 15cm × 15cm = £13.70, 5cm × 6.5cm = £4.08

Flaminal Forte gel
Alginate with glucose oxidase and lactoperoxidase, for moderately to heavily exuding wounds

Flaminal Forte gel dressing (Flen Health UK Ltd) 15g = £7.87
Flaminal Hydro gel
Alginates with glucose oxidase and lactoperoxidase, for lightly to moderately exuding wounds
Flaminal Hydro gel dressing (Flan Health UK Ltd) 15g = £7.87

Kendall AMD
Foam dressing with polihexanide, without adhesive border
Kendall AMD Antimicrobial foam dressing (H & R Healthcare Ltd) 10cm x 10cm square= £4.71, 10cm x 20cm rectangular= £8.92, 15cm x 15cm square= £8.92, 20cm x 20cm square= £13.07, 5cm x 5cm square= £2.50, 8.8cm x 7.5cm rectangular (fenestrated)= £4.23

Kendall AMD Plus
Foam dressing with polihexanide, without adhesive border
Kendall AMD Antimicrobial Plus foam dressing (H & R Healthcare Ltd) 10cm x 10cm square= £4.94, 8.8cm x 7.5cm rectangular (fenestrated)= £4.43

Octenilen Wound gel
Wound gel, hydroxyethylcellulose and propylene glycol, with octenidine hydrochloride
Octenilen Wound Gel dressing (Schulke & Mayr UK Ltd) 20ml= £4.78, 250ml= £25.21

Prontosan Wound Gel
Hydrogel containing betaine surfactant and polihexanide
Prontosan (B.Braun Medical Ltd) Wound gel dressing= £6.55

Suprasorb X + PHMB
Biosynthetic cellulose fibre dressing with polihexanide
Suprasorb X + PHMB dressing (Lohmann & Rauscher) 14cm x 20cm rectangular= £11.93, 2cm x 21cm rope= £7.43, 5cm x 5cm square= £2.63, 9cm x 9cm square= £5.24

Telfa AMD
Low adherence absorbent perforated plastic film faced dressing with polihexanide
Telfa AMD dressing (H & R Healthcare Ltd) 10cm x 7.5cm= £0.18, 20cm x 7.5cm= £0.28

Telfa AMD Island
Low adherence dressing with adhesive border and absorbent pad, with polihexanide
Telfa AMD Island dressing (H & R Healthcare Ltd) 10cm x 12.5cm= £0.59, 10cm x 20cm= £0.86, 10cm x 25.5cm= £0.98, 10cm x 35cm= £1.22

Chlorhexidine gauze dressing
Bactigras
Fabric of lino weave, wet and warp threads of cotton and/or viscose yarn, impregnated with ointment containing chlorhexidine acetate
Bactigras gauze dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm= no price available, 5cm x 5cm= no price available

Irrigation fluids
Octenilen Wound irrigation solution
Aqueous solution containing glycerol, ethelyxylglycerin and octenidine hydrochloride
Octenilen irrigation solution 350ml bottles (Schulke & Mayr UK Ltd) bottle £4.60

Prontosan Wound Irrigation Solution
Aqueous solution containing betaine surfactant and polihexanide
Prontosan irrigation solution (B.Braun Medical Ltd) 350ml bottles= £4.90, 40ml unit dose= £14.57

Specialised dressings
Protease-modulating matrix dressings
Cadesorb Ointment
Cadesorb (Smith & Nephew Healthcare Ltd) ointment= £9.47

Catris
Catris dressing (Cranage Healthcare Ltd) sachets= £3.80

Promogran
Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing
Promogran dressing (Syntegens Wound Management Ltd) 123 square cm= £15.75, 28 square cm= £5.23

Promogran Prisma Matrix
Collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing
Promogran Prisma dressing (Syntegens Wound Management Ltd) 123 square cm= £18.12, 28 square cm= £6.36

UrgoStart
Soft adherent polymer matrix containing nano-oligosaccharide factor (NOSF), with polurethane foam film backing
UrgoStart dressing (Urgo Ltd) 10cm x 10cm= £6.26, 15cm x 20cm= £11.26, 6cm x 6cm= £4.53, 12cm x 19cm heel= £8.63

UrgoStart Contact
Non-adherent soft polymer wound contact dressing containing nano-oligosaccharide factor (NOSF)
UrgoStart (Urgo Ltd) Contact dressing 5cm x 7cm= £3.03

Silicone keloid dressings
Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.
Silicone gel
Bapscarcare Silicone gel
Bapscarcare (Espere Healthcare Ltd) gel= £17.12

Cilitech
Silicone gel
Cilitech (Su-Med International (UK) Ltd) gel= £50.00

Dermatix
Silicone gel
Dermatix gel (Meda Pharmaceuticals Ltd)= £60.53

Kelo-cote UV
Silicone gel with SPF 30 UV protection
Kelo-cote (Alliance Pharmaceuticals Ltd) UV gel= £17.88

Kelo-cote gel
Silicone gel
Kelo-cote (Alliance Pharmaceuticals Ltd) gel= £51.00

Kelo-cote spray
Silicone spray
Kelo-cote (Alliance Pharmaceuticals Ltd) spray= £51.00

Scarsil
Silicone gel
ScarSil (Jobskin Ltd) gel= £15.19

Silgel STC-SE
Silicone gel
Silgel (Nagar Ltd) STC-SE gel= £19.00

Silicone sheets
Advasil Conform
Self-adhesive silicone gel sheet with polyurethane film backing
Advasil Conform sheet (Advantis Medical) 10cm x 10cm square= £5.24, 15cm x 10cm rectangular= £3.24

Bapscarcare T
Self-adhesive silicone gel sheet
Bapscarcare T sheet (Espere Healthcare Ltd) 10cm x 15cm rectangular= £9.07, 5cm x 30cm rectangular= £9.07, 5cm x 7cm rectangular= £3.17

Cica-Care
Soft, self-adhesive, semi-occlusive silicone gel sheet with backing
Cica-Care sheet (Smith & Nephew Healthcare Ltd) 15cm x 12cm rectangular= £29.30, 6cm x 12cm rectangular= £15.03

Cilitech
Silicone gel sheet
Cilitech sheet (Su-Med International (UK) Ltd) 10cm x 10cm square= £7.50, 10cm x 20cm rectangular= £12.50, 15cm x 15cm square= £14.00

Dermatix
Self-adhesive silicone gel sheet (clear- or fabric-backed)
Dermatix (Meda Pharmaceuticals Ltd) Clear sheet 13cm × 13cm square= £15.79, 13cm × 25cm rectangular= £28.53, 20cm × 30cm rectangular= £51.97, 4cm × 13cm rectangular= £6.88, Fabric sheet 13cm × 13cm square= £15.79, 13cm × 25cm rectangular= £28.53, 20cm × 30cm rectangular= £51.97, 4cm × 13cm rectangular= £6.88

Mepiform
Self-adhesive silicone gel sheet with polyurethane film backing
Mepiform sheet (Molnlycke Health Care Ltd) 4cm × 31cm rectangular= £11.20, 5cm × 7cm rectangular= £3.54, 9cm × 18cm rectangular= £13.86

Scarf FX
Self-adhesive, transparent, silicone gel sheet
Scarf FX sheet (Jobskin Ltd) 10cm × 20cm rectangular= £16.00, 22.5cm × 14.5cm shaped= £12.00, 25.5cm × 30.5cm rectangular= £60.00, 3.75cm × 22.5cm rectangular= £12.00, 7.5cm diameter shaped= £8.50

Siligel
Silicone gel sheet
Siligel sheet (Nago Ltd) 10cm × 10cm square= £13.50, 10cm × 30cm rectangular= £31.50, 10cm × 5cm rectangular= £7.50, 15cm × 10cm rectangular= £19.50, 20cm × 20cm rectangular= £40.00, 25cm × 15cm shaped= £21.12, 30cm × 5cm rectangular= £19.50, 40cm × 40cm square= £144.00, 46cm × 8.5cm shaped= £39.46, 5.5cm diameter shaped= £4.00

Adjunct dressings and appliances
Surgical dressings
Surgical dressings are used to protect wounds, absorb drainage, and control wound edges. They are often combined with a primary dressing to secure them to the wound. Surgical dressings can be layered into the cavity is often more suitable.

Cotton

Absorbent Cotton, BP
Carded cotton fibres of not less than 10 mm average staple length, available in rolls and balls
Absorbent (Robert Bailey & Son Plc) cotton BP 1988

Absorbent Cotton, Hospital Quality
As for absorbent cotton but lower quality materials, shorter staple length etc.
Absorbent (Robert Bailey & Son Plc) cotton hospital quality

Gauze and cotton tissue

Gamgee Tissue (blue)
Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2
Gamgee (Robinson Healthcare) tissue blue label

Gamgee Tissue (pink)
Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2
Gamgee (Robinson Healthcare) tissue pink label DT

Gauze and tissue

Absorbent Cotton Gauze, BP 1988
Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile
Absorbent (Robert Bailey & Son Plc) cotton BP 1988
Alvita (Alliance Healthcare (Distribution) Ltd) absorbent cotton BP 1988
Clini (CliniSupplies Ltd) absorbent cotton BP 1988
Vernaid (Synergy Health (UK) Ltd) absorbent cotton BP 1988

Absorbent Cotton and Viscose Ribbon Gauze, BP 1988
Woven fabric in ribbon form with fast selvedge edges, warp threads of cotton, weft threads of viscose or combined cotton and viscose yarn, sterile
Vernaid Fast Edge ribbon gauze sterile (Synergy Health (UK) Ltd) 1.25cm, 2.5cm

Lint

Absorbent Lint, BPC
Cotton cloth of plain weave with nap raised on one side from warp yarns
Absorbent (Robinson Healthcare) lint
Alvita (Alliance Healthcare (Distribution) Ltd) absorbent lint BPC
Clini (CliniSupplies Ltd) absorbent lint BPC

Pads

Drisorb
Absorbing Dressing Pads, Sterile
Drisorb (Synergy Health (UK) Ltd) dressing pad 10cm × 20cm= £0.17

PremierPad
Absorbing Dressing Pads, Sterile
PremierPad dressing pad (Shermon) 10cm × 20cm= £0.18, 20cm × 20cm= £0.25

XuPad
Absorbing Dressing Pads, Sterile
Xupad dressing pad (Richardson Healthcare Ltd) 10cm × 20cm= £0.17, 20cm × 20cm= £0.28, 20cm × 40cm= £0.40

Wound drainage pouches
Wound drainage pouches can be used in the management of wounds and fistulas with significant levels of exudate.

Biotrol Draina S
Wound drainage pouch
Biotrol Draina S wound drainage bag (B.Braun Medical Ltd) large (Transparent)= £98.03, medium (Transparent)= £79.71, mini (Transparent)= £79.95

Biotrol Draina S Vision
Wound drainage pouch
Draina S Vision (B.Braun Medical Ltd) 50 wound drainage bags= £103.84, 75 wound drainage bags= £109.70

Eakin Access window
For use with Eakin ® pouches
Eakin (Pelican Healthcare Ltd) access window large= £38.76

Eakin Wound pouch, bung closure
Wound pouch, bung closure
Eakin wound drainage bag with bung closure (Pelican Healthcare Ltd) large= £105.22, medium= £77.55, small= £55.38, and access window for horizontal wounds, extra large= £106.22, for horizontal wounds, extra large= £94.14, for vertical incision wounds, extra large= £94.14

Eakin Wound pouch, fold and tuck closure
Wound pouch, fold and tuck closure
Eakin wound drainage bag with fold and tuck closure (Pelican Healthcare Ltd) large= £94.14, medium= £71.99, small= £49.84, extra large= £83.07

Option Wound Manager
Wound drainage bag
Option wound manager bag (Oakmed Ltd) large= £162.58, medium= £136.41, small= £133.44, square= £142.34, extra small= £119.97

Option Wound Manager with access port
Wound drainage bag, with access port
Option wound manager bag with access port (Oakmed Ltd) large= £173.79, medium= £142.34, small= £139.37, square= £148.27, extra small= £131.18

Option Wound Manager, cut to fit
Wound drainage bag, cut to fit
Option wound manager bag (Oakmed Ltd) large= £85.47, medium= £81.61, small= £73.66

Welland Fistula bag
Wound drainage bag, cut-to-fit
Welland (Welland Medical Ltd) Fistula wound drainage bag= £84.29
Physical debridement pads

Debrisoft® is a pad that is used for the debridement of superficial wounds containing loose slough and debris, and for the removal of hyperkeratosis from the skin. Debrisoft® must be fully moistened with a wound cleansing solution before use and is not appropriate for use as a wound dressing.

Debrisoft Pad
Polyester fibres with bound edges and knitted outer surface coated with polycrylate
Debrisoft (Lohmann & Rauscher) pad 10cm × 10cm = £6.61

Complex adjunct therapies

Topical negative pressure therapy

Accessories
Renasys
Soft port and connector
Renasys (Smith & Nephew Healthcare Ltd) Soft Port = £11.38, connector for use with soft port = £3.34

V.A.C.
Drape, gel for canister, Sensa T.R.A.C. Pad
SensaT.R.A.C. (KCI Medical Ltd) pad = £11.04
T.R.A.C. (KCI Medical Ltd) connector = £3.16
V.A.C. (KCI Medical Ltd) drape = £9.46, gel strips = £3.79
Venturi
Gel patches, adhesive, and connector
Venturi (Talley Group Ltd) adhesive gel patch = £15.00, connector = £15.00

WoundASSIST gel strip
WoundASSIST (Huntleigh Healthcare Ltd) TNP gel strip = £3.37

Vacuum assisted closure products

Exsu-Fast kit 1
Dressing Kit
Exsu-Fast (Synergy Health (UK) Ltd) dressing kit 1 = £28.04

Exsu-Fast kit 2
Dressing Kit
Exsu-Fast (Synergy Health (UK) Ltd) dressing kit 2 = £35.83

Exsu-Fast kit 3
Dressing Kit
Exsu-Fast (Synergy Health (UK) Ltd) dressing kit 3 = £35.83

Exsu-Fast kit 4
Dressing Kit
Exsu-Fast (Synergy Health (UK) Ltd) dressing kit 4 = £28.04

V.A.C. GraniFoam
Polyurethane foam dressing (with adhesive drapes and pad connector); with or without silver
V.A.C. GraniFoam (KCI Medical Ltd) Bridge dressing kit = £32.29
Silver with SensaT.R.A.C dressing kit medium = £38.33, small = £31.05, dressing kit large = £31.94, medium = £27.53, small = £23.13

V.A.C. Simplace
Spiral-cut polyurethane foam dressings, vapour-permeable adhesive film dressings (with adhesive drapes and pad connector)
V.A.C. Simplace EX dressing kit (KCI Medical Ltd) medium = £30.82, small = £26.81

V.A.C. WhiteFoam
Polyvinyl alcohol foam dressing or dressing kit
V.A.C. WhiteFoam dressing (KCI Medical Ltd) large = £17.17, small = £16.72, kit large = £33.80, small = £26.11

Venturi
Wound sealing kit, flat drain; with or without channel drain
Venturi wound sealing kit with flat drain, (Talley Group Ltd) large = £17.50, standard = £15.00

WoundASSIST
Wound pack and channel drain
WoundASSIST TNP dressing pack (Huntleigh Healthcare Ltd) medium/large = £23.85, small/medium = £20.81, channel drain medium/large = £23.85, small/medium = £22.85, extra large = £34.05

Wound drainage collection devices

ActiV.A.C.
Canister with gel
ActiV.A.C (KCI Medical Ltd) canister with gel = £28.64
S-Canister
Canister kit
S-Canister (Smith & Nephew Healthcare Ltd) kit = £19.00

V.A.C Freedom
Canister with gel
V.A.C. (KCI Medical Ltd) Freedom Canister with gel = £29.08

Venturi
Canister kit with solidifier
Venturi (Talley Group Ltd) Compact canister kit = £12.50, canister kit = £12.50

WoundASSIST wound pack
Canister
WoundASSIST (Huntleigh Healthcare Ltd) TNP canister = £20.30

Wound care accessories

Dressing packs
The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; some packs shown below include cotton wool balls, which are not recommended for use on wounds.

Multiple Pack Dressing No. 1
Contains absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-wove bandages (banded)
Vernaid (Synergy Health (UK) Ltd) multiple pack dressing

Non-drug tariff specification sterile dressing packs

Dressit
Vitrex gloves, large apron, disposable bag, paper towel, softswabs, adsorbent pad, sterile field
Dressit sterile dressing pack (Richardson Healthcare Ltd) with medium/large gloves = £0.60, small/medium gloves = £0.60

Nurse It
Contains latex-free, powder-free nitrile gloves, sterile laminated paper sheet, large apron, non-woven swabs, paper towel, disposable bag, compartmented tray, disposable forceps, paper measuring tape
Nurse It sterile dressing pack (Medicareplus International Ltd) with medium/large gloves = £0.55, small/medium gloves = £0.55

Polyfield Nitrile Patient Pack
Contains powder-free nitrile gloves, laminate sheet, non-woven swabs, towel, polycrylene disposable bag, apron
Polyfield Nitrile Patient Pack (Shermond) with large gloves = £0.52, medium gloves = £0.52, small gloves = £0.52

Sterile Dressing Pack with Non-Woven Pads
Vernaid
Vernaid (Synergy Health (UK) Ltd) sterile dressing pack with non-woven pads

Sterile dressing packs
Vernaid
(Drug Tariff specification 10). Contains gauze and cotton tissue pad, gauze swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper
Vernaid (Synergy Health (UK) Ltd) sterile dressing pack

Woven and fabric swabs

Gauze Swab, PB 1988
Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type 1 folded into squares or rectangles of 8-ply with no cut edges exposed, sterile or non-sterile
Alvia gauze swab 8ply (Alliance Healthcare (Distribution) Ltd) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm
CS (CliniSupplies Ltd) gauze swab 8ply non-sterile 10cm × 10cm
Appendix 4

**within non-woven viscose fabric folded sterile**

10 cm × 10 cm

**CliniMed**

- **(polymeric adhesive mass)**

**Non-sterile**

**Sofsorb non-woven fabric swab 4ply**

10 cm × 10 cm

**Softswab non-woven fabric swab 4ply**

10 cm × 10 cm

**Fileted non-woven Fabric Swab**

**Regal**

**Non-sterile**

**Surgical adhesive tapes**

- Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and strapping containing rubber, or undergoing prolonged treatment.

- Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

**Occlusive adhesive tapes**

**Blenderm**

- (Impermeable Plastic Adhesive Tape, BP 1988). Extensible water-impermeable plastic film spread with a polymeric adhesive mass

**Blenderm tape**

(3M Health Care Ltd) 2.5cm= £1.78, 5cm= £3.39

**Sleek**

- (Impermeable Plastic Adhesive Tape, BP 1988). Extensible water-impermeable plastic film spread with an adhesive mass

**Leukoplast Sleek tape**

(3M medical Ltd) 2.5cm, 5cm, 7.5cm

**Permeable adhesive tapes**

**3M Kind Removal Silicone Tape**

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

3M Micropore Silicone tape

(3M Health Care Ltd) 2.5cm= £3.61, 5cm= £6.53

**Chemifix**

**Chemifix tape**

(Medicareplus International Ltd) 10cm= £2.10, 2.5cm= £0.90, 5cm= £1.40

**Chemipore**

- (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

**Chemipore tape**

(Medicareplus International Ltd) 1.25cm= £0.27, 2.5cm= £0.70, 5cm= £0.95

**Clinipore**

- (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

**Clinipore tape**

(Medicareplus International Ltd) 1.25cm= £0.35, 2.5cm= £0.74, 5cm= £1.00

**Elastoplast**

- (Elastic Adhesive Tape, BP 1988). Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide

**Tensoplast**

(3M medical Ltd) elastic adhesive tape 2.5cm

**Hypafix**

**Hypafix tape**

(3M medical Ltd) 10cm= £4.80, 15cm= £7.11, 2.5cm= £1.73, 20cm= £9.43, 30cm= £13.63, 5cm= £2.75

**Insil**

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

**Insil tape**

(Insight Medical Products Ltd) 2cm= £5.77, 4cm= £5.77

**Leukofix**

- (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

**Leukofix tape**

(3M medical Ltd) 1.25cm= £0.57, 2.5cm= £0.92, 5cm= £1.61

**Leukopor**

- (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

**Leukopor tape**

(3M medical Ltd) 1.25cm= £0.51, 2.5cm= £0.79, 5cm= £1.39

**Mediplast**

- (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

**Mediplast tape**

(Neomedic Ltd) 1.25cm= £0.30, 2.5cm= £0.50

**Mediplast**

Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide

**Mediplast Zinc Oxide plaster**

(Neomedic Ltd) 1.25cm= £0.82, 2.5cm= £1.19, 5cm= £1.99, 7.5cm= £2.99

**Mefix**

**Mefix tape**

(3M medical Ltd) 10cm= £2.92, 15cm= £3.98, 2.5cm= £1.03, 20cm= £5.10, 30cm= £7.32, 5cm= £1.83

**Mepitac**

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

**Mepitac tape**

(3M medical Ltd) 2cm= £7.01, 4cm= £7.01

**Micropore**

- (Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

www.getintopharma.com
Skin closure dressings

Skin closure strips are used as an alternative to sutures for closure of minor skin wounds and for additional suture support.

**Open-woven Bandage, Type 1 BP 1988**

Cotton cloth, plain weave, warp of cotton, weft of cotton, viscose, or combination, one continuous length

- **Omnifix tape** (Paul Hartmann Ltd) 10cm x 5m, 5.2cm x 5m, 5cm x 5m, 7.5cm x 5m
- **Vernaid white open woven bandage** (Synergy Health (UK) Ltd) 10cm x 5m, 5.2cm x 5m, 5cm x 5m, 7.5cm x 5m
- **White open woven bandage** (Robert Bailey & Son Plc) 10cm x 5m, 5.2cm x 5m, 5cm x 5m, 7.5cm x 5m

**Triangular Calico Bandage, BP 1980**

Unbleached calico right-angled triangle

- **Clini (Clinisupplies Ltd) triangular calico bandage BP 1980 90cm x 127cm**
- **Triangular (BSN medical Ltd) calico bandage 90cm x 127cm**

**Lightweight conforming bandages**

Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of conforming-stretch bandages (also termed contour bandages) is greater than that of cotton conforming bandages.

**Acti-Wrap**

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)

**Acti-Wrap (cohesive/latex free) bandage** (L&R Medical UK Ltd) 10cm x 4m= £0.83, 6cm x 4m= £0.48, 8cm x 4m= £0.70

**Cotton Conforming Bandage, BP 1988**

Cotton fabric, plain weave, treated to impart some elasticity to warp and weft

**Easifix Crinx bandage** (BSN medical Ltd) 10cm x 3.5m= £1.06, 15cm x 3.5m= £1.45, 5cm x 3.5m= £0.70, 7.5cm x 3.5m= £0.86

**Easifix**

Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)

**Easifix bandage** (BSN medical Ltd) 10cm x 4m= £0.52, 15cm x 4m= £0.89, 5cm x 4m= £0.36, 7.5cm x 4m= £0.44

**Easifix K**

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched

**Easifix K bandage** (BSN medical Ltd) 10cm x 4m= £0.19, 15cm x 4m= £0.33, 2.5cm x 4m= £0.10, 5cm x 4m= £0.11, 7.5cm x 4m= £0.17

**Hospiform bandage**

Fabric, plain weave, warp of polyamide, weft of viscose

**Hospiform bandage** (Paul Hartmann Ltd) 10cm x 4m= £0.19, 12cm x 4m= £0.24, 6cm x 4m= £0.14, 8cm x 4m= £0.17

**K-Band**

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched

**K-Band 50mm** (Urgo Ltd) 10cm x 4m= £0.29, 15cm x 4m= £0.50, 5cm x 4m= £0.21, 7cm x 4m= £0.26

**Knot Fix**

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched

**Knot Fix bandage** (Robert Bailey & Son Plc) 10cm x 4m= £0.17, 15cm x 4m= £0.33, 5cm x 4m= £0.12, 7cm x 4m= £0.17

**Knot-Band**

Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched

**Knot-Band 50mm** (Clinisupplies Ltd) 10cm x 4m= £0.17, 15cm x 4m= £0.31, 5cm x 4m= £0.10, 7cm x 4m= £0.15

**Kontour bandage** (Easigrip Ltd) 10cm x 4m= £0.40, 15cm x 4m= £0.66, 5cm x 4m= £0.28, 7.5cm x 4m= £0.35

**Bandages**

Non-extensible bandages

Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive can be used for closure of minor skin wounds and for additional suture support.

**Micropore tape** (3M Health Care Ltd) 1.25cm= £0.62, 2.5cm= £0.92, 5cm= £1.63

**Omnifix**

**Omnifix tape** (Paul Hartmann Ltd) 10cm= £4.14, 15cm= £6.11, 5cm= £2.46

**OpSite Flexifix Gentle**

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

**OpSite Flexifix Gentle tape** (Smith & Nephew Healthcare Ltd) 2.5cm= £0.60, 5cm= £1.87

PremierBand bandage (Sherwood) 10 cm × 4 m= £0.17, 15 cm × 4 m= £0.25, 7.5 cm × 4 m= £0.14

Slinky
Fabric plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)
Slinky bandage (Mohlycke Health Care Ltd) 10 cm × 4 m= £0.72, 15 cm × 4 m= £0.65, 7.5 cm × 4 m= £0.60

Stayform
Fabric plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)
Stayform bandage (Robinson Healthcare) 10 cm × 4 m= £0.40, 15 cm × 4 m= £0.68, 8 cm × 4 m= £0.29, 7.5 cm × 4 m= £0.36

Tubular bandages and garments
Tubular bandages are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been applied. The conformability of the elasticated versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate. Compression hosiery reduces the recurrence of venous leg ulcers and should be considered for use after wound healing. Silk clothing is available as an alternative to elasticated viscose stockinette garments, for use in the management of severe eczema and allergic skin conditions.

Elasticised Surgical Tubular Stockinette, Foam padded is used for relief of pressure and elimination of friction in relevant areas; porosity of foam lining allows normal water loss from skin surface.
For Elasticated Tubular Bandage, BP 1993, where no size stated by the prescriber, the 50 cm length should be supplied and width endorsed.
Non-elasticised Cotton Stockinette, Bleached, BP 1988 1 m lengths is used as basis (with wadding) for Plaster of Paris bandages etc.; 6 m length, compression bandage. For Non-elasticised Ribbed Cotton and Viscose Surgical Tubular Stockinette, BP 1988, the Drug Tariff specifies various combinations of sizes to provide sufficient material for part or full body coverage. It is used as protective dressings with tar-based and other steroid ointments.

Elasticated

Acti-Fast
(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage
Acti-Fast 2-way stretch stockinette (L&R Medical UK Ltd) 10.75 cm= £5.74, 17.5 cm= £1.85, 20 cm= £3.23, 3.5 cm= £0.56, 5 cm= £0.58, 7.5 cm= £0.78

Support bandages

DreamSkin
Knitted silk fabric, hypoallergenic, sericin-free, with methacrylate copolymer and zinc-based antibacterial

Tubifast 2-way stretch
(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage; various colours and sizes

CliniLite
Knitted fabric, viscose and elastomer yarn. Type

CliniPlus
Knitted fabric, viscose and elastomer yarn. Type

Support bandages
Light support bandages, which include the various forms of crepe bandage, are used in the prevention of oedema; they are also used to provide support for mild sprains and joints but their effectiveness has not been proven for this purpose. Since they have limited extensibility, they are able to provide light support without exerting undue pressure. For a warning against injudicious compression see Compression bandages.

Cotton Crepe Bandage
Light support bandage, 4.5 m stretched (all)

Hospicare C29 bandage (Paul Hartmann Ltd) 10cm x 4.5m £28.27, 15cm x 4.5m £34.27, 20cm x 4.5m £44.47, 25cm x 4.5m £53.67

Cotton Crepe Bandage, BP 1988
Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton and/or viscose threads; stretch bandage. 4.5 m stretched (both)

Elastocrepe bandage (BNF medical Ltd) 10cm x 4.5m, 7.5cm x 4.5m

**Crepe bandage** (Robert Bailey & Son Pk) 10cm × 4.5m, 15cm × 4.5m, 5cm × 4.5m, 7.5cm × 4.5m

**Propaz crepe bandage** (BSN medical Ltd) 10cm × 4.5m, 15cm × 4.5m, 5cm × 4.5m, 7.5cm × 4.5m

**Vermaid crepe bandage** (Synergy Health (UK) Ltd) 10cm × 4.5m, 15cm × 4.5m, 5cm × 4.5m, 7.5cm × 4.5m

**Elast Knitted fabric, viscose and elastomer yarn**. Type 2 (light support bandage)

**Elast (Molyl hype Healthcare Ltd) S bandage** 15cm × 12m= £5.64, bandage 10cm × 6m= £2.63, 10cm × 8m= £3.37, 15cm × 6m= £2.82

**Hospicrepe 233**
Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all)

**Hospicrepe 233 bandage** (Paul Hartmann Ltd) 10cm × 4.5m= £0.96, 15cm × 4.5m= £1.36, 5cm × 4.5m= £0.52, 7.5cm × 4.5m= £0.72

**Hospiline**
Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

**Hospiline bandage** (Paul Hartmann Ltd) 10cm × 4.5m= £0.63, 15cm × 4.5m= £0.92, 5cm × 4.5m= £0.37, 7.5cm × 4.5m= £0.52

**K-Lite**
Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

**K-Lite (Urgo Ltd) Long bandage** 10cm × 5.25m= £1.16, bandage 10cm × 4.5m= £1.02, 15cm × 4.5m= £1.47, 5cm × 4.5m= £0.56, 7cm × 4.5m= £0.78

**K-Plus**
Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

**K-Plus (Urgo Ltd) Long bandage** 10cm × 10.25m= £2.67, bandage 10cm × 8.7m= £2.31

**Knit-Firm**
Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

**Knit-Firm bandage** (Mallipledge Healthcare) 10cm × 4.5m= £0.66, 15cm × 4.5m= £0.96, 5cm × 4.5m= £0.36, 7cm × 4.5m= £0.51

**L3**
Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

**L3 (Smith & Nephew Healthcare Ltd) bandage** 10cm × 8.6m= £2.26

**Neosport**
Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

**Neosport bandage** (Neomedic Ltd) 10cm × 4.5m= £0.91, 15cm × 4.5m= £1.12, 5cm × 4.5m= £0.54, 7.5cm × 4.5m= £0.73

**PremierBand**
Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all)

**PremierBand bandage** (Sherwood) 10cm × 4.5m= £0.79, 15cm × 4.5m= £1.18, 5cm × 4.5m= £0.45, 7.5cm × 4.5m= £0.63

**Profore #2**
Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

**Profore #2 (Smith & Nephew Healthcare Ltd) bandage** 10cm × 4.5m= £1.39, latex free bandage 10cm × 4.5m= £1.47

**Profore #3**
Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

**Profore #3 (Smith & Nephew Healthcare Ltd) bandage** 10cm × 8.7m= £4.38

**Setocrepe**
Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

**Setocrepe (Molyl hype Healthcare Ltd) bandage** 10cm × 4.5m= £1.21

**Softcrepe**
Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

**Softcrepe bandage** (BSN medical Ltd) 10cm × 4.5m= £1.27, 15cm × 4.5m= £1.85, 5cm × 4.5m= £0.71, 7.5cm × 4.5m= £1.00

**Adhesive bandages**
Elastic adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with zinc paste bandage in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

**Elastic Adhesive Bandage, BP 1993**
Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched

**Tensoplast bandage** (BSN medical Ltd) 10cm × 4.5m, 5cm × 4.5m, 7.5cm × 4.5m

**Cohesive bandages**
Cohesive bandages adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. Cohesive bandages can be used to support sprained joints and as an outer layer for multi-layer compression bandaging; they should not be used if arterial disease is suspected.

**Cohesive extensible bandages**

**Coban**
Bandage

**Coban (3M Health Care Ltd) self-adherant bandage** 10cm × 6m= £2.95

**K Press**
Bandage

**K Press bandage** (Urgo Ltd) 10cm × 6.5m= £2.96, 10cm × 7.5m= £3.45, 12cm × 7.5m= £4.34, 8cm × 7.5cm= £3.25

**Profore #4**
Bandage

**Profore #4 (Smith & Nephew Healthcare Ltd) bandage** 10cm × 2.5m= £3.33, latex free bandage 10cm × 2.5m= £3.62

**Ultra Fast**
Bandage

**Ultra (Robinson Healthcare) Fast cohesive bandage** 10cm × 6.3m= £2.59

**Compression bandages**
High compression products are used to provide the high compression needed for the management of gross varices, post-thrombotic venous insufficiency, venous leg ulcers, and gross oedema in average-sized limbs. Their use calls for an expert knowledge of the elastic properties of the products and experience in the technique of providing careful
graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline p. 254 can be used as adjunct therapy if a chronic venous leg ulcer does not respond to compression bandaging [unlicensed indication].

**High compression bandages**

**High Compression Bandage**
- Cotton, viscose, nylon, and Lycra® extensible bandage, 3 m (unstretched)
- K Three (Urgo Ltd) bandage 10cm × 3m= £2.87
- SurePress (Convatec Ltd) bandage 10cm × 3m= £3.71

**PEC High Compression Bandages**
- Polyamide, elastane, and cotton compression (high) extensible bandage, 3.5 m unstretched
- Setopress (Molnlycke Health Care Ltd) bandage 10cm × 3.5m= £3.58

**VEC High Compression Bandages**
- Viscose, elastane, and cotton compression (high) extensible bandage, 3 m unstretched (both)
- Tensopress bandage (BSN medical Ltd) 10cm × 3m= £3.54, 7.5cm × 3m= £2.75

**Short stretch compression bandages**

**Actico Bandage**
- Actico Bandage (L&R Medical UK Ltd) 10cm × 6m= £3.43, 12cm × 6m= £4.38, 4cm × 6m= £2.46, 6cm × 6m= £2.88, 8cm × 6m= £3.31

**Comprilan Bandage**
- Comprilan bandage (BSN medical Ltd) 10cm × 5m= £3.46, 12cm × 5m= £4.22, 6cm × 5m= £2.74, 8cm × 5m= £3.22

**Rosidal K Bandage**
- Rosidal K Bandage (Lohmann & Rauscher) 10cm × 10m= £6.17, 10cm × 5m= £3.55, 12cm × 5m= £4.30, 6cm × 5m= £2.72, 8cm × 5m= £3.25

**Sub-compression wadding bandage**

**Cellona Undercast Padding**
- Padding
- Cellona Undercast padding bandage (Lohmann & Rauscher) 10cm × 2.75m= £0.48, 15cm × 2.75m= £0.62, 5cm × 2.75m= £0.32, 7.5cm × 2.75m= £0.39

**Flexi-Ban Padding**
- Flexi-Ban (L&R Medical UK Ltd) bandage 10cm × 3.5m= £0.51

**K Tech Reduced Padding**
- K Tech Reduced bandage 10cm × (Urgo Ltd) 6m= £4.79, 7.3m= £5.23

**K-Soft Padding**
- K-Soft (Urgo Ltd) Long bandage 10cm × 4.5m= £0.58, bandage 10cm × 3.5m= £0.46

**K-Tech (K Tech in DMD) Padding**
- K-Tech (K Tech in DMD) Reduced bandage 10cm × 7.3m= £5.23, bandage 10cm × 5m= £3.99, 10cm × 6m= £4.79, 12cm × 6m= £6.04, 12cm × 7.3m= £6.60, 8cm × 6m= £4.52, 8cm × 7.3m= £4.93

**Ortho-Band Plus Padding**
- Ortho-Band (Millp ledgeHealthcare) Plus bandage 10cm × 3.5m= £0.37

**Profore #1 Padding**
- Profore #1 (Smith & Nephew Healthcare Ltd) bandage 10cm × 3.5m= £0.72, latex free bandage 10cm × 3.5m= £0.78

**Softex Padding**
Graduated compression hosiery

**Class 1 Light Support**
Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel

**Class 2 Light Support**
Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel

**Class 2 Medium Support**
Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Class 3 Strong Support**
Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Knee caps**
Class 2 Medium Support
Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Class 3 Strong Support**
Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Lymphoedema garments**
Lymphoedema compression garments are used to maintain limb shape and prevent additional fluid retention. Either flat-bed or circular knitting methods are used in the manufacture of elasticated compression garments. Seamless, circular-knitted garments (in standard sizes) can be used to prevent swelling if the lymphoedema is well controlled and if the limb is in good shape and without skin folds. Flat-knitted garments (usually made-to-measure) with a seam, provide greater rigidity and stiffness to maintain reduction of lymphoedema following treatment with compression bandages. A standard range of light, medium, or high compression garments are available, as well as low compression (12–16 mmHg) arm sleeves, made-to-measure garments up to compression 90 mmHg, and accessories—see Drug Tariff for details. Note there are different compression values for lymphoedema garments and graduated compression hosiery, see Compression hosiery and garments above.

---

**Compression hosiery and garments**

£11.35, multi-layer compression bandage kit (8cm) 18cm–25cm ankle circumference=£7.77, 25cm–32cm ankle circumference=£8.45, multi-layer compression bandage kit size 0 short 18cm–25cm ankle circumference=£6.95, with UrgoStart multi-layer compression bandage kit 18cm–25cm ankle circumference=£10.27, 25cm–32cm ankle circumference=£10.95

**Medicated bandages**
Zinc Paste Bandage has been used with compression bandaging for the treatment of venous leg ulcers. However, paste bandages are associated with hypersensitivity reactions and should be used with caution. Zinc paste bandages are also used with coal tar or ichthammol in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions.

Zipzoc® can be used under appropriate compression bandages or hosiery in chronic venous insufficiency.

**Zinc Paste Bandage, BP 1993**
Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide; requires additional bandaging
Excipients: may include cetostearyl alcohol, hydroxybenzoates

**Viscopaste (Evolan Pharma AB) PB 7 bandage** 7.5cm × 6m= £3.74

**Zinc Paste and Ichtammol Bandage, BP 1993**
Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging
Excipients: may include cetostearyl alcohol

**Ichthammol**
(Evolan Pharma AB) bandage 7.5cm × 6m= £3.78

**Zipzoc**
Sterile rayon stocking impregnated with ointment containing zinc oxide 20%

**Zipzoc (Evolan Pharma AB) stockings**= £34.70

**Compression hosiery and garments**

Compression (elastic) hosiery is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging. Doppler testing to confirm arterial insufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

**Graduated Compression hosiery, Class 1 Light Support** is used for superficial or early varices, varicosis during pregnancy.

**Graduated Compression hosiery, Class 2 Medium Support** is used for varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy.

**Graduated Compression hosiery, Class 3 Strong Support** is used for gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis.

**Compression values for hosiery and lymphoedema garments**

**Class 1:** Compression hosiery (British standard) 14–17 mmHg, lymphoedema garments (European classification) 18–21 mmHg; **Class 2** Compression hosiery (British standard) 18–24 mmHg, lymphoedema garments (European classification) 23–32 mmHg; **Class 3** Compression hosiery (British standard) 25–35 mmHg, lymphoedema garments (European classification) 34–46 mmHg; **Class 4** Compression hosiery (British standard)—not available, lymphoedema garments (European classification) 49–70 mmHg; **Class 4 super** Compression hosiery (British standard)—not available, lymphoedema garments (European classification) 60–90 mmHg.
Dental Practitioners’ Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Licensed sugar-free versions, where available, are preferred.
Licensed alcohol-free mouthwashes, where available, are preferred.

Aciclovir Tablets, BP
Aciclovir Cream, BP
Aciclovir Oral Suspension, BP, 200 mg/5 mL
Aciclovir Tablets, BP, 200 mg
Amoxicillin Capsules, BP
Amoxicillin Oral Powder, DPF
Amoxicillin Oral Suspension, BP
Artificial Saliva Gel, DPF
Artificial Saliva Oral Spray, DPF
Artificial Saliva Pastilles, DPF
Artificial Saliva Protective Spray, DPF
Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS (patients suffering from dry mouth as a result of having or, having undergone, radiotherapy or sicca syndrome):
BioXtra Gel Mouthspray
BioXtra Moisturising Gel
Glansosane
Salvez
Artificial Saliva Substitute Spray, DPF
Aspirin Tablets, Dispensable, BP
Azithromycin Capsules, 250 mg, DPF
Azithromycin Oral Suspension, 200 mg/5 mL, DPF
Azithromycin Tablets, 250 mg, DPF
Azithromycin Tablets, 500 mg, DPF
Beclometasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as:
Clenil Modulite
Benzydamine Mouthwash, BP 0.15%
Benzydamine Oromucosal Spray, BP 0.15%
Betamethasone Soluble Tablets, 500 micrograms, DPF
Carbamazepine Tablets, BP
Cefalexin Capsules, BP
Cefalexin Oral Suspension, BP
Cefalexin Tablets, BP
Cefradine Capsules, BP
Cetirizine Tablets, BP, 10 mg
Chlorhexidine Gluconate Gel, BP
Chlorhexidine Mouthwash, BP
Chlorhexidine Oral Spray, DPF
Chlorpheniramine Oral Solution, BP
Chlorpheniramine Tablets, BP
Choline Salicylate Dental Gel, BP
Clarithromycin Oral Suspension, 125 mg/5 mL, DPF
Clarithromycin Oral Suspension, 250 mg/5 mL, DPF
Clarithromycin Tablets, BP
Clindamycin Capsules, BP
Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL
Diazepam Oral Solution, BP, 2 mg/5 mL
Diazepam Tablets, BP
Diclofenac Sodium Tablets, Gastro-resistant, BP
Dihydromocodeine Tablets, BP, 30 mg
Doxycline Tablets, Dispersible, BP
Doxycycline Capsules, BP, 100 mg
Doxycycline Tablets, 20 mg, DPF
Ephedrine Nasal Drops, BP
Erythromycin Ethyl Succinate Oral Suspension, BP
Erythromycin Ethyl Succinate Tablets, BP
Erythromycin Stearate Tablets, BP
Erythromycin Tablets, Gastro-resistant, BP
Fluconazole Capsules, 50 mg, DPF
Fluconazole Oral Suspension, 50 mg/5 mL, DPF
Hydrocortisone Cream, BP, 1%
Hydrocortisone Oromucosal Tablets, BP
Hydrogen Peroxide Mouthwash, BP, 6%
Ibuprofen Oral Suspension, BP, sugar-free
Ibuprofen Tablets, BP
Lansoprazole Capsules, Gastro-resistant, BP
Lidocaine Ointment, BP, 5%
Lidocaine Spray 10%, DPF
Loratadine Syrup, 5 mg/5 mL, DPF
Loratadine Tablets, BP, 10 mg
Menthol and Eucalyptus Inhalation, BP 1980
Metronidazole Oral Suspension, BP
Metronidazole Tablets, BP
Miconazole Cream, BP
Miconazole Oromucosal Gel, BP
Miconazole and Hydrocortisone Cream, BP
Miconazole and Hydrocortisone Ointment, BP
Nystatin Oral Suspension, BP
Omeprazole Capsules, Gastro-resistant, BP
Oxytetracycline Tablets, BP
Paracetamol Oral Suspension, BP
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP
Phenoxymethylpenicillin Oral Solution, BP
Phenoxymethylpenicillin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Saliva Stimulating Tablets, DPF
Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Mouthwash, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations.

For details of preparations that can be prescribed, see individual entries under the relevant drug monographs throughout the BNF publications.

Details of DPF preparations

Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF. Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

Amoxicillin Oral Powder
amoxicillin (as trihydrate) 3 g sachet
Artificial Saliva Gel
(proprietary product: Biotene Oralbalance), lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis.

Artificial Saliva Oral Spray
(proprietary product: Xerotin) consists of water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral.

Artificial Saliva Pastilles
(proprietary product: Salivix), consists of acacia, malic acid, and other ingredients.

Artificial Saliva Protective Spray
(proprietary product: Aquoral) consists of oxidised glycerol triesters, silicon dioxide, flavouring agents, aspartame.

Artificial Saliva Substitute Spray
(proprietary product: AS Saliva Orthana Spray) consists of mucin, methylparaben, benzalkonium chloride, EDTA, xylitol, peppermint oil, spearmint oil, mineral salts.

Azithromycin Capsules
azithromycin 250 mg.

Azithromycin Oral Suspension 200 mg/5 mL.
azithromycin 200 mg/5 mL when reconstituted with water.

Azithromycin Tablets
azithromycin 250 mg and 500 mg.

Betamethasone Soluble Tablets 500 micrograms.
betamethasone (as sodium phosphate) 500 micrograms.

Chlorhexidine Oral Spray
(proprietary product: Corsodyl Oral Spray), chlorhexidine gluconate 0.2%.

Clarithromycin Oral Suspension 125 mg/5 mL.
clarithromycin 125 mg/5 mL when reconstituted with water.

Clarithromycin Oral Suspension 250 mg/5 mL.
clarithromycin 250 mg/5 mL when reconstituted with water.

Doxycycline Tablets 20 mg.
(proprietary product: Periostat), doxycycline (as hyclate) 20 mg.

Fluconazole Capsules 50 mg.
fluconazole 50 mg.

Fluconazole Oral Suspension 50 mg/5 mL.
(proprietary product: Diflucan), fluconazole 50 mg/5 mL when reconstituted with water.

Lidocaine Spray 10%.
(proprietary product: Xylocaine Spray), lidocaine 10% supplying 10 mg lidocaine/spray.

Loratadine Syrup 5 mg/5 mL.
loratadine 5 mg/5 mL.

Saliva Stimulating Tablets
(proprietary product: SST), citric acid, malic acid and other ingredients in a sorbitol base.

Sodium Fluoride Toothpaste 0.619%.
(proprietary product: Duraphat ‘2800 ppm’ Toothpaste), sodium fluoride 0.619%.

Sodium Fluoride Toothpaste 1.1%.
(proprietary product: Duraphat ‘5000 ppm’ Toothpaste), sodium fluoride 1.1%.
Nurse Prescribers’ Formulary (NPF)

Nurse Prescribers’ Formulary for Community Practitioners

List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described under Details of NPF preparations. Preparations on this list which are not included in the BP or BPC are described under Details of NPF preparations.

Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Emollient Bath and Shower Preparations as listed below:

- Aqueous Cream, BP
- Balneum® (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
- Balneum Plus® Bath Oil (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
- Cetiraben® emollient Bath Additive
- Dermal® Bath Emollient
- Doublebase® Emollient Bath Additive
- Doublebase® Emollient Shower Gel
- Doublebase® Emollient Wash Gel
- Hydromol® Bath and Shower Emollient
- Oiatum® Emollient
- Oiatum® Gel
- Oiatum® Junior Bath Additive
- Zerolatum® Emollient Medicinal Bath Oil
- Folic Acid Tablets 400 micrograms, BP
- Glycerol Suppositories, BP
- Ibuprofen Oral Suspension, BP (except for indications and doses that are prescription-only)
- Ibuprofen Tablets, BP (except for indications and doses that are prescription-only)
- Ispaghula Husk Granules, BP
- Ispaghula Husk Granules, Effervescent, BP
- Ispaghula Husk Oral Powder, BP
- Lactulose Solution, BP
- Lidocaine Ointment, BP
- Lidocaine and Chlorhexidine Gel, BP
- Macrogol Oral Liquid, Compound, NPF
- Macrogol Oral Powder, Compound, NPF
- Macrogol Oral Powder, Compound, Half-strength, NPF
- Magnesium Hydroxide Mixture, BP
- Magnesium Sulfate Paste, BP
- Malathion aqueous lotions containing at least 0.5% of both of which are available as
- Mebendazole Tablets, NPF
- Mebendazole Tablets, BP
- Miconazole Oromucosal Gel, BP
- Mouthwash Solution-tablets, NPF
- Nicotine Inhalation Cartridge for Oromucosal Use, NPF
- Nicotine Lozenge, NPF
- Nicotine Medicated Chewing Gum, NPF
- Nicotine Nasal Spray, NPF
- Nicotine Oral Spray, NPF
- Nicotine Sublingual Tablets, NPF
- Nicotine Transdermal Patches, NPF
- Nystatin Oral Suspension, BP
- Olive Oil Ear Drops, BP
- Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)

www.getintopharma.com
Paracetamol Tablets, BP (max. 96 tablets; max. pack size 32 tables)
Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets; max. 96 tablets; max. pack size 32 tablets)
Permethrin Cream, NPF
Phosphates Enema, BP
Povidone–Iodine Solution, BP
Senna Oral Solution, NPF
Senna Tablets, BP
Senna and Ispaghula Granules, NPF
Sodium Chloride Solution, Sterile, BP
Sodium Citrate Compound Enema, NPF
Sodium Picosulphate Capsules, NPF
Sodium Picosulphate Elixir, NPF
Spermicidal contraceptives as listed below:
- Gygel® Contraceptive Jelly
- Sterculia Granules, NPF
- Sterculia and Frangula Granules, NPF
- Titanium Ointment, BP
- Water for Injections, BP
- Zinc and Castor Oil Ointment, BP
- Zinc Oxide and Dimeticone Spray, NPF
- Zinc Oxide Impregnated Medicated Bandage, NPF
- Zinc Oxide Impregnated Medicated Stocking, NPF
- Zinc Paste Bandage, BP 1993
- Zinc Paste and Ichthammol Bandage, BP 1993

**Appliances and Reagents (including Wound Management Products)**

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated N.

**Appliances** (including Contraceptive Devices) as listed in Part I of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressing) of the Scottish Drug Tariff). (Where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic.)

**Incontinence Appliances** as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff).

**Stoma Appliances and Associated Products** as listed in Part IX of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff).

**Chemical Reagents** as listed in Part IX of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff).

The Drug Tariffs can be accessed online at:
- National Health Service Drug Tariff for England and Wales: [www.ppa.org.uk/ppa/edt_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm)
- Health and Personal Social Services for Northern Ireland Drug Tariff: [www.hscbusiness.hscni.net/services/2034.htm](http://www.hscbusiness.hscni.net/services/2034.htm)

**Details of NPF preparations**

Preparations on the Nurse Prescribers’ Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers’ Formulary. Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

**Arachis Oil Enema**

arachis oil 100%

**Catheter Maintenance Solution, Sodium Chloride**

(proprietary products: OptiFlo S; Uro-Tainer Sodium Chloride; Ureflex-S), sodium chloride 0.9%

**Catheter Maintenance Solution, ‘Solution G’**

(proprietary products: OptiFlo G; Uro-Tainer Suby G; Ureflex G), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

**Catheter Maintenance Solution, ‘Solution R’**

(proprietary products: OptiFlo R; Uro-Tainer Solution R; Ureflex R), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

**Chlorhexidine gluconate alcoholic solutions**

(proprietary products: ChloraPrep, Hydrex Solution; Hydrex spray), chlorhexidine gluconate in alcoholic solution

**Chlorhexidine gluconate aqueous solutions**

(proprietary product: Unisept), chlorhexidine gluconate in aqueous solution

**Co-danthramer Capsules**

(co-danthramer 25/200 (dantron 25 mg, poloxamer 188’ 200 mg)

**Co-danthramer Capsules, Strong**

(co-danthramer 37.5/200 (dantron 37.5 mg, poloxamer 188’ 500 mg)

**Co-danthramer Oral Suspension**

(proprietary product: Codalax), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer 188’ 200 mg/5 mL)

**Co-danthramer Oral Suspension, Strong**

(proprietary product: Codalax Forte), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer 188’ 1 g/5 mL)

**Co-danthrusate Oral Suspension**

(proprietary product: Normax), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

**Dimeticone barrier creams**

(proprietary products Conotrane Cream, dimeticone 350’ 22%; Siopel Barrier Cream, dimeticone 1000’ 10%), dimeticone 10–22%

**Dimeticone Lotion**

(proprietary product: Hedrin), dimeticone 4%

**Docusate Enema**

(proprietary product: Norgalax Micro-enema), docusate sodium 120 mg in 10 g

**Liquid and White Soft Paraffin Ointment**

liquid paraffin 50%, white soft paraffin 50%

**Macrogol Oral Liquid, Compound**

(proprietary product: Movicol Liquid), macrogol 3350’ (polyethylene glycol 3350’ 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL)

**Macrogol Oral Powder, Compound**

(proprietary products: Laxido Orange, Molaxole, Movicol), macrogol 3350’ (polyethylene glycol 3350’ 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet; (amount of potassium chloride varies according to strength of Movicol® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K⁺ 5.4 mmol/litre)

**Macrogol Oral Powder, Compound, Half-strength**

(proprietary product: Movicol-Half), macrogol 3350’ (polyethylene glycol 3350’ 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet)
Malathion aqueous lotions (proprietary products: Derbac-M Liquid), malathion 0.5% in an aqueous basis

Mebendazole Oral Suspension
(proprietary product: Vermox), mebendazole 100 mg/5 mL.

Mebendazole Tablets
(proprietary products: Ovex, Vermox), mebendazole 100 mg (can be supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg)

Mouthwash Solution-tablets consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescence basis to make a mouthwash

Nicotine Inhalation Cartridge for Oromucosal Use
(proprietary products: NicAssist Inhalator, Nicorette Inhalator), nicotine 15 mg (for use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)

Nicotine Lozenge
nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: Nicorette Mint Lozenge, Nicotinell Mint Lozenge), or nicotine (as resinate) 1.5 mg, 2 mg, or 4 mg (proprietary product: NiQuitin Lozenges, NiQuitin Minis, NiQuitin Pre-quit)

Nicotine Medicated Chewing Gum
(proprietary products: NicAssist Gum, Nicorette Gum, Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg

Nicotine Nasal Spray
(proprietary product: NicAssist Nasal Spray, Nicorette Nasal Spray), nicotine 500 micrograms/metered spray

Nicotine Oral Spray
(proprietary product: Nicorette Quickmist), nicotine 1 mg/metered spray

Nicotine Sublingual Tablets
(proprietary product: NicAssist Microtab, Nicorette Microtab), nicotine (as a cyclodextrin complex) 2 mg (to be prescribed as either a starter pack (2 x 15-tablet discs with dispenser) or refill pack (7 x 15-tablet discs))

Nicotine Transdermal Patches releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary products: Boots NicAssist Patch, Nicorette Patch), or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (proprietary products: NicAssist Translucent Patch, Nicorette Invisi Patch), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear) (prescriber should specify the brand to be dispensed)

Permethrin Cream
(proprietary product: Lyclear Dermal Cream), permethrin 5%

Senna Oral Solution
(proprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL.

Senna and Ispaghula Granules
(proprietary product: Manevac Granules), senna fruit 12.4%, ispaghula 54.2%

Sodium Citrate Compound Enema
(proprietary products: Micolette Micro-enema; Micralax Micro-enema; Relaxit Micro-enema), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

Sodium Picosulfate Capsules
(proprietary products: Dulcolax Perles), sodium picosulfate 2.5 mg
Non-medical prescribing

Overview
A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers. Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

For information on the supply and administration of medicines to groups of patients using Patient Group Directions see Guidance on prescribing p. 1.

In order to protect patient safety, the initial prescribing and supply of medicines prescribed should normally remain separate functions performed by separate healthcare professionals.

Nurses
Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition. Unlicensed medicines are excluded from the Nurse Prescribing Formulary in Scotland.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine hydrochloride p. 456, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

The Nurse Prescribers’ Formulary (NPF) p. 1617 for Community Practitioners provides information on prescribing.

Pharmacists
Pharmacist Independent Prescribers can prescribe any medicine for any medical condition. This includes unlicensed medicines, subject to accepted clinical good practice.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine hydrochloride p. 456, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Physiotherapists
Physiotherapist Independent Prescribers can prescribe any medicine for any medical condition. This includes "off-label" medicines subject to accepted clinical good practice. They are also allowed to prescribe the following Controlled Drugs: oral or injectable morphine p. 463, transdermal fentanyl p. 458 and oral diazepam p. 343, dihydrocodeine tartrate p. 456, lorazepam p. 339, oxycodone hydrochloride p. 466 or temazepam p. 488.

Physiotherapist Independent Prescribers must work within their own level of professional competence and expertise.

Therapeutic radiographers
Therapeutic Radiographer Independent Prescribers can prescribe any medicine for any medical condition. This includes "off-label" medicines subject to accepted clinical good practice. Therapeutic Radiographer Independent Prescribers must work within their own level of professional competence and expertise.

Optometrists
Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

Podiatrists
Podiatrist Independent Prescribers can prescribe any medicine for any medical condition. This includes "off-label" medicines subject to accepted clinical good practice. They are also allowed to prescribe the following Controlled Drugs for oral administration: diazepam p. 343, dihydrocodeine tartrate p. 456, lorazepam p. 339 and temazepam p. 488.

Podiatrist Independent Prescribers must work within their own level of professional competence and expertise.

Further Information
For further details about the different types of prescribers, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).
Index of manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on ‘special-order’ manufacturers and specialist importing companies see ‘Special-order manufacturers’.

Special-order manufacturers

Unlicensed medicines are available from ‘special-order’ manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at tinyurl.com/cdsleke.

Licensed hospital manufacturing units also manufacture ‘special-order’ products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

# REPORT OF SUSPECTED ADVERSE DRUG REACTIONS

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See 'Adverse reactions to drugs' section in BNF or [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard) for guidance. Do not be put off reporting because some details are not known.

## PATIENT DETAILS
- **Patient Initials:**
- **Sex:** M / F
- **Is the patient pregnant?** Y / N
- **Ethnicity:**
- **Age (at time of reaction):**
- **Weight (kg):**
- **Identification number (e.g. Practice or Hospital Ref):**

## SUSPECTED DRUG(S)/VACCINE(S)

<table>
<thead>
<tr>
<th>Drug/Vaccine (Brand if known)</th>
<th>Batch</th>
<th>Route</th>
<th>Dosage</th>
<th>Date started</th>
<th>Date stopped</th>
<th>Prescribed for</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>

<tr>
<td>Other [ ]</td>
</tr>
</tbody>
</table>

- **Date reaction(s) started:**
- **Date reaction(s) stopped:**

Do you consider the reactions to be serious?  
[ ] Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

- [ ] Patient died due to reaction
- [ ] Involved or prolonged inpatient hospitalisation
- [ ] Life threatening
- [ ] Involved persistent or significant disability or incapacity
- [ ] Congenital abnormality
- [ ] Medically significant; please give details: __________________________

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

- [ ] Mild
- [ ] Unpleasant, but did not affect everyday activities
- [ ] Bad enough to affect everyday activities

Adult Advanced Life Support Algorithm

Resuscitation Council (UK) 2015
Adult Advanced Life Support

Unresponsive and not breathing normally

Call resuscitation team

CPR 30:2
Attach defibrillator/monitor
Minimise interruptions

Assess rhythm

Shockable (VF/Pulseless VT)

1 Shock
Minimise interruptions

Immediately resume CPR for 2 min
Minimise interruptions

Return of spontaneous circulation

Immediate post cardiac arrest treatment
- Use ABCDE approach
- Aim for SpO₂ of 94-96%
- Aim for normal PaCO₂
- 12-lead ECG
- Treat precipitating cause
- Targeted temperature management

Non-shockable (PEA/Asystole)

Immediately resume CPR for 2 min
Minimise interruptions

During CPR
- Ensure high quality chest compressions
- Minimise interruptions to compressions
- Give oxygen
- Use waveform capnography
- Continuous compressions when advanced airway in place
- Vascular access (intravenous or intraosseous)
- Give adrenaline every 3-5 min
- Give amiodarone after 3 shocks

Treat Reversible Causes
- Hypoxia
- Hypovolaemia
- Hypo-hyperkalaemia/metabolic
- Hypothermia
- Thrombosis - coronary or pulmonary
- Tension pneumothorax
- Tamponade – cardiac
- Toxins

Consider
- Ultrasound imaging
- Mechanical chest compressions to facilitate transfer/treatment
- Coronary angiography and percutaneous coronary intervention
- Extracorporeal CPR

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, 2015

www.getintopharma.com
Medical emergencies in the community

Overview
Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the patient’s condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

Acute coronary syndromes

- **ANGINA: UNSTABLE**
  - Aspirin dispersible tablets p. 121 (75 mg, 300 mg)
    - By Mouth (dispersed in water or chewed)
    - Adult: 300 mg
  - **PLUS**
  - **EITHER**
    - Glyceril trinitrate aerosol spray p. 218
      - (400 micrograms/metered dose)
      - Sublingually
      - Adult: 1–2 sprays, repeated as required
  - **OR**
    - Glyceril trinitrate tablets (300 micrograms, 500 micrograms, 600 micrograms)
      - Sublingually
      - Adult: 0.3–1 mg, repeated as required
  - **MYOCARDIAL INFARCTION: NON-ST-SEGMENT ELEVATION**
  - Treat as for Angina: unstable
  - **MYOCARDIAL INFARCTION: ST-SEGMENT ELEVATION**
  - Aspirin dispersible tablets (75 mg, 300 mg)
    - By Mouth (dispersed in water or chewed)
    - Adult: 300 mg
  - Glyceril trinitrate aerosol spray (400 micrograms/metered dose)
    - Sublingually
    - Adult: 1–2 sprays, repeated as required
  - **OR**
    - Glyceril trinitrate tablets (300 micrograms, 500 micrograms, 600 micrograms)
      - Sublingually
      - Adult: 0.3–1 mg, repeated as required

Airways disease, obstructive

- **ASTHMA: ACUTE**
  - Regard each emergency consultation as being for severe acute asthma until shown otherwise; failure to respond adequately at any time requires immediate transfer to hospital
  - **EITHER**
    - Salbutamol aerosol inhaler p. 252
      - (100 micrograms/metered inhalation)
      - By Aerosol Inhalation Via Large-Volume Spacer
      - (And a Close-Fitting Face Mask If Child Under 3 Years)
      - Adult and child: 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary
  - **OR**
    - Salbutamol nebuliser solution (1 mg/mL, 2 mg/mL)
      - By Inhalation of Nebulised Solution (Via Oxygen-Driven Nebuliser If Available)
      - Child 4 years and below: 2.5 mg every 20–30 minutes or as necessary
      - Child 5-11 years: 2.5–5 mg every 20–30 minutes or as necessary
      - Child 12-17 years: 5 mg every 20–30 minutes or as necessary
      - Adult: 5 mg every 20–30 minutes or as necessary
  - **OR**
    - Terbutaline sulfate nebuliser solution p. 255 (2.5 mg/mL)
      - By Inhalation of Nebulised Solution (Via Oxygen-Driven Nebuliser If Available)
      - Child 4 years and below: 5 mg every 20–30 minutes or as necessary
      - Child 5-11 years: 5–10 mg every 20–30 minutes or as necessary
      - Child 12-17 years: 10 mg every 20–30 minutes or as necessary
      - Adult: 10 mg every 20–30 minutes or as necessary
  - **PLUS** (In all cases)
  - **EITHER**
    - Prednisolone tablets p. 678 (or prednisolone soluble tablets) (5 mg)
      - By Mouth
      - Child 11 years and below: 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
      - Child 12-17 years: 40–50 mg once daily for at least 5 days
      - Adult: 40–50 mg once daily for at least 5 days
  - **OR**
    - Hydrocortisone p. 676 (preferably as sodium succinate)
      - By Intravenous Injection
      - Child 17 years and below: 4 mg/kg (max. 100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable:
        - Child 1 year and below: 25 mg
        - Child 2-4 years: 50 mg
        - Child 5-17 years: 100 mg
        - Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible
  - High-flow oxygen should be given if available (via face mask in children)
  - Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission.
  - While awaiting ambulance, repeat nebulised beta₂ agonist (as above) and give with

www.getintopharma.com
Ipratropium bromide nebuliser solution p. 246
(250 micrograms/mL)
BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
▷ Child 11 years and below: 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
▷ Child 12-17 years: 500 micrograms every 4–6 hours as necessary
▷ Adult: 500 micrograms every 4–6 hours as necessary
▷ CROUP
Dexamethasone oral solution p. 675 (2 mg/5 mL)
BY MOUTH
▷ Child 1 month-2 years: 150 micrograms/kg as a single dose

Anaphylaxis
▷ ANAPHYLAXIS
Adrenaline/epinephrine injection p. 222 (1 mg/mL (1 in 1000))
BY INTRAMUSCULAR INJECTION
▷ Child 5 years and below: 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
▷ Child 6-11 years: 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
▷ Child 12-17 years: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary
▷ Adult: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary
High-flow oxygen and intravenous fluids should be given as soon as available.
Chlorphenamine maleate injection p. 283
BY INTRAVENOUS OR INTRAMUSCULAR INJECTION
May help counter histamine-mediated vasodilation and bronchoconstriction.
Hydrocortisone (preferably as sodium succinate)
BY INTRAVENOUS INJECTION
Has delayed action but should be given to severely affected patients to prevent further deterioration.

Bacterial infection
▷ MENINGOCOCCAL DISEASE
Benzylenpenicillin sodium injection p. 547 (600 mg, 1.2 g)
BY INTRAMUSCULAR INJECTION (OR BY INTRAVENOUS INJECTION IF VENOUS ACCESS NOT AVAILABLE)
▷ Neonate: 300 mg
▷ Child 1 month-11 months: 300 mg
▷ Child 1-9 years: 600 mg
▷ Child 10-17 years: 1.2 g
▷ Adult: 1.2 g
NOTE A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer.
▷ OR if history of allergy to penicillin
Cefotaxime injection p. 527 (1 g)
BY INTRAVENOUS INJECTION (OR BY INTRAMUSCULAR INJECTION IF VENOUS ACCESS NOT AVAILABLE)
▷ Neonate: 50 mg/kg
▷ Child 1 month-11 years: 50 mg/kg (max. 1 g)
▷ Child 12-17 years: 1 g
▷ Adult: 1 g
NOTE A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.
▷ OR if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins
Chloramphenicol injection p. 568 (1 g)
BY INTRAVENOUS INJECTION
▷ Child: 12.5–25 mg/kg
▷ Adult: 12.5–25 mg/kg
 NOTE A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.
See also Central nervous system infections, antibacterial therapy p. 511.

Hypoglycaemia
▷ DIABETIC HYPOGLYCAEMIA
Glucose or sucrose
BY MOUTH
▷ Adult and child over 2 years: approx. 10–20 g (110–220 mL
Lucozade® Energy Original or 100–200 mL Coca-Cola®—both non-diet versions or 2–4 teaspoonfuls of sugar or 3–6 sugar lumps) repeated after 10–15 minutes if necessary
▷ OR if hypoglycaemia unresponsive or if oral route cannot be used
Glucagon injection p. 724 (1 mg/mL)
BY SUBCUTANEOUS OR INTRAMUSCULAR INJECTION
▷ Child body-weight up to 25 kg: 500 micrograms (0.5 mL)
▷ Child body-weight 25 kg and over: 1 mg (1 mL)
▷ Adult: 1 mg (1 mL)
▷ OR if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes
Glucose intravenous infusion p. 1041 (10%) BY INTRAVENOUS INJECTION INTO LARGE VEIN
▷ Child: 5 mL/kg (glucose 500 mg/kg)
Glucose intravenous infusion (20%) BY INTRAVENOUS INJECTION INTO LARGE VEIN
▷ Adult: 50 mL

Seizures
▷ CONVULSIVE (INCLUDING FEBRILE) SEIZURES LASTING LONGER THAN 5 MINUTES
▷ EITHER Diazepam rectal solution p. 343 (2 mg/mL, 4 mg/mL)
BY RECTUM
▷ Neonate: 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
▷ Child 1 month-1 year: 5 mg, repeated once after 10–15 minutes if necessary
▷ Child 2-11 years: 5–10 mg, repeated once after 10–15 minutes if necessary
▷ Child 12-17 years: 10–20 mg, repeated once after 10–15 minutes if necessary
▷ Adult: 10–20 mg, repeated once after 10–15 minutes if necessary
▷ Elderly: 10 mg, repeated once after 10–15 minutes if necessary
▷ OR Midazolam oromucosal solution p. 340
BY BUCCAL ADMINISTRATION, REPEATED ONCE AFTER 10 MINUTES IF NECESSARY
▷ Neonate: 300 micrograms/kg [unlicensed]
▷ Child 1-2 months: 300 micrograms/kg (max. 2.5 mg) [unlicensed]
▷ Child 3 months-11 months: 2.5 mg
▷ Child 1-4 years: 5 mg
▷ Child 5-9 years: 7.5 mg
▷ Child 10-17 years: 10 mg
▷ Adult: 10 mg [unlicensed]

- 1 litre = 1000 millilitres (mL)
- 1 millilitre (mL) = 1000 microlitres
- 1 pint = 568 mL

### Other units

- 1 kilocalorie (kcal) = 4186.8 joules (J)
- 1000 kilocalories (kcal) = 4.1868 megajoules (MJ)
- 1 megajoule (MJ) = 238.8 kilocalories (kcal)
- 1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)
- 1 kilopascal (kPa) = 7.5 mmHg (pressure)

### Plasma-drug concentrations

Plasma-drug concentrations in BNF publications are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

### Prescribing for children: weight, height, and gender

The table below shows the mean values for weight, height, and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of measurements. However, an individual’s weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

Recommended wording of cautionary and advisory labels

For details including Welsh Language translation see p. 1588

1  Warning: This medicine may make you sleepy
2  Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3  Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4  Warning: Do not drink alcohol
5  Do not take indigestion remedies 2 hours before or after you take this medicine
6  Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7  Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8  Warning: Do not stop taking this medicine unless your doctor tells you to stop
9  Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10 Warning: Read the additional information given with this medicine
11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12 Do not take anything containing aspirin while taking this medicine
13 Dissolve or mix with water before taking
14 This medicine may colour your urine. This is harmless
15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
17 Do not take more than... in 24 hours
18 Do not take more than... in 24 hours. Also, do not take more than... in any one week
19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
20 Take with or just after food, or a meal
21 Take 30 to 60 minutes before food
22 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
23 Suck or chew this medicine
24 Swallow this medicine whole. Do not chew or crush
25 Dissolve this medicine under your tongue
26 Take with a full glass of water
27 Spread thinly on the affected skin only
28 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
29 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
30 Contains aspirin. Do not take anything else containing aspirin while taking this medicine

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c. = ante cibum (before food)
b. d. = bis die (twice daily)
o. d. = omni die (every day)
o. m. = omni mane (every morning)
o. n. = omni nocte (every night)
p. c. = post cibum (after food)
p. r. n. = pro re nata (when required)
q. d. s. = quater die sumendum (to be taken four times daily)
q. q. h. = quaerat die quaque hora (every four hours)
stat = immediately
t. d. s. = ter die sumendum (to be taken three times daily)
t. i. d. = ter in die (three times daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102 Tartrazine
E104 Quinoline Yellow
E110 Sunset Yellow FCF
E123 Amaranth
E124 Ponceau 4R
E127 Erythrosine BS
E132 Indigo Carmine
E142 Green S
E171 Titanium Dioxide
E172 Iron oxides, iron hydroxides
E200 Sorbic Acid
E211 Sodium Benzoate
E223 Sodium Metabisulphite
E320 Butylated Hydroxyanisole
E321 Butylated Hydroxytoluene
E322 Lecithins
E420 Sorbitol
E421 Mannitol
E422 Glycerol
E901 Beeswax (white and yellow)
E1520 Propylene Glycol
