Since 1949 the British National Formulary (BNF) has been the UK's most trusted and authoritative healthcare resource, helping to ensure the safe and effective use of medicines at the point of care.

Now, as part of our anniversary celebrations, we want to showcase the rigorous editorial process that goes into creating the content that you rely on for your everyday practice. We will also go behind the scenes at the BNF in our ‘A day in the life’ articles. To find out more visit bnf.org

We really appreciate the support you have given the BNF for our first 70 years. If you have a story to tell about how the BNF has been pivotal in your healthcare journey, we would love to hear about it on social media, just use hashtag #BNF70years

Find out more about the BNF’s first 70 years at bnf.org
Access the BNF your way

The British National Formulary (BNF) and BNF for Children are updated monthly online via MedicinesComplete, ensuring healthcare professionals always have the latest medicines information.

**ONLINE**

BNF on MedicinesComplete
Access BNF and BNF for Children on MedicinesComplete and receive the very latest drug information through monthly online updates.

FormularyComplete
Create, edit and manage your own local formulary content built upon the trusted prescribing advice of the BNF and BNF for Children.

BNF on Evidence Search
Search the BNF and BNF for Children alongside other authoritative clinical and non-clinical evidence and best practice at www.evidence.nhs.uk from NICE.

**PRINT**

Eligible healthcare professionals will now receive one print copy a year – the September issue – to supplement online access. If you are entitled to an NHS copy please refer to page ii for full details on distribution, call 01268 495 609 or email BNF@wilmingtonhealthcare.com.

**PRINT SUBSCRIPTION**

BNF subscription – Take advantage of our print subscription option. We will send you the new BNF as soon as the book is published. One or two year packages (including or excluding BNF for Children) are available. Discounted pricing is also available on bulk sales.

**MOBILE**

BNF app – Stay up to date anywhere with the BNF app available for iOS and Android.
BNF eBook – Available as an ePDF. See www.pharmpress.com/bnf.
BNF on MedicinesComplete – Now mobile responsive.

How to purchase

Buy direct from Pharmaceutical Press by visiting www.pharmpress.com/bnf
For enquiries about the BNF or BNF for Children in print, contact direct@macmillan.co.uk
Tel: +44 (0) 1256 302 699
For enquiries concerning MedicinesComplete, FormularyComplete, or bulk orders of the print edition, contact pharmpress-support@rpharms.com
Tel: +44 (0) 20 7572 2266

Download mobile apps by visiting your appropriate app store. Available for iOS and Android
For pricing information please visit the website at www.pharmpress.com/bnf
For international sales contact your local sales agent. Contact details at www.pharmpress.com/Information-Help/Bookseller-contacts/agents
Stay up to date - sign up to the BNF eNewsletter at www.bnf.org/newsletter

www.getintopharma.com
The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society. It is published under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies, the UK Health Departments, the Medicines and Healthcare products Regulatory Agency, and a national guideline producer. The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association and a representative from the UK Health Departments. The Nurse Prescribers’ Advisory Group advises on the content relevant to nurses and includes representatives from different parts of the nursing community and from the UK Health Departments.

The BNF aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers’ product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF’s recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. Similarly, little or no information is included on medicines for very rare conditions. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services, see Medicines Information Services (see inside front cover).

It is important to use the most recent BNF information for making clinical decisions. The print edition of the BNF is updated in March and September each year. Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The more important changes are listed under Changes; changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The BNF Publications website (www.bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of the BNF—including versions for mobile devices and integration into local formularies—are also available.

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

Contributors for this update were:

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, C. Scully, R.A. Seymour, R. Welbury, and J.M. Zakrzewska. S. Kaur provided valuable advice on dental prescribing policy.

Valuable advice has been provided by the following expert groups: Advisory Committee on Malaria Prevention, Association of British Neurologists, British Association of Dermatologists’ Therapy & Guidelines Sub-committee, British Geriatrics Society, British Society of Gastroenterology, British Society of Paediatric Gastroenterology, Hepatology and Nutrition, Faculty of Sexual and Reproductive Healthcare, Neonatal and Paediatric Pharmacists Group, Royal College of Anaesthetists, Royal College of Obstetricians and Gynaecologists, Royal College of Psychiatrists, Vascular Society.

The MHRA have provided valuable assistance. Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

The BNF team are grateful for the support and access to in-house expertise at Pharmaceutical Press and acknowledge the assistance of A. Lourie, J. Macdonald, N. Potter and their teams.

M. D’Souza, D. Isaacson, A. Iqbal, N. Kaur, R.K. Khonsoorkh, I. Lowings, E. Richardson and T.T. Sham provided considerable assistance during the production of this update of the BNF.

How BNF Publications are constructed

Overview
The BNF is an independent professional publication that addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.

Hundreds of changes are made between print editions, and are published monthly in a number of digital formats. The most clinically significant updates are listed under Changes p. xvi.

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information. Validation of information follows a standardised process, reviewing emerging evidence, best-practice guidelines, and advice from a network of clinical experts. Where the evidence base is weak, further validation is undertaken through a process of peer review. The process and its governance are outlined in greater detail in the sections that follow.

Joint Formulary Committee
The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes pharmacy, medical, nursing and lay representatives; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA), the UK Health Departments, and a national guideline producer.
The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice.

Dental Advisory Group
The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers’ Advisory Group
The Nurse Prescribers’ Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers’ Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Expert advisers
The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that the BNF remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breastfeeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are often received for comment and assimilation into the BNF.

Editorial team
BNF clinical writers have all worked as pharmacists or possess a pharmacy degree and a further, relevant post-graduate qualification, and have a sound understanding of how drugs are used in clinical practice. As a team, the clinical writers are responsible for editing, maintaining, and updating BNF content. They follow a systematic prioritisation process in response to updates to the evidence base in order to ensure the most clinically important topics are reviewed as quickly as possible. In parallel the team of clinical writers undertakes a process of rolling revalidation, aiming to review all of the content in the BNF over a 3- to 4-year period.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. A set of standard criteria define when content is referred to expert advisers, the Joint Formulary Committee or other advisory groups, or submitted for peer review.

Clinical writers prepare the text for publication and undertake a number of validation checks on the knowledge at various stages of the production process.

Sources of BNF information
The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics
The BNF reviews summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed. Such processing involves:

- verifying the approved names of all relevant ingredients including ‘non-active’ ingredients (the BNF is committed to using approved names and descriptions as laid down by the Human Medicine Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breastfeeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager; changes relating to doses receive a further check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Literature
Clinical writers monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability (using tools based on SIGN methodology) and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

In addition to the routine process, which is used to identify ‘triggers’ for changing the content, systematic literature searches are used to identify the best quality evidence available to inform an update. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies.

Consensus guidelines
The advice in the BNF is checked against consensus guidelines produced by expert bodies. The quality of the guidelines is assessed using adapted versions of the AGREE II tool. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore impossible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the All Wales Medicines Strategy Group (AWMSG), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources
Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces Martindale: The Complete Drug Reference. The BNF has access to Martindale information resources and each team
keeps the other informed of significant developments and shifts in the trends of drug usage.

Peer review
Although every effort is made to identify the most robust data available, inevitably there are areas where the evidence base is weak or contradictory. While the BNF has the valuable support of expert advisers and the Joint Formulary Committee, the recommendations made may be subject to a further level of scrutiny through peer review to ensure they reflect best practice.

Content for peer review is posted on bnf.org and interested parties are notified via a number of channels, including the BNF e-newsletter.

Statutory information
The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescriptions only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Human Medicines Regulations 2012.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug are issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

Medicines and devices
NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in the BNF.

Comments from readers
Readers of the BNF are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

Comments from industry
Close scrutiny of BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNF’s presentation of the role of various drugs; this is yet another check on the balance of BNF’s advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Market research
Market research is conducted at regular intervals to gather feedback on specific areas of development.

Assessing the evidence
From January 2016, recommendations made in BNF publications have been evidence graded to reflect the strength of the recommendation. The addition of evidence grading is to support clinical decision making based on the best available evidence.

The BNF aims to revalidate all content over a rolling 3- to 4-year period and evidence grading will be applied to recommendations as content goes through the revalidation process. Therefore, initially, only a small number of recommendations will have been graded.

Grading system
The BNF has adopted a five level grading system from A to E, based on the former SIGN grading system. This grade is displayed next to the recommendation within the text.

Evidence used to make a recommendation is assessed for validity using standardised methodology tools based on AGREE II and assigned a level of evidence. The recommendation is then given a grade that is extrapolated from the level of evidence, and an assessment of the body of evidence and its applicability.

Evidence assigned a level 1- or 2- score has an unacceptable level of bias or confounding and is not used to form recommendations.

Levels of evidence
- **Level 1++**
  - High quality meta-analyses, systematic reviews of randomised controlled trials (RCTs), or RCTs with a very low risk of bias.
- **Level 1+**
  - Well-conducted meta-analyses, systematic reviews, or RCTs with a low risk of bias.
- **Level 1-**
  - Meta-analyses, systematic reviews, or RCTs with a high risk of bias.
- **Level 2++**
  - High quality systematic reviews of case control or cohort studies; or high quality case control or cohort studies with a very low risk of confounding or bias and a high probability that the relationship is causal.
- **Level 2+**
  - Well-conducted case control or cohort studies with a low risk of confounding or bias and a moderate probability that the relationship is causal.
- **Level 2-**
  - Case control or cohort studies with a high risk of confounding or bias and a significant risk that the relationship is not causal.
- **Level 3**
  - Non-analytic studies, e.g. case reports, case series.
- **Level 4**
  - Expert advice or clinical experience from respected authorities.

Grades of recommendation
- **Grade A: High strength**
  - NICE-accredited guidelines; or guidelines that pass AGREE II assessment; or at least one meta-analysis, systematic review, or RCT rated as 1++, and directly applicable to the target population; or a body of evidence consisting principally of studies rated as 1++, directly applicable to the target population, and demonstrating overall consistency of results.
- **Grade B: Moderate strength**
  - A body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 1++ or 1+.
- **Grade C: Low strength**
  - A body of evidence including studies rated as 2+, directly applicable to the target population and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 2+.
- **Grade D: Very low strength**
  - Evidence level 3; or extrapolated evidence from studies rated as 2+; or tertiary reference source created by a transparent, defined methodology, where the basis for recommendation is clear.
- **Grade E: Practice point**
  - Evidence level 4.
How to use BNF Publications in print

How to use the BNF
This edition of the BNF continues to display the fundamental change to the structure of the content that was first shown in BNF 70. The changes were made to bring consistency and clarity to BNF content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For reference, the most notable changes to the structure of the content include:

- Drug monographs – where possible, all information that relates to a single drug is contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.
- Drug class monographs – where substantial amounts of information are common to all drugs within a drug class (e.g. macrolides p. 536), a drug class monograph has been created to contain the common information.
- Medicinal forms – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.
- Section numbering – the BNF section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNF and BNF for Children, where drugs had different therapeutic uses in children.
- Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions p. 16.

Introduction
In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF effectively, and keep up to date with significant changes in the BNF that are relevant to their clinical practice. This How to Use the BNF is key in reinforcing the details of the new structure of the BNF to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

Structure of the BNF
This BNF edition continues to broadly follows the high-level structure of earlier editions of the BNF (i.e. those published before BNF 70):

Front matter, comprising information on how to use the BNF, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations).

Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; drug class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Airways disease, obstructive), with the treatment summaries first, (e.g. asthma), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta 2-agonist bronchodilators) and then alphabetically within each classification (e.g. Aclidinium bromide, Glycopyrronium bromide, Ipratropium bromide).

Appendices, covering interactions, borderline substances, cautionary and advisory labels, and woundcare.

Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturers’ contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

Navigating the BNF
The contents page provides the high-level layout of information within the BNF; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the thumbnail), alongside the chapter title. The top of the page includes the therapeutic use (the running head) alongside the page number.

Once on a page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, drug class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs, and treatment summaries. The index also includes the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types
Treatment summaries
Treatment summaries are of three main types;

- an overview of delivering a drug to a particular body system (e.g. Skin conditions, management p. 1220)
- a comparison between a group or groups of drugs (e.g. beta-adrenoceptor blockers (systemic) p. 147)
- an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension p. 140, or Malaria, prophylaxis p. 607).

In order to select safe and effective medicines for individual patients, information in the treatment summaries must be used in conjunction with other prescribing details about the drugs and knowledge of the patient’s medical and drug history.

Monographs
Overview
In earlier editions (i.e. before BNF 70), a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems. So, for example, codeine phosphate p. 454 was found in chapter 1, for its antimotility effects and chapter 4 for its analgesic effects. However, the monograph in
chapter 1 contained only the dose and some selected safety precautions.

Now, all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate p. 454 is now included in chapter 4. This carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol p. 568, L173, L196, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with earlier editions, into the relevant chapters.

This means that the majority of drugs are still placed in the same chapters and sections as earlier editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

**Nomenclature**

Monograph titles follow the convention of recommended international non-proprietary names (rINNs), or, in the absence of a rINN, British Approved Names. Relevant synonyms are included below the title and, in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references or flags used to signpost the user to any additional information they need to consider about a drug. This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. senna with ispaghula husk p. 63) or for drugs that are related to a drug class monograph (see Drug class monographs, below).

**Indication and dose**

User feedback has highlighted that one of the main uses of the BNF is identifying indications and doses of drugs. Therefore, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in earlier editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation, that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the patient should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. the elderly) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

In earlier editions of the BNF, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible these age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a patient is considered to be 64 up until the point of their 65th birthday, meaning that an age range of adult 18 to 64 is applicable to a patient from the day of their 18th birthday until the day before their 65th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight of up to 30 kg is applicable to a patient up to, but not including, the point that they tip the scales at 30 kg and a weight range of 35 to 60 kg is applicable to a patient as soon as they tip the scales at 35 kg right up until, but not including, the point that they tip the scales at 60 kg. All weight ranges should be interpreted in this way.

In all circumstances, it is important to consider the patient in question and their physical condition, and select the dose most appropriate for the individual.

**Other information relevant to Indication and dose**

The dose panel also contains, where known, an indication of pharmacokinetic considerations that may affect the choice of dose, and dose equivalence information, which may aid the selection of dose when switching between drugs or preparations.

The BNF includes unlicensed use of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF recommends an unlicensed medicine or the ‘off-label’ use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

**Minimising harm and drug safety**

The drug chosen to treat a particular condition should minimise the patient’s susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient’s other diseases. To achieve this, the Contra-indications, Cautions and Side-effects of the relevant drug should be reviewed.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug—i.e. a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient’s quality of life should also be assessed. For instance, in a patient who has difficulty sleeping, it may be preferable to avoid a drug that frequently causes insomnia.

Therefore, indication and advice section in the BNF, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and Healthcare products Regulatory Agency (MHRA) are found here.

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1, followed by details of drug interactions.

**Use of drugs in specific patient populations**

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under Prescribing in hepatic impairment p. 19, and Prescribing in renal impairment p. 19. Information about drugs that should be avoided or used with caution in hepatic disease or renal
Typical layout of a monograph and associated medicinal forms

1. **Class Monographs and drug monographs**
   In most cases, all information that relates to an individual drug is contained in its drug monograph and there is no symbol. Class monographs have been created where substantial amounts of information are common to all drugs within a drug class, these are indicated by a flag symbol in a circle.

   Drug monographs with a corresponding class monograph are indicated by a tab with a flag symbol:

   Class monograph

   The page number of the corresponding class monograph is indicated within the tab. For further information, see How to use BNF Publications.

2. **Drug classifications**
   Used to inform users of the class of a drug and to assist in finding other drugs of the same class. May be based on pharmacological class (e.g. opioids) but can also be associated with the use of the drug (e.g. cough suppressants).

3. **Review date**
   The date of last review of the content.

4. **Specific preparation name**
   If the dose varies with a specific preparation or formulation it appears under a heading of the preparation name.

---

**CLASSIFICATION**

**Drug monograph**

(Synonym) another name by which a drug may be known

- **DRUG ACTION** how a drug exerts its effect in the body

- **INDICATIONS AND DOSE**
  Indications are the clinical reasons a drug is used. The dose of a drug will often depend on the indications

  **Indication**
  - **ROUTE**

  **Age groups**: [Child/Adult/Elderly]

  - **DOSE ADJUSTMENTS DUE TO INTERACTIONS** dosing information when used concurrently with other drugs

  **DOSES AT EXTREMES OF BODY-WEIGHT** dosing information for patients who are overweight or underweight

  **DOSE EQUIVALENCE AND CONVERSION** information around the bioequivalence between formulations of the same drug, or equivalent doses of drugs that are members of the same class

  **PHARMACOKINETICS** how the body affects a drug (absorption, distribution, metabolism, and excretion)

  **POTENCY** a measure of drug activity expressed in terms of the concentration required to produce an effect of given intensity

- **UNLICENSED USE** describes the use of medicines outside the terms of their UK licence (off-label use), or use of medicines that have no licence for use in the UK

---

**IMPORTANT SAFETY INFORMATION**

Information produced and disseminated by drug regulators often highlights serious risks associated with the use of a drug, and may include advice that is mandatory

- **CONTRA-INDICATIONS** circumstances when a drug should be avoided
- **CAUTIONS** details of precautions required
- **INTERACTIONS** when one drug changes the effects of another drug; the mechanisms underlying drug interactions are explained in Appendix 1
- **SIDE-EFFECTS** listed in order of frequency, where known, and arranged alphabetically
- **ALLERGY AND CROSS-SENSITIVITY** for drugs that carry an increased risk of hypersensitivity reactions
- **CONCEPTION AND CONTRACEPTION** potential for a drug to have harmful effects on an unborn child when prescribing for a woman of childbearing age or for a man trying to father a child; information on the effect of drugs on the efficacy of latex condoms or diaphragms

www.getintopharma.com
- **PREGNANCY** advice on the use of a drug during pregnancy
- **BREAST FEEDING** advice on the use of a drug during breast feeding
- **HEPATIC IMPAIRMENT** advice on the use of a drug in hepatic impairment
- **RENAL IMPAIRMENT** advice on the use of a drug in renal impairment
- **PRE-TREATMENT SCREENING** covers one off tests required to assess the suitability of a patient for a particular drug
- **MONITORING REQUIREMENTS** specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index
- **EFFECTS ON LABORATORY TESTS** for drugs that can interfere with the accuracy of seemingly unrelated laboratory tests
- **TREATMENT CESSIONATION** specifies whether further monitoring or precautions are advised when the drug is withdrawn
- **DIRECTIONS FOR ADMINISTRATION** practical information on the preparation of intravenous drug infusions; general advice relevant to other routes of administration
- **PRESCRIBING AND DISPENSING INFORMATION** practical information around how a drug can be prescribed and dispensed including details of when brand prescribing is necessary
- **HANDLING AND STORAGE** includes information on drugs that can cause adverse effects to those who handle them before they are taken by, or administered to, a patient; advice on storage conditions
- **PATIENT AND CARER ADVICE** for drugs with a special need for counselling
- **PROFESSION SPECIFIC INFORMATION** provides details of the restrictions certain professions such as dental practitioners or nurse prescribers need to be aware of when prescribing on the NHS
- **NATIONAL FUNDING/ACCESS DECISIONS** details of NICE Technology Appraisals, SMC advice and AWMSG advice
- **LESS SUITABLE FOR PRESCRIBING** preparations that are considered by the Joint Formulary Committee to be less suitable for prescribing
- **EXCEPTION TO LEGAL CATEGORY** advice and information on drugs which may be sold without a prescription under specific conditions

### Evidence grading
Evidence grading to reflect the strengths of recommendations will be applied as content goes through the revalidation process. A five level evidence grading system based on the former SIGN grading system has been adopted. The grades A, B, C, D, E are displayed next to the recommendations within the text, and are preceded by the symbol: 🌟

For further information, see How BNF Publications are constructed

### Legal categories
Legal categories 🍀 This symbol has been placed against those preparations that are available only on a prescription issued by an appropriate practitioner. For more detailed information see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition)

<table>
<thead>
<tr>
<th>Legal category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P ☢️</td>
<td>These symbols indicate that the preparations are subject to the prescription requirements of the Misuse of Drugs Act</td>
</tr>
</tbody>
</table>

For regulations governing prescriptions for such preparations, see Controlled Drugs and Drug Dependence

Not all monographs include all possible sections; sections are only included when relevant information has been identified

### Medicinal forms
**Form**

- **CAUTIONARY AND ADVISORY LABELS** if applicable
- **EXCIPIENTS** clinically important but not comprehensive [consult manufacturer information for full details]
- **ELECTROLYTES** if clinically significant quantities occur

#### Preparation name (Manufacturer/Non-proprietary)
- **Drug name and strength pack sizes** 🍀 Prices

#### Combinations available
This indicates a combination preparation is available and a cross reference page number is provided to locate this preparation
impairment can be found in drug monographs under Hepatic impairment and Renal impairment (e.g. fluconazole p. 595). Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under Prescribing in pregnancy p. 23 and Prescribing in breast-feeding p. 23. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. Asthma, acute p. 240).

Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under Pregnancy, and Breast-feeding (e.g. fluconazole p. 595).

A section, Conception and contraception, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 1270) has been included.

Administration and monitoring
When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called Pre-treatment screening (e.g. abacavir p. 647). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A Directions for administration section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl p. 458).

After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The Monitoring section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline p. 274). Monitoring may, in certain cases, be affected by the impact of a drug on laboratory tests (e.g. hydroxocobalamin p. 1026), and this information is included in Effects on laboratory tests.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine hydrochloride p. 145): these are covered under Treatment cessation.

Choice and supply
The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (see Taking Medicines to Best Effect). Taking the time to explain to the patient (and carers) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline p. 564); this is shown in Patient and carer advice.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products may not be interchangeable (e.g. diltiazem hydrochloride p. 157), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil p. 813), or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride p. 66).

Medicinal forms
In the BNF, preparations follow immediately after the monograph for the drug that is their main ingredient. In earlier editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations section. This information has been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil p. 48).

The medicinal forms (formerly preparations) section provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement under the heading of “Medicinal Forms” that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Details of all medicinal forms available on the dm+d for each drug in BNF Publications appears online on MedicineComplete. In print editions, due to space constraints, only certain branded products are included in detail. Where medicinal forms are listed they should not be inferred as equivalent to the other brands listed under the same form heading. For example, all the products listed under a heading of “Modified release capsule” will be available as modified release capsules, however, the brands listed under that form heading may have different release profiles, the available strengths may vary and/or the products may have different licensing information. As with earlier editions of the BNF, practitioners must ensure that the particular product being prescribed or dispensed is appropriate.

As medicinal forms are derived from dm+d data, some drugs may appear under names derived from that data; this may vary slightly from those in previous BNF versions, e.g. sodium acid phosphate, is now sodium dihydrogen phosphate anhydrous.

Patients should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries.

In earlier editions, the BNF only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e.g. tablet). It is not possible to keep abreast of all the generic-products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms section. Details of these labels can be found in Appendix 3, Guidance for cautionary and advisory labels p. 1588. As these labels have now been applied at the level of the dose form, a full list of medicinal products with their relevant labels would be extensive. This list has therefore been removed, but the information is retained within the monograph.

In the case of compound preparations, the prescribing information for all constituents should be taken into account.
Prices in the BNF

Basic NHS net prices are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.nhsbsa.nhs.uk/edications-and-devices-dmd). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (apps.nhsbsa.nhs.uk/DMDBrowser/DMDBrowser.do). Prices have been calculated from the net cost used in pricing NHS prescriptions and generally reflect whole dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNF as prices vary between different manufacturers. In Appendix 4, prices stated are per dressing or bandage.

BNF prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.ppa.org.uk/ppa/edit intro.htm), Scotland (www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/), and Northern Ireland (www.hscbusiness.hscni.net/services/2034.htm); prices in the different tariffs may vary.

Drug class monographs

In earlier editions of the BNF, information relating to a class of drugs sharing the same properties (e.g. tetracyclines p. 564), was contained within the prescribing notes. In the updated structure, drug class monographs have been created to contain the common information; this ensures such information is easier to find, and has a more regularised structure.

For consistency and ease of use, the class monograph follows the same structure as a drug monograph. Class monographs are indicated by the presence of a flag (e.g. beta-adrenoceptor blockers (systemic) p. 147). If a drug monograph has a corresponding class monograph, that needs to be considered in tandem, in order to understand the full information about a drug, the monograph is also indicated by a flag (e.g. metoprolol tartrate p. 154). Within this flag, the page number of the drug class monograph is provided (e.g. 1234), to help navigate the user to this information. This is particularly useful where occasionally, due to differences in therapeutic use, the drug monograph may not directly follow the drug class monograph (e.g. sotalol hydrochloride p. 108).

Evidence grading

The BNF has adopted a five level evidence grading system (see How BNF Publications are constructed p. vii). Recommendations that are evidence graded can be identified by a symbol appearing immediately before the recommendation. The evidence grade is displayed at the end of the recommendation.

Other content

Nutrition

Appendix 2, Borderline substances p. 1556, includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

Wound dressings

A table on wound dressings in Appendix 4, Wound management products and elasticated garments p. 1591, allows an appropriate dressing to be selected based on the appearance and condition of the wound. Further information about the dressing can be found by following the cross-reference to the relevant classified section in the Appendix.

Advanced wound contact dressings have been classified in order of increasing absorbency.

Other useful information

Finding significant changes in the BNF

- Changes, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNF, as well as a list of preparations that have been discontinued and removed from the BNF. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies. So many changes are made for each update of the BNF, that not all of them can be accommodated in the Changes section. We encourage healthcare professionals to regularly review the prescribing information on drugs that they encounter frequently;

- Changes to the Dental Practitioners’ Formulary, are located at the end of the Dental List;

- E-newsletter, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for e-newsletters go to www.bnf.org.

- An e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. The module can be found at www.cppe.ac.uk.

Using other sources for medicines information

The BNF is designed as a digest for rapid reference. Less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.

www.getintopharma.com
Changes

Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

Significant changes

Significant changes that appear in the print edition of BNF 79 (September 2019 — March 2020):

- Abemaciclib p. 967 with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER2-negative, locally advanced or metastatic breast cancer [NICe guidance].
- Alemtuzumab p. 857 (Lemtrada®): restriction of use due to serious safety concerns [MHRA/CHM advice].
- Attention deficit hyperactivity disorder p. 346: updated guidance on management.
- Belimumab p. 845 (Benlysta®): increased risk of serious psychiatric events seen in clinical trials [MHRA/CHM advice].
- Benralizumab p. 266 for treating severe eosinophilic asthma [NICe guidance].
- Breast cancer p. 942: updated guidance on management.
- Brentuximab vedotin p. 664 for treating CD30-positive cutaneous T-cell lymphoma [NICe guidance].
- Brigatinib p. 971 for treating ALK-positive advanced non-small-cell lung cancer after crizotinib [NICe guidance].
- Carbimazole p. 771: increased risk of congenital malformations; strengthened advice on contraception [MHRA/CHM advice].
- Carbimazole p. 771: risk of acute pancreatitis [MHRA/CHM advice].
- Certolizumab pegol p. 1111 for treating moderate to severe plaque psoriasis [NICe guidance].
- Chronic heart failure p. 191: updated guidance on management.
- Controlled drugs and drug dependence p. 8: reclassification of gabapentin p. 315 and pregabalin p. 324 as Class C and Schedule 3 Controlled Drugs.
- Daratumumab p. 866 with bortezomib p. 964 and dexamethasone p. 675 for previously treated multiple myeloma [NICe guidance].
- Elvitegravir boosted with cobicistat: avoid use in pregnancy due to risk of treatment failure and maternal-to-child transmission of HIV-1 [MHRA/CHM advice] (see elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide p. 649 and elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil p. 650).
- Emollients (see Emollient and barrier preparations p. 1221): new information about risk of severe and fatal burns with paraffin-containing and paraffin-free emollients [MHRA/CHM advice].
- Encorafenib p. 578 and binimetinib p. 969 for unresectable or metastatic BRAF V600 mutation-positive melanoma [NICe guidance].
- Epilepsy p. 305: inclusion of guidance for the management of Dravet syndrome and Lennox-Gastaut syndrome.
- Ertugliflozin p. 707 as monotherapy or with metformin for treating type 2 diabetes [NICe guidance].
- Fluoroquinolone antibiotics (ciprofloxacin p. 558, levofloxacin p. 559, moxifloxacin p. 560, ofloxacin p. 561): new restrictions and precautions for use due to very rare reports of disabling and potentially long-lasting or irreversible side effects [MHRA/CHM advice].
- Gabapentin p. 315 (Neurontin®) and risk of abuse and dependence: new scheduling requirements from 1 April [MHRA/CHM advice].
- Gemtuzumab ozogamicin p. 869 for untreated acute myeloid leukaemia [NICe guidance].
- Heavy menstrual bleeding p. 753: updated recommendations for the use of ulipristal acetate.
- Hydrocortisone p. 1216: muco-adhesive buccal tablets: should not be used off-label for adrenal insufficiency in children due to serious risks [MHRA/CHM advice].
- Ipilimumab p. 871 (Yervoy®): reports of cytomegalovirus (CMV) gastrointestinal infection or reactivation [MHRA/CHM advice].
- Irinotecan hydrochloride p. 926, liposomal formulations (Onyxide®): reports of serious and fatal thromboembolic events [MHRA/CHM advice].
- Lenvatinib p. 987 for untreated advanced hepatocellular carcinoma [NICe guidance].
- Liposomal daunorubicin with cytarabine p. 900 for untreated acute myeloid leukaemia [NICe guidance].
- Methotrexate p. 913: updated recommendations for conception and contraception.
- Nivolumab p. 873 for adjuvant treatment of completely resected melanoma with lymph node involvement or metastatic disease [NICe guidance].
- Olaratumab p. 876 (Lartrano®): no new patients to be prescribed due to study showing no clinical benefit [MHRA/CHM advice].
- Pembrolizumab p. 878 for adjuvant treatment of resected melanoma with high risk of recurrence [NICe guidance].
- Pembrolizumab p. 878 with pemetrexed and platinum chemotherapy for untreated, metastatic, non-squamous non-small-cell lung cancer [NICe guidance].
- Pertuzumab p. 880 for adjuvant treatment of HER2-positive early stage breast cancer [NICe guidance].
- Pregabalin p. 324 (Lyrica®) and risk of abuse and dependence: new scheduling requirements from 1 April [MHRA/CHM advice].
- Prescribing in pregnancy p. 23: Medicines with teratogenic potential, what is effective contraception and how often is pregnancy testing needed? [MHRA/CHM advice].
- Quinolones p. 557: new MHRA/CHM advice on restrictions and precautions for use of fluoroquinolone antibiotics.
- Regorafenib p. 996 for previously treated advanced hepatocellular carcinoma [NICe guidance].
- Renal and ureteric stones p. 788: new guidance on management.
- Respiratory system infections, antibacterial therapy p. 515: new guidance for acute exacerbations of Bronchiectasis (non-cystic fibrosis).
Respiratory system infections, antibacterial therapy p. 515: updated guidance for acute exacerbations of Chronic obstructive pulmonary disease.

Respiratory system infections, antibacterial therapy p. 515: new guidance on management of Cough, acute.

SGLT2 inhibitors (canagliflozin p. 702, dapagliflozin p. 704, empagliflozin p. 706, ertugliflozin p. 707): reports of Fournier’s gangrene (necrotising fasciitis of the genitalia or perineum) [MHRA/CHM advice].

Smoking cessation p. 497: updated guidance.

Tapentadol p. 471 (Palexia®): risk of seizures and reports of serotonin syndrome when co-administered with other medicines [MHRA/CHM advice].

Tildrakizumab p. 1260 for treating moderate to severe plaque psoriasis [NICE guidance].

Tofacitinib p. 1105 for moderately to severely active ulcerative colitis [NICE guidance].

Tofacitinib p. 1105 (Xeljanz®): increased risk of pulmonary embolism and mortality in rheumatoid arthritis patients receiving 10 mg twice daily in a clinical trial [MHRA/CHM advice].

Valproate medicines and serious harms in pregnancy: new Annual Risk Acknowledgement Form and clinical guidance from professional bodies to support compliance with the Pregnancy Prevention Programme [MHRA/CHM advice] (see sodium valproate p. 327 and valproic acid p. 354).

Valproate medicines (see sodium valproate p. 327 and valproic acid p. 354): are you in acting in compliance with the pregnancy prevention measures? [MHRA/CHM advice].

Vandetanib p. 1003 for treating medullary thyroid cancer [NICE guidance].

Venetoclax p. 1007 with rituximab p. 882 for previously treated chronic lymphocytic leukaemia [NICE guidance].

Yellow fever vaccine, live p. 1327 (Stamaril®) and fatal adverse reactions: extreme caution needed in people who may be immunosuppressed [MHRA/CHM advice].

Yellow fever vaccine, live p. 1327 (Stamaril®) and fatal adverse reactions: extreme caution needed in those aged 60 years and older [MHRA/CHM advice] (BNF only).

Dose changes
Changes in dose statements that appear in the print edition of BNF 78 (September 2019 — March 2020):

- Adalimumab p. 1108 [maintenance dosing updated].
- Alirocumab p. 206 [dosing options for primary hypercholesterolaemia or mixed dyslipidaemia].
- Anthrax vaccine p. 1312 [dosing schedule updated].
- Imipenem with cilastatin p. 522 [dosing recommendation in renal impairment updated].
- Japanese encephalitis vaccine p. 1323 [dosing schedule updated].
- Malarone® (atovaquone with proguanil hydrochloride p. 615) [update to weight range for prophylaxis of falciparum malaria].
- Oseltamivir p. 662 [duration of treatment in immunocompromised patients].
- Pembrolizumab p. 878 [dose for non-small cell lung cancer (following prior chemotherapy) and melanoma].
- Rivaroxaban p. 128 [clarification of dosing options for prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism].
- Secukinumab p. 1100 [dosing for psoriatic arthritis].

New preparations
New preparations that appear in the print edition of BNF 78 (September 2019 — March 2020):

- Alunbrig® [brigatinib p. 971].
- Brafton® [encorafenib p. 978].
- Bavidal® [buprenorphine p. 447].
- Cidofovir p. 637.
- Delstrigo® [lamivudine with tenofovir disoproxil and doravirine p. 653].
- Diacomit® [stiripentol p. 330].
- Erleada® [apalutamide p. 946].
- Fortacin® [lidocaine with prilocaine p. 1354].
- Ilumetri® [tildrakizumab p. 1260].
- Intrarosa® [prasterone p. 833].
- Mektovi® [binimetinib p. 969].
- Namuscla® [mexiletine p. 1126].
- Ozempic® [semaglutide p. 701].
- Pifeltro® [doravirine p. 644].
- Prevyvis® [fetzimide p. 639].
- Steglatro® [ertugliflozin p. 707].
- Suliqua® [insulin glargine with lixisenatide p. 718].
- Symkevi® [tezacaftor with ivacaftor p. 295].
- Tegsedi® [notersen p. 408].
- Testavan® [testosterone p. 768].
- Verzenios® [abemaciclib p. 967].
Guidance on prescribing

General guidance
Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered. It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed. In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

Prescribing competency framework
The Royal Pharmaceutical Society has published a Prescribing Competency Framework that includes a common set of competencies that form the basis for prescribing, regardless of professional background. The competencies have been developed to help healthcare professionals to be safe and effective prescribers, with the aim of supporting patients to get the best outcomes from their medicines. It is available at www.rpharms.com/resources/frameworks/prescribers-competency-framework.

Multimorbidity
The presence of two or more long-term health conditions in a patient (multimorbidity) is associated with reduced quality of life, higher mortality, higher rates of adverse drug reactions, greater use of the health service, and a higher treatment burden (due to polypharmacy or multiple appointments). Treatment decisions in these patients should involve consideration of the patient’s needs, preferences for treatment, health priorities, and lifestyle with the aim of improving quality of life by reducing treatment burden, adverse events, and unplanned or uncoordinated care.

Prescribers should consider the risks and benefits of treatments recommended for patients with multimorbidity from guidance for single health conditions; evidence for these recommendations is commonly drawn from patients without multimorbidity or who are taking fewer prescribed regular medicines.

Treatments intended to relieve symptoms should be reviewed for effectiveness, including reducing or stopping the treatment and monitoring the effects. Alternatively, non-pharmacological treatments may be offered or treatments of limited benefit can be considered for discontinuation. The management of risk factors for future disease can be a major treatment burden for patients with multimorbidity and is not always appropriate.

Deprescribing
Deprescribing is the process of discontinuing or reducing the dose of medicines, supervised by a healthcare professional, with the aim of managing polypharmacy and improving outcomes. Deprescribing requires careful counselling and shared decision-making with patients, and is considered part of routine clinical care.

Taking medicines to best effect
Difficulties in adherence to drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- patients’ perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. swallowing the medicine, handling small tablets, or opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient wishes to achieve and the strategy for achieving them (‘concordance’). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect a patient’s acceptance of medicines.

Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician’s instructions by the pharmacist and other members of the healthcare team also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help: the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

Advanced Pharmacy Services
Advanced Services are provided as part of the NHS Community Pharmacy Contractual Framework, and include services such as the New Medicines Service and Medicines Use Review service. These services are provided by accredited community pharmacists, with the aim of targeting specific patients to help manage their medicines more effectively, improve adherence, and reduce medicines wastage.

New Medicines Service
The New Medicines Service (NMS) provides education and support to patients who are newly prescribed a medicine to manage a long-term condition. The service is split into three stages: patient engagement, intervention and follow-up. As of 2018, this service is available for patients living in England who have either been prescribed a new medicine for one of the following conditions – asthma, chronic obstructive pulmonary disease (COPD), type 2 diabetes, or hypertension, or have been prescribed a new antplatelet or anticoagulant. Patients can be offered the service by the prescriber nominal, or opportunistically by the community pharmacy. For further information, see: psnc.org.uk/services-commissioning/advanced-services/nms/.

Medicines Use Review
The Medicines Use Review (MUR) service consists of structured adherence-centred reviews with patients on multiple medicines, particularly those receiving medicines for long-term conditions. The service is undertaken periodically, or when there is a need to make an adherence-focused intervention due to a problem identified while providing the dispensing service. The pharmacist providing the service is required to ensure that at least 70% of all MURs undertaken in a year are for patients who fall into one or more of the national target groups. The national target groups for MURs in England are:

- patients taking high-risk medicines (NSAIDs, anticoagulants (including low molecular weight heparin), antplatelets, or diuretics);
- patients recently discharged from hospital who have had changes made to their medicines;
patients prescribed certain respiratory medicines;
- patients with, or at risk of cardiovascular disease, and are regularly prescribed at least four medicines.

For further information, see: pscn.org.uk/services-commissioning/advanced-services/murs/.

Wales, Northern Ireland, and Scotland have variations on this service, including different national target groups.

In Wales, see www.cwpales.org.uk/Contract-support-and-it/Advanced-Services/Medicines-Use-review-MUR.aspx

In Northern Ireland, see www.hscbusiness.hscni.net/services/2427.htm.

In Scotland, see www.communitypharmacyscotland.org.uk/nhs-care-services/services/chronic-medication-service/.

Biological medicines

Biological medicines are medicines that are made by or derived from a biological source using biotechnology processes, such as recombinant DNA technology. The size and complexity of biological medicines, as well as the way they are produced, may result in a degree of natural variability in molecules of the same active substance, particularly in different batches of the medicine. This variation is maintained within strict acceptable limits. Examples of biological medicines include insulins and monoclonal antibodies.

Biological medicines must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines.

Biosimilar medicines

A biosimilar medicine is a biological medicine that is highly similar and clinically equivalent (in terms of quality, safety, and efficacy) to an existing biological medicine that has already been authorised in the European Union (known as the reference biological medicine or originator medicine). The active substance of a biosimilar medicine is similar, but not identical, to the originator biological medicine. Once the patent for a biological medicine has expired, a biosimilar medicine may be authorised by the European Medicines Agency (EMA). A biosimilar medicine is not the same as a generic medicine, which contains a simpler molecular structure that is identical to the originator medicine.

Therapeutic equivalence

Biosimilar medicines should be considered to be therapeutically equivalent to the originator biological medicine within their authorised indications. Biosimilar medicines are usually licensed for all the indications of the originator biological medicine, but this depends on the evidence submitted to the EMA for authorisation and must be scientifically justified on the basis of demonstrated or extrapolated equivalence.

Prescribing and dispensing

The choice of whether to prescribe a biosimilar medicine or the originator biological medicine rests with the clinician in consultation with the patient.

Safety monitoring

Biosimilar medicines are subject to a black triangle status (▼) at the time of initial authorisation.

It is important to report suspected adverse reactions using the Yellow Card Scheme (see Adverse reactions to drugs p. 12). For all biological medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine.

UK Medicines Information centres have developed a validated tool to determine potential safety issues associated with all new medicines. These ‘in-use product safety assessment reports’ will be published for new biosimilar medicines as they become available, see www.sps.nhs.uk/home/medicines/.

National funding/access decisions

The Department of Health has confirmed that, in England, NICE can decide to apply the same remit, and the resulting technology appraisal guidance, to relevant biosimilar medicines which appear on the market subsequent to their originator biological medicine. In other circumstances, where a review of the evidence for a particular biosimilar medicine is necessary, NICE will consider producing an evidence summary (see Evidence summary: new medicines, www.nice.org.uk/about/what-we-do/our-programmes/nice-advice/evidence-summaries-new-medicines).

National information

In Northern Ireland, see niformulary.hscni.net/ManagedEntry/bios/Pages/default.aspx.

In Scotland, see www.scottishmedicines.org.uk/About_SMC/Policy_statements/Biosimilar_Medicines.

In Wales, see www.wales.nhs.uk/sites/documents/814/Biosimilar_4abIUHPositionStatement%5BNov2015%5D.pdf.

Availability

The following drugs are available as a biosimilar medicine:

- Adalimumab p. 1108
- Bevacizumab p. 862
- Enoxaparin sodium p. 132
- Epoetin alfa p. 1014
- Epoetin zeta p. 1016
- Etanercept p. 1113
- Filgrastim p. 1029
- Follitropin alfa p. 745
- Infliximab p. 1116
- Insulin glargine p. 718
- Insulin lispro p. 714
- Rituximab p. 882
- Somatropin p. 748
- Teriparatide p. 734
- Trastuzumab p. 885

Complementary and alternative medicine

An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John’s wort). Further information on herbal medicines is available at www.mhra.gov.uk.

Abbreviation of titles

In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles

Where non-proprietary (‘generic’) titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer’s version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations.

Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction.

www.getintopharma.com
Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Human Medicines Regulations 2012.

**Proprietary titles**
Names followed by the symbol® are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.

**Marketing authorisation and BNF advice**
In general the doses, indications, cautions, contra-indications, and side-effects in the BNF reflect those in the manufacturers’ data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from ‘special-order’ manufacturers or specialist importing companies.

Where an unlicensed drug is included in the BNF, this is indicated in square brackets after the entry. When the BNF suggests a use (or route) that is outside the licensed indication of a product (‘off-label’ use), this too is indicated. Unlicensed use of medicines becomes necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience.

The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual range of doses that are generally regarded as being suitable for adults.

**Prescribing unlicensed medicines**
Prescribing medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber’s professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient’s carer that the prescribed medicine is unlicensed.

**Oral syringes**
An oral syringe is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5 mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5–mL spoon is used for doses of 5 mL (or multiples thereof).

**Important** To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate oral or enteral syringe should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used); these syringes should not be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled ‘Oral’ or ‘Enteral’ in a large font size; it is the healthcare practitioner’s responsibility to label the syringe with this information if the manufacturer has not done so.

**Excipients**
Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in the BNF. Preparations containing hydrogenated glucose syrup, mannnitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of aspartame, gluten, sulfites, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in the BNF against the relevant preparation.

Information is provided on selected excipients in skin preparations, in vaccines, and on selected preparations and excipients in eye drops and injections.

The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of propylene glycol in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulfiram p. 495 and metronidazole p. 542.

The lactose content in most medicines is too small to cause problems in most lactose-intolerant patients. However in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

**Important** In the absence of information on excipients in the BNF and in the product literature (available at www.medicines.org.uk/emc), contact the manufacturer (see Index of Manufacturers) if it is essential to check details.

**Extemporaneous preparation**
A product should be dispensed extemporaneously only when no product with a marketing authorisation is available. The BP direction that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections).

**Drugs and driving**
Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs—commonly abused drugs, including amphetamines, cannabis, cocaine, and ketamine p. 1345, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Anyone found to have any of the drugs...
(including related drugs, for example, apomorphine hydrochloride p. 418) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride p. 428. However, the legislation provides a statutory “medical defence” for patients taking drugs for medical reasons in accordance with instructions, if their driving was not impaired—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine’s patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/collections/drug-driving.

Patents
In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

Health and safety
When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

Safety in the home
Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable child-resistant container unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted medicines by returning them to a supplier for destruction.

Labelling of prescribed medicines
There is a legal requirement for the following to appear on the label of any prescribed medicine:

- name of the patient;
- name and address of the supplying pharmacy;
- date of dispensing;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:

- the words ‘Keep out of the sight and reach of children’;
- where applicable, the words ‘Use this medicine only on your skin’.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

Non-proprietary names of compound preparations
Non-proprietary names of compound preparations which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix ‘co-’ should be retained.

Special care should also be taken to avoid creating generic names for modified-release preparations where the use of these names could lead to confusion between formulations with different lengths of action.

EEA and Swiss prescriptions
Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

Security and validity of prescriptions
The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD)
In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HSL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

NICE, Scottish Medicines Consortium and All Wales Medicines Strategy Group
Advice issued by the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC) and the All Wales Medicines Strategy Group (AWMSG) is included in the BNF when relevant. Details of the advice together with updates can be obtained from: www.nice.org.uk, www.scottishmedicines.org.uk and www.awmsg.org.
Prescription writing

Shared care
In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Requirements
Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for prescription-only medicines. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be calculated. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m² body-surface area e.g. mg/m² where this would reduce error.

The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg. Quantities of 1 gram or more should be written as 1 g etc. Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g. Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg. When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL. Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.
- ‘Micrograms’ and ‘nanograms’ should not be abbreviated. Similarly ‘units’ should not be abbreviated.
- The term ‘millilitre’ (mL or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used. (The use of capital L in mL is a printing convention throughout the BNF; both ‘mL’ and ‘ml’ are recognised SI abbreviations).
- Dose and dose frequency should be stated; in the case of preparations to be taken ‘as required’ a minimum dose interval should be specified. Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. ‘125 mg 3 times daily’); terms such as ‘5 mL’ or ‘1 tablet’ should be avoided except for compound preparations. When doses other than multiples of 5 mL are prescribed for oral liquid preparations the dose-volume will be provided by means of an oral syringe, (except for preparations intended to be measured with a pipette). Suitable quantities:
  - Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
  - Adult Mixtures (10 mL dose), 200 or 300 mL
  - Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack)
  - Eye Lotions, Gargles, and Mouthwashes, 200 mL
  - The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only; avoid creating generic titles for modified-release preparations.
  - The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated. When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.

- Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used.

Sample prescription

Prescribing by dentists
Until new prescribing arrangements are in place for NHS prescriptions, dentists should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners’ Formulary. The Human Medicines Regulations 2012 does not set any limitations upon the number and variety of substances which the dentist may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dentist may use or order whatever is required for the clinical situation. There is no statutory requirement for the dentist to communicate with a patient’s medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient’s interest and such communication is to be encouraged. For legal requirements relating to prescriptions
of Controlled Drugs, see Controlled drugs and drug dependence p. 8.

Computer-issued prescriptions
For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

1. The computer must print out the date, the patient’s surname, one forename, other initials, and address, and may also print out the patient’s title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.

2. The doctor’s name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor’s surgery address, reference number, and Primary Care Trust (PCT, Health Board in Scotland, Local Health Board in Wales) are also necessary. In addition, the surgery telephone number should be printed.

3. When prescriptions are to be signed by general practitioners, registrars, assistants, locums, or deputising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.

4. Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.

5. The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.

6. The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required.

7. The BNF recommendations should be followed as listed above.

8. Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as ‘as directed’ and ‘when required’, the maximum daily dose should normally be specified.

9. Numbers and codes used in the system for organising and retrieving data must never appear on the form.

10. Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.

11. A mechanism (such as printing a series of nonspecific characters) should be incorporated to cancel out unused space, or wording such as ‘no more items on this prescription’ may be added after the last item. Otherwise the doctor should delete the space manually.

12. To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.

13. Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor’s own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol ‘C’ (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).

14. Prescriptions for controlled drugs can be printed from the computer, but the prescriber’s signature must be handwritten (See Controlled Drugs and Drug Dependence; the prescriber may use a date stamp).

15. The strip of paper on the side of the FP10SS (GP10SS in Scotland, WP10SS in Wales) may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient’s name to appear at the top, but this should be preceded by ‘confidential’.

16. In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.

17. Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.
Emergency supply of medicines

Emergency supply requested by member of the public
Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
   i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
   ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
   iii) as to the dose that it would be appropriate for the person to take;

b) that no greater quantity shall be supplied than will provide 5 days’ treatment of phenobarbital p. 335, *phenobarbital sodium*, or Controlled Drugs in Schedules 4 or 5 (doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days’ treatment for other prescription-only medicines, except when the prescription-only medicine is:
   i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
   ii) an oral contraceptive when a full cycle may be supplied;
   iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;

c) that an entry shall be made by the pharmacist in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the patient;

d) that the container or package must be labelled to show:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name of the patient;
   iv) the name and address of the pharmacy;
   v) the words ‘Emergency supply’;
   vi) the words ‘Keep out of the reach of children’ (or similar warning);

e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 335 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

Emergency supply requested by prescriber
Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;

b) that the prescriber has undertaken to furnish a prescription within 72 hours;

c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;

d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 335 or *phenobarbital sodium* for the treatment of epilepsy: for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

e) that an entry shall be made in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the practitioner requesting the emergency supply;
   iv) the name and address of the patient;
   v) the date on the prescription;
   vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society’s guidelines
1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see *Medicines, Ethics and Practice*, London Pharmaceutical Press, (always consult latest edition).
Controlled drugs and drug dependence

Regulations and classification
The Misuse of Drugs Act, 1971 as amended prohibits certain activities in relation to ‘Controlled Drugs’, in particular their manufacture, supply, and possession (except where permitted by the 2001 Regulations or under licence from the Secretary of State). The penalties applicable to offences involving the different drugs are graded broadly according to the harmfulness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

- **Class C** includes: certain drugs related to the amfetamines such as benzetamine and chlorphentermine, buprenorphine p. 447, mazindol, meperbamate, pemoline, pipradrol, most benzodiazepines, tramadol hydrochloride p. 471, zaleplon, zolpidem tartrate, zopiclone, and androgenic and anabolic steroids, clenbuterol, choric gonadotrophin (HCG), non-human choric gonadotrophin, somatotropin, somatrem, and somatropin p. 748. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements. Records in registers do not need to be kept (except in the case of Sativex®).

- **Schedule 3** includes the barbiturates (except secobarbital, now Schedule 2), buprenorphine p. 447, gabapentin p. 315, mazindol, meperbamate, midazolam p. 340, pentazocine, phentermine, pregabaline, temazepam p. 488, and tramadol hydrochloride p. 471. They are subject to the special prescription requirements. Safe custody requirements do apply, except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), gabapentin p. 315, mazindol, meperbamate, midazolam p. 340, pentazocine, phentermine, pregabaline, and tramadol hydrochloride p. 471, or any stereoisomeric form or salts of the above. Records in registers do not need to be kept (although there are requirements for the retention of invoices for 2 years).

- **Schedule 4** includes in Part I drugs that are subject to minimal control, such as benzodiazepines (except temazepam p. 488 and midazolam p. 340, which are in Schedule 3), non-benzodiazepine hypnotics (zaleplon, zolpidem tartrate, and zopiclone) and Sativex®. Part II includes androgenic and anabolic steroids, clenbuterol, choric gonadotrophin (HCG), non-human choric gonadotrophin, somatotropin, somatrem, and somatropin p. 748. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements. Records in registers do not need to be kept (except in the case of Sativex®).

- **Schedule 5** includes preparations of certain Controlled Drugs (such as codeine, pholcodine p. 296 or morphine p. 463) which due to their low strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years. Since the Responsible Pharmacist Regulations were published in 2008, standing operation procedures for the management of Controlled Drugs, are required in registered pharmacies.

The Misuse of Drugs (Safe Custody) Regulations 1973 as amended details the storage and safe custody requirements for Controlled Drugs.

The Misuse of Drugs Regulations 2001 (and subsequent amendments) defines the classes of person who are authorised to supply and possess Controlled Drugs while acting in their professional capacities and lays down the conditions under which these activities may be carried out. In the 2001 regulations, drugs are divided into five Schedules, each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

- **Schedule 1** includes drugs not used medicinally such as hallucinogenic drugs (e.g. LSD), ecstasy-type substances, raw opium, and cannabis. A Home Office licence is generally required for their production, possession, or supply. A Controlled Drug register must be used to record details of any Schedule 1 Controlled Drugs received or supplied by a pharmacy.

- **Schedule 2** includes opiates (e.g. diamorphine hydrochloride p. 456 (heroin), morphine p. 463, methadone hydrochloride p. 502, oxycodone hydrochloride p. 469, pethidine hydrochloride p. 470), major stimulants (e.g. amphetamine), quinilbarbitone (secobarbital), cocaine, ketamine p. 1345, and cannabin-based products for medicinal use in humans. Schedule 2 Controlled Drugs are subject to the full Controlled Drug requirements relating to prescriptions, safe custody (except for quinilbarbitone (secobarbital) and some liquid preparations), and the need to keep a Controlled Drug register, (unless exempted in Schedule 5). Possession, supply and procurement is authorised for pharmacists and other classes of persons named in the 2001 Regulations.

Prescriptions
Preparations in Schedules 1, 2, 3, 4 and 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF and BNF for children using the following symbols:

- **01** for preparations in Schedule 1
- **02** for preparations in Schedule 2
- **03** for preparations in Schedule 3
- **04-1** for preparations in Schedule 4 (Part I)
- **04-2** for preparations in Schedule 4 (Part II)
- **05** for preparations in Schedule 5

The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance at www.gov.uk/dh).

**Prescription requirements** Prescriptions for Controlled Drugs that are subject to prescription requirements (all preparations in Schedules 2 and 3) must be indelible, must be signed by the prescriber, include the date on which they were signed, and specify the prescriber’s address (must be within the UK). A machine-written prescription is not acceptable.
acceptable, but the prescriber’s signature must be handwritten. Advanced electronic signatures can be accepted for Schedule 2 and 3 Controlled Drugs where the Electronic Prescribing Service (EPS) is used. All prescriptions for Controlled Drugs that are subject to the prescription requirements must always state:

- the name and address of the patient (use of a PO Box is not acceptable);
- in the case of a preparation, the form (the dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. MST Continus, or whether only one form is available), and, where appropriate, the strength of the preparation (when more than one strength of a preparation exists the strength required must be specified); to avoid ambiguity, where a prescription requests multiple strengths of a medicine, each strength should be prescribed separately (i.e. separate dose, total quantity, etc);
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units (tablets, capsules, ampoules), state the total number (in both words and figures) of dosage units to be supplied (e.g. 10 tablets of 10 mg rather than 100 mg total quantity);
- the dose, which must be clearly defined (i.e. the instruction ‘one as directed’ constitutes a dose but ‘as directed’ does not); it is not necessary that the dose is stated in both words and figures;
- the words ‘for dental treatment only’ if issued by a dentist.

A pharmacist is not allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (e.g. name, date, signature and GPhC registration number). The prescription should be marked with the date of supply at the time the Controlled Drug supply is made.

The Department of Health and the Scottish Government have issued a strong recommendation that the maximum quantity of Schedule 2, 3 or 4 Controlled Drugs prescribed should not exceed 30 days; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient’s notes.

A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription). Schedule 5 prescriptions are valid for 6 months from the appropriate date.

Medicines that are not Controlled Drugs should not be prescribed on the same form as a Schedule 2 or 3 Controlled Drug.

See sample prescription:

![Sample Prescription]

Instalments and repeatable prescriptions

Prescriptions for Schedule 2 or 3 Controlled Drugs can be dispensed by instalments. An instalment prescription must have an instalment direction including both the dose and the instalment amount specified separately on the prescription, and it must also state the interval between each time the medicine can be supplied.

The first instalment must be dispensed within 28 days of the appropriate day (i.e. date of signing unless the prescriber indicates a date before which the Controlled Drug should not be dispensed) and the remainder should be dispensed in accordance with the instructions on the prescription. The prescription must be marked with the date of each supply.

The instalment direction is a legal requirement and needs to be complied with, however, for certain situations (e.g. if a pharmacy is closed on the day an instalment is due) the Home Office has approved specific wording which provides pharmacists some flexibility for supply. For details, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition) or see Home Office approved wording for instalment prescribing (Circular 027/2015), available at www.gov.uk/.

Repeatable prescriptions are prescriptions which contain a direction that they can be dispensed more than once (e.g. repeat × 3). Only Schedule 4 and 5 Controlled Drugs are permitted on repeatable prescriptions.

Private prescriptions

Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms which are provided by local NHS England area teams in England (form FP10PCD), local NHS Health Boards in Scotland (form PPCD) and Wales (form W10PCD); in addition, prescriptions must specify the prescriber’s identification number (or a NHS prescriber code in Scotland).
Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

**Dependence and misuse**

The most common drugs of addiction are crack cocaine and opioids, particularly diamorphine hydrochloride p. 456 (heroin). For arrangements for prescribing of diamorphine hydrochloride, dipipanone, or cocaine for addicts, see Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts below.

Along with traditional stimulants, such as amphetamine and cocaine, there has been an emerging use of methamphetamine and a range of psychoactive substances with stimulant, depressant or hallucinogenic properties such as lysergide (lysergic acid diethylamide, LSD), ketamine or gamma-hydroxybutyrate (sodium oxybate, GHB).

Benzodiazepines and z-drugs (i.e. zopiclone p. 490, zolpidem tartrate p. 490) have their own potential for misuse and dependence and are often taken in combination with opiates or stimulants.

Cannabis-based products for medicinal use are Schedule 2 Controlled Drugs and can be prescribed only by clinicians listed on the Specialist Register of the General Medical Council. Cannabis with no approved medicinal use is a Schedule 1 Controlled Drug and cannot be prescribed. It remains the most frequently used illicit drug by young people and dependence can develop in around 10% of users. Cannabis use can exacerbate depression and it may cause an acute short-lived toxic psychosis which resolves with cessation, however paranoid symptoms may persist in chronic users; withdrawal symptoms can occur in some users and these can contribute to sleep problems, agitation and risk of self-harm.

**Supervised consumption**

Supervised consumption is not a legal requirement under the 2001 Regulations. Nevertheless, when supervised consumption is directed on the prescription, the Department of Health recommends that any deviance from the prescriber’s intended method of supply should be documented and the justification for this recorded. Individuals prescribed opioid substitution therapy can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment. It is good practice for pharmacists to alert the prescriber when a patient has missed consecutive daily doses.

**Prescribing drugs likely to cause dependence or misuse**

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a patient for the first time.
- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring. Prescribers are responsible for the security of prescription forms once issued to them. The stealing and misuse of prescription forms could be minimised by the following precautions:

- records of serial numbers received and issued should be retained for at least three years;
- blank prescriptions should never be pre-signed;
- prescription forms should not be left unattended and should be locked in a secure drawer, cupboard, or carrying case when not in use;
- doctors’, dentists’ and surgery stamps should be kept in a secure location separate from the prescription forms;
- alterations are best avoided but if any are made and the prescription is to be used, best practice is for the prescriber to cross out the error, initial and date the error, then write the correct information;
- if an error made in a prescription cannot be corrected, best practice for the prescriber is to put a line through the script and write ‘spoiled’ on the form, or destroy the form and start writing a new prescription;
- prescribers and pharmacists dispensing drugs prone to abuse should ensure compliance with all relevant legal requirements specially when dealing with prescriptions for Controlled Drugs (see Prescription requirements and Installments above);
- at the time of dispensing, prescriptions should be stamped with the pharmacy stamp and endorsed by the pharmacist or pharmacy technician with what has been supplied; where loss or theft is suspected, the police should be informed immediately.

**Travelling abroad**

Prescribed drugs listed in Schedule 4 Part II (CD Anab) for self-administration and Schedule 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are not subject to export or import licensing. A personal import/export licence is required for patients travelling abroad with Schedules 2, 3, or Part I (CD Benz) and Part II (CD Anab) Controlled Drugs if, they are carrying more than 3 months’ supply or are travelling for 3 calendar months or more. A Home Office licence is required for any amount of a Schedule 1 Controlled Drug imported into the UK for personal use regardless of the duration of travel. Further details can be obtained at www.gov.uk/guidance/controlled-drugs-licences-fees-and-returns or from the Home Office by contacting DFLU.ie@homeoffice.gsi.gov.uk. In cases of emergency, telephone (020) 7035 6230.

Applications for obtaining a licence must be supported by a cover letter signed by the prescribing doctor or drug worker, which must confirm:

- the patient’s name and address;
- the travel itinerary;
- the names of the prescribed Controlled Drug(s), doses and total amounts to be carried.

Applications for licences should be sent to the Home Office, Drugs & Firearms Licensing Unit, Fry Building, 2 Marsham Street, London, SW1P 4DF. Alternatively, completed application forms can be emailed to DFLU.ie@homeoffice.gsi.gov.uk. A minimum of 10 days should be allowed for processing the application.

Patients travelling for less than 3 months or carrying less than 3 months supply of Controlled Drugs do not require a...
personal export/import licence, but are advised to carry a
cover letter signed by the prescribing doctor or drug worker.
Those travelling for more than 3 months are advised to make
arrangements to have their medication prescribed by a
practitioner in the country they are visiting.
Doctors who want to take Controlled Drugs abroad while
accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who
want to take Controlled Drugs abroad solely in case a family
emergency should arise.
Personal export/import licences do not have any legal status
outside the UK and are issued only to comply with the
Misuse of Drugs Act 2001 and to facilitate passage through
UK Customs and Excise control. For clearance in the country
to be visited it is necessary to approach that country’s
consulate in the UK.

Notification of patients receiving structured
drug treatment for substance dependence
In England, doctors should report cases where they are
providing structured drug treatment for substance
dependence to their local National Drug Treatment
Monitoring System (NDTMS) Team. General information
about NDTMS can be found at www.gov.uk/government/
collections/alcohol-and-drug-misuse-prevention-and-treatment-
guidance.
Enquiries about NDTMS, and how to submit data, should
initially be directed to:

- EvidenceApplicationteam@phe.gov.uk

In Scotland, doctors should report cases to the Substance
Drug Misuse Database. General information about the
Scottish Drug Misuse Database can be found in
www.isdscotland.org/Health-Topics/Drugs-and-Alcohol-Misuse/
Drugs-Misuse/Scottish-Drug-Misuse-Database/. Enquiries about
reporting can be directed to:

- nss.isdsubstancemisuse@nhs.net

In Northern Ireland, the Misuse of Drugs (Notification of
and Supply to Addicts) (Northern Ireland) Regulations 1973
require doctors to send particulars of persons whom they
consider to be addicted to certain Controlled Drugs to the
Chief Medical Officer of the Ministry of Health and Social
Services. The Northern Ireland contact is:
Public Health Information & Research Branch
Department of Health,
Annexe 2,
Castle Buildings,
Stormont,
Belfast
BT4 3SQ
Tel: 028 9052 2340
phirb@health-ni.gov.uk
Public Health Information & Research Branch also
maintains the Northern Ireland Drug Misuse Database
(NIDMD) which collects detailed information on those
presenting for treatment, on drugs misused and injecting
behaviour; participation is not a statutory requirement.
In Wales, doctors should report cases where they are
providing structured drug treatment for substance
dependence on the Welsh National Database for Substance
Misuse; enquiries should be directed to: substancemisuse-
queries@wales.nhs.uk.

Prescribing of diamorphine (heroin),
dipipanone, and cocaine for addicts
The Misuse of Drugs (Supply to Addicts) Regulations 1997
require that only medical practitioners who hold a special
licence issued by the Home Secretary (or Scottish
Government’s Chief Medical Officer) may prescribe,
administer, or supply diamorphine hydrochloride p. 456,
dipipanone, or cocaine for the treatment of drug addiction.

Adverse reactions to drugs

Yellow card scheme
Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of the 

Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit’s educational material is available from www.dsrui.org.

Newer drugs and vaccines
Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice. The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Established drugs and vaccines
Healthcare professionals and coroners are asked to report all suspected reactions to established drugs (including over-the-counter, herbal, and unlicensed medicines and medicines used off-label) and vaccines that are serious, medically significant, or result in harm. Serious reactions include those that are fatal, life-threatening, disabling,
incapacitating, or which result in or prolong hospitalisation, or a congenital abnormality; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs. For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.

Medication errors
Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Adverse reactions to medical devices
Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF
The BNF includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers’ literature may be omitted from the BNF. Recognising that hypersensitivity reactions (including anaphylactic and anaphylactoid reactions) can occur with virtually all drugs, this effect is not generally listed, unless the drug carries an increased risk of such reactions or specific management advice is provided by the manufacturer. Administration site reactions have been omitted from the BNF (e.g. pain at injection site). The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes). Drugs that are applied locally or topically carry a theoretical or low risk of systemic absorption and therefore systemic side-effects for these drugs are not listed in the BNF unless they are associated with a high risk to patient safety. Infections are a known complication of treatment with drugs that affect the immune system (e.g. corticosteroids or immunosuppressants); this side-effect is listed in the BNF as ‘increased risk of infection’. Symptoms of drug withdrawal reactions are not individually listed, but are collectively termed ‘withdrawal syndrome’. Side-effects are generally listed alphabetically in order of frequency. In the product literature the frequency of side-effects is generally described as follows:

<table>
<thead>
<tr>
<th>Description of the frequency of side-effects</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Very common</td>
<td>greater than 1 in 10</td>
</tr>
<tr>
<td>Common</td>
<td>1 in 100 to 1 in 10</td>
</tr>
<tr>
<td>Uncommon [formerly ‘less commonly’ in BNF publications]</td>
<td>1 in 1000 to 1 in 1000</td>
</tr>
<tr>
<td>Rare</td>
<td>1 in 10 000 to 1 in 1000</td>
</tr>
<tr>
<td>Very rare</td>
<td>less than 1 in 10 000</td>
</tr>
<tr>
<td>Frequency not known</td>
<td>frequency is not defined by product literature or the side-effect has been reported from post-marketing surveillance data</td>
</tr>
</tbody>
</table>

For consistency, the terms used to describe side-effects are standardised using a defined vocabulary across all of the drug monographs in the BNF (e.g. postural hypotension is used for the term orthostatic hypotension).

Special problems
Delayed drug effects Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

The elderly Particular vigilance is required to identify adverse reactions in the elderly.

Congenital abnormalities When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

Children Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; all suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme (see also Adverse Drug Reactions in Children).

Prevention of adverse reactions
Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions to the drug or formulation;
- ask if the patient is already taking other drugs including self-medication drugs, health supplements, complementary and alternative therapies; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effect of the drug; notably of isoniazid p. 587 and the tricyclic antidepressants;
- prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
- whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- warn the patient if serious adverse reactions are liable to occur.
Drug allergy (suspected or confirmed)

Suspected drug allergy is any reaction caused by a drug with clinical features compatible with an immunological mechanism. All drugs have the potential to cause adverse drug reactions, but not all of these are allergic in nature. A reaction is more likely to be caused by drug allergy if:

- The reaction occurred while the patient was being treated with the drug, or
- The drug is known to cause this pattern of reaction, or
- The patient has had a similar reaction to the same drug or drug-class previously.

A suspected reaction is less likely to be caused by a drug allergy if there is a possible non-drug cause or if there are only symptoms present.

The following signs, allergic patterns and timing of onset can be used to help decide whether to suspect drug allergy:

### Immediate, rapidly-evolving reactions (onset usually less than 1 hour after drug exposure)
- Anaphylaxis, with erythema, urticaria or angioedema, and hypotension and/or bronchospasm. See also Antihistamines, allergen immunotherapy and allergic emergencies p. 277
- Urticaria or angioedema without systemic features
- Exacerbation of asthma e.g. with non-steroidal anti-inflammatory drugs (NSAIDs)

### Non-immediate reactions, without systemic involvement (onset usually 6–10 days after first drug exposure or 3 days after second exposure)
- Cutaneous reactions, e.g. widespread red macules and/or papules, or, fixed drug eruption (localised inflamed skin)
- Non-immediate reactions, with systemic involvement (onset may be variable, usually 3 days to 6 weeks after first drug exposure, depending on features, or 3 days after second exposure)
- Cutaneous reactions with systemic features, e.g. drug reaction with eosinophilia and systemic signs (DRESS) or drug hypersensitivity syndrome (DHS), characterised by widespread red macules, papules or erythema, fever, lymphadenopathy, liver dysfunction or eosinophilia
- Toxic epidermal necrolysis or Stevens–Johnson syndrome
- Acute generalised exanthematous pustulosis (AGEP)

### Suspected drug allergy information

Suspected drug allergy information should be clearly and accurately documented in clinical notes and prescriptions, and shared among all healthcare professionals. Patients should be given information about which drugs and drug-classes to avoid and encouraged to share their drug allergy status.

- If a drug allergy is suspected, consider stopping the suspected drug and advising the patient or carer to avoid this drug in future. Symptoms of the acute reaction should be treated, in hospital if severe. Patients presenting with a suspected anaphylactic reaction, or a severe or non-immediate cutaneous reaction, should be referred to a specialist drug allergy service. Patients presenting with a suspected drug allergic reaction or anaphylaxis to NSAIDs, and local and general anaesthetics may also need to be referred to a specialist drug allergy service, e.g. in cases of anaphylactoid reactions or to determine future treatment options. Patients presenting with a suspected drug allergic reaction or anaphylaxis associated with beta-lactam antibiotics should be referred to a specialist drug allergy service if their disease or condition can only be treated by a beta-lactam antibiotic or they are likely to need beta-lactam antibiotics frequently in the future (e.g. immunodeficient patients).
- For further information see Drug allergy: diagnosis and management. NICE Clinical Guideline 183 (September 2014) www.nice.org.uk/guidance/cg183.

### Oral side-effects of drugs

Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient’s medical practitioner may be necessary.

**Oral mucosa** Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind.

- Aspirin tablets p. 121 allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration.
- Flavouring agents, particularly essential oils, may sensitise the skin, but mucosal swelling is not usually prominent.
- The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate p. 913. Other drugs capable of causing oral ulceration include ACE inhibitors, gold, nicoaridil p. 212, NSAIDs, pancreatin p. 96, penicillamine p. 1097, proguanil hydrochloride p. 618, and protease inhibitors.

Erythema multiforme or Stevens–Johnson syndrome may follow the use of a wide range of drugs including antibacterials, antiretrovirals, sulfonamide derivatives, and anticonvulsants; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of toxic epidermal necrolysis have been reported with a similar range of drugs.

- Lichenoid eruptions are associated with ACE inhibitors, NSAIDs, methyldopa p. 145, chloroquine p. 616, oral antidiabetics, thiazide diuretics, and gold.
- CANDIDIASIS can complicate treatment with antibacterials and immunosuppressants and is an occasional side-effect of corticosteroid inhalers.

**Teeth and jaw** Brown staining of the teeth frequently follows the use of chlorhexidine mouthwash, spray or gel p. 1211, but can readily be removed by polishing. Iron salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav suspension p. 551. Intrinsic staining of the teeth is most commonly caused by tetracyclines. They will affect the teeth if given at any time from about the fourth month in utero until the age of twelve years; they are contra-indicated during pregnancy, in breastfeeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey.

- Excessive ingestion of fluoride leads to dental fluorosis with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child’s age (taking into account the fluoride content of the local drinking water and of toothpaste).

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease. All patients receiving bisphosphonates should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients with a cancer receiving bevacizumab p. 862 or sunitinib p. 999 may also be at risk of osteonecrosis of the jaw.

**Periodontium** Gingival overgrowth (gingival hyperplasia) is a side-effect of phenytoin p. 323 and sometimes of ciclosporin p. 838 or of nifedipine p. 162 (and some other calcium-channel blockers). Thrombocytopenia may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

**Salivary glands** The most common effect that drugs have on the salivary glands is to reduce flow (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene;
they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly antimuscarinics (anticholinergics), antidepressants (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), alpha-blockers, antihistamines, antipsychotics, baclofen p. 1128, bupropion hydrochloride p. 498, clonidine hydrochloride p. 145, 5HT1 agonists, opioids, and tizanidine p. 1129. Excessive use of diuretics can also result in xerostomia. Some drugs (e.g. clozapine p. 396, neostigmine p. 1125) can increase saliva production but this is rarely a problem unless the patient has associated difficulty in swallowing. Pain in the salivary glands has been reported with some antihypertensives (e.g. clonidine hydrochloride p. 145, methyldopa p. 145) and with vinca alkaloids. Swelling of the salivary glands can occur with iodides, antithyroid drugs, phenothiazines, and sulfonamides.

**Taste**

There can be decreased taste acuity or alteration in taste sensation. Many drugs are implicated, including amiodarone hydrochloride p. 105, calcitonin, ACE inhibitors, carbimazole p. 771, clarithromycin p. 538, gold, griseofulvin p. 601, lithium salts, metformin hydrochloride p. 692, metronidazole p. 542, penicillamine p. 1097, phenindione p. 140, propafenone hydrochloride p. 104, protease inhibitors, terbinafine p. 1234, and zopiclone p. 490.

**Defective medicines**

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should not be confused with an Adverse Drug Reaction where the product conforms to its specification. The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

The Defective Medicines Report Centre

Guidance on intravenous infusions

Intravenous additives policies
A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned. Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards. The information that follows should be read in conjunction with local policy documents.

Guidelines
- Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion container should be labelled with the patient’s name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer’s label that is still valid.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems
Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitate or other chemical changes. Precipitation or other particle concentration changes, particularly species of bacteria or virus, may occur with loss of potency, increase in toxicity, or other chemical changes. Precipitation or other particle concentration changes, particularly species of bacteria or virus, may occur with loss of potency, increase in toxicity, or other chemical changes.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, ‘salting-out’ effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin). It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed. A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated). If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as Vitlipid N® may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 mL.

Method
Ready-prepared infusions should be used whenever available. Potassium chloride is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. Lidocaine hydrochloride is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%). When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions. It is also important in certain instances that an infusion fluid of specific pH be used (e.g. furosemide injection requires dilution in infusions of pH greater than 5.5).

When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed or coalescence of fat globules and separation of phases, the solutions may become opalescent or precipitate.
differences in density. **Potassium chloride** is particularly prone to this ‘layering’ effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. dacarbazine and sodium nitroprusside. Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24–48 mL) of sodium chloride intravenous infusion (0.9%).

**Information provided in the BNF**

The BNF gives information about preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

Drugs for **continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by **intermittent infusion** in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the ‘piggy-back’ technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

**Addition via the drip tubing** is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

**Drugs given by intravenous infusion**

The BNF includes information on addition to **Glucose intravenous infusion 5 and 10%**, and **Sodium chloride intravenous infusion 0.9%**. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with **Sodium chloride and glucose intravenous infusion**. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.
Prescribing in children

Overview
For detailed advice on medicines used for children, consult BNF for Children. Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity. Whenever possible, intramuscular injections should be avoided in children because they are painful. Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use. Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications (‘off-label’ use) is often necessary in paediatric practice.

Adverse drug reactions in children
Suspected adverse drug reactions in children and young adults under 18 years should be reported through the Yellow Card Scheme. Yellow cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are:

- serious, medically significant or result in harm.

Serious events are fatal, life-threatening, a congenital abnormality, disabling or incapacitating, or resulting in hospitalisation;
- associated with newer drugs and vaccines; the most up to date list of black triangle medicines is available at: www.mhra.gov.uk/blacktriangle

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card.

The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not have been extensively tested in children;
- many drugs are not specifically licensed for use in children and are used either ‘off-label’ or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit’s Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRSL). If reported to the NRSL, these will be shared with the MHRA. If the NRSL is not available and harm occurs, report using a Yellow Card.

Prescription writing
Prescriptions should be written according to the guidelines in Prescription Writing. Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for all prescriptions for children.

It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL an oral syringe will be supplied. Parents should be advised not to add any medicines to the infant’s feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents.

Parents must be warned to keep all medicines out of reach of children.

Rare paediatric conditions
Information on substances such as biotin and sodium benzoate used in rare metabolic conditions is included in BNF for Children; further information can be obtained from:

- Alder Hey Children’s Hospital
- Drug Information Centre, Liverpool, L2 2AP
- Great Ormond Street Hospital for Children Pharmacy, Great Ormond St, London, WC1N 3JH

Dosage in children
Children’s doses in the BNF are stated in the individual drug entries.

Doses are generally based on body-weight (in kilograms) or specific age ranges. In the BNF and BNF for Children, the term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent (1 month–17 years). An age range is specified when the dose information applies to a narrower age range than a child from 1 month–17 years.

Dose calculation
Many children’s doses are standardised by weight (and therefore require multiplying by the body-weight in kilograms to determine the child’s dose); occasionally, the doses have been standardised by body surface area (in m²).

These methods should be used rather than attempting to calculate a child’s dose on the basis of doses used in adults. For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such
cases, dose should be calculated from an ideal weight, related to height and age. **Body surface area (BSA) estimates** are sometimes preferable to body-weight for calculation of paediatric doses since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to **BNF for Children**. Where the dose for children is not stated, prescribers should consult **BNF for Children** or seek advice from a medicines information centre.

**Prescribing in hepatic impairment**

**Overview**
Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

**Impaired drug metabolism**
Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired. A few drugs, e.g. rifampicin p. 582 and fusidic acid p. 571, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

**Hypoproteinaemia**
The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin p. 323 and prednisolone p. 678.

**Reduced clotting**
Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the sensitivity to oral anticoagulants such as warfarin sodium p. 140 and phenindione p. 140.

**Hepatic encephalopathy**
In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

** Fluid overload**
Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention e.g. NSAIDs and corticosteroids.

**Hepatotoxic drugs**
Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

**Prescribing in renal impairment**

**Issues encountered in renal impairment**
The use of drugs in patients with reduced renal function can give rise to problems for several reasons:
- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification.

**General guidance**
Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug monograph in the BNF. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration. Dose recommendations are based on the severity of renal impairment. The total daily maintenance dose of a drug can
be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration.

**Important: dosage adjustment advice in the BNF**

Clinical laboratories routinely report renal function in adults based on estimated glomerular filtration rate (eGFR) or Cockcroft and Gault formula or the Modification of Diet in Renal disease (MDRD) formula. However, in product literature, the effects of renal impairment on drug elimination is usually stated in terms of creatinine clearance as a surrogate for GFR. The information on dosage adjustment in the BNF is usually expressed in terms of eGFR. Exceptions to the use of eGFR include toxic drugs, in elderly patients and in patients at extremes of muscle mass (see Estimating renal function in elderly patients, below) where calculation of CrCl is recommended. Although these two measures of renal function are not interchangeable, for most drugs and for most adult patients of average build and height, eGFR (rather than CrCl) can be used to determine dosage adjustments.

**Nephrotic drugs**

Nephrotic drugs should, if possible, be avoided in patients with renal disease because the consequences of nephroticity are likely to be more serious when renal reserve is already reduced. During intercurrent illness the risk of acute kidney injury is increased in patients with an eGFR of less than 60 mL/min/1.73 m²; potentially nephrotic or renally excreted drugs may require dose reduction or temporary discontinuation.

**Renal replacement therapy and transplantation**

For prescribing in patients who have received a renal transplant or who are on renal replacement therapy (peritoneal dialysis or haemodialysis), consult specialist literature.

**Estimating renal function**

Direct measure of Glomerular filtration rate (GFR) using plasma or urinary clearance is considered the best overall index of renal function. However, this is difficult to do in practice. As an alternative, the estimated Glomerular filtration rate (eGFR) based on serum creatinine is used to assess renal function. Creatinine clearance (CrCl) is also used as an estimate of GFR. Various equations for estimating glomerular filtration rate exist, however there is no compelling evidence to support the superiority of any given method for drug dosing in all patient populations or clinical situations. There is also insufficient evidence to provide definitive guidance about dosage adjustment of all drugs in patients with reduced renal function. Therefore, an understanding of drug pharmacokinetics is necessary in order to make appropriate dosing decisions. Using serum creatinine to derive eGFR has a number of limitations; serum creatinine levels are dependent on muscle mass and diet, therefore estimates should be interpreted with caution in certain individuals (such as the elderly, body builders, amputees, in muscle-wasting disorders and vegans)—estimates will be higher or lower than the true value. Creatinine-derived measurements are also not useful in periods of rapidly changing renal function or in patients with AKI.

**Estimated glomerular filtration rate**

**Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) formula**

The CKD-EPI formula is the recommended method for estimating GFR and calculating drug doses in most patients with renal impairment. CKD-EPI is adjusted for body surface area (BSA) and utilises serum creatinine, age, sex and race as variables. Clinical laboratories should use the CKD-EPI formula to routinely report eGFR.

**CKD-EPI equation**

\[
eGFR \text{ (ml/min/1.73} \text{ m}^2) = 141 \times \min(\text{SCr/K}, 1)^{\ast} \times \max(\text{SCr/K}, 1)^{0.209} \times 0.993^{\ast} \times 1.018 \text{ if female} \times 1.159 \text{ if black}
\]

Where:

- \( \text{SCr} = \) serum creatinine in mg/dl;
- \( K = 0.7 \) for females and 0.9 for males;
- \( a = -0.329 \) for females and -0.411 for males;
- \( \min(\text{SCr/K}, 1) \) indicates the minimum of SCr/K or 1;
- \( \max(\text{SCr/K}, 1) \) indicates the maximum of SCr/K or 1.

**Modification of Diet in Renal disease (MDRD)**

The MDRD formula, like CKD–EPI, is expressed in terms of body surface area. It is less accurate than the CKD–EPI formula when eGFR is greater than 60 mL/min/1.73 m². It also overestimates GFR in elderly patients.

**Estimated creatinine clearance**

**Cockcroft and Gault**

The Cockcroft and Gault formula is the preferred method for estimating renal function or calculating drug doses in patients with renal impairment who are elderly or at extremes of muscle mass (see below); it provides an estimate of CrCl (which is not equivalent to eGFR).

**Estimated Creatinine Clearance**

\[
\text{Creatinine Clearance} = \frac{(140 - \text{Age}) \times \text{Weight} \times \text{Constant}}{\text{Serum creatinine}} \text{in ml/minute}
\]

- Age in years
- Weight in kilograms (use ideal body weight where fat is likely to be the major contributor to body mass)
- Serum creatinine in micromol/litre
- Constant = 1.23 for men; 1.04 for women

**Estimating renal function in patients at extremes of muscle mass**

In patients at both extremes of muscle mass, eGFR should be interpreted with caution. Reduced muscle mass will lead to overestimation of GFR and increased muscle mass will lead to underestimation of the GFR. Creatinine clearance or absolute glomerular filtration rate should be used to adjust drug doses in patients with a BMI less than 18 kg/m² or greater than 40 kg/m². Ideal body weight should be used to calculate the CrCl.

Where the patient’s actual body weight is less than their ideal body weight, actual body weight should be used instead.

The absolute glomerular filtration rate is determined by removing the normalisation for BSA from the eGFR using the following formula:

\[
\text{GFR (Absolute)} = \text{eGFR} \times (\text{individual’s body surface area} / 1.73)
\]

The ideal body weight is calculated as follows:

**Ideal body weight (kilograms) = Constant \times 0.91**

**Height - 152.4**

Where:

- Constant = 50 for men; 45.5 for women
- Height in centimetres

**Estimating renal function in elderly patients**

The Cockcroft and Gault formula is the preferred method for estimating renal function in elderly patients aged 75 years and over.
Chronic kidney disease

Classification of chronic kidney disease using GFR and ACR categories

Chronic kidney disease is classified using a combination of GFR and albumin:creatinine ratio (ACR). A decreased GFR and an increased ACR is associated with an increased risk of adverse outcomes. For example, a person with an eGFR of 25 ml/min/1.73 m² and an ACR of 15 mg/mmol has a CKD classification of G4A2.

**Classification of chronic kidney disease using GFR and ACR categories**

![Diagram showing the classification of chronic kidney disease using GFR and ACR categories.](image)

<table>
<thead>
<tr>
<th>GFR categories (ml/min/1.73m²), description and range</th>
<th>ACR categories (mg/mmol), description and range</th>
</tr>
</thead>
<tbody>
<tr>

<td>A3</td>
</tr>
</tbody>
</table>

- **Normal or high** (≥90 ml/min/1.73m²)
- **Mild reduction relative to normal range for a young adult** (60–89 ml/min/1.73m²)
- **Mild-moderate reduction** (45–59 ml/min/1.73m²)
- **Moderate-severe reduction** (30–44 ml/min/1.73m²)
- **Severe reduction** (15–29 ml/min/1.73m²)
- **Kidney failure** (<15 ml/min/1.73m²)

**Abbreviations:** ACR, albumin:creatinine ratio; CKD, chronic kidney disease; GFR, glomerular filtration rate

*Adapted with the kind permission of the Kidney Disease: Improving Global Outcomes (KDIGO) CKD Work Group, 2013.*
Advanced Pharmacy Services

Patients with renal impairment may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.
Prescribing in pregnancy

Overview
Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child.

During the first trimester drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy. During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery.

Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The BNF and BNF for Children identify drugs which:
- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy

The information is based on human data, but information from animal studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in maternal physiology but this is beyond the scope of the BNF and BNF for Children.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF and BNF for Children.

Important
Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF and BNF for Children provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service. www.uktis.org.

Tel: 0344 892 0909 (09.00–17.00 Monday to Friday; urgent enquiries only outside these hours).

MHRA/CHM advice: Medicines with teratogenic potential: what is effective contraception and how often is pregnancy testing needed? (March 2019)
Guidance is available on contraceptive methods and frequency of pregnancy testing to reduce inadvertent exposures during pregnancy in a woman taking a medicine of teratogenic potential. When using these medicines, a woman should be advised of the risks and encouraged to use the most effective contraceptive method taking into account her personal circumstances. The likelihood of pregnancy should be assessed before each prescription of a medicine with known teratogenic potential, by performing a pregnancy test. If pregnancy cannot be excluded, the decision to start or continue treatment will depend on individual circumstances, such as the urgency for treatment and alternative treatment options. If feasible, treatment with a medicine with teratogenic potential should be delayed until pregnancy has been excluded by a repeat test.

Prescribing in breast-feeding

Overview
Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:
- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction.

A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin p. 203), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity.

Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital p. 335) while others can affect lactation (e.g. bromocriptine p. 419).

The BNF identifies drugs:
- that should be used with caution or are contra-indicated in breast-feeding;
- that can be given to the mother during breast-feeding because they are present in milk in amounts which are too small to be harmful to the infant;
that might be present in milk in significant amount but are not known to be harmful.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

**Important**

For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.
Prescribing in palliative care

Overview
Palliative care is an approach that improves the quality of life of patients and their families facing life-threatening illness, through the prevention and relief of suffering by means of early identification and impeccable assessment and treatment of pain and other problems, physical, psychosocial, and spiritual. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team.

Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams.

Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish.

Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

Drug treatment
The number of drugs should be as few as possible, for even the taking of medicine may be an effort.

Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain
Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 444, NSAID), opioid (e.g. codeine phosphate p. 454 ‘weak’, morphine p. 463 ‘strong’) and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol p. 444 or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine phosphate p. 454 or tramadol hydrochloride p. 471 can be considered for moderate pain. If these preparations do not control the pain then morphine p. 463 is the most useful opioid analgesic. Alternatives to morphine p. 463, including transdermal buprenorphine p. 447, transdermal fentanyl p. 458, hydromorphone hydrochloride p. 462, methadone hydrochloride p. 502, or oxycodone hydrochloride p. 466, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases
In addition to the above approach, radiotherapy, bisphosphonates, and radioactive isotopes of strontium chloride (Megace® available from GE Healthcare) may be useful for pain due to bone metastases.

Neuropathic pain
Patients with neuropathic pain may benefit from a trial of a tricyclic antidepressant. An antiepileptic may be added or substituted if pain persists; gabapentin p. 315 and pregabalin p. 324 are licensed for neuropathic pain. Ketamine p. 1345 is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 675, which reduces oedema around the tumour, thus reducing compression. Nerve blocks or regional anaesthesia techniques (including the use of epidural and intrathecal catheters) can be considered when pain is localised to a specific area.

Pain management with opioids

Oral route
Treatment with morphine p. 463 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment, increasing age, or frailty. The dose is given either as an immediate-release preparation 4-hourly or as a modified-release preparation 12-hourly, in addition to rescue doses. If pain occurs between regular doses of morphine p. 463 ('breakthrough pain'), an additional dose ('rescue dose') of immediate-release morphine p. 463 should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each patient should be assessed on an individual basis. Formulations of fentanyl p. 458 that are administered nasally, buccally or sublingually are also licensed for breakthrough pain.

When adjusting the dose of morphine p. 463, the number of rescue doses required and the response to them should be taken into account; increments of morphine p. 463 should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine p. 463 stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures.

Morphine immediate-release 30mg 4-hourly (or modified-release 100 mg 12-hourly) is usually adequate for most patients; some patients require morphine immediate-release up to 200mg 4-hourly (or modified-release 600 mg 12-hourly), occasionally more is needed. Once their pain is controlled, patients started on 4-hourly immediate-release morphine p. 463 can be transferred to the same total 24-hour dose of morphine p. 463 given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of, the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine p. 463. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.

Oxycodone hydrochloride p. 466 can be used in patients who require an opioid but cannot tolerate morphine p. 463. If the patient is already receiving an opioid, oxycodone hydrochloride p. 466 should be started at a dose equivalent to the current analgesic (see below). Oxycodone hydrochloride p. 466 immediate-release preparations can be given for breakthrough pain.
### Equivalent doses of opioid analgesics.

<td></td>
</tr>
</tbody>
</table>

**Parenteral route** The equivalent parenteral dose of morphine p. 463 (subcutaneous, intramuscular, or intravenous) is about half of the oral dose. If the patient is unable to swallow, generally morphine p. 463 is administered as a continuous subcutaneous infusion (for details, see Continuous Subcutaneous Infusions below). Diamorphine hydrochloride p. 456 is sometimes preferred, because being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose of diamorphine hydrochloride p. 456 is about one-third of the oral dose of morphine p. 463.

If the patient can resume taking medicines by mouth, then oral morphine p. 463 may be substituted for subcutaneous infusion of morphine p. 463 or diamorphine hydrochloride p. 456, see table above of approximate equivalent doses of morphine p. 463 and diamorphine hydrochloride p. 456. The infusion is discontinued when the first oral dose of morphine p. 463 is given.

**Rectal route** Morphine p. 463 is also available for rectal administration as suppositories; alternatively oxycodone hydrochloride suppositories p. 466 can be obtained on special order.

**Transdermal route** Transdermal preparations of fentanyl p. 458 and buprenorphine p. 447 are available, they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations, see under buprenorphine p. 447 and fentanyl p. 458 (inappropriate use has caused fatalities). Immediate-release morphine p. 463 can be given for breakthrough pain.

The following 24-hour oral doses of morphine p. 463 are considered to be approximately equivalent to the buprenorphine p. 447 and fentanyl p. 458 patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

### Buprenorphine patches are approximately equivalent to the following 24-hour doses of oral morphine

<table>
<thead>
<tr>
<th>Morphine Dose</th>
<th>Buprenorphine Patch</th>

</tr>
<tr>
<td>168 mg daily</td>
<td>‘70’ patch</td>
</tr>
</tbody>
</table>

Formulations of transdermal patches are available as 72-hourly, 96-hourly and 7-day patches, for further information see buprenorphine p. 447. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

### 72-hour Fentanyl patches are approximately equivalent to the following 24-hour doses of oral morphine

<table>
<thead>
<tr>
<th>Morphine Dose</th>
<th>Fentanyl Patch</th>
</tr>
</thead>
<tbody>
<tr>
<td>30 mg daily</td>
<td>‘12’ patch</td>
</tr>
<tr>
<td>60 mg daily</td>

</tr>
<tr>
<td>180 mg daily</td>
<td>‘75’ patch</td>
</tr>
<tr>
<td>240 mg daily</td>
<td>‘100’ patch</td>
</tr>
</tbody>
</table>

Fentanyl equivalences in this table are for patients on well-tolerated opioid therapy for long periods; for patients who are opioid naive or who have been stable on oral morphine or other immediate-release opioid for only several weeks, see Transdermal Route. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

### Symptom control

Several recommendations in this section involve unlicensed indications or routes.

**Anorexia** Anorexia may be helped by prednisolone p. 678 or dexamethasone p. 675.

**Bowel colic and excessive respiratory secretions** Bowel colic and excessive respiratory secretions may be reduced by a subcutaneous injection of hyoscine hydrobromide p. 439, hyoscine butylbromide p. 85, or glycopyrronium bromide p. 1335. These antimuscarinics are generally given every 4 hours when required, but hourly use is occasionally necessary, particularly in excessive respiratory secretions. If symptoms persist, they can be given regularly via a continuous infusion device. Care is required to avoid the discomfort of dry mouth.

**Capillary bleeding** Capillary bleeding can be treated with tranexamic acid p. 110 by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 110 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 222 can be applied to the affected area. Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K (see phytomenadione p. 1089 and menadiol sodium phosphate p. 1089) should be considered.

**Constipation** Constipation is a common cause of distress and is almost invariable after administration of an opioid.
analgesic. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramine p. 62) or lactulose solution p. 56 with a senna preparation p. 63 should be used. Methylnaltrexone bromide p. 64 is licensed for the treatment of opioid-induced constipation.

**Convolusions** Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin p. 323 or carbamazepine p. 311 should be considered. When oral medication is no longer possible, diazepam p. 343 given rectally, or phenobarbital p. 335 by injection is continued as prophylaxis. For the use of midazolam p. 340 by subcutaneous infusion using a continuous infusion device see below.

**Dry mouth** Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 1219 or miconazole p. 1219, alternatively, fluconazole p. 595 can be given by mouth. Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

**Dysphagia** A corticosteroid such as dexamethasone p. 675 may help, temporarily, if there is an obstruction due to tumour. See also *Dry mouth*, above.

**Dyspnoea** Breathlessness at rest may be relieved by regular oral morphine p. 463 in carefully titrated doses. Diazepam p. 343 may be helpful for dyspnoea associated with anxiety. A corticosteroid, such as dexamethasone p. 675, may also be helpful if there is bronchospasm or partial obstruction.

**Fungating tumours** Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 542 is often required to reduce malodour but topical metronidazole p. 1230 is also used.

**Gastro-intestinal pain** The pain of bowel colic may be reduced by loperamide hydrochloride p. 66. Hyoscine hydrobromide p. 439 may also be helpful, given sublingually as *Kwells*™ tablets. Subcutaneous injections of hyoscine butylbromide p. 85, hyoscine hydrobromide p. 439, and glycopyrronium bromide p. 1335 can also be used to treat bowel colic. Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiemetic such as domperidone p. 85, and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 1219 or miconazole p. 1219, alternatively, fluconazole p. 595 can be given by mouth. Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

**Hiccup** Hiccup due to gastric distension may be helped by a preparation incorporating an antacid with an antiemetic such as domperidone p. 85, and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 1219 or miconazole p. 1219, alternatively, fluconazole p. 595 can be given by mouth. Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

**Insomnia** Patients with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam p. 488, may be useful.

**Intractable cough** Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 463. Methadone hydrochloride linctus p. 502 should be avoided because it has a long duration of action and tends to accumulate.

**Muscle spasm** The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 343 or baclofen p. 1128.

**Nausea and vomiting** Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started. A prokinetic antiemetic may be a preferred choice for first-line therapy. Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol p. 386 or metoclopramide hydrochloride p. 432. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide hydrochloride p. 432 has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently.

Haloperidol p. 386 is used by mouth for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine p. 430 is given rectally. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness. Levomepromazine p. 441 is used as an antiemetic, it is given by mouth or by subcutaneous injection at bedtime. For the dose by subcutaneous infusion see below. Dexamethasone p. 675 by mouth can be used as an adjunct. Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

For the administration of antiemetics by subcutaneous infusion using a continuous infusion device, see below.

For the treatment of nausea and vomiting associated with cancer chemotherapy see *Cytoxic drugs* p. 888.

**Pruritus** Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. In the case of obstructive jaundice, further measures include administration of ciclosporin p. 197.

**Raised intracranial pressure** Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 675 and should be given before 6 p.m. to reduce the risk of insomnia.

**Restlessness and confusion** Restlessness and confusion may require treatment with an antipsychotic, e.g. haloperidol p. 386 or levomepromazine p. 441, by mouth or by subcutaneous injection, both repeated every 2 hours if required. The dose and frequency is adjusted according to the level of patient distress and the response. A regular maintenance dose should also be considered, given twice daily either by mouth or by subcutaneous injection; alternatively use a continuous infusion device. Levomepromazine p. 441 is licensed to treat pain in palliative care—this use is reserved for distressed patients with severe pain unresponsive to other measures (seek specialist advice).

**Continuous subcutaneous infusions** Although drugs can usually be administered by mouth to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a *continuous subcutaneous infusion*, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the parenteral route are:

- the patient is unable to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma

www.getintopharma.com
there is malignant bowel obstruction in patients for whom further surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube)
occasionally when the patient does not wish to take regular medication by mouth.

**Syringe driver rate settings** Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of medication errors.

**Bowel colic and excessive respiratory secretions** Hyoscine hydrobromide p. 439 effectively reduces respiratory secretions and bowel colic and is sedative (but occasionally causes paradoxical agitation). Hyoscine butyrylbromide p. 85 is used for bowel colic and for excessive respiratory secretions, and is less sedative than hyoscine hydrobromide p. 439. Glycopyrronium bromide p. 1335 may also be used to treat bowel colic or excessive respiratory secretions.

**Confusion and restlessness** Haloperidol p. 386 has little sedative effect. Levomepromazine p. 441 has a sedative effect. Midazolam p. 340 is a sedative and an antiepileptic that may be used in addition to an antipsychotic drug in a very restless patient. Midazolam p. 340 is also used for myoclonus.

**Convulsions** If a patient has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam p. 340 is the benzodiazepine antiepileptic of choice for continuous subcutaneous infusion.

**Nausea and vomiting** Haloperidol p. 386 and levomepromazine p. 441 can both be given as a subcutaneous infusion but sedation can limit the dose of levomepromazine p. 441.

Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility, below). Metoclopramide hydrochloride p. 432 can cause skin reactions. Octreotide p. 950, which stimulates water and electrolyte absorption and inhibits water secretion in the small bowel, can be used by subcutaneous infusion to reduce intestinal secretions and to reduce vomiting due to bowel obstruction.

**Pain control** Diamorphine hydrochloride p. 456 is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and Compatibility, below). The table shows approximate equivalent doses of morphine p. 463 and diamorphine hydrochloride p. 456.

**Mixing and compatibility** The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 384, prochlorperazine p. 389, and diazepam p. 343 are contra-indicated as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 430 and levomepromazine p. 441 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 1040) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

**Compatibility with diamorphine** Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either water for injections or physiological saline (sodium chloride 0.9%) is a suitable diluent—above that strength only water for injections is used (to avoid precipitation).

The following can be mixed with diamorphine:

- **Cyclizine**, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- **Dexamethasone**, special care is needed to avoid precipitation of dexamethasone when preparing it.
- **Haloperidol**, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
- **Hyoscine butyrylbromide**
- **Hyoscine hydrobromide**
- **Levomepromazine**
- **Metoclopramide**, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- **Midazolam**

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discolouration) and to ensure that the infusion is running at the correct rate.

**Problems encountered with syringe drivers** The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs too quickly check the rate setting and the calculation;
- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.
Equivalent doses of morphine sulfate and diamorphine hydrochloride given over 24 hours

These equivalences are *approximate only* and should be adjusted according to response

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection subcutaneously—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.
Prescribing in the elderly

Overview
Old people, especially the very old, require special care and consideration from prescribers. *Medicines for Older People*, a component document of the National Service Framework for Older People (Department of Health, National Service Framework for Older People. London: Department of Health, March 2001), describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

Appropriate prescribing
Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance. The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients’ medicines should be reviewed regularly and medicines which are not of benefit should be stopped. Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and light-headedness when associated with social stress as in widowhood, loneliness, and family dispersal. In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help poor prognosis or with poor overall health. Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance. The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients’ medicines should be reviewed regularly and medicines which are not of benefit should be stopped. Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and light-headedness when associated with social stress as in widowhood, loneliness, and family dispersal. In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help poor prognosis or with poor overall health.

Form of medicine
Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

Manifestations of ageing
In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as light-headedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

Sensitivity
The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics, benzodiazepines, antipsychotics, and antiparkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as anti-hypertensives and NSAIDs.

Pharmacokinetics
Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients. The most important effect of age is reduced renal clearance. Many aged patients thus excrete drugs slowly, and are highly susceptible to nephrotoxic drugs. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin p. 109) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

Adverse reactions
Adverse reactions often present in the elderly in a vague and non-specific fashion. Confusion is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are constipation (with antimuscarinics and many tranquillisers) and postural hypotension and falls (with diuretics and many psychotropics).

Hypnotics
Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems. Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

Diuretics
Diuretics are overprescribed in old age and should not be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

NSAIDs
Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk. Owing to the increased susceptibility of the elderly to the side-effects of NSAIDs the following recommendations are made:

- for osteoarthritis, soft-tissue lesions, and back pain, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick;
- for osteoarthritis, soft-tissue lesions, back pain, and pain in rheumatoid arthritis, paracetamol p. 444 should be used first and can often provide adequate pain relief;
- alternatively, a low-dose NSAID (e.g. ibuprofen p. 1141 up to 1.2g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol p. 444;
- do not give two NSAIDs at the same time.

Prophylaxis of NSAID-induced peptic ulcers may be required if continued NSAID treatment is necessary see, NSAID-associated ulcers under Peptic ulceration p. 72.

Other drugs
Other drugs which commonly cause adverse reactions are antiparkinsonian drugs, antihypertensives, psychotropics, and digoxin p. 109. The usual maintenance dose of digoxin p. 109 in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily. Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole p. 562, mianserin
hydrochloride p. 371) should be avoided unless there is no acceptable alternative. The elderly generally require a lower maintenance dose of warfarin sodium p. 140 than younger adults; once again, the outcome of bleeding tends to be more serious.

**Guidelines**
Always consider whether a drug is indicated at all.

**Limit range**
It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

**Reduce dose**
Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide p. 709) should be avoided altogether.

**Review regularly**
Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

**Simplify regimens**
Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

**Explain clearly**
Write full instructions on every prescription (including repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like ‘as directed’. Child-resistant containers may be unsuitable.

**Repeats and disposal**
Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities. If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.

---

**Anti-doping**
UK Anti-Doping, the national body responsible for the UK’s anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. Information regarding the use of medicines in sport is available from:

- UK Anti-doping
- Fleetbank House
- 2-6 Salisbury Square
- London
- EC4Y 8AE
- (020) 7842 3450
- ukad@ukad.org.uk
- [www.ukad.org.uk](http://www.ukad.org.uk)

Information about the prohibited status of specific medications based on the current World Anti-Doping Agency Prohibited List is available from Global Drug Reference Online: [www.globaldro.com/UK/search](http://www.globaldro.com/UK/search)

**General Medical Council’s advice**
Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual’s performance in sport contravene the GMC’s guidance, and such actions would usually raise a question of a doctor’s continued registration. This does not preclude the provision of any care or treatment where the doctor’s intention is to protect or improve the patient’s health.
Prescribing in dental practice

General guidance
Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF.

The following is a list of topics of particular relevance to dentists.
- Prescribing by dentists, see Prescription writing p. 5
- Oral side-effects of drugs, see Adverse reactions to drugs p. 12
- Medical emergencies in dental practice, see below
- Medical problems in dental practice, see below

Drug management of dental and oral conditions

Dental and orofacial pain
- Neuropathic pain p. 483
- Non-opioid analgesics and compound analgesic preparations, see Analgesics p. 442
- Opioid analgesics, see Analgesics p. 442
- Non-steroidal anti-inflammatory drugs p. 1130

Oral infections
- Bacterial infections, see Antibacterials, principles of therapy p. 505
- Phenoxybenzylpenicillin p. 548
- Broad-spectrum penicillins (amoxicillin p. 548 and ampicillin p. 550)
- Cephalosporins (cefalexin p. 524 and cefradine p. 525)
- Tetracyclines p. 564
- Macrolides (clarithromycin p. 538, erythromycin p. 539 and azithromycin p. 536)
- Clindamycin p. 535
- Metronidazole p. 542
- Fusidic acid p. 571

Fungal infections, see Antifungals, systemic use p. 591
- Local treatment, see Oropharyngeal fungal infections p. 1218
- Systemic treatment, see Antifungals, systemic use p. 591

Viral infections
- Herpetic gingivostomatitis, local treatment, see Oropharyngeal viral infections p. 1219
- Herpetic gingivostomatitis, systemic treatment, see Oropharyngeal viral infections p. 1219
- Herpesvirus infections p. 632
- Herpes labialis, see Skin infections p. 1228

Anaesthetics, anxiolytics and hypnotics
- Sedation, anaesthesia, and resuscitation in dental practice p. 1329
- Hypnotics, see Hypnotics and anxiolytics p. 484
- Sedation for dental procedures, see Hypnotics and anxiolytics p. 484
- Anaesthesia (local) p. 1347

Minerals
- Fluoride imbalance p. 1212

Orofacial pain
- Oral ulceration and inflammation p. 1214
- Mouthwashes, gargles and dentifrices, see Mouthwashes and other preparations for oropharyngeal use p. 1210
- Dry mouth, see Treatment of dry mouth p. 1208
- Aromatic inhalations, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 296
- Nasal decongestants, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 296

Dental Practitioners’ Formulary p. 1615

Medical emergencies in dental practice

This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dentists and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. See also algorithm of the procedure for Cardiopulmonary resuscitation p. 222.

The drugs referred to in this section include:
- Adrenaline/epinephrine Injection, adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1 mL amps p. 222
- Aspirin Dispersible Tablets 300 mg p. 121
- Glucagon Injection p. 724, glucagon (as hydrochloride), 1-unit vial (with solvent) p. 724
- Glucose p. 1041 (for administration by mouth)
- Glyceryl trinitrate Spray p. 218
- Midazolam Oromucosal Solution p. 340
- Oxygen
- Salbutamol Aerosol Inhalation, salbutamol 100 micrograms-metered inhalation p. 252

Adrenal insufficiency
Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see individual monographs for details of corticosteroid cover before dental surgical procedures under general anaesthesia).

Management
- Lay the patient flat
- Give oxygen
- Transfer patient urgently to hospital

Anaphylaxis
A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential.

Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).

Symptoms and signs
- Paraesthesia, flushing, and swelling of face
- Generalised itching, especially of hands and feet
- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

Management
First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline/epinephrine injection p. 222. This is given intramuscularly in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for immediate self-administration. The dose is repeated if necessary at 5-minute intervals according to blood pressure,
pulse, and respiratory function. **Oxygen** administration is also of primary importance. Arrangements should be made to transfer the patient to hospital urgently.

### Asthma

Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient’s short-acting beta, agonist inhaler such as salbutamol 100 micrograms/puff p. 252; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, **oxygen** should be given with salbutamol 5 mg p. 252 or terbutaline sulfate 10 mg p. 255 by nebuliser; if a nebuliser is unavailable, then 2–10 puffs of salbutamol 100 micrograms/ metered inhalation should be given (preferably by a large-volume spacer), and repeated every 10–20 minutes if necessary. If asthma is part of a more generalised anaphylactic reaction, an intramuscular injection of adrenaline/epinephrine p. 222 (as detailed under **Anaphylaxis**) should be given.

Patients with severe chronic asthma or whose asthma has deteriorated previously during a dental procedure may require an increase in their prophylactic medication before a dental procedure. This should be discussed with the patient’s medical practitioner and may include increasing the dose of inhaled or oral corticosteroid.

### Cardiac emergencies

If there is a history of **angina** the patient will probably carry glyceryl trinitrate spray or tablets p. 218 (or isosorbide dinitrate tablets p. 220) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient’s own medication. See also **Coronary Artery Disease** below.

**Arrhythmias** may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also **Pacemakers** below.

The pain of **myocardial infarction** is similar to that of angina but generally more severe and more prolonged. For general advice see also **Coronary Artery Disease** below.

### Symptoms and signs of myocardial infarction:

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

### Initial management of myocardial infarction:

Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. **Oxygen** may be administered.

Sublingual glyceryl trinitrate p. 218 may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, **aspirin** p. 121 in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see **Management of ST-Segment Elevation Myocardial Infarction**.

If the patient collapses and loses consciousness attempt standard resuscitation measures. See also **algorithm** of the procedure for Cardiopulmonary resuscitation p. 222.

### Epileptic seizures

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

### Symptoms and signs

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

### Management

During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give **oxygen** to support respiration if necessary.

Do not attempt to restrain convulsive movements. After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway. After the convulsion the patient may be confused (‘post-ictal confusion’) and may need reassurance and sympathy. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred. Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

**Midazolam** oromucosal solution p. 340 can be given by the buccal route in adults as a single dose of 10 mg [unlicensed]. For further details on the management of status epilepticus, including details of paediatric doses of midazolam p. 340, see Drugs used in status epilepticus (Epilepsy p. 305).

Focal seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

### Hypoglycaemia

Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or a few lumps of sugar. Children may not have such prominent changes but may appear unduly lethargic.

www.getintopharma.com
Symptoms and signs
- Shaking and trembling
- Sweating
- Pins and needles’ in lips and tongue
- Hunger
- Palpitation
- Headache (occasionally)
- Double vision
- Difficulty in concentration
- Slurring of speech
- Confusion
- Change of behaviour; truculence
- Convulsions
- Unconsciousness

Management
Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of Lucozade® Energy Original 110 mL, Coca-Cola® 100 mL, Ribena® Blackcurrant 19 mL (to be diluted), 2 teaspoons sugar, and also from 3 sugar lumps. (Proprietary products of quick-acting carbohydrate e.g. GlucoGel®, Dextrogel®, GSF-Syrup®, Rapilose® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia). If necessary this may be repeated in 10–15 minutes.

Note: the carbohydrate content of some commercially available glucose-containing drinks is currently subject to change—individual product labels should be checked. Patients should be aware that for a time, both old and new bottles and cans may be available—individual product labels should be checked.

If glucose cannot be given by mouth, if it is ineffective, or if the hypoglycaemia causes unconsciousness, glucagon 1 mg (1 unit) should be given by intramuscular (or subcutaneous) injection; a child under 8 years or of body-weight under 25 kg should be given 500 micrograms. Once the patient regains consciousness oral glucose should be administered as above. If glucagon is ineffective or contra-indicated, the patient should be transferred urgently to hospital. The patient must also be admitted to hospital if hypoglycaemia is caused by an oral antidiabetic drug.

Syncope
Insufficient blood supply to the brain results in loss of consciousness. The commonest cause is a vasovagal attack or simple faint (syncope) due to emotional stress.

Symptoms and signs
- Patient feels faint
- Low blood pressure
- Pallor and sweating
- Yawning and slow pulse
- Nausea and vomiting
- Dilated pupils
- Muscular twitching

Management
- Lay the patient as flat as is reasonably comfortable and, in the absence of associated breathlessness, raise the legs to improve cerebral circulation
- Loosen any tight clothing around the neck
- Once consciousness is regained, give sugar in water or a cup of sweet tea

Other possible causes
- Postural hypotension can be a consequence of rising abruptly or of standing upright for too long; antihypertensive drugs predispose to this. When rising, susceptible patients should take their time. Management is as for a vasovagal attack.
- Under stressful circumstances, some patients hyperventilate. This gives rise to feelings of faintness but does not usually result in syncope. In most cases reassurance is all that is necessary; rebreathing from cupped hands or a bag may be helpful but calls for careful supervision.
- Adrenal insufficiency or arrhythmias are other possible causes of syncope.

Medical problems in dental practice
Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition. If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient’s general practitioner or hospital consultant.

Allergy
Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis above.

Arrhythmias
Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dentists should be aware that such patients may be receiving anticoagulant therapy. The patient’s medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam p. 488) may be useful in some instances for very anxious patients.

See also Cardiac emergencies above, and Dental Anaesthesia (Anaesthesia (local) p. 1347).

Cardiac protheses
For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis below. For advice on patients receiving anticoagulants, see Thromboembolic disease below.

Coronary artery disease
Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient’s medical practitioner before commencing treatment. See also Cardiac Emergencies above.

Treatment with low-dose aspirin (75 mg daily), clopidogrel p. 123, or dipyridamole p. 124 should not be stopped routinely nor should the dose be altered before dental procedures.

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

Cyanotic heart disease
Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

Hypertension
Patients with hypertension are likely to be receiving antihypertensive drugs. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia (Anaesthesia (local) p. 1347).
Immunosuppression and indwelling intraperitoneal catheters
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis. The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Infective endocarditis
While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a greater risk of infective endocarditis than a single dental procedure. Antibacterial prophylaxis and chlorhexidine mouthwash p. 1211 are not recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Reduction of oral bacteraemia Patients at risk of endocarditis including those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:

- need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of ‘spontaneous’ bacteraemia.

Postoperative care Patients at risk of endocarditis including those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be warned to report to the doctor or dentist any unexplained illness that develops after dental treatment.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

Patients on anticoagulant therapy
For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease below.

Joint prostheses
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive. The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Pacemakers
Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The manufacturer’s literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

Thromboembolic disease
Patients receiving a heparin or an oral anticoagulant such as warfarin sodium p. 140, acenocoumarol p. 139 (nicoumalone), phenindione p. 140, apixaban p. 125, dabigatran etexilate p. 136 or rivaroxaban p. 128 may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed. For a patient requiring long-term therapy with warfarin sodium p. 140, the patient’s medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin sodium p. 140 without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If it is necessary to remove several teeth, a single extraction may be done at one visit; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding. For a patient on long-term warfarin sodium p. 140, the advice of the clinician responsible for the patient’s anticoagulation should be sought if:

- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are contra–indicated in patients taking anticoagulants with an INR above the therapeutic range, and in those with any disorder of haemostasis. In patients taking anticoagulants who have a stable INR within the therapeutic range, intramuscular injections should be avoided if possible; if an intramuscular injection is necessary, the patient should be informed of the increased risk of localised bleeding and monitored carefully.
A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.

Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine p. 311, imidazole and triazole antifungals (including miconazole p. 830), erythromycin p. 539, clarithromycin p. 538, and metronidazole p. 542; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparins, phenindione, rivaroxaban, and coumarins). Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin p. 550 or amoxicillin p. 548. Information on the treatment of patients who take anticoagulants is available at www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant.

Liver disease
Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with jaundice, ascites, or evidence of encephalopathy. For guidance on prescribing for patients with hepatic impairment, see Prescribing in hepatic impairment p. 19. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Renal impairment
The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs. Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists. For guidance on prescribing in patients with renal impairment, see Prescribing in renal impairment p. 19. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

Pregnancy
Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester. For guidance on prescribing in pregnancy, see Prescribing in pregnancy p. 23. Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

Breast-feeding
Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant. For guidance on prescribing in breast-feeding, see Prescribing in breast-feeding p. 23. Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.
Chapter 1
Gastro-intestinal system

CONTENTS

1 Chronic bowel disorders
  1.1 Coeliac disease
  1.2 Diverticular disease and diverticulitis
  1.3 Inflammatory bowel disease
  1.4 Irritable bowel syndrome
  1.5 Short bowel syndrome

2 Constipation and bowel cleansing
  2.1 Bowel cleansing
  2.2 Constipation

3 Diarrhoea

4 Disorders of gastric acid and ulceration
  4.1 Dyspepsia
  4.2 Gastric and duodenal ulceration

5 Helicobacter pylori diagnosis

6 Food allergy

7 Gastro-intestinal smooth muscle spasm

8 Liver disorders and related conditions
  7.1 Biliary disorders
  7.2 Oesophageal varices

9 Obesity

10 Reduced exocrine secretions

11 Stoma care

1 Chronic bowel disorders

1.1 Coeliac disease

Coeliac disease

Description of condition
Coeliac disease is an autoimmune condition which is associated with chronic inflammation of the small intestine. Dietary proteins known as gluten, which are present in wheat, barley and rye, activate an abnormal immune response in the intestinal mucosa, which can lead to malabsorption of nutrients.

Aims of treatment
The management of coeliac disease is aimed at eliminating symptoms (such as diarrhoea, bloating and abdominal pain) and reducing the risk of complications, including those resulting from malabsorption of nutrients.

Non-drug treatment

The only effective treatment for coeliac disease is a strict, life-long, gluten-free diet. A range of gluten-free products is available for prescription (see Borderline substances).

Drug treatment

Patients who have coeliac disease are at an increased risk of malabsorption of key nutrients (such as calcium and vitamin D). Their risk of osteoporosis and the need for active treatment of bone disease should form part of the ongoing management of coeliac disease. Supplementation of key nutrients may be required if dietary intake is insufficient.

Patients who have coeliac disease should be advised not to self-medicate with over-the-counter vitamins or mineral supplements. Initiation of supplementation should involve a discussion with a member of the patient’s healthcare team in order to identify the individual needs of the patient and to allow for appropriate ongoing monitoring.

Confirmed cases of refractory coeliac disease should be referred to a specialist centre. Treatment with prednisolone p. 678 can be considered for initial management while awaiting specialist advice.

Useful Resources

1.2 Diverticular disease and diverticulitis

Diverticular disease and diverticulitis

Description of condition
Diverticular disease is a condition where diverticula (sac-like protrusions of mucosa through the muscular colonic wall) cause intermittent lower abdominal pain in the absence of inflammation or infection. The prevalence of diverticula increases with age, with the majority of patients older than 50 years.

Diverticulitis occurs when the diverticula become inflamed and infected, causing marked lower abdominal pain usually accompanied by fever and general malaise, and occasionally, with large rectal bleeds. Complicated diverticulitis includes episodes associated with an abscess, free perforation, fistula, obstruction, or stricture.

To ensure that an accurate diagnosis of diverticular disease and diverticulitis is made, consider and exclude all other causes of lower abdominal pain prior to treatment.

Aims of treatment
The aim of treatment is to relieve symptoms of diverticular disease, cure episodes of diverticulitis, and reduce the risk of recurrences and complications.
Drug treatment

A high-fibre diet is recommended for the treatment of symptomatic diverticular disease, although evidence supporting this is inconsistent and of low quality. Bulk-forming drugs have also been used, but evidence of their effectiveness is lacking.

Treatment of uncomplicated diverticulitis includes a low residue diet and bowel rest. Antibacterials are recommended only when the patient presents with signs of infection or is immunocompromised, as there is no evidence to support routine administration.

Patients with complicated diverticulitis or with severe presentation, require hospital admission, treatment with intravenous antibacterials (covering Gram-negative organisms and anaerobes), and bowel rest.

There is insufficient evidence to justify the role of fibre, rifaximin p. 575, antisepsmodics, mesalazine p. 41, and probiotics in the prevention or treatment of diverticulitis.

Elective surgery to provide symptomatic relief or prevent recurrence, should be considered for patients following recovery from an episode of complicated diverticulitis. This includes episodes associated with free perforation, abscess, fistula, obstruction, or stricture. Urgent sigmoid colectomy is required for patients with diffuse peritonitis or for those in whom non-operative management of acute diverticulitis fails.

1.3 Inflammatory bowel disease

Inflammatory bowel disease

Chronic inflammatory bowel diseases include Crohn’s disease below and Ulcerative colitis p. 39.

Drugs used in chronic bowel disorders

Aminosalicylates

Sulfasalazine p. 44 is a combination of 5-aminosalicylic acid (‘5-ASA’) and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, mesalazine p. 41 (5-aminosalicylic acid), balsalazide sodium p. 41 (a pro-drug of 5-aminosalicylic acid) and olsalazine sodium p. 44 (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders and lupus-like syndrome also seen with sulfasalazine.

Drugs affecting the immune response

Folic acid p. 1025 should be given to reduce the possibility of methotrexate p. 913 toxicity [unlicensed indication]. Folic acid is usually given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Cytokine modulators

Infliximab p. 1116, adalimumab p. 1108, and golimumab p. 1115 are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision.

Crohn’s disease

Description of condition

Crohn’s disease is a chronic, inflammatory bowel disease that mainly affects the gastro-intestinal tract. It is characterised by thickened areas of the gastro-intestinal wall with inflammation extending through all layers, deep ulceration and fissuring of the mucosa, and the presence of granulomas; affected areas may occur in any part of the gastro-intestinal tract, interspersed with areas of relatively normal tissue. Crohn’s disease may present as recurrent attacks, with acute exacerbations combined with periods of remission or less active disease. Symptoms depend on the site of disease but may include abdominal pain, diarrhoea, fever, weight loss and rectal bleeding.

Complications of Crohn’s disease include intestinal strictures, abscesses in the wall of the intestine or adjacent structures, fistulae, anaemia, malnutrition, colorectal and small bowel cancers, and growth failure and delayed puberty in children. Crohn’s disease may also be associated with extra-intestinal manifestation: the most common are arthritis and abnormalities of the joints, eyes, liver and skin. Crohn’s disease is also a cause of secondary osteoporosis and those at greatest risk should be monitored for osteopenia and assessed for the risk of fractures.

Fistulizing Crohn’s disease

Fistulizing Crohn’s disease is a complication that involves the formation of a fistula between the intestine and adjacent structures, such as perianal skin, bladder, and vagina. It occurs in about one quarter of patients, mostly when the disease involves the ileocolonic area.

Aims of treatment

Treatment is largely directed at the induction and maintenance of remission and the relief of symptoms. Active treatment of acute Crohn’s disease should be distinguished from preventing relapse. The aims of drug treatment are to reduce symptoms and maintain or improve quality of life, while minimising toxicity related to drugs over both the short and long term.

In fistulating Crohn’s disease, surgery and medical treatment aim to close and maintain closure of the fistula.

Non-drug treatment

In addition to drug treatment, management options for Crohn’s disease include Smoking cessation p. 497 and attention to nutrition, which plays an important role in supportive care. Surgery may be considered in certain patients with early disease limited to the distal ileum and in severe or chronic active disease.

Drug treatment

Treatment of acute disease

Monotherapy

A corticosteroid (either prednisolone p. 678 or methylprednisolone p. 678 or intravenous hydrocortisone p. 676), is used to induce remission in patients with a first presentation or a single inflammatory exacerbation of Crohn’s disease in a 12-month period.

In patients with distal ileal, ileocaecal or right-sided colonic disease, in whom a conventional corticosteroid is unsuitable or contra-indicated, budesonide p. 45 may be considered. Budesonide is less effective but may cause fewer side-effects than other corticosteroids, as systemic exposure is limited. Aminosalicylates (such as sulfasalazine p. 44 and mesalazine p. 41) are an alternative option in these patients. They are less effective than a corticosteroid or budesonide, but may be preferred because they have fewer side-effects. Aminosalicylates and budesonide are not appropriate for severe presentations or exacerbations.

Add-on treatment

Add on treatment is prescribed if there are two or more inflammatory exacerbations in a 12-month period, or the corticosteroid dose cannot be reduced.

Azathioprine p. 836 or mercaptopurine p. 912 [unlicensed indications] can be added to a corticosteroid or budesonide to induce remission. In patients who cannot tolerate azathioprine or mercaptopurine or in whom thiopurine methyltransferase (TPMT) activity is deficient, methotrexate p. 913 can be added to a corticosteroid.
Under specialist supervision, monoclonal antibody therapies, adalimumab p. 1108 and infliximab p. 1116, are options for the treatment of severe, active Crohn’s disease, following inadequate response to conventional therapies or in those who are intolerant of or have contra-indications to conventional therapy. Vedolizumab p. 46 is recommended as a treatment option for moderate to severely active Crohn’s disease when therapy with adalimumab or infliximab is unsuccessful, is contra-indicated or not tolerated. See also National funding/access decisions for adalimumab, infliximab and vedolizumab.

Adalimumab and infliximab can be used as monotherapy or combined with an immunosuppressant although there is uncertainty about the comparative effectiveness and long-term side-effects of therapy.

Maintenance of remission

Patients who choose not to receive maintenance treatment during remission should be made aware of the symptoms that may suggest a relapse (most frequently unintended weight loss, abdominal pain, diarrhoea and general ill-health). For those who choose not to receive maintenance treatment during remission, a suitable follow up plan should be agreed upon and information provided on how to access healthcare if a relapse should occur.

Azathioprine or mercaptopurine [unlicensed indications] as monotherapy can be used to maintain remission when previously used with a corticosteroid to induce remission. They may also be used in patients who have not previously received these drugs (particularly those with adverse prognostic factors such as early age of onset, perianal disease, corticosteroid use at presentation, and severe presentations). Methotrexate can be used to maintain remission only in patients who required methotrexate to induce remission, or who are intolerant of or are not suitable for azathioprine or mercaptopurine for maintenance. Corticosteroids or budesonide should not used.

Maintaining remission following surgery

Azathioprine or mercaptopurine [unlicensed indications] can be considered to maintain remission after surgery in patients with adverse prognostic factors such as more than one resection, or previously complicated or debilitating disease (for example abscess, involvement of adjacent structures, fistulating or penetrating disease). Aminosalicylates can also be considered as an option, however budesonide or enteral nutrition should not be used.

Other treatments

Loperamide hydrochloride p. 66 or codeine phosphate p. 454 can be used to manage diarrhoea associated with Crohn’s disease in those who do not have colitis. Colestyramine p. 197 is licensed for the relief of diarrhoea associated with Crohn’s disease. See also Diarrhoea (acute) p. 65.

Fistulating Crohn’s disease

Perianal fistulae are the most common occurrence in patients with fistulating Crohn’s disease. Treatment may not be necessary for simple, asymptomatic perianal fistulae. When fistulae are symptomatic, local drainage and surgery may be required in conjunction with the medical therapy.

Metronidazole p. 542 or ciprofloxacin p. 558 [unlicensed indications], alone or in combination, can improve symptoms of fistulating Crohn’s disease but complete healing occurs rarely. Metronidazole is usually given for 1 month, but no longer than 3 months because of concerns about peripheral neuropathy. Other antibiotics should be given if specifically indicated (e.g. in sepsis associated with fistulae and perianal disease) and for managing bacterial overgrowth in the small bowel.

Either azathioprine or mercaptopurine [unlicensed indications] is used to control the inflammation in fistulating Crohn’s disease and they are continued for maintenance. Infliximab is recommended for patients with active fistulating Crohn’s disease who have not responded to conventional therapy (including antibacterials, drainage and immunsuppressive treatments), or who are intolerant of or have contra-indications to conventional therapy. Infliximab p. 1116 should be used after ensuring that all sepsis is actively draining.

Abscess drainage, fistulotomy, and seton insertion may be appropriate, particularly before infliximab treatment.

Azathioprine p. 836, mercaptopurine p. 912, or infliximab should be continued as maintenance treatment for at least one year.

For the management of non-perianal fistulating Crohn’s disease (including entero-gynaecological and enterovesical fistulae) surgery is the only recommended approach.

Useful Resources

www.nice.org.uk/guidance/cg152

Ulcerative colitis

Description of condition

Ulcerative colitis is a chronic inflammatory condition, characterised by diffuse mucosal inflammation—it has a relapsing-remitting pattern. It is a life-long disease that is associated with significant morbidity. It most commonly presents between the ages of 15 and 25 years, although diagnosis can be made at any age.

The pattern of inflammation is continuous, extending from the rectum upwards to a varying degree. Inflammation of the rectum is referred to as proctitis, and inflammation of the rectum and sigmoid colon as proctosigmoiditis. Left-sided colitis refers to disease involving the colon distal to the splenic flexure. Extensive colitis affects the colon proximal to the splenic flexure, and includes pan-colitis, where the whole colon is involved. Common symptoms of active disease or relapse include bloody diarrhoea, an urgent need to defaecate, and abdominal pain.

Ulcerative colitis is classified as subacute if it is moderate-to-severely active disease which can be managed in an outpatient setting, and does not require hospitalisation or consideration of urgent surgical intervention.

Complications associated with ulcerative colitis include an increased risk of colorectal cancer, secondary osteoporosis, venous thromboembolism and toxic megacolon.

Aims of treatment

Treatment is focused on treating active disease to manage symptoms and to induce and maintain remission.

Drug treatment

Overview

Management of ulcerative colitis is dependent on factors such as clinical severity, extent of disease, and patient preference. Clinical and laboratory investigations are used to determine the extent and severity of disease and to guide treatment. Severity is classified as mild, moderate or severe by using the Truelove and Witts’ Severity Index to assess bowel movements, heart rate, erythrocyte sedimentation rate and the presence of pyrexia, melaena or anaemia—see the NICE guideline for Ulcerative Colitis for further information (Useful resources below).

The extent of disease should be considered when choosing the route of administration for aminosalicylates and corticosteroids; whether oral treatment, topical treatment or
both are to be used. If the inflammation is distal, a rectal preparation is adequate but if the inflammation is extended, systemic medication is required. Either suppositories or enemas can be offered, taking into account the patient’s preferences.

Rectal foam preparations and suppositories can be used when patients have difficulty retaining liquid enemas. Diarrhoea associated with ulcerative colitis is sometimes treated with anti-diarrhoeal drugs (such as loperamide hydrochloride p. 66 or codeine phosphate p. 454) on the advice of a specialist; however their use is contra-indicated in acute ulcerative colitis as they can increase the risk of toxic megacolon.

A macrogol-containing osmotic laxative (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 57) may be useful for proximal faecal loading in proctitis.

Oral aminosalicylates for the treatment of ulcerative colitis are available in different preparations and release forms. The preparation and dosing schedule should be chosen taking into account the delivery characteristics and suitability for the patient. When used to maintain remission, single daily doses of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

Treatment of acute mild-to-moderate ulcerative colitis

Acute treatment to induce remission generally consists of an aminosalicylate with or without a corticosteroid.

Oral and rectal aminosalicylate in combination can be used as first line treatment in patients with acute, mild-to-moderate extensive ulcerative colitis; as this is associated with higher rates of improvement in disease activity.

Proctitis and proctosigmoiditis

Aminosalicylates are recommended as first-line treatment for patients with a mild-to-moderate initial presentation or inflammatory exacerbation. Using a rectal aminosalicylate (mesalazine p. 41 or sulfasalazine p. 44) alone is likely to be more effective for patients with proctitis and proctosigmoiditis. Monotherapy with an oral aminosalicylate (balsalazide sodium p. 41, mesalazine, olsalazine sodium p. 44, sulfasalazine) can be considered for patients who prefer not to use enemas or suppositories, although this may not be as effective.

A rectal corticosteroid (budesonide p. 45, hydrocortisone p. 676 or prednisolone p. 676) or oral prednisolone can be considered in patients who are intolerant to, or decline, or have a contra-indication to aminosalicylates.

Oral prednisolone should be considered for the treatment of patients with subacute proctitis or proctosigmoiditis.

Left-sided or extensive ulcerative colitis

First-line treatment in patients with left-sided or extensive ulcerative colitis is a high induction dose of an oral aminosalicylate, with addition of a rectal aminosalicylate or oral beclometasone dipropionate if necessary. Oral prednisolone alone is recommended for patients who cannot tolerate or who decline aminosalicylates, in whom aminosalicylates are contra-indicated or in patients with subacute left-sided or extensive ulcerative colitis.

Initial treatment failure in all extents of mild-to-moderate disease

In all patients who are treated with an aminosalicylate, if there are no improvements within four weeks of initial treatment or if symptoms worsen, addition of oral prednisolone to aminosalicylate therapy can be considered (disclosure beclometasone dipropionate p. 45 if adding oral prednisolone). If there is still no response after 2–4 weeks of prednisolone, consider adding oral tacrolimus p. 841 [unlicensed indication] to induce remission. Budesonide multimatrix (a corticosteroid that is taken orally but exerts its action topically in the colon) is licensed for inducing remission in mild-to-moderate active ulcerative colitis in adults for whom aminosalicylate treatment is not sufficient and can be considered as an additional therapeutic option.

Moderate disease may require treatment with a monoclonal antibody due to inadequate response to conventional treatment or if conventional treatment is not tolerated or contra-indicated (see Monoclonal antibodies for ulcerative colitis below).

Treatment of acute severe ulcerative colitis

Acute severe ulcerative colitis of any extent can be life-threatening and is regarded as a medical emergency.

Intravenous corticosteroids (such as hydrocortisone or methylprednisolone p. 678) should be given to induce remission in patients with acute severe ulcerative colitis (at first presentation or an exacerbation) while assessing the need for surgery. If intravenous corticosteroids are contra-indicated, declined or cannot be tolerated, then intravenous ciclosporin p. 838 [unlicensed indication] or surgery should be considered. A combination of intravenous ciclosporin with intravenous corticosteroids, or surgery is second line therapy for patients who have little or no improvement within 72 hours of starting intravenous corticosteroids or whose symptoms worsen despite treatment.

Research has shown that infliximab p. 1116 is as effective as ciclosporin and, in practice, it is commonly used in these patients instead of ciclosporin—see also Monoclonal antibodies for acute ulcerative colitis, below.

In patients who experience an initial response to steroids followed by deterioration, stool cultures should be taken to exclude the presence of pathogens; cytomegalovirus activation should be considered.

Monoclonal antibodies for acute ulcerative colitis

Adalimumab p. 1108, golimumab p. 1115, infliximab p. 1116 and vedolizumab p. 46 can be used to treat moderate-to-severe active ulcerative colitis following an inadequate response to conventional treatment options, or if conventional treatment options are not tolerated or contra-indicated. Treatment with these agents is continued into the maintenance phase, if effective and tolerated. See also National funding/access decisions for adalimumab, golimumab, infliximab and vedolizumab.

Infliximab can be used to treat acute exacerbations of severely active ulcerative colitis if ciclosporin p. 838 is contra-indicated or clinically inappropriate.

Maintaining remission in mild, moderate or severe ulcerative colitis

To reduce the chances of relapse occurring, maintenance therapy with an aminosalicylate is recommended in most patients. Corticosteroids are not suitable for maintenance treatment because of their side-effects.

After a mild-to-moderate inflammatory exacerbation of proctitis or proctosigmoiditis, a rectal aminosalicylate can be started alone or in combination with an oral aminosalicylate, administered daily or as part of an intermittent regimen (such as twice to three times weekly or the first seven days of each month). An oral aminosalicylate can be used alone in patients who prefer not to use enemas or suppositories, although this may not be as effective.

A low-dose of oral aminosalicylate is given to maintain remission in patients after a mild-to-moderate inflammatory exacerbation of left-sided or extensive ulcerative colitis.

When used to maintain remission, single daily doses of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

Oral azathioprine p. 836 or mercaptopurine p. 912 [unlicensed indications] can be considered to maintain remission, if there has been two or more inflammatory exacerbations in a 12-month period that required treatment with systemic corticosteroids, or if remission is not
maintained by aminosalicylates, or following a single acute severe episode. There is no evidence to support the use of methotrexate
p. 913 to induce or maintain remission in ulcerative colitis, though its use is common in clinical practice.

Monoclonal antibodies for maintaining remission of ulcerative colitis
Treatment with these agents is continued into the maintenance phase, if effective and tolerated in acute disease. See also National funding/access decisions for adalimumab, golimumab, infliximab and vedolizumab.

Non-drug treatment
Surgery may be necessary as emergency treatment for severe ulcerative colitis that does not respond to drug treatment. Patients can also choose to have elective surgery for unresponsive or frequently relapsing disease that is affecting their quality of life.

AMINOSALICYLATES

Aminosalicylates

- SIDE-EFFECTS
  - Common or very common Arthralgia · cough · diarrhoea · dizziness · fever · gastrointestinal discomfort · headache · leucopenia · nausea · skin reactions · vomiting
  - Uncommon Alopecia · depression · dyspnoea · myalgia · photosensitivity reaction · thrombocytopenia
  - Rare or very rare Agranulocytosis · bone marrow disorders · cardiac inflammation · hepatitis · neutropenia · pancreatitis · peripheral neuropathy · renal impairment · respiratory disorders
  - Frequency not known Angioedema · eosinophilia · haemolytic anaemia · nephritis tubulointerstitial · oligozaospermia (reversible) · ulcerative colitis aggravated
  - SIDE-EFFECTS, FURTHER INFORMATION A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.
  - ALLERGY AND CROSS-SENSITIVITY Contra-indicated in salicylate hypersensitivity.
  - RENAL IMPAIRMENT Monitoring Renal function should be monitored more frequently in renal impairment.
  - MONITORING REQUIREMENTS Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment.
  - PATIENT AND CARER ADVICE Blood disorders Patients receiving aminosalicylates, and their carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment.

Balsalazide sodium

- INDICATIONS AND DOSE
  - Treatment of mild to moderate ulcerative colitis, acute attack
    - BY MOUTH
    - Adult: 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks
  - Maintenance of remission of ulcerative colitis
    - BY MOUTH
    - Adult: 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day

- CAUTIONS History of asthma
- INTERACTIONS Appendix 1: balsalazide
- SIDE-EFFECTS Blood disorder · cholelithiasis · lupus-like syndrome
- PREGNANCY Manufacturer advises avoid.
- BREAST FEEDING Diarrhoea may develop in the infant. Monitoring Monitor breast-fed infants for diarrhoea.
- HEPATIC IMPAIRMENT Manufacturer advises caution; avoid in severe impairment (no information available).
- RENAL IMPAIRMENT Manufacturer advises avoid in moderate to severe impairment.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
  - Capsule CAUTIONARY AND ADVISORY LABELS 21, 25
    - Colazide (Almirall Ltd) Balsalazide disodium 750 mg Colazide 750mg capsules [ ] 130 capsule £30.42 DT = £30.42

Mesalazine

- INDICATIONS AND DOSE
  - DOSE EQUIVALENCE AND CONVERSION
  - Treatment of mild to moderate ulcerative colitis, acute attack
    - BY MOUTH
    - Adult: 2.4–4.8 g daily in divided doses
  - Maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis
    - BY MOUTH
    - Adult: 1.2–2.4 g daily in divided doses

- ASACOL® MR 800MG TABLETS
  - Treatment of mild to moderate ulcerative colitis, acute attack
    - BY MOUTH
    - Adult: 2.4–4.8 g daily in divided doses

- ASACOL® MR 400MG TABLETS
  - Treatment of mild to moderate ulcerative colitis, acute attack
    - BY MOUTH
    - Adult: 2.4 g daily in divided doses

- Maintenance of remission of ulcerative colitis
  - BY MOUTH
  - Adult: Up to 2.4 g once daily, alternatively up to 2.4 g daily in divided doses

- Maintenance of remission of Crohn’s ileo-colitis
  - BY MOUTH
  - Adult: Up to 2.4 g daily in divided doses
ASACOL® FOAM ENEMA
Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region
- BY RECTUM
- Adult: 1 g daily for 4–6 weeks, to be administered into the rectum

Treatment of acute attack of mild to moderate ulcerative colitis, affecting the descending colon
- BY RECTUM
- Adult: 2 g once daily for 4–6 weeks, to be administered into the rectum

ASACOL® SUPPOSITORIES
Treatment of acute attack of mild to moderate ulcerative colitis and maintenance of remission
- BY RECTUM
- Adult: 0.75–1.5 g daily in divided doses, last dose to be administered at bedtime

MEZAVANT® XL
Treatment of mild to moderate ulcerative colitis, acute attack
- BY MOUTH
- Adult: 2.4–4.8 g once daily, increased if necessary to 4.8 g once daily, review treatment at 8 weeks

Maintenance of remission of ulcerative colitis
- BY MOUTH
- Adult: 2.4 g once daily

OCTASA®
Treatment of mild to moderate ulcerative colitis, acute attack
- BY MOUTH
- Adult: 2.4–4.8 g once daily, alternatively 2.4–4.8 g daily in divided doses, dose over 2.4 g daily in divided doses only

Maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis
- BY MOUTH
- Adult: 1.2–2.4 g once daily, alternatively daily in divided doses

PENTASA® GRANULES
Treatment of mild to moderate ulcerative colitis, acute attack
- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses
- Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–4 divided doses

Maintenance of remission of ulcerative colitis
- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 40 kg and above): 2 g once daily
- Adult: 2 g once daily

PENTASA® RETENTION ENEMA
Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission
- BY RECTUM
- Adult: 1 g once daily, dose to be administered at bedtime

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region
- BY RECTUM
- Child 12–17 years: 1 g once daily, dose to be administered at bedtime

PENTASA® SUPPOSITORIES
Treatment of acute attack, ulcerative proctitis
- BY RECTUM
- Adult: 1 g daily for 2–4 weeks

Maintenance, ulcerative proctitis
- BY RECTUM
- Adult: 1 g daily

PENTASA® TABLETS
Treatment of mild to moderate ulcerative colitis, acute attack
- BY MOUTH
- Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–3 divided doses

Maintenance of remission of ulcerative colitis
- BY MOUTH
- Adult: 2 g once daily

SALOFALK® ENEMA
Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission
- BY RECTUM
- Adult: 2 g once daily, dose to be administered at bedtime

SALOFALK® GRANULES
Treatment of mild to moderate ulcerative colitis, acute attack
- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
- Child 5–17 years (body-weight 40 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1 g 3 times a day
- Adult: 1.5–3 g once daily, dose preferably taken in the morning, alternatively 0.5–1 g 3 times a day

Maintenance of remission of ulcerative colitis
- BY MOUTH
- Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
- Child 5–17 years (body-weight 40 kg and above): 500 mg 3 times a day
- Adult: 500 mg 3 times a day

SALOFALK® RECTAL FOAM
Treatment of mild ulcerative colitis affecting sigmoid colon and rectum
- BY RECTUM
- Child 12–17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses
- Adult: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses

SALOFALK® SUPPOSITORIES
Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon and descending colon
- BY RECTUM
- Adult: 0.5–1 g 2–3 times a day, adjusted according to response, dose to be given using 500 mg suppositories

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum
- BY RECTUM
- Adult: 1 g daily, preferably at bedtime, dose to be given using 1 g suppositories
Inflammatory bowel disease

**SALOFALK® TABLETS**

**Treatment of mild to moderate ulcerative colitis, acute attack**
- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 0.5–1 g 3 times a day
  - Adult: 0.5–1 g 3 times a day

**Maintenance of remission of ulcerative colitis**
- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5-17 years (body-weight 40 kg and above): 500 mg 3 times a day
  - Adult: 500 mg 3 times a day

- **UNLICENSED USE**

- **CONTRA-INDICATIONS**
  - Blood clotting abnormalities (in children)

- **CAUTIONS**
  - Elderly: pulmonary disease

- **INTERACTIONS** → Appendix 1: mesalazine

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Rare or very rare: Cholestasis exacerbated - drug fever - flatulence - nephritis
  - **SPECIFIC SIDE-EFFECTS**
    - Rare or very rare: Constipation
  - **PREGNANCY**
    - Negligible quantities cross placenta.
  - **BREAST FEEDING**
    - Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk.
    - Monitor: Monitor breast-fed infant for diarrhoea.
  - **HEPATIC IMPAIRMENT**
    - Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
  - **RENAL IMPAIRMENT**
    - In adults: Use with caution. Avoid if eGFR less than 20 mL/minute/1.73 m².
    - In children: Use with caution. Avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**
  - **PENTASA® TABLETS** Tablets may be halved, quartered, or dispersed in water, but should not be chewed.
  - **PENTASA® GRANULES** Granules should be placed on tongue and washed down with water or orange juice without chewing.
    - In children: Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.
  - **SALOFALK® GRANULES** Granules should be placed on tongue and washed down with water without chewing.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - There is no evidence to show that any oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.
  - Flavours of granule formulations of Salofalk® may include vanilla.
  - **PATIENT AND CARER ADVICE**
    - If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms. Some products may require special administration advice; patients and carers should be informed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Modified-release tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 21 (does not apply to Pentasa® tablets), 25 (does not apply to Pentasa® tablets)

44 Chronic bowel disorders

**Olsalazine sodium**

**INDICATIONS AND DOSE**

_Treatment of acute attack of mild ulcerative colitis_

- **BY MOUTH**
  - Adult: 1 g daily in divided doses, doses to be taken after meals, then increased if necessary up to 3 g daily in divided doses (max. per dose 1 g), dose to be increased over 1 week

_Maintenance of remission of mild ulcerative colitis_

- **BY MOUTH**
  - Adult: Maintenance 500 mg twice daily, dose to be taken after food

**INTERACTIONS** → Appendix 1: olsalazine

**SIDE-EFFECTS**

- Uncommon Paraesthesia - tachycardia
- Frequency not known Palpitations - vision blurred
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING**

Monitoring Monitor breast-fed infants for diarrhoea.

**RENAL IMPAIRMENT** Use with caution; manufacturer advises avoid in significant impairment.

**DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and contents sprinkled on food.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

_Cautory and Advisory Labels 21_

- **Olsalazine sodium (Non-proprietary)**
  - Olsalazine sodium 500 mg Olsalazine 500mg tablets 60 tablet
    - **Price** £161.00 DT = £161.00

_Capsule_ Cautory and Advisory Labels 21

- **Olsalazine sodium (Non-proprietary)**
  - Olsalazine sodium 250 mg Olsalazine 250mg capsules 112 capsule
    - **Price** £144.00 DT = £144.00

**Sulfasalazine**

(Sulphasalazine)

**INDICATIONS AND DOSE**

_Treatment of acute attack of mild to moderate and severe ulcerative colitis_** Active Crohn’s disease_

- **BY MOUTH**
  - Adult: 1–2 g 4 times a day until remission occurs, corticosteroids may also be given, if necessary

- **BY RECTUM**
  - Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

_Maintenance of remission of mild to moderate and severe ulcerative colitis_

- **BY MOUTH**
  - Adult: 500 mg 4 times a day

**INTERACTIONS** → Appendix 1: sulfasalazine

**SIDE-EFFECTS**

- Common or very common Insomnia - stomatitis - taste altered - tinnitus - urine abnormalities
- Uncommon Face oedema - seizure - vasculitis - vertigo
- Frequency not known Anaemia - appetite decreased - ataxia - cyanosis - encephalopathy - haematuria - hallucination - hepatic failure - hypoprothrombinemia - lymphadenopathy - macrocytosis - meningitis aseptic - methaemoglobinemia - nephrotic syndrome - parotitis - periorbital oedema - pseudomembranous enterocolitis - serum sickness - severe cutaneous adverse reactions (SCARs) - smell disorders - systemic lupus erythematosus (SLE) - yellow discolouration of body fluids

**SIDE-EFFECTS, FURTHER INFORMATION** Incidence of side-effects increases with higher doses.

**Blood disorders** Haematological abnormalities occur usually in the first 3 to 6 months of treatment—discontinue if these occur.

**PREGNANCY** Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.

**BREAST FEEDING** Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**RENAL IMPAIRMENT** Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.
- Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
- Liver function Liver function tests should be performed at monthly intervals for first 3 months.

**PATIENT AND CARER ADVICE**

Contact lenses Some soft contact lenses may be stained.

**IMPORTANT SAFETY INFORMATION**

SAFE PRACTICE

Sulfasalazine has been confused with sulfadiazine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS**
  - Acute porphyrias p. 1058 · G6PD deficiency · history of allergy · history of asthma · maintain adequate fluid intake · risk of haemato logical toxicity · risk of hepatic toxicity · slow acetylator status

- **INTERACTIONS** → Appendix 1: sulfasalazine

- **SIDE-EFFECTS**
  - Common or very common Insomnia - stomatitis - taste altered - tinnitus - urine abnormalities
  - Uncommon Face oedema - seizure - vasculitis - vertigo
  - Frequency not known Anaemia - appetite decreased - ataxia - cyanosis - encephalopathy - haematuria - hallucination - hepatic failure - hypoprothrombinemia - lymphadenopathy - macrocytosis - meningitis aseptic - methaemoglobinemia - nephrotic syndrome - parotitis - periorbital oedema - pseudomembranous enterocolitis - serum sickness - severe cutaneous adverse reactions (SCARs) - smell disorders - systemic lupus erythematosus (SLE) - yellow discolouration of body fluids

**SIDE-EFFECTS, FURTHER INFORMATION** Incidence of side-effects increases with higher doses.

**Blood disorders** Haematological abnormalities occur usually in the first 3 to 6 months of treatment—discontinue if these occur.

**PREGNANCY** Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.

**BREAST FEEDING** Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**RENAL IMPAIRMENT** Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.
- Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
- Liver function Liver function tests should be performed at monthly intervals for first 3 months.

**PATIENT AND CARER ADVICE**

Contact lenses Some soft contact lenses may be stained.
**INDICATIONS AND DOSE**

**BUDENOFALK® CAPSULES**

Mild to moderate Crohn’s disease affecting the ileum or ascending colon
- **BY MOUTH**
  - Adult: 9 mg once daily for 8 weeks, to be taken in the morning, alternatively 3 mg 3 times a day for 8 weeks, reduce dose gradually over two weeks following treatment

Collagenous colitis
- **BY MOUTH**
  - Adult: 9 mg once daily for 8 weeks, to be taken in the morning, reduce dose gradually over two weeks following treatment

Autoimmune hepatitis, induction of remission
- **BY MOUTH**
  - Adult: 3 mg 3 times a day

Autoimmune hepatitis, maintenance
- **BY MOUTH**
  - Adult: 3 mg twice daily

**BUDENOFALK® GRANULES**

Mild to moderate Crohn’s disease affecting the ileum or ascending colon | Collagenous colitis
- **BY MOUTH**
  - Adult: 9 mg once daily for 8 weeks, to be taken in the morning about 30 minutes before breakfast, reduce dose gradually over two weeks following treatment

**BUDENOFALK® RECTAL FOAM**

Ulcerative colitis affecting sigmoid colon and rectum
- **BY RECTUM**
  - Adult: 1 metered application once daily for up to 8 weeks

**DOSE EQUIVALENCE AND CONVERSION**

For **Budenofalk®** rectal foam: 1 metered application is equivalent to budesonide 2 mg.

**CORTIMENT®**

Induction of remission of mild-to-moderate active ulcerative colitis
- **BY MOUTH**
  - Adult: 9 mg once daily, to be taken in the morning

Mild to moderate Crohn’s disease affecting the ileum or ascending colon
- **BY MOUTH**
  - Adult: 9 mg once daily for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment, to be taken in the morning

**ENTOCORT® CAPSULES**

Active microscopic colitis
- **BY MOUTH**
  - Adult: 9 mg once daily, to be taken in the morning

**ENTOCORT® ENEMA**

Ulcerative colitis involving rectal and recto-sigmoid disease
- **BY RECTUM**
  - Adult: 1 enema daily for 4 weeks, to be administered at bedtime

**CAUTIONS**

Autoimmune hepatitis

**INTERACTIONS**

Appendix 1: corticosteroids
**IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES, ANTI-LYMPHOCYTE**

**Vedolizumab**

**DRUG ACTION**
Vedolizumab is a monoclonal antibody that binds specifically to the α4β7 integrin, which is expressed on gut homing T helper lymphocytes and causes a reduction in gastrointestinal inflammation.

**INDICATIONS AND DOSE**
Moderate to severe active ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 10 weeks of initial dose

Moderate to severe active Crohn's disease in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if no response is observed, an additional dose of 300 mg may be given 10 weeks after initial dose; if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 14 weeks of initial dose

**CONTRA-INDICATIONS**
Severe active infection

**CAUTIONS**
Controlled chronic severe infection - history of recurring severe infection - previous treatment with natalizumab (wait at least 12 weeks between natalizumab use and initiation of vedolizumab unless potential benefit outweighs risk) - previous treatment with rituximab

**CAUTIONS, FURTHER INFORMATION**
Risk of infection. Patients must be screened for tuberculosis before starting treatment; if latent tuberculosis is diagnosed, appropriate treatment must be initiated prior to vedolizumab treatment; if tuberculosis is diagnosed during treatment, discontinue vedolizumab until infection is resolved.

Patients should be brought up to date with current immunisation schedule before initiating treatment.

**INTERACTIONS**
- Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**
Common or very common Arthralgia - constipation - cough - fatigue - fever - gastrointestinal discomfort - gastrointestinal disorders - headache - hypertension - increased risk of infection - muscle spasms - muscle
Irritable bowel syndrome

Description of condition
Irritable bowel syndrome (IBS) is a common, chronic, relapsing, and often life-long condition, mainly affecting people aged between 20 and 30 years. It is more common in women. Symptoms include abdominal pain or discomfort, disordered defaecation (either diarrhoea, or constipation with straining, urgency, and incomplete evacuation), passage of mucus, and bloating. Symptoms are usually relieved by defaecation. Obtaining an accurate clinical diagnosis of IBS prior to treatment is crucial.

Aims of treatment
The treatment of IBS is focused on symptom control, in order to improve quality of life.

Non-drug treatment

Diet and lifestyle changes are important for effective self-management of IBS. Patients should be encouraged to increase physical activity, and advised to eat regularly, without missing meals or leaving long gaps between meals. Dietary advice should also include, limiting fresh fruit consumption to no more than 3 portions per day. The fibre intake of patients with IBS should be reviewed. If an increase in dietary fibre is required, soluble fibre such as ispaghula husk p. 55, or foods high in soluble fibre such as oats, are recommended. Intake of insoluble fibre (e.g. bran) and ‘resistant starch’ should be reduced or discouraged as they may exacerbate symptoms. Fluid intake (mostly water) should be increased to at least 8 cups each day and the intake of caffeine, alcohol and fizzy drinks reduced. The artificial sweetener sorbitol should be avoided in patients with diarrhoea. Where probiotics are being used, continue for at least 4 weeks while monitoring the effect.

If a patient’s symptoms persist following lifestyle and dietary advice, single food avoidance and exclusion diets may be an option under the supervision of a dietitian or medical specialist.

NICE decisions

Vedolizumab for treating moderately to severely active Crohn’s disease after prior therapy (August 2015) NICE TA352

Vedolizumab is recommended as an option for the treatment of moderate to severe active Crohn’s disease in adults if:

- a tumour necrosis factor-alpha inhibitor has failed (that is, the disease has responded inadequately or has lost response to treatment) or
- a tumour necrosis factor-alpha inhibitor cannot be tolerated or is contra-indicated,
- and the manufacturer provides vedolizumab with the discount agreed in the patient access scheme.

Vedolizumab should be given as a planned course of treatment until treatment fails, or surgery is needed, or until 12 months after starting treatment, whichever is the shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

Patients currently receiving vedolizumab whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (July 2015) that vedolizumab (Entyvio®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with moderately to severely active Crohn’s disease who have had an inadequate response with, lost response to, or were intolerant to a TNF-α antagonist; it is also accepted for use in NHS Scotland for the treatment of adult patients with moderately to severely active ulcerative colitis who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a TNF-α antagonist.

- MEDICINAL FORMS
  - Powder for solution for infusion
  - Entyvio (Takeda UK Ltd)
  - Vedolizumab 300 mg

1.4 Irritable bowel syndrome

24-Feb-2016
Drug treatment

The choice of drug treatment depends on the nature and severity of the symptoms. Many drug treatment options for IBS are available over-the-counter.

Antispasmodics (such as alverine citrate p. 86, mebeverine hydrochloride p. 86 and peppermint oil below) can be taken in addition to dietary and lifestyle changes. A laxative (excluding lactulose p. 56 as it may cause bloating) can be used to treat constipation. Patients who have not responded to laxatives from the different classes and who have had constipation for at least 12 months, can be treated with linaclotide below. Loperamide hydrochloride p. 66 is the first-line choice of anti-motility drug for relief of diarrhoea. Patients with IBS should be advised how on to adjust their dose of laxative or anti-motility drug according to stool consistency, with the aim of achieving a soft, well-formed stool.

A low-dose tricyclic antidepressant, such as amitriptyline hydrochloride p. 372 [unlicensed indication], can be used for abdominal pain or discomfort as a second-line option in patients who have not responded to antispasmodics, anti-motility drugs, or laxatives. A selective serotonin reuptake inhibitor may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

Psychological intervention can be offered to patients who have no relief of IBS symptoms after 12 months of drug treatment.

Useful Resources

ANTISPASMODICS

Mebeverine with ispaghula husk

04-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, mebeverine hydrochloride p. 86, ispaghula husk p. 55.

- **INDICATIONS AND DOSE**
  - Irritable bowel syndrome
    - **BY MOUTH**
      - Child 12-17 years: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal
      - Adult: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal

- **DIRECTIONS FOR ADMINISTRATION**
  Contents of one sachet should be stirred into a glass (approx. 150 mL) of cold water and drunk immediately.

- **PATIENT AND CARER ADVICE**
  Patients or carers should be given advice on how to administer ispaghula husk with mebeverine granules.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Effervescent granules**
  - **CAUTIONARY AND ADVISORY LABELS** 13, 22
  - **EXCipients:** May contain Aspartame
  - **ELECTROLYTES:** May contain Potassium
  - **Fybogel Mebeverine** (Reckitt Benckiser Healthcare (UK) Ltd)
    - Mebeverine hydrochloride 135 mg, Ispaghula husk
    - 3.5 gram Fybogel Mebeverine effervescent granules sachets orange sugar-free | 10 sachet (£4.81 DT = £4.81)

Peppermint oil

- **INDICATIONS AND DOSE**
  - **COLPERMIN ®**
    - Relief of abdominal colic and distension, particularly in irritable bowel syndrome
      - **BY MOUTH**
        - Child 15-17 years: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water
        - Adult: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water

  - **MINTEC ®**
    - Relief of abdominal colic and distension, particularly in irritable bowel syndrome
      - **BY MOUTH**
        - Adult: 1–2 capsules 3 times a day for up to 2–3 months if necessary, dose to be taken before meals, swallowed whole with water

- **CAUTIONS**
  - Sensitivity to menthol

- **INTERACTIONS**
  - Appendix 1: peppermint oil

- **SIDE-EFFECTS**
  - Ataxia · bradycardia · gastrointestinal discomfort · gastrooesophageal reflux disease · headache · nausea · paraesthesia · rash erythematous · tremor · vomiting

- **PREGNANCY**
  - Not known to be harmful.

- **BREAST FEEDING**
  - Significant levels of menthol in breast milk unlikely.

- **DIRECTIONS FOR ADMINISTRATION**
  Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Gastro-resistant capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 5, 22, 25
  - **Mintec** (Almirall Ltd)
    - Peppermint oil 200 microtitre Mintec 0.2ml gastro-resistant capsules | 84 capsule (£0.40 DT = £0.70)

  - **Modified-release capsule**
    - **CAUTIONARY AND ADVISORY LABELS** 5, 22, 25
    - **EXCipients:** May contain Arachis (peanut) oil
    - **Colpermin** (Johnson & Johnson Ltd)
      - Peppermint oil 200 microtitre Colpermin gastro-resistant modified-release capsules | 20 capsule (£3.77 | 100 capsule (£14.33 DT = £14.33)

LAXATIVES > GUANYLATE CYCLASE-C RECEPTOR AGONISTS

Linaclotide

- **INDICATIONS AND DOSE**
  - Moderate to severe irritable bowel syndrome with constipation
    - **BY MOUTH**
      - Adult: 290 micrograms once daily, dose to be taken at least 30 minutes before meals, review treatment if no response after 4 weeks

- **CONTRA-INDICATIONS**
  - Gastro-intestinal obstruction · inflammatory bowel disease

- **CAUTIONS**
  - Predisposition to fluid and electrolyte disturbances

- **SIDE-EFFECTS**
  - Common or very common: Diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders
  - Uncommon: Appetite decreased · dehydration · haemorrhage · hypokalaemia · nausea · postural hypotension · vomiting

www.getintopharma.com
1.5 Short bowel syndrome

### Short bowel syndrome

**Description of condition**

Patients with a shortened bowel due to large surgical resection (with or without stoma formation) may require medical management to ensure adequate absorption of nutrients and fluid. Absorption of oral medication is also often impaired.

**Aims of treatment**

The management of short bowel syndrome focuses on ensuring adequate nutrition and drug absorption, thereby reducing the risk of complications resulting from these effects.

**Drug treatment**

#### Nutritional deficiencies

- **Antimotility drugs**
  - Loperamide hydrochloride p. 66 and codeine phosphate p. 454 reduce intestinal motility and thus exert antidiarrhoeal actions. Loperamide hydrochloride is preferred as it is not sedative and does not cause dependence or fat malabsorption. High doses of loperamide hydrochloride [unlicensed] may be required in patients with a short bowel due to disrupted enterohepatic circulation and rapid gastrointestinal transit time. If the desired response is not obtained with loperamide hydrochloride, codeine phosphate may be added to therapy.
  - Co-phenotrope p. 66 has traditionally been used alone or in combination with other medications to help decrease faecal output. Co-phenotrope crosses the blood–brain barrier and can produce central nervous system side-effects, which may limit its use; the potential for dependence and anticholinergic effects may also restrict its use.

- **Colestyramine**
  - In patients with an intact colon and less than 100 cm of ileum resected, colestyramine p. 197 can be used to bind the unabsorbed bile salts and reduce diarrhoea. When colestyramine is given to these patients, it is important to monitor for evidence of fat malabsorption (steatorrhoea) or fat-soluble vitamin deficiencies.

- **Antisecretory drugs**
  - Drugs that reduce gastric acid secretion reduce jejunoostomy output. Omeprazole p. 88 is readily absorbed in the duodenum and upper small bowel, but if less than 50 cm of jejunum remains, it may need to be given intravenously.
  - Octreotide [unlicensed indication] reduces ileostomy diarrhoea and large volume jejunostomy output by inhibiting multiple pro-secretory substances. There is insufficient evidence to establish its role in the management of short bowel syndrome.

- **Growth factors**
  - Growth factors can be used to facilitate intestinal adaptation after surgery in patients with short bowel syndrome, thus enhancing fluid, electrolyte, and micronutrient absorption.
  - Opioid antagonists should have been optimised.
  - Antidiarrhoeal agents, intravenous fluids, or oral rehydration salts.
  - Use of a proton pump inhibitor alone does not eliminate the need for further intervention for fluid control (such as antimitotic agents, intravenous fluids, or oral rehydration salts).

- **Enteric-coated and modified-release preparations**
  - Enteric-coated and modified-release preparations are unsuitable for use in patients with short bowel syndrome.
50 Constipation and bowel cleansing

AMINO ACIDS AND DERIVATIVES

Teduglutide

- **DRUG ACTION** Teduglutide is an analogue of human glucagon-like peptide-2 (GLP-2), which preserves mucosal integrity by promoting growth and repair of the intestine.

- **INDICATIONS AND DOSE**
  - **Short bowel syndrome (initiated under specialist supervision)**
    - **BY SUBCUTANEOUS INJECTION**
    - Adult: 0.05 mg/kg once daily, dose to be administered to alternating quadrants of the abdomen; alternatively the thigh can be used, for optimal injection volume per body weight, consult product literature. Review treatment after 6 months

- **CONTRA-INDICATIONS** Active or suspected malignancy - history of gastro-intestinal malignancy (in previous 5 years)

- **CAUTIONS** Abrupt withdrawal of parenteral support (reduce gradually with concomitant monitoring of fluid status) - cardiac insufficiency - cardiovascular disease - colo-rectal polyps - hypertension

- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · appetite decreased · congestive heart failure · cough · dysphoria · fluid imbalance · gallbladder disorders · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal stoma complication · headache · influenza like illness · insomnia · nausea · pancreatitis · peripheral oedema · respiratory tract infection · vomiting
  - **Uncommon** Syncope

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises caution in patients with tetracycline hypersensitivity.

- **PREGNANCY** Specialist sources indicate use if necessary—no human data available.

- **BREAST FEEDING** Manufacturer advises avoid—toxicity in animal studies.

- **RENAIL IMPAIRMENT**
  - **Dose adjustments** Manufacturer advises use half the daily dose in moderate or severe impairment and end-stage renal disease.

- **MONITORING REQUIREMENTS** Manufacturer advises monitoring of small bowel function, gall bladder, bile ducts and pancreas during treatment.

- **TREATMENT CESSATION** Caution when discontinuing treatment—risk of dehydration.

- **PATIENT AND CARER ADVICE** Patients with cardiovascular disease should seek medical attention if they notice sudden weight gain, swollen ankles or dyspnoea—may indicate increased fluid absorption.

Other drugs used for Short bowel syndrome Cimetidine, p. 74

LAXATIVES

Citric acid with magnesium carbonate

- **INDICATIONS AND DOSE**
  - **Bowel evacuation for surgery, colonoscopy or radiological examination**
    - **BY MOUTH**
      - Child 5–9 years: One-third of a sachet to be given at 8 a.m. the day before the procedure and, one-third of a sachet to be given between 2 and 4 p.m. the day before the procedure
      - Child 10–17 years: 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure
      - Adult: 1 sachet, given at 8 a.m. the day before the procedure and 1 sachet, given between 2 and 4 p.m. the day before the procedure, use half the dose in frail elderly patients

- **CONTRA-INDICATIONS** Acute severe colitis · gastric retention · gastro-intestinal obstruction · gastro-intestinal perforation · toxic megacolon

- **CAUTIONS** Children · colitis (avoid if acute severe colitis) · dehydrated · elderly · hypovolaemia (should be corrected before administration of bowel cleansing preparations) · impaired gag reflex or possibility of regurgitation or aspiration · patients with fluid and electrolyte disturbances

- **INTERACTIONS** Adequate hydration should be maintained during treatment.

- **SIDE-EFFECTS**
  - **Common or very common** Gastrointestinal discomfort · nausea · vomiting
  - **Uncommon** Dehydration · dizziness · electrolyte imbalance · headache

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution.

- **RENAIL IMPAIRMENT**
  - In adults Avoid if eGFR less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.
  - In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.

Other drugs used for Bowel cleansing Bisacodyl, p. 61 · Docusate sodium, p. 61 · Magnesium sulfate, p. 1051

www.getintopharma.com
Macrogol 3350 with anhydrous sodium sulfate, ascorbic acid, potassium chloride, sodium ascorbate and sodium chloride

(Polyethylene glycols)

01-Mar-2018

- **Indications and dose**

  MOVIPREP®

  Bowel cleansing [before any procedure requiring a clean bowel]
  
  - **By mouth**
  
  Adult: 1 litre daily for 2 doses; first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure; alternatively 2 litres daily for 1 dose; reconstituted solution to be taken on the evening before the procedure, or on the morning of the procedure, treatment should be completed at least 1 hour before clinical procedures conducted without general anaesthesia, and at least 2 hours before clinical procedures conducted under general anaesthesia

  PLENVU®

  Bowel cleansing [before any procedure requiring a clean bowel]
  
  - **By mouth**
  
  Adult: 500 mL daily for 2 doses; first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively 1 litre daily in 2 divided doses, reconstituted solution to be taken either on the evening before the procedure, or in the morning of the procedure—separate doses by at least 1 hour, treatment should be completed at least 1 hour before clinical procedures conducted without general anaesthesia, and at least 2 hours before clinical procedures conducted under general anaesthesia

- **Contra-indications**

  Disorders of gastric emptying - G6PD deficiency - gastrointestinal obstruction - gastrointestinal perforation - ileus - toxic megacolon

- **Caution**

  Debilitated patients - dehydration (correct before administration) - impaired consciousness - impaired gag reflex or possibility of regurgitation or aspiration - moderate to severe cardiac impairment - patients at risk of arrhythmia (including those with thyroid disease or electrolyte imbalance) - severe acute inflammatory bowel disease

- **Interactions**

  → Appendix 1: bowel cleansing preparations

- **Side-effects**

  - Common or very common: Chills - dehydration - dizziness - fever - gastrointestinal discomfort - headaches - hunger - malaise - nausea - sleep disorder - thirst - vomiting
  
  
  - Frequency not known: Flatulence - hyponatraemic seizure

- **Further information**

  Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

- **Pregnancy**

  Manufacturer advises use only if essential—no or limited information available.

- **Breast feeding**

  Manufacturer advises use only if essential—no information available.

- **Renal impairment**

  Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

- **Monitoring requirements**

  Manufacturer advises consider monitoring baseline and post-treatment electrolytes, renal function and ECG as appropriate, in debilitated patients, those with significant renal impairment, arrhythmia, or at risk of electrolyte imbalance.

- **Directions for administration**

  PLENVU®

  Manufacturer advises the contents of the single sachet for Dose 1 should be made up to 500 mL with water and taken over 30 minutes; the contents of the 2 sachets (A and B) should be made up to 500 mL with water and taken over 30 minutes. Each dose should be followed by 500 mL of clear fluid taken over 30 minutes.

  MOVIPREP®

  Manufacturer advises one pair of sachets (A and B) should be made up to 1 litre with water and taken over 1–2 hours; 1 litre of other clear fluid should also be taken during treatment.

- **Prescribing and dispensing information**

  PLENVU®

  Dose 1 (single sachet) when reconstituted up to 500 mL with water provides Na+: 160.9 mmol, K+: 13.3 mmol, Cl−: 47.6 mmol; Dose 2 (sachets A and B) when reconstituted up to 500 mL with water provides Na+: 297.6 mmol, K+: 16.1 mmol, Cl−: 70.9 mmol.

  MOVIPREP®

  1 pair of sachets (A+B) when reconstituted up to 1 litre with water provides Na+: 181.6 mmol (Na+: 56.2 mmol absorbable), K+: 14.2 mmol, Cl−: 59.8 mmol.

- **Patient and carer advice**

  Manufacturer advises solid food should not be taken during treatment until procedure completed.

- **Medicinal forms**

  There can be variation in the licensing of different medicines containing the same drug.

  **Oral powder**

  **Cautionary and advisory labels** 10, 13

  **Excipients:** May contain Aspartame

  **Electrolytes:** May contain Chloride, potassium, sodium

  MOVIPREP (Forum Health Products Ltd)

  MOVIPREP oral powder sachets sugar-free | 1 sachet £0.36

  PLENVO (Forum Health Products Ltd)

  PLENVO oral powder sachets sugar-free | 3 sachet £12.43
Macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride
*(Formulated as a bowel cleansing preparation)*

- **INDICATIONS AND DOSE**
  - Bowel cleansing before radiological examination, colonoscopy, or surgery
    - **INITIALLY BY MOUTH**
    - Adult: Initially 2 litres daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively (by mouth) initially 250 mL every 10–15 minutes, reconstituted solution to be administered, alternatively (by nasogastric tube) initially 20–30 mL/minute, starting on the day before procedure until 4 litres have been consumed

- **CONTRA-INDICATIONS**
  - Acute severe colitis - gastric retention - gastro-intestinal obstruction - gastro-intestinal perforation - toxic megacolon

- **CAUTIONS**
  - Colitis (avoid if acute severe colitis) - debilitated patients - elderly - fluid and electrolyte disturbances - heart failure - hypovolaemia (should be corrected before administration of bowel cleansing preparations) - impaired gag reflex or possibility of regurgitation or aspiration

- **INTERACTIONS**
  - Appendix 1: bowel cleansing preparations

- **SIDE-EFFECTS**

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

- **PREGNANCY**
  - Manufacturers advise use only if essential — no information available.

- **BREAST FEEDING**
  - Manufacturers advise use only if essential — no information available.

- **MONITORING REQUIREMENTS**
  - Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

- **DIRECTIONS FOR ADMINISTRATION**
  - 1 sachet should be reconstituted with 1 litre of water. Flavouring such as clear fruit cordials may be added if required. After reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Each Klean-Prep® sachet provides Na+: 125 mmol, K+: 10 mmol, Cl: 35 mmol and HCO₃⁻ 20mmol when reconstituted with 1 litre of water.

- **PATIENT AND CARER ADVICE**
  - Solid food should not be taken for 2 hours before starting treatment. Adequate hydration should be maintained during treatment. Treatment can be stopped if bowel motions become watery and clear.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Powder**
  - **CAUTIONARY AND ADVISORY LABELS** 10, 13
  - **EXCIPIENTS:** May contain Aspartame
  - **ELECTROLYTES:** May contain Bicarbonate, chloride, potassium, sodium
  - **Klean-Prep** (Forum Health Products Ltd)
  - Potassium chloride 742.5 mg, Sodium chloride 1.465 gram, Sodium bicarbonate 1.685 gram, Sodium sulfate anhydrous

---

LAXATIVES

Magnesium citrate with sodium picosulfate
*(Formulated as a bowel cleansing preparation)*

- **INDICATIONS AND DOSE**
  - **CITRAFLEET® SACHETS**
    - Bowel evacuation on day before radiological examination, endoscopy, or surgery
      - **BY MOUTH**
      - Adult: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours
      - Child 2–3 years: 0.5 sachet taken before 8 a.m., then 0.5 sachet after 6–8 hours
      - Child 4–8 years: 1 sachet taken before 8 a.m., then 0.5 sachet after 6–8 hours
      - Child 9–17 years: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours
      - Adult: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours

  - **PICOLAX® SACHETS**
    - Bowel evacuation on day before radiological procedure, endoscopy, or surgery
      - **BY MOUTH**
      - Child 1 year: 0.25 sachet taken before 8 a.m., then 0.25 sachet after 6–8 hours
      - Child 2–3 years: 0.5 sachet taken before 8 a.m., then 0.5 sachet after 6–8 hours
      - Child 4–8 years: 1 sachet taken before 8 a.m., then 0.5 sachet after 6–8 hours
      - Child 9–17 years: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours
      - Adult: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours

- **CONTRA-INDICATIONS**
  - Acute severe colitis - ascites - congestive cardiac failure - gastric retention - gastro-intestinal obstruction - gastro-intestinal perforation - gastro-intestinal ulceration - toxic megacolon

- **CAUTIONS**
  - Cardiac disease (avoid in congestive cardiac failure) - children - colitis (avoid if acute severe colitis) - debilitated patients - elderly - fluid and electrolyte disturbances - hypovolaemia (should be corrected before administration) - impaired gag reflex or possibility of regurgitation or aspiration - recent gastro-intestinal surgery

- **SIDE-EFFECTS**
  - **Common or very common** Gastrointestinal discomfort - headache - nausea
  - **Uncommon** Confusion - electrolyte imbalance - gastrointestinal disorders - seizures - skin reactions - vomiting

- **PREGNANCY**
  - Caution.

- **BREAST FEEDING**
  - Caution.

- **HEPATIC IMPAIRMENT**
  - Avoid in hepatic coma if risk of renal failure.

- **RENAL IMPAIRMENT**
  - In adults: Avoid if eGFR less than 30 mL/minute/1.73 m² — risk of hypermagnesaemia.
  - In children: Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² — risk of hypermagnesaemia.

- **DIRECTIONS FOR ADMINISTRATION**
  - One sachet of sodium picosulfate with magnesium citrate powders should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.
**Descripción de la condición**

La constipación es defecación que es insatisfactoria porque de frecuentes heces, dificultad de deposición, o incompleta evacuación. Puede ocurrir en la edad y es comúnmente visto en mujeres, el ancianos, y durante inmadura evacuación. Se puede presentar en cualquier edad y es un problema en la digestión y motilidad intestinal. Los pacientes y los cuidadores deben ser informados de que el calor se genera durante el reconstrucción y que los líquidos recomendados durante el procedimiento. Se recomienda el uso de co-danthramer y co-danthrusate en la constipación de los pacientes hospitalizados. El líquido parafinas p. 61 también se puede usar como un lubricante para el uso de enemas y promover un movimiento intestinal. El uso de co-danthramer y co-danthrusate se limitan en la constipación de los pacientes que presentan hipertensión y otros síntomas como astenia, dolor abdominal y pérdida de peso. Se ha utilizado la gelatina de aracíis y el aceite de girasol en la constipación de los pacientes que no toleran el bran. Methylcellulose también actúa como un estimulante. 

**Sintomáticos laxativos**

Los laxativos pueden ser de uso oral o rectal. Se pueden clasificar en diferentes categorías: estímulos, osmóticos y de masa. Los laxativos deben ser usados con cuidado y evitar el abuso. Se puede ver en las tablas de dosis y precauciones.

**Otros usos de la constipación**

Linaclotide p. 48 es un guanylate ciclasa-C receptor agonista que es licenciado para el tratamiento de la constipación en adultos y mayores. Incrementa la excreción de líquido intestinal y reduce la depresión, y disminuye el dolor. 

**Prucalopride p. 60 es un agonista de serotonina 5HT4 receptor con propiedades prokinéticas. Se ha licenciado para el tratamiento de la constipación crónica en adultos.**

**Preparaciones de limpieza fecal**

Las preparaciones de limpieza fecal son usadas después de la cirugía, colonoscopia o radiológicamente para asegurarse que el paciente está libre de contenido sólido; ejemplos incluyen macroglis 3350 con anhidrados de sodio sulfato, potasio y otros aditivos. 

**Referencias**

chloride, sodium bicarbonate and sodium chloride p. 52, citric acid with magnesium carbonate p. 50, magnesium citrate with sodium picosulfate p. 52 and sodium acid phosphate with sodium phosphate p. 59. Bowel cleansing treatments are not treatments for constipation.

Management

Short-duration constipation

In the management of short-duration constipation (where dietary measures are ineffective) treatment should be started with a bulk-forming laxative, ensuring adequate fluid intake. If stools remain hard, add or switch to an osmotic laxative. If stools are soft but difficult to pass or the person complains of inadequate emptying, a stimulant laxative should be added.

Opioid-induced constipation

See also Constipation under Prescribing in palliative care p. 25. In patients with opioid-induced constipation, an osmotic laxative (or docusate sodium to soften the stools) and a stimulant laxative is recommended. Bulk-forming laxatives should be avoided. Naloxegol p. 65 is recommended for the treatment of opioid-induced constipation when response to other laxatives is inadequate.

Methylnaltrexone bromide p. 64 is licensed for the treatment of opioid-induced constipation when response to other laxatives is inadequate. Manufacturer advises that in patients receiving palliative care, methylmaltrexone bromide should be used as an adjunct to existing laxative therapy.

Faecal impaction

The treatment of faecal impaction depends on the stool consistency. In patients with hard stools, a high dose of an oral macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) may be considered. In those with soft stools, or with hard stools after a few days treatment with a macrogol, an oral stimulant laxative should be started or added to the previous treatment. If the response to oral laxatives is inadequate, for soft stools consider rectal administration of bisacodyl, and for hard stools rectal administration of glycerol, or glycerol plus bisacodyl. Alternatively, a docusate sodium or sodium citrate enema p. 789 may be tried.

If the response is still insufficient, a sodium acid phosphate with sodium phosphate or arachis oil retention enema may be necessary. For hard faeces it can be helpful to give the arachis oil enema p. 60 overnight before giving a sodium acid phosphate with sodium phosphate p. 59 or sodium citrate enema p. 789 the following day. Enemas may need to be repeated several times to clear hard impacted faeces.

Chronic constipation

In the management of chronic constipation, treatment should be started with a bulk-forming laxative, whilst ensuring good hydration. If stools remain hard, add or change to an osmotic laxative such as a macrogol. Lactulose p. 56 is an alternative if macrogols are not effective, or not tolerated. If the response is inadequate, a stimulant laxative can be added. The dose of laxative should be adjusted gradually to produce one or two soft, formed stools per day.

If at least two laxatives (from different classes) have been tried at the highest tolerated recommended doses for at least 6 months, the use of prucalopride p. 60 (in women only) should be considered. If treatment with prucalopride is not effective after 4 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Laxatives can be slowly withdrawn when regular bowel movements occur without difficulty, according to the frequency and consistency of the stools. If a combination of laxatives has been used, reduce and stop one laxative at a time; if possible, the stimulant laxative should be reduced first. However, it may be necessary to also adjust the dose of the osmotic laxative to compensate.

Constipation in pregnancy and breast-feeding

If dietary and lifestyle changes fail to control constipation in pregnancy, fibre supplements in the form of bran or wheat are likely to help women experiencing constipation in pregnancy, and raise no serious concerns about side-effects to the mother or fetus. A bulk-forming laxative is the first choice during pregnancy if fibre supplements fail. An osmotic laxative, such as lactulose, can also be used. Bisacodyl p. 61 or senna p. 63 may be suitable if a stimulant effect is necessary but use of senna should be avoided near term or if there is a history of unstable pregnancy. Stimulant laxatives are more effective than bulk-forming laxatives but are more likely to cause side-effects (diarrhoea and abdominal discomfort), reducing their acceptability to patients. Docusate sodium p. 61 and glycerol suppositories p. 63 can also be used. A bulk-forming laxative is the first choice during breastfeeding, if dietary measures fail. Lactulose or a macrogol may be used if stools remain hard. As an alternative, a short course of a stimulant laxative such as bisacodyl or senna can be considered.

Constipation in children

Early identification of constipation and effective treatment can improve outcomes for children. Without early diagnosis and treatment, an acute episode of constipation can lead to anal fissure and become chronic.

The first-line treatment for children with constipation requires the use of a laxative in combination with dietary modification or with behavioural interventions. Diet modification alone is not recommended as first-line treatment.

In children an increase in dietary fibre, adequate fluid intake, and exercise is advised. Diet should be balanced and contain fruits, and vegetables, high-fibre bread, baked beans, and wholegrain breakfast cereals. Unprocessed bran (which may cause bloating and flatulence and reduces the absorption of micronutrients) is not recommended. If faecal impaction is not present (or has been treated), the child should be treated promptly with a laxative. A macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 57) is preferred as first-line management. If the response is inadequate, add a stimulant laxative or change to a stimulant laxative if the first-line therapy is not tolerated. If stools remain hard, lactulose or another laxative with softening effects, such as docusate sodium can be added.

In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of months, according to response. Some children may require laxative therapy for several years.

A shorter duration of laxative treatment may be possible in some children with a short history of constipation.

Laxatives should be administered at a time that produces an effect that is likely to fit in with the child’s toilet routine.

Faecal impaction in children

Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing a macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) is used to clear faecal mass and to establish and maintain soft well-formed stools, using an escalating dose regimen depending on symptoms and response. If disimpaction does not occur after 2 weeks, a stimulant laxative can be added or if stools are hard, used in
LAXATIVES > BULK-FORMING LAXATIVES

**Ispaghula husk**

**DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

---

**INDICATIONS AND DOSE**

**Constipation**

- **BY MOUTH**
  - Child 1 month-5 years: 2.5–5 mL twice daily, dose to be taken only when prescribed by a doctor, as half or whole level spoonful in water, preferably after meals, morning and evening.
  - Child 6-11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals, morning and evening.
  - Child 12–17 years: 1 sachet twice daily, dose to be given in water preferably after meals, morning and evening.
  - Adult: 1 sachet twice daily, dose to be given in water preferably taken after food, morning and evening.

**DOSE EQUIVALENCE AND CONVERSION**

- 1 sachet equivalent to 2 level 5 mL spoonfuls.

---

**CONTRA-INDICATIONS**

- Colonic atony, faecal impaction, intestinal obstruction, reduced gut motility.

**CAUTIONS**

- Adequate fluid intake should be maintained to avoid intestinal obstruction.

**SIDE-EFFECTS**

- Abdominal distension, bronchospasm, conjunctivitis, gastrointestinal disorders, hypersensitivity, rhinitis, skin reactions.

**DIRECTIONS FOR ADMINISTRATION**

- Dose to be taken with at least 150 mL liquid.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of soluble granules formulations may include plain, lemon, or orange.

**HANDLING AND STORAGE**

- Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.

**PATIENT AND CARER ADVICE**

- Manufacturer advises that preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed. Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

---

**Methylcellulose**

**DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

---

**INDICATIONS AND DOSE**

**Constipation | Diarrhoea**

- **BY MOUTH USING TABLETS**
  - Adult: 3–6 tablets twice daily.

**CONTRA-INDICATIONS**

- Colonic atony, difficulty in swallowing, faecal impaction, infective bowel disease, intestinal obstruction.

**CAUTIONS**

- Adequate fluid intake should be maintained to avoid intestinal obstruction.

**CAUTIONS, FURTHER INFORMATION**

- It may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility to ensure adequate fluid intake.

**SIDE-EFFECTS**

- Abdominal distension, gastrointestinal disorders.

**DIRECTIONS FOR ADMINISTRATION**

- In constipation the dose should be taken with at least 300 mL liquid. In diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose.

**PATIENT AND CARER ADVICE**

- Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

---

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Celevac (Advanz Pharma)
  - Methylcellulose "450" 500 mg
  - 112 tablet
  - £3.22 DT = £3.22

**Sterculia**

**DRUG ACTION** Sterculia is a bulk-forming laxative. It relieves constipation by increasing faecal mass which stimulates peristalsis.

---

**INDICATIONS AND DOSE**

**Constipation**

- **BY MOUTH**
  - Child 6-11 years: 0.5–1 sachet 1–2 times a day, alternatively, half to one heaped 5 mL spoonful once or twice a day; washed down without chewing with plenty of liquid after meals.
  - Child 12–17 years: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5 mL spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals.
  - Adult: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5 mL spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals.

LACTULOSE
Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride

18-Apr-2018

**INDICATIONS AND DOSE**

**Chronic constipation (dose for ‘paediatric’ sachets)**
- **BY MOUTH**
  - Child 2-5 years: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
  - Child 6-11 years: 2 sachets daily, adjust dose to produce regular soft stools; maximum 4 sachets per day

**Prevention of faecal impaction (dose for ‘paediatric’ sachets)**
- **BY MOUTH**
  - Child 5-11 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy; maximum 12 sachets per day

**Chronic constipation (dose for ‘half-strength’ sachets)**
- **BY MOUTH**
  - Child 12-17 years: 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2–4 sachets daily
  - Adult: 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2–4 sachets daily

**Faecal impaction (dose for ‘half-strength’ sachets)**
- **BY MOUTH**
  - Child 12-17 years: 8 sachets on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 16 sachets per day
  - Adult: 8 sachets on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 16 sachets per day

**Chronic constipation (dose for ‘full-strength’ sachets)**
- **BY MOUTH**
  - Child 12-17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily
  - Adult: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

**Faecal impaction (dose for ‘full-strength’ sachets)**
- **BY MOUTH**
  - Child 12-17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day
  - Adult: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

**DOSE EQUIVALENCE AND CONVERSION**
- Each paediatric sachet contains 6.563 g of macrogol 3350; each ‘half-strength’ sachet contains 6.563 g of macrogol 3350; each ‘full-strength’ sachet contains 13.125 g of macrogol 3350.

**MOVICOL® READY TO TAKE SACHETS**

**Chronic constipation**
- **BY MOUTH**
  - Child 12-17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily
  - Adult: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

**Faecal impaction**
- **BY MOUTH**
  - Child 12-17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period; patients should also take an additional 1 litre of fluid daily, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day
  - Adult: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

**VISTAPREP® ORAL POWDER**

**Bowel cleansing before colonoscopy**
- **BY MOUTH**
  - Adult: 3–4 litres, reconstituted solution taken over 4 hours, generally on the day of procedure; alternatively, it can be taken on the evening before procedure or started on the evening before procedure and completed on the morning of procedure

**UNLICENSED USE**
- In children Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride may be used as detailed below, although these situations are considered outside the scope of its licence:
  - (VFG) dose for chronic constipation/prevention of faecal impaction in children aged 6 years;
  - dose titration schedule for faecal impaction in children aged 12–17 years.
- In adults Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride may be used as detailed below, although this is considered outside the scope of its licence: (VFG) dose titration schedule for faecal impaction.
CONTRA-INDICATIONS
Intestinal obstruction - intestinal perforation - paralytic ileus - severe inflammatory conditions of the intestinal tract (including Crohn’s disease, ulcerative colitis and toxic megacolon) - use of 'paediatric' sachets for faecal impaction in impaired cardiovascular function (no information available) (in children).

VISTAPREP® ORAL POWDER
Impaired consciousness - impaired swallowing reflex - moderate-to-severe heart failure—limited safety information available - risk of regurgitation or aspiration - severe dehydration—limited safety information available

CAUTIONS
Cardiovascular impairment (should not take more than 2 'full-strength' sachets or 4 'half-strength' sachets in any one hour) - impaired consciousness (with high doses) - impaired gag reflex (with high doses).

VISTAPREP® ORAL POWDER
Chronic inflammatory bowel disease - elderly - heart rhythm abnormalities - reflux oesophagitis (with high doses)

SIDE-EFFECTS
Electrolyte imbalance (discontinue if symptoms occur) - flatulence - gastrointestinal discomfort - nausea - vomiting

PREGNANCY
Manufacturers advise may be used—limited data available.

HEPATIC IMPAIRMENT

VISTAPREP® ORAL POWDER
Manufacturer advises avoid (limited information available).

RENAL IMPAIRMENT
In children Manufacturers advise avoid use of 'paediatric' sachets for faecal impaction—no information available.

VISTAPREP® ORAL POWDER
Manufacturer advises avoid—limited safety information available.

DIRECTIONS FOR ADMINISTRATION
Manufacturers advise dissolve contents of each 'half-strength' sachet of oral powder in 62.5 mL of water, and each 'full-strength' sachet of oral powder in 125 mL of water; after reconstitution the solution should be kept in a refrigerator—for further information consult product literature.

In children Manufacturers advise dissolve contents of each 'paediatric' sachet of oral powder in 62.5 mL of water; after reconstitution the solution should be kept in a refrigerator—for further information consult product literature.

MOVICOL® LIQUID
Manufacturer advises dilute 25 mL of oral concentrate with 100 mL of water; after dilution the solution should be discarded if unused after 24 hours.

VISTAPREP® ORAL POWDER
Manufacturer advises dissolve the contents of each sachet in 1 L water; if not consumed immediately, the reconstituted solution should be kept in a refrigerator and discarded if unused after 48 hours.

PATIENT AND CARER ADVICE
Patients or carers should be counselled on how to take the oral powder and oral solution.

• Medicines for Children leaflet: Movicol for constipation www.medicinesforchildren.org.uk/movicol-constipation

VISTAPREP® ORAL POWDER
Manufacturer advises treatment can be stopped if bowel motions become watery and clear.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

  - With rectal use Use with caution.

- **MONITORING REQUIREMENTS**
  - With oral use Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

- **DIRECTIONS FOR ADMINISTRATION**
  - **Fleet® PHOSPHO-SODA** Copious intake of water or other clear fluids (e.g. clear soup, strained fruit juice without pulp, black tea or coffee) recommended until midnight before morning procedure and until 8 a.m. before afternoon procedure. At least one glass (approx 240 mL) of water or other clear fluid should also be taken immediately before each dose.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - When prepared extemporaneously, the BP states Phosphates Enema BP Formula B consists of sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL.
PATIENT AND CARER ADVICE

FLEET® PHOSPHO-SODA Intake of solid food should be stopped for at least 6 hours before starting treatment and until procedure completed. Patients or carers should be advised that adequate hydration should be maintained during treatment. Patients or carers should be given advice on administration of FLEET® Phospho-soda oral solution.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 10 ELECTROLYTES: May contain Phosphate, sodium

- Fleet Phospho-soda (Casen Recordati S.L.) Disodium hydrogen phosphate dodecahydrate 240 mg per 1 ml, Sodium dihydrogen phosphate dihydrate 542 mg per 1 ml Phospho-soda 24.4g/10.8g oral solution sugar-free | 90 ml

Enema

- Sodium acid phosphate with sodium phosphate (Non-proprietary) Disodium hydrogen phosphate dodecahydrate 80 mg per 1 ml, Sodium dihydrogen phosphate dihydrate 100 mg per 1 ml Phospho-soda enema (Formula B) 128ml long tube | 1 enema £4.79
- Fleet Ready-to-use (Casen Recordati S.L.) Disodium hydrogen phosphate dodecahydrate 80 mg per 1 ml, Sodium dihydrogen phosphate dihydrate 181 mg per 1 ml Clean Ready-to-use 133ml enema | 1 enema £1.95 DT + £1.95

LAXATIVES > SELECTIVE 5-HT₄ RECEPTOR AGONISTS

Prucalopride 07-Feb-2009

DRUG ACTION A selective serotonin 5-HT₄-receptor agonist with prokinetic properties.

INDICATIONS AND DOSE Chronic constipation when other laxatives fail to provide an adequate response

- BY MOUTH
  - Adult: 2 mg once daily, review treatment if no response after 4 weeks
  - Elderly: Initially 1 mg once daily, increased if necessary to 2 mg once daily, review treatment if no response after 4 weeks

CONTRA-INDICATIONS Crohn’s disease, intestinal obstruction, intestinal perforation, toxic megacolon, ulcerative colitis

CAUTIONS History of arrhythmias, history of ischaemic heart disease

SIDE-EFFECTS

- Common or very common Appetite decreased, diarrhoea, dizziness, fatigue, gastrointestinal discomfort, gastrointestinal disorders, headache, nausea, vomiting
- Uncommon Anorectal haemorrhage, fever, malaise, palpitations, tremor, urinary frequency increased SIDE-EFFECTS, FURTHER INFORMATION Side-effects generally occur at the start of treatment and are usually transient.

CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception during treatment.

PREGNANCY Manufacturer advises avoid—limited data available.

BREAST FEEDING Manufacturer advises avoid—present in milk.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (risk of increased exposure, limited information available).

Dose adjustments Manufacturer advises initial dose of 1 mg once daily in severe impairment; if tolerated this may be increased to 2 mg once daily.

RENAI IMPAIRMENT Dose adjustments Manufacturer recommends a reduced dose of 1 mg daily if eGFR less than 30 ml/minute/1.73 m².

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises that dizziness and fatigue may initially affect ability to drive or operate machinery.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

- Prucalopride for the treatment of chronic constipation in women (December 2010) NICE TA211 Prucalopride (Resolor®) is recommended as an option for the treatment of chronic constipation in women for whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and invasive treatment for constipation is being considered. If treatment with prucalopride is not effective after 4 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered. Prucalopride should only be prescribed by a clinician with experience of treating chronic constipation, after careful review of the patient’s previous courses of laxative treatments.

Scottish Medicines Consortium (SMC) decisions

SMC No. 653/10

The Scottish Medicines Consortium has advised (July 2011) that prucalopride (Resolor®) is not recommended for use within NHS Scotland for the symptomatic treatment of chronic constipation of women in whom laxatives fail to provide adequate relief.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Resolor (Shire Pharmaceuticals Ltd) Prucalopride (as Prucalopride succinate) 1 mg | 28 tablet | £38.69 DT + £38.69
- Prucalopride (as Prucalopride succinate) 2 mg | 28 tablet | £59.52 DT + £59.52

LAXATIVES > SOFTENING LAXATIVES

Arachis oil

INDICATIONS AND DOSE To soften impacted faeces

- BY RECTUM
  - Adult: 130 mL as required

CAUTIONS Hypersensitivity to soya - intestinal obstruction

ALLERGY AND CROSS-SENSITIVITY Contra-indicated ifhistory of hypersensitivity to arachis oil or peanuts.

DIRECTIONS FOR ADMINISTRATION Warm enema in warm water before use.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Enema

- Arachis oil (Non-proprietary) Arachis oil 1 ml per 1 ml Arachis oil 130ml enema | 1 enema £47.50 DT + £47.50

www.getintopharma.com
### Docusate sodium

*Trade names: Norgalax, Docusol, Docusol Paediatric*  
*Type: Laxative*

#### INDICATIONS AND DOSE

**Constipation**
- **ERYTHROMYCIN, CHLORAMPHENICOL**: Chronic constipation in children under 12 years of age
- **COLOSTOMY, INTUSSUSCEPTION, PNEUMOTHORAX**: Bowel clearance before radiological procedures and surgery
- **ACUTE Appendicitis, PERFORATED Ulcers**: Acute surgical abdominal conditions (in adults)
- **AMM可用于长期使用**: Electrolyte imbalance with prolonged use (in children)
- **ATTACKS**: Gastrointestinal discomfort • nausea
- **ANGIOEDEMA**: Angioedema

#### DIRECTIONS FOR ADMINISTRATION

**BY MOUTH**
- **DOSAGE**
  - Child 6 months–1 year: 1.25 mg 3 times a day, adjusted according to response, use paediatric oral solution
  - Child 2–11 years: 2.5–25 mg 3 times a day, adjusted according to response, use paediatric oral solution
  - Adult: Up to 500 mg daily in divided doses, adjusted according to response

**BY RECTUM**
- **Adult**: 120 mg for 1 dose
- **Child**: 400 mg, to be administered with barium meal

**PHARMACOKINETICS**
- Oral preparations act within 1–2 days; response to rectal administration usually occurs within 20 minutes.

#### CONTRA-INDICATIONS

-**CHILDREN UNDER 3 YEARS**: Bowel obstruction
-**DISTURBED LACTATION**: Breastfeeding
-**RARE**: Gastrointestinal discomfort, nausea

#### INTERACTIONS

-**DIFFERENT MEDICINES CONTAINING THE SAME DRUG**: None known

#### SIDE-EFFECTS

-**NAUSEA**: Common
-**RASH**: Rare

#### MEDICINAL FORMS

- **ORAL SOLUTION**: Liquid paraffin
- **ENEMA**: Docusate sodium 2.5 mg/1 ml

#### PATIENT AND CARER ADVICE

- **ażel**: Use paediatric oral solution for children 1–7 years
- **anych**: Use adult oral solution

### Liquid paraffin

*Trade names: Domestos, Clearblue*  
*Type: Laxative*

#### INDICATIONS AND DOSE

**Constipation**
- **BY MOUTH**
  - **CHILDREN**: 5–20 mg once daily, increased if necessary up to 20 mg once daily
  - **ADULTS**: 5–10 mg once daily

**BY RECTUM**
- **CHILDREN**: 10 mg once daily
- **ADULTS**: 10 mg twice daily

**PHARMACOKINETICS**
- Tablets act within 10–12 hours; suppositories act in 20–60 minutes.

### Bisacodyl

*Trade names: Co-danthrusate*  
*Type: Stimulant laxative*

#### INDICATIONS AND DOSE

**Constipation**
- **BY MOUTH**
  - **CHILDREN**: 5–20 mg once daily, increased if necessary up to 20 mg once daily
  - **ADULTS**: 5–10 mg once daily

**BY RECTUM**
- **CHILDREN**: 10 mg once daily
- **ADULTS**: 10 mg twice daily

**SIDE-EFFECTS**
- **NAUSEA**: Common
- **VOMITING**: Rare

**CONTRA-INDICATIONS**

-**CHILDREN UNDER 3 YEARS**: Bowel obstruction
-**DISTURBED LACTATION**: Breastfeeding
-**RARE**: Gastrointestinal discomfort, nausea

**MEDICINAL FORMS**

- **ORAL PREPARATIONS**: Docusate sodium 1 mg/1 ml
- **ENEMA**: Docusate sodium 2.5 mg/1 ml

**PATIENT AND CARER ADVICE**

- **ażel**: Use paediatric oral solution for children 1–7 years
- **anych**: Use adult oral solution

**CONTRA-INDICATIONS**

-**CHILDREN UNDER 3 YEARS**: Bowel obstruction
-**DISTURBED LACTATION**: Breastfeeding
-**RARE**: Gastrointestinal discomfort, nausea

**MEDICINAL FORMS**

- **ORAL PREPARATIONS**: Docusate sodium 1 mg/1 ml
- **ENEMA**: Docusate sodium 2.5 mg/1 ml

**PATIENT AND CARER ADVICE**

- **ążel**: Use paediatric oral solution for children 1–7 years
- **anych**: Use adult oral solution

Co-danthramer

**CONTRA-INDICATIONS** Acute abdominal conditions (in children) - acute inflammatory bowel disease - acute surgical abdominal conditions (in adults) - intestinal obstruction - severe dehydration

**CAUTIONS** Excessive use of stimulant laxatives can cause diarrhea and related effects such as hypokalaemia - may cause local irritation - rodent studies indicate potential carcinogenic risk

**CAUTIONS, FURTHER INFORMATION**
- Local irritation - Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies—risk of irritation and excoriation).
- SIDE-EFFECTS Abdominal cramps - asthenia - gastrointestinal disorders - hypermagnesaemia - skin reactions - urine red
- PREGNANCY Manufacturers advise avoid—limited information available.
- BREAST FEEDING Manufacturers advise avoid—no information available.

**PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of co-danthramer in palliative care, see www.medicinescomplete.com/#/content/palliative/stimulant-laxatives.

---

- BREAST FEEDING Manufacturers advise avoid—no information available.
Gastro-intestinal system

Senna

**INDICATIONS AND DOSE**

**Constipation**

- **BY MOUTH USING TABLETS**
  - Child 6–17 years: 7.5–30 mg once daily, adjusted according to response
  - Adult: 7.5–15 mg daily (max. per dose 30 mg daily), dose usually taken at bedtime; initial dose should be low then gradually increased, higher doses may be prescribed under medical supervision
- **BY MOUTH USING SYRUP**
  - Child 1 month-3 years: 3.75–15 mg once daily, adjusted according to response
  - Child 4–17 years: 3.75–30 mg once daily, adjusted according to response
  - Adult: 7.5–15 mg once daily (max. per dose 30 mg daily), dose usually taken at bedtime, higher doses may be prescribed under medical supervision

**PHARMACOKINETICS**

- Onset of action 8–12 hours.

**UNLICENSED USE**

- Syrup not licensed for use in children under 2 years.

**SIDE-EFFECTS**

- Excessive use can cause hypokalaemia.
- Specialist sources indicate suitable use in pregnancy.

**PREGNANCY**

- Specialist sources indicate suitable use in breast-feeding in infants over 1 month.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Senna for constipation

**NATIONAL FUNDING/ACCESS DECISIONS**

- NHS restrictions: Senokot® tablets are not prescribable in NHS primary care.

**EXCEPTIONS TO LEGAL CATEGORY**

- Senna is on sale to the public for use in children over 12 years; doses on packs may vary from those in BNF Publications.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Senokot** (Forum Health Products Ltd, Reckitt Benckiser Healthcare (UK) Ltd)
  - Sennoside B (as Sennosides) 1.5 mg per 1 ml
  - Syrup Pharmacy sugar free sugar-free 500 ml $4.76 DT + $4.76

**Tablet**

- **Senna** (Non-proprietary)
  - Sennoside B (as Sennosides) 7.5 mg
  - Senokot 7.5mg/5ml Oral solution Pharmacy sugar free sugar-free 20 tablet $1.00 | 60 tablet $1.81 DT + $1.81 | 100 tablet $2.15
  - **Senokot** (Reckitt Benckiser Healthcare (UK) Ltd, Forum Health Products Ltd)
  - Sennoside B (as Sennosides) 15 mg
  - Senokot Max Strength 15mg tablets 24 tablet $3.23 | 48 tablet $5.69

**SIDE-EFFECTS, FURTHER INFORMATION**

- In rare cases, haematuria.
- Pseudomelanosis coli.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Constipation

**Senna with ispaghula husk**

The properties listed below are those particular to the combination only. For the properties of the components please consider, senna above, ispaghula husk p. 55.

**INDICATIONS AND DOSE**

**Constipation**

- **BY MOUTH**
  - Child 12-17 years: 5–10 g once daily, to be taken at night, 5 g equivalent to one level spoonful of granules
  - Adult: 5–10 g once daily, to be taken at night, 5 g equivalent to one level spoonful of granules

**PREGNANCY**

- Manufacturer advises avoid during first trimester. To be used only intermittently and only if dietary and lifestyle changes fail.

**DIRECTIONS FOR ADMINISTRATION**

- Take at night with at least 150 mL liquid.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Granules**

- **CAUTIONARY AND ADVISORY LABELS**
  - 25 EXCipients: May contain Sucrose
  - Manevac (Meda Pharmaceuticals Ltd)

- Senna fruit 124 mg per 1 gram, Ispaghula 542 mg per 1 gram Manevac granules 400 gram $9.50 DT + $9.50
Sodium picosulfate (Sodium picosulphate)

**DRUG ACTION** Sodium picosulfate is a stimulant laxative. After metabolism in the colon it stimulates the mucosa thereby increasing the motility of the large intestine.

**INDICATIONS AND DOSE**
- **Constipation**
  - **BY MOUTH**
    - Child 1 month–3 years: 2.5–10 mg once daily, adjusted according to response
    - Child 4–17 years: 2.5–20 mg once daily, adjusted according to response
    - Adult: 5–10 mg once daily, dose to be taken at bedtime

**SIDE-EFFECTS**
- Common or very common: Diarrhoea, gastrointestinal discomfort
- Uncommon: Dizziness, nausea, vomiting
- Frequency not known: Angioedema, skin reactions, syncope

**CONTRA-INDICATIONS**
- Intestinal obstruction
- Undiagnosed abdominal pain

**UNLICENSED USE**
- Sodium picosulfate doses in BNF
- Publications adhere to national guidelines and may differ from those in product literature.

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**PHARMACOKINETICS**
- Onset of action 6–12 hours.

**PHARMACOKINETICS**
- May act within 30–60 minutes.

Methylnaltrexone bromide (Methylnaltrexone bromide)

**DRUG ACTION**
- Methylnaltrexone bromide is a peripherally acting opioid-receptor antagonist. It therefore blocks the gastrointestinal (constipating) effects of opioids without altering their central analgesic effects.

**INDICATIONS AND DOSE**
- **Opioid-induced constipation in patients with chronic pain (except palliative care patients with advanced illness)**
  - **BY SUBCUTANEOUS INJECTION**
    - Adult: 12 mg once daily if required, to be given as 4–7 doses weekly

**SIDE-EFFECTS**
- Frequency not known
- Uncommon
- Common or very common

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**UNLICENSED USE**
- Sodium picosulfate doses in BNF
- Publications adhere to national guidelines and may differ from those in product literature.

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**PHARMACOKINETICS**
- Onset of action 6–12 hours.

**PHARMACOKINETICS**
- May act within 30–60 minutes.

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**UNLICENSED USE**
- Sodium picosulfate doses in BNF
- Publications adhere to national guidelines and may differ from those in product literature.

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**INTERACTIONS**
- Appendix 1: sodium picosulfate

- There can be variation in the licensing of different medicines containing the same drug.

**PHARMACOKINETICS**
- Onset of action 6–12 hours.

**PHARMACOKINETICS**
- May act within 30–60 minutes.

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**PHARMACOKINETICS**
- Onset of action 6–12 hours.

**PHARMACOKINETICS**
- May act within 30–60 minutes.

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**UNLICENSED USE**
- Sodium picosulfate doses in BNF
- Publications adhere to national guidelines and may differ from those in product literature.

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**PHARMACOKINETICS**
- Onset of action 6–12 hours.

**PHARMACOKINETICS**
- May act within 30–60 minutes.

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**UNLICENSED USE**
- Sodium picosulfate doses in BNF
- Publications adhere to national guidelines and may differ from those in product literature.

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**CONTRA-INDICATIONS**
- Acute surgical abdominal conditions
- Gastro-intestinal obstruction
- Undiagnosed abdominal pain

**INTERACTIONS**
- Appendix 1: sodium picosulfate

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**PHARMACOKINETICS**
- Onset of action 6–12 hours.

**PHARMACOKINETICS**
- May act within 30–60 minutes.
Naloxegol

**DRUG ACTION** Naloxegol is a peripherally acting opioid receptor antagonist. It therefore decreases the constipating effects of opioids without altering their central analgesic effects.

**INDICATIONS AND DOSE**

Opioid-induced constipation when response to laxatives inadequate

- **BY MOUTH**
  - Adult: 25 mg once daily, to be taken in the morning

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises reduce initial dose to 12.5 mg daily with concurrent use of moderate inhibitors of CYP3A4, increasing to 25 mg daily if well tolerated.

**CONTRA-INDICATIONS**

Gastro-intestinal or peritoneum malignancy (risk of gastro-intestinal perforation) - known or suspected gastro-intestinal obstruction - patients at risk of recurrent gastro-intestinal obstruction - recurrent or advanced ovarian cancer (risk of gastro-intestinal perforation) - vascular endothelial growth factor (VEGF) inhibitor treatment (risk of gastro-intestinal perforation)

**CAUTIONS**

- Alzheimer’s disease (advanced) - cardiovascular disease - CNS metastases - congestive heart failure (symptomatic) - Crohn’s disease - diverticulitis (active or recurrent) - multiple sclerosis (active) - peptic ulcer disease (severe) - primary brain malignancies - QT interval over 500 milliseconds - recent history of myocardial infarction (within 6 months)

**CAUTIONS, FURTHER INFORMATION**

- Disruptions to blood-brain barrier
- Manufacturer advises caution in patients with clinically important disruptions to the blood-brain barrier (e.g. advanced Alzheimer’s disease, active multiple sclerosis, primary brain malignancies) — risk of uptake into the CNS.
- Cardiovascular disorders
- Safety and efficacy has not been established in patients with these conditions.

**INTERACTIONS**

- Appendix 1: naloxegol

**SIDE-EFFECTS**

- Common or very common: Abdominal pain - diarrhoea - flatulence - headache - hyperhidrosis - nasopharyngitis - nausea - vomiting
- Uncommon: Withdrawal syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**

- Manufacturer advises that gastrointestinal side-effects typically occur shortly after initiation of treatment — consider reducing the dose.
- PREGNANCY
- Manufacturer advises avoid — limited data available but toxicity at high doses in animal studies; theoretical risk of opioid withdrawal in fetus.
- BREAST FEEDING
- Manufacturer advises avoid — present in milk in animal studies and theoretical risk of opioid withdrawal in breast-fed infants.
- HEPATIC IMPAIRMENT
- Manufacturer advises avoid in severe impairment (no information available).
- RENAL IMPAIRMENT
- Dose adjustments
- Manufacturer advises lower initial dose in moderate to severe impairment — initially 12.5 mg daily, increase to 25 mg if well tolerated.
- **DIRECTIONS FOR ADMINISTRATION**
- Manufacturer advises tablets can be crushed, mixed with 120 mL of water and taken immediately if patients are unable to swallow tablets whole. The mixture may be administered via a nasogastric tube, if required.
- **PATIENT AND CARER ADVICE**
- Manufacturer advises patients report severe, persistent or worsening gastro-intestinal effects (such as abdominal pain) to their prescriber.

### NATIONAL FUNDING/ACCESS DECISIONS

**NICE decisions**

- Naloxegol for treating opioid-induced constipation (July 2015)

Naloxegol (Moventig®) is recommended as a possible treatment for opioid induced constipation in patients whose response to laxatives is inadequate.

**www.nice.org.uk/guidance/ta345**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| CAUTIONARY AND ADVISORY LABELS | 23 |
| Naloxegol (as Naloxegol oxalate) 12.5 mg | Moventig 12.5mg tablets |
| 30 tablet (PO) £55.20 DT + £55.20 |
| Naloxegol (as Naloxegol oxalate) 25 mg | Moventig 25mg tablets |
| 30 tablet (PO) £55.20 DT + £55.20 |

### Diarrhoea (acute)

**Description of condition**

Diarrhoea is the abnormal passing of loose or liquid stools, with increased frequency, increased volume, or both. Acute diarrhoea is that which lasts less than 14 days, but symptoms usually improve within 2–4 days. It can result from infection, as a side-effect of a drug, or as an acute symptom of a chronic gastro-intestinal disorder (such as Inflammatory bowel disease p. 38 or Irritable bowel syndrome p. 47). It may also result from the accumulation of non-absorbed osmotically active solutes in the gastro-intestinal lumen (e.g. in lactase deficiency) or from the gastro-intestinal effects of secretory stimuli (other than the enterotoxins from an infection). It may also occur when intestinal motility or morphology is altered.

Prompt investigation is required to identify or exclude any serious underlying cause if the patient has any red flag symptoms such as unexplained weight loss, rectal bleeding, persistent diarrhoea, a systemic illness, has received recent hospital treatment or antibiotic treatment, or following foreign travel (other than to Western Europe, North America, Australia or New Zealand).

### Aims of treatment

The priority of acute diarrhoea treatment, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion and the management of dehydration when it is present. This is particularly important in infants, frail and elderly patients, when excessive water and electrolyte loss and dehydration can be life-threatening.

### Treatment

Most episodes of acute diarrhoea will settle spontaneously without the need for any medical treatment. Oral rehydration therapy (ORT, such as disodium hydrogen citrate with glucose, potassium chloride and sodium chloride p. 1042; potassium chloride with sodium chloride p. 1040; potassium chloride with rice powder, sodium chloride and sodium citrate p. 1042) is the mainstay of treatment for acute diarrhoea to prevent or correct diarrhoea dehydration and to maintain the appropriate fluid intake once rehydration is achieved—see Fluids and electrolytes p. 1035.

However, in patients with severe dehydration and in those unable to drink, immediate admission to hospital and urgent replacement treatment with an intravenous rehydration fluid is recommended—see Fluids and electrolytes p. 1035.

The antimotility drug loperamide hydrochloride p. 66 is usually considered to be the standard treatment when rapid
control of symptoms is required. It can also be used for mild-to-moderate travellers’ diarrhoea (e.g. where toilet amenities are limited or unavailable) but should be avoided in bloody or suspected inflammatory diarrhoea (febrile patients) and in cases of significant abdominal pain (which also suggests inflammatory diarrhoea).

Loperamide hydrochloride is also the first-line treatment for patients with faecal incontinence [unlicensed indication] after the underlying cause of incontinence has been addressed. 

Racecadotril p. 68 is licensed as an adjunct to rehydration for the symptomatic treatment of uncomplicated acute diarrhoea in adults and children over 3 months.

There is insufficient evidence to recommend adsorbent preparations (such as kaolin p. 68) in acute diarrhoea.

**Antibacterial drugs for acute diarrhoea**

| LSG | Ciprofloxacin p. 558 is occasionally used for prophyaxis against travellers’ diarrhoea, but routine use is not recommended. | See also Gastro-intestinal system infections, antibacterial therapy p. 512. |

**Related drugs**

Other drugs used for diarrhoea: codeine phosphate p. 454, co-phenotrope below, methylcellulose p. 55, rifaximin p. 757.

### Gastro-intestinal obstruction

**Co-phenotrope**

**Control of faecal consistency after colostomy or ileostomy**

| BY MOUTH | |
| Child 4-8 years: 1 tablet 3 times a day | |
| Child 9-11 years: 1 tablet 4 times a day | |
| Child 12-15 years: 2 tablets 3 times a day | |
| Child 16-17 years: Initially 4 tablets, then 2 tablets 4 times a day | |
| Adult: Initially 4 tablets, then 2 tablets 4 times a day | |

**INDICATIONS AND DOSE**

**Acute diarrhoea**

- Adult: 10 ml. every 6 hours, dose to be given in water

**CONTRA-INDICATIONS**

Acute abdominal - delayed gastric emptying - heart failure secondary to chronic lung disease - phaeochromocytoma

**CAUTIONS**

Cardiac arrhythmias - pancreatitis - severe cor pulmonale

**INTERACTIONS**

- Appendix 1: atropine - opioids

**BREAST FEEDING**

Therapeutic doses unlikely to affect infant.

**RENAL IMPAIRMENT**

Avoid use or reduce dose; opioid effects increased and prolonged, and increased cerebral sensitivity occurs.

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Kaolin and Morphine Mixture, BP consists of light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550–800 micrograms/10 ml.

**LESS SUITABLE FOR PRESCRIBING**

Kaolin and Morphine Mixture, BP (Kaolin and Morphine Oral Suspension) is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

- Co-phenotrope (Non-proprietary)

**Atropine**

- Sulfate 25 microgram, Diphenoxylate hydrochloride 2.5 mg Lomotil 2.5mg/25microgram tablets

100 tablet

**Kaolin with morphine**

Diarrhoea  67

### PATIENT AND CARER ADVICE
Medicines for Children leaflet: Loperamide for diarrhoea
[www.medicinesforchildren.org.uk/loperamide-diarrhoea](http://www.medicinesforchildren.org.uk/loperamide-diarrhoea)

### EXCEPTIONS TO LEGAL CATEGORY
Loperamide can be sold to the public, for use in adults and children over 12 years, provided it is licensed and labelled for the treatment of acute diarrhoea.

Loperamide can be sold to the public, provided it is licensed and labelled for the treatment of acute diarrhoea associated with irritable bowel syndrome (after initial diagnosis by a doctor) in adults over 18 years of age.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, tablet, capsule, oral solution sugar-free, chewable tablets, orodispersible tablets, and solution.

### Important Safety Information
**MHRA/CHM Advice:** Reports of Serious Cardiac Adverse Reactions with High Doses of Loperamide Associated with Abuse or Misuse (September 2017)

Serious cardiovascular events (such as QT prolongation, torsades de pointes, and cardiac arrest), including fatalities, have been reported in association with large overdoses of loperamide.

Healthcare professionals are reminded that if symptoms of overdose occur, naloxone can be given as an antidote. The duration of action of loperamide is longer than that of naloxone (1–3 hours), so repeated treatment with naloxone might be indicated; patients should be monitored closely for at least 48 hours to detect possible CNS depression.

Pharmacists should remind patients not to take more than the recommended dose on the label.

### Contraindications
Active ulcerative colitis - antibiotic-associated colitis - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided

### Caution
Not recommended for children under 12 years

### Interactions
[Appendix 1: loperamide](#)

### Side-effects
Common or very common - Gastrointestinal disorders - headache - nausea

Uncommon - Dizziness - drowsiness - dry mouth - gastrointestinal discomfort - skin reactions - vomiting

Rare or very rare - Angioedema - consciousness impaired - coordination abnormal - fatigue - miosis - muscle tone increased - severe cutaneous adverse reactions (SCARs) - urinary retention

### Pregnancy
Manufacturers advise avoid — no information available.

### Breast Feeding
Amount probably too small to be harmful.

### Hepatic Impairment
Manufacturer advises caution — risk of reduced first pass metabolism leading to central nervous system toxicity.

### Prescribing and Dispensing Information
Palliative care - For further information on the use of loperamide in palliative care, see [www.medicinescomplete.com/#content/palliative/loperamide](http://www.medicinescomplete.com/#content/palliative/loperamide).

Antidiarrhoeals > Enkephalinase inhibitors

Racecadotril

**INDICATIONS AND DOSE**
Adjuvant to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea

- **BY MOUTH USING CAPSULES**
  - Adult: Initially 100 mg, then 100 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days, dose to be taken preferably before food
  - **BY MOUTH USING GRANULES**
    - Child 3 months–17 years (body-weight up to 9 kg): 10 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
    - Child 3 months–17 years (body-weight 9–12 kg): 20 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
    - Child 3 months–17 years (body-weight 13–27 kg): 30 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
    - Child 3 months–17 years (body-weight 28 kg and above): 60 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days

**CONTRA-INDICATIONS**
Antibiotic-associated diarrhoea

**SIDE-EFFECTS**
- **Uncommon** Skin reactions • Tonsillitis
- **Frequency not known** Angioedema • Erythema nodosum • Eyelid oedema • Face oedema • Oral disorders

**SIDE-EFFECTS, FURTHER INFORMATION**
Severe skin reactions have been reported—discontinue treatment immediately.

**PREGNANCY**
Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
- In adults: Manufacturer advises caution.
- In children: Manufacturer advises avoid (no information available).

**RENAL IMPAIRMENT**
- In adults: Manufacturer advises caution.
- In children: Manufacturer advises avoid.

**DIRECTIONS FOR ADMINISTRATION**
Granules may be added to food or mixed with water or bottle feeds and then taken immediately.

**PATIENT AND CARER ADVICE**
Patients and carers should be given advice on how to administer racecadotril granules.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium, has advised (July 2014) that racecadotril (Hidrasec®) is not recommended for use within NHS Scotland for the treatment of acute diarrhoea in children because there is insufficient evidence that it improves the recovery rate.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Granules

- **EXCIPIENTS:** May contain Sucrose
  - **Hidrasec:** (Lincoln Medical Ltd)
    - Racecadotril 10 mg: Hidrasec infants 10 mg granules sachets: 20 sachets £8.42
    - Racecadotril 30 mg: Hidrasec Children 30 mg granules sachets: 20 sachets £8.42

4 Disorders of gastric acid and ulceration

4.1 Dyspepsia

**Dyspepsia**

**Overview**
Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration and, gastric cancer, but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by ‘alarm features’ (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained, recent-onset dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation p. 497, and raising the head of the bed. Some medications may cause dyspepsia—these should be stopped, if possible.

Antacids may provide some symptomatic relief, however if symptoms persist in uninvestigated dyspepsia, treatment involves a proton pump inhibitor for up to 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long term. Patients with uninvestigated dyspepsia, who do not respond to an initial trial with a proton pump inhibitor, should be tested for Helicobacter pylori and given eradication therapy if H. pylori is present. Alternatively, particularly in populations where H. pylori infection is more likely, the “test and treat” strategy for H. pylori can be used before a trial with a proton pump inhibitor.

If H. pylori is present in patients with functional (investigated, non-ulcer) dyspepsia, eradication therapy should be provided. If symptoms persist, treatment with either a proton pump inhibitor or a histamine H~2~ receptor antagonist can be given for 4 weeks. These antisecretory drugs can be used intermittently to control symptoms long term. However, most patients with...
functional dyspepsia do not benefit symptomatically from *H. pylori* eradication therapy or antisecretory drugs.

**ANTACIDS**

**Antacids**

**Overview**

Antacids (usually containing aluminium or magnesium compounds) can often relieve symptoms in *ulcer dyspepsia* and in *non-erosive gastro-oesophageal reflux*; they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, although additional doses may be required. Conventional doses of liquid magnesium–aluminium antacids promote ulcer healing, but less well than antisecretory drugs; proof of a relationship between healing and neutralising capacity is lacking. Liquid preparations are more effective than tablet preparations. Liquid preparations contain more than one antacid may be the same as simpler preparations. Complexes such as hydrotalcite confer no special advantage. Liquid preparations containing thickening agents do not appear to be a risk if renal function is normal.

**Aluminium- and magnesium-containing** antacids (e.g. aluminium hydroxide p. 1052, magnesium carbonate p. 71, co-magaldrate p. 70 and magnesium trisilicate p. 71), being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal. The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as hydrotalcite confer no special advantage. Sodium bicarbonate p. 1038 should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders and acidosis.

**Bismuth-containing** antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic, causing encephalopathy; they tend to be constipating.

**Calcium-containing** antacids can induce rebound acid secretion: with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.

**Simeticone**

Simeticone (activated dimeticone) p. 71 is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care.

**Alginates**

Alginates taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel (‘raft’) that floats on the surface of the stomach contents, thereby reducing symptoms of reflux.

The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

**ANTACIDS, ALGINATE**

### Alginic acid

**INDICATIONS AND DOSE**

**GAVISCON INFANT® POWDER SACHETS**

Management of *gastro-oesophageal reflux disease*

- BY MOUTH
  - Child 1–23 months (body-weight up to 4.5 kg): 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day
  - Child 1–23 months (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day

**CONTRA-INDICATIONS**

Intestinal obstruction – preterm neonates - where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature)

**GAVISON INFANT® POWDER SACHETS**

- Concurrent use of preparations containing thickening agents
- **RENAL IMPAIRMENT**
  - In patients with fluid retention, avoid antacids containing large amounts of sodium.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Each half of the dual-sachet is identified as ‘one dose’.
  - To avoid errors prescribe with directions in terms of ‘dose’.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder**

**ELECTROLYTES:** May contain Sodium

**Sodium alginate with potassium bicarbonate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginic acid above.

**INDICATIONS AND DOSE**

Management of mild symptoms of *dyspepsia* and *gastro-oesophageal reflux disease*

- BY MOUTH USING CHEWABLE TABLETS
  - Child 6–11 years (under medical advice only): 1 tablet, to be chewed after meals and at bedtime
  - Child 12–17 years: 1–2 tablets, to be chewed after meals and at bedtime
  - Adult: 1–2 tablets, to be chewed after meals and at bedtime

- BY MOUTH USING ORAL SUSPENSION
  - Child 2–11 years (under medical advice only): 2.5–5 mL, to be taken after meals and at bedtime
  - Child 12–17 years: 5–10 mL, to be taken after meals and at bedtime
  - Adult: 5–10 mL, to be taken after meals and at bedtime

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral liquid formulations may include aniseed or peppermint.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

**ELECTROLYTES:** May contain Potassium, sodium

Disorders of gastric acid and ulceration

Co-magaldrox

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 1052, magnesium hydroxide p. 59.

- **INDICATIONS AND DOSE**
  - **MAALOX®**
    - **Dyspepsia**
      - **BY MOUTH**
        - Child 14–17 years: 10–20 mL, to be taken 20–60 minutes after meals, and at bedtime or when required
        - Adult: 10–20 mL, to be taken 20–60 minutes after meals, and at bedtime or when required
      - **MUCOGEL®**
        - **Dyspepsia**
          - **BY MOUTH**
            - Child 12–17 years: 10–20 mL 3 times a day, to be taken 20–60 minutes after meals, and at bedtime, or when required
            - Adult: 10–20 mL 3 times a day, to be taken 20–60 minutes after meals, and at bedtime, or when required

- **INTERACTIONS** → Appendix 1: antacids • magnesium
- **PRESCRIBING AND DISPENSING INFORMATION**

Co-magaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively.

- **MAALOX®** Maalox® suspension is low in sodium.
- **MUCOGEL®** Mucogel® suspension is low in sodium.

- **MAGNESIUM hydroxide**
  - **INDICATIONS AND DOSE**
    - **Dyspepsia**
      - **BY MOUTH**
        - Child 8–11 years: 5 mL 4 times a day as required, to be taken between meals and at bedtime
        - Child 12–17 years: 10 mL 4 times a day as required, to be taken between meals and at bedtime
        - Adult: 10 mL 4 times a day as required, to be taken between meals and at bedtime

- **CONTRA-INDICATIONS**
  - Hypophosphataemia • infants • neonates
  - **CONTRA-INDICATIONS, FURTHER INFORMATION**
    - Aluminium-containing antacids Aluminium-containing antacids should not be used in neonates and infants because accumulation may lead to increased plasma-aluminium concentrations.
    - **RENAL IMPAIRMENT**
      - **Dose adjustments** Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.
      - In adults There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).
      - In children Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.
    - **PRESCRIBING AND DISPENSING INFORMATION**
      - Altacite Plus® is low in Na+.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Oral suspension
  - **Maalox®**
    - Aluminium hydroxide 35 mg per 1 mL
    - Magnesium hydroxide 40 mg per 1 mL
    - Maalox 175mg/200mg/5ml oral suspension sugar-free | 250 mL GSK £2.33 DT + £2.33
  - **Mucogel®**
    - Mucogel oral suspension sugar-free | 500 mL GSK £2.99 DT + £2.99

**Simeticone with aluminium hydroxide and magnesium hydroxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, simeticone p. 71, aluminium hydroxide p. 1052.

- **INDICATIONS AND DOSE**
  - **Dyspepsia**
    - **BY MOUTH**
      - Child 12-17 years: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required
      - Adult: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required

- **INTERACTIONS** → Appendix 1: antacids

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Oral suspension
  - **Maalox Plus®**
    - Simeticone 5 mg per 1 mL
    - Magnesium hydroxide 39 mg per 1 mL
    - Aluminium hydroxide gel dried 44 mg per 1 mL
    - Maalox Plus oral suspension sugar-free | 250 mL GSK £2.91
Magnesium carbonate

- **INDICATIONS AND DOSE**
  - **Dyspepsia**
    - **By mouth using oral suspension**
    - Adults: 10 mL 3 times a day, dose to be taken in water
  - **Contra-indications**
    - Hypophosphataemia
  - **Interactions**
    - **Antacids**
    - **Magnesium with aluminium hydroxide**
      - Avoid or used at a reduced dose
      - Evidence of benefit in infantile colic uncertain
  - **Side-effects**
    - Diarrhoea
  - **Hepatic impairment**
    - In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.
  - **Renal impairment**
    - Magnesium carbonate mixture has a high sodium content; avoid in patients with fluid retention.
    - **Dose adjustments**
      - Avoid or use at a reduced dose
      - Increased risk of toxicity.
  - **Prescribing and dispensing information**
    - When prepared extemporaneously, the BP states Magnesium Carbonate Mixture, BP consists of light magnesium carbonate 3%, sodium bicarbonate 5%, in a suitable vehicle containing aromatic cardamom tincture.
  - **Medicinal forms**
    - No licensed medicines listed.

Magnesium trisilicate

- **INDICATIONS AND DOSE**
  - **Dyspepsia**
    - **By mouth using chewable tablets**
    - Adults: 1–2 tablets as required
  - **Contra-indications**
    - Hypophosphataemia
  - **Interactions**
    - **Antacids**
    - **Magnesium with aluminium hydroxide**
      - Avoid or used at a reduced dose
      - Evidence of benefit in infantile colic uncertain
  - **Side-effects**
    - Diarrhoea
  - **Hepatic impairment**
    - Avoid in hepatic coma; risk of renal failure.
    - **Dose adjustments**
      - Avoid or use at a reduced dose
      - Increased risk of toxicity.
  - **Prescribing and dispensing information**
    - When prepared extemporaneously, the BP states Magnesium Trisilicate, BP consists of 5% each of magnesium trisilicate, light magnesium carbonate, and sodium bicarbonate in a suitable vehicle with a peppermint flavour.
  - **Medicinal forms**
    - No licensed medicines listed.

Magnesium trisilicate with magnesium carbonate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, magnesium trisilicate above, magnesium carbonate above, sodium bicarbonate p. 1038.

- **INDICATIONS AND DOSE**
  - **Dyspepsia**
    - **By mouth**
      - Child 5–11 years: 5–10 mL 3 times a day, alternatively as required, dose to be made up with water
      - Child 12–17 years: 10–20 mL 3 times a day, alternatively as required, dose to be made up with water
      - Adults: 10–20 mL 3 times a day, alternatively as required, dose to be made up with water
  - **Contra-indications**
    - Hypophosphataemia • Severe renal failure
  - **Caution**
    - Heart failure • Hypermagnesaemia • Hypertension • Metabolic alkalosis • Respiratory alkalosis
  - **Interactions**
    - Antacids • Magnesium with aluminium hydroxide and magnesium carbonate mixtures have high sodium content; avoid in patients with fluid retention.
  - **Prescribing and dispensing information**
    - When prepared extemporaneously, the BP states Magnesium Trisilicate Mixture, BP consists of 5% each of magnesium trisilicate, light magnesium carbonate, and sodium bicarbonate in a suitable vehicle with a peppermint flavour.
  - **Medicinal forms**
    - No licensed medicines listed.

Simeticone

(Activated dimeticone)

- **Drug action**
  - Simeticone (activated dimeticone) is an antifoaming agent.

- **Indications and dose**
  - **Dentinox®**
    - Colic/Wind pains
      - **By mouth**
        - Child 1 month–1 year: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day
  - **Infacol®**
    - Colic/Wind pains
      - **By mouth**
        - Child 1 month–1 year: 0.5–1 mL, to be taken before feeds
  - **Prescribing and dispensing information**
    - **Dentinox®**
      - The brand name Dentinox® is also used for other preparations including teething gel.
  - **Patient and carer advice**
    - Infacol® Patients or carers should be given advice on use of the Infacol® dropper.
  - **Less suitable for prescribing**
    - Infacol® Infacol® is less suitable for prescribing (evidence of benefit in infantile colic uncertain).
  - **Dentinox®**
    - Denthin® colic drops are less suitable for prescribing (evidence of benefit in infantile colic uncertain).
  - **Medicinal forms**
    - There can be variation in the licensing of different medicines containing the same drug.

- **Oral suspension**
  - Infacol (Teva UK Ltd)
    - Simeticone 40 mg per 1 ml
      - Infacol 40 mg/ml oral suspension sugar-free | 50 ml [GSL] £2.71 DT + £2.71 sugar-free | 55 ml [GSL] £3.20 sugar-free | 85 ml [GSL] £4.66
  - Oral drops
    - Dentinox Infant (Dendron Ltd)
      - Simeticone 8.4 mg per 1 ml
      - Denthin infant colic drops | 100 mL [GSL] £1.80 DT + £1.80
  - Combinations available: Co-simalite, p. 70 • Simeticone with aluminium hydroxide and magnesium hydroxide, p. 70
4.2 Gastric and duodenal ulceration

Peptic ulceration

Overview

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, Smoking cessation p. 497 and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by Helicobacter pylori.

Helicobacter pylori infection

Eradication of Helicobacter pylori reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. It also causes regression of most localized gastric mucosa associated lymphoid-tissue (MALT) lymphomas. The presence of H. pylori should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of H. pylori; reinfection is rare. Antibiotic associated colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin p. 538, and either amoxicillin p. 548 or metronidazole p. 542 can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with a macrolide for other infections, a regimen containing a proton pump inhibitor, amoxicillin and metronidazole is preferred for initial therapy. These regimens eradicate H. pylori in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H₂-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during treatment.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of H. pylori eradication and are not recommended. Tinidazole p. 544 is also used occasionally for H. pylori eradication as an alternative to metronidazole; tinidazole should be combined with antisecretory drugs and other antibacterials.

Routine retesting, to confirm eradication, is not necessary unless the patient has gastric MALT lymphoma or complicated H. pylori associated peptic ulcer.

A two-week regimen comprising a proton pump inhibitor plus tetracycline p. 567, plus metronidazole can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

See under NSAID-associated ulcers for the role of H. pylori eradication therapy in patients starting or taking a NSAID. Also see Dyspepsia p. 68 for H. pylori eradication in patients with dyspepsia.

Test for Helicobacter pylori

¹³C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with Helicobacter pylori. The test involves collection of breath samples before and after ingestion of an oral solution of ¹³C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific ¹³C-Urea breath test kit for children is available (Helicobacter Test INFAI for children of the age 3–11®). However, the appropriateness of testing for H. pylori infection in children has not been established.

NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use. The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs. Whenever possible, the NSAID should be withdrawn if an ulcer occurs.

Patients at high risk of developing gastro-intestinal complications with a NSAID include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastro-intestinal side-effects, or those with serious co-morbidity (e.g. cardiovascular disease, diabetes, renal or hepatic impairment). In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a H₂-receptor antagonist such as ranitidine p. 75 given at twice the usual dose or misoprostol p. 77 are alternatives. Colic and diarrhoea may limit the dose of misoprostol. Its use is most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn. A combination of a cyclo-oxygenase-2 selective inhibitor with a proton pump inhibitor may be more appropriate for those with a history of upper gastro-intestinal bleeding or 3 or more risk factors for gastro-intestinal ulceration, but see NSAIDs and Cardiovascular Events.

NSAID use and H. pylori infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of H. pylori is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are H. pylori positive, and who are about to start long-term treatment with a non-selective NSAID, eradication of H. pylori may reduce the overall risk of ulceration.

In a patient who has developed an ulcer, if the NSAID can be discontinued, a proton pump inhibitor usually produces the most rapid healing; alternatively, the ulcer can be treated with a H₂-receptor antagonist or misoprostol. On healing, patients should be tested for H. pylori and given eradication therapy if H. pylori is present (see also Test for Helicobacter pylori).

If treatment with a non-selective NSAID needs to continue, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur);
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular Events; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

If treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in
patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

**GASTROPROTECTIVE COMPLEXES AND CHELATORS**

### Chelates and complexes

#### Overview
Sucralfate below may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulfated sucrose but has minimal antacid properties.

---

#### Sucralfate

### INDICATIONS AND DOSE

**Benign gastric ulceration | Benign duodenal ulceration**

- **BY MOUTH**
  - Child 15-17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day
  - Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

**Chronic gastritis**

- **Adults:** 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

**Prophylaxis of stress ulceration in child under intensive care**

- **BY MOUTH**
  - Child 15-17 years: 1 g 6 times a day; maximum 8 g per day

**Prophylaxis of stress ulceration**

- **BY MOUTH**
  - Adult: 1 g 6 times a day; maximum 8 g per day

### UNLICENSED USE

- In children: Tablets not licensed for prophylaxis of stress ulceration.

### CAUTIONS

- Patients under intensive care (Important: reports of bezoar formation)

---

### Recommended regimens for Helicobacter pylori eradication in adults

### CAUTIONS, FURTHER INFORMATION

- Bezoar formation: Following reports of bezoar formation associated with sucralfate, caution is advised in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying.

### INTERACTIONS

- Appendix 1: sucralfate

### SIDE-EFFECTS

- Common or very common: Constipation
- Uncommon: Dry mouth, nausea
- Rare or very rare: Bezoar, rash

### FREQUENCY NOT KNOWN

- Back pain, bone disorders, diarrhoea, dizziness, drowsiness, encephalopathy, flatulence, headache, vertigo

### PREGNANCY

- No evidence of harm; absorption from gastrointestinal tract negligible.

### BREAST FEEDING

- Amount probably too small to be harmful.

### RENAL IMPAIRMENT

- Use with caution; aluminium is absorbed and may accumulate.

### DIRECTIONS FOR ADMINISTRATION

- Oral suspension blocks fine-bore feeding tubes. Crushed tablets may be dispersed in water.

### PRESCRIBING AND DISPENSING INFORMATION

- Flavours of oral liquid formulations may include aniseed and caramel.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

### Tablet

### H2-RECEPTOR ANTAGONISTS

#### H2-receptor antagonists

##### Overview

Histamine H2-receptor antagonists heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H2-receptor blockade; they are also used to relieve symptoms of gastro-oesophageal reflux disease. H2-receptor antagonists should not normally be used for Zollinger-Ellison syndrome because proton pump inhibitors are more effective.
Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in Helicobacter pylori positive patients by eradication regimens.

In adults, H₂-receptor antagonists are used for the treatment of functional dyspepsia and may be used for the treatment of uninvestigated dyspepsia without alarm features. H₂-receptor antagonist therapy can promote healing of NSAID-associated ulcers (particularly duodenal).

Treatment with a H₂-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from gastroduodenal erosions in hepatic coma, and possibly in other conditions requiring intensive care. H₂-receptor antagonists also reduce the risk of acid aspiration in obstetric patients at delivery (Mendelson's syndrome).

### H₂-receptor antagonists

#### CAUTIONS

- Signs and symptoms of gastric cancer (in adults)

#### CAUTIONS, FURTHER INFORMATION

- Gastric cancer
- In adults H₂-receptor antagonists might mask symptoms of gastric cancer; particular care is required in patients presenting with ‘alarm features’ in such cases gastric malignancy should be ruled out before treatment.

#### SIDE-EFFECTS

- Common or very common Constipation; diarrhoea; dizziness; fatigue; headache; myalgia; skin reactions
- Uncommon Confusion; depression; erectile dysfunction; gynaecomastia; hallucination; hepatic disorders; leucopenia; nausea; tachycardia
- Rare or very rare Agranulocytosis; alopecia; arthralgia; atrioventricular block; fever; galactorrhoea; pancytopenia; thrombocytopenia; vasculitis

### Cimetidine

#### INDICATIONS AND DOSE

- **Benign duodenal ulceration**
  - **BY MOUTH**
  - Adult: 400 mg twice daily for at least 4 weeks, to be taken with breakfast and at night, alternatively 800 mg once daily for at least 4 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

- **Benign gastric ulceration**
  - **BY MOUTH**
  - Adult: 400 mg twice daily for 6 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 6 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

- **NSAID-associated ulceration**
  - **BY MOUTH**
  - Adult: 400 mg twice daily for 8 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 8 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

- **Reflux oesophagitis**
  - **BY MOUTH**
  - Adult: 400 mg 4 times a day for 4–8 weeks

### Prophylaxis of stress ulceration

- **BY MOUTH**
  - Adult: 200–400 mg every 4–6 hours

### Gastric acid reduction in obstetrics

- **BY MOUTH**
  - Adult: Initially 400 mg, to be administered at start of labour, then increased if necessary up to 400 mg every 4 hours, do not use syrup in prophylaxis of acid aspiration; maximum 2.4 g per day

### Gastric acid reduction during surgical procedures

- **BY MOUTH**
  - Adult: 400 mg, to be given 90–120 minutes before induction of general anaesthesia

### Short-bowel syndrome

- **BY MOUTH**
  - Adult: 400 mg twice daily, adjusted according to response, to be taken with breakfast and at bedtime

### To reduce degradation of pancreatic enzyme supplements

- **BY MOUTH**
  - Adult: 0.8–1.6 g daily in 4 divided doses, dose to be taken 1–1.5 hours before meals

#### INTERACTIONS

- → Appendix 1: H₂ receptor antagonists

#### SIDE-EFFECTS

- Rare or very rare Anaphylactic reaction; aplastic anaemia; nephritis tubulointerstitial; pancreatitis; sinus bradycardia

#### PREGNANCY

- Manufacturer advises avoid unless essential.

#### BREAST FEEDING

- Significant amount present in milk—not known to be harmful but manufacturer advises avoid.

#### HEPATIC IMPAIRMENT

- Increased risk of confusion.

#### Dose adjustments

- Reduce dose

#### RENAL IMPAIRMENT

- Occasional risk of confusion.

#### Dose adjustments

- Reduce dose to 200 mg 4 times daily if eGFR 30–50 mL/minute/1.73 m².
- Reduce dose to 200 mg 3 times daily if eGFR 15–30 mL/minute/1.73 m².
- Reduce dose to 200 mg twice daily if eGFR less than 15 mL/minute/1.73 m².

#### EXCEPTIONS TO LEGAL CATEGORY

- Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg).

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Oral solution

- EXCIPIENTS: May contain Propylene glycol
- **Cimetidine (Non-proprietary)**
- Cimetidine 40 mg per 1 ml Cimetidine 200mg/5ml oral solution sugar free sugar-free | 300 ml | £14.24–£14.25 DT = £14.25
- Tagamet (Essential Pharma Ltd) Cimetidine 40 mg per 1 ml Tagamet 200mg/5ml syrup | 600 ml | £28.49 DT = £28.49

#### Tablet

- **Cimetidine (Non-proprietary)**
- Cimetidine 200 mg Cimetidine 200mg tablets | 60 tablet | £45.59 DT = £18.15
- Cimetidine 400 mg Cimetidine 400mg tablets | 60 tablet | £120.00
- Cimetidine 800 mg Cimetidine 800mg tablets | 30 tablet | £15.91
- Tagamet (Chenidex Pharma Ltd) Cimetidine 400 mg Tagamet 400mg tablets | 60 tablet | £15.48 DT = £15.48
- Cimetidine 800 mg Tagamet 800mg tablets | 30 tablet | £22.62 DT = £15.91
- Cimetidine 800 mg Tagamet 800mg tablets | 30 tablet | £22.62 DT = £15.48
**Famotidine**

### INDICATIONS AND DOSE

**Gastric and duodenal ulceration**
- **Treatment of benign gastric and duodenal ulceration**
  - **BY MOUTH**
  - Adult: 40 mg once daily for 4–8 weeks, dose to be taken at night

**Maintenance treatment of duodenal ulceration**
- **BY MOUTH**
- Adult: 20 mg once daily, dose to be taken at night

**Reflux oesophagitis**
- **BY MOUTH**
- Adult: 20–40 mg twice daily for 6–12 weeks; maintenance 20 mg twice daily

### INTERACTIONS
- Appendix 1: H2 receptor antagonists

### SIDE-EFFECTS
- Uncommon: Appetite decreased, dry mouth, taste altered, vomiting
- Rare or very rare: Anxiety, chest tightness, drowsiness, insomnia, interstitial pneumonia, libido decreased, muscle cramps, neutropenia, paraesthesia, psychiatric disorder, seizures, severe cutaneous adverse reactions (SCARs)

### PREGNANCY
- Manufacturer advises avoid unless potential benefit outweighs risk.

### BREAST FEEDING
- Present in milk—not known to be harmful but manufacturer advises avoid.

### RENAL IMPAIRMENT
- Seizures reported very rarely.
- **Dose adjustments** Use normal dose every 36–48 hours or use half normal dose if eGFR less than 50 mL/minute/1.73 m².

### EXCEPTIONS TO LEGAL CATEGORY
- Ranitidine can be sold to the public for the prevention and treatment of symptoms of food-related heartburn and meal-induced indigestion in adults and children over 16 years; max. single dose 75 mg, max. daily dose 150 mg for max. 14 days.

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Capsule
- **Nizatidine (Non-proprietary)**
  - Nizatidine 150 mg: Nizatidine 150 mg capsules | 30 capsule
    - £12.20 DT = £3.90
  - Nizatidine 300 mg: Nizatidine 300 mg capsules | 30 capsule
    - £15.43 DT = £5.14

---

**Ranitidine**

### INDICATIONS AND DOSE

**Benign gastric ulceration | Duodenal ulceration**
- **BY MOUTH**
- Child 1-5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- Child 6 months–2 years: 2–4 mg/kg twice daily
- Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg)
- Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night
- Adult: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night

**Chronic episodic dyspepsia**
- **BY MOUTH**
- Adult: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night

**NSAID-associated gastric ulceration**
- **BY MOUTH**
- Adult: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night

**NSAID-associated duodenal ulcer**
- **BY MOUTH**
- Adult: 300 mg twice daily for 4 weeks, to achieve a higher healing rate

**Prophylaxis of NSAID-associated gastric ulcer | Prophylaxis of NSAID-associated duodenal ulcer**
- **BY MOUTH**
- Adult: 300 mg twice daily

**Gastro-oesophageal reflux disease**
- **BY MOUTH**
- Adult: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night

**Moderate to severe gastro-oesophageal reflux disease**
- **BY MOUTH**
- Adult: 600 mg daily in 2–4 divided doses for up to 12 weeks

**Long-term treatment of healed gastro-oesophageal reflux disease**
- **BY MOUTH**
- Adult: 150 mg twice daily
Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics

- **BY MOUTH**
- Adult: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours

Gastric acid reduction (prophylaxis of acid aspiration) in surgical procedures

- **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
- Adult: 50 mg, to be given 45–60 minutes before induction of anaesthesia, intravenous injection diluted to 20 mL and given over at least 2 minutes, alternatively (by mouth) 150 mg, to be given 2 hours before induction of anaesthesia and also when possible on the preceding evening

**Prophylaxis of stress ulceration**

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
- Adult: 50 mg every 8 hours, dose to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

**Reflux oesophagitis and other conditions where gastric acid reduction is beneficial**

- **BY MOUTH**
  - Child 1–5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
  - Child 6 months–2 years: 2–4 mg/kg twice daily
  - Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg); increased to up to 5 mg/kg twice daily (max. per dose 300 mg), dose increase for severe gastro-oesophageal disease
  - Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night, then increased if necessary to 300 mg twice daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease, alternatively increased if necessary to 150 mg 4 times a day for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease

**Conditions where reduction of gastric acidity is beneficial and oral route not available**

- **BY INTRAMUSCULAR INJECTION**
- Adult: 50 mg every 6–8 hours
- By slow intravenous injection
- Adult: 50 mg, dose to be diluted to 20 mL and given over at least 2 minutes; may be repeated every 6–8 hours

**UNLICENSED USE**

- In children Oral preparations not licensed for use in children under 3 years.
- In adults Doses given for prophylaxis of NSAID-associated gastric or duodenal ulcer, and prophylaxis of stress ulceration, are not licensed.

**INTERACTIONS**

- Appendix 1: H2 receptor antagonists

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Rare or very rare Bone marrow depression, bradycardia, breath conditions, dyskinesia, nephritis acute interstitial, pancreatitis acute, vision blurred
- Frequency not known Dyspepsia

**SPECIFIC SIDE-EFFECTS**

- Rare or very rare
  - With parenteral use Anaphylactic shock, cardiac arrest
- **PREGNANCY** Manufacturer advises avoid unless essential, but not known to be harmful.
- **BREAST FEEDING** Significant amount present in milk, but not known to be harmful.
- **RENAL IMPAIRMENT**
  - Dose adjustments
  - In adults Use half normal dose if eGFR less than 50 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

- For intravenous infusion (Zantac®), give intermittently in Glucose 5% or Sodium Chloride 0.9%.

**PATIENT AND CARER ADVICE**

- In fat malabsorption syndrome, give oral doses 1–2 hours before food to enhance effects of pancreatic enzyme replacement.
- Medicines for Children leaflet: Ranitidine for acid reflux
- www.medicinesforchildren.org.uk/ranitidine-acid-reflux

**EXCEPTIONS TO LEGAL CATEGORY**

- Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).

**MEDIcular FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, infusion

www.getintopharma.com
Misoprostol

**DRUG ACTION** Misoprostol is a synthetic prostaglandin analogue that has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers.

**INDICATIONS AND DOSE**

**CYTOTEC ®**

Benign gastric ulcer | Benign duodenal ulcer | NSAID-induced peptic ulcer

- **BY MOUTH**
  - Adult: 200 micrograms 2–4 times a day
  - Adult: 400 micrograms twice daily, alternatively 200 micrograms 4 times a day continued for at least 4 weeks or may be continued for up to 8 weeks if required, dose to be taken with breakfast (or main meals) and at bedtime

**Prophylaxis of NSAID-induced peptic ulcer**

- **BY MOUTH**
  - Adult: 200 micrograms 2–4 times a day

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common: Nausea, rash, vomiting
- Uncommon: Uterine rupture

**SPECIFIC SIDE-EFFECTS**

- Common or very common: Constipation, diarrhoea, dizziness, flatulence, gastrointestinal discomfort, headache
- Uncommon: Fever, haemorrhage, menstrual cycle irregularities, postmenopausal haemorrhage, uterine cramps
- Frequency not known: Chills

**SIDE-EFFECTS, FURTHER INFORMATION** Diarrhoea may occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids.

**CONCEPTION AND CONCEPTION**

Manufacturer advises do not use in women of childbearing potential unless pregnancy has been excluded; patients must use effective contraception during treatment, and be informed of the risks of taking misoprostol if pregnant.

**PREGNANCY**

Manufacturer advises avoid—induces uterine contractions, and associated with abortion and birth defects; teratogenic in first trimester.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk, and may cause diarrhoea in nursing infants. Tertiary sources state present in milk but amount probably too small to be harmful; to further reduce risk following termination of pregnancy, consider interrupting breastfeeding for 5 hours after a dose.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks. Manufacturer advises patients should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**

**MEIYODELLE ® VAGINAL DELIVERY SYSTEM**

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3627

The All Wales Medicines Strategy Group has advised (March 2018) that misoprostol (Myoselle ®) is recommended as an option for use within NHS Wales for the induction of labour in women with an unfavourable cervix, from 36 weeks gestation, in whom induction is clinically indicated.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

  - Misoprostol 200 microgram Cytosex 200microgram tablets | 60 tablet pack £10.03 BT + £1.03

## PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

GASTROPROTECTIVE

**PROSTAGLANDINS, PROSTAGLANDIN ANALOGUES AND CYTOTEC ®**

Promoting healing of gastric and duodenal ulcers.

Misoprostol is a synthetic prostaglandin analogue that has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers. It is a prostaglandin-E1 analogue that has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers.

21-Feb-2018

**Overview**

Proton pump inhibitors are effective short-term treatments for gastric and duodenal ulcers; they are also used in combination with antibiotics for the eradication of Helicobacter pylori (see specific regimens). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery. Proton pump inhibitors can be used for the treatment of dyspepsia and gastro-oesophageal reflux disease.

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers. In patients who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur. A proton pump inhibitor can be used to reduce the degradation of pancreatic enzyme supplements in patients with cystic fibrosis. They can also be used to control excessive secretion of gastric acid in Zollinger–Ellison syndrome; high doses are often required.

**DRUG ACTION** Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen–potassium adenosine triphosphatase enzyme system (the ‘proton pump’) of the gastric parietal cell.

**IMPORTANT SAFETY INFORMATION**

**MHRA ADVICE: PROTON PUMP INHIBITORS (PPIs): VERY LOW RISK OF SUBACUTE CUTANEOUS LUPUS ERYTHEMATOSUS (SEPTEMBER 2015)**

Very infrequent cases of subacute cutaneous lupus erythematosus (S克莱) have been reported in patients taking PPIs. Drug-induced S克莱 can occur weeks, months or even years after exposure to the drug.

If a patient treated with a PPI develops lesions—especially in sun-exposed areas of the skin—and it is accompanied by arthralgia:

- Advise them to avoid exposing the skin to sunlight;
- Consider S克莱 as a possible diagnosis;
- Consider discontinuing PPI treatment unless it is imperative for a serious acid-related condition; a patient who develops S克莱 with a particular PPI may be at risk of the same reaction with another;
- In most cases, symptoms resolve on PPI withdrawal; topical or systemic steroids might be necessary for treatment of S克莱 only if there are no signs of remission after a few weeks or months.

**CAUTIONS**

Can increase the risk of fractures (particularly when used at high doses for over a year in the elderly) — may increase the risk of gastro-intestinal infections (including Clostridium difficile infection) — may mask the symptoms of gastric cancer (in adults) — patients at risk of osteoporosis.
**CAUTIONS, FURTHER INFORMATION**
- Risk of osteoporosis Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy.
- Gastric cancer
- In adults Particular care is required in those presenting with ‘alarm features’, in such cases gastric malignancy should be ruled out before treatment.

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - constipation - diarrhoea - dizziness - dry mouth - gastrointestinal disorders - headache - insomnia - nausea - skin reactions - vomiting
- **Uncommon** Arthralgia - bone fractures - confusion - depression - drowsiness - leucopenia - malaise - myalgia - paraesthesia - peripheral oedema - thrombocytopenia - vertigo - vision disorders
- **Rare or very rare** Agranulocytosis - alopecia - gynaecomastia - hallucination - hepatic disorders - hyperhidrosis - hyponatraemia - nephritis - tubulointerstitial - pancytopenia - photosensitivity reaction - severe cutaneous adverse reactions (SCARs) - stomatitis - taste altered
- **Frequency not known** Hypomagnesaemia (more common after 1 year of treatment, but sometimes after 3 months of treatment) - subacute cutaneous lupus erythematosus

**MONITORING REQUIREMENTS** Measurement of serum-magnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin.

**PRESCRIBING AND DISPENSING INFORMATION** A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

---

### Esomeprazole

- **INDICATIONS AND DOSE**
  - **NSAID-associated gastric ulcer**
    - **BY MOUTH**
      - Adult: 20 mg once daily for 4–8 weeks
      - Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes
  - **Prophylaxis of NSAID-associated gastric ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment**
    - **BY MOUTH**
      - Adult: 20 mg daily
  - **Prophylaxis of NSAID-associated gastric or duodenal ulcer**
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes
  - **Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis)**
    - **BY MOUTH**
      - Child 1–11 years (body-weight 10–19 kg): 10 mg once daily for 8 weeks
      - Child 1–11 years (body-weight 20 kg and above): 10–20 mg once daily for 8 weeks
      - Child 12–17 years: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily
      - Adult: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily

- **INTERACTIONS** → Appendix 1: proton pump inhibitors
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Uncommon** Encephalopathy
    - **Rare or very rare** Aggression - agitation - bronchospasm - increased risk of infection - muscle weakness
  - **SPECIFIC SIDE-EFFECTS**
    - **Rare or very rare**
      - With parenteral use Renal failure
      - With parenteral use Electrolyte imbalance - vitamin B12 deficiency
  - **PREGNANCY** Manufacturer advises caution—no information available.
  - **BREAST FEEDING** Manufacturer advises avoid—no information available.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
  - **Dose adjustments** With oral use in adults Manufacturer advises max. 20 mg daily in severe impairment.
    - With intravenous use in adults Manufacturer advises for gastro-oesophageal reflux disease, max. 20 mg daily in severe impairment. Manufacturer advises for bleeding ulcers, by intravenous infusion, initially 80 mg, then 4 mg/hour for 72 hours in severe impairment.
    - In children Manufacturer advises in children 1–11 years, max. 10 mg daily in severe impairment. Manufacturer advises in children 12–17 years, max. 20 mg daily in severe impairment.
  - **RENAAL IMPAIRMENT** Manufacturer advises caution in severe renal insufficiency.
  - **DIRECTIONS FOR ADMINISTRATION**
    - With intravenous use in adults For intravenous infusion (Nexium®), give continuously or intermittently in Sodium Chloride 0.9%; reconstitute 40–80 mg with up to 100 ml infusion fluid; for intermittent infusion, give requisite amounts.
dose over 10–30 minutes; stable for 12 hours in Sodium Chloride 0.9%.

- With oral use: Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes. Do not chew or chew tablets; swallow whole or disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose. For administration through a gastric tube, consult product literature.

- **PATIENT AND CARER ADVICE**

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

## Gastro-resistant capsule

- **Esomeprazole (Non-proprietary)**
  - Esomeprazole as Esomeprazole magnesium dihydrate 20 mg Esomeprazole 20mg gastro-resistant capsules 28 capsule [POM] £12.95 DT + £1.86
  - Esomeprazole as Esomeprazole magnesium dihydrate 20 mg Esomeprazole 40mg gastro-resistant capsules 28 capsule [POM] £11.36 DT + £2.27

- **Emozul (Consilient Health Ltd)**
  - Esomeprazole as Esomeprazole magnesium dihydrate 20 mg Emozul 20mg gastro-resistant capsules 28 capsule [POM] £2.18 DT + £1.86

- **Ventra (Ethypharm UK Ltd)**
  - Esomeprazole as Esomeprazole magnesium dihydrate 20 mg Ventra 20mg gastro-resistant capsules 28 capsule [POM] £2.78 DT + £2.27

## Gastro-resistant tablet

- **Esomeprazole (Non-proprietary)**
  - Esomeprazole as Esomeprazole magnesium trihydrate 20 mg Esomeprazole 20mg gastro-resistant tablets 28 tablet [POM] £18.50 DT + £2.15
  - Esomeprazole as Esomeprazole magnesium trihydrate 40 mg Esomeprazole 40mg gastro-resistant tablets 28 tablet [POM] £3.76 DT + £2.83

- **Nexium (AstraZeneca UK Ltd, Pfizer Consumer Healthcare Ltd)**
  - Esomeprazole as Esomeprazole magnesium trihydrate 20 mg Nexium 20mg gastro-resistant tablets 28 tablet [POM] £16.50 DT + £2.15
  - Esomeprazole as Esomeprazole magnesium trihydrate 40 mg Nexium 40mg gastro-resistant tablets 28 tablet [POM] £2.97 DT + £2.27

## Powder for solution for injection

- **Esomeprazole (Non-proprietary)**
  - Esomeprazole as Esomeprazole sodium 40 mg Esomeprazole 40mg powder for solution for injection vials 1 vial [POM] £3.07–3.13 (Hospital only)
  - **Nexium (AstraZeneca UK Ltd)**
    - Esomeprazole as Esomeprazole sodium 40 mg Nexium L.V. 40mg powder for solution for injection vials 1 vial [POM] £4.25 (Hospital only)

## Gastro-resistant granules

- **CAUTIONARY AND ADVISORY LABELS 25**

- **Nexium (AstraZeneca UK Ltd)**
  - Esomeprazole as Esomeprazole magnesium trihydrate 10 mg Nexium 10mg gastro-resistant granules sachets 28 sachet [POM] £25.19 DT + £25.19

---

**Lansoprazole**

### INDICATIONS AND DOSE

**Helicobacter pylori** eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

- **BY MOUTH**
  - Adult: 30 mg twice daily

**Benign gastric ulcer**

- **BY MOUTH**
  - Adult: 30 mg once daily for 8 weeks, dose to be taken in the morning

**Duodenal ulcer**

- **BY MOUTH**
  - Adult: 30 mg once daily for 4 weeks, dose to be taken in the morning; maintenance 15 mg once daily

**NSAID-associated duodenal ulcer**

- **BY MOUTH**
  - Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed

**Prophylaxis of NSAID-associated duodenal ulcer**

- **Prophylaxis of NSAID-associated gastric ulcer**

- **BY MOUTH**
  - Adult: 15–30 mg once daily

**Zollinger–Ellison syndrome (and other hypersecretory conditions)**

- **BY MOUTH**
  - Adult: Initially 60 mg once daily, adjusted according to response, daily doses of 120 mg or more given in two divided doses

**Gastro-oesophageal reflux disease**

- **BY MOUTH**
  - Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 15–30 mg once daily, doses to be taken in the morning

**Severe oesophagitis**

- **BY MOUTH**
  - Adult: 30 mg once daily for 8 weeks, continue as maintenance treatment if appropriate

**Severe oesophagitis, refractory to initial treatment**

- **BY MOUTH**
  - Adult: 30 mg twice daily

**Acid-related dyspepsia**

- **BY MOUTH**
  - Adult: 15–30 mg once daily for 2–4 weeks, doses to be taken in the morning

---

**UNLICENSED USE** Lansoprazole doses in BNF may differ from those in product literature. Not licensed at 30 mg twice daily for severe oesophagitis refractory to initial treatment.

**INTERACTIONS** Appendix 1: proton pump inhibitors

**SIDE-EFFECTS**

- **Common or very common** Dry throat · fatigue
- **Uncommon** Eosinophilia · oedema
- **Rare or very rare** Anaemia · angioedema · appetite decreased · erectile dysfunction · fever · glossitis · oesophageal candidiasis · pancreatitis · restlessness · tremor

**PREGNANCY** Manufacturer advises avoid.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).

**Dose adjustments** Manufacturer advises dose reduction of 50% in moderate to severe impairment.
Disorders of gastric acid and ulceration

**Gastro-intestinal system**

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder.

**Gastro-resistant capsule**

- Lansoprazole (Non-proprietary)
  - Lansoprazole 15 mg Lansoprazole 15 mg gastro-resistant capsules | 28 capsule [POM] £22.93 DT = £0.76
  - Lansoprazole 30 mg Lansoprazole 30 mg gastro-resistant capsules | 28 capsule [POM] £23.63 DT = £0.81

**Orodispersible tablet**

- Lansoprazole (Non-proprietary)
  - Lansoprazole 15 mg Lansoprazole 15 mg orodispersible tablets | 28 tablet [POM] £2.90 DT = £0.29
  - Lansoprazole 30 mg Lansoprazole 30 mg orodispersible tablets | 28 tablet [POM] £6.99 DT = £0.26

- Zoton FasTab (Pfizer Ltd)
  - Lansoprazole 15 mg Zoton FastTab 15 mg | 28 tablet [POM] £2.99 DT = £0.29
  - Lansoprazole 30 mg Zoton FastTab 30 mg | 28 tablet [POM] £5.50 DT = £0.26

**INTERACTIONS**

- Appendix: : proton pump inhibitors

**SIDE-EFFECTS**

- Rare or very rare: Aggression, agitation, bronchospasm, encephalopathy, gastrointestinal candidiasis, muscle weakness

**PREGNANCY**

- Not known to be harmful.

**HEPATIC IMPAIRMENT**

- Not more than 20 mg daily should be needed.

---

**Prophylaxis in patients with a history of NSAID-associated duodenal ulcer who require continued NSAID treatment**

**Prophylaxis in patients with a history of NSAID-associated gastric ulcer who require continued NSAID treatment**

**Prophylaxis in patients with a history of NSAID-associated gastroduodenal lesions who require continued NSAID treatment**

- **BY MOUTH**
  - Adult: 20 mg once daily

**Zollinger–Ellison syndrome**

- **BY MOUTH**
  - Adult: Initially 60 mg once daily; usual dose 20–120 mg daily, total daily doses greater than 80 mg should be given in 2 divided doses
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Initially 60 mg once daily, adjusted according to response, total daily doses greater than 60 mg should be given in 2 divided doses, injection to be given over 5 minutes, infusion to be given over 20–30 minutes

**Gastro-oesophageal reflux disease**

- **BY MOUTH**
  - Adult: 20 mg once daily for 4 weeks, continued for a further 4–8 weeks if not fully healed; maintenance 20 mg once daily

**Gastro-oesophageal reflux disease refractory to other treatment**

- **BY MOUTH**
  - Adult: 40 mg once daily for 8 weeks; maintenance 20 mg once daily

**Acid reflux disease (long-term management)**

- **BY MOUTH**
  - Adult: 10 mg once daily, increased to 20 mg once daily, dose only increased if symptoms return

**Acid-related dyspepsia**

- **BY MOUTH**
  - Adult: 10–20 mg once daily for 2–4 weeks according to response

**Treatment and prevention of benign gastric ulcers**

**Treatment and prevention of duodenal ulcers**

**Treatment and prevention of NSAID-associated ulcers**

**Treatment and prevention of gastro-oesophageal reflux disease**

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 40 mg once daily until oral administration possible, injection to be given over 5 minutes, infusion to be given over 20–30 minutes

**Major peptic ulcer bleeding (following endoscopic treatment)**

- **INITIALLY BY INTRAVENOUS INFUSION**
  - Adult: Initially 80 mg, to be given over 40–60 minutes, then (by continuous intravenous infusion) 8 mg/hour for 72 hours, subsequent dose then changed to oral therapy

---

**DIRECTIONS FOR ADMINISTRATION**

- Orodispensible tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube.

**PATIENT AND CARER ADVICE**

- Counselling on administration of orodispersible tablet advised.

**PROFESSION SPECIFIC INFORMATION**

- Dental practitioners’ formulary Lansoprazole capsules may be prescribed.

**MEDICATION FORMS**

With oral use: Omeprazole (Non-proprietary) powder for solution for infusion, Mezzopram, Losec MUPS.

Gastro-resistant omeprazole capsules may be prescribed.

**DIRECTIONS FOR ADMINISTRATION**

- **For administration by mouth, swallow whole, or disperse Losec MUPS® tablets in water, or mix capsule contents or Losec MUPS® tablets with fruit juice or yoghurt. Preparations consisting of an e/t capsule within a tablet should not be opened.**
  - With intravenous use For intravenous infusion (Losec®), give intermittently or continuously in Glucose 5% or Sodium chloride 0.9%; reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% or 12 hours in sodium chloride 0.9%.

**PATIENT AND CARER ADVICE**

- **With oral use** Counselling on administration advised.

**PROFESSION SPECIFIC INFORMATION**

- Dental practitioners’ formulary
- Gastro-resistant omeprazole capsules may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**

- With oral use Omeprazole 10 mg tablets can be sold to the public for the short-term relief of reflux-like symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks, and a pack size of 28 tablets.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Pantoprazole**

- **INDICATIONS AND DOSE**

  * Helicobacter pylori eradication in combination with amoxicillin and clarithromycin; or in combination with clarithromycin and metronidazole*
  
  - **BY MOUTH**
    - Adult: 40 mg twice daily
  
  * Benign gastric ulcer*
  
  - **BY MOUTH**
    - Adult: 40 mg daily for 8 weeks; increased if necessary up to 80 mg daily, dose increased in severe cases

**Gastric ulcer**

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

**Duodenal ulcer**

- **BY MOUTH**
  - Adult: 40 mg daily for 4 weeks; increased if necessary up to 80 mg daily, dose increased in severe cases
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

**Prophylaxis of NSAID-associated gastric ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment**

- **Prophylaxis of NSAID-associated duodenal ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment**
  
  - **BY MOUTH**
    - Adult: 20 mg daily

**Gastro-oesophageal reflux disease**

- **BY MOUTH**
  - Adult: 20–80 mg daily for 4 weeks, continued for further 4 weeks if not fully healed, dose to be taken in the morning; maintenance 20 mg daily and increased to 40 mg daily, increased only if symptoms return
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

**Zollinger–Ellison syndrome (and other hypersecretory conditions)**

- **BY MOUTH**
  - Adult: Initially 80 mg daily (max. dose 80 mg), adjusted according to response
  - Elderly: 40 mg daily
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Initially 80 mg, alternatively 160 mg in 2 divided doses, if rapid acid control required, then 80 mg once daily (max. dose 80 mg), adjusted according to response

**INTERACTIONS**

- Appendix 1: proton pump inhibitors

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Uncommon: Asthenia - gastrointestinal discomfort - sleep disorder
- Rare or very rare: Angioedema - hyperlipidaemia - weight change

**SPECIFIC SIDE-EFFECTS**

- With intravenous use: Electrolyte imbalance - muscle spasms

**PREGNANCY**

- Manufacturer advises avoid unless potential benefit outweighs risk—fetotoxic in animals.

**BREAST FEEDING**

- Manufacturer advises avoid unless potential benefit outweighs risk—small amount present in milk.

**HEPATIC IMPAIRMENT**

Dose adjustments: Max. 20 mg daily in severe impairment and cirrhosis.
82 Disorders of gastric acid and ulceration

**Rabeprazole sodium**

**INDICATIONS AND DOSE**

- **Benign gastric ulcer**
  - **BY MOUTH**
  - Adult: 20 mg daily for 8 weeks, dose to be taken in the morning

  - **Pantoprazole (as Pantoprazole sodium sesquihydrate)**
  - **5 mg** Pantoprazole 5mg gastro-resistant tablets | 28 tablet | £13.04 DT = £0.50

**Medicines for the treatment of gastro-oesophageal reflux disease**

4.3 **Gastro-oesophageal reflux disease**

**Gastro-oesophageal reflux disease**

**Management**

Gastro-oesophageal reflux disease (including non-erosive gastro-oesophageal reflux and erosive oesophagitis) is associated with heartburn, acid regurgitation, and sometimes, difficulty in swallowing (dysphagia); oesophageal inflammation (oesophagitis), ulceration, and stricture formation may occur and there is an association with asthma.

The management of gastro-oesophageal reflux disease includes drug treatment, lifestyle changes and, in some cases, surgery. Initial treatment is guided by the severity of symptoms and treatment is then adjusted according to response. The extent of healing depends on the severity of the disease, the treatment chosen, and the duration of therapy.

Patients with gastro-oesophageal reflux disease should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, Smoking cessation p. 497, and raising the head of the bed.

For mild symptoms of gastro-oesophageal reflux disease, initial management may include the use of **antacids and alginites**. Alginate-containing antacids can form a ‘raft’ that floats on the surface of the stomach contents to reduce reflux and protect the oesophageal mucosa. **Histamine H₂-receptor antagonists** may relieve symptoms and permit...
reduction in antacid consumption. However, proton pump inhibitors provide more effective relief of symptoms than H₂-receptor antagonists. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by giving treatment intermittently).

For severe symptoms of gastro-oesophageal reflux disease or for patients with a proven or severe pathology (e.g. oesophagitis, oesophageal ulceration, oesophagopharyngeal reflux, Barrett’s oesophagus), initial management involves the use of a proton pump inhibitor; patients need to be reassessed if symptoms persist despite treatment for 4–6 weeks with a proton pump inhibitor. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by reducing the dose of the proton pump inhibitor or by giving it intermittently, or by substituting treatment with a histamine H₂-receptor antagonist).

However, for endoscopically confirmed erosive, ulcerative, or strictureing disease, or Barrett’s oesophagus, treatment with a proton pump inhibitor usually needs to be maintained at the minimum effective dose.

### Pregnancy

If dietary and lifestyle changes fail to control gastro-oesophageal reflux disease in pregnancy, an antacid or an alginate can be used. If this is ineffective, ranitidine p. 75 can be tried. Omeprazole p. 80 is reserved for women with severe or complicated reflux disease.

### Gastro-oesophageal reflux disease in children

Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thickener or thickened formula feed can be used (with advice of a dietician). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, life-style changes similar to those for adults may be helpful followed if necessary by treatment with an alginate-containing preparation.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital; an H₂-receptor antagonist may be needed to reduce acid secretion. If the oesophagitis is resistant to H₂-receptor blockade, the proton pump inhibitor omeprazole can be tried.

### Other drugs used for Gastro-oesophageal reflux disease

- Cimetidine, p. 74 - Esomeprazole, p. 78 - Famotidine, p. 75 - Lansoprazole, p. 76 - Nizatidine, p. 75 - Pantoprazole, p. 81 - Ranitidine sodium, p. 82

### 4.4 Helicobacter pylori diagnosis

#### DIAGNOSTIC AGENTS

**Urea (13C)**

- **INDICATIONS AND DOSE**
  - Diagnosis of gastro-duodenal Helicobacter pylori infection
    - **BY MOUTH**
    - Adult: (consult product literature)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Soluble tablet**
  - **Pylobactell** (Torbet Laboratories Ltd)
    - Urea [13-C] 100 mg Pylobactell breath test kit | 1 kit | £20.75
    - DT = £20.75
  - **Urea [13-C] 45 mg** Helicobacter Test INFAl for children breath test kit sugar-free | 1 kit | £19.10
    - DT = £19.10
  - **Urea [13-C] 75 mg** Helicobacter Test INFAl breath test kit sugar-free | 1 kit | £21.70
    - DT = £21.70
5 Food allergy

Food allergy

Description of condition
Food allergy is an adverse immune response to a food, commonly associated with cutaneous and gastro-intestinal reactions, and less frequently associated with respiratory reactions and anaphylaxis. It is distinct from food intolerance which is non-immunological. Cow’s milk, hen’s eggs, soy, wheat, peanuts, tree nuts, fish, and shellfish are the most common allergens. Cross-reactivity between similar foods can occur (e.g. allergy to other mammalian milk in patients with cow’s milk allergy).

Management of food allergy

Allergy caused by specific foods should be managed by strict avoidance of the causal food. Sodium cromoglicate p. 270 is licensed as an adjunct to dietary avoidance in patients with food allergy. Educating patients about appropriate nutrition, food preparation, and the risks of accidental exposure is recommended, such as food and drinks to avoid, ensuring adequate nutritional intake, and interpreting food labels.

Drug treatment

There is low quality evidence to support the use of antihistamines to treat acute, non-life-threatening symptoms (such as flushing and urticaria) if accidental ingestion of allergenic food has occurred (see Antihistamines, under Antihistamines, allergen immunotherapy and allergic emergencies p. 277). Chlorphenamine maleate p. 283 is licensed for the symptomatic control of food allergy. In case of food-induced anaphylaxis, adrenaline/epinephrine p. 222 is the first-line immediate treatment (see also Allergic emergencies, under Antihistamines, allergen immunotherapy and allergic emergencies p. 277). Patients who are at risk of anaphylaxis should be trained to use self-injectable adrenaline/epinephrine.

6 Gastro-intestinal smooth muscle spasm

Antispasmodics

Antimuscarinics

The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in irritable bowel syndrome.

Antimuscarinics (formerly termed ‘anticholinergics’) reduce intestinal motility. They can be used for the management of irritable bowel syndrome.

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulfate p. 1166 and dicycloverine hydrochloride below and the quaternary ammonium compounds propantheline bromide p. 86 and hyoscyamine butylbromide p. 85. The quaternary ammonium compounds are less lipid soluble than atropine sulfate and are less likely to cross the blood–brain barrier; they are also less well absorbed from the gastro-intestinal tract.
### Dicycloverine hydrochloride with aluminium hydroxide, magnesium oxide and simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, dicycloverine hydrochloride p. 84, aluminium hydroxide p. 1052, simeticone p. 71.

### Hyoscine butylbromide

**INDICATIONS AND DOSE**

Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

- **ORAL SUSPENSION**
  - Kolantion (Peckforton Pharmaceuticals Ltd)
    - Dicycloverine hydrochloride 500 microgram per 1 mL, Simeticone 4 mg per 1 mL, Magnesium oxide light 20 mg per 1 mL, aluminium hydroxide dried 40 mg per 1 mL
    - Kolantion gel sugar-free 100 mL £4.00 sugar-free 500 mL £6.00

**PALLIATIVE CARE**

- **Hyoscine butylbromide in palliative care,** see
  - www.medicinescomplete.com/#/content/palliative/hyoscine-butylbromide

**IMPORTANT SAFETY INFORMATION**

MHRA CHM ADVICE: HYOSCINE BUTYLBROMIDE (BUSCOPAN®)

- **INJECTION: RISK OF SERIOUS ADVERSE EFFECTS IN PATIENTS WITH UNDERLYING CARDIAC DISEASE (FEBRUARY 2017)**

The MHRA advises that hyoscine butylbromide injection can cause serious adverse effects including tachycardia, hypotension, and anaphylaxis; several reports have noted that anaphylaxis is more likely to be fatal in patients with underlying coronary heart disease.

Hyoscine butylbromide injection is contra-indicated in patients with tachycardia and should be used with caution in patients with cardiac disease; the MHRA recommends that these patients are monitored and that resuscitation equipment and trained personnel are readily available.

**CONTRA-INDICATIONS**

- With intramuscular use or intravenous use
  - Tachycardia

**SIDE-EFFECTS**

- General side-effects
  - Dyspnœa
  - Specific side-effects
  - With parenteral use
  - Mydriasis

**PREGNANCY**

Manufacturer advises avoid.

**BREAST FEEDING**

Amount too small to be harmful.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use in children
  - For administration by mouth, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.
  - With intravenous use in children
    - For intravenous injection, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.

**PRESCRIBING AND DISPENSING INFORMATION**

- Palliative care For further information on the use of hyoscine butylbromide in palliative care, see www.medicinescomplete.com/#/content/palliative/hyoscine-butylbromide.

**EXCEPTIONS TO LEGAL CATEGORY**

Hyoscine butylbromide tablets can be sold to the public for medically confirmed irritable bowel syndrome, provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg.

---

**BNF 78**

**Gastro-intestinal smooth muscle spasm**

- Child 2–4 years: 5 mg 3–4 times a day
- Child 5–11 years: 10 mg 3–4 times a day

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm | Dysmenorrhoea

- **BY MOUTH**
  - Child 12-17 years: 60–120 mg 1–3 times a day
  - Adult: 60–120 mg 1–3 times a day

**CONTRA-INDICATIONS** Intestinal obstruction - paralytic ileus

**SIDE-EFFECTS** Dizziness - dyspnoea - headache - jaundice (reversible on discontinuation) - nausea - skin reactions - wheezing

**PREGNANCY** Manufacturer advises avoid—limited information available

**BREAST FEEDING** Manufacturer advises avoid—limited information available

**PATIENT AND CARER ADVICE** Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

**Mebeverine hydrochloride** 12-Feb-2019

**INDICATIONS AND DOSE**

Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 10-17 years: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals
  - Adult: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals

**Irritable bowel syndrome**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: 200 mg twice daily
  - Adult: 200 mg twice daily

**UNLICENSED USE** Tablets and modified-release capsules not licensed for use in children.

**CONTRA-INDICATIONS** Paralytic ileus

**SIDE-EFFECTS** Angioedema - face oedema - skin reactions

**PREGNANCY** Not known to be harmful—manufacturers advise avoid.

**BREAST FEEDING** Manufacturers advise avoid—no information available.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on the timing of administration of mebeverine hydrochloride tablets and oral suspension. Medicines for Children leaflet: Mebeverine for intestinal spasms www.medicinesforchildren.org.uk/mebeverine-intestinal-spasms

**EXCEPTIONS TO LEGAL CATEGORY**

- In adults Mebeverine hydrochloride can be sold to the public for symptomatic relief of irritable bowel syndrome provided that max. single dose is 135 mg and max. daily dose is 405 mg; for uses other than symptomatic relief of irritable bowel syndrome provided that max. single dose is 100 mg and max. daily dose is 300 mg.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral suspension**
- Mebeverine hydrochloride (Non-proprietary)
  - Mebeverine hydrochloride (as Mebeverine pamoate) 10 mg per 1 ml Mebeverine 50mg/5ml oral suspension sugar free-sugar-free | 300 ml [Pos] £187.00 DT = £187.00

**Modified-release capsule**

CAUTIONARY AND ADVISORY LABELS 25
- Mebeverine hydrochloride (Non-proprietary)
  - Mebeverine hydrochloride 200 mg Mebeverine 200mg modified-release capsules | 60 capsule [Pos] £8.31 DT = £8.29
stones in the gallbladder or in the bile duct, and the symptoms and complications that they may cause. The majority of patients with gallstones remain asymptomatic. When the stones irritate the gallbladder or block part of the biliary system, the patient can experience symptoms such as pain, or infection and inflammation that if left untreated, can lead to severe complications such as biliary colic, acute cholecystitis, cholangitis, pancreatitis, and obstructive jaundice.

Non-drug treatment

Asymptomatic gallbladder stones do not need to be treated unless symptoms develop. The definitive treatment of symptomatic gallstones (and all bile duct stones) is surgical removal by laparoscopic cholecystectomy.

Drug treatment

Analgesia should be offered to control pain symptoms. Paracetamol p. 444 or a nonsteroidal anti-inflammatory drug (see Non-steroidal anti-inflammatory drugs p. 1130) is recommended for intermittent mild-to-moderate pain. Intramuscular diclofenac sodium p. 1135 can be given for severe pain or, if not suitable, an intramuscular opioid (such as morphine p. 463 or pethidine hydrochloride p. 470).

Although ursodeoxycholic acid p. 89 has been used for the management of gallstone disease, there is no evidence to support its use.

Useful Resources

### Inborn errors of primary bile acid synthesis

#### Description of condition

Inborn errors of primary bile acid synthesis are a group of diseases in which the liver does not produce enough primary bile acids due to enzyme deficiencies. These acids are the main components of the bile, and include cholic acid and chenodeoxycholic acid.

**Treatment**

Cholic acid p. 88 is licensed for the treatment of inborn errors in primary bile acid synthesis due to an inborn deficiency of two specific liver enzymes. It acts by replacing some of the missing bile acids, therefore relieving the symptoms of the disease.

Chenodeoxycholic acid p. 88 is licensed for the treatment of inborn errors of primary bile acid synthesis due to a deficiency of one specific enzyme in the bile acid synthesis pathway when presenting as cerebrotendinous xanthomatosis. Ursodeoxycholic acid p. 89 [unlicensed indication] has been used to treat inborn errors of primary bile acid synthesis, but there is an absence of evidence to recommend its use.

### Primary biliary cholangitis

#### Description of condition

Primary biliary cholangitis (or primary biliary cirrhosis) is a chronic cholestatic disease which develops due to progressive destruction of small and intermediate bile ducts...
Liver disorders and related conditions

Bile acids

Chenodeoxycholic acid

**INDICATIONS AND DOSE**

Cerebrotendinous xanthomatosis (specialist use only)

- **BY MOUTH**
  - Adult: Initially 750 mg daily in 3 divided doses, increased if necessary up to 1000 mg daily in divided doses

- **CONTRA-INDICATIONS** Non-functioning gall bladder - radio-opaque stones

- **INTERACTIONS** → Appendix 1: chenodeoxycholic acid

- **SIDE-EFFECTS** Constipation

- **PREGNANCY** Manufacturer advises avoid - fetotoxicity reported in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises monitor - no information available.

- **RENAL IMPAIRMENT** Manufacturer advises monitor - no information available.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor serum cholesterol and/or urine bile alcohols every 3 months during the initiation of therapy and dose adjustment, and then at least annually; liver function should also be monitored during initiation of therapy and then at least annually; additional or more frequent investigations may need to be undertaken to monitor therapy during periods of fast growth or concomitant disease.

- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth in patients who are unable to swallow capsules and/or need to take a dose below 250 mg, manufacturer advises add capsule contents to sodium bicarbonate solution 8.4%—for further information, consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**

  - Chenodeoxycholic acid (non-proprietary) ▼
    - Chenodeoxycholic acid 250 mg: Chenodeoxycholic acid 250 mg capsules | 100 capsule [POD] £14,000.00

Cholic acid

**DRUG ACTION** Cholic acid is the predominant primary bile acid in humans, which can be used to provide a source of bile acid in patients with inborn deficiencies in bile acid synthesis.

**INDICATIONS AND DOSE**

Inborn errors of primary bile acid synthesis (initiated by a specialist)

- **BY MOUTH**
  - Adult: Usual dose 5–15 mg/kg daily; increased in steps of 50 mg daily in divided doses if required, dose to be given with food at the same time each day; Usual maximum 500 mg/24 hours

- **INTERACTIONS** → Appendix 1: cholic acid

- **SIDE-EFFECTS** Cholelithiasis (long term use) - diarrhoea - pruritus

- **PREGNANCY** Limited data available—not known to be harmful, manufacturer advises continue treatment. Monitoring: Manufacturer advises monitor patient parameters more frequently in pregnancy.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution and stop treatment if there are signs of severe hepatic failure—limited information available (no experience with impairment from causes not related to inborn errors of primary bile acid synthesis).

  - **Dose adjustments** Manufacturer advises adjust dose as the degree of impairment improves during treatment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor serum and/or urine bile-acid concentrations every 3 months for the first year, then every 6 months for three years, then annually; monitor liver function tests at the same or greater frequency.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules may be opened and the content added to infant formula, juice, fruit compote, or yoghurt for administration.

- **PATIENT AND CARER ADVICE** Counselling advised on administration.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**

  - CAUTIONARY AND ADVISORY LABELS 25
    - Cholic acid 250 mg: Orphacol (Laboratoires CTRS) ▼
      - Cholic acid 50 mg Orphacol 50 mg capsules | 30 capsule [POD] £1,860.00
      - Cholic acid 250 mg: Orphacol 250 mg capsules | 30 capsule [POD] £6,520.00

Obeticholic acid

**DRUG ACTION** Obeticholic acid is a selective farnesoid X receptor agonist, which decreases circulating bile acid.

**INDICATIONS AND DOSE**

Primary biliary cholangitis in combination with ursodeoxycholic acid when response to ursodeoxycholic acid has been inadequate, or as monotherapy in patients intolerant of ursodeoxycholic acid

- **BY MOUTH**
  - Adult: Initially 5 mg once daily for 5 months, then increased to 10 mg once daily if necessary and if tolerated, for dose adjustments due to severe pruritus, consult product literature

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: OBETICHLIC ACID (OCALIVA®): RISK OF SERIOUS LIVER INJURY IN PATIENTS WITH PRE-EXISTING MODERATE OR SEVERE HEPATIC IMPAIRMENT; REMINDER TO ADJUST DOSING ACCORDING TO LIVER FUNCTION MONITORING (APRIL 2018)

The MHRA is aware of reports of serious liver injuries and deaths in patients with primary biliary cholangitis with pre-existing moderate or severe liver impairment who were not adequately dose-adjusted. Follow dose reduction and monitoring advice in these patients to
reduce the risk of serious liver injury; for further information, see Hepatic impairment and Monitoring.

- CONTRA-INDICATIONS Complete biliary obstruction
- INTERACTIONS Appendix 1: obeticholic acid
- SIDE-EFFECTS Common or very common Arthralgia - constipation - dizziness - fatigue - fever - gastrointestinal discomfort - oropharyngeal pain - palpitations - peripheral oedema - skin reactions
- Frequency not known Hepatic failure
- PREGNANCY Dose adjustments No evidence of harm but manufacturer advises avoid.
- BREAST FEEDING Not known to be harmful but manufacturer advises avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment or decompensated cirrhosis (risk of increased exposure).
- Dose adjustments Manufacturer advises initial dose reduction to 5 mg once weekly in moderate to severe impairment or decompensated cirrhosis; titrate dose according to alkaline phosphatase and/or total bilirubin level—consult product literature.
- MONITORING REQUIREMENTS Manufacturer advises hepatic status before treatment initiation and then monitor for progression of primary biliary cholangitis with laboratory and clinical assessment to evaluate the need for dose reduction; patients at an increased risk of hepatic decompensation, including those with laboratory evidence of worsening liver function and/or progression to cirrhosis, should be monitored more closely.
- NATIONAL FUNDING/ACCESS DECISIONS
  - NICE decisions
    - Obeticholic acid for treating primary biliary cholangitis (April 2017) NICE T4443
    - Obeticholic acid (Ocaliva®) is recommended as an option for treating primary biliary cholangitis, in combination with ursodeoxycholic acid when response to ursodeoxycholic acid is inadequate, or as monotherapy when ursodeoxycholic acid is not tolerated and only if the manufacturer provides obeticholic acid with the discount agreed in the patient access scheme. Response to obeticholic acid should be assessed after 12 months and treatment continued only if there is evidence of clinical benefit.
    - www.nice.org.uk/guidance/t4443
  - Scottish Medicines Consortium (SMC) decisions
    - The Scottish Medicines Consortium has advised (June 2017) that ursodeoxycholic acid (Ocaliva®) is accepted for use within NHS Scotland for the treatment of primary biliary cholangitis in combination with ursodeoxycholic acid when response to ursodeoxycholic acid is inadequate, or as monotherapy when ursodeoxycholic acid is not tolerated. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.
- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral suspension**

| Ursosnur | Ursosnur 500mg tablets | 100 tablet | £49.00 DT = £49.00 |

**Dissolution of gallstones**

- **BY MOUTH**
  - Adult: 8–12 mg/kg once daily, dose to be taken at bedtime, alternatively 8–12 mg/kg daily in 2 divided doses for up to 2 years; treatment is continued for 3–4 months after stones dissolve

**Primary biliary cirrhosis**

- **BY MOUTH**
  - Adult: 12–16 mg/kg daily in 3 divided doses for 3 months, then 12–16 mg/kg once daily, dose to be taken at bedtime

- CONTRA-INDICATIONS Acute inflammation of the gall bladder - frequent episodes of biliary colic - inflammatory diseases and other conditions of the colon, liver or small intestine which interfere with enterohepatic circulation of bile salts - non-functioning gall bladder - radio-opaque stones
- CAUTIONS Liver disease
- INTERACTIONS Appendix 1: ursodeoxycholic acid
- SIDE-EFFECTS Common or very common Diarrhoea - pale faeces
- Rare or very rare Cholelithiasis calcification - skin reactions
- Frequency not known Nausea - vomiting
- PREGNANCY No evidence of harm but manufacturer advises avoid.
- BREAST FEEDING Not known to be harmful but manufacturer advises avoid.
- HEPATIC IMPAIRMENT Avoid in chronic liver disease (but used in primary biliary cirrhosis).
- MONITORING REQUIREMENTS In primary biliary cirrhosis, monitor liver function every 4 weeks for 3 months, then every 3 months.
- PATIENT AND CARER ADVICE Patients should be given dietary advice (including avoidance of excessive cholesterol and calories).
**Capsule**

*Obesity*

**INDICATIONS AND DOSE**

**Biliary disorders**
- **BY MOUTH**
- Adult: 1–2 capsules 3 times a day, to be taken before food

**LESS SUITABLE FOR PRESCRIBING** *Rowachol®* is less suitable for prescribing.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

*CAUTIONARY AND ADVISORY LABELS 22*

- *Rowachol* (Meadow Laboratories Ltd)
- *Cineole 2 mg, Borneol 5 mg, Camphene 5 mg, Menthone 6 mg, (Meadow Laboratories Ltd)*
- *Terlipressin acetate 200 microgram per 1 ml* (Alliance Pharmaceuticals Ltd)

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES**

**Vasopressin and analogues**

**Terlipressin acetate**

**INDICATIONS AND DOSE**

**GLYPRESSIN® INJECTION**

**Bleeding from oesophageal varices**
- **BY INTRAVENOUS INJECTION**
- Adult (body-weight up to 50 kg): Initially 2 mg every 4 hours until bleeding controlled, then reduced to 1 mg every 4 hours if required, maximum duration 48 hours
- Adult (body-weight 50 kg and above): Initially 2 mg every 4 hours until bleeding controlled, reduced if not tolerated to 1 mg every 4 hours, maximum duration 48 hours

**VARIQUEL® INJECTION**

**Bleeding from oesophageal varices**
- **BY INTRAVENOUS INJECTION**
- Adult (body-weight up to 50 kg): Initially 1 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
- Adult (body-weight 50–69 kg): Initially 1.5 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
- Adult (body-weight 70 kg and above): Initially 2 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute

**CAUTIONS**
Arrhythmia - elderly - electrolyte and fluid disturbances - heart disease - history of QT-interval prolongation - respiratory disease - septic shock - uncontrolled hypertension - vascular disease

**SIDE-EFFECTS**
- **Common or very common** Abdominal cramps - arrhythmias - diarrhoea - headache - hypertension - hypotension - pallor - peripheral ischaemia - vasoconstriction
- **Uncommon** Chest pain - cyanosis - fluid overload - heart failure - hot flush - hypotension - intestinal ischaemia - ischaemic heart disease - lymphangitis - myocardial infarction - nausea - pulmonary oedema - respiratory disorders - seizure - skin necrosis - uterine disorders - vomiting
- **Rare or very rare** Dyspnoea - hyperglycaemia - stroke

**PREGNANCY**
Avoid unless benefits outweigh risk — uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported.

**BREAST FEEDING**
Avoid unless benefits outweigh risk — no information available.

**RENAI IMPAIRMENT**
Use with caution in chronic renal failure.

**MEDITICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- *Terlipressin acetate 120 microgram per 1 ml Glypressin 1mg/8.5ml solution for injection ampoules | 5 ampoule* (£)
- *Variquel (Alliance Pharmaceuticals Ltd)*
- *Terlipressin acetate 200 microgram per 1 ml* (Alliance Pharmaceuticals Ltd)

**8 Obesity**

**Obesity**

*01-Jun-2016*

**Description of condition**

Obesity is directly linked to many health problems including cardiovascular disease, type 2 diabetes, fatty liver disease, gallstones, and gastro-oesophageal reflux disease. It is also linked to psychological and psychiatric morbidities.

In adults, obesity is generally classified as a body mass index (BMI) of > 30 kg/m², though BMI should be interpreted with caution as it is not a direct measure of adiposity, particularly in patients who are very muscular or have muscle weakness or atrophy.

Waist circumference should also be considered as it may provide an indication of total body fat and a risk of obesity-related health problems. Men with a waist circumference > 94 cm (> 90 cm for Asian men), and women with a waist circumference of > 80 cm are at increased risk of obesity-related health problems. A waist circumference of > 102 cm in men and > 88 cm in women indicates a very high risk of obesity-related health problems.

**Aims of treatment**

Management should be aimed at modest, sustainable weight loss and maintenance of a healthy weight, to reduce the risk factors associated with obesity.

**Overview**

Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity. Patients should be monitored for changes in weight, as well as changes in blood pressure and blood lipids, and for other associated conditions.

An initial assessment should consider potential underlying causes (e.g. hypothyroidism) and a review of the
appropriateness of current medications which are known to cause weight gain, e.g., atypical antipsychotics, beta-adrenoceptor blocking drugs, insulin (when used in the treatment of type 2 diabetes), lithium carbonate, lithium citrate, sodium valproate, sulphonylureas, thiazolidinediones, and tricyclic antidepressants. ▶

**Lifestyle changes**

Patients should be encouraged to engage in a sustainable weight management programme which includes strategies to change behaviour, increase physical activity, and improve diet and eating behaviour. ▶

**Drug treatment**

Drug treatment should never be used as the sole element of treatment and should be used as part of an overall weight management plan. An anti-obesity drug should be considered only for those with a BMI of > 30 kg/m², in whom diet, exercise and behaviour changes fail to achieve a realistic reduction in weight. In the presence of associated risk factors, it may be appropriate to prescribe an anti-obesity drug to individuals with a BMI of > 28 kg/m². A vitamin and mineral supplement may also be considered if there is concern about inadequate micronutrient intake, particularly for vulnerable groups such as in the elderly and younger patients.

The effect of management should be monitored on a regular basis with reinforcement of supporting lifestyle advice. Rates of weight loss may be slower in patients with type 2 diabetes, so less strict goals than in those without diabetes may be appropriate.

Orlistat p. 92, is the only drug currently available in the UK that is recommended specifically for the management of obesity; it acts by reducing the absorption of dietary fat.

Orlistat is licensed for use as an adjunct in the management of obesity in patients with a BMI of > 30 kg/m², or, in individuals with a BMI of > 28 kg/m² in the presence of other risk factors. Treatment with orlistat may also be used to maintain weight loss rather than to continue to lose weight. Discontinuation of treatment with orlistat should be considered after 12 weeks if weight loss has not exceeded 5% since the start of treatment. ▶

Drugs which produce a feeling of satiety (such as methyccellulose p. 55 and sterculia p. 55 [unlicensed indications]) have been used in an attempt to control appetite, but there is little evidence for their efficacy. Various centrally acting appetite suppressants, including stimulants and serotonergic drugs (such as dexfenfluramine, fenfluramine, sibutramine, and rimonabant), have been used in the management of obesity but have been withdrawn or are no longer recommended due to serious safety concerns or their addictive potential.

**Surgery**

Bariatric surgery may be considered for patients who have a BMI of > 40 kg/m² (Obesity III, morbid obesity), or between 35–39.9 kg/m² (Obesity II) and a significant disease (such as type 2 diabetes or high blood pressure) which could be improved with weight loss, and if all appropriate non-surgical measures have been tried but clinically beneficial weight loss has not been achieved or maintained. ▶

Other drugs used for Obesity Liraglutide, p. 699

### ANTIDEPRESSANTS > SEROTONIN AND NORADRENALINE RE- UPTAKE INHIBITORS

**Naltrexone with bupropion**

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupropion hydrochloride p. 498, naltrexone hydrochloride p. 497.

**Indications and dose**

Adjunct in obesity (in conjunction with dietary measures and increased physical activity in individuals with a body mass index (BMI) of 30 kg/m² or more or in individuals with a BMI of 27 kg/m² or more in the presence of one or more weight related co-morbidity)

- **By mouth**
  - Adult 18–75 years: Initially 1 tablet daily for 7 days, then increased to 1 tablet twice daily for 7 days, then increased to 3 tablets daily in divided doses for 7 days, two tablets to be taken in the morning, and one tablet to be taken in the evening, then maintenance 2 tablets twice daily, review treatment after 16 weeks and then annually

**Dose equivalence and conversion**

- Each tablet contains 8 mg naltrexone with 90 mg bupropion.

**Contra-indications**

- Uncontrolled hypertension

**Cautionary and advisory labels**

- History of mania - hypertension

**Interactions**

- Appendix 1: bupropion - naltrexone

**Hepatic impairment**

Manufacturer advises avoid (no information available).

**Renal Impairment**

Manufacturer advises avoid in moderate-to-severe impairment—limited information available.

**Prescribing and dispensing information**

Prescribers should consult the Mysimba® Physician Prescribing Checklist provided by the manufacturer, before initiation of treatment.

**National funding/access decisions**

**NICE decisions**

- Naltrexone–bupropion for managing overweight and obesity (December 2017) NICE TA494

Naltrexone–bupropion is not recommended within its marketing authorisation for managing overweight and obesity in adults alongside a reduced-calorie diet and increased physical activity.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

PERIPHERALLY ACTING ANTI OBESITY PRODUCTS > LIPASE INHIBITORS

Orlistat

> DRUG ACTION Orlistat, a lipase inhibitor, reduces the absorption of dietary fat.

> INDICATIONS AND DOSE

Adjunct in obesity (in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30 kg/m² or more in individuals with a BMI of 28 kg/m² or more in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia)

> BY MOUTH

- Adult: 120 mg up to 3 times a day, dose to be taken immediately before, during, or up to 1 hour after each main meal, continue treatment beyond 12 weeks only if weight loss since start of treatment exceeds 5% (target for initial weight loss may be lower in patients with type 2 diabetes), if a meal is missed or contains no fat, the dose of orlistat should be omitted

> CONTRA-INDICATIONS Cholestasis · chronic malabsorption syndrome

> CAUTIONS Chronic kidney disease · may impair absorption of fat-soluble vitamins · volume depletion

CAUTIONS, FURTHER INFORMATION Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.

> INTERACTIONS Appendix 1: orlistat

> SIDE-EFFECTS

- Common or very common Abdominal pain (may be minimised by reduced fat intake) · anxiety · diarrhoea · gastrointestinal disorders

- Frequency not known Anorectal haemorrhage · bullous dermatitis · cholelithiasis · diverticulitis · hepatitis · oxalate nephropathy · pancreatitis · renal failure

> PREGNANCY Use with caution.

> BREAST FEEDING Avoid—no information available.

9 Rectal and anal disorders

Other drugs used for Rectal and anal disorders Diltiazem hydrochloride, p. 157

9.1 Anal fissures

Anal fissure

Description of condition

An anal fissure is a tear or ulcer in the lining of the anal canal, immediately within the anal margin. Clinical features of anal fissure include bleeding and persistent pain on defecation, and a linear split in the anal mucosa.

Aims of treatment

The aim of treatment is to relieve pain and promote healing of the fissure.

Drug treatment

Acute anal fissure

Initial management of acute anal fissures (present for less than 6 weeks) should focus on ensuring that stools are soft and easily passed. Bulk-forming laxatives (such as ispaghula husk p. 55) are recommended and an osmotic laxative (such as lactulose p. 56) can be considered as an alternative—see also Constipation p. 53, for further information about these laxatives. Short-term use of a topical preparation containing a local anaesthetic (such as lidocaine hydrochloride p. 103) or a simple analgesic (such as paracetamol p. 444 or ibuprofen p. 1141) may be offered for prolonged burning pain following defecation. If these measures are inadequate, the patient should be referred for specialist treatment in hospital.

Chronic anal fissure

Chronic anal fissures (present for 6 weeks or longer), and associated pain, may be treated with glyceryl trinitrate rectal ointment 0.4% or 0.2% p. 218 [unlicensed] (available from Special-order manufacturers p. 1626 or specialist importing companies). Limited evidence suggests that the strength used does not influence the effectiveness, but that the higher strength potentially increases the incidence of side-effects. Healing rates with topical glyceryl trinitrate are marginally superior to placebo, but the incidence of headache as an adverse effect is quite high (about 20–30% of patients). Recurrence of the fissure after treatment is common.

As an alternative to glyceryl trinitrate rectal ointment, chronic anal fissure may also be treated with topical diltiazem hydrochloride 2% p. 157 [unlicensed] or nifedipine 0.2–0.5% p. 162 [unlicensed] (available from Special-order manufacturers p. 1626 or specialist importing companies), which have a lower incidence of adverse effects than topical glyceryl trinitrate. Oral nifedipine [unlicensed indication] and oral diltiazem hydrochloride [unlicensed indication] may be as effective as topical treatment, but the incidence of adverse effects is likely to be higher and topical preparations are preferred.

Patients who do not respond to first-line treatment may be referred to a specialist for local injection of botulinum toxin type A [unlicensed indication].

Non-drug treatment

Surgery is an effective option for the management of chronic anal fissure in adults but is generally reserved for those who do not respond to drug treatment.
9.2 Haemorrhoids

**Haemorrhoids**

**Description of condition**

Haemorrhoids, or piles, are abnormal swellings of the vascular mucosal anal cushions around the anus. Internal haemorrhoids arise above the dentate line and are usually painless unless they become strangulated. External haemorrhoids originate below the dentate line and can be itchy or painful. Women are predisposed to developing haemorrhoids during pregnancy.

**Aims of treatment**

The aims of treatment are to reduce the symptoms (pain, bleeding and swelling), promote healing, and prevent recurrence.

**Non-drug treatment**

Stools should be kept soft and easy to pass (to minimise straining) by increasing dietary fibre and fluid intake. Advice about perianal hygiene is helpful to aid healing and reduce irritation and itching.

**Drug treatment**

If constipation is reported, it should be treated. A bulk-forming laxative can be prescribed (see Constipation p. 53).

A simple analgesic such as paracetamol p. 444 can be used for pain relief. Opioid analgesics should be avoided as they can cause constipation, and NSAIDs should be avoided if rectal bleeding is present.

Topical preparations that contain a combination of local anaesthetics, corticosteroids, astringents, lubricants, and antiseptics are available—see Related drugs below. They can offer symptomatic relief of local pain and itching but evidence does not suggest that any preparation is more effective than any other.

Topical preparations containing local anaesthetics (lidocaine, benzocaine, cinchocaine and pramocaine) should only be used for a few days as they may cause sensitisation of the anal skin. Local anaesthetics can be absorbed through the rectal mucosa (with a theoretical risk of systemic side effects) and very rarely may cause increased irritation; therefore excessive application should be avoided.

Topical preparations combining corticosteroids with local anaesthetics and soothing agents are available for the management of haemorrhoids. They may ameliorate local perianal inflammation, but no data suggest that they actually reduce haemorrhoidal swelling, bleeding, or protrusion.

Topical corticosteroids are suitable for occasional short-term use (no more than 7 days) after exclusion of infections (such as perianal streptococcal infection, *herpes simplex* or perianal thrush). Long-term use of corticosteroid creams can cause ulceration or permanent damage due to thinning of the perianal skin and should be avoided.

Continuous or excessive use carries a risk of adrenal suppression and systemic corticosteroid effects. Recurrent symptoms, should be referred to secondary care for further investigation and management.

Treatments available from specialists include rubber band ligation, injection sclerotherapy (using phenol p. 95 in oil), infrared coagulation/photocoagulation, bipolar diathermy and direct-current electrotherapy, haemorrhoidectomy, stapled haemorrhoidectomy, and haemorrhoidal artery ligation.

**Pregnancy**

Bulk forming laxatives are not absorbed, and are therefore safe for use in pregnant women (see Pregnancy, under Constipation p. 53). No topical haemorrhoidal preparations are licensed for use during pregnancy.

If treatment with a topical haemorrhoidal preparation is required, a soothing preparation containing simple, soothing products (not local anaesthetics or corticosteroids) can be considered.

**Related drugs**

Topical preparations used for haemorrhoids: lidocaine hydrochloride with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide below, cinchocaine hydrochloride with fluocortolone caproate and fluocortolone pivalate p. 94, cinchocaine with hydrocortisone p. 94, cinchocaine with prednisolone p. 94.

### CORTICOSTEROIDS

**Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide**

21-Dec-2017

**INDICATIONS AND DOSE**

**Haemorrhoids**

**Pruritus ani**

* BY RECTUM USING OINTMENT
  
  Adult: Apply twice daily for no longer than 7 days, to be applied morning and night, an additional dose should be applied after a bowel movement.

* BY RECTUM USING SUPPOSITORIES
  
  Adult: 1 suppository twice daily for no longer than 7 days, to be inserted night and morning, additional dose after a bowel movement.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

**CAUTIONS**

Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**PRESCRIBING AND DISPENSING INFORMATION**

A proprietary brand Anusol Plus HC® (ointment and suppositories) is on sale to the public.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

* Anusol-Hc (Church & Dwight UK Ltd)
  
  Hydrocortisone acetate 2.5 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Benzyl benzoate 12.5 mg per 1 gram, Peru Balsam 18.75 mg per 1 gram, Bismuth subgallate 22.5 mg per 1 gram, Zinc oxide 107.5 mg per 1 gram
  
  Anusol HC ointment | 30 gram [Pax] £2.49

**Suppository**

* Anusol-Hc (Church & Dwight UK Ltd)
  
  Hydrocortisone acetate 10 mg, Bismuth oxide 24 mg, Benzyl benzoate 33 mg, Peru Balsam 49 mg, Bismuth subgallate 59 mg, Zinc oxide 296 mg
  
  Anusol HC suppositories | 12 suppository [Pax] £1.74
## Cinchocaine hydrochloride with fluocortolone caproate and fluocortolone pivalate

**21-Dec-2017**

### INDICATIONS AND DOSE

**Haemorrhoids | Pruritus ani**

- **Adult:** Apply twice daily for 5–7 days, apply 3–4 times a day if required, on the first day of treatment, then apply once daily for a few days after symptoms have cleared
- **By rectum using suppositories:**
  - Adult: Initially 1 suppository daily for 5–7 days, to be inserted after a bowel movement, then 1 suppository once daily on alternate days for 1 week

**Haemorrhoids (severe cases) | Pruritus ani (severe cases)**

- **Adult:** Initially 1 suppository 2–3 times a day for 5–7 days, then 1 suppository once daily on alternate days for 1 week

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE:** CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

- **Caution:** Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) – local anaesthetic component may cause sensitisation (use for short periods only — no longer than a few days)

### MEDICINAL FORMS

- **There can be variation in the licensing of different medicines containing the same drug.**

    - **Uniproct** (Meadow Laboratories Ltd)
      - Fluocortolone pivalate 920 microgram per 1 gram, Fluocortolone caproate 950 microgram per 1 gram, Cinchocaine hydrochloride 5 mg per 1 gram
      - Ultraproct ointment | 30 gram [P08] £8.27
  - **Suppository**
    - **Uniproct** (Meadow Laboratories Ltd)
      - Fluocortolone pivalate 610 microgram, Fluocortolone caproate 630 microgram, Cinchocaine hydrochloride 1 mg
      - Ultraproct suppositories | 12 suppository [P08] £4.06

## Cinchocaine with hydrocortisone

**21-Dec-2017**

### INDICATIONS AND DOSE

**Proctosedyl Ointment**

- **Pruritus ani**
  - **Child:** Apply twice daily, to be administered morning and night and after a bowel movement. Apply externally or by rectum. Do not use for longer than 7 days
  - **Adult:** Apply twice daily, to be administered morning and night and after a bowel movement. Apply externally or by rectum. Do not use for longer than 7 days

**Proctosedyl Suppositories**

- **Pruritus ani**
  - **Child 12–17 years:** 1 suppository, insert suppository night and morning and after a bowel movement. Do not use for longer than 7 days

## Cinchocaine with prednisolone

**21-Dec-2017**

### INDICATIONS AND DOSE

- **Pruritus ani**
  - **Adult:** Apply twice daily for 5–7 days, apply 3–4 times a day on the first day if necessary, then apply once daily for a few days after symptoms have cleared
  - **By rectum using suppositories:**
  - **Adult:** 1 suppository daily for 5–7 days, to be inserted after a bowel movement
### Hydrocortisone with pramocaine

**INDICATIONS AND DOSE**

**Haemorrhoids** | **Proctitis**  
--- | ---  
**BY RECTUM USING AEROSOL SPRAY**  
**Adult:** 1 spray up to 3 times a day for no longer than 7 days without medical advice, spray once over the affected area  
**BY RECTUM USING OINTMENT**  
**Adult:** Apply several times daily, for short term use only  

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

### Phenol

**INDICATIONS AND DOSE**

**Haemorrhoids (particularly when unprolapsed)**  
**BY SUBMUCOSAL INJECTION**  
**Adult:** 2–3 mL, dose (using phenol 5%) to be injected into the submucosal layer at the base of the pile; several injections may be given at different sites, max. total injected 10 mL at any one time  

**SIDE-EFFECTS** Abdominal sepsis · abscess · dizziness · erectile dysfunction · fever · hepatitis · increased risk of infection · injection site necrosis · ulcer · urinary disorders  

**PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Oily Phenol Injection, BP consists of phenol 5% in a suitable fixed oil.

**MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection  

**Solution for injection**  
**Phenol (Non-proprietary)**  
Phenol 50 mg per 1 ml Oily phenol 5% solution for injection 5ml ampoules | 10 ampoules (POM) £70.31 DT = £70.31

### Exocrine pancreatic insufficiency

**Description of condition**

Exocrine pancreatic insufficiency is characterised by reduced secretion of pancreatic enzymes into the duodenum.  

The main clinical manifestations are malabsorption and malnutrition, associated with low circulating levels of fat-soluble vitamins, amino acids, and trace elements. The main manifestations are maldigestion and malnutrition, associated with low circulating levels of micronutrients, fat-soluble vitamins and lipoproteins.

Patients also present with gastro-intestinal symptoms such as diarrhoea, abdominal cramps and steatorrhoea.

Exocrine pancreatic insufficiency can result from chronic pancreatitis, cystic fibrosis, obstructive pancreatic tumours,
Aims of treatment
The aim of treatment is to relieve gastro-intestinal symptoms and to achieve a normal nutritional status.

Drug treatment
Pancreatic enzyme replacement therapy with pancreatin below is the mainstay of treatment for exocrine pancreatic insufficiency.

Pancreatin contains the three main groups of digestive enzymes: lipase, amylase and protease. These enzymes respectively digest fats, carbohydrates and proteins into their basic components so that they can be absorbed and utilised by the body. Pancreatin should be administered with meals and snacks. The dose should be adjusted, as necessary, to the lowest effective dose according to the symptoms of malabsorption and maldigestion.

Fibrosing colonopathy has been reported in patients with cystic fibrosis taking high dose pancreatic enzyme replacement therapy (in excess of 10 000 units/kg/day of lipase). Possible risk factors are gender (in children, boys are at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years. Manufacturers of Pancrease HL® and Nutrizym 22® recommend that the total dose of pancreatin used in patients with cystic fibrosis should not usually exceed 10 000 units/kg/day of lipase. Manufacturers of pancreatin recommend that if a patient taking pancreatin develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic disease, Zollinger-Ellison syndrome, and gastrointestinal or pancreatic surgical resection.

There is limited evidence that acid suppression may improve the effectiveness of pancreatin. Acid-suppressing drugs (proton pump inhibitors or H2-receptor antagonists) may be trialled in patients who continue to experience symptoms despite high doses of pancreatin.

Levels of fat-soluble vitamins and micronutrients (such as zinc and selenium) should be routinely assessed and supplementation advised whenever necessary.

Non-drug treatment
Dietary advice should be provided. Food intake should be distributed between three main meals per day, and two or three snacks. Food that is difficult to digest should be avoided, such as legumes (peas, beans, lentils) and high-fibre foods. Alcohol should be avoided completely. Reduced fat diets are not recommended.

Medium-chain triglycerides (see MCT oil, in Borderline substances), which are directly absorbed by the intestinal mucosa, were thought to be useful in some patients. However evidence has shown that MCT-enriched preparations offer no advantage over a normal balanced diet.

PANCREATIC ENZYMES

Pancreatin

INDICATIONS AND DOSE
CREON® 10000
Pancreatic insufficiency
"BY MOUTH"
Child: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
CREON® 25000
Pancreatic insufficiency
"BY MOUTH"
Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
CREON® 40000
Pancreatic insufficiency
"BY MOUTH"
Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
CREON® MICRO
Pancreatic insufficiency
"BY MOUTH"
Child: Initially 100 mg, for administration advice, see Directions for administration
Adult: Initially 100 mg, for administration advice, see Directions for administration
DOSE EQUIVALENCE AND CONVERSION
For Creon® Micro: 100 mg granules = one measured spoonful (spoon supplied with product).

Dietary advice should be provided. Food intake should be distributed between three main meals per day, and two or three snacks. Food that is difficult to digest should be avoided, such as legumes (peas, beans, lentils) and high-fibre foods. Alcohol should be avoided completely. Reduced fat diets are not recommended.

Medium-chain triglycerides (see MCT oil, in Borderline substances), which are directly absorbed by the intestinal mucosa, were thought to be useful in some patients. However evidence has shown that MCT-enriched preparations offer no advantage over a normal balanced diet.

NUTRIZYM 22® GASTRO-RESISTANT CAPSULES

Pancreatic insufficiency
- BY MOUTH
  - Adult: Initially 1–2 capsules, dose to be taken with meals and 1 capsule as required, dose to be taken with snacks, doses should be swallowed whole or contents taken with water, or mixed with acidic fluid or soft food (then swallowed immediately without chewing)
  - Adult: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

PANCREASE HL®

Pancreatic insufficiency
- BY MOUTH
  - Child 15-17 years: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

PANCREX®

Pancreatic insufficiency
- BY MOUTH
  - Child 2-17 years: 5–10 g, to be taken just before meals, washed down or mixed with milk or water
  - Adult: 5–10 g, to be taken just before meals; washed down or mixed with milk or water

PANCREX® V

Pancreatic insufficiency
- BY MOUTH
  - Child 1-11 months: 1–2 capsules, contents of capsule to be mixed with feeds
  - Child 1-17 years: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food
  - Adult: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food

PANCREX® V POWDER

Pancreatic insufficiency
- BY MOUTH
  - Child: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water
  - Adult: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water

PANCREX® V TABLETS

Pancreatic insufficiency
- BY MOUTH
  - Child 2-17 years: 5–15 tablets, to be taken before meals
  - Adult: 5–15 tablets, to be taken before meals

PANCREX® V TABLETS FORTE

Pancreatic insufficiency
- BY MOUTH
  - Child 2-17 years: 6–10 tablets, to be taken before meals
  - Adult: 6–10 tablets, to be taken before meals

CONTRA-INDICATIONS

PANCREASE HL® Should not be used in children aged 15 years or less with cystic fibrosis

CAUTIONS Can irritate the perioral skin and buccal mucosa if retained in the mouth; excessive doses can cause perianal irritation

INTERACTIONS Appendix 1: pancreatin

SIDE-EFFECTS
- Common or very common Abdominal distension · constipation · nausea · vomiting
- Uncommon Skin reactions
- Frequency not known Fibrosing colonopathy
- PREGNANCY Not known to be harmful

DIRECTIONS FOR ADMINISTRATION Pancreatin is inactivated by gastric acid therefore manufacturer advises pancreatin preparations are best taken with food (or immediately before or after food). Since pancreatin is inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; manufacturer advises the resulting mixtures should not be kept for more than one hour and any left-over food or liquid containing pancreatin should be discarded. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Manufacturer advises gastro-resistant granules should be mixed with slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Capsules containing enteric-coated granules can be opened and the granules administered in the same way. For infants, Creon® Micro granules can be mixed with a small amount of milk on a spoon and administered immediately—granules should not be added to the baby’s bottle. Manufacturer advises Pancrex® V powder may be administered via nasogastric tube or gastrostomy tube—consult local and national official guidelines.

PRESCRIBING AND DISPENSING INFORMATION Preparations may contain porc pancreatin—consult product literature.

HANDLING AND STORAGE Hypersensitivity reactions occur occasionally and may affect those handling the powder.

PATIENT AND CARER ADVICE Patients or carers should be given advice on administration. It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations. Medicines for Children leaflet: Pancreatin for pancreatic insufficiency www.medicinesforchildren.org.uk/pancreatin-pancreatic-insufficiency

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant capsule
- Creon® (Mylan)
  - Protease 600 unit, Amylase 8000 unit, Lipase 10000 unit Creon 10000 gastro-resistant capsules £12.93

**Stoma care**

**Description of condition**

A stoma is an artificial opening on the abdomen to divert the flow of faeces or urine into an external pouch located outside the body. This procedure may be temporary or permanent. Colostomy and ileostomy are the most common forms of stoma but a gastrostomy, jejunostomy, duodenostomy or caecostomy may also be performed. Understanding the type and extent of surgical intervention in each patient is crucial in managing the patient’s pharmaceutical needs correctly.

**Overview**

Prescribing for patients with stoma calls for special care due to modifications in drug delivery, resulting in a higher risk of sub-optimal absorption. The following is a brief account of some of the main points to be borne in mind.

**Enteric-coated and modified-release medicines** are unsuitable, particularly in patients with an ileostomy, as there may not be sufficient release of active ingredient. Soluble tablets, liquids, capsules or uncoated tablets are more suitable due to their quicker dissolution. When a solid-dose form such as a capsule or a tablet is given, the contents of the ostomy bag should be checked for any remnants. Preparations containing sorbitol as an excipient should be avoided, due to its laxative side effects.

**Analgesics**

Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required, paracetamol is usually suitable. Anti-inflammatory analgesics may cause gastric irritation and bleeding; faecal output should be monitored for traces of blood.

**Antacids**

The tendency to diarrhoea from magnesium salts or constipation from aluminium or calcium salts may be increased in patients with stoma.

**Antisecretory drugs**

The gastric acid secretion often increases stoma output. Proton pump inhibitors and somatostatin analogues (octreotide p. 950 and lanreotide p. 949) are often used to reduce this risk.

**Antidiarrhoeal drugs**

Loperamide hydrochloride p. 66 and codeine phosphate p. 454 reduce intestinal motility and decrease water and sodium output from an ileostomy. Loperamide hydrochloride circulates through the enterohepatic circulation, which is disrupted in patients with a short bowel; high doses of loperamide hydrochloride may be required. Codeine phosphate can be added if response with loperamide hydrochloride alone is inadequate.

**Potassium supplements**

Liquid formulations are preferred to modified-release formulations. The daily dose should be split to avoid osmotic diarrhoea.

**Care of stoma**

Patients and their carers are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

1 Arrhythmias

Overview
Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment.

Ectopic beats
If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

Atrial fibrillation
Treatment of patients with atrial fibrillation aims to reduce symptoms and prevent complications, especially stroke. All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism. Atrial fibrillation can be managed by either controlling the ventricular rate (‘rate control’) or by attempting to restore and maintain sinus rhythm (‘rhythm control’). At any stage if treatment fails to control symptoms, or, if symptoms reoccur after cardioversion and specialised management is required, referral should be made within 4 weeks. If drug treatment fails to control the symptoms of atrial fibrillation or is unsuitable, ablation strategies can be considered. Review anticoagulation, stroke, and bleeding risk at least annually in all patients with atrial fibrillation.

Acute presentation
All patients with life-threatening haemodynamic instability caused by new-onset atrial fibrillation should undergo emergency electrical cardioversion without delaying to achieve anticoagulation. In patients presenting acutely but without life-threatening haemodynamic instability, rate or rhythm control can be offered if the onset of arrhythmia is less than 48 hours; rate control is preferred if onset is more than 48 hours or uncertain. Consideration of pharmacological or electrical cardioversion should be based on clinical circumstances. If pharmacological cardioversion has been agreed, intravenous amiodarone hydrochloride p. 105, or alternatively flecainide acetate p. 103, can be used (amiodarone hydrochloride is preferred if there is structural heart disease). If urgent rate control is required, a beta-blocker or verapamil hydrochloride p. 164 can be given intravenously.

Cardioversion
Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an oral or intravenous antiarrhythmic drug e.g. flecainide acetate or amiodarone hydrochloride. If atrial fibrillation has been present for more than 48 hours, electrical cardioversion is preferred and should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced, and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks; prior to cardioversion, offer rate control as appropriate.

Drug treatment
Rate control is the preferred first-line drug treatment strategy for atrial fibrillation except in patients with new-onset atrial fibrillation, atrial flutter suitable for an ablation strategy, atrial fibrillation with a reversible cause, or if rhythm control is more suitable based on clinical judgement. Ventricular rate can be controlled with a standard beta-blocker (not sotalol hydrochloride p. 108) or a rate-limiting calcium channel blocker such as diltiazem hydrochloride p. 157 [unlicensed indication], or verapamil hydrochloride as monotherapy. Choice of drug should be based on individual symptoms, heart rate, comorbidities, and patient preference. Digoxin p. 109 is usually only effective for controlling the ventricular rate at rest, and should therefore only be used as monotherapy in predominantly sedentary patients with non-paroxysmal atrial fibrillation. When a single drug fails to adequately control the ventricular rate, a combination of two drugs including a beta-blocker, digoxin, or diltiazem hydrochloride can be used. If symptoms are not controlled with a combination of two drugs, a rhythm-control strategy should be considered. If ventricular function is diminished, the combination of a beta-blocker (that is licensed for use in heart failure) and digoxin is preferred. Digoxin is also used when atrial fibrillation is accompanied by congestive heart failure.
If drug treatment is required to maintain sinus rhythm (‘rhythm control’) post-cardioversion, a standard beta-blocker is used. If a standard beta-blocker is not appropriate or is ineffective, consider an oral anti-arrhythmic drug such as sotalol hydrochloride, flecainide acetate, propafenone hydrochloride p. 104, or amiodarone hydrochloride; dronedarone p. 106 may be considered in paroxysmal or persistent atrial fibrillation (see NICE guidance). If necessary, amiodarone hydrochloride can be started 4 weeks before and continuing for up to 12 months after electrical cardioversion to increase success of the procedure, and to maintain sinus rhythm. Flecainide acetate or propafenone hydrochloride should be started for patients with left ventricular impairment or heart failure.

**Paroxysmal atrial fibrillation**

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a standard beta-blocker. Alternatively, if symptoms persist or a standard beta-blocker is inappropriate, an oral anti-arrhythmic drug such as dronedarone (see NICE guidance), sotalol hydrochloride, flecainide acetate, propafenone hydrochloride, or amiodarone hydrochloride can be given (see also Paroxysmal supraventricular tachycardia and Supraventricular arrhythmias). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored using the ‘pill-in-the-pocket’ approach; this involves the patient taking oral flecainide acetate or propafenone hydrochloride to self-treat an episode of atrial fibrillation when it occurs.

**Stroke prevention**

All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis; the need needs to be balanced with the patient’s risk of bleeding; a NICE guideline (NICE clinical guideline 180 (June 2014). Atrial fibrillation: The management of atrial fibrillation) recommends using the CHA2DS2VASc assessment tool for stroke risk and the HAS-BLED tool for bleeding risk prior to and during anticoagulation. Risk factors for stroke taken into account by CHA2DS2-VASc include prior ischaemic stroke, transient ischaemic attacks, or thromboembolic events, heart failure, left ventricular systolic dysfunction, vascular disease, diabetes, hypertension, females, and patients over 65 years. Patients with a very low risk of stroke (CHA2DS2-VASc score of 0 for men or 1 for women) do not require an antithrombotic for stroke prevention. Parenteral anticoagulation should be offered to patients with new-onset atrial fibrillation who are receiving subtherapeutic or no anticoagulation therapy until assessment is made, and appropriate anticoagulation is started. Oral anticoagulation should be offered to patients with confirmed diagnosis of atrial fibrillation in whom sinus rhythm has not been successfully restored within 48 hours of onset, patients who have had, or are at high risk of recurrence of atrial fibrillation such as those with structural heart disease, prolonged history of atrial fibrillation (more than 12 months), a history of failed attempts at cardioversion, and patients whom the risk of stroke outweighs the risk of bleeding. Anticoagulation treatment should not be withheld solely because of the risk of falls, and choice of treatment should be based on clinical features and patient preferences. Oral anticoagulation may be with a vitamin K antagonist (e.g. warfarin sodium p. 140, or in non-valvular atrial fibrillation with apixaban p. 125, dabigatran etexilate p. 136, edoxaban p. 126, or rivaroxaban p. 128. Anticoagulants are also indicated during cardioversion procedures. Aspirin p. 121 is less effective than warfarin sodium at preventing emboli; the modest benefit is offset by the risk of bleeding, and aspirin should not be offered as monotherapy solely for stroke prevention in atrial fibrillation. If anticoagulant treatment is contra-indicated or not tolerated, left atrial appendage occlusion can be considered.

**Atrial flutter**

Like atrial fibrillation, treatment options for atrial flutter involve either controlling the ventricular rate or attempting to restore and maintain sinus rhythm. However, atrial flutter generally responds less well to drug treatment than atrial fibrillation.

Control of the ventricular rate is usually an interim measure pending restoration of sinus rhythm. Ventricular rate can be controlled by administration of a beta-blocker, diltiazem hydrochloride p. 157 [unlicensed indication], or verapamil hydrochloride p. 164; an intravenous beta-blocker or verapamil hydrochloride is preferred for rapid control. Digoxin p. 109 can be added if rate control remains inadequate, and may be particularly useful in those with heart failure.

Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, percutaneous anticoagulation should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks.

Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide acetate p. 103 or propafenone hydrochloride p. 104 can slow atrial flutter, resulting in 1:1 conduction to the ventricles, and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem hydrochloride [unlicensed indication], or verapamil hydrochloride. Amiodarone hydrochloride p. 105 can be used when other drug treatments are contra-indicated or ineffective.

All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation.

**Paroxysmal supraventricular tachycardia**

This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring. If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, intravenous adenosine p. 107 should be given. If adenosine is ineffective or contra-indicated, intravenous verapamil hydrochloride is an alternative, but it should be avoided in patients recently treated with beta-blockers.

Failure to terminate paroxysmal supraventricular tachycardia with reflex vagal stimulation or drug treatment may suggest an arrhythmia of atrial origin, such as focal atrial tachycardia or atrial flutter.

Treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found).

Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem hydrochloride, verapamil hydrochloride, beta-blockers including sotalol hydrochloride p. 108, flecainide acetate or propafenone hydrochloride.
**Arrhythmias after myocardial infarction**

In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an antiarrhythmic until an ECG record has been obtained. Bradycardia, particularly if complicated by hypotension, should be treated with an intravenous dose of atrotive sulfate p. 1334 the dose may be repeated if necessary. If there is a risk of asystole, or if the patient is unstable and has failed to respond to atrotive sulfate, adrenaline/epinephrine p. 222 should be given by intravenous infusion, and the dose adjusted according to response.

For further advice, refer to the most recent recommendations of the Resuscitation Council (UK) available at www.resus.org.uk.

**Ventricular tachycardia**

Pulseless ventricular tachycardia or ventricular fibrillation should be treated with immediate defibrillation (see Cardiopulmonary resuscitation).

Patients with unstable sustained ventricular tachycardia, who continue to deteriorate with signs of hypotension or reduced cardiac output, should receive direct current cardioversion to restore sinus rhythm. If this fails, intravenous amiodarone hydrochloride should be administered and direct current cardioversion repeated.

Patients with sustained ventricular tachycardia who are haemodynamically stable can be treated with intravenous anti-arrhythmic drugs. Amiodarone hydrochloride is the preferred drug. Flecainide acetate, propafenone hydrochloride, and, although less effective, lidocaine hydrochloride, and, although less effective, lidocaine hydrochloride p. 103 have all been used. If sinus rhythm is not restored, direct current cardioversion or pacing should be considered. Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker.

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol hydrochloride (in place of a standard beta-blocker), or amiodarone hydrochloride (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

**Torsade de pointes**

**Torsade de pointes** is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulfate p. 1051 is usually effective. A beta-blocker (but not sotalol hydrochloride) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

**Anti-arrhythmic drugs**

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride), and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

- **Class I:** membrane stabilising drugs (e.g. lidocaine, flecaïnide)
- **Class II:** beta-blockers
- **Class III:** amiodarone; sotalol (also Class II)
- **Class IV:** calcium-channel blockers (includes verapamil but not dihydropyridines)

The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaeia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

**Supraventricular arrhythmias**

Adenosine p. 107 is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyridamole p. 124), most side-effects are short lived. Unlike verapamil hydrochloride p. 164, adenosine can be used after a beta-blocker. Verapamil hydrochloride may be preferable to adenosine in asthma.

Oral administration of a cardiac glycoside (such as digoxin p. 109) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff- Parkinson-White syndrome).

Verapamil hydrochloride is usually effective for supraventricular tachycardias. An initial intravenous dose (important: serious beta-blocker interaction hazard) may be followed by oral treatment; hypotension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil hydrochloride with dangerous consequences.

Intravenous administration of a beta-blocker such as esmolol hydrochloride p. 154 or propranolol hydrochloride p. 150, can achieve rapid control of the ventricular rate. Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride p. 105, betablockers, disopyramide p. 102, flecaïnide acetate p. 103, procainamide (available from ‘special-order’ manufacturers or specialist importing companies), and propafenone hydrochloride p. 104.

**Supraventricular and ventricular arrhythmias**

Amiodarone hydrochloride is used in the treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated. It can be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It can also be used for tachyarrhythmias associated with Wolf-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone hydrochloride may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone hydrochloride, intravenous amiodarone hydrochloride acts relatively rapidly.

Intravenous injection of amiodarone hydrochloride can be used in cardiopulmonary resuscitation for ventricular

www.getintopharma.com
Arrhythmias

Antiarrhythmics > Class IA

Disopyramide

Indications and dose
Prevention and treatment of ventricular and supraventricular arrhythmias, including after myocardial infarction / Maintenance of sinus rhythm after cardioversion

- By mouth using immediate-release medicines
  - Adult: 300–800 mg daily in divided doses
- By mouth using modified-release medicines
  - Adult: 250–375 mg every 12 hours

Contra-Indications
Bundle-branch block associated with first-degree AV block - second- and third-degree AV block or bifascicular block (unless pacemaker fitted) - severe heart failure (unless secondary to arrhythmia) - severe sinus node dysfunction

Caution
Atrial flutter or atrial tachycardia with partial block - avoid in Acute porphyrias

Interactions
Appendix 1: antiarrhythmics

Side-effects

Pregnancy
Manufacturer advises use only if potential benefit outweighs risk; may induce labour if used in third trimester.

Breastfeeding
Present in milk – use only if essential.

Hepatic Impairment
For immediate-release capsules, manufacturer advises caution (risk of increased half-life).

Renal Impairment
Avoid modified-release preparation.

Dose adjustments
Reduce dose by increasing dose interval; adjust according to response.

Monitoring Requirements
Monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or torsade de pointses (discontinue if occur).

Monitoring serum potassium.

Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Modified-release tablet
Cautionary and Advisory Labels 25
- Rythmodan Retard (Sanofi)
- Disopyramide (as Disopyramide phosphate) 250 mg Rythmodan Retard 250mg tablets | 60 tablet | £32.08 DT = £32.08

Capsule
- Disopyramide (Non-proprietary)
- Disopyramide 100 mg Disopyramide 100mg capsules | 84 capsule | £26.51 DT = £24.30
- Disopyramide 150 mg Disopyramide 150mg capsules | 84 capsule | £33.40 DT = £27.58
- Rythmodan (Sanofi)
- Disopyramide 100 mg Rythmodan 100mg capsules | 84 capsule | £14.14 DT = £24.30

Advanced Pharmacy Services
Patients with an arrhythmia may be eligible for the New Medicines Service / Medicine Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Other drugs used for Arrhythmias
- Acebutolol, p. 152
- Atenolol, p. 152
- Metoprolol tartrate, p. 154

ANTIARRHYTHMICS › CLASS IB

Lidocaine hydrochloride
(Lignocaine hydrochloride)

- INDICATIONS AND DOSE
  Cardiopulmonary resuscitation (as an alternative if amiodarone is not available)
  - BY INTRAVENOUS INJECTION
  - Adult: 1 mg/kg, do not exceed 3 mg/kg over the first hour

Ventricular arrhythmias, especially after myocardial infarction in patients without gross circulatory impairment
  - INITIALLY BY INTRAVENOUS INJECTION
  - Adult: 100 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes).
  - If an intravenous infusion is not immediately available the initial intravenous injection of 100 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

Ventricular arrhythmias, especially after myocardial infarction in lighter patients or those whose circulation is severely impaired
  - INITIALLY BY INTRAVENOUS INJECTION
  - Adult: Initially 50 mg, to be given as a bolus dose over a few minutes, followed immediately by (by intravenous infusion) 4 mg/minute for 30 minutes, then (by intravenous infusion) 2 mg/minute for 2 hours, then (by intravenous infusion) 1 mg/minute, reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion), following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes).
  - If an intravenous infusion is not immediately available the initial intravenous injection of 50 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

- CONTRA-INDICATIONS
  All grades of atrioventricular block - severe myocardial depression - sino-atrial disorders

- CAUTIONS
  Acute porphyrias p. 1058 (consider infusion with glucose for its anti-porphyrinogenic effects) - congestive cardiac failure (consider lower dose) - post cardiac surgery (consider lower dose)

- INTERACTIONS ➔ Appendix 1: antiarrhythmics

- SIDE-EFFECTS
  Anxiety - arrhythmias - atrioventricular block - cardiac arrest - circulatory collapse - confusion - dizziness - drowsiness - euphoric mood - headache - hypotension (may lead to cardiac arrest) - loss of consciousness - methaemoglobinemia - muscle twitching - myocardial contractility decreased - nausea - neurological effects - nystagmus - pain - psychosis - respiratory disorders - seizure - sensation abnormal - temperature sensation altered - tinnitus - tremor - vision blurred - vomiting

- SIDE-EFFECTS, FURTHER INFORMATION
  Methaemoglobinemia
  Methylthioninium chloride is licensed for the acute symptomatic treatment of drug-induced methaemoglobinemia.

- PREGNANCY
  Crosses the placenta but not known to be harmful in animal studies — use if benefit outweighs risk.

- BREAST FEEDING
  Present in milk but amount too small to be harmful.

HEPATIC IMPAIRMENT
  Caution — increased risk of side-effects.

RENAL IMPAIRMENT
  Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

- MONITORING REQUIREMENTS
  - With systemic use Monitor ECG and have resuscitation facilities available.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

  Solution for injection
  - Lidocaine hydrochloride (Non-proprietary)
    - Lidocaine hydrochloride 5 mg per 1 ml
      - Adult: 50 mg/10ml (0.5%) solution for injection ampoules | 10 ampoule (Po) £7.00
    - Lidocaine hydrochloride 10 mg per 1 ml
      - Adult: 100 mg/10ml (1%) solution for injection vials | 10 vial (V) £19.00–£22.00 DT = £22.00

  Lidocaine 200mg/20ml (1%) solution for injection ampoules | 10 ampoule (Po) £10.00–£11.00 DT = £11.00
  - Lidocaine 50mg/5ml (1%) solution for injection ampoules | 10 ampoule (Po) £2.59–£12.00 DT = £2.59
  - Lidocaine 20mg/2ml (1%) solution for injection ampoules | 10 ampoule (Po) £1.20 DT = £1.20
  - Lidocaine hydrochloride 20 mg per 1 ml
    - Adult: 100mg/5ml (2%) solution for injection ampoules | 10 ampoule (Po) £2.70–£12.00 DT = £2.70
  - Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 vial (V) £15.90–£23.00 DT = £23.00
  - Lidocaine 200mg/10ml (2%) solution for injection ampoules | 10 ampoule (Po) £14.95
  - Lidocaine 40mg/2ml (2%) solution for injection ampoules | 10 ampoule (Po) £1.10–£2.37
  - Lidocaine 40mg/20ml (2%) solution for injection ampoules | 10 ampoule (Po) £8.00–£11.40 DT = £11.40

ANTIARRHYTHMICS › CLASS IC

Flecainide acetate

- INDICATIONS AND DOSE
  Supraventricular arrhythmias
  - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
    - Adult: Initially 50 mg twice daily, increased if necessary up to 300 mg daily
  - BY MOUTH USING MODIFIED-RELEASE MEDICINES
    - Adult: 200 mg daily
  - Ventricular arrhythmias (initiated under direction of hospital consultant)
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Adult: Initially 100 mg twice daily for 3–5 days, maximum 400 mg daily reserved for rapid control or in heavily built patients; for maintenance, reduce to the lowest dose that controls the arrhythmia

DOSE ADJUSTMENTS DUE TO INTERACTIONS
  - Manufacturer advises reduce dose by half with concurrent use of amiodarone.

DOSE EQUIVALENCE AND CONVERSION
  - Patients stabilised on 200 mg daily immediate-release flecainide may be transferred to modified-release medicines.

UNLICENSED USE
  Capsules and tablets: licensed for AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily). Immediate-release tablets only: licensed for symptomatic sustained ventricular tachycardia, disabling symptoms of premature ventricular
Propafenone hydrochloride

**INDICATIONS AND DOSE**

**Ventricular arrhythmias (specialist supervision in hospital) | Paroxysmal supraventricular tachyarrhythmias which include paroxysmal atrial flutter or fibrillation and paroxysmal re-entrant tachycardias involving the AV node or accessory pathway, where standard therapy ineffective or contra-indicated (specialist supervision in hospital)**

▶ **BY MOUTH**

- **Adult:** Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 3 days, reduce total daily dose for patients under 70 kg
- **Elderly:** Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 5 days, reduce total daily dose for patients under 70 kg

▶ **CONTRA-INDICATIONS**

- Atrial conduction defects (unless adequately paced)
- Brugada syndrome
- Bundle branch block (unless adequately paced)
- Cardiogenic shock (except arrhythmia induced)
- Distal block (unless adequately paced)
- Electrolyte disturbances
- Marked hypotension
- Myasthenia gravis
- Myocardial infarction
- Within last 3 months
- Second degree or greater AV block (unless adequately paced)
- Severe bradycardia
- Severe obstructive pulmonary disease (due to weak beta-blocking activity)
- Sinus node dysfunction (unless adequately paced)
- Uncontrolled congestive heart failure with left ventricular ejection fraction less than 35%

▶ **CAUTIONS**

- Elderly: great caution in mild to moderate obstructive airways disease owing to beta-blocking activity
- Heart failure: pacemaker patients: potential for conversion of paroxysmal atrial fibrillation to atrial flutter with 2:1 or 1:1 conduction block

▶ **INTERACTIONS**

→ Appendix 1: antiarrhythmics

▶ **SIDE-EFFECTS**

- **Common or very common**
  - Anxiety, confusion, dizziness, dyspnoea, fever, oedema, vision disorders
- **Uncommon**
  - Alopecia, appetite decreased, constipation, diarrhoea, flatulence, gastrointestinal discomfort, nausea, skin reactions, vomiting

▶ **FREQUENCY NOT KNOWN**

- Altered pacing threshold, atrioventricular block, cardiac arrest, chest pain, heart failure, hypotension, palpitations, QT interval prolongation

▶ **PREGNANCY**

- Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in animal studies; infant hyperbilirubinaemia also reported.

▶ **BREAST FEEDING**

- Significant amount present in milk but not known to be harmful.

▶ **HEPATIC IMPAIRMENT**

- **Dose adjustments**
  - Avoid or reduce dose in severe impairment.

▶ **RENAL IMPAIRMENT**

- **Dose adjustments**
  - Reduce initial oral dose to max. 100 mg daily if eGFR less than 35 mL/minute/1.73 m².

▶ **MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release capsule**

ANTIARRHYTHMICS > CLASS III

Amiodarone hydrochloride

● INDICATIONS AND DOSE

Treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated (including paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, ventricular fibrillation, and tachyarrhythmias associated with Wolff-Parkinson-White syndrome) (initiated in hospital or under specialist supervision)

▶ BY MOUTH

Adult: 200 mg 3 times a day for 1 week, then reduced to 200 mg twice daily for a further week, followed by maintenance dose, usually 200 mg daily or the minimum dose required to control arrhythmia

▶ BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, to be given over 20–120 minutes with ECG monitoring, subsequent infusions given if necessary according to response; maximum 1.2 g per day

Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation (for cardiopulmonary resuscitation)

▶ INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 300 mg, dose to be considered after administration of adrenaline, dose should be given from a pre-filled syringe or diluted in 20 mL. Glucose 5%, then (by intravenous injection) 150 mg if required, followed by (by intravenous infusion) 900 mg/24 hours

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SOFOSBUVIR WITH DACLATASVIR; SOFOSBUVIR AND LEDIPASVIR (MAY 2015); SIMEPREVIR WITH SOFOSBUVIR (AUGUST 2015): RISK OF SEVERE BRADYCARDIA AND HEART BLOCK WHEN TAKEN WITH AMIODARONE

Avoid concomitant use unless other antiarrhythmics cannot be given.

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Avoid in severe conduction disturbances (unless pacemaker fitted) - avoid in sinus node disease (unless pacemaker fitted) - iodine sensitivity - sino-atrial heart block (except in cardiac arrest) - sinus bradycardia (except in cardiac arrest) - thyroid dysfunction

SPECIFIC CONTRA-INDICATIONS

With intravenous use - Avoid bolus injection in cardiomyopathy - avoid bolus injection in congestive heart failure - avoid in circulatory collapse - avoid in severe arterial hypertension - avoid in severe respiratory failure

● CAUTIONS

GENERAL CAUTIONS

Acute porphyrias p. 1058 - conduction disturbances (in excessive dosage) - elderly - heart failure - hypokalaemia - severe bradycardia (in excessive dosage)

SPECIFIC CAUTIONS

With intravenous use moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) - severe hepatocellular toxicity

INTERACTIONS → Appendix 1: antiarrhythmics

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common Arrhythmias - hepatic disorders - hyperthyroidism - nausea - respiratory disorders - skin reactions

Rare or very rare Bronchospasm (in patients with severe respiratory failure) - headache - idiopathic intracranial hypertension - nerve disorders - SIADH

Frequency not known Angioedema - confusion - delirium - pancreatitis - severe cutaneous adverse reactions (SCARs)

SPECIFIC SIDE-EFFECTS

Common or very common

With oral use Constipation - corneal deposits - hypothyroidism - movement disorders - photosensitivity reaction - sleep disorders - taste altered - vomiting

With parenteral use Hypotension (following rapid injection)

Uncommon

With oral use Cardiac conduction disorders - dry mouth - myopathy (usually reversible on discontinuation) - peripheral neuropathy (usually reversible on discontinuation)

Rare or very rare

With oral use Alopecia - aplastic anaemia - epididymo-orchitis - erectile dysfunction - haemolytic anaemia - pulmonary haemorrhage - thrombocytopenia - vertigo

With parenteral use Hot flush - hyperhidrosis

Frequency not known

With oral use Altered smell sensation - appetite decreased - parkinsonism - vasculitis

With parenteral use Agranulocytosis - libido decreased - neutropenia

SIDE-EFFECTS, FURTHER INFORMATION

Corneal microdeposits

Patients taking amiodarone may develop corneal microdeposits ( reversible on withdrawal of treatment). However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.

Thyroid function

Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Hepatotoxicity

Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.

Pulmonary toxicity

Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone.

PREGNANCY

Possible risk of neonatal goitre; use only if no alternative.

BREAST FEEDING

Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.

MONITORING REQUIREMENTS

Thyroid function tests should be performed before treatment and then every 6 months. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore tri-
iodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis.

- Liver function tests required before treatment and then every 6 months.
- Serum potassium concentration should be measured before treatment.
- Chest x-ray required before treatment.
- If concomitant use of amiodarone with sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir cannot be avoided because other anti-arrhythmics are not tolerated or contra-indicated, patients should be closely monitored, particularly during the first weeks of treatment. Patients at high risk of bradycardia should be monitored continuously for 48 hours in an appropriate clinical setting after starting concomitant treatment. Patients who have stopped amiodarone within the last few months and need to start sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir should be monitored.

- With intravenous use ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (Cordarone X®), give continuously or intermittently in Glucose 5%. Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; should not be diluted to less than 600 micrograms/mL. See cardio-pulmonary resuscitation for details of infusion in extreme emergency. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexphthalate (DEHP).
- With oral use For administration by mouth, tablets may be crushed and dispersed in water; injection solution should not be given orally (irritant).

**PATIENT AND CARER ADVICE** Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used.

If taking amiodarone with concomitant sofosbuvir and daclatasvir, simeprevir and sofosbuvir, or sofosbuvir and ledipasvir, patients and their carers should be told how to recognise signs and symptoms of bradycardia and heart block and advised to seek immediate medical attention if symptoms such as shortness of breath, light-headedness, palpitations, fainting, unusual tiredness or chest pain develop.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**Dronedarone**

**DRUG ACTION** Dronedarone is a multi-channel blocking anti-arrhythmic drug.

**INDICATIONS AND DOSE**

Maintenance of sinus rhythm after cardioversion in clinically stable patients with paroxysmal or persistent atrial fibrillation, when alternative treatments are unsuitable (initiated under specialist supervision)

- BY MOUTH
- Adult: 400 mg twice daily

**CONTRA-INDICATIONS**

- Atrial conduction defects - bradycardia - complete bundle branch block - distal block - existing or previous heart failure or left ventricular systolic dysfunction - haemodynamically unstable patients - liver toxicity associated with previous amiodarone use - lung toxicity associated with previous amiodarone use - permanent atrial fibrillation - prolonged QT interval - second- or third-degree AV block - sick sinus syndrome (unless pacemaker fitted) - sinus node dysfunction

**CAUTIONS**

- Coronary artery disease - correct hypokalaemia and hypomagnesaemia before starting and during treatment

**SIDE-EFFECTS**

- Common or very common Asthenia - bradycardia - congestive heart failure - diarrhoea - gastrointestinal discomfort - nausea - QT interval prolongation - skin reactions - vomiting

- Uncommon Photosensitivity reaction - respiratory disorders - taste altered

- Rare or very rare Hepatic disorders - vasculitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Liver injury** Liver injury including life-threatening acute liver failure reported rarely; discontinue treatment if 2 consecutive alanine aminotransferase concentrations exceed 3 times upper limit of normal.

- **Heart failure** New onset or worsening heart failure reported. If heart failure or left ventricular systolic dysfunction develops, discontinue treatment.

- **Pulmonary toxicity** Interstitial lung disease, pneumonitis and pulmonary fibrosis reported. Investigate if symptoms such as dyspnoea or dry cough develop and discontinue if confirmed.

**PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

**RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Ongoing monitoring should occur under specialist supervision.
- Monitor for heart failure.
- Perform ECG at least every 6 months—consider discontinuation if atrial fibrillation reoccurs.
- Measure serum creatinine before treatment and 7 days after initiation—if raised, measure again after a further 7 days and consider discontinuation if creatinine continues to rise.
Monitor liver function before treatment, 1 week and 1 month after initiation of treatment, then monthly for 6 months, then every 3 months for 6 months and periodically thereafter.

**PATIENT AND CARER ADVICE**
Heart failure Patients or their carers should be told how to recognise signs of heart failure and advised to seek prompt medical attention if symptoms such as weight gain, dependent oedema, or dyspnoea develop or worsen. Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as abdominal pain, anorexia, nausea, vomiting, fever, malaise, itching, dark urine, or jaundice develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

> NICE decisions
- Dronedarone for the treatment of non-permanent atrial fibrillation (December 2012) NICE TA197

Dronedarone is an option for the maintenance of sinus rhythm after successful cardioversion in paroxysmal or persistent atrial fibrillation which is not controlled by first-line therapy (usually including beta-blockers), and after alternative options have been considered in patients:
- who have at least 1 of the following cardiovascular risk factors: hypertension requiring drugs of at least 2 different classes, diabetes mellitus, previous transient ischaemic attack, stroke or systemic embolism, left atrial diameter of 50 mm or greater, or age 70 years or older and
- who do not have left ventricular systolic dysfunction nor a history of, or current, heart failure

Patients who do not meet the above criteria who are currently receiving dronedarone should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/TA197

> MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Multaq** (Sanofi)
  - Dronedarone (as Dronedarone hydrochloride) 400 mg Multaq 400mg tablets | 20 tablet (PST) £22.50 | 60 tablet (PST) £67.50

**ANTIARRHYTHMICS**

### Adenosine

**INDICATIONS AND DOSE**

**Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) Used to aid to diagnosis of broad or narrow complex supraventricular tachycardias**

- **BY RAPID INTRAVENOUS INJECTION**
  - Adult: Initially 3 mg, administer into a central or large peripheral vein and give over 2 seconds, followed by 6 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, increments should not be given if high level AV block develops at any particular dose

**SIDE-EFFECTS**

- Common or very common Abdominal discomfort - arrhythmias - atroventricular block - chest discomfort - chest pain (discontinue) - dizziness - dry mouth - dyspnoea - flushing - headache - hypotension (discontinue if severe) - pain - paraesthesia - throat discomfort
- Uncommon Asthenia - back discomfort - bradycardia (discontinue if asystole or severe bradycardia occur) - hyperhidrosis - limb discomfort - nervousness - taste metallic - Rare or very rare Drowsiness - nasal congestion - nipple tenderness - respiratory disorders - respiratory failure (discontinue) - tinnitus - tremor - urinary urgency - vision blurred

**PREGNANCY**
Large doses may produce fetal toxicity; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
No information available—unlikely to be present in milk owing to short half-life.

**MONITORING REQUIREMENTS**
Monitor ECG and have resuscitation facilities available.

**DIRECTIONS FOR ADMINISTRATION**
For rapid intravenous injection give over 2 seconds into central or large peripheral vein followed by rapid Sodium Chloride 0.9% flush; injection solution may be diluted with Sodium Chloride 0.9% if required.
Sotalol hydrochloride

**INDICATIONS AND DOSE**

Symptomatic non-sustained ventricular tachyarrhythmias. Prevent or postpone paroxysmal atrial fibrillation or atrial flutter, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery. Maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter.

**BY MOUTH**

Adult: Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days.

**LIFE-THREATENING ARRHYTHMIAS INCLUDING VENTRICULAR TACHYARRHYTHMIAS**

**BY MOUTH**

Adult: Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days. Higher doses of 480–640 mg daily may be required for life-threatening ventricular arrhythmias (under specialist supervision).

**IMPORTANT SAFETY INFORMATION**

Sotalol may prolong the QT interval, and it occasionally causes life-threatening ventricular arrhythmias. In patients taking sotalol—electrolyte disturbances, particularly hypokalaemia and hypomagnesaemia should be corrected before sotalol started and during use.

**CONTRA-INDICATIONS**

Long QT syndrome (congenital or acquired).

**CAUTIONS**

Diarrhoea (severe or prolonged).

**INTERACTIONS**

Appendix 1: beta blockers, non-selective.

**SIDE-EFFECTS**

Common or very common: Anxiety, arthralgia, chest pain, dyspepsia, fever, fatigue, hearing impairment, mood altered, muscle spasms, oedema, palpitations, sexual dysfunction, taste altered, torsade de pointes (increased risk in females).

**BREAST FEEDING**

Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 10 mL/minute/1.73 m².

Dose adjustments: Use half normal dose if eGFR 30–60 mL/minute/1.73 m²; use one-quarter normal dose if eGFR 10–30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion.

**SOLUTION FOR INJECTION**

Electrolytes: May contain Sodium.

- **Adenosine (Non-proprietary)**
  - Sotalol hydrochloride 80 mg (Cheplapharm Arzneimittel GmbH)
  - 28 tablet [DT] £1.53 / + £1.19
  - Sotalol hydrochloride 160 mg (Sanofi)
  - 28 tablet [DT] £3.75 / + £1.55
  - Sotalol hydrochloride 200 mg (Beta-Cardone Pharma)
  - 28 tablet [DT] £2.20 / + £1.40
  - Sotalol hydrochloride 40 mg (Advanz Pharma)
  - 28 tablet [DT] £0.95 / + £3.97

**BETA-ADRENOCEPTOR BLOCKERS**

**NON-SELECTIVE**

**SOTALOL HYDROCHLORIDE**

**CARBDICAL GLYOSIDES**

**Cardiac glycosides**

**Digoxin-specific antibody**

Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (see further information, under Poisoning, emergency treatment p. 1359). Digoxin-specific antibody fragments p. 1368 are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradycardia. Digoxin unresponsive to atropine sulphate p. 1334 and when measures beyond the withdrawal of digoxin p. 109 and correction of any electrolyte abnormalities are considered necessary.

**Digoxin**

Digoxin is most useful for controlling ventricular response in persistent and permanent atrial fibrillation and atrial flutter. Digoxin also has a role in heart failure.

For management of atrial fibrillation the maintenance dose of digoxin can usually be determined by the ventricular rate at rest, which should not usually be allowed to fall persistently below 60 beats per minute.

Digoxin is now rarely used for rapid control of heart rate (see management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be divided to avoid nausea); renal function is the most important determinant of digoxin dosage.
Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. The plasma concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Digoxin should be used with special care in the elderly, who may be particularly susceptible to digitals toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitals toxicity; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplementation.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdose.

Digoxin

**Indications and dose**

- **Drug action** Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

- **Contraindications** Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution), hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—but use with caution), intermittent complete heart block, myocarditis, second degree AV block, supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) (although can be used in infancy) - ventricular tachycardia or fibrillation

- **CAUTIONS** Hypercalcaemia (risk of digitalis toxicity), hypokalaemia (risk of digitalis toxicity), hypomagnesaemia (risk of digitalis toxicity), hypoxia (risk of digitalis toxicity), recent myocardial infarction, severe respiratory disease, sick sinus syndrome, thyroid disease

- **INTERACTIONS**
  - Appendix 1: digoxin

- **Side effects**
  - Common or very common Arrhythmias, cardiac conduction disorder, cerebral impairment, diarrhoea, dizziness, eosinophilia, nausea, skin reactions, vision disorders, vomiting
  - Uncommon Depression
  - Rare or very rare Appetite decreased, asthenia, confusion, gastrointestinal disorders, gynaecomastia, headache, malaise, psychosis, thrombocytopenia

**Overdose** If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

- **Pregnancy**
  - Dose adjustments May need dosage adjustment.

- **Breast feeding**
  - Amount too small to be harmful.

**Renal impairment**

- Dose adjustments Reduce dose.

- Monitoring Monitor plasma-digoxin concentration in renal impairment.

**Monitoring requirements**

- For plasma-digoxin concentration assay, blood should be taken at least 6 hours after a dose.

- Monitor serum electrolytes and renal function. Toxicity increased by electrolyte disturbances.

- With intravenous use Avoid rapid intravenous administration (risk of hypertension and reduced coronary flow). For intravenous infusion (Lanoxin®), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not more than 62.5 micrograms/ml. To be given over at least 2 hours.

- With oral use. For oral administration, oral solution must not be diluted.

- **Patient and carer advice** Patient counselling is advised for digoxin elixir (use pipette).

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

**Tablet**

- **Digoxin (Non-proprietary)**
  - Digoxin 62.5 microgram tablets (£0.09)
  - Digoxin 125 microgram tablets (£0.18)
  - Digoxin 250 microgram tablets (£0.35)

- **Lanoxin** (Aspen Pharma Trading Ltd)
  - Digoxin 62.5 microgram tablets (£0.09)
  - Lanoxin 125 microgram tablets (£0.18)

**Solution for infusion**

- **Digoxin (Non-proprietary)**
  - Digoxin 250 microgram per 1 ml (£0.70)
  - Lanoxin (Aspen Pharma Trading Ltd)
  - Lanoxin 125 microgram per 1 ml (£0.18)

- **Lanoxin** (Aspen Pharma Trading Ltd)

- **Digoxin 250 microgram per 1 ml (£3.30)**
Bleeding disorders

2 Antifibrinolytic drugs and haemostatics

Overview
Fibrin dissolution can be impaired by the administration of tranexamic acid below, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic hyphaema) and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in thrombolytic overdose.

Desmopressin is used in the management of heavy menstrual bleeding and its use is no longer recommended.

TRANSAEMORRHAGICS

Tranexamic acid

26-Apr-2017

- INDICATIONS AND DOSE
- Local fibrinolysis
  - Adult: 1–1.5 g 2–3 times a day, alternatively 15–25 mg/kg 2–3 times a day
  - Initially by slow intravenous injection
  - Adult: 0.5–1 g 2–3 times a day, to be administered at a rate not exceeding 100 mg/minute, followed by (by continuous intravenous infusion) 25–50 mg/kg if required, dose to be given over 24 hours

- Menorrhagia
  - By mouth
  - Adult: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

- Hereditary angioedema
  - By mouth
  - Adult: 1–1.5 g 2–3 times a day, for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards

- Epistaxis
  - By mouth
  - Adult: 1 g 3 times a day for 7 days

- General fibrinolysis
  - By slow intravenous injection
  - Adult: 1 g every 6–8 hours, alternatively 15 mg/kg every 6–8 hours, dose to be given at a rate not exceeding 100 mg/minute

PREVENTION AND TREATMENT OF SIGNIFICANT HEMORRHAGE FOLLOWINGTRAUMA

- Initially by slow intravenous injection
- Adult: Loading dose 1 g to be given over 10 minutes, treatment should commence within 8 hours of injury, followed by (by intravenous infusion) 1 g to be given over 8 hours

- UNLICENSED USE
  - Use of tranexamic acid by continuous intravenous infusion for treatment of local fibrinolysis is an unlicensed route of administration.
  - Not licensed for prevention and treatment of significant haemorrhage following trauma.

- CONTRA-INDICATIONS
  - Fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding).
  - History of convulsions.
  - Thromboembolic disease.

- CAUTIONS
  - Irregular menstrual bleeding (establish cause before initiating therapy).
  - Massive haematuria (avoid if risk of ureteric obstruction).
  - Patients receiving oral contraceptives (increased risk of thrombosis).

- INTERACTIONS
  - Tranexamic acid

- SIDE-EFFECTS
  - General side-effects
    - Diarrhoea (reduce dose).
    - Nausea.
    - Vomiting.
    - Allergic dermatitis.
    - Colour vision change.
    - Seizure.

  - Specific side-effects
    - Hypotension.
    - Visual impairment.

  - Pregnancy
    - No evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.

  - Breastfeeding
    - Small amount present in milk—antifibrinolytic effect in infant unlikely.

  - Renal impairment
    - Dose adjustments.

  - Monitoring requirements
    - Regular liver function tests in long-term treatment of hereditary angioedema.

  - Directions for administration
    - For intravenous infusion
      - (Cyclokapron®), give continuously in Glucose 5% or Sodium chloride 0.9%.

- Medicinal forms
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, and solution for injection.

- Tablet
  - Tranexamic acid (Non-proprietary)
    - Tranexamic acid 500 mg tablets
      - 60 tablets (Boehringer Ingelheim) £32.10 DT + £5.42
    - Tranexamic acid 500 mg tablets
      - 60 tablets (Boehringer Ingelheim) £32.10 DT + £5.42

- Solution for injection
  - Tranexamic acid (Non-proprietary)
    - Tranexamic acid 100 mg per 1 ml
      - Tranexamic acid 500mg/5ml solution for injection ampoules
      - 5 ampoules (Boehringer Ingelheim) £7.50 DT + £7.50
      - 10 ampoules (Boehringer Ingelheim) £15.47 DT + £15.47 (Hospital only)
Etamsylate
(Ethamsylate)

**INDICATIONS AND DOSE**

**Short-term blood loss in menorrhagia**
- **BY MOUTH**
- Adult: 500 mg 4 times a day during menstruation

**CONTRA-INDICATIONS**
Acute porphyrias p. 1058

**CAUTIONS**
Exclude structural or histological causes of menorrhagia, or fibroids causing distortion of the uterine cavity, before initiating treatment.

**SIDE-EFFECTS**
Diarrhoea • fever (discontinue) • headache • nausea • rash • vomiting

**BREAST FEEDING**
Present in milk—manufacturer advises avoid.

**LESS SUITABLE FOR PRESCRIBING**
Less suitable for prescribing.

**MEDICINAL FORMS**
Forms available from special-order manufacturers include: tablet, oral solution

---

**2.1 Coagulation factor deficiencies**

**BLOOD AND RELATED PRODUCTS**

**Coagulation proteins**

**Dried prothrombin complex**
(Human prothrombin complex)

**INDICATIONS AND DOSE**

Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available | Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)
- **BY INTRAVENOUS INFUSION**
- Adult: (consult haematologist)
  - Major bleeding in patients on warfarin following phytomenadione (initiated under specialist supervision)
  - **BY INTRAVENOUS INFUSION**
  - Adult: 25–50 units/kg

**CONTRA-INDICATIONS**
Angina • history of heparin induced thrombocytopenia • recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of thromboembolic complications).

**CAUTIONS**
Disseminated intravascular coagulation • history of myocardial infarction or coronary heart disease • postoperative use • risk of thrombosis

**SIDE-EFFECTS**
Rare or very rare
- Fever • headache • hypersensitivity
- Frequency not known
- Disseminated intravascular coagulation • nephrotic syndrome • thromboembolism

**HEPATIC IMPAIRMENT**
Manufacturer advises caution (risk of thromboembolic complications).

**MONITORING**
Monitor closely in hepatic impairment (risk of thromboembolic complications).

**PRESCRIBING AND DISPENSING INFORMATION**

Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X.
Available from CSL Behring (Beriplex® P/N), Octapharma (Octaplex®),

**MEDICINAL FORMS** No licensed medicines listed.

**Factor VIIIa (recombinant)**
(Eptacog alfa (activated))

**INDICATIONS AND DOSE**
Treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann’s thrombasthenia

▶ BY INTRAVENOUS INJECTION
▶ Adult: (consult haematologist)

**CAUTIONS** Disseminated intravascular coagulation - risk of thrombosis

**SIDE-EFFECTS**
Uncommon: Embolism and thrombosis - fever - hepatic disorders - intestinal ischaemia - skin reactions

▶ Rare or very rare: Angina pectoris - cerebrovascular insufficiency - coagulation disorders - headache - myocardial infarction - nausea - peripheral ischaemia

**Frequency not known**: Angioedema - flushing

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- NoveSeven (Novo Nordisk Ltd)
  - Eptacog alfa activated 50000 unit: NoveSeven 1mg (50,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection £525.20 (Hospital only)
  - NovoSeven 1mg (50,000units) powder and solvent for solution for injection vials | 1 vial £525.20 (Hospital only)
  - Eptacog alfa activated 100000 unit: NovoSeven 2mg (100,000units) powder and solvent for solution for injection vials | 1 vial £1,050.60 (Hospital only)
  - NovoSeven 2mg (100,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection £525.20 (Hospital only)
- Eptacog alfa activated 250000 unit: NovoSeven 5mg (250,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection £2,662.00 (Hospital only)
  - NovoSeven 5mg (250,000units) powder and solvent for solution for injection vials | 1 vial £2,662.00 (Hospital only)
  - Eptacog alfa activated 400000 unit: NovoSeven 8mg (400,000units) powder and solvent for solution for injection vials | 1 vial £4,201.00 (Hospital only)
  - NovoSeven 8mg (400,000units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection £4,201.00 (Hospital only)

**Factor VIII fraction, dried**
(Human coagulation factor VIII, dried)

**INDICATIONS AND DOSE**
Treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency (Von Willebrand's disease)

▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION
▶ Adult: (consult haematologist)

**CAUTIONS** Intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates

**SIDE-EFFECTS**

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- Factor VIII fraction, dried (Non-proprietary)
  - Factor VIII 500 unit: Dried Factor VIII Fraction type BY 500unit powder and solvent for solution for injection vials | 1 vial £210.00
  - Advate (Baxalta UK Ltd)
    - Octocog alfa 250 unit: Advate 250unit powder and solvent for solution for injection vials | 1 vial £177.50
    - Octocog alfa 500 unit: Advate 500unit powder and solvent for solution for injection vials | 1 vial £355.00
    - Octocog alfa 1000 unit: Advate 1000unit powder and solvent for solution for injection vials | 1 vial £710.00
  - Octocog alfa 2000 unit: Advate 2000unit powder and solvent for solution for injection vials | 1 vial £1,420.00
- Alphanate (Grifols UK Ltd)
  - Factor VIII high purity 1000 unit, von Willebrand factor 1200 unit: Alphanate 100unit powder and solvent for solution for injection vials | 1 vial £330.00
  - Factor VIII high purity 1500 unit, von Willebrand factor 1800 unit: Alphanate 150unit powder and solvent for solution for injection vials | 1 vial £495.00
  - Elocta (Swedish Orphan Biovitrum Ltd)
    - Efmoroctocog alfa 250 unit: Elocta 250unit powder and solvent for solution for injection vials | 1 vial £600.00 (Hospital only)
    - Efmoroctocog alfa 500 unit: Elocta 500unit powder and solvent for solution for injection vials | 1 vial £1,050.60 (Hospital only)
    - Efmoroctocog alfa 1000 unit: Elocta 1000unit powder and solvent for solution for injection vials | 1 vial £1,500.00 (Hospital only)
    - Efmoroctocog alfa 1500 unit: Elocta 1500unit powder and solvent for solution for injection vials | 1 vial £1,775.00 (Hospital only)
    - Efmoroctocog alfa 2000 unit: Elocta 2000unit powder and solvent for solution for injection vials | 1 vial £2,310.00 (Hospital only)
    - Efmoroctocog alfa 3000 unit: Elocta 3000unit powder and solvent for solution for injection vials | 1 vial £3,150.00 (Hospital only)
- Fanhdi (Grifols UK Ltd)
  - Factor VIII high purity 500 unit: Fanhdi 500unit powder and solvent for solution for injection vials | 1 vial £1,650.00 (Hospital only)
  - Factor VIII high purity 1000 unit: Fanhdi 1000unit powder and solvent for solution for injection vials | 1 vial £3,300.00 (Hospital only)
  - Factor VIII high purity 1500 unit: Fanhdi 1500unit powder and solvent for solution for injection vials | 1 vial £4,950.00
- Haemocin (Biotest (UK) Ltd)
  - Factor VIII high purity 250 unit: Haemocin 250unit powder and solvent for solution for injection vials | 1 vial £150.00 (Hospital only)
  - Factor VIII high purity 500 unit: Haemocin 500unit powder and solvent for solution for injection vials | 1 vial £300.00 (Hospital only)
  - Factor VIII high purity 1000 unit: Haemocin 1000unit powder and solvent for solution for injection vials | 1 vial £600.00 (Hospital only)
- Kogenate (Bayer Plc)
  - Octocog alfa 2000 unit: Kogenate Bayer 200unit powder and solvent for solution for injection vials | 1 vial £1,260.00
  - Kogenate Bayer (Bayer Plc)
    - Octocog alfa 250 unit: Kogenate Bayer 250unit powder and solvent for solution for injection vials | 1 vial £1,750.00
    - Octocog alfa 500 unit: Kogenate Bayer 500unit powder and solvent for solution for injection vials | 1 vial £3,150.00
    - Octocog alfa 1000 unit: Kogenate Bayer 1000unit powder and solvent for solution for injection vials | 1 vial £6,300.00

**MONITORING REQUIREMENTS**
Monitor for development of factor VIII inhibitors.

**PRESCRIBING AND DISPENSING INFORMATION**
Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor. Optivate®, Fanhdi®, and Octanate® are not indicated for use in von Willebrand’s disease.

Recombinant human coagulation factor VIII including octocog alfa, moroctocog alfa, and simoctocog alfa are not indicated for use in von Willebrand’s disease.
Coagulation factor deficiencies

**CONTRA-INDICATIONS** Disseminated intravascular coagulation

**CAUTIONS** Risk of thrombosis—principally with former low purity products

**SIDE-EFFECTS**
- Common or very common Anxiety, back pain, dyspnoea, hypersensitivity, nausea, skin reactions - vasodilation
- Rare or very rare Angioedema, cardiac discomfort, disseminated intravascular coagulation, embolism and thrombosis, headache, hypotension, lehargy, myocardial infarction, tachycardia, vomiting, wheezing
- Frequency not known Nephrotic syndrome

**PRESCRIBING AND DISPENSING INFORMATION** Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - Alphanine (Grifols UK Ltd)
  - Factor IX high purity 1000 unit (Hospital only)
  - Haemonine (Biotest (UK) Ltd)
  - ReFacto AF (Bio Products Laboratory Ltd)
  - ReFacto high purity 1000 unit (Hospital only)

- **Powder and solvent for solution for infusion**
  - Benefix (Pfizer Ltd)
  - Nonacog alfa 250 unit (Hospital only)
  - Replene-F (Bio Products Laboratory Ltd)
  - Replene-VF (Bio Products Laboratory Ltd)

**Factor XII fraction, dried**

(Human fibrin-stabilising factor, dried)

**INDICATIONS AND DOSE**
- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: (consult haematologist)

**SIDE-EFFECTS**
- Rare or very rare Anaphylactoid reaction - dyspnoea - skin reactions

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - Fibrogammin P (CSL Behring UK Ltd)
  - Factor XIII 250 unit (Hospital only)

---

**BNF 78**

**Medicines for the Cardiovascular System**

**Factor IX fraction, dried**

Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

- BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- Adults: (consult haematologist)
Fibrinogen, dried
(Human fibrinogen)

- **INDICATIONS AND DOSE**
  Treatment of haemorrhage in congenital hypofibrinogenaemia or afibrinogenaemia
  - By Intravenous injection, or by Intravenous infusion
  - Adult: (consult haematologist)

- **CAUTIONS** Risk of thrombosis
- **SIDE-EFFECTS**
  - Common or very common: Fever, thromboembolism
  - Frequency not known: Chest pain, chills, cough, dyspnoea, nausea, skin reactions, tachycardia, vomiting
- **PREGNANCY** Manufacturer advises not known to be harmful—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Fibrinogen is prepared from human plasma.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - Powder for solution for infusion
    - Ristap (CSL Behring UK Ltd)
      - Fibrinogen 1 gram: Ristap 1g powder for solution for infusion vials | 1 vial PDP £400.00

Protein C concentrate

- **INDICATIONS AND DOSE**
  Congenital protein C deficiency
  - By Intravenous Injection
  - Adult: (consult haematologist)

- **CAUTIONS** Hypersensitivity to heparins
- **SIDE-EFFECTS**
  - Rare or very rare: Dizziness, fever, skin reactions
  - Frequency not known: Haemorrhaxia, hyperhidrosis, restlessness

- **PRESCRIBING AND DISPENSING INFORMATION**
  Protein C is prepared from human plasma.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - Powder and solvent for solution for injection
    - Ceprotin (Baxalta UK Ltd)
      - Protein C 500 unit: Ceprotin 500 unit powder and solvent for solution for injection vials | 1 vial PDP £2,000.00
      - Protein C 1000 unit: Ceprotin 1000 unit powder and solvent for solution for injection vials | 1 vial PDP £1,000.00

Factor VIII inhibitor bypassing fraction

- **INDICATIONS AND DOSE**
  Treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors
  - Treatment of haemorrhage in non-haemophilic patients with acquired factor VIII inhibitors
  - By Intravenous infusion, or by Intravenous injection
  - Adult: (consult haematologist)

- **CONTRA-INDICATIONS**
  Disseminated intravascular coagulation

- **SIDE-EFFECTS**
  - Common or very common: Dizziness, headache, hypersensitivity, hypotension, skin reactions
  - Frequency not known: Abdominal discomfort, anamnestic reaction, angioedema, chest discomfort, chills, cough, diarrhoea, disseminated intravascular coagulation, drowsiness, dyspnoea, embolism and thrombosis, fever, flushing, hypertension, ischaemic stroke, malaise, myocardial infarction, nausea, paraesthesia, respiratory disorders, restlessness, tachycardia, taste altered, vomiting

- **PRESCRIBING AND DISPENSING INFORMATION**
  Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - Powder and solvent for solution for injection
    - FEIBA Imuno (Baxalta UK Ltd)
      - Factor VIII inhibitor bypassing fraction 500 unit: FEIBA 500 unit powder and solvent for solution for injection vials | 1 vial PDP £390.00
      - Factor VIII inhibitor bypassing fraction 1000 unit: FEIBA 1,000 unit powder and solvent for solution for infusion vials | 1 vial PDP £780.00

Fresh frozen plasma

- **INDICATIONS AND DOSE**
  Replacement of coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced
  - By Intravenous infusion
  - Adult: (consult haematologist)

  Major bleeding in patients on warfarin following phytomenadione (if dried prothrombin complex is unavailable)
  - Adult: 15 mL/kilogram

- **CONTRA-INDICATIONS**
  Avoid use as a volume expander - IgA deficiency with confirmed antibodies to IgA

- **CAUTIONS**
  Cardiac decompensation - need for compatibility - pulmonary oedema - severe protein S deficiency (avoid products with low protein S activity e.g. OctaplasLG)

- **SIDE-EFFECTS**
  - Common or very common: Skin reactions
  - Uncommon: Fever, hypersensitivity, hypoxia, nausea, sensation abnormal, vomiting
  - Rare or very rare: Abdominal pain, anxiety, arrhythmias, back pain, cardiac arrest, chest discomfort, chills, circulatory collapse, citrate toxicity, dizziness, dyspnoea, flushing, haemolytic anaemia, haemorrhage, hyperhidrosis, hypertension, hypotension, localised oedema, malaise, procedural complications, pulmonary oedema, respiratory disorders, thromboembolism

- **PRESCRIBING AND DISPENSING INFORMATION**
  Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood.
  A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (OctaplasLG).
2.2 Subarachnoid haemorrhage

CALCIUM-CHANNEL BLOCKERS

Nimodipine

07-Feb-2018

● DRUG ACTION Nimodipine is a dihydropyridine calcium-channel blocker.

● INDICATIONS AND DOSE

Prevention of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

BY MOUTH

Adult: 60 mg every 4 hours, to be started within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days.

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

BY INTRAVENOUS INFUSION

Adult (body-weight up to 70 kg): Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter.

Adult (body-weight 70 kg and above): Initially 1 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter.

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage in patients with unstable blood pressure

BY INTRAVENOUS INFUSION

Adult: Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Nimodipine has been confused with amlodipine; care must be taken to ensure the correct drug is prescribed and dispensed.

● CONTRA-INDICATIONS Unstable angina - within 1 month of myocardial infarction

● CAUTIONS Cerebral oedema - hypotension - severely raised intracranial pressure

● INTERACTIONS Appendix 1: calcium channel blockers

● SIDE-EFFECTS

Uncommon

Thrombocytopenia - vasodilatation

Rare or very rare

Bradycardia - ileus

● PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

● BREAST FEEDING Manufacturer advises avoidance—present in milk.

● RENAL IMPAIRMENT Monitoring - With intravenous use Manufacturer advises monitor renal function closely in renal impairment.

● DIRECTIONS FOR ADMINISTRATION Avoid concomitant administration of nimodipine infusion and tablets.

- With oral use For administration by mouth, tablets may be crushed or halved but are light sensitive—administer immediately.

- With intravenous use For intravenous infusion, give via drip tubing in Glucose 5% or Sodium chloride 0.9%. Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light.

- With intravenous use Polyethylene, polypropylene, or glass apparatus should be used.

2.3 Antithrombotic drugs

3 Blood clots

3.1 Blocked catheters and lines

Other drugs used for Blocked catheters and lines

Heparin (unfractionated), p. 133 · Urokinase, p. 138

ANTITHROMBOTIC DRUGS

Epoprostenol

(Prostacyclin)

● DRUG ACTION Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

● INDICATIONS AND DOSE

Inhibition of platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated

Treatment of primary pulmonary hypertension resistant to other treatments, usually with oral anti-coagulation (initiated by a specialist)

BY CONTINUOUS INTRAVENOUS INFUSION

Adult: (consult product literature)

- Initial dose - 0.5 μg/kg/min, increased after 30 minutes to 1 μg/kg/min

- Maximum dose - 20 μg/kg/min

- Bolus - 15 μg/kg

PHARMACOKINETICS

- Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

- Contra-indications

Severe left ventricular dysfunction

Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension) - extreme caution in coronary artery disease - haemorrhagic diathesis - pulmonary veno-occlusive disease - reconstituted solution highly alkaline—avoid extravasation (irritant to tissues) - risk of pulmonary

www.getintopharma.com
Venous thromboembolism prophylaxis

Overview
Venous thromboembolism includes deep-vein thrombosis and pulmonary embolism and occurs as a result of thrombus formation in a vein.

Venous thromboembolism prophylaxis

All patients should undergo a risk assessment to identify their risk of venous thromboembolism and bleeding on admission to hospital. Commonly used risk assessment tools can be found at www.nice.org.uk/guidance/ng89/resources. Patients considered to be at high risk of venous thromboembolism include those who are anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of venous thromboembolism, thrombophilic disorder, and patients over 60 years of age. Pregnancy and the postpartum period are also risk factors for venous thromboembolism.

There are two methods of thromboprophylaxis: mechanical and pharmacological. Options for mechanical prophylaxis are anti-embolism stockings that provide graduated compression and produce a calf pressure of 14–15 mmHg, and intermittent pneumatic compression.

Anti-embolism stockings should be worn day and night until the patient is sufficiently mobile; they should not be offered to patients admitted with acute stroke or those with conditions such as peripheral arterial disease, peripheral neuropathy, severe leg oedema, or local conditions (e.g. gangrene, dermatitis).

When using pharmacological prophylaxis, in most cases, it should start as soon as possible or within 14 hours of admission. Patients with risk factors for bleeding (e.g. acute stroke, thrombocytopenia, acquired or untreated inherited bleeding disorders) should only receive pharmacological prophylaxis when their risk of venous thromboembolism outweighs their risk of bleeding. Patients receiving anticoagulant therapy who are at high risk of venous thromboembolism should be considered for prophylaxis if their anticoagulant therapy is interrupted, for example during the peri-operative period.

For full guidance on prophylaxis of venous thromboembolism, see NICE guideline 89 (www.nice.org.uk/guidance/ng89).

Surgical patients
To reduce the risk of venous thromboembolism in surgical patients, regional anaesthesia over general anaesthesia should be used if possible.

Mechanical prophylaxis (e.g. anti-embolism stockings or intermittent pneumatic compression) should be offered to patients with major trauma, or undergoing cranial, abdominal, bariatric, thoracic, maxillofacial, ear, nose, and throat, cardiac or elective spinal surgery. Prophylaxis should continue until the patient is sufficiently mobile or discharged from hospital (or for 30 days in spinal injury, elective spinal surgery or cranial surgery). Choice of mechanical prophylaxis depends on factors such as the type of surgery, suitability for the patient, and their condition.

Pharmacological prophylaxis should be considered in patients undergoing general or orthopaedic surgery when the risk of venous thromboembolism outweighs the risk of bleeding. The choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy.

A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; heparin (unfractionated) p. 133 is preferred in patients with renal impairment.

Fondaparinux sodium p. 127 is an option for patients undergoing abdominal, bariatric, thoracic or cardiac surgery, or for patients with lower limb immobilisation or fragility fractures of the pelvis, hip or proximal femur.

Pharmacological prophylaxis in general surgery should usually continue for at least 7 days post-surgery, or until sufficient mobility has been re-established. Pharmacological prophylaxis should be extended to 28 days after major cancer surgery in the abdomen, and to 30 days in spinal surgery.

Mechanical prophylaxis with intermittent pneumatic compression should be considered when pharmacological prophylaxis is contra-indicated in patients undergoing lower limb amputation, or those with major trauma or fragility fractures of the pelvis, hip or proximal femur.

Patients undergoing an elective hip replacement should be given thromboprophylaxis with either a low molecular weight heparin administered for 10 days followed by low-dose aspirin p. 121 for a further 28 days, or a low molecular weight heparin administered for 28 days in combination with anti-embolism stockings until discharge, or rivaroxaban p. 128. If these options are unsuitable, apixaban p. 125 or dabigatran etexilate p. 136 can be considered as alternatives. If pharmacological prophylaxis is contra-indicated, anti-embolism stockings can be used until discharge.

Patients undergoing an elective knee replacement should be given thromboprophylaxis with either low-dose aspirin p. 121 for 14 days, or a low molecular weight heparin administered for 14 days in combination with anti-embolism stockings until discharge, or rivaroxaban. If these options are
unsuitable, apixaban or dabigatran etexilate can be considered as alternatives. If pharmacological prophylaxis is contra-indicated, intermittent pneumatic compression can be used until the patient is mobile.

**Medical patients**

The choice of prophylaxis will depend on the medical condition, suitability for the patient, and local policy. Acutely ill medical patients who are at high risk of venous thromboembolism should be offered pharmacological prophylaxis. Patients should be given either a low molecular weight heparin as a first-line option, or fondaparinux sodium as an alternative, for a minimum of 7 days. Patients with renal impairment should be given either a low molecular weight heparin or heparin (unfractionated) and the dose should be adjusted as necessary.

Mechanical prophylaxis can be considered when pharmacological prophylaxis is contra-indicated; their use should be continued until the patient is sufficiently mobile. In patients admitted with acute stroke, mechanical prophylaxis with intermittent pneumatic compression should be considered, as anti-embolism stockings are unsuitable in these patients; their use should be started within 3 days of the acute stroke and continued for 30 days, or until the patient is sufficiently mobile or discharged from hospital.

**Thromboprophylaxis in pregnancy**

All pregnant women (who are not in active labour), or women who have given birth, had a miscarriage or termination of pregnancy during the past 6 weeks, with a risk of venous thromboembolism that outweighs the risk of bleeding should be considered for pharmacological prophylaxis with a low molecular weight heparin during hospital admission. In pregnant women, prophylaxis should be continued until there is no longer a risk of venous thromboembolism, or until discharge from hospital. Women who have given birth, had a miscarriage or termination of pregnancy during the past 6 weeks, should start thromboprophylaxis with a low molecular weight heparin 4–8 hours after the event, unless contra-indicated, and continue for a minimum of 7 days.

Additional mechanical prophylaxis should be considered for women who are likely to be immobilised or have significantly reduced mobility and continued until the woman is sufficiently mobile or discharged from hospital. Intermittent pneumatic compression should be used as the first-line option and anti-embolism stockings as an alternative.

**Edoxaban**

Edoxaban p. 126, an inhibitor of factor Xa, can be given orally for the treatment and prophylaxis of venous thromboembolism, although, it should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy. Duration of therapy should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e. recent surgery, trauma, immobilisation, and longer durations should be based on permanent risk factors or idiopathic deep-vein thrombosis or pulmonary embolism.

**Treatment of venous thromboembolism**

For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, heparin (unfractionated) p. 133 is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or (for deep-vein thrombosis only) by intermittent subcutaneous injection. Intermittent intravenous injection of heparin (unfractionated) is no longer recommended. An oral anticoagulant (usually warfarin sodium p. 140 is started at the same time as unfractionated or low molecular weight heparin (the heparin needs to be continued for at least 5 days and until the INR is ≥2 for at least 24 hours). Laboratory monitoring for heparin (unfractionated), preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure (for heparin (unfractionated). A low molecular weight heparin or, in some circumstances, heparin (unfractionated) is also used in regimens for the management of myocardial infarction and unstable angina.

**Treatment of venous thromboembolism in pregnancy**

Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 131, enoxaparin sodium p. 132, and tinzaparin sodium p. 134. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

**Extracorporeal circuits**

Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

**Haemorrhage**

If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate p. 1368 is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

**Advanced Pharmacy Services**

Patients with, or at risk of venous thromboembolism may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

---

**Stroke**

**Overview**

Stroke is associated with a significant risk of morbidity and mortality. Patients presenting with acute symptoms should be immediately transferred to hospital for accurate diagnosis of stroke type, and urgent initiation of appropriate treatment; patients should be managed by a specialist multidisciplinary stroke team.

The following notes give an overview of the initial and long-term management of transient ischaemic attack, ischaemic stroke, and intra-cerebral haemorrhage.

**Transient ischaemic attack**

Patients suspected of having a transient ischaemic attack should immediately receive aspirin p. 121 (patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel p. 123 [unlicensed use] as an alternative). Following a confirmed diagnosis, patients should receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke).

**Ischaemic stroke**

**Initial management**

Alteplase p. 216 is recommended in the treatment of acute ischaemic stroke if it can be administered within 4.5 hours of symptom onset; it should be given by medical staff...
Cardiovascular system

already receiving anticoagulation for a prosthetic heart valve

be considered for anticoagulant treatment. Patients

fibrillation following a disabling ischaemic stroke should receive aspirin before

in the acute phase of ischaemic stroke.

Anticoagulants should be considered after cardio-embolic

be initiated 24 hours after thrombolysis (or as soon as possible within

patients who are in sinus rhythm. However, parenteral anticoagulants may

are symptomomatic of, or at high

risk of developing, deep vein thrombosis or pulmonary embolism; warfarin sodium p. 140 should not be commenced

in the acute phase of ischaemic stroke.

Anticoagulants are not recommended as an alternative to

antiplatelet drugs in acute ischaemic stroke in patients who

which include both antiplatelets and anticoagulants: dipyridamole and

ischaemic stroke in patients with atrial

in the acute phase of ischaemic stroke. Statins should be avoided following

intracerebral haemorrhage, however they can be used with caution when the risk of a vascular event outweighs the risk

of further haemorrhage.

Advanced Pharmacy Services

Patients at risk of, or patients with a history of stroke or

transient ischaemic attack, may be eligible for the New

Medicines Service / Medicines Use Review service provided by

a community pharmacist. For further information, see

Advanced Pharmacy Services in Guidance on prescribing p. 1.

Oral anticoagulants

Overview

The main use of anticoagulants is to prevent thrombus

formation or extension of an existing thrombus in the

slower-moving venous side of the circulation, where the

thrombus consists of a fibrin web enmeshed with platelets and

red cells.

Anticoagulants are of less use in preventing thrombus

formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Coumarins and phenindione

The oral anticoagulants warfarin sodium p. 140,

acenocoumarol p. 139 and phenindione p. 140, antagonise

the effects of vitamin K, and take at least 48 to 72 hours for

the anticoagulant effect to develop fully; warfarin sodium is the
drug of choice. If an immediate effect is required, unfraccionated or low molecular weight heparin must be
given concomitantly.

These oral anticoagulants should not be used in cerebral

artery thrombosis or peripheral artery occlusion as first-line

treatment; aspirin p. 121 is more appropriate for reduction of

risk in transient ischaemic attacks. Unfraccionated or a low

molecular weight heparin (see under Parenteral anticoagulants p. 120) is usually preferred for the

prophylaxis of venous thromboembolism in patients

undergoing surgery; alternatively, warfarin sodium can be

continued in selected patients currently taking long-term

warfarin sodium and who are at high risk of

thromboembolism (seek expert advice).

Dose

The base-line prothrombin time should be determined but

the initial dose should not be delayed whilst awaiting the

result.

Target INR

The following indications and target INRs for adults for

warfarin take into account recommendations of the British

Society for Haematology guidelines on oral anticoagulation with warfarin—fourth edition. Br J Haematol 2011; 154:

311–324:

An INR which is within 0.5 units of the target value is
generally satisfactory; larger deviations require dosage
adjustment. Target values (rather than ranges) are now recommended.
INR 2.5 for:

- treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium)
- atrial fibrillation
- cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR)
- dilated cardiomyopathy
- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction INR 3.5 for:
- recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2;
- Mechanical prosthetic heart valves:
  - the recommended target INR depends on the type and location of the valve, and patient-related risk factors
  - consider increasing the INR target or adding an antplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

**Duration**
The risks of thromboembolism recurrence and anticoagulant-related bleeding should be considered when deciding the duration of anticoagulation.

- 6 weeks for isolated calf-vein deep-vein thrombosis
- 3 months for venous thromboembolism provoked by surgery or other transient risk factor (e.g. combined oral contraceptive use, pregnancy, plaster cast)
- at least 3 months for unprovoked proximal deep-vein thrombosis or pulmonary embolism; long-term anticoagulation may be required.

**Haemorrhage**
The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. Br J Haematol 2011; 154: 311–324) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to adults taking warfarin:

- Major bleeding—stop warfarin sodium; give phytonadionide p. 1089 (vitamin K) by slow intravenous injection; give dried prothrombin complex p. 111 (factors II, VII, IX, and X); if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal
- INR >8.0, minor bleeding—stop warfarin sodium; give phytonadionide (vitamin K) by slow intravenous injection; repeat dose of phytonadionide if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytonadionide (vitamin K) by mouth using the intravenous preparation orally [unlicensed use]; repeat dose of phytonadionide if INR still too high after 24 hours; restart warfarin when INR <5.0
- INR 5.0–8.0, minor bleeding—stop warfarin sodium; give phytonadionide (vitamin K) by slow intravenous injection; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, no bleeding— withholding 1 or 2 doses of warfarin sodium and reduce subsequent maintenance dose
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

**Peri-operative anticoagulation**
Warfarin sodium should usually be stopped 5 days before elective surgery; phytonadionide (vitamin K) by mouth (using the intravenous preparation orally [unlicensed use]) should be given the day before surgery if the INR is >1.5. If haemostasis is adequate, warfarin sodium can be resumed at the normal maintenance dose on the evening of surgery or the next day.

Patients stopping warfarin sodium prior to surgery who are considered to be at high risk of thromboembolism (e.g. those with a venous thromboembolic event within the last 3 months, atrial fibrillation with previous stroke or transient ischaemic attack, or mitral mechanical heart valve) may require interim therapy (“bridging”) with a low molecular weight heparin (using treatment dose). The low molecular weight heparin should be stopped at least 24 hours before surgery; if the surgery carries a high risk of bleeding, the low molecular weight heparin should not be restarted until at least 48 hours after surgery.

Patients on warfarin sodium p. 140 who require emergency surgery that can be delayed for 6–12 hours can be given intravenous phytonadionide p. 1089 (vitamin K) to reverse the anticoagulant effect. If surgery cannot be delayed, dried prothrombin complex p. 111 can be given in addition to intravenous phytonadionide (vitamin K) and the INR checked before surgery.

**Combined anticoagulant and antiplatelet therapy**
Existing antiplatelet therapy following an acute coronary syndrome or percutaneous coronary intervention should be continued for the necessary duration according to the indication being treated. The addition of warfarin sodium, when indicated (e.g. for venous thromboembolism or atrial fibrillation) should be considered following an assessment of the patient’s risk of bleeding and discussion with a cardiologist. The duration of treatment with dual therapy (e.g. aspirin and warfarin sodium) or triple therapy (e.g. aspirin with clopidogrel and warfarin sodium) should be kept to a minimum where possible. The risk of bleeding with aspirin and warfarin sodium dual therapy is lower than with clopidogrel and warfarin sodium. Depending on the indications being treated and the patient’s risk of thromboembolism, it may be possible to withhold antiplatelet therapy until warfarin sodium therapy is complete, or vice versa (on specialist advice) in order to reduce the length of time on dual or triple therapy.

**Advanced Pharmacy Services**
Patient taking oral anticoagulants may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further
Parenteral anticoagulants

Overview
The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Heparin
Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as ‘standard’ or heparin (unfractionated) p. 133 to distinguish it from the low molecular weight heparins, which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin (unfractionated) can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

Low molecular weight heparins
Low molecular weight heparins (dalteparin sodium p. 131, enoxaparin sodium p. 132, and tinzaparin sodium p. 134) are usually preferred over heparin (unfractionated) in the prevention of venous thromboembolism because they are as effective and they have a lower risk of heparin-induced thrombocytopenia. The standard prophylactic regimen does not require anticoagulant monitoring. The duration of action of low molecular weight heparins is longer than that of heparin (unfractionated) and once-daily subcutaneous administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are generally preferred over heparin (unfractionated) in the treatment of deep vein thrombosis and pulmonary embolism, and are also used in the treatment of myocardial infarction, unstable coronary artery disease (see under Acute coronary syndromes p. 213) and for the prevention of clotting in extracorporeal circuits.

Dalteparin sodium and tinzaparin sodium (only 20 000 unit/mL syringe) are also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months. Treatment should be initiated by healthcare professionals experienced in the treatment of venous thromboembolism.

Heparinoids
Danaparoid sodium p. 130 is a heparinoid used for prophylaxis of deep-vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop heparin-induced thrombocytopenia.

Argatroban
An oral anticoagulant can be given with argatroban monohydrate p. 135, but it should only be started once thrombocytopenia has substantially resolved.

Hirudins
Bivalirudin, a hirudin analogue, is a thrombin inhibitor which is licensed for unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention, and as an anticoagulant for patients undergoing percutaneous coronary intervention (including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention—see also Management of ST-segment elevation myocardial infarction (STEMI) in Acute coronary syndromes p. 213).

Heparin flushes
The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Epoprostenol
Epoprostenol (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anticoagulation; it should be initiated by specialists in pulmonary hypertension.

Epoprostenol is a potent vasodilator. It has a short half-life of approximately 3 minutes and therefore it must be administered by continuous intravenous infusion.

Fondaparinux
Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

ANTIDOTES AND CHELATORS

Idarucizumab

- **DRUG ACTION** Idarucizumab is a humanised monoclonal antibody fragment that binds specifically to dabigatran and its metabolites, thereby reversing the anticoagulant effect.

- **INDICATIONS AND DOSE** Rapid reversal of dabigatran for emergency procedures, or in life-threatening or uncontrolled bleeding (specialist supervision in hospital)
  - By intravenous injection, or by intravenous infusion
  - Adult: 5 g, followed by 5 g if required

- **CAUTIONS** Risk of thrombosis
  - **FURTHER INFORMATION** Manufacturer advises to consider re-starting anticoagulant therapy as soon as medically appropriate to reduce the risk of thrombosis.
  - Dabigatran can be re-started 24 hours after administration of idarucizumab; other anticoagulant therapy can be started at any time.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that one dose of Praxbind is administered as either two consecutive intravenous infusions, each given over 5–10 minutes, or as a bolus injection.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions
    - SMC No. 1178/16
    - The Scottish Medicines Consortium has advised (September 2016) that idarucizumab (Praxbind) is accepted for use within NHS Scotland for adults treated with dabigatran etexilate when rapid reversal of its anticoagulant effects is required for emergency surgery/urgent procedures or in life-threatening or uncontrolled bleeding.

Other drugs used for Thromboembolism Streptokinase, p. 217
Antiplatelet drugs

Overview

Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Use of aspirin below in primary prevention of cardiovascular disease, in patients with or without diabetes, or hypertension, is not recommended. Long-term use of low-dose aspirin is recommended in patients with established cardiovascular disease (secondary prevention); a unduly high blood pressure must be controlled before aspirin is given. If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor can be added. For full guidance on the assessment and prevention of cardiovascular disease risk, see Cardiovascular disease risk assessment and prevention p. 189.

Aspirin is given following coronary bypass surgery. It is also used in atrial fibrillation, for intermittent claudication, for stable angina and acute coronary syndromes, for use following placement of coronary stents and for use in stroke.

Clopidogrel p. 123 is used for the prevention of atherothrombotic events in patients with a history of symptomatic ischaemic disease (e.g. ischaemic stroke).

In patients with non-ST elevation acute coronary syndromes, clopidogrel, should be given for three months in addition to long-term low-dose aspirin. a

Clopidogrel is also used, in combination with low-dose aspirin, for the prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (and at least one risk factor for a vascular event), and for whom warfarin sodium p. 140 is unsuitable.

Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy may be an alternative when aspirin is contra-indicated, for example in patients with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor.

Dipyridamole p. 124 is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks.

Prasugrel p. 214, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention; the combination is usually given for up to 12 months.

Ticagrelor p. 215, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome; the combination is usually given for up to 12 months.

Cangrelor p. 209, in combination with aspirin, is licensed for the reduction of thrombotic cardiovascular events in patients with coronary artery disease undergoing percutaneous coronary intervention (PCI) who have not received treatment with oral clopidogrel, prasugrel or ticagrelor prior to the procedure and in whom oral therapy with these drugs is not suitable. Cangrelor is to be used under expert supervision only.

Antiplatelet drugs and coronary stents

Patients selected for percutaneous coronary intervention, with the placement of a coronary stent, will require dual antiplatelet therapy with aspirin and either cangrelor, clopidogrel, prasugrel, or ticagrelor [unlicensed]. Aspirin therapy should continue indefinitely. a Following percutaneous coronary intervention in patients with stable angina, clopidogrel is recommended in addition to aspirin for at least 1 month after placement of a bare-metal stent, and for at least 6 months if a drug-eluting stent is used. a

Clopidogrel should not be discontinued prematurely in patients with a drug-eluting stent—there is an increased risk of stent thrombosis as a result of the eluted drug slowing the re-endothelialisation process. Patients considered to be at high-risk of developing late stent thrombosis with a drug-eluting stent may require a longer duration of treatment with clopidogrel combined with aspirin. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients undergoing percutaneous coronary intervention.

Glycoprotein Ilb/IIa inhibitors

Glycoprotein Ilb/IIa inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab is a monoclonal antibody which binds to glycoprotein Ilb/IIa receptors and to other related sites; it is licensed as an adjunct to heparin (unfractionated) p. 133 and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk of thrombocytopenia). Epifibatide p. 210 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 210 (in combination with heparin (unfractionated), aspirin, and clopidogrel) also inhibit glycoprotein Ilb/IIa receptors; they are licensed for use to prevent early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction. Tirofiban is also licensed for use in combination with heparin (unfractionated), aspirin, and clopidogrel, for the reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction intended for primary percutaneous coronary intervention. Abciximab, epifibatide and tirofiban should be used by specialists only.

Epoprostenol p. 115 is also used to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated.

Advanced Pharmacy Services

Patients taking antiplatelet drugs may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Aspirin

(Acetylsalicylic Acid)

INDICATIONS AND DOSE

Cardiovascular disease (secondary prevention)

BY MOUTH

Adult: 75 mg daily

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) / Management of ST-segment elevation myocardial infarction (STEMI)

BY MOUTH

Adult: 300 mg, chewed or dispersed in water continued
Cardiovascular system

Rare or very rare

With oral use

Uncommon

Common or very common

Rare or very rare

SIDE-EFFECTS

CAUTIONS

CONTRA-INDICATIONS

Active peptic ulceration - bleeding disorders (antiplatelet dose) - children under 16 years (risk of Reye’s syndrome) - haemophilia - previous peptic ulceration (analgesic dose) - severe cardiac failure (analgesic dose)

CONTRA-INDICATIONS, FURTHER INFORMATION

Reye’s syndrome Owing to an association with Reye’s syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease.

CAUTIONS

Allergic disease - anaemia - asthma - dehydraton - elderly - G6PD deficiency - preferably avoid during fever or viral infection in children (risk of Reye’s syndrome) - previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration) - thyrotoxicosis - uncontrolled hypertension

INTERACTIONS

Appendix 1: aspirin

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Rare or very rare

Asthmatic attack - bronchospasm

SPECIFIC SIDE-EFFECTS

Common or very common

With oral use

Dyspepsia - haemorrhage

Uncommon

With oral use

Dyspnoea - rhinitis - severe cutaneous adverse reactions (SCARs) - skin reactions

Rare or very rare

With oral use

Aplastic anaemia - erythema nodosum - gastrointestinal haemorrhage (severe) - granulocytosis - haemorrhagic vasculitis - intracranial haemorrhage - menorrhagia - nausea - thrombocytopenia - vomiting

Frequency not known

With oral use

Fluid retention - gastrointestinal disorders - headache - hearing loss - hepatic failure - hyperuricaemia - iron deficiency anaemia - renal impairment - sodium retention - tinnitus - vertigo

Overdose

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning.

For specific details on the management of poisoning, see Aspirin, under Emergency treatment of poisoning p. 1359.

ALLERGY AND CROSS-SENSITIVITY

Aspirin is contra-indicated in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID.

PREGNANCY

Use antiplatelet doses with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); high doses may be related to intra-uterine growth restriction, teratogenic effects, closure of fetal ductus arteriosus in uterus and possibly persistent pulmonary hypertension of newborn; kernicterus may occur in jaundiced neonates.

BREAST FEEDING

Avoid—possible risk of Reye’s syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low.

HEPATIC IMPAIRMENT

Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment.

RENAL IMPAIRMENT

Use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding.

PRESCRIBING AND DISPENSING INFORMATION

BP directs that when no strength is stated the 300 mg strength should be dispensed, and that when soluble aspirin tablets are prescribed, dispersible aspirin tablets shall be dispensed.

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary

Aspirin Dispersible Tablets 300 mg may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY

Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 5, 25, 32

Clopidogrel  

**INDICATIONS AND DOSE**

Prevention of atherothrombotic events in percutaneous coronary intervention (adjunct with aspirin) in patients not already on clopidogrel

- **BY MOUTH**
  - Adult: Loading dose 300 mg, to be taken prior to the procedure, alternatively loading dose 600 mg, higher dose may produce a greater and more rapid inhibition of platelet aggregation

Transient ischaemic attack for patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor: Acute ischaemic stroke for patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor

- **BY MOUTH**
  - Adult: 75 mg once daily

Prevention of atherothrombotic events in peripheral arterial disease or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke

- **BY MOUTH**
  - Adult: 75 mg once daily

**Unlicensed use**

- 600 mg loading dose prior to percutaneous coronary intervention is an unlicensed dose. Use in transient ischaemic attack or acute ischaemic stroke, in patients with aspirin hypersensitivity or intolerant of aspirin, is unlicensed.

**CONTRA-INDICATIONS**

- Active bleeding

**CAUTIONS**

- Discontinue 7 days before elective surgery if antiplatelet effect not desirable - patients at risk of increased bleeding from trauma, surgery, or other pathological conditions

**INTERACTIONS**

- Appendix 1: clopidogrel

**SIDE-EFFECTS**

- Common or very common: Diarrhoea, gastrointestinal discomfort, haemorrhage, skin reactions

- Uncommon: Constipation, dizziness, eosinophilia, gastrointestinal disorders, headache, intracranial haemorrhage, leucopenia, nausea, paraesthesia, thrombocytopenia, vomiting

- Rare or very rare: Acquired haemophilia, agranulocytosis, anaemia, angioedema, arthralgia, arthritis, bone marrow disorders, confusion, fever, glomerulonephritis, gynaecomastia, hallucination, hepatic disorders, hypersensitivity, hypotension, myalgia, neutropenia, pancreatitis, respiratory disorders, severe cutaneous adverse reactions (SCARs), stomatitis, taste altered, ulcerative colitis, vasculitis, vertigo, wound haemorrhage

- Frequency not known: Kounis syndrome

**ALLERGY AND CROSS-SENSITIVITY**

- Caution with history of hypersensitivity reactions to thienopyridines (e.g. prasugrel).

**PREGNANCY**

- Manufacturer advises avoid — no information available.

**BREAST FEEDING**

- Manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in moderate impairment in patients with an increased risk of bleeding—limited information available; avoid in severe impairment.

**RENAL IMPAIRMENT**

- Manufacturer advises caution.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Clopidogrel and modified-release dipyridamole for the prevention of occlusive vascular events (December 2010)

**SMC No. 88/04**

The Scottish Medicines Consortium has advised (March 2004) that clopidogrel (Plavix®) is accepted for restricted use within NHS Scotland for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients only.

**SMC No. 390/07**

The Scottish Medicines Consortium has advised (August 2007) that clopidogrel (Plavix®) is accepted for restricted use within NHS Scotland for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.

---

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- Aspirin (Non-proprietary)
  - Aspirin 75 mg: 28 tablet [POM] £3.50 DT = £1.12
  - Aspirin 300 mg: 100 tablet [POM] £1.12–£10.69

**Suppository**

**CAUTIONARY AND ADVISORY LABELS**

- Aspirin (Non-proprietary)
  - Aspirin 150 mg: 10 suppository [P] £18.67 DT = £18.67
  - Aspirin 300 mg: 10 suppository [P] £35.89 DT = £35.89

**Dispersible tablet**

**CAUTIONARY AND ADVISORY LABELS**

- Aspirin (Non-proprietary)
  - Aspirin 75 mg: 1000 tablet [POM] £18.57–£20.00
  - Aspirin 300 mg: 100 tablet [POM] £5.59 DT = £6.34
  - Danamep (Ecogen Europe Ltd)
  - Aspirin 75 mg: 28 tablet [POM] £0.50 DT = £0.56

---

**NATIONAL FUNDING/ACCESS DECISIONS**

**SMC No. 88/04**

The Scottish Medicines Consortium has advised (March 2004) that clopidogrel (Plavix®) is accepted for restricted use within NHS Scotland for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients only.

**SMC No. 390/07**

The Scottish Medicines Consortium has advised (August 2007) that clopidogrel (Plavix®) is accepted for restricted use within NHS Scotland for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.

---

**Frequency not known**

- Kounis syndrome

---

**SIDE-EFFECTS**

- Common or very common: Diarrhoea, gastrointestinal discomfort, haemorrhage, skin reactions

- Uncommon: Constipation, dizziness, eosinophilia, gastrointestinal disorders, headache, intracranial haemorrhage, leucopenia, nausea, paraesthesia, thrombocytopenia, vomiting

- Rare or very rare: Acquired haemophilia, agranulocytosis, anaemia, angioedema, arthralgia, arthritis, bone marrow disorders, confusion, fever, glomerulonephritis, gynaecomastia, hallucination, hepatic disorders, hypersensitivity, hypotension, myalgia, neutropenia, pancreatitis, respiratory disorders, severe cutaneous adverse reactions (SCARs), stomatitis, taste altered, ulcerative colitis, vasculitis, vertigo, wound haemorrhage

- Frequency not known: Kounis syndrome

---

**ALLERGY AND CROSS-SENSITIVITY**

- Caution with history of hypersensitivity reactions to thienopyridines (e.g. prasugrel).

---

**PREGNANCY**

- Manufacturer advises avoid — no information available.

---

**BREAST FEEDING**

- Manufacturer advises avoid.

---

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in moderate impairment in patients with an increased risk of bleeding—limited information available; avoid in severe impairment.

---

**RENAL IMPAIRMENT**

- Manufacturer advises caution.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Clopidogrel and modified-release dipyridamole for the prevention of occlusive vascular events (December 2010)

**SMC No. 88/04**

The Scottish Medicines Consortium has advised (March 2004) that clopidogrel (Plavix®) is accepted for restricted use within NHS Scotland for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients only.

**SMC No. 390/07**

The Scottish Medicines Consortium has advised (August 2007) that clopidogrel (Plavix®) is accepted for restricted use within NHS Scotland for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.
**Clopidogrel and modified-release dipyridamole for the prevention of occlusive vascular events (December 2010)**

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Tablet

- **Clopidogrel (Non-proprietary)**
  - Clopidogrel 75 mg: Clopidogrel 75mg tablets | 28 tablet | £33.94 DT = £1.40
  - 30 tablet | £1.40-£36.95
- **Plavix (Sanofi)**
  - Clopidogrel 75 mg: Plavix 75mg tablets | 30 tablet | £35.64
  - 300mg tablets | 30 tablet | £142.54 DT = £142.54

## INDICATIONS AND DOSE

**Secondary prevention of ischaemic stroke (not associated with atrial fibrillation) and transient ischaemic attacks (used alone or with aspirin)**

- **Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves**
  - By mouth using modified-release medicines
  - Adult: 200 mg twice daily, to be taken preferably with food

- **Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves**
  - By mouth using immediate-release medicines
  - Adult: 300–600 mg daily in 3–4 divided doses

- **Myocardial imaging—diagnostic use only**
  - By intravenous injection
  - Adult: (consult product literature)

## CAUTIONS

- Aortic stenosis, coagulation disorders, heart failure, hypotension, left ventricular outflow obstruction, may exacerbate migraine, myasthenia gravis (risk of exacerbation), rapidly worsening angina, recent myocardial infarction

## INTERACTIONS

- Appendix 1: dipyridamole

## SIDE-EFFECTS

- Common or very common: Angina pectoris, diarrhoea, dizziness, headache, myalgia, nausea, skin reactions, vomiting
- Frequency not known: Angioedema, bronchospasm, haemorrhage, hot flush, hypotension, tachycardia, thrombocytopenia

## PREGNANCY

- Not known to be harmful.

## BREAST FEEDING

- Manufacturers advise use only if essential—small amount present in milk.

## PRESCRIBING AND DISPENSING INFORMATION

- Modified-release capsules should be dispensed in original container (pack contains a desiccant) and any capsules remaining should be discarded 6 weeks after opening.

## NATIONAL FUNDING/ACCESS DECISIONS

### NICE decisions

- Clopidogrel and modified-release dipyridamole for the prevention of occlusive vascular events (December 2010)

  The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

  Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:
  - a transient ischaemic attack, or
  - an ischaemic stroke, only if clopidogrel is contra-indicated or not tolerated.

  Modified-release dipyridamole monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:
  - an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, or
  - a transient ischaemic attack, only if aspirin is contra-indicated or not tolerated.

  Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

  www.nice.org.uk/guidance/ta210

## Dipyridamole

### 14-Feb-2019

#### Dipyridamole with aspirin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dipyridamole above, aspirin p. 121.

#### INDICATIONS AND DOSE

- **Secondary prevention of ischaemic stroke and transient ischaemic attacks**

  - By mouth using modified-release medicines
  - Adult: 25/200 mg twice daily

#### INTERACTIONS

- Appendix 1: aspirin · dipyridamole

#### PRESCRIBING AND DISPENSING INFORMATION

- Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Dipyridamole (Non-proprietary)**
  - Dipyridamole 10 mg per 1 ml: Dipyridamole 50mg/5ml oral suspension sugar free sugar-free | 150 ml | £39.40 DT = £39.40
  - Dipyridamole 40 mg per 1 ml: Dipyridamole 200mg/5ml oral suspension sugar free sugar-free | 150 ml | £133.53 DT = £133.53

- **Modified-release capsule**

  - CAUTIONARY AND ADVISORY LABELS 21, 25
  - **Attila (Dr Reddy's Laboratories (UK) Ltd)**
    - Dipyridamole 200 mg: Attila 200mg modified-release capsules | 60 capsule | £9.56 DT = £9.56
  - **Ofcram PR (Advanz Pharma)**
    - Dipyridamole 200 mg: Ofcram PR 200mg capsules | 60 capsule | £10.06 DT = £9.56
  - **Dipyridamole 100 mg**
    - Dipyridamole 25mg tablets | 84 tablet | £0.39 DT = £9.40
    - Dipyridamole 100mg tablets | 84 tablet | £12.50 DT = £4.66
Apixaban

**DRUG ACTION** Apixaban is a direct inhibitor of activated factor X (factor Xa).

**INDICATIONS AND DOSE**
- **Prophylaxis of venous thromboembolism following knee replacement surgery**
  - **BY MOUTH**
  - Adult: 2.5 mg twice daily for 10–14 days, to be started 12–24 hours after surgery
- **Prophylaxis of venous thromboembolism following hip replacement surgery**
  - **BY MOUTH**
  - Adult: 2.5 mg twice daily for 32–38 days, to be started 12–24 hours after surgery
- **Treatment of deep-vein thrombosis**
  - **BY MOUTH**
  - Adult: Initially 10 mg twice daily for 7 days, then maintenance 5 mg twice daily
- **Prophylaxis of recurrent deep-vein thrombosis**
- **Prophylaxis of recurrent pulmonary embolism**
- **Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and at least one risk factor (such as previous stroke or transient ischaemic attack, symptomatic heart failure, diabetes mellitus, hypertension, or age 75 years and over)**
  - **BY MOUTH**
  - Adult: 5 mg twice daily, reduce dose to 2.5 mg twice daily in patients with at least two of the following characteristics: age 80 years and over, body-weight less than 61 kg, or serum creatinine 133 micromol/litre and over

**DOSE EQUIVALENCE AND CONVERSION**
- For information on changing from, or to, other anticoagulants, consult product literature.

**CONTRA-INDICATIONS**
- Active, clinically significant bleeding
- Risk factors for major bleeding

**SIDE-EFFECTS**
- Common or very common: Anaemia, haemorrhage, nausea, skin reactions
- Uncommon: CNS haemorrhage, hypotension, post-procedural haematoma, thrombocytopenia, wound complications

**PREGNANCY**
- Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in mild to moderate impairment (or if hepatic transaminases greater than 2 times the upper limit of normal, or if bilirubin is equal or greater than 1.5 times the upper limit of normal); avoid in severe impairment or impairment associated with coaguropathy and clinically relevant bleeding risk.

**RENAL IMPAIRMENT**
- Manufacturer advises avoid if creatinine clearance less than 15 mL/minute—no information available. When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery, prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism, and treatment of deep-vein thrombosis or pulmonary embolism, use with caution if creatinine clearance 15–29 mL/minute.

**Dose adjustments**
- When used for prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation, reduce dose to 2.5 mg twice daily if serum-creatinine 133 micromol/litre and over is associated with age 80 years and over or body-weight less than 61 kg; reduce dose to 2.5 mg twice daily if creatinine clearance 15–29 mL/minute.

**MONITORING REQUIREMENTS**
- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).

**PRESCRIBING AND DISPENSING INFORMATION**
- Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobilisation.
- Apixaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy.

**PATIENT AND CARER ADVICE**
- Patients should be provided with an alert card and advised to keep it with them at all times.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Apixaban for the prevention of venous thromboembolism after total hip or knee replacement in adults (January 2012) NICE TA245
- Apixaban (Eliquis ®) is an option for the prevention of venous thromboembolism in adults after elective hip or knee replacement surgery. [www.nice.org.uk/guidance/ta245](http://www.nice.org.uk/guidance/ta245)
- Apixaban for preventing stroke and systemic embolism in people with non-valvular atrial fibrillation (February 2013) NICE TA275
- Apixaban (Eliquis ®) is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation in accordance with its licensed indication; with one or more of the following risk factors:
  - previous stroke or transient ischaemic attack
  - symptomatic heart failure
  - age >75 years
  - diabetes mellitus
  - hypertension.
- The risks and benefits of apixaban compared to warfarin, dabigatran etexilate, and rivaroxaban should be discussed with the patient. [www.nice.org.uk/guidance/ta275](http://www.nice.org.uk/guidance/ta275)
Apixaban for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (June 2015) NICE TA341

Apixaban (Eliquis®) is an option for the treatment and prevention of recurrent deep vein thrombosis and pulmonary embolism in adults.

www.nice.org.uk/guidance/ta341

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS**
    - **10**
      - **Eliquis (Bristol-Myers Squibb Pharmaceuticals Ltd)**
        - Apixaban 2.5 mg: Eliquis 2.5mg tablets | 10 tablet (Pm) £9.50 | 20 tablet (Pm) £19.00 | 60 tablet (Pm) £51.00 DT + £5.00
        - Apixaban 5 mg: Eliquis 5mg tablets | 28 tablet (Pm) £26.60 | 56 tablet (Pm) £53.20 DT + £53.20

---

**Edoxaban**

**DRUG ACTION** Edoxaban is a direct and reversible inhibitor of activated factor X (factor Xa), which prevents conversion of prothrombin to thrombin and prolongs clotting time, thereby reducing the risk of thrombus formation.

**INDICATIONS AND DOSE**

- **Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation, in patients with at least one risk factor (such as congestive heart failure, hypertension, aged 75 years and over, diabetes mellitus, previous stroke or transient ischaemic attack)**
  - **BY MOUTH**
    - Adult (body-weight up to 61 kg): 30 mg once daily
    - Adult (body-weight 61 kg and above): 60 mg once daily

- **Treatment of deep vein thrombosis | Prophylaxis of recurrent deep vein thrombosis | Treatment of pulmonary embolism | Prophylaxis of recurrent pulmonary embolism**
  - **BY MOUTH**
    - Adult (body-weight up to 61 kg): 30 mg once daily, duration of treatment adjusted according to risk factors—consult product literature, treatment should follow initial use of parenteral anticoagulant for at least 5 days
    - Adult (body-weight 61 kg and above): 60 mg once daily, duration of treatment adjusted according to risk factors—consult product literature, treatment should follow initial use of parenteral anticoagulant for at least 5 days

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises max. dose of 30 mg once daily with concurrent ciclosporin, dronedarone, erythromycin, or ketoconazole.

**DOSE EQUIVALENCE AND CONVERSION**

- For information on changing from, or to, other anticoagulants, consult product literature.

**CONTRA-INDICATIONS** Active bleeding · arteriovenous malformations · current or recent gastro-intestinal ulceration · hepatic disease (associated with coagulopathy and clinically relevant bleeding risk) · known or suspected oesophageal varices · major intrasplinal or intracerebral vascular abnormalities · presence of malignant neoplasms at high risk of bleeding · recent brain or spinal injury · recent brain, spinal or ophthalmic surgery · recent intraocular haemorrhage · uncontrolled severe hypertension · vascular aneurysms

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Risk for major bleeding Edoxaban treatment is contra-indicated in patients with significant risk factors for major bleeding, these include those listed above.

**CAUTIONS**

- Moderate to severe mitral stenosis (safety and efficacy not established) · prosthetic heart valve (safety and efficacy not established) · risk of bleeding · surgery

**CAUTIONS, FURTHER INFORMATION**

- Surgery 
  - Manufacturer recommends to discontinue treatment at least 24 hours before a surgical procedure; the risk of bleeding should be weighed against the urgency of the intervention—consult product literature.

**INTERACTIONS**

- Appendix 1: edoxaban

**SIDE-EFFECTS**

- Common or very common 
  - Anaemia · haemorrhage · nausea · skin reactions

- Uncommon 
  - CNS haemorrhage

**SIDE-EFFECTS, FURTHER INFORMATION**

- Should a bleeding complication arise in a patient receiving edoxaban, the manufacturer recommends to delay the next dose or treatment should be discontinued as appropriate.

**PREGNANCY**

- Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**

- Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in mild to moderate impairment, or if liver transaminases greater than 2 times the upper limit of normal, or total bilirubin 1.5 times the upper limit of normal or greater; avoid in severe impairment or hepatic disease associated with coagulopathy and clinically relevant bleeding risk.

**RENAL IMPAIRMENT**

- Manufacturer advises avoid if creatinine clearance less than 15 mL/minute.

**Monitoring requirements**

- Manufacturer advises monitor renal function before treatment and when clinically indicated during treatment; monitor hepatic function before treatment and repeat periodically if treatment duration longer than 1 year.

- Manufacturer advises monitor for signs of mucosal bleeding and anaemia in patients at increased risk; treatment should be stopped if severe bleeding occurs.

- No routine anticoagulant monitoring required (INR tests are unreliable).

**PATIENT AND CARER ADVICE**

- Patients should be provided with an alert card and advised to keep it with them at all times.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Edoxaban for treating and preventing deep vein thrombosis and pulmonary embolism (August 2015) NICE TA354
  - Edoxaban (Lixiana®) is recommended as an option for treating and preventing recurrent deep vein thrombosis and pulmonary embolism.
  - www.nice.org.uk/guidance/ta354

- Edoxaban for preventing stroke and systemic embolism in people with non-valvular atrial fibrillation (September 2015) NICE TA355
  - Edoxaban (Lixiana®) is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation, with one or more of the following risk factors:
    - previous stroke or transient ischaemic attack
    - congestive heart failure
    - age ≥ 75 years
    - diabetes mellitus
    - hypertension

The risks and benefits of edoxaban treatment compared to warfarin, apixaban, dabigatran etexilate, and rivaroxaban should be discussed with the patient.

www.nice.org.uk/guidance/ta355
**Fondaparinux sodium**

**DRUG ACTION** Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

**INDICATIONS AND DOSE**

Prophylaxis of venous thromboembolism in patients after undergoing major orthopaedic surgery of the hip or leg, or abdominal surgery

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 2.5 mg, dose to be given 6 hours after surgery, then 2.5 mg once daily.

Prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 2.5 mg once daily.

**TREATMENT OF SUPERFICIAL-VEIN THROMBOSIS**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 2.5 mg once daily for at least 30 days (max. 45 days if high risk of thromboembolic complications), treatment should be stopped 24 hours before surgery and restarted at least 6 hours post operatively.

**TREATMENT OF UNSTABLE ANGINA AND NON-ST-SEGMENT ELEVATION MYOCARDIAL INFARCTION**

- **INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Initially 2.5 mg daily for the first day, then (by subcutaneous injection) 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively.

**TREATMENT OF DEEP-VEIN THROMBOSIS AND PULMONARY EMBOLISM**

- **BY SUBCUTANEOUS INJECTION**
  - Adult (body-weight up to 50 kg): 5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours).
  - Adult (body-weight 50-100 kg): 7.5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours).
  - Adult (body-weight 101 kg and above): 10 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours).

**CONTRA-INDICATIONS** Active bleeding • bacterial endocarditis

**CAUTIONS** Active gastro-intestinal ulcer disease • bleeding disorders • brain surgery • elderly patients • low body-weight • ophthalmic surgery • recent intracranial haemorrhage • risk of catheter thrombus during percutaneous coronary intervention • spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses) • spinal surgery

**INTERACTIONS** → Appendix 1: fondaparinux

**SIDE-EFFECTS**

- Common or very common Anaemia • haemorrhage
- Uncommon Chest pain • coagulation disorder • dyspnoea • fever • hepatic function abnormal • nausea • oedema • platelet abnormalities • skin reactions • thrombocytopenia • vomiting • wound secretion

**RARE OR VERY RARE** Anxiety • confusion • constipation • cough • diarrhoea • dizziness • drowsiness • fatigue • gastritis • gastrointestinal discomfort • genitai oedema • headache • hyperbilirubinaemia • hypersensitivity • hypokalaemia • hypotension • leg pain • post procedural infection • syncope • vasodilation • vertigo

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs possible risk—no information available.

**BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

- When used for Venous thromboembolism, unstable angina, non-ST-segment elevation myocardial infarction and ST-segment elevation myocardial infarction Manufacturer advises caution in severe impairment (increased risk of bleeding complications).
- When used for Superficial-vein thrombosis Manufacturer advises avoid in severe impairment (no information available).

**RENAL IMPAIRMENT** Increased risk of bleeding in renal impairment.

- When used for treatment of acute coronary syndromes or prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Avoid if eGFR less than 20 mL/minute/1.73 m².
- When used for treatment of venous thromboembolism Use with caution if eGFR 30–50 mL/minute/1.73 m², avoid if eGFR less than 30 mL/minute/1.73 m².

**DOSAGE ADJUSTMENTS** When used for prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis Reduce dose to 1.5 mg daily if eGFR 20–50 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Arixtra®), give intermittently in Sodium chloride 0.9%. For ST-segment elevation myocardial infarction, add requisite dose to 25-50 mL infusion fluid and give over 1-2 minutes.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Fondaparinux sodium (Non-proprietary)**
  - Fondaparinux sodium 5 mg per 1 ml Fondaparinux sodium 2.5mg/0.5ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £82.79 DT = £82.79
  - Fondaparinux sodium 12.5 mg per 1 ml Fondaparinux sodium 5mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £110.70 DT = £116.53
  - Fondaparinux sodium 10mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £110.70 DT = £116.53
  - Fondaparinux sodium 7.5mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £110.70 DT = £116.53
  - Arixtra (Aspen Pharma Trading Ltd)
  - Fondaparinux sodium 5 mg per 1 ml Arixtra 2.5mg/0.5ml solution for injection pre-filled syringes | 10 pre-filled disposable injection | £82.79 DT = £82.79
Cardiovascular system

CONTRA-INDICATIONS

DRUG ACTION

Rivaroxaban is a direct inhibitor of activated factor X (factor Xa).

INDICATIONS AND DOSE

Prophylaxis of venous thromboembolism following knee replacement surgery
- BY MOUTH
  - Adult: 10 mg once daily for 2 weeks, to be started 6–10 hours after surgery.

Prophylaxis of venous thromboembolism following hip replacement surgery
- BY MOUTH
  - Adult: 10 mg once daily for 5 weeks, to be started 6–10 hours after surgery.

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism
- BY MOUTH
  - Adult: Initially 15 mg twice daily for 21 days, then maintenance 20 mg once daily, to be taken with food, for duration of treatment, consult product literature.

Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism
- BY MOUTH
  - Adult: 10 mg once daily, following completion of at least 6 months of anticoagulant treatment, to be taken with food, consider 20 mg once daily in those at high risk of recurrence (such as complicated comorbidities, or previous recurrence with rivaroxaban 10 mg once daily).

Prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: congestive heart failure, hypertension, previous stroke or transient ischaemic attack, age > 75 years, or diabetes mellitus
- BY MOUTH
  - Adult: 20 mg once daily, to be taken with food.

Prophylaxis of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers (in combination with aspirin alone or aspirin and clopidogrel)
- BY MOUTH
  - Adult: 2.5 mg twice daily usual duration 12 months.

Prophylaxis of atherothrombotic events in patients with coronary artery disease or symptomatic peripheral artery disease at high risk of ischaemic events (in combination with aspirin)
- BY MOUTH
  - Adult: 2.5 mg twice daily.

DOSE EQUIVALENCE AND CONVERSION
- For information on changing from, or to, or other anticoagulants—consult product literature.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS
Active bleeding - malignant neoplasms - oesophageal varices - recent brain surgery - recent gastro-intestinal ulcer - recent intracranial haemorrhage - recent ophthalmic surgery - recent spine surgery - significant risk of major bleeding - vascular aneurysm

SPECIFIC CONTRA-INDICATIONS
- When used for prophylaxis of atherothrombotic events following an acute coronary syndrome Previous stroke - transient ischaemic attack.
- When used for prophylaxis of atherothrombotic events in patients with coronary artery disease or symptomatic peripheral artery disease previous stroke (no information available).

CAUTIONS

GENERAL CAUTIONS
Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal) - bronchiectasis - elderly - prostatic heart valve (efficacy not established) - risk of bleeding - rivaroxaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy - severe hypertension - vascular retinopathy.

SPECIFIC CAUTIONS
- When used for prophylaxis of atherothrombotic events following an acute coronary syndrome
  - Body-weight less than 60 kg.
- When used for prophylaxis of atherothrombotic events in patients with coronary artery disease or symptomatic peripheral artery disease
  - Body-weight less than 60 kg.

INTERACTIONS
- Appendix 1: rivaroxaban.

SIDE-EFFECTS
- Common or very common
- Uncommon
- Rare or very rare
  - Vascular pseudoanoeurn.

PREGNANCY
- Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING
- Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
- Manufacturer advises avoid in hepatic disease with coagulopathy and clinically-relevant bleeding risk including patients with moderate to severe cirrhosis.

RENAL IMPAIRMENT
- Manufacturer advises caution if creatinine clearance 15–29 mL/minute; avoid if creatinine clearance less than 15 mL/minute. Use with caution if concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature).

Dose adjustments
- When used for Treatment of deep-vein thrombosis or pulmonary embolism Following the first 21 days of treatment for deep-vein thrombosis or pulmonary embolism, the usual dose of 20 mg once daily can be given, but manufacturer advises consider reducing to 15 mg once daily if creatinine clearance 15–49 mL/minute and the risk of bleeding outweighs the risk of recurrent deep-vein thrombosis or pulmonary embolism.
- When used for Prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism When the recommended dose is 20 mg once daily, manufacturer advises consider reducing to 15 mg once daily if creatinine clearance 15–49 mL/minute and the risk of bleeding outweighs the risk of recurrent deep-vein thrombosis or pulmonary embolism.
- When used for Prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism When the recommended dose is 20 mg once daily, manufacturer advises consider reducing to 15 mg once daily if creatinine clearance 15–49 mL/minute.

www.getintopharma.com
Thromboembolism 129

Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs. No routine anticoagulant monitoring required (INR tests are unreliable).

Directions for Administration Tablets may be crushed and mixed with water or apple puree just before administration.

Prescribing and Dispensing Information Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers. Treatment should be started as soon as possible after the patient has been stabilised following the acute coronary event, at the earliest 24 hours after admission to hospital, and at the time when parenteral anticoagulation therapy would normally be discontinued; the usual duration of treatment is 12 months.

Patient and Carer Advice Patients should be provided with an alert card and advised to keep it with them at all times.

National Funding/Access Decisions

NICE decisions

Rivaroxaban for the prevention of venous thromboembolism after total hip or total knee replacement in adults (April 2009) NICE TA170 Rivaroxaban (Xarelto (Bayer Plc)) is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery. www.nice.org.uk/guidance/ta170

Rivaroxaban for the prevention of stroke and systemic embolism in people with atrial fibrillation (May 2012) NICE TA256 Rivaroxaban (Xarelto (Bayer Plc)) is an option for the prevention of stroke and systemic embolism (in accordance with its licensed indication) in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: previous stroke or transient ischaemic attack, congestive heart failure, age ≥75 years, diabetes mellitus, hypertension. The risks and benefits of rivaroxaban compared with warfarin should be discussed with the patient. www.nice.org.uk/guidance/ta256

Rivaroxaban for treating pulmonary embolism and preventing recurrent venous thromboembolism (June 2013) NICE TA287 Rivaroxaban (Xarelto (Bayer Plc)) is an option for treating pulmonary embolism and preventing recurrent deep-vein thrombosis and pulmonary embolism in adults. www.nice.org.uk/guidance/ta287

Rivaroxaban for preventing adverse outcomes after acute management of acute coronary syndrome (March 2015) NICE TA335 Rivaroxaban (Xarelto (Bayer Plc)) is an option within its marketing authorisation, in combination with aspirin plus clopidogrel or aspirin alone, for preventing atherothrombotic events in patients who have had an acute coronary syndrome with elevated cardiac biomarkers.

The patient’s risk of bleeding should be carefully assessed before treatment is initiated and the risks and benefits of rivaroxaban in combination with aspirin plus clopidogrel or with aspirin alone, compared with aspirin plus clopidogrel or aspirin alone should be discussed with the patient. A decision on continuation of treatment should be taken no later than 12 months after starting treatment. www.nice.org.uk/guidance/ta335

Scottish Medicines Consortium (SMC) decisions

SMC No. 519/08 The Scottish Medicines Consortium has advised (December 2008) that rivaroxaban (Xarelto (Bayer Plc)) is accepted for use within NHS Scotland for the prevention of venous thromboembolism in adults undergoing elective hip or knee replacement surgery. www.nice.org.uk/guidance/ta287

SMC No. 756/12 The Scottish Medicines Consortium has advised (February 2012) that rivaroxaban (Xarelto (Bayer Plc)) is accepted for restricted use within NHS Scotland for the treatment of stroke and systemic embolism in adults with non-valvular atrial fibrillation with one or more risk factors, such as congestive heart failure, hypertension, age ≥75 years, diabetes mellitus, prior stroke or transient ischaemic attack. Its use is restricted to patients with poor INR control despite compliance with coumarin anticoagulant therapy, or to patients who are allergic to, or unable to tolerate, a coumarin anticoagulant. www.nice.org.uk/guidance/ta287

SMC No. 755/12 The Scottish Medicines Consortium has advised (February 2012) that rivaroxaban (Xarelto (Bayer Plc)) is accepted for use within NHS Scotland for the treatment of deep-vein thrombosis (DVT), and prevention of recurrent DVT and pulmonary embolism following an acute DVT in adults. SMC No. 852/13 The Scottish Medicines Consortium has advised (March 2013) that rivaroxaban (Xarelto (Bayer Plc)) is accepted for use within NHS Scotland for the treatment of pulmonary embolism (PE), and prevention of recurrent deep-vein thrombosis and PE in adults. SMC No. SMC2128 The Scottish Medicines Consortium has advised (February 2019) that rivaroxaban (Xarelto (Bayer Plc)) is accepted for restricted use within NHS Scotland in combination with acetylsalicylic acid for the prevention of atherothrombotic events in adults with stable coronary artery disease that does not require dual antiplatelet therapy.

Medicinal Forms There can be variation in the licensing of different medicines containing the same drug.

www.getintopharma.com
### Danaparoid sodium

**24-Jul-2018**

#### INDICATIONS AND DOSE
- **Prevention of deep-vein thrombosis in general or orthopaedic surgery**
  - Adult: 750 units twice daily for 7–10 days, initiate treatment before operation, with last pre-operative dose 1–4 hours before surgery
- **Thromboembolic disease in patients with history of heparin-induced thrombocytopenia**
  - **INITIALLY BY INTRAVENOUS INJECTION**
    - Adult (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
    - Adult (body-weight 55–89 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
    - Adult (body-weight 90 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days

#### CONTRA-INDICATIONS
- Active peptic ulcer (unless this is the reason for operation), acute bacterial endocarditis, diabetic retinopathy, epidermal anaesthesia (with treatment doses), haemophilia and other haemorrhagic disorders, recent cerebral haemorrhage, severe hypertension, spinal anaesthesia (with treatment doses), thrombocytopenia (unless patient has heparin-induced thrombocytopenia).

#### CAUTIONS
- Antibodies to heparins (risk of antibody-induced thrombocytopenia), body-weight over 90 kg, recent bleeding, risk of bleeding.

#### SIDE-EFFECTS
- Common or very common: Haemorrhage, heparin-induced thrombocytopenia, skin reactions, thrombocytopenia.
- Uncommon: Procedural haematomata.
- Rare or very rare: Anaphylactic reaction, heparin-induced thrombocytopenia.

#### INTERACTIONS
- Appendix 1: danaparoid.

#### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection
- **Danaparoid sodium (Non-proprietary)**
  - Danaparoid sodium 1250 unit per 1 ml
  - 750 units/0.7 ml solution for injection ampoules: 10 ampoules
  - £59.99

### Heparins

#### CONTRA-INDICATIONS
- Acute bacterial endocarditis, major trauma, epidural anaesthesia with treatment doses, haemophilia and other haemorrhagic disorders, peptic ulcer, recent cerebral haemorrhage, recent surgery to eye, recent surgery to nervous system, severe hypertension, spinal anaesthesia with treatment doses, thrombocytopenia (including history of heparin-induced thrombocytopenia).

#### CAUTIONS
- Elderly.

#### SIDE-EFFECTS
- Common or very common: Haemorrhage, heparin-induced thrombocytopenia, skin reactions, thrombocytopenia, thrombosis.
- Uncommon: CNS haemorrhage.
- Rare or very rare: Alopecia, hyperkalaemia, osteoporosis, priapism.
- Frequency not known: Hypoaldosteronism.

#### SIDE-EFFECTS, FURTHER INFORMATION
- **Haemorrhage**
  - If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

- **Heparin-induced thrombocytopenia**
  - Clinically important heparin-induced thrombocytopenia is immune-mediated and can be complicated by thrombosis. Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

- **Hyperkalaemia**
  - Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.

#### ALLERGY AND CROSS-SENSITIVITY
- Hypersensitivity to unfractionated or low molecular weight heparin.

#### MONITORING REQUIREMENTS
- **Heparin-induced thrombocytopenia**
  - Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology’s Guidelines on the diagnosis and management of heparin-induced thrombocytopenia: second edition. *Br J Haematol* 2012; 159: 528–540.

- **Hyperkalaemia**
  - Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.
Dalteparin sodium

**INDICATIONS AND DOSE**

**FRAGMIN®**

**Treatment of deep-vein thrombosis** | **Treatment of pulmonary embolism**

- BY SUBCUTANEOUS INJECTION
  - Adult: 200 units/kg daily (max. per dose 18 000 units) until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)

**Treatment of deep-vein thrombosis** (in patients at increased risk of haemorrhage) | **Treatment of pulmonary embolism** (in patients at increased risk of haemorrhage)

- BY SUBCUTANEOUS INJECTION
  - Adult: 100 units/kg twice daily until adequate oral anticoagulation with vitamin K antagonist established (at least 5 days of combined treatment is usually required)

**Unstable coronary artery disease**

- BY SUBCUTANEOUS INJECTION
  - Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for 5–8 days

**Prevention of clotting in extracorporeal circuits**

- TO THE DEVICE AS A FLUSH
  - Adult: (consult product literature)

**FRAGMIN® GRADUATED SYRINGES**

**Unstable coronary artery disease** (including non-ST-segment-elevation myocardial infarction)

- BY SUBCUTANEOUS INJECTION
  - Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for up to 8 days

**Patients with unstable coronary artery disease** (including non-ST-segment-elevation myocardial infarction) awaiting angiography or revascularisation and having already had 8 days treatment with dalteparin

- BY SUBCUTANEOUS INJECTION
  - Adult (body-weight up to 70 kg and male): 5000 units every 12 hours until the day of the procedure (max. 45 days).
  - Adult (body-weight up to 80 kg and female): 5000 units every 12 hours until the day of the procedure (max. 45 days).
  - Adult (body-weight 70 kg and above and male): 7500 units every 12 hours until the day of the procedure (max. 45 days).
  - Adult (body-weight 80 kg and above and female): 7500 units every 12 hours until the day of the procedure (max. 45 days).

**FRAGMIN® SINGLE-DOSE SYRINGES**

**Prophylaxis of deep-vein thrombosis** in surgical patients—moderate risk

- BY SUBCUTANEOUS INJECTION
  - Adult: Initially 2500 units for 1 dose, dose to be given 1–2 hours before surgery, then 2500 units every 24 hours

**Prophylaxis of deep-vein thrombosis** in surgical patients—high risk

- BY SUBCUTANEOUS INJECTION
  - Adult: Initially 2500 units for 1 dose, dose to be administered 1–2 hours before surgery, followed by 2500 units after 8–12 hours, then 5000 units every 24 hours, alternatively initially 5000 units for 1 dose, dose to be given on the evening before surgery, followed by 5000 units after 24 hours, then 5000 units every 24 hours
UNLICENSÉ USE  Not licensed for treatment of venous thromboembolism in pregnancy.

INTERACTIONS  → Appendix 1: low molecular-weight heparins

SIDE-EFFECTS  Epidural haematoma - prothrombotic cardiac valve thrombosis

PREGNANCY  Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.

RENAL IMPAIRMENT  Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.

HEPATIC IMPAIRMENT  Manufacturer advises caution in severe impairment (increased risk of bleeding complications).

DOSE adjustments  Manufacturer advises consider dose reduction in severe impairment.

RENAL IMPAIRMENT  Use of unfractionated heparin may be preferable.

DOSE adjustments  Risk of bleeding may be increased—dose reduction may be required.

MONITORING REQUIREMENTS

▶ For monitoring during treatment of deep-vein thrombosis and of pulmonary embolism, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti–Factor Xa 0.5–1 unit/mL); monitoring not required for once–daily treatment regimen and not generally necessary for twice–daily regimen.

▶ Routine monitoring of anti–Factor Xa activity is not usually required during treatment with dalteparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 683/11 The Scottish Medicines Consortium has advised (March 2011) that dalteparin (Fragmin®) is accepted for restricted use within NHS Scotland as extended treatment of symptomatic venous thromboembolism (VTE) and prevention of its recurrence in patients with solid tumours, if initiated by healthcare professionals experienced in the treatment of VTE.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

Thromboprophylaxis during pregnancy
- **BY SUBCUTANEOUS INJECTION**
  - Adult: 5000–10 000 units every 12 hours, to be administered with monitoring. **Important**: prevention of prosthetic heart-valve thrombosis in pregnancy calls for specialist management

Haemodialysis
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 1000–5000 units, followed by (by continuous intravenous infusion) 250–1000 units/hour

Prevention of clotting in extracorporeal circuits
- **TO THE DEVICE AS A FLUSH**
  - Adult: (consult product literature)
  - To maintain patency of catheters, cannulas, other indwelling intravenous infusion devices
  - **TO THE DEVICE AS A FLUSH**
  - Adult: 10–200 units, to be flushed through every 4–8 hours, not for therapeutic use

- **INTERACTIONS** → Appendix 1: heparin (unfractionated)
- **SIDE-EFFECTS** Adrenal insufficiency, hypokalaemia, rebound hyperlipidaemia
- **PREGNANCY** Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.
- **BREAST FEEDING** Not excreted into milk due to high molecular weight.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; consider avoiding in severe impairment (increased risk of bleeding complications).
  - **Dose adjustments** Manufacturer advises consider dose reduction if used in severe impairment.
- **RENAL IMPAIRMENT**
  - **Dose adjustments** Risk of bleeding increased in severe impairment—dose may need to be reduced.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%; administration with a motorised pump is advisable.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses listed take into account the guidelines of the British Society for Haematology.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**
- **EXCIPIENTS**: May contain Benzyl alcohol
  - **Heparin (unfractionated) (Non-proprietary)**
    - Heparin sodium 1000 unit per 1 ml Heparin sodium 1000 units/1ml solution for injection ampoules | 10 ampoule (£9.05) £4.85 DT = £14.85
    - Heparin sodium 5000 units/5ml solution for injection vials | 10 vial (£6.15) £16.50–£37.41 DT = £16.50
    - Heparin sodium 20,000 units/20ml solution for injection ampoules | 10 ampoule (£30.50) £70.88 DT = £70.88
    - Heparin sodium 5000 units/5ml solution for injection ampoules | 10 ampoule (£43.05) £37.47 DT = £37.47
    - Heparin sodium 10,000 units/10ml solution for injection ampoules | 10 ampoule (£64.59) £64.59
    - Heparin sodium 5000 unit per 1 ml Heparin sodium 5000 units/1ml solution for injection ampoules | 10 ampoule (£29.04) £29.04

Heparin sodium 25,000units/5ml solution for injection vials | 10 vial (£5.00) £45.00
Heparin sodium 25,000units/5ml solution for injection ampoules | 10 ampoule (£75.78) £75.78
Heparin calcium 25000 unit per 1 ml Heparin calcium 5,000units/0.2ml solution for injection ampoules | 10 ampoule (£64.70 DT = £44.70
Heparin sodium 25000 unit per 1 ml Heparin sodium 25,000units/1ml solution for injection ampoules | 10 ampoule (£76.95 DT = £76.95
Heparin sodium 5,000units/0.2ml solution for injection ampoules | 10 ampoule (£37.35 DT = £37.35

**Intravenous flush**
- **EXCIPIENTS**: May contain Benzyl alcohol
  - **Heparin (unfractionated) (Non-proprietary)**
    - Heparin sodium 10 unit per 1 ml Heparin sodium 50units/5ml patency solution ampoules | 10 ampoule (£14.96 DT = £14.96
    - Heparin sodium 50units/5ml LV flush solution ampoules | 10 ampoule (£14.96 DT = £14.96
    - Heparin sodium 100 unit per 1 ml Heparin sodium 200units/2ml LV flush solution ampoules | 10 ampoule (£15.68 DT = £15.68
    - Heparin sodium 200units/2ml patency solution ampoules | 10 ampoule (£15.68 DT = £15.68

**Infusion**
- **Heparin (unfractionated) (Non-proprietary)**
  - Heparin sodium 2 unit per 1 ml Heparin sodium 1,000units/500ml infusion Viaflex bags 1 bar (£52.00) £52.00
  - Heparin sodium 2,000units/1 litre infusion Viaflex bags 1 bar (£68.00) £68.00
  - Heparin sodium 5 unit per 1 ml Heparin sodium 5,000units/1 litre infusion Viaflex bags 1 bar (£96.00) £96.00

**Tinzaparin sodium**

- **INDICATIONS AND DOSE**
  - **INNOHEP® 10,000 UNITS/ML**
    - **Prophylaxis of deep-vein thrombosis (general surgery)**
      - **BY SUBCUTANEOUS INJECTION**
        - Adult: 3500 units for 1 dose, dose to be given 2 hours before surgery, then 3500 units every 24 hours
    - **Prophylaxis of deep-vein thrombosis (orthopaedic surgery)**
      - **BY SUBCUTANEOUS INJECTION**
        - Adult: Initially 50 units/kg for 1 dose, dose to be given 2 hours before surgery, then 50 units/kg every 24 hours, alternatively initially 4500 units for 1 dose, dose to be given 12 hours before surgery, then 4500 units every 24 hours
    - **Prevention of clotting in extracorporeal circuits**
      - **TO THE DEVICE AS A FLUSH**
      - Adult: (consult product literature)
    - **INNOHEP® 20,000 UNITS/ML**
      - **Extended treatment of venous thromboembolism and prevention of recurrence in patients with active cancer**
        - **BY SUBCUTANEOUS INJECTION**
          - Adult: 175 units/kg once daily for 6 months; the benefit of continued treatment beyond 6 months should be evaluated
      - **Treatment of deep-vein thrombosis | Treatment of pulmonary embolism**
        - **BY SUBCUTANEOUS INJECTION**
          - Adult: 175 units/kg once daily until adequate oral anticoagulation established, treatment regimens do not require anticoagulation monitoring
      - **Treatment of venous thromboembolism in pregnancy**
        - **BY SUBCUTANEOUS INJECTION**
          - Adult: 175 units/kg once daily, dose based on early pregnancy body-weight, treatment regimens do not require anticoagulation monitoring

- **UNLICENSED USE** Not licensed for the treatment of venous thromboembolism in pregnancy.
Thromboembolism 135

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (when initiating concomitant warfarin treatment)

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Adult: Reduced to 2 micrograms/kg/minute, dose should be temporarily reduced and INR measured after 4–6 hours; warfarin should be initiated at intended maintenance dose (do not give loading dose of warfarin); consult product literature for further details

- **CAUTIOUS** Bleeding disorders - diabetic retinopathy - gastro-intestinal ulceration - immediately after lumbar puncture - major surgery (especially of brain, spinal cord, or eye) - risk of bleeding - severe hypertension - spinal anaesthesia

- **INTERACTIONS** → Appendix 1: argatroban

- **SIDE-EFFECTS**
  - Common or very common: Anaemia - haemorrhage - nausea - skin reactions

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment—monitor aPTT; avoid in severe impairment or in patients with impairment undergoing percutaneous coronary intervention.

- **Dose adjustments** Manufacturer advises reduce initial dose to 0.5 micrograms/kg/minute in moderate impairment; adjust dose according to aPTT and as clinically indicated—consult product literature.

- **MONITORING REQUIREMENTS** Determine activated partial thromboplastin time 2 hours after start of treatment, then 2 or 4 hours after infusion rate altered (consult product literature), and at least once daily thereafter.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Exembol - Ready to use®), manufacturer advises administer 1 mg/mL solution via a syringe driver. For intravenous infusion (Exembol - Multidose®), manufacturer advises continuously in Glucose 5%, Sodium chloride 0.9% or Sodium lactate intravenous infusion compound; dilute to a concentration of 1 mg/mL prior to use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**EXCIPIENTS:** May contain Benzyl alcohol, sulfites

---

**Thromboembolism 135**

**Antithrombotic Drugs > Thrombin inhibitors, direct**

**Argatroban monohydrate**

- **INDICATIONS AND DOSE**
  - **Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment**
    - **INITIALLY BY CONTINUOUS INTRAVENOUS INFUSION**
    - Adult: Initially 2 micrograms/kg/minute, dose to be adjusted according to activated partial thromboplastin time, (by intravenous infusion) increased to up to 10 micrograms/kg/minute maximum duration of treatment 14 days
  - **Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (for dose in cardiac surgery, percutaneous coronary intervention, or critically ill patients)**
    - **BY CONTINUOUS INTRAVENOUS INFUSION**
    - Adult: (consult product literature)

**Solution for infusion**

**EXCIPIENTS:** May contain Ethanol

- **Argatroban monohydrate (Non-proprietary)**
  - Argatroban monohydrate 1 mg per 1 mL Argatroban 50mg/50ml solution for infusion vials | 1 vial (PMD) £94.69
  - Exembol (Mitsubishi Tanabe Pharma Europe Ltd)
    - Argatroban monohydrate 1 mg per 1 mL Exembol 50mg/50ml solution for infusion vials | 4 vial (PMD) £198.80 (Hospital only)
  - Argatroban monohydrate 100 mg per 1 mL Exembol Multidose 250mg/2.5ml concentrate for solution for infusion vials | 1 vial (PMD) £5.09

www.getintopharma.com
Bivalirudin

**Drug Action**
Bivalirudin, a hirudin analogue, is a thrombin inhibitor.

**Indications and Dose**

Unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention (in addition to aspirin and clopidogrel)
- **Initially by intravenous injection**
  - Adult: Initially 100 micrograms/kg, then (by intravenous infusion) 250 micrograms/kg/hour for up to 72 hours in medically managed patients

Unstable angina or non-ST-segment elevation myocardial infarction (in addition to aspirin and clopidogrel) in patients proceeding to percutaneous coronary intervention or coronary artery bypass surgery without cardiopulmonary bypass
- **Initially by intravenous injection**
  - Adult: Initially 100 micrograms/kg, then (by intravenous infusion) 1.75 mg/kg/hour for duration of procedure; (by intravenous infusion) reduced to 250 micrograms/kg/hour for 4–12 hours as necessary following percutaneous coronary intervention, for patients proceeding to coronary artery bypass surgery with cardiopulmonary bypass, discontinue intravenous infusion 1 hour before procedure and treat with unfractionated heparin

Anticoagulation in patients undergoing percutaneous coronary intervention including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention (in addition to aspirin and clopidogrel)
- **Initially by intravenous injection**
  - Adult: Initially 750 micrograms/kg, followed immediately by (by intravenous infusion) 1.75 mg/kg/hour during procedure and for up to 4 hours after procedure, then (by intravenous infusion) reduced to 250 micrograms/kg/hour for a further 4–12 hours if necessary

**Contra-Indications**
Active bleeding, bleeding disorders, severe hypertension, subacute bacterial endocarditis

**Cautions**
Brachytherapy procedures, previous exposure to lepirudin (theoretical risk from lepirudin antibodies)

**Interactions**
Appendix 3: bivalirudin

**Side-effects**

Common or very common
- Procedural complications, skin reactions
Uncommon
- Anaemia, headache, hypersensitivity, hypotension, nausea, shock, thrombocytopenia
Rare or very rare
- Arrhythmias, cardiac tamponade, chest pain, compartment syndrome, dyspnoea, embolism and thrombosis, intracranial haemorrhage, pain, vascular disorders, vomiting

**Pregnancy**
Manufacturer advises avoid unless potential benefit outweighs risk

**Breast Feeding**
Manufacturer advises caution

**Renal Impairment**
Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments
- When used for percutaneous coronary intervention: Reduce rate of infusion to 1.4 mg/kg/hour if eGFR 30–60 mL/minute/1.73 m² and monitor blood clotting parameters.

**Directions for Administration**
- For intravenous infusion (Angiox®), give continuously in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid.

**National Funding/Access Decisions**

**NICE decisions**
- Bivalirudin for the treatment of ST-segment elevation myocardial infarction (July 2011) NICE TA230
  - Bivalirudin (Angiox®) in combination with aspirin and clopidogrel is recommended for the treatment of adults with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention. www.nice.org.uk/guidance/ta230

**Scottish Medicines Consortium (SMC) decisions**
SMC No. 516/08
The Scottish Medicines Consortium has advised (December 2008) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland for adults with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

SMC No. 638/10
The Scottish Medicines Consortium has advised (September 2010) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland as an anticoagulant in adults undergoing percutaneous coronary intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
- **Bivalirudin (Non-proprietary)**
  - Bivalirudin 250 mg

Prophylaxis of venous thromboembolism following total knee replacement surgery

**By Mouth**
- Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 10 days, to be taken on the first day after surgery
- Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 10 days, to be taken on the first day after surgery

Prophylaxis of venous thromboembolism following total knee replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil
- **By Mouth**
  - Adult 18–74 years: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 10 days, to be taken on the first day after surgery
  - Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 10 days, to be taken on the first day after surgery

Prophylaxis of venous thromboembolism following total hip replacement surgery

**By Mouth**
- Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 28–35 days, to be taken on the first day after surgery
Prophylaxis of venous thromboembolism following total hip replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil

**BY MOUTH**

- Adult 75–110 years: 150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
- Adult 75 years and over: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

**BY MOUTH**

- Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 28–35 days, to be taken on the first day after surgery
- Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 28–35 days, to be taken on the first day after surgery
- Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 28–35 days, to be taken on the first day after surgery

**SIDE-EFFECTS**

- **Common** or **very common**
  - Hepatic function abnormal
- **Uncommon**
  - Anaemia
  - Diarrhoea
  - Gastrointestinal haemorrhage
  - Hyperbilirubinaemia
  - Nausea
  - Post procedural complications
  - Vomiting
  - Wound complications
- **Rare or very rare**
  - Angioedema
  - Dysphagia
  - Gastrointestinal discomfort
  - Gastrointestinal disorders
  - Intracranial haemorrhage
  - Post procedural drainage
  - Skin reactions
  - Thrombocytopenia
  - Wound drainage
- **Frequency not known**
  - Bronchospasm

**CONTRA-INDICATIONS**

- Active bleeding
- Do not use as anticoagulant for prophylactic heart valve or valve repair
- Recent intracranial haemorrhage
- Recent intracranial haemorrhage
- Recent ophthalmic surgery
- Recent spine surgery
- Recent ophthalmic surgery
- Significant risk of major bleeding
- Vascular aneurysm

**CAUTIONS**

- Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor neurological signs)
- Bacterial endocarditis
- Bleeding disorders
- Body weight less than 50 kg
- Elderly
- Gastritis
- Gastro-oesophageal reflux
- Oesophagitis
- Recent biopsy
- Recent major trauma
- Thrombocytopenia

**INTERACTIONS**

- Appendix 1: dabigatran

**DOSE EQUIVALENCE AND CONVERSION**

- For information on changing from, or to, other anticoagulants, consult product literature.

**PROPHYLAXIS OF STROKE AND SYSTEMIC EMBOLISM IN NON-VALVULAR ATRIAL FIBRILLATION**

- By mouth
- Adult: 110–150 mg twice daily

**CONTRA-INDICATIONS**

- Active bleeding
- Do not use as anticoagulant for prophylactic heart valve or valve repair
- Recent intracranial haemorrhage
- Recent ophthalmic surgery
- Recent spine surgery
- Significant risk of major bleeding
- Vascular aneurysm

**CAUTIONS**

- Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor neurological signs)
- Bacterial endocarditis
- Bleeding disorders
- Body weight less than 50 kg
- Elderly
- Gastritis
- Gastro-oesophageal reflux
- Oesophagitis
- Recent biopsy
- Recent major trauma
- Thrombocytopenia

**INTERACTIONS**

- Appendix 1: dabigatran

**DOSE EQUIVALENCE AND CONVERSION**

- For information on changing from, or to, other anticoagulants, consult product literature.
Cardiovascular system

Dabigatran etexilate for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation

Patients should be provided with an alert card and advised to keep it with them at all times.

NATIONAL FUNDING/ACCESS DECISIONS

Dabigatran etexilate (as Dabigatran etexilate mesilate)

110 mg Pradaxa 110mg capsules | 10 capsule £8.50 | 60 capsule £51.00 DT + £51.00

Dabigatran etexilate (as Dabigatran etexilate mesilate)

150 mg Pradaxa 150mg capsules | 60 capsule £51.00 DT + £51.00

ANTITHROMBOTIC DRUGS >TISSUE PLASMINOGEN ACTIVATORS

Urokinase

INDICATIONS AND DOSE

Deep-vein thrombosis (thromboembolic occlusive vascular disease)

- Initial 4400 units/kg, to be given over 10–20 minutes, followed by 100 000 units/hour for 2–3 days

Pulmonary embolism (thromboembolic occlusive vascular disease)

- Initial 4400 units/kg, to be given over 10–20 minutes, followed by 4400 units/kg/hour for 12 hours

Occlusive peripheral arterial disease (thromboembolic occlusive vascular disease)

- By intra-arterial infusion

Occluded central venous catheters (blocked by fibrin clots)

- By intravenous infusion, or by intra-arterial infusion

- Adult: (consult product literature)

Occluded arteriovenous haemodialysis shunts (blocked by fibrin clots)

- By intravenous infusion, or by intra-arterial infusion

Syner-Kinase®

Deep-vein thrombosis (thromboembolic occlusive vascular disease)

- By intravenous infusion

Pulmonary embolism (thromboembolic occlusive vascular disease)

- Initially by intravenous infusion

- Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 mL sodium chloride 0.9%, followed by 4400 units/kg/hour for 12–24 hours

Occlusive peripheral arterial disease

- By intra-arterial infusion

Occluded intravenous catheters and cannulas (blocked by fibrin clots)

- By intra-arterial injection, or by intravenous injection

- Adult: 5000–25 000 units, to be injected directly into catheter or cannula, dose dissolved in suitable volume

MEDICINAL FORMS

Capsule

CAUTIONARY AND ADVISORY LABELS

- Pradaxa (Boehringer Ingelheim Ltd)

Dabigatran etexilate (as Dabigatran etexilate mesilate)

75 mg Pradaxa 75mg capsules | 10 capsule £8.50 | 60 capsule £51.00 DT + £51.00
of sodium chloride 0.9% to fill the catheter or cannula lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

- **INTERACTIONS** → Appendix 1: urokinase
- **SIDE-EFFECTS**
  - Common or very common Artery dissection - embolism and thrombosis - stroke
  - Rare or very rare Renal failure
  - Rare or very rare Vascular pseudoaneurysm
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment.
- **Dose adjustments** Manufacturer advises consider dose reduction in mild to moderate impairment.
- **RENAL IMPAIRMENT** Dose reduction may be required.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Syner-KINASE™), give continuously or intermittently in Sodium chloride 0.9%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Syner-KINASE (Syner-Med Pharmaceutical Products) Ltd
  - Urokinase 10000 unit Syner-KINASE 10,000 unit powder for solution for injection vials | 1 vial £35.95 (Hospital only)
  - Urokinase 25000 unit Syner-KINASE 25,000 unit powder for solution for injection vials | 1 vial £45.95 (Hospital only)
  - Urokinase 100000 unit Syner-KINASE 100,000 unit powder for solution for injection vials | 1 vial £112.95 (Hospital only)
  - Urokinase 250000 unit Syner-KINASE 250,000 unit powder for solution for injection vials | 1 vial £95 (Hospital only)
  - Urokinase 500000 unit Syner-KINASE 500,000 unit powder for solution for injection vials | 1 vial £112 (Hospital only)

**Antithrombotic Drugs** → **Vitamin K Antagonists**

**Vitamin K antagonists**

**Gastrointestinal**
- **CONTRA-INDICATIONS** Avoid use within 48 hours postpartum - haemorrhagic stroke - significant bleeding
- **CAUTIONS** Bacterial endocarditis (use only if warfarin otherwise indicated) - conditions in which risk of bleeding is increased - history of gastrointestinal bleeding - hyperthyroidism - hypothyroidism - peptic ulcer - postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery) - recent ischaemic stroke - recent surgery - uncontrolled hypertension
- **SIDE-EFFECTS**
  - Common or very common Haemorrhage
  - Rare or very rare Alopecia - nausea - vomiting
  - Frequency not known Blue toe syndrome - CNS haemorrhage - diarrhoea - fever - haemorrhaxa - jaundice - pancreatitis - skin necrosis (increased risk in patients with protein C or protein S deficiency) - skin reactions
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should be warned of the danger of teratogenicity.

**Pregnancy**
- **INDICATIONS AND DOSE** Prophylaxis of embolism in rheumatic heart disease and atrial fibrillation | Prophylaxis and treatment of venous thrombosis and pulmonary embolism: Transient ischaemic attacks
  - **BY MOUTH**
    - Adult: Initially 2–4 mg once daily for 2 days, alternatively initially 6 mg on day 1, then 4 mg on day 2; maintenance 1–8 mg daily, adjusted according to response, dose to be taken at the same time each day, lower doses may be required in patients over 65 years, severe heart failure with hepatic congestion, and malnutrition
- **CAUTIONS** Patients over 65 years
- **INTERACTIONS** → Appendix 1: coumarins

**Acenocoumarol**

(Nicoumalone)

**Electroni...**
SIDE-EFFECTS

- Rare or very rare Appetite decreased · liver injury · skin necrosis haemorrhagic (increased risk in patients with protein C or protein S deficiency) · vasculitis

- BREAST FEEDING Risk of haemorrhage; increased by vitamin K deficiency—manufacturer recommends prophylactic vitamin K for the infant (consult product literature).

- HEPATIC IMPAIRMENT
  Dose adjustments Manufacturer advises consider dose reduction in mild to moderate impairment.

- RENAL IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe impairment.

- PATIENT AND CARER ADVICE Anticoagulant card to be provided.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 10
  - Acenocoumarol 1 mg
  - Warfarin sodium 1 mg
  - Warfarin sodium 3 mg
  - Warfarin sodium 5 mg

**Phenindione**

**INDICATIONS AND DOSE**

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism

- BY MOUTH
  - Adult: Initially 200 mg on day 1, then 100 mg on day 2, then, adjusted according to response; maintenance 50–150 mg daily

**INTERACTIONS** → Appendix 1: phenindione

**SIDE-EFFECTS** Agranulocytosis · albuminuria · eosinophilia · hepatitis · increased leucocytes · kidney injury · leucopenia · lymphadenopathy · pancytopenia · renal tubular necrosis · taste altered

- BREAST FEEDING Avoid. Risk of haemorrhage; increased by vitamin K deficiency.

- RENAL IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe impairment.

- PATIENT AND CARER ADVICE Patient counselling is advised for phenindione tablets (may turn urine pink or orange). Anticoagulant card to be provided.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 10, 14
  - Phenindione (Non-proprietary)
    - 10 mg
    - 25 mg

**Warfarin sodium**

10-Oct-2016

**INDICATIONS AND DOSE**

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks

- BY MOUTH
  - Adult: Initially 5–10 mg, to be taken on day 1; subsequent doses dependent on the prothrombin time

**INTERACTIONS** → Appendix 1: coumarins

**SIDE-EFFECTS** Calciphipasis · hepatic function abnormal

**PREGNANCY** Babies of mothers taking warfarin at the time of delivery need to be offered immediate prophylaxis with intramuscular phynomenadone (vitamin K).

- BREAST FEEDING Not present in milk in significant amounts and appears safe. Risk of haemorrhage which is increased by vitamin K deficiency.

- RENAL IMPAIRMENT Use with caution in mild to moderate impairment.

- PATIENT AND CARER ADVICE Anticoagulant card to be provided.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral suspension**

- CAUTIONARY AND ADVISORY LABELS 10
  - Warfarin sodium (Non-proprietary)
    - 1 mg per ml

**Tablet**

**INDICATIONS AND DOSE**

Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks

- BY MOUTH
  - Adult: Initially 5–10 mg, to be taken on day 1; subsequent doses dependent on the prothrombin time

4 Blood pressure conditions

4.1 Hypertension

**Overview**

Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment. Advice on antihypertensive therapy in this section takes into account the recommendations of NICE clinical guidance 127
Hypertension thresholds and targets for treatment

Patients presenting with a blood pressure of 140/90 mmHg or higher when measured in a clinic setting, should be offered ambulatory blood pressure monitoring (or home blood pressure monitoring if ambulatory blood pressure monitoring is unsuitable) to confirm the diagnosis and stage of hypertension.

Stage 1 hypertension:
- Clinic blood pressure 140/90 mmHg or higher, and ambulatory daytime average or home blood pressure average 135/85 mmHg or higher
- Treat patients under 80 years who have stage 1 hypertension and target-organ damage (e.g. left ventricular hypertrophy, chronic kidney disease, hypertensive retinopathy), cardiovascular disease, renal disease, diabetes, or a 10 year cardiovascular risk ≥20%; in the absence of these conditions, advise lifestyle changes and review annually. For patients under 40 years with stage 1 hypertension but no overt target-organ damage, cardiovascular disease, renal disease, or diabetes, consider seeking specialist advice for evaluation of secondary causes of hypertension.

Stage 2 hypertension:
- Clinic blood pressure 160/100 mmHg or higher, and ambulatory daytime average or home blood pressure average 150/95 mmHg or higher
- Treat all patients who have stage 2 hypertension, regardless of age

Severe hypertension:
- Clinic systolic blood pressure ≥180 mmHg or clinic diastolic blood pressure ≥110 mmHg; treat promptly—see Hypertensive Crises, below.

A target clinic blood pressure below 140/90 mmHg is suggested for patients under 80 years; a target ambulatory or home blood pressure average (during the patient’s waking hours) of below 135/85 mmHg is suggested for patients under 80 years; see also Hypertension in the Elderly, below. A target clinic blood pressure below 130/80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, or diabetes in the presence of kidney, eye, or cerebrovascular disease. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

Drugs for hypertension

A single antihypertensive drug is often inadequate in the management of hypertension, and additional antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently (see Hypertensive Crises), an interval of at least 4 weeks should be allowed to determine response; clinicians should ensure antihypertensive drugs are titrated to the optimum or maximum tolerated dose at each step of treatment. Response to drug treatment may be affected by age and ethnicity.

Patients under 55 years:

Step 1
- **ACE inhibitor:** if not tolerated, offer an angiotensin-II receptor antagonist. If both ACE inhibitors and angiotensin-II receptor antagonists are contra-indicated or not tolerated, consider a **beta-blocker**; beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or at high risk of developing diabetes.

Step 2
- ACE inhibitor or angiotensin-II receptor antagonist in combination with a **calcium-channel blocker**. If a calcium-channel blocker is not tolerated or if there is evidence of, or a high risk of, heart failure, give a **thiazide-related diuretic** (e.g. chlortalidone or indapamide). If a beta-blocker was given at Step 1, add a calcium channel blocker in preference to a thiazide-related diuretic (see Step 1).

Step 3
- ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker and a **thiazide-related diuretic**.

Step 4 (resistant hypertension)
- Consider seeking specialist advice.
- Add low-dose **spirolactone** [unlicensed indication], or use high-dose thiazide related diuretic if plasma-potassium concentration above 4.5 mmol/litre
- Monitor renal function and electrolytes
- If additional diuretic therapy is contra-indicated, ineffectivel, or not tolerated, consider an **alpha-blocker** or a beta-blocker.

Patients over 55 years, and patients of any age who are of African or Caribbean family origin:

Step 1
- Calcium-channel blocker; if not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlortalidone or indapamide).

Step 2
- Calcium-channel blocker or thiazide-related diuretic in combination with an ACE inhibitor or angiotensin-II receptor antagonist (an angiotensin-II receptor antagonist in combination with a calcium-channel blocker is preferred in patients of African or Caribbean family origin).

Steps 3 and 4
- Treat as for patients under 55 years

Cardiovascular risk reduction

Aspirin p. 121 reduces the risk of cardiovascular events and myocardial infarction. Unduly high blood pressure must be controlled before aspirin is given. Unless contra-indicated, aspirin is recommended for all patients with established cardiovascular disease. Use of aspirin in primary prevention, in those with or without diabetes, is of unproven benefit. For the role of aspirin in the prevention of stroke in patients with atrial fibrillation, see Arrhythmias p. 99. Statins are also of benefit in cardiovascular disease or in those who are at high risk of developing cardiovascular disease.

For full guidance on the risk assessment and prevention of cardiovascular disease, see Cardiovascular disease risk assessment and prevention p. 189.

Hypertension in the elderly

Benefit from antihypertensive therapy is evident up to at least 80 years of age, but it is probably inappropriate to apply a strict age limit when deciding on drug therapy. Patients who reach 80 years of age while taking antihypertensive drugs should continue treatment, provided that it continues to be of benefit and does not cause significant side-effects. If
Cardiovascular system

Blood pressure conditions

BNF 78

patients are aged over 80 years when diagnosed with stage 1 hypertension, the decision to treat should be based on the presence of other comorbidities; patients with stage 2 hypertension should be treated as for patients over 55 years. A target clinic blood pressure below 150/90 mmHg is suggested for patients over 80 years; the suggested target ambulatory or home blood pressure average (during the patient’s waking hours) is below 145/85 mmHg.

Isolated systolic hypertension

Isolated systolic hypertension (systolic pressure >160 mmHg, diastolic pressure <90 mmHg) is common in patients over 60 years, and is associated with an increased cardiovascular disease risk; it should be treated as for patients with both a raised systolic and diastolic blood pressure. Patients with severe postural hypotension should be referred to a specialist.

Hypertension in diabetes

Hypertension in diabetic patients should be treated aggressively with lifestyle modification and drug treatment.

For patients with diabetes, a target clinic blood pressure below 140/80 mmHg is suggested (below 130/80 mmHg is advised if kidney, eye, or cerebrovascular disease are also present). However, in some individuals, it may not be possible to achieve this level of control despite appropriate therapy. Most patients require a combination of antihypertensive drugs.

Hypertension is common in type 2 diabetes, and antihypertensive treatment prevents macrovascular and microvascular complications. In type 1 diabetes, hypertension usually indicates the presence of diabetic nephropathy. An ACE inhibitor (or an angiotensin-II receptor antagonist) may have a specific role in the management of diabetic nephropathy; in patients with type 2 diabetes, an ACE inhibitor (or an angiotensin-II receptor antagonist) can delay progression of microalbuminuria to nephropathy.

Hypertension in renal disease

A target clinic blood pressure below 140/90 mmHg is suggested (below 130/80 mmHg is advised in patients with chronic kidney disease and diabetes, or if proteinuria exceeds 1 g in 24 hours). An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required.

Hypertension in pregnancy

Hypertensive complications in pregnancy can be hazardous for both the mother and the fetus, and are associated with a significant risk of morbidity and mortality; complications can occur in pregnant women with pre-existing chronic hypertension, or in those who develop hypertension in the latter half of pregnancy.

Labetalol hydrochloride p. 148 is widely used for treating hypertension in pregnancy. Methyldopa p. 145 is considered safe for use in pregnancy. Modified-release preparations of nifedipine p. 162 [unlicensed] are also used. The following advice takes into account the recommendations of NICE Clinical Guideline 107 (August 2010), Hypertension in Pregnancy.

Pregnant women with chronic hypertension who are already receiving antihypertensive treatment should have their drug therapy reviewed. In uncomplicated chronic hypertension, a target blood pressure of <150/100 mmHg is recommended; women with target-organ damage as a result of chronic hypertension, and in women with chronic hypertension who have given birth, a target blood pressure of <140/90 mmHg is advised. Long-term antihypertensive treatment should be reviewed 2 weeks following the birth. Women managed with methyldopa during pregnancy should discontinue treatment and restart their original antihypertensive medication within 2 days of the birth.

Pregnant women are at high risk of developing pre-eclampsia if they have chronic kidney disease, diabetes mellitus, autoimmune disease, chronic hypertension, or if they have had hypertension during a previous pregnancy; these women are advised to take aspirin p. 121 once daily [unlicensed indication] from week 12 of pregnancy until the baby is born. Women with more than one moderate risk factor (first pregnancy, aged >40 years, pregnancy interval >10 years, BMI ≥35 kg/m² at first visit, multiple pregnancy, or family history of pre-eclampsia) for developing pre-eclampsia are also advised to take aspirin once daily [unlicensed indication] from week 12 of pregnancy until the baby is born.

Women with pre-eclampsia or gestational hypertension who present with a blood pressure over 150/100 mmHg, should receive initial treatment with oral labetalol hydrochloride to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg. If labetalol hydrochloride is unsuitable, methyldopa or modified-release nifedipine may be considered. Women with gestational hypertension or pre-eclampsia who have been managed with methyldopa during pregnancy should discontinue treatment within 2 days of the birth. Women with a blood pressure of ≥160/110 mmHg who require critical care during pregnancy or after birth should receive immediate treatment with either oral or intravenous labetalol hydrochloride, intravenous hydralazine hydrochloride p. 180, or oral modified-release nifedipine to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg.

Also see use of magnesium sulfate p. 1051 in pre-eclampsia and eclampsia. Women with pre-eclampsia where birth is considered likely within 7 days, intramuscular betamethasone p. 674 [unlicensed indication] is recommended for fetal lung maturation.

Hypertensive crises

If blood pressure is reduced too quickly in the management of hypertensive crises, there is a risk of reduced organ perfusion leading to cerebral infarction, blindness, deterioration in renal function, and myocardial ischaemia.

A hypertensive emergency is defined as severe hypertension with acute damage to the target organs (e.g. severe papilloedema or retinal haemorrhage, or the presence of clinical conditions such as acute coronary syndromes, acute aortic dissection, acute pulmonary oedema, hypertensive encephalopathy, acute cerebral infarction, intracerebral or subarachnoid haemorrhage, eclampsia, or rapidly progressing renal failure); prompt treatment with intravenous antihypertensive therapy is generally required. Over the first few minutes or within 2 hours, blood pressure should be reduced by 20–25%. When intravenous therapy is indicated, treatment options include sodium nitroprusside p. 182 [unlicensed], nicardipine hydrochloride p. 161, labetalol hydrochloride, glyceryl trinitrate p. 218, phentolamine mesilate p. 181, hydralazine hydrochloride, or esmolol hydrochloride p. 154; choice of drug is dependent on concomitant conditions and clinical status of the patient.

Severe hypertension (blood pressure ≥180/110 mmHg) without acute target-organ damage is defined as a hypertensive urgency; blood pressure should be reduced gradually over 24–48 hours with oral antihypertensive therapy, such as labetalol hydrochloride, or the calcium-channel blockers amlodipine p. 156 or felodipine p. 160. Use of sublingual nifedipine is not recommended.

Also see advice on short-term management of hypertensive episodes in pheochromocytoma.
Phaeochromocytoma
Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors; the optimal choice of drug therapy remains unclear. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker; a cardiacselective beta-blocker is preferred.

Phenoxybenzamine hydrochloride p. 181, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects. Phentolamine mesilate is a short-acting alpha-blocker used mainly during surgery of phaeochromocytoma; its use for the diagnosis of phaeochromocytoma has been superseded by measurement of catecholamines in blood and urine.

Metirosine (available from ‘special-order’ manufacturers or specialist importing companies) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of phaeochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor blocking drug may also be required. Metirosine should not be used to treat essential hypertension.

Advanced Pharmacy Services
Patients with hypertension may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Antihypertensive drugs
Vasodilator antihypertensive drugs
Vasodilators have a potent hypertensive effect, especially when used in combination with a beta-blocker and a thiazide. Important: see Hypertension (hypertensive crises) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 180 is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 182 [unlicensed] is given by intravenous infusion to control severe hypertensive emergencies when parenteral treatment is necessary.

Minoxidil p. 181 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 227, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin p. 784, doxazosin p. 783, and terazosin p. 786 have alpha-blocking and vasodilator properties.

Ambrisentan p. 184, bosentan p. 185, iloprost p. 184, macitentan p. 185, sildenafil p. 813, and tadalafil p. 814 are licensed for the treatment of pulmonary arterial hypertension and should be used under specialist supervision. Epoprostenol p. 115 can be used in patients with primary pulmonary hypertension resistant to other treatments. Bosentan is also licensed to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease. Riociguat p. 186 is licensed for the treatment of pulmonary arterial hypertension and chronic thromboembolic pulmonary hypertension; it should be used under specialist supervision.

Sitaxentan has been withdrawn from the market because the benefit of treatment does not outweigh the risk of severe hepatotoxicity.

Centrally acting antihypertensive drugs
Methyldopa p. 145 is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy.

Clonidine hydrochloride p. 145 has the disadvantage that sudden withdrawal of treatment may cause severe rebound hypertension.

Moxonidine p. 146, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.

Adrenergic neurone blocking drugs
Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.

Guanethidine monosulfate p. 182, which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure, however alternative treatments are preferred.

Alpha-adrenoceptor blocking drugs
Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. Doxazosin, indoramin p. 784, and terazosin have properties similar to those of prazosin.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

Prostatic hyperplasia
Alfuzosin hydrochloride p. 782, doxazosin, indoramin, prazosin, tamsulosin hydrochloride p. 785, and terazosin are indicated for benign prostatic hyperplasia.

Drugs affecting the renin-angiotensin system
Angiotensin-converting enzyme inhibitors
Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

Heart failure
ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone p. 193 may be beneficial in severe heart failure and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Prolonged first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide 80 mg daily or more). Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of
serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

**Hypertension**

An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well. ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy. They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

**Diabetic nephropathy**

ACE inhibitors have a role in the management of diabetic nephropathy.

**Prophylaxis of cardiovascular events**

ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction. ACE inhibitors may also have a role in preventing cardiovascular events.

**Initiation under specialist supervision**

ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:

- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- receiving concomitant angiotensin-II receptor antagonist or aliskiren;
- with hypovolaemia;
- with hyponatraemia (plasma-sodium concentration below 130 mmol/litre);
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

**Renal effects**

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced. Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

**ACE inhibitors in combination with other drugs**

See also, Concomitant use of drugs affecting the renin-angiotensin system, below.

**Concomitant diuretics**

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

**Combination products**

Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

**Angiotensin-II receptor antagonists**

Azilsartan medoxomil p. 174, candesartan cilexetil p. 175, eprosartan p. 175, irbesartan p. 175, losartan potassium p. 176, olmesartan medoxomil p. 177, telmisartan p. 178, and valsartan p. 179 are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure or diabetic nephropathy. Candesartan cilexetil and valsartan are also licensed as adjuncts to ACE inhibitors under specialist supervision, in the management of heart failure when other treatments are unsuitable.

**Renal effects**

Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under Angiotensin-converting enzyme inhibitors, above).

**Renin inhibitor**

Aliskiren is a renin inhibitor that is licensed for the treatment of hypertension.

**Concomitant use of drugs affecting the renin-angiotensin system**

Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren p. 179) is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an
ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended.

For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

Other drugs used for Hypertension

Clonidine hydrochloride 25 microgram tablets | 112 tablets [PO] £3.15 DT £3.77
Clonidine hydrochloride 50 microgram tablets | 100 tablet [PO] £8.04 DT £8.04

ANTIHYPERTENSIVES, CENTRALLY ACTING

Clonidine hydrochloride

INDICATIONS AND DOSE

Hypertension

Adult: Initially 50–100 micrograms 3 times a day, increase dose every second or third day, usual maximum dose 1.2 mg daily

Prevention of recurrent migraine | Prevention of vascular headache | Menopausal symptoms, particularly flushing and vasomotor conditions

BY MOUTH

Adult: Initially 50 micrograms twice daily for 2 weeks, then increased if necessary to 75 micrograms twice daily

Unlicensed use

Clonidine may also be used for Tourette syndrome and sedation—unlicensed indications.

Contra-indications

Severe bradycardia secondary to second- or third-degree AV block or sick sinus syndrome

Caution

Cerebrovascular disease - constipation - depression - dizziness - dry mouth - fatigue - headache - nausea - postural hypotension - salivary gland pain - sedation - sexual dysfunction - sleep disorders - vomiting

Uncommon

Delusions - hallucination - malaise - paraesthesia - Raynaud’s phenomenon - skin reactions

Rare or very rare

Alopecia - atrophic ventricular block - dry eye - dryness - eye pain - gastrointestinal disorders - integumental pseudo-obstruction - nasal dryness

Frequency not known

Accommodation disorder - arrhythmias - confusion

Pregnancy

May lower fetal heart rate. Avoid oral use unless potential benefit outweighs risk. Avoid using injection.

Breast feeding

Avoid—present in milk.

Renal impairment

Dose adjustments

Use with caution in severe impairment—reduce initial dose and increase gradually.

Treatment cessation

In hypertension, must be withdrawn gradually to avoid severe rebound hypertension.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

Less suitable for prescribing

Clonidine is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Clonidine hydrochloride (Non-proprietary)

Clonidine hydrochloride 25 microgram tablets | 112 tablet [PO] £3.15 DT £3.77
Clonidine hydrochloride 50 microgram tablets | 100 tablet [PO] £8.04 DT £8.04

Clonidine hydrochloride 10 microgram per 1 ml Clonidine 50micrograms/5ml oral solution sugar free sugar-free | 100 ml [PO] £66.80 DT £66.80

Methyldopa

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult: Initially 250 mg 2–3 times a day, dose should be increased gradually at intervals of at least 2 days; maximum 3 g per day

Elderly: Initially 125 mg twice daily, dose should be increased gradually; maximum 2 g per day

Contra-indications

Acute porphyrias p. 1058 - depression - phaeochromocytoma

Caution

History of depression - history of hepatic impairment

Interactions

Appendix 1: methyldopa

Side-effects

Side-effects, further information

Side-effects are minimised if the daily dose is kept below 1g.

Pregnancy

Not known to be harmful.

Breast feeding

Amount too small to be harmful.

Hepatic impairment

Manufacturer advises avoid in active disease.

Renal impairment

Increased sensitivity to hypotensive and sedative effect.

Dose adjustments

Start with small dose.

Monitoring requirements

Monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs.

www.getintopharma.com
Moxonidine

**INDICATIONS AND DOSE**

**Mild to moderate essential hypertension**

- **By mouth**
  - Adult: 200 micrograms once daily for 3 weeks, dose to be taken in the morning, then increased if necessary to 400 micrograms daily in 1–2 divided doses (max. per dose 400 micrograms), maximum daily dose to be given in 2 divided doses; maximum 600 micrograms per day

- **Contra-indications**
  - Bradycardia, conduction disorders, second- or third-degree AV block, severe heart failure, sick sinus syndrome, sino-atrial block

- **Cautions**
  - First-degree AV block, moderate heart failure, severe coronary artery disease, unstable angina

- **Interactions**
  - Appendix 1: moxonidine

- **Side-effects**
  - Common or very common: Asthenia, diarrhoea, dizziness, drowsiness, dry mouth, dyspepsia, headache, insomnia, nausea, pain, skin reactions, vertigo, vomiting

- **Uncommon**
  - Angioedema, bradycardia, nervousness, oedema, syncope, tinnitus

- **Pregnancy**
  - Manufacturer advises avoid—no information available

- **Breast Feeding**
  - Present in milk—manufacturer advises avoid

- **Renal Impairment**
  - Avoid if eGFR less than 30 mL/minute/1.73 m²

  - Dose Adjustments
    - Max. single dose 200 micrograms and max. daily dose 400 micrograms if eGFR 30–60 mL/minute/1.73 m²

- **Treatment Cessation**
  - Avoid abrupt withdrawal (if concomitant treatment with beta-blocker has to be stopped, discontinue beta-blocker first, then moxonidine after a few days)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Beta-Adrenoceptor Blocking Drugs**

**Overview**

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them, which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors. Celiprolol hydrochloride p. 153, pindolol p. 156, acebutolol p. 152, and oxprenolol hydrochloride have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities.

Some beta-blockers are lipid soluble and some are water soluble. Atenolol p. 152, celiprolol hydrochloride, nadolol p. 149, and sotalol hydrochloride p. 108 are the most watersoluble; they are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares.

Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers, such as atenolol, bisoprolol fumarate p. 153, celiprolol hydrochloride, and nadolol, have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure.

Labetalol hydrochloride p. 148, celiprolol hydrochloride, carvedilol p. 148, and nebivolol p. 155 are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance.

There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate bronchospasm and should therefore usually be avoided in patients with a history of asthma. When there is no suitable alternative, it may be necessary for a patient with well-controlled asthma, or chronic obstructive pulmonary disease (without significant reversible airways obstruction), to receive treatment with a beta-blocker for a co-existing condition (e.g. heart failure or following myocardial infarction). In this situation, a cardioselective beta-blocker should be selected and initiated at a low dose by a specialist; the patient should be closely monitored for adverse effects. Atenolol, bisoprolol fumarate,
metoprolol tartrate p. 154, nebivolol, and (to a lesser extent) acebutolol, have less effect on the beta,(bronchial) receptors and are, therefore, relatively cardioselective, but they are not cardioselective. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Hypertension

The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high.

Beta-blockers can be used to control the pulse rate in patients with phaeochromocytoma. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamine hydrochloride p. 181 should always be used together with the beta-blocker.

Angina

By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with angina (see management of stable angina and acute coronary syndromes for further details). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

Myocardial infarction

For specific comments see management of ST-segment elevation myocardial infarction and non-ST-segment elevation myocardial infarction.

Several studies have shown that some beta-blockers can reduce the recurrence rate of myocardial infarction. However, uncontrolled heart failure, hypertension, bradyarrhythmias, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. Atenolol and metoprolol tartrate may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while acebutolol, metoprolol tartrate, propranolol hydrochloride p. 150, and timolol maleate p. 151 have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less convincing; some have not been tested in trials of secondary prevention.

Arrhythmias

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachycardias, and are used to control those following myocardial infarction.

Sotalol hydrochloride p. 154 is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, when sustained beta-blockade might be hazardous.

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Heart failure

Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. Bisoprolol fumarate p. 153 and carvedilol p. 148 reduce mortality in any grade of stable heart failure; nebivolol p. 155 is licensed for stable mild to moderate heart failure in patients over 70 years. Ideally, treatment should be initiated by those experienced in the management of heart failure.

Thyrotoxicosis

Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol hydrochloride p. 150 can reverse clinical symptoms of thyrotoxicosis within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier.

Other uses

Beta-blockers have been used to alleviate some symptoms of anxiety; probably patients with palpitation, tremor, and tachycardia respond best. Beta-blockers are also used in the prophylaxis of migraine. Betaxolol p. 1180, levobunolol hydrochloride p. 1180, and timolol maleate p. 1180 are used topically in glaucoma.

Beta-adrenoceptor blockers (systemic)

- **CONTRA-INDICATIONS**
  - Asthma - cardiogenic shock - hypotension - marked bradycardia - metabolic acidosis - phaeochromocytoma (apart from specific use with alpha-blockers) - Prinzmetal's angina - second-degree AV block - severe peripheral arterial disease - sick sinus syndrome - third-degree AV block - uncontrolled heart failure

  **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Bronchospasm Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no

  www.getintopharma.com
alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

- **CAUTIONS** Diabetes - first-degree AV block - history of obstructive airways disease (introduce cautiously) - myasthenia gravis - portal hypertension (risk of deterioration in liver function) - psoriasis - symptoms of hypoglycaemia may be masked - symptoms of thyrotoxicosis may be masked

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal discomfort - bradycardia - confusion - depression - diarrhoea - dizziness - dry eye (reversible on discontinuation) - dyspnoea - erectile dysfunction - fatigue - headache - heart failure - nausea - paraesthesia - peripheral coldness - peripheral vascular disease - rash (reversible on discontinuation) - sleep disorders - syncope - visual impairment - vomiting
  - **Uncommon** Atrioventricular block - bronchospasm
  - **Rare or very rare** Hallucination

- **SIDE-EFFECTS, FURTHER INFORMATION** With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate.

- **Overdose** Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate.

- **SIDE-EFFECTS, FURTHER INFORMATION** With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate.

- **MONITORING REQUIREMENTS** Monitor lung function (in patients with a history of obstructive airway disease).

- **TREATMENT CESSATION** Avoid abrupt withdrawal especially in ischaemic heart disease. Sudden cessation of a beta-blocker can cause a rebound worsening of myocardial ischaemia and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped.

**BETA-ADRENOCEPTOR BLOCKERS**

**BETA-ADRENOCEPTOR BLOCKERS**

**Beta-Adrenoceptor Blockers**

**Carvedilol**

15-Jun-2018

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - **BY MOUTH**
    - Adult: Initially 12.5 mg once daily for 2 days, then increased to 25 mg once daily; increased if necessary up to 50 mg daily, dose to be increased at intervals of at least 2 weeks and can be given as a single dose or in divided doses

**Labetalol hydrochloride**

01-Aug-2018

- **INDICATIONS AND DOSE**
  - Controlled hypotension in anaesthesia
    - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
    - Adult: (consult product literature or local protocols)
Hypertension

Hypertension of pregnancy

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 20 mg/hour, then increased if necessary to 40 mg/hour after 30 minutes, then increased if necessary to 80 mg/hour after 30 minutes, then increased if necessary to 160 mg/hour after 30 minutes, adjusted according to response; Usual maximum 160 mg/hour
  - **BY MOUTH**
  - Adult: Use dose for hypertension

Hypertensive emergencies

- **BY INTRAVENOUS INJECTION**
  - Adult: 50 mg, to be given over at least 1 minute, then 50 mg every 5 minutes if required until a satisfactory response occurs; maximum 200 mg per course
  - **BY INTRAVENOUS INFUSION**
  - Adult: Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 100 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day
  - Elderly: Initially 50 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day
  - **BY INTRAVENOUS INJECTION**
  - Adult: 50 mg, dose to be given over at least 1 minute, then 50 mg after 5 minutes if required; maximum 200 mg per course
  - **BY INTRAVENOUS INFUSION**
  - Adult: Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

- **CAUTIONS**  Liver damage
- **INTERACTIONS**  – Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Drug fever, ejaculation failure, hyper-sensitivity, urinary disorders
  - **RARE or VERY RARE**  Hepatic disorders, systemic lupus erythematosus (SLE), toxic myopathy, tremor
  - **FREQUENCY NOT KNOWN**  Alopecia, cyanosis, hyperhidrosis, hyperkalaemia, interstitial lung disease, lethargy, muscle cramps, nasal congestion, peripheral oedema, postural hypotension, psychosis, skin reactions, thrombocytopenia
  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use: Fever, hypoglycaemia masked, thyrotoxicosis masked
    - With oral use: Photosensitivity reaction
  - **PREGNANCY**  The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).
  - **PEDIATRICS**
  - **BREAST FEEDING**  Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).

**HEPATIC IMPAIRMENT**  Manufacturer advises caution (risk of slow metabolism).

- **Dose adjustments**  Manufacturer advises consider dose reduction.

**RENAL IMPAIRMENT**

- **Dose adjustments**  Dose reduction may be required.

**MONITORING REQUIREMENTS**

- Liver damage: Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted.

**EFFECT ON LABORATORY TESTS**  Interferes with laboratory tests for catecholamines.

**DIRECTIONS FOR ADMINISTRATION**

- For intravenous infusion, give intermittently in glucose 5% or sodium chloride and glucose. Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette. Avoid upright position during and for 3 hours after intravenous administration.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**

- **Labetalol hydrochloride (Non-proprietary)**

**Nadolol**

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - **BY MOUTH**
      - Adult: Initially 80 mg once daily, then increased in steps of up to 80 mg every week if required, doses higher than the maximum are rarely necessary; maximum 240 mg per day
  - **Angina**
    - **BY MOUTH**
      - Adult: Initially 40 mg once daily, then increased if necessary up to 160 mg daily, doses should be increased at weekly intervals, maximum dose rarely is used; maximum 240 mg per day
  - **Arrhythmias**
    - **BY MOUTH**
      - Adult: Initially 40 mg once daily, then increased if necessary up to 160 mg once daily, doses should be increased at weekly intervals; reduced to 40 mg daily if bradycardia occurs

www.getintopharma.com
Migraine prophylaxis

- **BY MOUTH**
- Adult: Initially 40 mg once daily, then increased in steps of 40 mg every week, adjusted according to response; maintenance 80–160 mg once daily

Thyrotoxicosis (adjunct)

- **BY MOUTH**
- Adult: 80–160 mg once daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS** Uncommon Appetite decreased · behaviour abnormal · constipation · cough · dry mouth · dyspepsia · facial swelling · flatulence · hyperhidrosis · nasal congestion · sedation · sexual dysfunction · skin reactions · speech slurred · tinnitus · vision blurred · weight increased
- **Frequency not known** Alopecia · hypoglycaemia

- **BREAST FEEDING** Water soluble beta-blockers such as nadolol are present in breast milk in greater amounts than other beta blockers.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Dose adjustments: Increase dosage interval if eGFR less than 50 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Propranolol hydrochloride

- **INDICATIONS AND DOSE**

Thyrotoxicosis (adjunct)

- **BY MOUTH**
- Adult: 10–40 mg 3–4 times a day

Thyrotoxic crisis

- **BY INTRAVENOUS INJECTION**
- Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum total dose is 5 mg in anaesthesia; maximum 10 mg per course

Hypertension

- **BY MOUTH**
- Adult: Initially 80 mg twice daily, dose should be increased at weekly intervals as required; maintenance 160–320 mg daily

Prophylaxis of variceal bleeding in portal hypertension

- **BY MOUTH**
- Adult: Initially 40 mg twice daily, then increased to 80 mg twice daily (max. per dose 160 mg twice daily), dose to be adjusted according to heart rate

Phaeochromocytoma (only with an alpha-blocker) in preparation for surgery

- **BY MOUTH**
- Adult: 60 mg daily for 3 days before surgery

Phaeochromocytoma (only with an alpha-blocker) in patients unsuitable for surgery

- **BY MOUTH**
- Adult: 30 mg daily

Angina

- **BY MOUTH**
- Adult: 40 mg once daily, then increased if necessary to 40 mg 3 times a day

Essential tremor

- **BY MOUTH**
- Adult: Initially 40 mg 2–3 times a day; maintenance 120–240 mg daily

Hypertrophic cardiomyopathy · Anxiety tachycardia

- **BY MOUTH**
- Adult: 10–40 mg 3–4 times a day

Anxiety with symptoms such as palpitation, sweating and tremor

- **BY MOUTH**
- Adult: 40 mg once daily, then increased if necessary to 40 mg 3 times a day

Prophylaxis after myocardial infarction

- **BY MOUTH**
- Adult: Initially 40 mg 4 times a day for 2–3 days, then 80 mg twice daily, start treatment 5 to 21 days after infarction

Essential tremor

- **BY MOUTH**
- Adult: Initially 40 mg 2–3 times a day; maintenance 80–160 mg daily

Migraine prophylaxis

- **BY MOUTH**
- Adult: 80–240 mg daily in divided doses

Arrhythmias

- **BY MOUTH**
- Adult: 10–40 mg 3–4 times a day

- **BY INTRAVENOUS INJECTION**
- Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum 10 mg per course (5 mg in anaesthesia)

**IMPORTANT SAFETY INFORMATION**

### Acebutolol

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Adult: Initially 400 mg daily for 2 weeks, alternatively initially 200 mg twice daily for 2 weeks, then increased if necessary to 400 mg twice daily; maximum 1.2 g per day

**Angina**
- **BY MOUTH**
  - Adult: Initially 400 mg daily, alternatively initially 200 mg twice daily; maximum 1.2 g per day

**Arrhythmias**
- **BY MOUTH**
  - Adult: 0.4–1.2 g daily in 2–3 divided doses

**Severe angina**
- **BY MOUTH**
  - Adult: Initially 300 mg 3 times a day; maximum 1.2 g per day

**INTERACTIONS** → Appendix 1: beta blockers, selective

**SIDE-EFFECTS**

- **Common or very common** Gastrointestinal disorder
- **Frequency not known** Cyanosis - hepatic disorders - lupus-like syndrome - nervous system disorder - psychosis - respiratory disorders - sexual dysfunction

**BREAST FEEDING**

Acebutolol and water soluble beta-blockers are present in breast milk in greater amounts than other beta-blockers.

**RENAL IMPAIRMENT**

**Dose adjustments**
- **Halve dose if eGFR 25–50 mL/minute/1.73 m²**; use quarter dose if eGFR less than 25 mL/minute/1.73 m²; do not administer more than once daily.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 8
  - **Sectral** (Sanofi)
    - Acebutolol (as Acebutolol hydrochloride) 400 mg | Sectral 400mg tablets | 28 tablet
  - **Price** £18.62

### Atenolol

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Adult: 25–50 mg daily, higher doses are rarely necessary

**Angina**
- **BY MOUTH**
  - Adult: 100 mg daily in 1–2 divided doses

**Arrhythmias**
- **BY MOUTH**
  - Adult: 50–100 mg daily

**Migraine prophylaxis**
- **BY MOUTH**
  - Adult: 150 micrograms/kg every 12 hours if required, to be given over 20 minutes

**Early intervention within 12 hours of myocardial infarction**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: 5–10 mg, to be given at a rate of 1 mg/minute, followed by (by mouth) 50 mg after 15 minutes, then (by mouth) 50 mg after 12 hours, then (by mouth) 100 mg after 12 hours, then (by mouth) 100 mg once daily

**INTERACTIONS** → Appendix 1: beta blockers, selective

**SIDE-EFFECTS**

- **Common or very common** Gastrointestinal disorder
- **Rare or very rare** Alopecia - dry mouth - hepatic disorders - mood altered - postural hypotension - psychosis - skin reactions - thrombocytopenia

**BREAST FEEDING**

Water soluble beta-blockers such as atenolol are present in breast milk in greater amounts than other beta-blockers.

**RENAL IMPAIRMENT**

**Dose adjustments**
- **With oral use**
  - Max. 50 mg daily if eGFR 15–35 mL/minute/1.73 m²; max. 25 mg daily or 50 mg on alternate days if eGFR less than 15 mL/minute/1.73 m².
  - With intravenous use
    - Max. 10 mg on alternate days if eGFR 15–35 mL/minute/1.73 m²; max. 10 mg every 4 days if eGFR less than 15 mL/minute/1.73 m².

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

Atenolol has been confused with amiodipine; care must be taken to ensure the correct drug is prescribed and dispensed.
DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Tenormin®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Suggested infusion time 20 minutes.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Solution for injection
Tenormin (AstraZeneca UK Ltd)

Interactions with nifedipine
The properties listed below are those particular to the combination only. For the properties of the components please consider, atenolol p. 152, nifedipine p. 162.

INDICATIONS AND DOSE
Hypertension
BY MOUTH
Adult: 1 capsule daily, increased if necessary to 1 capsule twice daily
Elderly: 1 capsule daily

Angina
BY MOUTH
Adult: 1 capsule twice daily

INTERACTIONS → Appendix 1: beta blockers, selective calcium channel blockers

PRESCRIBING AND DISPENSING INFORMATION Only indicated when calcium-channel blocker or beta-blocker alone proves inadequate.

INDICATIONS AND DOSE
Hypertension
BY MOUTH
Adult: 5–10 mg once daily; maximum 20 mg per day

Adjunct in heart failure
BY MOUTH
Adult: Initially 1.25 mg once daily for 1 week, dose to be taken in the morning, then increased if tolerated to 2.5 mg once daily for 1 week, then increased if tolerated to 3.75 mg once daily for 1 week, then increased if tolerated to 5 mg once daily for 4 weeks, then increased if tolerated to 7.5 mg once daily for 4 weeks, then increased if tolerated to 10 mg once daily; maximum 10 mg per day

CONTRA-INDICATIONS Acute or decompensated heart failure requiring intravenous inotropes · sino-atrial block

CAUTIONS Ensure heart failure not worsening before increasing dose

INTERACTIONS → Appendix 1: beta blockers, selective

SIDE-EFFECTS
– Common or very common Constipation
– Uncommon Muscle cramps · muscle weakness · postural hypotension
– Rare or very rare Allergic rhinitis · alopecia · auditory disorder · conjunctivitis · flushing · hepatitis · hypersensitivity · pruritus

HEPATIC IMPAIRMENT
Dose adjustments Max. 10 mg daily in severe impairment.

RENAL IMPAIRMENT
Dose adjustments Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 10 mg daily).

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
CAUTIONARY AND ADVISORY LABELS B
Bisoprolol fumarate (Non-proprietary)
Bisoprolol fumarate 1.25 mg Bisoprolol 1.25mg tablets | 28 tablet £7.43 DT = £0.76

Bisoprolol fumarate 7.5 mg Cardicor 7.5mg tablets | 28 tablet £5.90 DT = £0.97
Bisoprolol fumarate 10 mg Cardicor 10mg tablets | 28 tablet £5.90 DT = £0.75

INDICATIONS AND DOSE
Mild to moderate hypertension
BY MOUTH
Adult: 200 mg once daily, dose to be taken in the morning, then increased if necessary to 400 mg once daily

INTERACTIONS → Appendix 1: beta blockers, selective

SIDE-EFFECTS
Alveolitis allergic · dermatitis psoriasiform · drowsiness · hypoglycaemia masked · palpitations · thyrotoxicosis masked · tremor

BREAST FEEDING Manufacturers advise avoidance.

HEPATIC IMPAIRMENT
Dose adjustments Consider dose reduction.

RENAL IMPAIRMENT Avoid if eGFR less than 15 mL/minute/1.73 m².
Dose adjustments Reduce dose by half if eGFR 15–40 mL/minute/1.73 m².

www.getintopharma.com
Co-tenidone

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult: 50/12.5 mg daily, alternatively increased if necessary to 100/25 mg daily, doses higher than 50 mg atenolol rarely necessary

**DOSE EQUIVALENCE AND CONVERSION**

- A mixture of atenolol and chlortalidone in mass proportions corresponding to 4 parts of atenolol and 1 part chlortalidone.

**INTERACTIONS**

- Appendix 1: beta blockers, selective - thiazide diuretics

**SIDE-EFFECTS**

- Common or very common - Gastrointestinal disorder - glucose tolerance impaired
- Rare or very rare - Alopecia - dry mouth - hepatic disorders - mood altered - neutropenia - psychosis - skin reactions
- Frequency not known - Lupus-like syndrome
- **PREGNANCY** Avoid. Diuretics not used to treat hypertension in pregnancy.
- **BREAST FEEDING** Atenolol present in milk in greater amounts than some other beta-blockers. Possible toxicity due to beta-blockade—monitor infant. Large doses of chlortalidone may suppress lactation.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m²—consider alternative treatment.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**SPECIAL OR EQUIVALENTS**

- **Tablet**
  - Celiprolol hydrochloride 200 mg Celiprolol 200 mg tablets | 28 tablet (Pfizer) £4.81 DT + £6.9
  - Celiprolol hydrochloride 400 mg Celiprolol 400 mg tablets | 28 tablet (Pfizer) £10.20 DT + £10.78
  - Co-tenidone (Sanofi)
  - Celiprolol hydrochloride 200 mg Celiprolot 200 mg tablets | 28 tablet (Pfizer) £11.83 DT + £6.56
  - Celiprolol hydrochloride 400 mg Celiprolot 400 mg tablets | 28 tablet (Pfizer) £39.65 DT + £10.78

Esmolol hydrochloride

**INDICATIONS AND DOSE**

Short-term treatment of supraventricular arrhythmias (including atrial fibrillation, atrial flutter, sinus tachycardia) / Tachycardia and hypertension in peri-operative period

- **BY INTRAVENOUS INFUSION**
  - Adult: 50–200 micrograms/kg/minute, consult product literature for details of dose titration and doses during peri-operative period

**INTERACTIONS**

- Appendix 1: beta blockers, selective

**SIDE-EFFECTS**

- Common or very common - Anxiety - appetite decreased - concentration impaired - drowsiness - hyperhidrosis
- Rare or very rare - Cardiac arrest - extravasation necrosis - thrombophlebitis
- Frequency not known - Angioedema - coronary vasospasm - hyperkalaemia - metabolic acidosis
- **BREAST FEEDING** Manufacturer advises avoidance.
- **RENAL IMPAIRMENT** Manufacturer advises caution.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Esmolol hydrochloride (Non-proprietary)
  - Esmolol hydrochloride 10 mg per 1 ml Esmolol hydrochloride 100mg/10ml solution for injection vials | 5 vial (Pfizer) £38.95 (Hospital only)
  - Esmolol 100 mg/10 ml solution for injection vials | 10 vial (Pfizer) £100.00 (Hospital only)
  - Esmolol hydrochloride 100 mg per 1 ml Brevibloc Premixed 100 mg/10 ml solution for injection vials | 5 vial (Pfizer)

**Solution for infusion**

- Brevibloc (Baxter Healthcare Ltd)
  - Esmolol hydrochloride 10 mg per 1 ml Brevibloc Premixed 2.5 g/250 ml infusion bags | 1 bag (Pfizer) £89.69

**Metoprol tartrate**

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses, high doses are rarely required; maximum 400 mg per day
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 200 mg once daily

**Angina**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 50–100 mg 2–3 times a day
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 200–400 mg daily

**Arrhythmias**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Usual dose 50 mg 2–3 times a day, then increased if necessary up to 300 mg daily in divided doses
- **BY INTRAVENOUS INJECTION**
  - Adult: Up to 5 mg, dose to be given at a rate of 1–2 mg/minute, then up to 5 mg after 5 minutes if required, total dose of 10–15 mg
Hypertension

Migraine prophylaxis
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: 100–200 mg daily in divided doses
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult: 200 mg daily

Hyperthyroidism (adjunct)
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: 50 mg 4 times a day

Early intervention within 12 hours of infarction
- **INITIALLY BY INTRAVENOUS INJECTION**
- Adult: Initially 2–4 mg, given at induction or to control arrhythmias developing during anaesthesia, then 2 mg, repeated if necessary; maximum 10 mg per course

INTERACTIONS → Appendix 1: beta blockers, selective

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- **Common or very common** Constriction, palpitations, postural disorders
- **Uncommon** Chest pain, drowsiness, dystrophic skin lesion, hyperhidrosis, muscle cramps, oedema, skin reactions, weight increased
- **Rare or very rare** Alopecia, arrhythmia, conjunctivitis, dry mouth, eye irritation, gangrene, hepatitis, rhinitis, sexual dysfunction, thrombocytopenia

SPECIFIC SIDE-EFFECTS
- **Uncommon**
  - With intravenous use: Cardiogenic shock, concentration impaired
  - Rare or very rare
    - With intravenous use: Anxiety, arthralgia, atrioventricular block exacerbated, memory loss, photosensitivity reaction, taste altered, tinnitus
    - With oral use: Alertness decreased, arthritis, auditory disorder, personality disorder
    - **Frequency unknown**
      - With oral use: Peyronie’s disease, retroperitoneal fibrosis

HEPATIC IMPAIRMENT

Dose adjustments: Reduce dose in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet
- **CAUTIONARY AND ADVISORY LABELS**
- Nebivolol (Non-proprietary)
  - Nebivolol (as Nebivolol hydrochloride) 2.5 mg Nebivolol 2.5 mg tablets | 28 tablet (PO) £6.84 DT + £11.70
  - Nebivolol (as Nebivolol hydrochloride) 5 mg Nebivolol 5 mg tablets | 28 tablet (PO) £9.23 DT + £4.37
  - Nebivolol (as Nebivolol hydrochloride) 10 mg Nebivolol 10 mg tablets | 28 tablet (PO) £25.88 DT + £25.88
  - Nebilet (A. Menarini Farmaceutica Internazionale SRL) Nebivolol (as Nebivolol hydrochloride) 5 mg Nebilet 5 mg tablets | 28 tablet (PO) £9.23 DT + £4.37

CALCIUM-CHANNEL BLOCKERS

Calcium-channel blockers

Overview

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil hydrochloride p. 164, diltiazem hydrochloride p. 157, and the dihydropyridine calcium-channel blockers (amlodipine p. 156, felodipine p. 160, lercanidipine hydrochloride p. 161, nicardipine hydrochloride p. 161, nifedipine p. 162, and nimodipine p. 115). Calcium channel blockers, with the exception of amloidipine, should be avoided in heart failure as they can further depress cardiac function and exacerbate symptoms. For further guidance on the management of heart failure, see Chronic heart failure p. 191. With the exception of amloidipine, they can also increase mortality after myocardial infarction in patients with left ventricular dysfunction and pulmonary congestion.

Verapamil hydrochloride is used for the treatment of angina, hypertension, and arrhythmias. It is a highly negatively inotropic calcium channel–blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should not be used with beta-blockers. Constipation is the most common side-effect.

Nebivolol

- **INDICATIONS AND DOSE**
  - **Essential hypertension**
    - **BY MOUTH**
      - Adult: 5 mg daily
      - Elderly: Initially 2.5 mg daily, then increased if necessary to 5 mg daily
  - **Hypertension in patient with renal impairment**
    - **BY MOUTH**
      - Adult: Initially 2.5 mg once daily, then increased if necessary to 5 mg once daily
  - **Adjunct in stable mild to moderate heart failure**
    - **BY MOUTH**
      - Adult 70 years and over: Initially 1.25 mg once daily for 1–2 weeks, then increased if tolerated to 2.5 mg once daily for 1–2 weeks, then increased if tolerated to 5 mg once daily for 1–2 weeks, then increased if tolerated to 10 mg once daily

- **CONTRA-INDICATIONS**
  - Acute or decompensated heart failure requiring intravenous inotropes

- **INTERACTIONS** → Appendix 1: beta blockers, selective

- **SIDE-EFFECTS**
  - **Common or very common** Constipation, palpitations, postural hypertension
  - **Uncommon** Dyspepsia, flatulence, skin reactions

- **BREAST FEEDING**
  - Manufacturers advise avoidance.

- **HEPATIC IMPAIRMENT**
  - No information available—manufacturers advise avoidance.

- **RENAL IMPAIRMENT**
  - Manufacturer advises avoid in heart failure if serum creatinine greater than 250 micromol/litre.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

www.getintopharma.com
Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride, and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work.

Nifedipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. Amlodipine and felodipine also resemble nifedipine and nicardipine hydrochloride in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a longer duration of action and can be given once daily. Nifedipine, nicardipine hydrochloride, amlodipine, and felodipine are used for the treatment of angina or hypertension. All are valuable in forms of angina associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Intravenous nicardipine hydrochloride is licensed for the treatment of acute life-threatening hypertension, for example in the event of malignant arterial hypertension or hypertensive encephalopathy; aortic dissection, when a short-acting beta-blocker is not suitable, or in combination with a beta-blocker when beta-blockade alone is not effective; severe pre-eclampsia, when other intravenous anti-hypertensives are not recommended or are contra-indicated; and for treatment of postoperative hypertension.

Lacidipine and lercanidipine hydrochloride have similar effects to those of nifedipine and nicardipine hydrochloride; they are indicated for hypertension only.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem hydrochloride is effective in most forms of angina; the longer-acting formulation is also used for hypertension. It may be used in patients for whom beta-blockers are contra-indicated or ineffective. It has a less negative inotropic effect than verapamil hydrochloride and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

Unstable angina
Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem hydrochloride or verapamil hydrochloride should be reserved for patients resistant to treatment with beta-blockers.

Calcium-channel blockers

**DRUG ACTION**
Calcium-channel blockers (less correctly called ‘calcium-antagonists’) interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

**SIDE-EFFECTS**
- Common or very common Dizziness · flushing · headache · nausea · palpitations · peripheral oedema · rash · tachycardia · vomiting
- Uncommon Gingival hyperplasia

**INTERACTIONS**
- Appendix 1: calcium channel blockers

**CONTRA-INDICATIONS**
- Cardiogenic shock · significant aortic stenosis · unstable angina

**TREATMENT CESSATION**
- There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

**INDICATIONS AND DOSE**

### Prophylaxis of angina
- **BY MOUTH**
  - Adult: Initially 5 mg once daily; maximum 10 mg per day

### Hypertension
- **BY MOUTH**
  - Adult: Initially 5 mg once daily; maximum 10 mg per day

### DOSE EQUIVALENCE AND CONVERSION
- Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

**IMPORTANT SAFETY INFORMATION**
**SAFE PRACTICE**
Amlodipine has been confused with nimodipine and atenolol; care must be taken to ensure the correct drug is prescribed and dispensed.

**CONTRA-INDICATIONS**
- Cardiogenic shock · significant aortic stenosis · unstable angina

**INTERACTIONS**
- Appendix 1: calcium channel blockers

**SIDE-EFFECTS**
- Common or very common Asthenia · constipation · diarrhoea · drowsiness · dyspnoea · gastrointestinal discomfort · gastrointestinal disorders · joint disorders · muscle complaints · oedema · vision disorders
- Uncommon Alopecia · anxiety · arrhythmias · chest pain · cough · depression · dry mouth · erectile dysfunction · gynaecomastia · hyperhidrosis · hypertension · insomnia · malaise · mood altered · pain · rhinitis · sensation abnormal · skin reactions · syncope · taste altered · tinnitus · tremor · urinary disorders · weight changes
- Rare or very rare Angioedema · confusion · hepatic disorders · hyperglycaemia · hypersensitivity · leucopenia · muscle tone increased · myocardial infarction · pancreatitis · peripheral neuropathy · photosensitivity reaction · Stevens-Johnson syndrome · thrombocytopenia · vasculitis
- Frequency not known Extrapyramidal symptoms · pulmonary oedema

**PREGNANCY**
- No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.

**CREST FEEDING**
- Manufacturer advises avoid—no information available.
**Hypertension**

- **INDICATIONS AND DOSE**
  - Hypertension in patients stabilised on the individual components in the same proportions
    - **BY MOUTH**
    - Adult: (consult product literature)
  - **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists - calcium channel blockers

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

### Diltiazem hydrochloride

- **INDICATIONS AND DOSE**
  - **Prophylaxis and treatment of angina**
    - **BY MOUTH**
    - Adult: Initially 60 mg 3 times a day, adjusted according to response; maximum 360 mg per day
    - Elderly: Initially 60 mg twice daily, adjusted according to response; maximum 360 mg per day
  - **Chronic anal fissure**
    - **BY RECTUM USING CREAM, OR BY RECTUM USING OINTMENT**
    - Adult: Apply twice daily until pain stops. Max. duration of use 8 weeks, apply to the anal canal, using 2% topical preparation
    - **BY MOUTH**
    - Adult: 60 mg twice daily until pain stops. Max. duration of use 8 weeks

### Clevidipine

- **INDICATIONS AND DOSE**
  - Hypertension in the peri-operative setting (specialist use only)
    - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 2 mg/hour, dose may be doubled every 90 seconds as necessary; usual dose 4–6 mg/hour (max. per dose 32 mg/hour); maximum 500 mg per day

### Amlodipine with valsartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, amlodipine p. 156, valsartan p. 179.

- **INDICATIONS AND DOSE**
  - Hypertension in patients stabilised on the individual components in the same proportions
    - **BY MOUTH**
    - Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists - calcium channel blockers

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

### Diltiazem hydrochloride

- **INDICATIONS AND DOSE**
  - **Prophylaxis and treatment of angina**
    - **BY MOUTH**
    - Adult: Initially 60 mg 3 times a day, adjusted according to response; maximum 360 mg per day
    - Elderly: Initially 60 mg twice daily, adjusted according to response; maximum 360 mg per day
  - **Chronic anal fissure**
    - **BY RECTUM USING CREAM, OR BY RECTUM USING OINTMENT**
    - Adult: Apply twice daily until pain stops. Max. duration of use 8 weeks, apply to the anal canal, using 2% topical preparation
    - **BY MOUTH**
    - Adult: 60 mg twice daily until pain stops. Max. duration of use 8 weeks

### Clevidipine

- **INDICATIONS AND DOSE**
  - Hypertension in the peri-operative setting (specialist use only)
    - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 2 mg/hour, dose may be doubled every 90 seconds as necessary; usual dose 4–6 mg/hour (max. per dose 32 mg/hour); maximum 500 mg per day

ZEMTARO®

Angina
▶ BY MOUTH
Adult: 180–300 mg once daily, increased if necessary to 480 mg once daily
Elderly: Initially 120 mg once daily, increased if necessary to 480 mg once daily

Mild to moderate hypertension
▶ BY MOUTH
Adult: 180–300 mg once daily, increased if necessary to 360 mg once daily
Elderly: Initially 120 mg once daily, increased if necessary to 360 mg once daily

UNLICENSED USE (EXC) Diltiazem is used for the treatment of chronic anal fissures, but it is not licensed for this indication.

CONTRA-INDICATIONS
With systemic use Acute porphyrias p. 1058. Left ventricular failure with pulmonary congestion - second- or third-degree AV block (unless pacemaker fitted) - severe bradycardia - sick sinus syndrome

CONTRA-INDICATIONS, FURTHER INFORMATION
Systemic absorption following rectal use is unknown, therefore consider the possibility of contra-indications listed for systemic use.

CAUTIONS
With systemic use Bradycardia (avoid if severe) - first degree AV block - heart failure - prolonged PR interval - significantly impaired left ventricular function

CAUTIONS, FURTHER INFORMATION Systemic absorption following rectal use is unknown, therefore consider the possibility of cautions listed for systemic use.

INTERACTIONS → Appendix 1: calcium channel blockers

SIDE-EFFECTS
Common or very common Cardiac conduction disorders - constipation - gastrointestinal discomfort - malaise - skin reactions

Uncommon Arrhythmias - diarrhoea - insomnia - nervousness - postural hypotension

Rare or very rare Dry mouth

Frequency not known Angioedema - cardiac arrest - congestive heart failure - depression - extrapyramidal symptoms - fever - gynaecomastia - hepatitis - hyperglycaemia - hyperhidrosis - mood altered - photosensitivity reaction - severe cutaneous adverse reactions (SCARs) - thrombocytopenia - vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption following rectal use is unknown, therefore consider the possibility of side-effects listed for oral use.

OVERDOSE With oral use In overdose, diltiazem has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

PREGNANCY With systemic use Avoid.

BREAST FEEDING With systemic use Significant amount present in milk—no evidence of harm but avoid unless no safer alternative.
RENAL IMPAIRMENT

Hypertension

For treatment of angina, dose form not appropriate for initial dose titration; up to 120 mg twice a day may be required. ADIZEM-XL® Dose for angina and mild to moderate hypertension—initially 120 mg once daily. DILZEM® XL Dose for angina and mild to moderate hypertension—initially 120 mg once daily. ZEMTARD® Dose for angina and mild to moderate hypertension—initially 120 mg once daily. DILCARDIA® SR Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day. ANGITIL® XL Dose form not appropriate for initial dose titration. SLOZEM® Dose for angina and mild to moderate hypertension—initially 120 mg once daily. TILDIE® LA Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily. VIAZEM® XL Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

RENAL IMPAIRMENT

Dose adjustments • With systemic use Start with smaller dose. TILDIE® RETARD® Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day.

For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

ADIZEM-XL® Dose for angina and mild to moderate hypertension—initially 120 mg once daily. DILZEM® XL Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily. VIAZEM® XL Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

PRESCRIBING AND DISPENSING INFORMATION

• With systemic use The standard formulations containing 60 mg dilatiazem hydrochloride are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation ‘modified-release’, their duration of action corresponds to that of tablets requiring administration more frequently. Different versions of modified-release preparations containing more than 60 mg dilatiazem hydrochloride may not have the same clinical effect. To avoid confusion between these different formulations of dilatiazem, prescribers should specify the brand to be dispensed.

PATIENT AND CARER ADVICE

TILDIE® RETARD® Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution Modified-release tablet

Felodipine

**DRUG ACTION** Felodipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**Prophylaxis of angina**

- **BY MOUTH**
  - Adult: Initially 5 mg once daily; increased if necessary to 10 mg once daily, to be taken in the morning
  - Elderly: Initially 2.5 mg once daily; increased if necessary to 10 mg once daily, to be taken in the morning

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 5 mg once daily; usual maintenance 5–10 mg once daily, to be taken in the morning, doses above 20 mg rarely needed
  - Elderly: Initially 2.5 mg daily; usual maintenance 5–10 mg once daily, to be taken in the morning, doses above 20 mg rarely needed

**SIDE-EFFECTS**

- **Uncommon** Abdominal pain, fatigue, paresthesia, skin reactions
- **Rare or very rare** Arthralgia, gingivitis, hypersensitivity vasculitis, myalgia, photosensitivity reaction, sexual dysfunction, syncope, urinary frequency increased

**PREGNANCY** Avoid; toxicity in animal studies; may inhibit labour.

**BREAST FEEDING** Present in milk but amount probably too small to be harmful.

**HEPATIC IMPAIRMENT** Dose adjustments Manufacturer advises consider dose reduction.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Modified-release tablet**

**FACED tokens**

- **Cardiovascular system**
- **Blood pressure conditions**
- **Lacidipine**

**Lacidipine**

**DRUG ACTION** Lacidipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 2 mg daily; increased if necessary to 4 mg daily, then increased if necessary to 6 mg daily, dose increases should occur at intervals of 3–4 weeks, to be taken preferably in the morning

**SIDE-EFFECTS**

- **Uncommon** Abdominal pain, fatigue, paresthesia, skin reactions
- **Rare** Azoospermia, arthralgia, asymptomatic asymptomatic, cyanosis, epistaxis, gingivitis, hypotension, hypothyroidism, increased urination, periorbital oedema, sexual dysfunction, syncope, urinary frequency increased

**CONTRA-INDICATIONS** Acute porphyrias p. 1058, aortic stenosis - avoid within 1 month of myocardial infarction, cardiogenic shock - unstable angina

**CAUTIONS** Cardiac conduction abnormalities - poor cardiac reserve
Hypertension 161

Nicardipine hydrochloride

**DRUG ACTION** Nicardipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

Prophylaxis of angina

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

Mild to moderate hypertension

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

Life-threatening hypertension (specialist use only) | Postoperative hypertension (specialist use only)

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Adult: Initially 3–5 mg/hour for 15 minutes, increased in steps of 0.5–1 mg every 15 minutes, adjusted according to response, maximum rate 15 mg/hour, reduce dose gradually when target blood pressure achieved; maintenance 2–4 mg/hour
  - Elderly: Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

Life-threatening hypertension in patients with hepatic or renal impairment (specialist use only) | Postoperative hypertension in patients with hepatic or renal impairment (specialist use only)

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Adult: Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

Acute life-threatening hypertension in pregnancy (specialist use only)

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Adult: Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, usual maximum rate 4 mg/hour in treatment of pre-eclampsia (maximum rate 15 mg/hour)

**CONTRA-INDICATIONS**

- General contra-indications
  - Acute porphyrias p. 1058
  - Cardiogenic shock
  - Significant or advanced aortic stenosis
  - Unstable or acute attacks of angina

Specific contra-indications

- With intravenous use: avoid within 8 days of myocardial infarction or compensatory hypertension
- With oral use: avoid within 1 month of myocardial infarction

**CAUTIONS**

- Congestive heart failure: elderly
- Pulmonary oedema
- Significantly impaired left ventricular function: stroke
- Withdraw if ischaemic pain occurs or existing pain worsens within 30 minutes of initiating treatment or increasing dose

**SPECIFIC CAUTIONS**

- With intravenous use: Elevated intracranial pressure

**INTERACTIONS**

- Appendix 1: calcium channel blockers
162 Blood pressure conditions

Nifedipine

**INDICATIONS AND DOSE**

**Raynaud’s syndrome**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

**Angina prophylaxis (not recommended)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

**Postponement of premature labour**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 20 mg, followed by 10–20 mg 3–4 times a day, adjusted according to uterine activity

**Hiccups in palliative care**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 10 mg 3 times a day

**Chronic anal fissure**

- **BY RECTUM USING OINTMENT**
  - Adult: Apply 2–3 times a day until pain stops. Max. duration of use 8 weeks, apply to anal canal, using 0.2%–0.5% topical preparation
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
    - Adult: 20 mg twice daily until pain stops. Max. duration of use 8 weeks

**ADALAT RETARD®**

**Hypertension | Angina prophylaxis**

- **BY MOUTH**
  - Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**ADALAT® LA**

**Hypertension**

- **BY MOUTH**
  - Adult: 20–30 mg once daily, increased if necessary up to 90 mg once daily

**Angina prophylaxis**

- **BY MOUTH**
  - Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

**ADIPINE® MR**

**Hypertension | Angina prophylaxis**

- **BY MOUTH**
  - Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**ADIPINE® XL**

**Hypertension**

- **BY MOUTH**
  - Adult: 30 mg daily, increased if necessary up to 90 mg daily

**CORACTEN® SR**

**Hypertension | Angina prophylaxis**

- **BY MOUTH**
  - Adult: Initially 10 mg twice daily, increased if necessary up to 40 mg twice daily

**CORACTEN® XL**

**Hypertension | Angina prophylaxis**

- **BY MOUTH**
  - Adult: Initially 30 mg daily, increased if necessary up to 90 mg daily

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Hypotension
- Frequency not known Pulmonary oedema, thrombocytopenia

**SPECIFIC SIDE-EFFECTS**

- With intravenous use: Atrioventricular block, erythema, hepatic disorders, ischaemic heart disease, paralytic ileus
- With oral use: Abdominal distress, angina pectoris, exacerbated asthenia, depression, drowsiness, dyspnoea, erectile dysfunction, feeling hot, hepatic function abnormal, insomnia, nervous system disorder, paraesthesia, renal impairment, skin reactions, tinnitus, urinary frequency increased

**SIDE-EFFECTS, FURTHER INFORMATION**

Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur — during intravenous use consider stopping infusion or decreasing dose by half.

**PREGNANCY**

May inhibit labour. Not to be used in multiple pregnancy (twins or more) unless there is no other acceptable alternative. Toxicity in animal studies. Risk of severe maternal hypotension and fatal fetal hypoxia — avoid excessive decrease in blood pressure.

For treatment of acute life-threatening hypertension only.

**BREAST FEEDING**

Manufacturer advises avoid — present in breast milk.

**HEPATIC IMPAIRMENT**

Dose adjustments
- With oral use: Manufacturer advises consider using lowest initial dose and extending dosing interval according to individual response
- With intravenous use: See Indications and dose section.

**RENAL IMPAIRMENT**

Dose adjustments
- With oral use: Consider using lowest initial dose and extending dosing interval according to individual response
- With intravenous use: Use with caution — use lower initial dose

**MONITORING REQUIREMENTS**

Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.

**DIRECTIONS FOR ADMINISTRATION**

Intravenous nifedipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored. For **intravenous infusion** give continuously in Glucose 5%; dilute dose in infusion fluid to a final concentration of 100–200 micrograms/mL (undiluted solution via central venous line only) and give via volumetric infusion pump or syringe driver; protect from light; to minimise peripheral venous irritation, change site of infusion every 12 hours; risk of adsorption on to plastic of infusion set in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions — consult product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Solution for infusion**

- **Nifedipine hydrochloride (Non-proprietary)**
  - Nicardipine hydrochloride 1 mg per 1 ml Nicardipine 10mg/10ml solution for injection ampoules | 5 ampoule (£0.40) £2.00
  - Nicardipine hydrochloride 2.5 mg per 1 ml Cardene IV 25mg/10ml solution for infusion ampoules | 10 ampoule (£0.45) £7.50

**Capsule**

- **Nifedipine hydrochloride (Non-proprietary)**
  - Nicardipine hydrochloride 20 mg — Nicardipine 20mg capsules | 56 capsule (£0.38 DT = £6.00)

- **Nifedipine hydrochloride 30 mg — Nicardipine 30mg capsules | 56 capsule (£0.73 DT = £7.50

---

**Cardene (Astellas Pharma Ltd)**

- Nicardipine hydrochloride 20 mg Cardene 20mg capsules | 56 capsule (£0.40 DT = £6.00)
- Nicardipine hydrochloride 30 mg Cardene 30mg capsules | 56 capsule (£0.73 DT = £7.50

---

www.getintopharma.com
Hypertension | Angina prophylaxis

- **BY MOUTH**
  - Adult: Initially 40 mg once daily, increased if necessary to 80 mg daily in 1–2 divided doses

**NIFEDIPRESS** ® MR

Hypertension | Angina prophylaxis

- **BY MOUTH**
  - Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**TENSIPINE** ® MR

Hypertension | Angina prophylaxis

- **BY MOUTH**
  - Adult: Initially 10 mg twice daily, adjusted according to response to 40 mg twice daily

**VALNI** ® XL

Severe hypertension | Prophylaxis of angina

- **BY MOUTH**
  - Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

- **UNLICENSED USE**
  - With systemic use Not licensed for use in postponing premature labour.
  - With oral use Not licensed for use in postponing premature labour.
  - With systemic use Nifedipine is used for the treatment of chronic anal fissure, but is not licensed for this indication.

- **CONTRA-INDICATIONS**
  - With systemic use Acute attacks of angina - cardiogenic shock - significant aortic stenosis - unstable angina - within 1 month of myocardial infarction

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Systemic absorption following rectal use is unknown, therefore consider the possibility of contra-indications listed for systemic use.

- **CAUTIONS**
  - With systemic use Diabetes mellitus - elderly - heart failure - poor cardiac reserve - severe hypotension - short-acting formulations are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia - significantly impaired left ventricular function (heart failure deterioration observed) - withdrawn if ischaemic pain occurs or existing pain worsens shortly after initiating treatment

**CAUTIONS, FURTHER INFORMATION**

Systemic absorption following rectal use is unknown, therefore consider the possibility of cautions listed for systemic use.

**ADALAT** ® LA

Crohn’s disease - decreased lumen diameter of the gastro-intestinal tract - history of gastro-intestinal obstruction - history of oesophageal obstruction - inflammatory bowel disease

**CAUTIONS, FURTHER INFORMATION**

Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease (including Crohn’s disease).

**VALNI** ® XL

Decreased lumen diameter of gastro-intestinal tract - history of gastro-intestinal obstruction - history of oesophageal obstruction - ileostomy after proctocolectomy - inflammatory bowel disease

**CAUTIONS, FURTHER INFORMATION**

Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, inflammatory bowel disease, or ileostomy after proctocolectomy.

- **INTERACTIONS**
  - Appendix 1: calcium channel blockers

- **SIDE-EFFECTS**
  - Common or very common Constipation - malaise - oedema - vasodilation

- **SIDE-EFFECTS, FURTHER INFORMATION**

Systemic absorption following rectal use is unknown, therefore consider the possibility of side-effects listed for oral use.

- **PREGNANCY**
  - With systemic use May inhibit labour; manufacturer advises avoid before week 20, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension. Use only if other treatment options are not indicated or have failed.

- **BREAST FEEDING**
  - With systemic use Amount too small to be harmful but manufacturers advise avoid.

- **HEPATIC IMPAIRMENT**
  - With oral use For once-daily preparations, manufacturers advise dose form not appropriate (owing to the duration of action of the formulation).

**DIRECTIONS FOR ADMINISTRATION**

**FORTIPINE** ® LA 40

Take with or just after food, or a meal.

**PRESCRIBING AND DISPENSING INFORMATION**

Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed.

**Palliative care**

For further information on the use of nifedipine in palliative care, see [www.medicinescomplete.com/#/content/palliative/nifedipine](http://www.medicinescomplete.com/#/content/palliative/nifedipine).

- Verapamil hydrochloride (Non-proprietary) Verapamil hydrochloride 8 mg per 1 ml

**Thiazides and related diuretics**

**Thiazides and Related Diuretics**

**CONTRA-INDICATIONS**
- Addison’s disease - hypercalcaemia - hypoponatraemia - refractory hypokalaemia - symptomatic hyperuricaemia

**CAUTIONS**
- Diabetes - gout - hyperaldosteronism - malnourishment - nephrotic syndrome - systemic lupus erythematosus

**CAUTIONS, FURTHER INFORMATION**
- Potassium loss
- Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.
- Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements.
- Potassium supplements or potassium-sparing diuretics are seldom necessary when thiazides are used in the routine treatment of hypertension.
- In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.
- Elderly
- Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).
- Existing conditions
- Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.

**SIDE-EFFECTS**
- Common or very common
- Alkalosis hypochloraemic - constipation - diarrhoea - dizziness - electrolyte imbalance - headache - hyperuricaemia - nausea - postural hypotension - urticaria
- Uncommon
- Agranulocytosis - aplastic anaemia - leucopenia
- Alkalosis hypochloraemic - diabetes - electrocardiographic - electrolyte imbalance - pancreatitis - photosensitivity reaction - thrombocytopenia

**PREGNANCY**
- Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.

**HEPATIC IMPAIRMENT**
- General, manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT**
- Thiazides and related diuretics are ineffective if eGFR is less than 30 mL/minute/1.73 m² and should be avoided. Metolazone remains effective if eGFR is less than 30 mL/minute/1.73 m² but is associated with a risk of excessive diuresis.

**Monitoring**
- Electrolytes should be monitored in renal impairment.

**www.getintopharma.com**
**Co-amilozide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrochlorothiazide below.

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
- Adult: Initially 2.5/25 mg daily, increased if necessary up to 5/50 mg daily

**Congestive heart failure**
- **BY MOUTH**
- Adult: Initially 2.5/25 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

**Oedema and ascites in cirrhosis of the liver**
- **BY MOUTH**
- Adult: Initially 5/50 mg daily; increased if necessary up to 10/100 mg daily, reduce dose for maintenance if possible

**DOSE EQUIVALENCE AND CONVERSION**
- A mixture of amiloride hydrochloride and hydrochlorothiazide in the mass proportions of 1 part amiloride hydrochloride to 10 parts hydrochlorothiazide.

**Hydrochlorothiazide**

**INDICATIONS AND DOSE**

Indications listed in combination monographs (available in the UK only in combination with other drugs)
- **BY MOUTH**
- Adult: Doses listed in combination monographs

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVISE: HYDROCHLOROTHIAZIDE: RISK OF NON-MELANOMA SKIN CANCER, PARTICULARLY IN LONG-TERM USE (NOVEMBER 2018)

The MHRA advises healthcare professionals to:
- inform patients taking hydrochlorothiazide-containing products of the cumulative, dose-dependent increased risk of non-melanoma skin cancer, particularly in long-term use, and advise patients to regularly check for and report any new or changed skin lesions or moles;
- advise patients to limit exposure to sunlight and UV rays and use adequate sun protection;
- reconsider the use of hydrochlorothiazide in patients who have had previous skin cancer;
- examine all suspicious moles or skin lesions (potentially including histological examination of biopsies).

**INTERACTIONS** → Appendix 1: thiazide diuretics
## Indapamide

### DRUG ACTION
Indapamide is a thiazide-like diuretic with antihypertensive effects. At lower doses, vasodilatation is more prominent than diuresis; the diuretic effect becomes more apparent with higher doses.

### INDICATIONS AND DOSE

#### Essential hypertension

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 2.5 mg daily, dose to be taken in the morning
  - Adult: 1.5 mg daily, dose to be taken preferably in the morning

#### CAUTIONS
Acute porphyrias p. 1058

#### INTERACTIONS
Appendix 1: thiazide diuretics

### SIDE-EFFECTS

- **Common or very common** Hypersensitivity - skin reactions
- **Uncommon** Vomiting
- **Rare or very rare** Angioedema - arthralgias - dry mouth - fatigue - haemolytic anaemia - hepatic disorders - paraesthesia - renal failure - severe cutaneous adverse reactions (SCARs) - vertigo
- **Frequency not known** Hepatic encephalopathy - QT interval prolongation - syncope - systemic lupus erythematosus exacerbated - vision disorders
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to sulphonamides.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

### MEDICINAL FORMS
Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

### DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM

#### ACE INHIBITORS

- **CONTRA-INDICATIONS** The combination of an ACE inhibitor with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m² — the combination of an ACE inhibitor with aliskiren is contra-indicated in patients with diabetes mellitus.

- **CAUTIONS**
  - Afro-Caribbean patients (may respond less well to ACE inhibitors - concomitant diuretics - diabetes (may lower blood glucose) - first dose hypotension (especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure)
  - peripheral vascular disease or generalised atherosclerosis (risk of clinically silent renovascular disease) - primary aldosteronism (patients may respond less well to ACE inhibitors) - the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) - use with care (or avoid) in those with a history of idiopathic or hereditary angioedema - use with care (or avoid) in those with hypertrophic cardiomyopathy - use with care in patients with severe or symptomatic aortic stenosis (risk of hypotension)

- **CAUTIONS, FURTHER INFORMATION**
  - Anaphylactoid reactions - To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulfate; they should also be withheld before desensitisation with wap or bee venom.

### SIDE-EFFECTS

- **Common or very common** Alopecia - angina pectoris - angioedema (may be delayed; more common in Afro-Caribbean patients) - arthralgias - ashenia - chest pain - constipation - cough - diarrhoea - dizziness - drowsiness - dry mouth - dyspnoea - electrolyte imbalance - gastrointestinal discomfort - headache - hypotension - myalgia - nausea - palpitations - paraesthesia - renal impairment - rhinitis - skin reactions - sleep disorder - syncope - taste altered - tinnitus - vertigo - vomiting

- **Uncommon**

- **Rare or very rare**

- **Stevens-Johnson syndrome**
SIDE-EFFECTS, FURTHER INFORMATION

In light of reports of cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.

- **ALLERGY AND CROSS-SENSITIVITY** ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).

- **PREGNANCY** ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal renal function and control and renal function; skull defects and oligohydramnios have also been reported.

- **BREAST FEEDING** Information on the use of ACE inhibitors in breast-feeding is limited.

- **RENAL IMPAIRMENT**
  
  **Dose adjustments** Use with caution, starting with low dose, and adjust according to response. Hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced.

- **MONITORING REQUIREMENTS** Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).

- **DIRECTIONS FOR ADMINISTRATION** For hypertension the first dose should preferably be given at bedtime.

### Captopril

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  
  - Adult: Initially 12.5–25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken
  
  - Elderly: Initially 6.25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

**Essential hypertension if used in volume depletion, cardiac decompensation, or renovascular hypertension**

- **BY MOUTH**
  
  Adult: Initially 6.25–12.5 mg for 1 dose (under close medical supervision), then 6.25–12.5 mg twice daily; increased if necessary up to 100 mg daily in 1–2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

**Heart failure**

- **BY MOUTH**
  
  Adult (under close medical supervision): Initially 6.25–12.5 mg 2–3 times a day, then increased if tolerated to up to 150 mg daily in divided doses, dose to be increased gradually at intervals of at least 2 weeks

**Short-term treatment within 24 hours of onset of myocardial infarction in clinically stable patients**

- **BY MOUTH**
  
  Adult: Initially 6.25 mg, then increased to 12.5 mg after 2 hours, followed by 25 mg after 12 hours; increased if tolerated to 50 mg twice daily for 4 weeks

**Prophylaxis of symptomatic heart failure after myocardial infarction in clinically stable patients with asymptomatic left ventricular dysfunction (starting 3–16 days after infarction) (under close medical supervision)**

- **BY MOUTH**
  
  - Adult: Initially 6.25 mg daily, then increased to 12.5 mg 3 times a day for 2 days, then increased if tolerated to 25 mg 3 times a day, then increased if tolerated to 75–150 mg daily in 2–3 divided doses, doses exceeding 75 mg per day to be increased gradually

**Diabetic nephropathy in type 1 diabetes mellitus**

- **BY MOUTH**
  
  - Adult: 75–100 mg daily in divided doses

**CAUTIONS**

- Children (efficacy and safety not fully established)

**INTERACTIONS** → Appendix 1: ACE inhibitors

**SIDE-EFFECTS**

- **Common or very common** Insomnia - peptic ulcer
  
  - Uncommon Appetite decreased - flushing - malaise - pallor - Raynaud’s phenomenon
  
  - Rare or very rare Anaemia - aplastic anaemia - autoimmune disorder - cardiac arrest - cardiogenic shock - cerebrovascular insufficiency - depression - gynaecomastia - hepatic disorders - hypoglycaemia - lymphadenopathy - nephrotic syndrome - oral disorders - proteinuria - urinary disorders - vision blurred

**BREAST FEEDING**

Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.

**RENAL IMPAIRMENT**

**Dose adjustments** Reduce dose; max. initial dose 50 mg if eGFR above 40 mL/minute/1.73 m²; max. initial dose 25 mg daily (do not exceed 100 mg daily) if eGFR 20–40 mL/minute/1.73 m²; max. initial dose 12.5 mg daily (do not exceed 75 mg daily) if eGFR 10–20 mL/minute/1.73 m²; max. initial dose 6.25 mg daily (do not exceed 37.5 mg daily) if eGFR less than 10 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

**Tablet**

- **Captopril (Non-proprietary)**
  
  - Captopril 12.5 mg: Captopril 12.5mg tablets | 56 tablet | £0.97 DT = £0.92
  
  - Captopril 25 mg: Captopril 25mg tablets | 56 tablet | £0.80 DT = £0.80
  
  - Captopril 50 mg: Captopril 50mg tablets | 56 tablet | £1.52 DT = £1.50

**Oral solution**

**ELECTROLYTES:** May contain Sodium

- **Captopril (Non-proprietary)**
  
  - Captopril 1 mg per 1 ml: Captopril 5mg/5ml oral solution sugar free | 100 ml | £93.30–£98.21 DT = £97.23
  
  - Captopril 2.5 mg per 1 ml: Captopril 25mg/5ml oral solution sugar free | 100 ml | £103.49–£108.94 DT = £107.85
  
  - Noyada (Martin-Dino Pharmaceuticals Ltd)
    
    - Captopril 1 mg per 1 ml: Noyada 5mg/5ml oral solution sugar-free | 100 ml | £98.21 DT = £97.23
    
    - Captopril 5 mg per 1 ml: Noyada 25mg/5ml oral solution sugar-free | 100 ml | £108.94 DT = £107.85

www.getintopharma.com
Enalapril maleate

**INDICATIONS AND DOSE**

**Hypertension**
- By mouth
  - Adult: Initially 5 mg once daily, lower initial doses may be required when used in addition to diuretic or in renal impairment; maintenance 20 mg once daily; maximum 40 mg per day

**Heart failure**
- By mouth
  - Adult (under close medical supervision): Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks

**Prevention of symptomatic heart failure in patients with asymptomatic left ventricular dysfunction**
- By mouth
  - Adult (under close medical supervision): Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks

**INTERACTIONS**
- Appendix 1: ACE inhibitors
- **SIDE-EFFECTS**
  - Common or very common: Depression, hypersensitivity, vision blurred
  - Uncommon: Anaemia, appetite decreased, asthma, bone marrow disorders, flushing, gastrointestinal disorders, hoarseness, hypoglycaemia, malaise, muscle cramps, nervousness, proteinuria, rhinorrhea, sleep disorders, throat pain
  - Rare or very rare: Autoimmune disorder, gynaecomastia, hepatic disorders, lymphadenopathy, oral disorders, Raynaud’s phenomenon, toxic epidermal necrolysis
  - Frequency not known: Arthritis, leucocytosis, myositis, serositis, Sjadih, vasculitis
- **BREAST FEEDING**: Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.
- **HEPATIC IMPAIRMENT**: Enalapril is a prodrug.
- **RENAL IMPAIRMENT**: Dose adjustments: Max. initial dose 2.5 mg daily if eGFR less than 30 ml/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**: Tablets may be crushed and suspended in water immediately before use.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Tablet**
  - **Enalapril maleate (Non-proprietary)**
    - Enalapril maleate 2.5 mg: Enalapril 2.5 mg tablets | 28 tablet | £5.63 DT = £5.15
    - Enalapril maleate 5 mg: Enalapril 5 mg tablets | 28 tablet | £4.13 DT = £3.74
    - Enalapril maleate 10 mg: Enalapril 10 mg tablets | 28 tablet | £5.64 DT = £5.11
    - Enalapril maleate 20 mg: Enalapril 20 mg tablets | 28 tablet | £6.63 DT = £6.16
  - **Innovace (Merck Sharp & Dohme Ltd)**
    - Enalapril maleate 2.5 mg: Innovace 2.5 mg tablets | 28 tablet | £5.35 DT = £5.15
    - Enalapril maleate 5 mg: Innovace 5 mg tablets | 28 tablet | £4.13 DT = £3.74
    - Enalapril maleate 10 mg: Innovace 10 mg tablets | 28 tablet | £5.64 DT = £5.11
    - Enalapril maleate 20 mg: Innovace 20 mg tablets | 28 tablet | £6.63 DT = £6.16

Enalapril with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, enalapril maleate above, hydrochlorothiazide p. 166.

**INDICATIONS AND DOSE**

**Mild to moderate hypertension in patients stabilised on the individual components in the same proportions**
- **BY MOUTH**
  - Adult: (consult product literature)

**INTERACTIONS**
- Appendix 1: ACE inhibitors - thiazide diuretics

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Enalapril with hydrochlorothiazide (Non-proprietary)
      - Hydrochlorothiazide 12.5 mg, Enalapril maleate 20 mg | Enalapril 20mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet | £20.00 DT = £19.98
      - Innovace (Merck Sharp & Dohme Ltd)
        - Hydrochlorothiazide 12.5 mg, Enalapril maleate 20 mg | Innovace 20mg/12.5mg tablets | 28 tablet | £13.90 DT = £13.98

Fosinopril sodium

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Adult: Initially 10 mg daily for 4 weeks, then increased if necessary up to 40 mg daily, doses over 40 mg not shown to increase efficacy

**Congestive heart failure (adjunct) (under close medical supervision)**
- **BY MOUTH**
  - Adult: Initially 10 mg once daily, then increased if tolerated to 40 mg once daily, doses to be increased gradually

**INTERACTIONS**
- Appendix 1: ACE inhibitors

**SIDE-EFFECTS**
- Common or very common: Eye disorder, increased risk of infection, mood altered, oedema, pain, sexual dysfunction, urinary disorder, visual impairment
- Frequency not known: Appetite normal, arthritis, balance impaired, behaviour abnormal, cardiac arrest, cardiac conduction disorder, cerebrovascular insufficiency, depression, dysphagia, dysphonia, ear pain, fatigue, flushing, gout, haemorrhage, hypertensive crisis, lymphadenopathy, memory loss, muscle weakness, oral disorders, prostatic disorder, tremor, weight changes

**BREAST FEEDING**: Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT**: Fosinopril is a prodrug. Manufacturer advises caution (risk of increased exposure).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
  - **Tablet**
    - Fosinopril sodium (Non-proprietary)
      - Fosinopril sodium 10 mg: Fosinopril 10mg tablets | 28 tablet | £5.73 DT = £4.07
      - Fosinopril sodium 20 mg: Fosinopril 20mg tablets | 28 tablet | £33.98 DT = £33.98
Cardiovascular system

170 Blood pressure conditions

Imidapril hydrochloride

**INDICATIONS AND DOSE**

**Essential hypertension**

- **BY MOUTH**
  - Adult: Initially 5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, doses to be increased at intervals of at least 3 weeks; maximum 20 mg per day
  - Elderly: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, doses to be increased at intervals of at least 3 weeks

**Essential hypertension in patients with heart failure, angina or cerebrovascular disease**

- **BY MOUTH**
  - Adult: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, dose to be increased at intervals of at least 3 weeks; maximum 20 mg per day

**INTERACTIONS** → Appendix 1: ACE inhibitors

**SIDE-EFFECTS**

- Uncommon: Cerebrovascular disorder - increased risk of infection - joint swelling - limb pain - oedema
- Rare or very rare: Anaemia

**HEPATIC IMPAIRMENT**

Imidapril is a prodrug. Manufacturer advises caution (risk of increased exposure).

**DOSE adjustments**

Manufacturer advises initial dose of 2.5 mg daily.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 30 mL/minute/1.73 m².

**DOSE adjustments**

Initial dose 2.5 mg daily if eGFR 30–80 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Tanatril (Mitsubishi Tanabe Pharma Europe Ltd)
  - Imidapril hydrochloride 5 mg: Tanatril 5 mg tablets | 28 tablet | £6.40 DT = £6.40
  - Imidapril hydrochloride 10 mg: Tanatril 10 mg tablets | 28 tablet | £7.22 DT = £7.22
  - Imidapril hydrochloride 20 mg: Tanatril 20 mg tablets | 28 tablet | £8.67 DT = £8.67

Lisinopril

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 10 mg once daily; usual maintenance 20 mg once daily; maximum 80 mg per day

**Hypertension, when used in addition to diuretic, in cardiac decompensation or in volume depletion**

- **BY MOUTH**
  - Adult: Initially 2.5–5 mg once daily; usual maintenance 20 mg once daily; maximum 80 mg per day

**Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure over 120 mmHg**

- **BY MOUTH**
  - Adult: Initially 5 mg, taken within 24 hours of myocardial infarction, followed by 5 mg, to be taken 24 hours after initial dose, then 10 mg, to be taken 24 hours after second dose, then 10 mg once daily for 6 weeks (or continued if heart failure), temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs during treatment (systolic blood pressure less than 90 mmHg for more than 1 hour)

**Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure 100–120 mmHg**

- **BY MOUTH**
  - Adult: Initially 2.5 mg once daily, maintenance 5 mg once daily, increase to maintenance dose only after at least 3 days of the initial dose, should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg, temporarily reduce maintenance dose to 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)

**Renal complications of diabetes mellitus**

- **BY MOUTH**
  - Adult: Initially 2.5–5 mg once daily, adjusted according to response; usual dose 10–20 mg once daily

**Heart failure (adjunct) (under close medical supervision)**

- **BY MOUTH**
  - Adult: Initially 2.5 mg once daily; increased in steps of up to 10 mg at least every 2 weeks; maximum 35 mg per day

**INTERACTIONS** → Appendix 1: ACE inhibitors

**SIDE-EFFECTS**

- Common or very common: Joint pain - muscle pain - joint swelling - limb pain - oedema - peripheral oedema - SIADH
- Uncommon: Rheumatoid arthritis - vasculitis - drug fever
- Rare or very rare: Anaemia

**HEPATIC IMPAIRMENT**

Imidapril is a prodrug. Manufacturer advises caution (risk of increased exposure).

**DOSE adjustments**

Manufacturer advises initial dose of 2.5 mg daily.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 30 mL/minute/1.73 m².

**DOSE adjustments**

Initial dose 2.5 mg daily if eGFR 30–80 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Tanatril (Mitsubishi Tanabe Pharma Europe Ltd)
  - Lisinopril (Non-proprietary)

### Lisinopril with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, lisinopril p. 170, hydrochlorothiazide p. 166.

#### INDICATIONS AND DOSE
- Mild to moderate hypertension in patients stabilised on the individual components in the same proportions
- **INDICATIONS AND DOSE**
- **INTERACTIONS** 
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### MEDICINAL FORMS

- **Tablet**
  - Lisinopril with hydrochlorothiazide (Non-proprietary)
  - Lisinopril 10 mg, Hydrochlorothiazide 12.5 mg  Lisinopril 10mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet (PO) £2.80 DT = £2.69
  - Hydrochlorothiazide 12.5 mg, Lisinopril 20 mg  Lisinopril 20mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet (PO) £2.45 DT = £2.41
  - Zestoretic (AstraZeneca UK Ltd)
    - Lisinopril 10 mg, Hydrochlorothiazide 12.5 mg  Zestoretic 10 tablets | 28 tablet (PO) £13.62 DT = £2.63
    - Hydrochlorothiazide 12.5 mg, Lisinopril 20 mg  Zestoretic 20 tablets | 28 tablet (PO) £13.82 DT = £2.41

### Perindopril arginine

#### INDICATIONS AND DOSE
- **Hypertension**
  - **INDICATIONS AND DOSE**
  - **INTERACTIONS** 
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Perindopril arginine with indapamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, perindopril arginine above, indapamide p. 167.

#### INDICATIONS AND DOSE
- **Hypertension not adequately controlled by perindopril alone**
- **INTERACTIONS** 
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Perindopril erbumine

#### INDICATIONS AND DOSE
- **Hypertension**
- **INTERACTIONS** 
- **SIDE-EFFECTS**
- **MEDICINAL FORMS**

---

www.getintopharma.com
Prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease

▶ BY MOUTH
- Adult: Initially 4 mg once daily for 2 weeks, dose to be taken in the morning, then increased if tolerated to 8 mg once daily
- Elderly: Initially 2 mg once daily for 1 week, then increased if tolerated to 4 mg once daily for 1 week, then increased if tolerated to 8 mg once daily

INTERACTIONS → Appendix 1: ACE inhibitors
SIDE-EFFECTS
- Common or very common Muscle cramps - visual impairment
- Rare or very rare Cholestasis

BREAST FEEDING Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

HEPATIC IMPAIRMENT Perindopril is a prodrug. Manufacturer advises caution when used in combination with a diuretic.

RENAL IMPAIRMENT
Dose adjustments
- Max. initial dose 2.5 mg once daily if eGFR 30–60 mL/minute/1.73 m²; 2 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m².

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Tablet
- CAUTIONARY AND ADVISORY LABELS 22

Perindopril erbumine (Non-proprietary)
- Perindopril erbumine 2 mg Perindopril erbumine 2mg tablets | 30 tablet PSM £12.09 DT = £2.04 | 56 tablet PSM £3.34 | 60 tablet PSM £13.90
- Perindopril erbumine 4 mg Perindopril erbumine 4mg tablets | 30 tablet PSM £12.39 DT = £2.33 | 56 tablet PSM £3.38 | 60 tablet PSM £27.80
- Perindopril erbumine 8 mg Perindopril erbumine 8mg tablets | 30 tablet PSM £12.99 DT = £2.53 | 56 tablet PSM £3.88 | 60 tablet PSM £40.00

Quinapril with hydrochlorothiazide
The properties listed below are those particular to the combination only. For the properties of the components please consider, quinapril above, hydrochlorothiazide p. 166.

INDICATIONS AND DOSE
Hypertension in patients stabilised on the individual components in the same proportions
- BY MOUTH
- Adult: (consult product literature)

INTERACTIONS → Appendix 1: ACE inhibitors - thiazide diuretics

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Quinapril with hydrochlorothiazide (Non-proprietary)
  - Quinapril (Non-proprietary)
    - Quinapril (as Quinapril hydrochloride) 5 mg Quinapril 5mg tablets | 28 tablet PSM £8.59 DT = £8.60
    - Quinapril (as Quinapril hydrochloride) 40 mg Quinapril 40mg tablets | 28 tablet PSM £4.20 DT = £3.72
  - Accupro (Pfizer Ltd)
    - Quinapril (as Quinapril hydrochloride) 5 mg Accupro 5mg tablets | 28 tablet PSM £8.60 DT = £8.60
    - Quinapril (as Quinapril hydrochloride) 10 mg Accupro 10mg tablets | 28 tablet PSM £8.60 DT = £8.60
    - Quinapril (as Quinapril hydrochloride) 20 mg Accupro 20mg tablets | 28 tablet PSM £10.79 DT = £10.79
    - Quinapril (as Quinapril hydrochloride) 40 mg Accupro 40mg tablets | 28 tablet PSM £9.75 DT = £3.72

Rampiril

INDICATIONS AND DOSE
Hypertension
- BY MOUTH
- Adult: Initially 1.25–2.5 mg once daily, increased if necessary up to 10 mg once daily, dose to be increased at intervals of 2–4 weeks
**MEDICINAL FORMS**

**Breast feeding**

Frequency not known

- Uncommon
- Common or very common

**Side-effects**

- Gastrointestinal disorders - increased risk of infection - muscle spasms
- Anxiety - appetite decreased - asthma exacerbated - depressed mood - flushing - libido decreased - myocardiial ischaemia - nasal congestion - proteinuria aggravated - vision disorders
- Conjunctivitis - hearing impairment - hepatic disorders - hypoperfusion - movement disorders - onycholysis - oral disorders - tremor - vascular stenosis - vasculitis
- Altered smell sensation - bone marrow failure - cerebrovascular insufficiency - concentration impaired - enanthema - gynaecomastia - hypersensitivity - Raynaud’s phenomenon - SIADH - toxic epidermal necrolysis

**Breast Feeding**

- Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**Hepatic Impairment**

Ramipril is a prodrug: Manufacturer advises caution.

**Dose Adjustments**

Manufacturer advises maximum 2.5 mg daily.

**Renal Impairment**

Dose adjustments

- Max. daily dose 5 mg if eGFR 30–60 ml/minute/1.73 m²; max. initial dose 1.25 mg once daily (do not exceed 5 mg daily) if eGFR less than 30 ml/minute/1.73 m².

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral Solution**

- **Ramipril (Non-proprietary)**
  - Ramipril 500 microgram per 1 ml | 150 ml | £36.00 DT = £96.00

---

**INDICATIONS AND DOSE**

**Hypertension in patients stabilised on the individual components in the same proportions**

- **By Mouth**
- Adult: (consult product literature)

**INTERACTIONS**

- Appendix 1: ACE inhibitors - calcium channel blockers

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

**Cautionary and Advisory Labels**

- **Triapin** (Sanofi)
- **Felodipine** 5 mg, **Ramipril** 2.5 mg

**Felodipine 5 mg, Ramipril 2.5 mg**

- 28 tablet | £24.55 DT = £48.05
- 28 tablet [PST] £17.00 DT = £34.00

**Felodipine 5 mg, Ramipril 10 mg**

- 28 tablet | £30.00 DT = £60.00
- 28 tablet [PST] £18.00 DT = £36.00

**Ramipril with felodipine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ramipril p. 172, felodipine p. 160.

---

**INDICATIONS AND DOSE**

**Mild to moderate hypertension**

- **By Mouth**
- Adult: Initially 500 micrograms once daily; increased to 1–2 mg once daily, dose to be increased at intervals of 2–4 weeks; maximum 4 mg per day

**Prophylaxis after myocardial infarction in patients with left ventricular dysfunction (starting as early as 3 days after infarction)**

- **By Mouth**
- Adult: Initially 500 micrograms once daily, then increased to up to 4 mg once daily, doses to be increased gradually
**SIDE-EFFECTS**

- **Uncommon** Feeling abnormal • gastrointestinal disorders • hot flush • increased risk of infection • insomnia • libido decreased • malaise • muscle spasms • pain • rhinorrhea
- **Rare or very rare** Anaemia • anxiety • appetite abnormal • azotaemia • cerebrovascular insufficiency • depression • enzyme abnormality • eye disorder • eye inflammation • gout • haemorrhage • hallucination • hyperbilirubinaemia • hyperglycaemia • hypersensitivity • hyperuricaemia • migraine • movement disorders • myocardial ischaemia • oedema • osteoarthritis • platelet disorder • throat irritation • urinary disorders • vascular disorders • visual impairment • white blood cell disorder
- **Frequency not known** Atrialventricular block • cardiac arrest • jaundice • proteinuria • toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION** If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril.

**BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT** Trandolapril is a prodrug. Manufacturer advises caution.

**Dose adjustments** Manufacturer advises consider initial dose of 20 mg in mild to moderate impairment.

**RENAL IMPAIRMENT** Dose adjustments Use with caution, starting with low dose, and adjust according to response.

**MONITORING REQUIREMENTS** Monitor plasma-potassium concentration, particularly in the elderly and in patients with renal impairment.

**Azilsartan medoxomil**

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult 18-74 years: Initially 40 mg once daily, increased if necessary to 80 mg once daily
  - Adult 75 years and over: Initially 20–40 mg once daily, increased if necessary to 80 mg once daily

**Hypertension with intravascular volume depletion**

- **BY MOUTH**
  - Adult: Initially 20–40 mg daily, increased if necessary to 80 mg daily

**CAUTIONS** Heart failure

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

**SIDE-EFFECTS**

- **Uncommon** Angioedema • myalgia • skin reactions • thrombocytopenia
- **Rare or very rare** Arthralgia • hepatic function abnormal

**PREGNANCY** Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.

**BREAST FEEDING** Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Capsule**

- Trandolapril (Non-proprietary)
  - Trandolapril 500 microgram capsules 14 capsule £1.66 DT = £1.66
  - Trandolapril 1 mg capsules 28 capsule £20.21 DT = £20.21
  - Trandolapril 2 mg capsules 28 capsule £2.94 DT = £2.52
  - Trandolapril 4 mg capsules 28 capsule £11.39 DT = £11.39

**DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM**

**ANGIOTENSIN II RECEPTOR ANTAGONISTS**

**ANGIOTENSIN II receptor antagonists**

**CONTRA-INDICATIONS** The combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m² • the combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with diabetes mellitus

**CAUTIONS** Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist) • aortic or mitral valve stenosis • elderly (lower initial doses may be appropriate) • hypertrophic cardiomyopathy • patients with a history of angiodema • patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) • renal artery stenosis

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain • asthenia • back pain • cough • diarrhoea • dizziness • headache • hyperkalaemia • hypotension • nausea • postural

hypotension (more common in patients with intravascular volume depletion, e.g. those taking high-dose diuretics) • renal impairment • vertigo • vomiting

- **Uncommon** Angioedema • myalgia • skin reactions • thrombocytopenia

- **Rare or very rare** Arthralgia • hepatic function abnormal

**PREGNANCY** Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.

**BREAST FEEDING** Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**

**Dose adjustments** Use with caution, starting with low dose, and adjust according to response.

**MONITORING REQUIREMENTS** Monitor plasma-potassium concentration, particularly in the elderly and in patients with renal impairment.

**Azilsartan medoxomil**

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult 18-74 years: Initially 40 mg once daily, increased if necessary to 80 mg once daily
  - Adult 75 years and over: Initially 20–40 mg once daily, increased if necessary to 80 mg once daily

**Hypertension with intravascular volume depletion**

- **BY MOUTH**
  - Adult: Initially 20–40 mg daily, increased if necessary to 80 mg daily

**CAUTIONS** Heart failure

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

**SIDE-EFFECTS**

- **Uncommon** Hyperuricaemia • muscle spasms • peripheral oedema

**HEPATIC IMPAIRMENT**

**Dose adjustments** Manufacturer advises consider initial dose of 20 mg in mild to moderate impairment.

**Monitoring** Manufacturer advises monitor closely in mild to moderate hepatic impairment (limited information available).

**RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Edarbi (Takeda UK Ltd)
  - Azilsartan medoxomil 20 mg Edarbi 20mg tablets 28 tablet £16.80 DT = £16.80
  - Azilsartan medoxomil 40 mg Edarbi 40mg tablets 28 tablet £16.80 DT = £16.80
  - Azilsartan medoxomil 80 mg Edarbi 80mg tablets 28 tablet £19.95 DT = £19.95
Candesartan cilexetil

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - **BY MOUTH**
      - Adult: Initially 8 mg once daily, increased if necessary up to 32 mg once daily, doses to be increased at intervals of 4 weeks; usual dose 8 mg once daily
  - **Hypertension with intravascular volume depletion**
    - **BY MOUTH**
      - Adult: Initially 4 mg once daily, increased if necessary up to 32 mg daily, doses to be increased at intervals of 4 weeks; usual dose 8 mg once daily
  - **Heart failure with impaired left ventricular systolic function when ACE inhibitors are not tolerated**
    - **BY MOUTH**
      - Adult: Initially 4 mg once daily, increased at intervals of at least 2 weeks to ‘target’ dose of 32 mg once daily or to maximum tolerated dose; maximum 32 mg per day

- **CONTRA-INDICATIONS**
- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
- **SIDE-EFFECTS**
  - Common or very common: Increased risk of infection
  - Rare or very rare: Agranulocytosis, hepatitis, hyponatraemia, leucopenia, neutropenia
- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid in severe impairment or cholestasis.
  - **Dose adjustments**
  - Manufacturer advises initial dose reduction to 4 mg once daily in mild to moderate impairment; adjust according to response.
- **RENAL IMPAIRMENT**
  - Use with caution if eGFR less than 30 mL/minute/1.73 m².
  - **Dose adjustments**
  - Initially 4 mg daily.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- Candesartan cilexetil (Non-proprietary)
  - Candesartan cilexetil 2 mg: Candesartan 2mg tablets | 7 tablet (PO) £2.86 DT = £1.76
  - Candesartan cilexetil 4 mg: Candesartan 4mg tablets | 7 tablet (PO) £3.88 DT = £0.54 | 28 tablet (PO) £0.49–£3.78
  - Candesartan cilexetil 8 mg: Candesartan 8mg tablets | 28 tablet (PO) £9.89 DT = £0.99
  - Candesartan cilexetil 16 mg: Candesartan 16mg tablets | 28 tablet (PO) £12.72 DT = £1.78
  - Candesartan cilexetil 32 mg: Candesartan 32mg tablets | 28 tablet (PO) £16.13 DT = £1.76
  - Amias (Takeda UK Ltd)
    - Candesartan cilexetil 2 mg: Amias 2mg tablets | 7 tablet (PO) £3.58 DT = £1.76
    - Candesartan cilexetil 4 mg: Amias 4mg tablets | 7 tablet (PO) £3.88 DT = £0.54 | 28 tablet (PO) £9.78
    - Candesartan cilexetil 8 mg: Amias 8mg tablets | 28 tablet (PO) £9.89 DT = £0.99
    - Candesartan cilexetil 16 mg: Amias 16mg tablets | 28 tablet (PO) £12.72 DT = £1.78
    - Candesartan cilexetil 32 mg: Amias 32mg tablets | 28 tablet (PO) £16.13 DT = £1.76

Eprosartan

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - **BY MOUTH**
      - Adult: 600 mg once daily
  - **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
  - **SIDE-EFFECTS**
    - Common or very common: Gastrointestinal disorder, rhinitis
  - **RENAL IMPAIRMENT**
    - Dose adjustments: Caution if eGFR less than 30 mL/minute/1.73 m².

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 21
  - Eprosartan (Non-proprietary)
    - Eprosartan (as Eprosartan mesilate) 300 mg: Eprosartan 300mg tablets | 28 tablet (PO) £7.31 DT = £7.31
    - Eprosartan (as Eprosartan mesilate) 400 mg: Eprosartan 400mg tablets | 56 tablet (PO) £13.43 DT = £13.17
    - Eprosartan (as Eprosartan mesilate) 600 mg: Eprosartan 600mg tablets | 28 tablet (PO) £14.31 DT = £14.31
    - Teveten (Mylan)
      - Eprosartan (as Eprosartan mesilate) 300 mg: Teveten 300mg tablets | 28 tablet (PO) £7.31 DT = £7.31
      - Eprosartan (as Eprosartan mesilate) 600 mg: Teveten 600mg tablets | 28 tablet (PO) £14.31 DT = £14.31

Irbesartan

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - **BY MOUTH**
      - Adult 18–74 years: Initially 150 mg once daily, increased if necessary to 300 mg once daily
      - Adult 75 years and over: Initially 75–150 mg once daily, increased if necessary to 300 mg once daily
  - **Renal disease in hypertensive type 2 diabetes mellitus**
    - **BY MOUTH**
      - Adult 18–74 years: Initially 150 mg once daily, increased if tolerated to 300 mg once daily
      - Adult 75 years and over: Initially 75–150 mg once daily, increased if tolerated to 300 mg once daily
  - **Renal disease in hypertensive type 2 diabetes mellitus in patients receiving haemodialysis**
    - **BY MOUTH**
      - Adult: Initially 75–150 mg once daily, increased if necessary to 300 mg once daily

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists
- **SIDE-EFFECTS**
  - Common or very common: Musculoskeletal pain
  - Uncommon: Chest pain, dyspepsia, flushing, hepatic disorders, sexual dysfunction, tachycardia
  - Frequency not known: Hypersensitivity vasculitis, muscle cramps, taste altered, tinnitus
**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**
- **Irbesartan (Non-proprietary)**
  - **Irbesartan 75 mg** [Irbesartan 75mg tablets] | 28 tablet [PoM] £9.69 DT = £1.43
  - **Irbesartan 150 mg** [Irbesartan 150mg tablets] | 28 tablet [PoM] £11.84 DT = £2.18
  - **Irbesartan 300 mg** [Irbesartan 300mg tablets] | 28 tablet [PoM] £15.93 DT = £2.77
- **Aprovel** (Sanofi)
  - **Irbesartan 75 mg** [Aprovel 75mg tablets] | 28 tablet [PoM] £9.69 DT = £1.43
  - **Irbesartan 150 mg** [Aprovel 150mg tablets] | 28 tablet [PoM] £11.84 DT = £2.18
  - **Irbesartan 300 mg** [Aprovel 300mg tablets] | 28 tablet [PoM] £15.93 DT = £2.77
- **Ifirmasta** (Consilient Health Ltd)
  - **Irbesartan 75 mg** [Ifirmasta 75mg tablets] | 28 tablet [PoM] £8.23 DT = £1.43
  - **Irbesartan 150 mg** [Ifirmasta 150mg tablets] | 28 tablet [PoM] £10.06 DT = £2.18
  - **Irbesartan 300 mg** [Ifirmasta 300mg tablets] | 28 tablet [PoM] £13.54 DT = £2.77

**Chronic heart failure when ACE inhibitors are unsuitable or contra-indicated**
- **BY MOUTH**
  - **Adult:** Initially 12.5 mg once daily, increased if tolerated to up to 150 mg once daily, doses to be increased at weekly intervals

**Hypertension (including reduction of stroke risk in hypertension with left ventricular hypertrophy)**
- **BY MOUTH**
  - **Adult 18-75 years:** Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily
  - **Adult 76 years and over:** Initially 25 mg once daily for several weeks, then increased if necessary to 100 mg once daily

**Hypertension with intravascular volume depletion**
- **BY MOUTH**
  - **Adult 18-75 years:** Initially 25 mg once daily for several weeks, then increased if necessary up to 100 mg once daily

**Irbesartan with hydrochlorothiazide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, irbesartan p. 175, hydrochlorothiazide p. 166.

**INDICATIONS AND DOSE**

**Hypertension not adequately controlled with irbesartan alone**
- **BY MOUTH**
- **Adult:** (consult product literature)

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists · thiazide diuretics

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Irbesartan with hydrochlorothiazide (Non-proprietary)**
  - **Hydrochlorothiazide 12.5 mg, Irbesartan 150 mg** [Irbesartan 150mg / Hydrochlorothiazide 12.5mg tablets] | 28 tablet [PoM] £7.92 DT = £1.46
  - **Hydrochlorothiazide 25 mg, Irbesartan 300 mg** [Irbesartan 300mg / Hydrochlorothiazide 25mg tablets] | 28 tablet [PoM] £8.24 DT = £1.66
  - **Hydrochlorothiazide 12.5 mg, Irbesartan 300 mg** [Irbesartan 300mg / Hydrochlorothiazide 12.5mg tablets] | 28 tablet [PoM] £10.37 DT = £1.67
- **CoAprovel** (Sanofi)
  - **Hydrochlorothiazide 12.5 mg, Irbesartan 150 mg** [CoAprovel 150mg/12.5mg tablets] | 28 tablet [PoM] £11.84 DT = £2.47
  - **Hydrochlorothiazide 25 mg, Irbesartan 300 mg** [CoAprovel 300mg/25mg tablets] | 28 tablet [PoM] £15.93 DT = £3.47
  - **Hydrochlorothiazide 12.5 mg, Irbesartan 300 mg** [CoAprovel 300mg/12.5mg tablets] | 28 tablet [PoM] £15.93 DT = £3.47

**Losartan potassium**

**INDICATIONS AND DOSE**

**Diabetic nephropathy in type 2 diabetes mellitus**
- **BY MOUTH**
  - **Adult 18-75 years:** Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily
  - **Adult 76 years and over:** Initially 25 mg once daily for several weeks, then increased if necessary to 100 mg once daily

**CAUTIONS** Severe heart failure

**SIDE-EFFECTS**
- **Common or very common** Anaemia · hypoglycaemia · postural disorders
- **Uncommon** Angina pectoris · constipation · drowsiness · dyspnoea · oedema · palpitations · sleep disorder
- **Rare or very rare** Atrial fibrillation · hepatitis · hypersensitivity · paraesthesia · stroke · syncope · vasculitis
- **Frequency not known** Depression · erectile dysfunction · hynotonatrexia · influenza like illness · malaise · migraine · pancreatitis · photosensitivity reaction · rhabdomyolysis · taste altered · tinnitus · urinary tract infection

**HEPATIC IMPAIRMENT**

Dose adjustments
- Manufacturer advises consider dose reduction if history of impairment (risk of increased plasma concentrations).

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include berry-citrus.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral suspension**
- **Cozaar** (Merck Sharpe & Dohme Ltd)
  - **Losartan potassium 2.5 mg per 1 ml** [Cozaar 2.5mg/ml oral suspension sugar-free] | 200 ml [PoM] £53.68 DT = £53.68

**Tablet**
- **Losartan potassium (Non-proprietary)**
  - **Losartan potassium 12.5 mg** [Losartan 125mg tablets] | 28 tablet [PoM] £30.00 DT = £3.09
  - **Losartan potassium 25 mg** [Losartan 25mg tablets] | 28 tablet [PoM] £16.18 DT = £3.28
  - **Losartan potassium 50 mg** [Losartan 50mg tablets] | 28 tablet [PoM] £12.80 DT = £2.70
  - **Losartan potassium 100 mg** [Losartan 100mg tablets] | 28 tablet [PoM] £16.18 DT = £1.95
- **Cozaar** (Merck Sharp & Dohme Ltd)
  - **Losartan potassium 12.5 mg** [Cozaar 12.5mg tablets] | 28 tablet [PoM] £9.70 DT = £3.09
  - **Losartan potassium 25 mg** [Cozaar 25mg tablets] | 28 tablet [PoM] £16.18 DT = £3.28
  - **Losartan potassium 50 mg** [Cozaar 50mg tablets] | 28 tablet [PoM] £12.80 DT = £2.07
  - **Losartan potassium 100 mg** [Cozaar 100mg tablets] | 28 tablet [PoM] £16.18 DT = £1.95
Losartan with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, losartan potassium p. 176, hydrochlorothiazide p. 166.

**INDICATIONS AND DOSE**

**Hypertension not adequately controlled with losartan alone**

- **BY MOUTH**
- **Adult**: (consult product literature)

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists - thiazide diuretics

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Losartan with hydrochlorothiazide (Non-proprietary)**
  - Hydrochlorothiazide 12.5 mg, Losartan potassium 50 mg
    - 50 mg: Losartan 50mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [POM] £12.80 DT = £1.21
  - Hydrochlorothiazide 25 mg, Losartan potassium 100 mg
    - 100 mg: Losartan 100mg / Hydrochlorothiazide 25mg tablets | 28 tablet [POM] £16.18 DT = £1.29
- **Cozaar-Comp** (Merck Sharp & Dohme Ltd)
  - Hydrochlorothiazide 12.5 mg, Losartan potassium 50 mg
    - 50 mg: Losartan 100mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [POM] £16.18 DT = £1.14
  - Hydrochlorothiazide 25 mg, Losartan potassium 100 mg
    - 100 mg: Losartan 100mg / Hydrochlorothiazide 25mg tablets | 28 tablet [POM] £16.18 DT = £1.14

**Olmesartan medoxomil**

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
- **Adult**: Initially 10 mg daily, increased if necessary to 20 mg daily; maximum 40 mg per day

**CONTRA-INDICATIONS**

Biliary obstruction

**SIDE-EFFECTS**

- **Common or very common**
  - Arthritis - bone pain - chest pain - dyspepsia - haematuria - hypertriglyceridaemia - hypuricaemia - increased risk of infection - influenza like illness - oedema
- **Uncommon**
  - Angina pectoris - malaise
- **Rare or very rare**
  - Lethargy - muscle spasms - sprue-like enteropathy

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate impairment; avoid in severe impairment (no information available).

**Dose adjustments**

Manufacturer advises maximum 20 mg daily in moderate impairment.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 20 mL/minute/1.73 m².

**Dose adjustments**

Max. 20 mg daily if eGFR 20–60 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Olmesartan medoxomil (Non-proprietary)**
  - Olmesartan medoxomil 10 mg: Olmesartan medoxomil 10mg tablets | 28 tablet [POM] £10.40 DT = £1.47
  - Olmesartan medoxomil 20 mg: Olmesartan medoxomil 20mg tablets | 28 tablet [POM] £12.30 DT = £1.52
  - Olmesartan medoxomil 40 mg: Olmesartan medoxomil 40mg tablets | 28 tablet [POM] £16.63 DT = £2.01

      - Tolura 80 mg Tolura 80mg tablets | 28 tablet £17.00 DT = £4.90

Telmisartan

INDICATIONS AND DOSE
Hypertension
  - BY MOUTH
  - Adult: Initially 20–40 mg once daily for at least 4 weeks, increased if necessary up to 80 mg once daily

PREVENTION OF CARDIOVASCULAR EVENTS IN PATIENTS WITH ESTABLISHED Atherosclerotic Cardiovascular Disease, OR TYPE 2 DIABETES MELLITUS WITH TARGET-ORGAN DAMAGE
  - BY MOUTH
  - Adult: 80 mg once daily

CONTRA-INDICATIONS
  Biliary obstructive disorders - cholestasis

INTERACTIONS
  → Appendix 1: angiotensin-II receptor antagonists

SIDE-EFFECTS
  - Uncommon Anaemia - arthralgias - chest pain - cystitis - depression - dyspnoea - flatulence - gastrointestinal discomfort - hyperhidrosis - increased risk of infection - insomnia - muscle spasms - sciatia - syncope

Rare or very rare
  Anxiety - drowsiness - dry mouth - eosinophilia - hypoglycaemia - influenza-like illness - interstitial lung disease - liver disorder - pain in extremity - sepsis - taste altered - tendon pain - visual impairment

HEPATIC IMPAIRMENT
Dose adjustments Manufacturer advises maximum 40 mg daily in mild to moderate impairment.

RENAL IMPAIRMENT
Dose adjustments Manufacturer advises initial dose of 20 mg once daily in severe impairment.

MEDICAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Table
  - Micards Plus (Boehringer Ingelheim Ltd)
    - Hydrochlorothiazide 12.5 mg, Telmisartan 40 mg
      - Micards Plus 12.5mg/40mg tablets | 28 tablet £13.61 DT = £3.61
    - Hydrochlorothiazide 25 mg, Telmisartan 80 mg
      - Micards Plus 25mg/80mg tablets | 28 tablet £17.00 DT = £5.17
  - Actelors HCT (Actavis UK Ltd)
    - Hydrochlorothiazide 12.5 mg, Telmisartan 40 mg
      - Actelors HCT 12.5mg/40mg tablets | 28 tablet £13.61 DT = £3.61
    - Hydrochlorothiazide 25 mg, Telmisartan 80 mg
      - Actelors HCT 25mg/80mg tablets | 28 tablet £17.00 DT = £5.17
  - MicardsPlus (Boehringer Ingelheim Ltd)
    - Hydrochlorothiazide 12.5 mg, Telmisartan 40 mg
      - MicardsPlus 12.5mg/40mg tablets | 28 tablet £13.61 DT = £3.61
    - Hydrochlorothiazide 12.5 mg, Telmisartan 80 mg
      - MicardsPlus 12.5mg/80mg tablets | 28 tablet £17.00 DT = £5.17
Valsartan

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Adult: Initially 80 mg once daily, increased if necessary up to 320 mg daily, doses to be increased at intervals of up to 4 weeks

**Hypertension with intravascular volume depletion**
- **BY MOUTH**
  - Adult: Initially 40 mg once daily, increased if necessary up to 320 mg daily, doses to be increased at intervals of at least 2 weeks

**Heart failure when ACE inhibitors cannot be used, or in conjunction with an ACE inhibitor when a beta-blocker cannot be used**
- **BY MOUTH**
  - Adult: Initially 40 mg twice daily, increased to up to 160 mg twice daily, doses to be increased at intervals of at least 2 weeks

**Myocardial infarction with left ventricular failure or left ventricular systolic dysfunction (adjunct)**
- **BY MOUTH**
  - Adult: Initially 20 mg twice daily, increased if necessary up to 160 mg twice daily, doses to be increased over several weeks if tolerated

**CONTRA-INDICATIONS**
- Biliary cirrhosis - cholestasis

**INTERACTIONS**
- Appendix 1: angiotensin-II receptor antagonists - thiazide diuretics

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Valsartan with hydrochlorothiazide (Non-proprietary)
  - Hydrochlorothiazide 12.5 mg, Valsartan 80 mg: 28 tablet (BNF) £13.07 DT = £6.79
  - Hydrochlorothiazide 25 mg, Valsartan 160 mg: 28 tablet (BNF) £18.41 DT = £7.81

**DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM**

**Aliskiren**

**DRUG ACTION**
- Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I.

**INDICATIONS AND DOSE**
- Essential hypertension either alone or in combination with other antihypertensives
  - **BY MOUTH**
    - Adult: 150 mg once daily, increased if necessary to 300 mg once daily

**CONTRA-INDICATIONS**
- Concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with an eGFR less than 60 mL/minute/1.73 m² - concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with diabetes mellitus - hereditary angioedema - idiopathic angioedema

**CAUTIONS**
- Combination treatment with an ACE inhibitor - combination treatment with an angiotensin-II receptor antagonist - concomitant use of diuretics (first doses may cause hypotension - initiate with care) - history of angioedema - moderate to severe congestive heart failure - patients at risk of renal impairment - salt depletion (first doses may cause hypotension - initiate with care) - volume depletion (first doses may cause hypotension - initiate with care)
CAUTIONS, FURTHER INFORMATION

- Concomitant use of drugs affecting the renin-angiotensin system. Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren) is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended. For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

- INTERACTIONS ➔ Appendix 1: aliskiren

- SIDE-EFFECTS ➔ Appendix 2: aliskiren

- Common or very common Arthralgia • diarrhea • dizziness • electrolyte imbalance

- Uncommon Cough • oral disorder • palpitations • peripheral oedema • renal impairment • severe cutaneous adverse reactions (SCARs) • skin reactions

- Rare or very rare Angioedema • hypersensitivity

- Frequency not known Dyspnoea • hepatic disorders • nausea • vertigo • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- If diuretics are severe or persistent discontinue treatment.

- PREGNANCY Manufacturer advises avoid—no information available; other drugs acting on the renin-angiotensin system have been associated with fetal malformations and neonatal death.

- BREAST FEEDING Present in milk in animal studies—manufacturer advises avoid.

- RENAL IMPAIRMENT Avoid if eGFR is less than 30 mL/minute/1.73 m²—no information available. Use with caution in renal artery stenosis—no information available.

- Monitoring Monitor plasma-potassium concentration in renal impairment.

- MONITORING REQUIREMENTS Monitor patients with a history of angioedema closely during treatment.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 462/08

The Scottish Medicines Consortium has advised (February 2010) that aliskiren (Rasilez®) is not recommended for use within NHS Scotland for the treatment of essential hypertension as the economic case was not demonstrated.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS

- Rasilez (Noden Pharma DAC) Aliskiren (as Aliskiren hemifumarate) 150 mg tablets | 28 tablet | £28.51 DT + £28.51 Aliskiren (as Aliskiren hemifumarate) 300 mg tablets | 28 tablet | £34.27 DT + £34.27

VASODILATORS ➔ VASODILATOR ANTIHYPERTENSIVES

Hydralazine hydrochloride [29-Mar-2017]

INDICATIONS AND DOSE

Moderate to severe hypertension (adjunct) ➔ BY MOUTH

- Adult: Initially 25 mg twice daily, increased if necessary up to 50 mg twice daily

Heart failure (with long acting nitrate) (initiated in hospital or under specialist supervision) ➔ BY MOUTH

- Adult: Initially 25 mg 3–4 times a day, subsequent doses to be increased every 2 days if necessary; usual maintenance 50–75 mg 4 times a day

Hypertensive emergencies (including during pregnancy) ➔ By intravenous infusion

- Adult: Initially 200–300 micrograms/minute; usual maintenance 50–150 micrograms/minute

- By slow intravenous injection

- Adult: 5–10 mg, to be diluted with 10 mL sodium chloride 0.9%; dose may be repeated after 20–30 minutes

CONTRA-INDICATIONS

Acute porphyrias p. 1058 • cor pulmonale • disseasing aortic aneurysm • high output heart failure • idiopathic systemic lupus erythematosus • myocardial insufficiency due to mechanical obstruction • severe tachycardia

CAUTIONS

Cerebrovascular disease • coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised) • occasionally blood pressure reduction too rapid even with low parenteral doses

INTERACTIONS ➔ Appendix 1: hydralazine

SIDE-EFFECTS

- Common or very common Angina pectoris • diarrhea • dizziness • flushing • gastrointestinal disorders • headache • hypotension • joint disorders • lupus-like syndrome (after long-term therapy with over 100 mg daily (or less in women and in slow acetylator individuals)) • myalgia • nasal congestion • nausea • palpitations • tachycardia • vomiting

- Rare or very rare Acute kidney injury • agranulocytosis • anaemia • anxiety • appetite decreased • conjunctivitis • depression • dyspnoea • eosinophilia • eye disorders • fever • glomerulonephritis • haematuria • haemolytic anaemia • hallucination • heart failure • hepatic disorders • leucocytosis • leucopenia • lymphadenopathy • malaise • nerve disorders • neutropenia • oedema • pancytopenia • paradoxical pressor response • paraesthesia • pleuritic pain • proteinuria • skin reactions • splenomegaly • thrombocytopenia • urinary retention • vasculitis • weight decreased

SIDE-EFFECTS, FURTHER INFORMATION

The incidence of side-effects is lower if the dose is kept below 100mg daily, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

PREGNANCY

Neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension. Manufacturer advises avoid before third trimester.

BREAST FEEDING

Present in milk but not known to be harmful.

Monitoring

Monitor infant in breast-feeding.

HEPATIC IMPAIRMENT

Manufacturer advises caution (risk of accumulation).

www.getintopharma.com
Dose adjustments Manufacturer advises adjust dose or dosing interval according to clinical response.

- **RENAI IMPAIRMENT**
  - **Dose adjustments** Reduce dose if eGFR less than 30 mL/minute/1.73 m².
  
- **MONITORING REQUIREMENTS** Manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose above 100 mg daily, but evidence of clinical value unsatisfactory.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Apresoline®) give continuously in Sodium chloride 0.9%. Suggested infusion volume 500 mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution.

- **Tablet**
  - **EXCIPIENTS:** May contain Gluten, propylene glycol
  
  **Hydralazine hydrochloride (Non-proprietary)**
  - Hydralazine hydrochloride 25 mg | 56 tablet | £0.37 DT = £15.18 | 84 tablet | £14.00
  - Hydralazine hydrochloride 50 mg | 56 tablet | £0.82 DT = £15.46
  - **Apresoline** (Advanz Pharma)
    - Hydralazine hydrochloride 25 mg | 84 tablet | £1.38
  
  **Powder for solution for injection**
  - **Hydralazine hydrochloride (Non-proprietary)**
    - Hydralazine hydrochloride 20 mg | Hydralazine 20mg powder for concentrate for solution for injection ampoules | 5 ampoule | £74.17

---

Minoxidil

- **INDICATIONS AND DOSE**
  - **Severe hypertension, in addition to a diuretic and a beta-blocker**
    - **BY MOUTH**
      - **Adult:** Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day
      - **Elderly:** Initially 2.5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

- **CONTRA-INDICATIONS**
  - Phaeochromocytoma
  - **CAUTIONS**
    - Acute porphyrias p. 1058 - after myocardial infarction (usually 3–4 weeks) - history of cerebrovascular accident
  
- **INTERACTIONS**
  - Appendix 1: minoxidil

- **SIDE-EFFECTS**
  - **Common or very common** Fluid retention - hair changes - oedema - cardiac disorders - pericarditis - tachycardia
  - **Rare or very rare** Leucopenia - skin reactions - Stevens-Johnson syndrome - thrombocytopenia
  
- **Frequency not known** Angina pectoris - breast tenderness - gastrointestinal disorder - pleural effusion - sodium retention - weight increased

- **PREGNANCY** Avoid - possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.

- **BREAST FEEDING** Present in milk but not known to be harmful.

- **RENAI IMPAIRMENT** Use with caution in significant impairment.

---

4.1a Hypertension associated with phaeochromocytoma

Other drugs used for Hypertension associated with phaeochromocytoma

Propranolol hydrochloride, p. 150

**VASODILATORS > PERIPHERAL VASODILATORS**

**Phenoxybenzamine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Hypertension in phaeochromocytoma**
    - **BY MOUTH**
      - **Adult:** Initially 10 mg daily, increased in steps of 10 mg daily until hypertension controlled or treatment not tolerated; maintenance 1–2 mg/kg daily in 2 divided doses

- **CONTRA-INDICATIONS** During recovery period after myocardial infarction (usually 3–4 weeks) - history of cerebrovascular accident

- **CAUTIONS**
  - Avoid contact with skin (risk of contact sensitisation) - avoid in Acute porphyrias p. 1058 - carcinogenic in animals - cerebrovascular disease - congestive heart failure - elderly - severe ischaemic heart disease

- **SIDE-EFFECTS**
  - Abdominal distress - dizziness - ejaculation failure - fatigue - miosis - nasal congestion - postural hypotension - reflex tachycardia

- **PREGNANCY** Hypertension may occur in newborn.

- **BREAST FEEDING** May be present in milk.

- **RENAI IMPAIRMENT** Use with caution.

- **HANDLING AND STORAGE** Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

- **Capsule**
  - Phenoxybenzamine hydrochloride (Non-proprietary)
    - Phenoxybenzamine hydrochloride 10 mg | 10 mg capsules | 30 capsule | £106.61

---

**Phentolamine mesilate**

- **INDICATIONS AND DOSE**
  - **Hypertensive episodes due to phaeochromocytoma e.g. during surgery**
    - **BY INTRAVENOUS INJECTION**
      - **Adult:** 2–5 mg, repeated if necessary

- **Diagnosis of phaeochromocytoma**
  - **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  
  - **Adult:** (consult product literature)
CONTRA-INDICATIONS  Angina - coronary insufficiency - evidence of coronary artery disease - history of myocardial infarction - hypotension

CAUTIONS  Elderly - gastritis - peptic ulcer

SIDE-EFFECTS
- Common or very common  Arrhythmias - headache - hypertension - oral pain - post procedural pain
- Uncommon  Abdominal pain upper - diarrhoea - facial swelling - pain - paraesthesia - pruritus - vomiting

PREGNANCY  Use with caution—may cause marked decrease in maternal blood pressure with resulting fetal anoxia.

BREAST FEEDING  Manufacturer advises avoiding exposure to breast feeding.

Antihypertensives

Sodium nitroprusside

Caution

UNLICENSED USE  Not licensed for use in the UK.

CONTRA-INDICATIONS  Compensatory hypertension - Leber’s optic atrophy - severe vitamin B12 deficiency

CAUTIONS  Elderly - hypotension - ischaemic heart disease - impair ed cerebral circulation - ischaemic heart disease

INTERACTIONS  Appendix 1: sodium nitroprusside

SIDE-EFFECTS
- Uncommon  Depression - dermatitis - dry mouth - heart failure - nausea - vision blurred - vomiting
- Rare or very rare  Alopecia - asthma - ischaemic heart disease - myalgia - parotid gland enlargement - tremor
- PREGNANCY  Postural hypotension and reduced uteroplacental perfusion. Should not be used to treat hypertension in pregnancy.
- REN AL IMPAIRMENT  Avoid if eGFR less than 40 mL/minute/1.73 m².
- Dose adjustments  Reduce dose if eGFR 40–65 mL/minute/1.73 m².
- LESS SUITABLE FOR PRESCRIBING  Guanethidine monosulfate is less suitable for prescribing.

Other drugs used for Hypertensive crises

Hydralazine hydrochloride, p. 180  Labetalol hydrochloride, p. 148

Cautions

Avoid if eGFR less than 40 mL/minute/1.73 m².

M edication forms

Sodium nitroprusside

Indications and Dose

Hypertensive crises
- Hypertensive crises (but no longer recommended)

Hypertensive emergencies
- By intravenous infusion

Adult: Initially 0.5–1.5 micrograms/kg/minute, increased in steps of 500 nanograms/kg/minute every 5 minutes, usual dose 0.5–8 micrograms/kg/minute, use lower doses if already receiving other antihypertensives, stop if response unsatisfactory with max. dose in 10 minutes, lower initial dose of 300 nanograms/kg/minute has been used

Maintenance of blood pressure at 30–40% lower than pretreatment diastolic blood pressure
- By intravenous infusion

Adult: 20–400 micrograms/min, use lower doses for patients being treated with other antihypertensives

Controlled hypotension in anaesthesia during surgery
- By intravenous infusion

Adult: To 1.5 micrograms/kg/minute

Acute or chronic heart failure
- By intravenous infusion

Adult: Initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary; usual dose 10–200 micrograms/minute normally for max. 3 days

MONITORING REQUIREMENTS  Monitor blood pressure (including intra-arterial blood pressure) and blood-

Other drugs used for Pulmonary hypertension
Epoprostenol, p. 115 · Sildenafil, p. 813 · Tadalafil, p. 814

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Selexipag

DRUG ACTION Selexipag is a selective prostacyclin (IP) receptor agonist.

INDICATIONS AND DOSE
Pulmonary arterial hypertension either as combination therapy (if insufficiently controlled with an endothelin receptor antagonist and/or a phosphodiesterase type-5 inhibitor), or as monotherapy (initiated under specialist supervision)

BY MOUTH

Adult: Initially 200 micrograms twice daily, increased in steps of 200 micrograms twice daily at weekly intervals up to the highest tolerated dose. Usual maintenance 200–1600 micrograms twice daily. Initial dose and first dose after each dose increase should be taken in the evening. Maximum 3200 micrograms per day.

CONTRA-INDICATIONS Cerebrovascular event (within the last 3 months) congenital or acquired valvular defects with myocardial function disorders (not related to pulmonary hypertension) decompenated cardiac failure (unless under close medical supervision). Myocardial infarction (within last 6 months) severe arrhythmias severe coronary heart disease unstable angina.

CAUTIONS Elderly, limited information available.

INTERACTIONS Appendix 1: selexipag.

SIDE-EFFECTS

Common or very common Abdominal pain, anaemia, appetite decreased, arthralgia, diarrhoea, flushing, headache, hyperthyroidism, hypotension, myalgia, nasal congestion, nasopharyngitis, nausea, pain, skin reactions, vomiting, weight decreased.

Uncommon Sinus tachycardia.

PREGNANCY Manufacturer advises avoid—no information available.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).

Dose adjustments Manufacturer advises initial dose reduction to 200 micrograms once daily in moderate impairment, increased in steps of 200 micrograms once daily at weekly intervals up to the highest tolerated dose.

RENAL IMPAIRMENT Manufacturer advises caution with dose titration in severe impairment.

PATIENT AND CARER ADVICE
Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If a dose is missed for 3 days or more, treatment should be restarted at a lower dose and then increased—consult product literature.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) decisions
SMC No. 1235/17 The Scottish Medicines Consortium has advised (updated May 2018) that selexipag (Uptravi®) is accepted for restricted use within NHS Scotland for the long-term treatment of pulmonary arterial hypertension in adults with WHO functional class III, as combination therapy in patients insufficiently controlled with an endothelin receptor antagonist and a phosphodiesterase type-5 inhibitor, and who would be considered for treatment with inhaled iloprost. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions
AWMSG No. 700
The All Wales Medicines Strategy Group has advised (June 2018) that selexipag (Uptravi®) is recommended as an option for restricted use within NHS Wales as a triple combination therapy for the treatment of pulmonary arterial hypertension (PAH) in adults with WHO functional class III as combination therapy in patients insufficiently controlled on dual therapy with an endothelin receptor antagonist and a phosphodiesterase type-5 inhibitor. Selexipag (Uptravi®) is not recommended for use within NHS Wales outside of this sub-population. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

Uptravi (Actelion Pharmaceuticals UK Ltd)

Selexipag 200 microgram Uptravi 200 microgram tablets | 60 tablet (Posm) £3,000.00 | 140 tablet (Posm) £7,000.00
Selexipag 400 microgram Uptravi 400 microgram tablets | 60 tablet (Posm) £3,000.00
Selexipag 600 microgram Uptravi 600 microgram tablets | 60 tablet (Posm) £3,000.00
Selexipag 800 microgram Uptravi 800 microgram tablets | 60 tablet (Posm) £3,000.00
Selexipag 1 mg Uptravi 1,000 microgram tablets | 60 tablet (Posm) £3,000.00
Selexipag 1.2 mg Uptravi 1,200 microgram tablets | 60 tablet (Posm) £3,000.00
Selexipag 1.4 mg Uptravi 1,400 microgram tablets | 60 tablet (Posm) £3,000.00
Selexipag 1.6 mg Uptravi 1,600 microgram tablets | 60 tablet (Posm) £3,000.00
ANTITHROMBOTIC DRUGS > PROSTAGLANDINS, CARDIOVASCULAR

Iloprost

- **INDICATIONS AND DOSE**
  - Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)
  - By inhalation of nebulised solution
  - Adult: Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, increased if tolerated to 5 micrograms 6–9 times a day, adjusted according to response; reduced if not tolerated to 2.5 micrograms 6–9 times a day, reduce to lower maintenance dose if high dose not tolerated

- **CONTRA-INDICATIONS**
  - Conditions which increase risk of haemorrhage: congenital or acquired valvular defects of the myocardium, decompensated cardiac failure (unless under close medical supervision), pulmonary veno-occlusive disease, severe arrhythmias, unstable angina, within 3 months of cerebrovascular events, within 6 months of myocardial infarction

- **CAUTIONS**
  - **GENERAL CAUTIONS**
    - Hypotension (do not initiate if systolic blood pressure below 85 mmHg), unstable pulmonary hypertension with advanced right heart failure
  - **SPECIFIC CAUTIONS**
    - Acute pulmonary infection, chronic obstructive pulmonary disease, severe asthma

- **INTERACTIONS**
  - Appendix 1: Iloprost

- **SIDE-EFFECTS**
  - Common or very common: Chest discomfort, cough, diarrhoea, dizziness, dysphonia, haemorrhage, headache, hypotension, nausea, oral disorders, pain, palpitations, rash, syncope, tachycardia, throat complaints, vasodilatation, vomiting
  - Frequency not known: Respiratory disorders, taste altered, thrombocytopenia

- **PREGNANCY**
  - Use if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Elimination reduced.
  - Dose adjustments: Initially 2.5 micrograms at intervals of 3–4 hours (max. 6 times daily), adjusted according to response (consult product literature).

- **DIRECTIONS FOR ADMINISTRATION**
  - For inhale treatment, to minimise accidental exposure use only with nebulisers listed in Ventavis product literature in a well ventilated room.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Delivery characteristics of nebuliser devices may vary—only switch devices under medical supervision.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions
  - SMC No. 219/05
  - The Scottish Medicines Consortium has advised (December 2005) that iloprost (Ventavis®) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Nebuliser liquid
    - **Ventavis** (Bayer Plc)
      - Iloprost (as iloprost trometamol) 10 microgram per 1 ml
      - Ventavis 10 micrograms/ml nebuliser solution 1ml ampoules (42 ampoule £560.27, 168 ampoule £2,241.08)
    - Iloprost (as iloprost trometamol) 20 microgram per 1 ml
      - Ventavis 20 micrograms/ml nebuliser solution 1ml ampoules (42 ampoule £560.27, 168 ampoule £2,241.08)

ENDOTHELIN RECEPTOR ANTAGONISTS

Ambrisentan

- **INDICATIONS AND DOSE**
  - Pulmonary arterial hypertension (initiated under specialist supervision)
  - By mouth
    - Adult: 5 mg once daily, increased if necessary to 10 mg once daily

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises max. dose 5 mg daily and close monitoring with concurrent use of ciclosporin.

- **CONTRA-INDICATIONS**
  - Idiopathic pulmonary fibrosis

- **CAUTIONS**
  - Not to be initiated in significant anaemia

- **INTERACTIONS**
  - Appendix 1: ambrisentan

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, anaemia, asthenia, constipation, diarrhoea, dizziness, epistaxis, flushing, headaches, hypersensitivity, increased risk of infection, nasal congestion, nausea, palpitations, skin reactions, syncope, tinnitus, vision disorders, vomiting
  - Uncommon: Hepatic disorders, sudden hearing loss

- **CONCEPTION AND CONTRACEPTION**
  - Exclude pregnancy before treatment and ensure effective contraception during treatment. Monthly pregnancy tests advised.

- **PREGNANCY**
  - Avoid (teratogenic in animal studies).

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid in severe impairment or if baseline serum transaminases exceed 3 times the upper limit of normal.

- **RENAL IMPAIRMENT**
  - Use with caution if eGFR less than 30 ml/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor haemoglobin concentration or haematocrit after observation (consult product literature).

- **Scottish Medicines Consortium (SMC) decisions**
  - SMC No. 511/08
  - The Scottish Medicines Consortium has advised (November 2008) that ambrisentan (Volibris®) is accepted for restricted use within NHS Scotland for the treatment of patients with pulmonary arterial hypertension (PAH) classified as WHO functional class II and III, to improve exercise capacity, when prescribed by specialists in the Scottish Pulmonary Vascular Unit or similar specialists.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Volibris (GlaxoSmithKline UK Ltd)
  - Ambrisentan 5 mg Volibris 5mg tablets | 30 tablet £1,618.08
  - Ambrisentan 10 mg Volibris 10mg tablets | 30 tablet £1,618.08

www.getintopharma.com
Bosentan

- INDICATIONS AND DOSE
  Pulmonary arterial hypertension (initiated under specialist supervision)
  > BY MOUTH
  > Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg); maximum 500 mg per day

- Systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)
  > BY MOUTH
  > Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily

- CONTRA-INDICATIONS
  Acute porphyrias p. 1058

- CAUTIONS
  Not to be initiated if systemic systolic blood pressure is below 85 mmHg

- INTERACTIONS
  > Appendix 1: bosentan

- SIDE-EFFECTS
  > Common or very common
    Anaemia - diarrhoea - flushing - gastrooesophageal reflux disease - headache - nasal congestion - palpitations - skin reactions - syncope
  > Uncommon
    Hepatic disorders - leucopenia - neutropenia - thrombocytopenia
  > Rare or very rare
    Angioedema
  > Frequency not known
    Vision blurred

- CONCEPTION AND CONTRACEPTION
  Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.

- PREGNANCY
  Avoid (teratogenic in animal studies).

- BREAST FEEDING
  Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT
  Manufacturer advises avoid in moderate-to-severe impairment or if baseline serum transaminases exceed 3 times the upper limit of normal.

- MONITORING REQUIREMENTS
  > Monitor haemoglobin before and during treatment, monthly for first 4 months, then 3-monthly.
  > Monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment.

- TREATMENT CESSION
  Avoid abrupt withdrawal—withdraw treatment gradually.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Tablet
  > Bosentan (Non-proprietary)
    Bosentan (as Bosentan monohydrate) 62.5 mg 62.5 mg tablets | 56 tablet £112.50–£1,510.21
    Bosentan (as Bosentan monohydrate) 125 mg 125 mg tablets | 56 tablet £112.50–£1,510.21
  > Stayveer (Advanz Pharma)
    Bosentan (as Bosentan monohydrate) 62.5 mg Stayveer 62.5 mg tablets | 56 tablet £208.34
    Bosentan (as Bosentan monohydrate) 125 mg Stayveer 125 mg tablets | 56 tablet £208.34
  > Tracleer (Actelion Pharmaceuticals UK Ltd)
    Bosentan (as Bosentan monohydrate) 62.5 mg Tracleer 62.5 mg tablets | 56 tablet £1,510.21
    Bosentan (as Bosentan monohydrate) 125 mg Tracleer 125 mg tablets | 56 tablet £1,510.21

Macitentan

- INDICATIONS AND DOSE
  Pulmonary arterial hypertension (initiated under specialist supervision)
  > BY MOUTH
  > Adult: 10 mg daily

- CONTRA-INDICATIONS
  Severe anaemia

- CAUTIONS
  Patients over 75 years - pulmonary veno-occlusive disease

- INTERACTIONS
  > Appendix 1: macitentan

- SIDE-EFFECTS
  > Common or very common
    Anaemia - headache - increased risk of infection - nasal congestion
  > CONCEPTION AND CONTRACEPTION
    Manufacturer advises exclusion of pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment. Monthly pregnancy tests advised.
  > PREGNANCY
    Toxicity in animal studies.
  > BREAST FEEDING
    Manufacturer advises avoid—present in milk in animal studies.
  > HEPATIC IMPAIRMENT
    Manufacturer advises avoid in severe impairment or if hepatic transaminases are greater than 3 times the upper limit of normal.
  > RENAL IMPAIRMENT
    Manufacturer advises caution in severe impairment and avoid in patients undergoing dialysis (no information available).

- MONITORING
  In renal impairment consider monitoring blood pressure (risk of hypotension).

- MONITORING REQUIREMENTS
  > Monitor liver function before treatment, then monthly thereafter (discontinue if unexplained persistent raised serum transaminases or signs of hepatic injury—can restart on advice on hepatologist if liver function tests return to normal and no hepatic injury).
  > Monitor haemoglobin concentration before treatment and then as indicated.

- PATIENT AND CARER ADVICE
  Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as dark urine, nausea, vomiting, fatigue, abdominal pain, or pruritus develop.
  Patient card should be provided.

- NATIONAL FUNDING/ACCESS DECISIONS
  Scottish Medicines Consortium (SMC) decisions
  SMC No. 952/14
  The Scottish Medicines Consortium has advised (April 2014) that macitentan (Opsumit®) should be initiated and prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Tablet
  > Opsumit (Actelion Pharmaceuticals UK Ltd)
    Macitentan 10 mg Opsumit 10 mg tablets | 30 tablet £2,306.00
GUANYLATE CYCLASE STIMULATORS

Riociguat

21-Feb-2019

● INDICATIONS AND DOSE

**Chronic thromboembolic pulmonary hypertension that is recurrent or persistent following surgery, or is inoperable (initiated under specialist supervision)**

Monotherapy or in combination with an endothelin receptor antagonist for idiopathic or hereditary pulmonary arterial hypertension, or pulmonary arterial hypertension associated with connective tissue disease (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: Initially 1 mg 3 times a day for 2 weeks, increased in steps of 0.5 mg 3 times a day, dose to be increased every 2 weeks, increased to up to 2.5 mg 3 times a day (max. per dose 2.5 mg 3 times a day), increase up to maximum dose only if systolic blood pressure > 95 mmHg and no signs of hypotension, if treatment interrupted for 3 or more days, restart at 1 mg three times daily for 2 weeks and titrate as before, during titration, reduce dose by 0.5 mg three times daily if systolic blood pressure falls below 95 mmHg and patient shows signs of hypotension

**CONTRA-INDICATIONS**

History of serious haemoptysis - previous bronchial artery embolisation - pulmonary hypertension associated with idiopathic interstitial pneumonias - pulmonary veno-occlusive disease

**CAUTIONS**

Autonomic dysfunction - elderly (risk of hypotension) - hypotension (do not initiate if systolic blood pressure below 95 mmHg) - hypovolaemia - severe left ventricular outflow obstruction

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment. Monthly pregnancy tests advised.

**PREGNANCY**

Avoid—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate impairment; avoid in severe impairment (no information available).

**Dose adjustments**

Manufacturer advises cautious dose titration in moderate impairment.

**RENASCENCE IMPAIRMENT**

Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—limited information available.

**Dose adjustments**

Titrate dose cautiously—risk of hypotension.

**DIRECTIONS FOR ADMINISTRATION**

Tablets may be crushed and mixed with water or soft foods and swallowed immediately.

**PATIENT AND CARER ADVICE**

Smoking cessation advised (response possibly reduced). Patients should inform prescriber if smoking started or stopped during treatment; dose adjustment may be necessary.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1001/14

The Scottish Medicines Consortium has advised (December 2014) that riociguat (Adempas®) is accepted for restricted use within NHS Scotland for the treatment of chronic thromboembolic pulmonary hypertension in adults for whom a phosphodiesterase type-5 inhibitor is inappropriate, not tolerated, or ineffective, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1056/15

The Scottish Medicines Consortium has advised (July 2015) that riociguat (Adempas®) is accepted for restricted use within NHS Scotland for the treatment of pulmonary arterial hypertension in adults as specific monotherapy as an alternative treatment option to endothelin receptor antagonist monotherapy and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit or by similar specialists. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

  - 84 tablet £1,994.72

4.2 Hypotension and shock

**Sympathomimetics**

**Inotropic sympathomimetics**

**Shock**

Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline/epinephrine p. 222, dobutamine p. 222 or dopamine hydrochloride p. 187. In septic shock, when fluid replacement and inotropic support fail to maintain blood
pressure, the vasoconstrictor noradrenaline/norepinephrine p. 188 may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further it may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock in Anhistamines, allergen immunotherapy and allergic emergencies p. 277.

**Vasoconstrictor sympathomimetics**

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed.

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen, elevation of the legs, and injection of a pressor drug such as ephedrine hydrochloride p. 272. As well as constricting peripheral vessels ephedrine hydrochloride also accelerates the heart rate (by acting on beta receptors). Use must be made of this dual action of ephedrine hydrochloride to manage associated bradycardia (although intravenous injection of atropine sulfate p. 1334 may also be required if bradycardia persists).

**SYMPATHOMIMETICS > INOTROPIC**

**Dopamine hydrochloride**

- **DRUG ACTION** Dopamine is a cardiac stimulant which acts on beta, receptors in cardiac muscle, and increases contractility with little effect on rate.

- **INDICATIONS AND DOSE**
  - **Cardiogenic shock in infarction or cardiac surgery**
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially 2–5 micrograms/kg/minute
  - **CONTRA-INDICATIONS** Phaeochromocytoma - tachyarrhythmia
  - **CAUTIONS** Correct hypovolaemia - hypertension (may raise blood pressure) - hyperthyroidism - low dose in shock due to acute myocardial infarction
  - **INTERACTIONS** → Appendix 1: sympathomimetics, inotrope
  - **SIDE-EFFECTS** Angina pectoris - anxiety - arrhythmias - azotaemia - cardiac conduction disorder - dyspnoea - gangrene - headache - hypertension - mydriasis - nausea - palpitations - piloerection - polyuria - tremor - vasoconstriction - vomiting
  - **PREGNANCY** No evidence of harm in animal studies—manufacturer advises use only if potential benefit outweighs risk.
  - **BREAST FEEDING** May suppress lactation—known to be harmful.
  - **DIRECTIONS FOR ADMINISTRATION** Dopamine concentrate for intravenous infusion to be diluted before use. For intravenous infusion give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to max. concentration of 3.2 mg/mL; incompatible with bicarbonate.

**SYMPATHOMIMETICS > VASOCONSTRICTOR**

**Metaraminol**

- **INDICATIONS AND DOSE**
  - **Acute hypotension**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 15–100 mg, adjusted according to response
  - **Emergency treatment of acute hypotension**
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Adult: Initially 0.5–5 mg, then (by intravenous infusion) 15–100 mg, adjusted according to response
  - **CONTRA-INDICATIONS** Hypertension
  - **CAUTIONS** Cirrhosis - coronary vascular thrombosis - diabetes mellitus - elderly - extravasation at injection site may cause necrosis - following myocardial infarction - hypercapnia - hypothyroidism - hypoxia - mesenteric vascular thrombosis - peripheral vascular thrombosis - Prinzmetal’s variant angina - uncorrected hypovolaemia
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for infusion**

- **Dopamine hydrochloride (Non-proprietary)**
  - Dopamine hydrochloride 40 mg per 1 ml Dopamine 200mg/5ml solution for infusion ampoules | 5 ampoule | £20.00 (Hospital only) | 5 ampoule | £20.00 | 10 ampoule | £4.04
  - Dopamine hydrochloride 160 mg per 1 ml Dopamine 800mg/5ml solution for infusion ampoules | 10 ampoule | £34.00

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for injection**

- **Metaraminol (Non-proprietary)**
  - Metaraminol (as Metaraminol tartrate) 10 mg per 1 ml Metaraminol 10mg/1ml solution for injection ampoules | 10 ampoule | £4.93

[www.getintopharma.com](http://www.getintopharma.com)
Midodrine hydrochloride

**DRUG ACTION** Midodrine hydrochloride is a pro-drug of desglymidodrine. Desglymidodrine is a sympathomimetic agent, which acts on peripheral alpha-adrenergic receptors to increase arterial resistance, resulting in an increase in blood pressure.

**INDICATIONS AND DOSE**

Severe orthostatic hypotension due to autonomic dysfunction when corrective factors have been ruled out and other forms of treatment are inadequate

- **BY MOUTH**
  - Adult: Initially 2.5 mg 3 times a day, increased if necessary up to 10 mg 3 times a day, dose to be increased at weekly intervals, according to blood pressure measurements; usual maintenance 10 mg 3 times a day, avoid administration at night; the last daily dose should be taken at least 4 hours before bedtime

- **CONTRA-INDICATIONS** Aortic aneurysm - blood vessel spasm - bradycardia - cardiac conduction disturbances - cerebrovascular occlusion - congestive heart failure - hypertension - hyperthyroidism - myocardial infarction - narrow-angle glaucoma - pheochromocytoma - proliferative diabetic retinopathy - serious obliterative blood vessel disease - serious prostate disorder - urinary retention

- **CAUTIONS** Atherosclerotic cardiovascular disease (especially with symptoms of intestinal angina or claudication of the legs) - autonomic dysfunction - elderly (manufacturer recommends cautious dose titration) - prostate disorders

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS**
  - **Common or very common** Chills - flushing - gastrointestinal discomfort - headache - nausea - paraesthesia - piloerection - scalp pruritus - skin reactions - stomatitis - supine hypertension (dose-dependent) - urinary disorders
  - **Uncommon** Anxiety - arrhythmias - irritability - sleep disorders
  - **Rare or very rare** Hepatic function abnormal - palpitations
  - **Frequency not known** Confusion - diarrhea - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises that treatment must be stopped if supine hypertension is not controlled by reducing the dose.

**CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment in women of childbearing potential.

**PREGNANCY** Manufacturer advises avoid—t响icity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**RENAI IMPAIRMENT** Manufacturer advises avoid in severe or acute impairment.

**MONITORING REQUIREMENTS**

- Manufacturer advises measure hepatic and renal function before treatment and at regular intervals during treatment.
- Manufacturer advises regular monitoring of supine and standing blood pressure due to the risk of hypertension in the supine position.

**PATIENT AND CARER ADVICE** Manufacturer advises that patients report symptoms of supine hypertension (such as chest pain, palpitations, shortness of breath, headache and blurred vision) immediately. The risk of supine hypertension at night can be reduced by raising the head of the bed.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **Midodrine hydrochloride (Non-proprietary)**
    - Midodrine hydrochloride 2.5 mg
      - 100 tablet [POM] £55.05 DT £55.05
    - Midodrine hydrochloride 5 mg
      - 100 tablet [POM] £75.05 DT £75.05
  - **Bramox (Brancaster Pharma Ltd)**
    - Midodrine hydrochloride 2.5 mg
      - 100 tablet [POM] £55.05 DT £55.05
    - Midodrine hydrochloride 5 mg
      - 100 tablet [POM] £75.05 DT £75.05
  - **Midotense (Transdermal Ltd)**
    - Midodrine hydrochloride 2.5 mg
      - 30 tablet [POM] £15.69

Noradrenaline/norepinephrine

**INDICATIONS AND DOSE**

**Acute hypotension [initial and on-going treatment]**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 0.16–0.33 mL/minute, adjusted according to response, dose applies to a solution containing noradrenaline 40 micrograms/base)/mL only; dilute the 1 mg/mL concentrate for infusion for this solution—consult product literature

**On-going treatment of acute hypotension [with escalating dose requirements]**

- **BY INTRAVENOUS INFUSION**
  - Adult (body-weight 50 kg and above): Use the 0.08 mg/mL solution for infusion (consult product literature)

**DOSE EQUIVALENCE AND CONVERSION**

- 1 mg of noradrenaline base is equivalent to 2 mg of noradrenaline acid tartrate. **Doses expressed as the base.**

**IMPORTANT SAFETY INFORMATION**

**ASSOCIATION OF NORADRENALINE/NOREPINEPHRINE**

Healthcare professionals should be aware of the differences in strength and presentation between noradrenaline/norepinephrine products—manufacturer advises noradrenaline 0.08 mg/mL solution for infusion must not be diluted before use and should only be used for the on-going treatment of patients already established on noradrenaline therapy, whose dose requirements are clinically confirmed to be escalating.

**CONTRA-INDICATIONS** Hypertension

**CAUTIONS** Coronary vascular thrombosis - diabetes mellitus - elderly - extravasation at injection site may cause necrosis - following myocardial infarction - hypercapnia - hyperthyroidism - hypoxia - mesenteric vascular thrombosis - peripheral vascular thrombosis - Prinzmetal’s variant angina - uncorrected hypovolaemia

**INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

**SIDE-EFFECTS** Anxiety - arrhythmias - dyspnoea - extravasation necrosis - headache - hypertension - hypovolaemia - peripheral ischaemia

**PREGNANCY** Manufacturer advises use if potential benefit outweighs risk—may reduce placental perfusion and induce fetal bradycardia.

**MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.

5 Cardiovascular risk assessment and prevention

Cardiovascular disease risk assessment and prevention

Description of condition
Cardiovascular disease is a term that describes a group of disorders of the heart and blood vessels caused by atherosclerosis and thrombosis, which includes coronary heart disease, stroke, peripheral arterial disease, and aortic disease.

The risk of cardiovascular disease is greater in men, patients over 50 years of age, patients with a family history of cardiovascular disease, and in certain ethnic backgrounds such as South Asians. Cardiovascular disease also has several important, and potentially modifiable, risk factors such as hypertension, abnormal lipids, obesity, diabetes mellitus, and psychosocial factors such as depression, anxiety and social isolation. Low physical activity, poor diet, smoking, and excessive alcohol intake are also risk factors.

Aims of treatment
The overall aim of treatment is to prevent the occurrence of a cardiovascular event by reducing modifiable risk factors through lifestyle changes and drug management.

Cardiovascular risk assessment
Identifying patients who are at risk of cardiovascular disease should be based on their presenting risk factors, clinical judgement, and use of risk calculators. Cardiovascular risk assessment calculators are used to predict the likelihood of a cardiovascular event occurring over a given period of time.

Cardiovascular risk assessments should be offered every 5 years to all patients over 40 years of age with no history of cardiovascular disease, and to all patients, regardless of age, with a first-degree relative who has premature atherosclerotic cardiovascular disease or familial dyslipidaemia.

Risk assessment with a calculator is not required in patients who are at high risk of cardiovascular disease. High-
Cardiovascular system

Cardiovascular disease prevention

All patients at any risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet (such as increasing fruit and vegetable consumption, reducing saturated fat and dietary salt intake), increasing physical exercise, weight management, reducing alcohol consumption, and Smoking cessation p. 497.

Further preventative measures with drug treatment should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention), and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention).

Primary prevention

Antiplatelet therapy

Aspirin p. 121 is not recommended for primary prevention of cardiovascular disease due to the limited benefit gained versus risk of adverse effects such as bleeding.

Antihypertensive therapy

Antihypertensive drug treatment should be offered to patients who are at high risk of cardiovascular disease and have a sustained elevated blood pressure over 140/90 mmHg. For guidance on prescribing antihypertensive drugs, see Hypertension p. 140.

Lipid-lowering therapy

A statin is recommended as the lipid-lowering drug of choice for primary prevention of cardiovascular disease. All modifiable risk factors, comorbidities, and secondary causes of dyslipidaemia (e.g. uncontrolled diabetes mellitus, hepatic disease, nephrotic syndrome, excessive alcohol consumption, and hypothyroidism) should be managed before starting treatment with a statin. Correcting hypothyroidism itself may resolve the lipid abnormality, whereas untreated hypothyroidism, and nephrotic syndrome increase the risk of myositis with lipid-regulating drugs.

Treatment with low-dose atorvastatin p. 202 should also be offered to all patients who are at high risk of cardiovascular disease. Low-dose atorvastatin p. 202 should also be considered in all adults with type 1 diabetes mellitus.

Patients aged 85 years and over may also benefit from low-dose atorvastatin p. 202 to reduce their risk of non-fatal myocardial infarction, however, factors such as polypharmacy, frailty or comorbidities should be taken into account before starting statin therapy.

Specialist advice should be sought regarding alternative treatment options in patients at high risk of cardiovascular disease who are intolerant of three different statins.

Ezetimibe p. 198 and bile acid sequestrants such as colestevarmine p. 197 and colestipol hydrochloride p. 197 should only be considered for primary prevention in patients with an elevated cardiovascular risk in whom statin therapy is contra-indicated, and in patients with familial hypercholesterolaemia.

Although fibrates are generally not recommended for primary prevention of cardiovascular disease, they can be considered in patients with marked hypertriglyceridaemia and low HDL-cholesterol levels.

If cholesterol remains above target levels despite other tolerated lipid-lowering therapy in patients at high risk of vascular events, the use of PCSK9 inhibitors, such as alirocumab p. 206 and evolocumab p. 207, should be considered [unlicensed indication].

Lipid-lowering therapy recommendations from Joint British Societies’ consensus (2014), NICE Clinical guideline 181 (July 2014, updated September 2016), and SIGN Clinical guideline 149 (June 2017) all differ in certain respects for prevention of cardiovascular disease in patients with diabetes mellitus—see individual guidelines for further details.

For further information on lipid-lowering therapy, see Dyslipidaemias p. 196.
Heart failure 191

Heart failure 23-Oct-2018

Description of condition

Heart failure is a progressive clinical syndrome caused by structural or functional abnormalities of the heart, resulting in reduced cardiac output. It is characterised by symptoms such as shortness of breath, persistent coughing or wheezing, ankle swelling, reduced exercise tolerance, and fatigue. These symptoms may be accompanied by signs such as elevated jugular venous pressure, pulmonary crackles, and pulmonary oedema.

The risk of heart failure is greater in men, smokers and diabetic patients, and increases with age.

The most common cause of heart failure is coronary heart disease, however, patients of African or Afro-Caribbean origin are more likely to develop heart failure secondary to hypertension. In addition to coronary heart disease, heart failure often co-exists with other co-morbidities such as chronic kidney disease, atrial fibrillation, hypertension, dyslipidaemia, obesity, diabetes mellitus, and chronic obstructive pulmonary disease. Patients with co-morbidities have a worse prognosis, and the presence of atrial fibrillation or chronic kidney disease affects the management of heart failure in these patients. Complications of heart failure include chronic kidney disease, atrial fibrillation, depression, cachexia, sexual dysfunction, and sudden cardiac death.

Heart failure can be defined as either having a reduced or preserved ejection fraction. Both conditions present with signs and symptoms of heart failure. In heart failure with reduced ejection fraction, the left ventricle loses its ability to contract normally and therefore presents with an ejection fraction of less than 40%. In heart failure with preserved ejection fraction, the left ventricle loses its ability to relax normally therefore the ejection fraction is normal or only mildly reduced.

The New York Heart Association (NYHA) functional classification tool is used to define the progression of chronic heart failure according to severity of symptoms and limitation to physical activity. Heart failure is considered to be stable or chronic when symptoms remain unchanged for at least one month despite optimal management.

Advanced Pharmacy Services

Patients with, or at risk of cardiovascular disease may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Useful Resources

6 Heart failure

Chronic heart failure

Secondary prevention

Antiplatelet therapy

Antiplatelet therapy with low-dose daily aspirin p. 121 should be offered to patients with established atherosclerotic disease. Alternatively, clopidogrel p. 123 can be considered in patients who are intolerant of aspirin or in whom it is contra-indicated.

Clopidogrel p. 123 or a combination of dipyridamole with aspirin p. 124 should be considered to prevent recurrence of stroke and other vascular events in all patients with a history of stroke or transient ischaemic attack and who are in sinus rhythm. For further information, see Stroke p. 117.

Antihypertensive therapy

Antihypertensive drug treatment is recommended in patients with established cardiovascular disease and a sustained elevated blood pressure over 140/90 mmHg. For guidance on prescribing of antihypertensive drugs, see Hypertension p. 140.

Lipid-lowering therapy

A high-intensity statin, defined as the dose at which a reduction in LDL-cholesterol of greater than 40% is achieved, is the lipid-lowering therapy of choice for secondary prevention of cardiovascular disease. Treatment with high-dose atorvastatin p. 202 should be offered to all patients with established atherosclerotic cardiovascular disease. However, a lower dose can be used if the patient is at an increased risk of side effects or drug interactions. High-dose simvastatin p. 205 is generally avoided due to the risk of myopathy, unless the patient has been stable on this regimen for at least one year. Patients who are stable on a low- or medium-intensity statin should discuss the benefits and risks of switching to a high-intensity statin at their next medication review.

Total cholesterol, HDL-cholesterol, and non-HDL cholesterol concentrations should be checked 3 months after starting treatment with a high-intensity statin.

NICE Clinical Guideline 181 and SIGN 149 guideline recommend aiming for a reduction in non-HDL cholesterol concentration greater than 40%, whereas, JBS3 recommends a target non-HDL cholesterol concentration below 2.5 mmol/litre. If these targets are not achieved, adherence to drug treatment should be checked and lifestyle modifications optimised. In patients judged to be at a higher risk because of comorbidities, risk score, or clinical judgment, an increase in the statin dose (if started on less than maximum atorvastatin p. 202 dose) should be considered.

Specialist advice should be sought regarding alternative treatment options in patients with existing cardiovascular disease who are intolerant of three different statins.

If LDL-cholesterol remains inadequately controlled, ezetimibe p. 198 and bile acid sequestrants such as colestevamine and colestipol hydrochloride, can be considered for use in combination with a statin at the maximum tolerated dose.

Although fibrates are generally not recommended for secondary prevention of cardiovascular disease, they should be considered in patients with marked hypertriglyceridaemia, and low HDL-cholesterol levels.

For further information on lipid-lowering therapy, see Dyslipidaemias p. 196.

Psychological risk factors

Psychological treatment should be considered in patients with mood and anxiety disorders and comorbid cardiovascular disease; complex patients may require referral to a specialist. Selective serotonin re-uptake inhibitors (SSRIs) should be considered for treatment in patients with depression and coronary heart disease. For guidance on prescribing of antidepressant drugs see Antidepressant drugs p. 399.
Heart failure

**Aims of treatment**

The aims of treatment are to reduce mortality, relieve symptoms, improve exercise tolerance, and reduce the incidence of acute exacerbations.

**Non-drug treatment**

- Patients with heart failure should be advised to make lifestyle changes to reduce the risk of progression of their heart failure and associated co-morbidities. These include Smoking cessation p. 497, reducing alcohol consumption, increasing physical exercise if appropriate, weight control, and dietary changes such as increasing fruit and vegetable consumption and reducing saturated fat intake. Patients should be encouraged to weigh themselves daily at a set time of day and to report any weight gain of more than 1.5–2.0 kg in 2 days to their GP or heart failure specialist. Salt and fluid intake should only be restricted if these are high, and a salt intake of less than 6 g per day is advised. Patients with dilutional hyponatraemia should only restrict their fluid intake. Salt substitutes containing potassium should be avoided to reduce the risk of hyperkalaemia.

- Contraception and pregnancy should be discussed with women of childbearing potential and heart failure. Advice from a heart failure specialist and an obstetrician should be sought if pregnancy occurs or is being considered.

- Patients should be given the opportunity to join a personalised rehabilitation programme including education, psychological support, and exercise when appropriate.

- Implantable cardioverter defibrillators and cardiac resynchronisation therapy are treatment options recommended in patients with heart failure and a reduced ejection fraction of less than 35%. If symptoms remain severe and unresponsive despite optimal drug treatment, specialist referral should be considered.

**Drug treatment**

- The treatment of heart failure should include management of symptoms, risk factors and underlying causes and complications. Patients should have their medication reviewed, and any drugs that may cause or worsen their heart failure should be stopped if appropriate.

- Vaccination against pneumococcal disease, and annual influenza vaccination is recommended.

- Rate-limiting calcium-channel blockers (verapamil hydrochloride p. 1,64, and diltiazem hydrochloride p. 157) and short-acting dipyridamole (e.g. nifedipine p. 162, or nicardipine hydrochloride p. 161) should be avoided in patients who have heart failure with reduced ejection fraction as these drugs reduce cardiac contractility. Patients with heart failure and angina may safely be treated with amiodipine p. 156.

- Diuretics are recommended for the relief of breathlessness and oedema in patients with fluid retention. Loop diuretics such as furosemide p. 227, bumetanide p. 227, or torasemide p. 228 are usually the diuretics of choice. Thiazide diuretics may only be of benefit in patients with mild fluid retention and an eGFR greater than 30 ml/minute/1.73 m². Diuretic doses should be titrated according to clinical response and adjusted if needed following the initiation of subsequent heart failure treatments, to minimise the risk of dehydration, renal impairment or hypotension. If symptoms persist despite optimal titration, advice from a heart failure specialist should be sought.

- An angiotensin-converting enzyme (ACE) inhibitor (e.g. perindopril, ramipril p. 172, captopril p. 168, enalapril maleate p. 169, lisinopril p. 170, quinapril p. 172 or fosinopril sodium p. 169) and a beta-blocker licensed for heart failure (e.g. bisoprolol fumarate p. 153, carvedilol p. 148, or nebivolol p. 155) should be given as first-line treatment to reduce morbidity and mortality. Treatment with a beta-blocker should not be withheld because of age or the presence of diabetes, chronic obstructive pulmonary disease, peripheral vascular disease, erectile dysfunction, or interstitial pulmonary disease. Patients who are already taking a beta-blocker for co-morbidities (e.g. angina or hypertension) and whose condition is stable should be switched to a beta-blocker licensed for heart failure. Clinical judgement should be used when deciding whether to start an ACE inhibitor or beta blocker first. The additional drug should only be initiated when the patient is stable on their existing treatment. Treatment should be initiated at a low dose and slowly titrated up to the maximum tolerated dose.

- An angiotensin II receptor blocker (ARB) licensed for heart failure (e.g. candesartan cilexetil p. 175, losartan potassium p. 176, or valsartan p. 179) can be considered if ACE inhibitors are not tolerated.

- Patients with heart failure and preserved ejection fraction (e.g. candesartan cilexetil p. 175, losartan potassium p. 176, or valsartan p. 179) can be considered if ACE inhibitors are not tolerated.

- If heart failure symptoms persist or worsen despite optimal first-line treatment, an aldosterone antagonist such as spironolactone p. 193 or eplerenone p. 193 should be offered as add-on therapy unless contra-indicated (e.g. due to hyperkalaemia or renal impairment). Hydralazine hydrochloride p. 180 combined with a nitrate can be considered under the advice of a heart failure specialist in patients who are intolerant of both ACE inhibitors and ARBs (in particular those of African or Caribbean origin with moderate to severe heart failure).

- Doses should only be increased if the patient is stable on their existing treatment. Treatment should be initiated at a low dose and slowly titrated up to the maximum tolerated dose.

**Monitoring drug treatment**

**Chronic heart failure with preserved ejection fraction**

- When initiating ACE inhibitors, ARBs and aldosterone antagonists, serum potassium and sodium, renal function, and blood pressure should be checked prior to starting treatment, 1-2 weeks after starting treatment, and at each dose increment. Once the target, or maximum tolerated dose is achieved, treatment should be monitored monthly for 3 months and then at least every 6 months, and if the patient becomes acutely unwell.

- When initiating beta blockers, heart rate, blood pressure and symptom control should be assessed at the start of treatment and after each dose change.

- In patients with chronic kidney disease, lower doses and slower dose titrations of ACE inhibitors, ARBs, aldosterone antagonists and digoxin should be considered. Advice from a renal specialist should be considered where appropriate.

**Chronic heart failure with preserved ejection fraction**

- Patients with heart failure and preserved ejection fraction should be managed under the care of a heart failure specialist. For the relief of fluid retention symptoms, a low to medium dose loop diuretic should be prescribed. If the patient fails to respond to treatment, advice from a heart failure specialist should be sought.

**Advanced heart failure**

Breathlessness is a common symptom in advanced heart failure and may occur even with optimal management and in the absence of clinical pulmonary oedema. Long-term oxygen therapy is not recommended in advanced heart failure, although it may be considered in patients with heart failure and additional co-morbidities that would benefit from...
oxygen therapy such as chronic obstructive pulmonary disease.

**Advanced Pharmacy Services**
Patients with heart failure may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

### Eplerenone

| **INDICATIONS AND DOSE** |
| Adjunct in stable patients with left ventricular ejection fraction ≤40% with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event) Adjunct in chronic mild heart failure with left ventricular ejection fraction ≤30% |
| BY MOUTH |
| Adult: Initially 25 mg daily, then increased to 50 mg daily, increased within 4 weeks of initial treatment |
single dose or divided doses, maintenance dose adjusted according to response

Moderate to severe heart failure (adjunct)

- **BY MOUTH**
  - Adult: Initially 25 mg once daily, then adjusted according to response to 50 mg once daily

Resistant hypertension (adjunct)

- **BY MOUTH**
  - Adult: 25 mg once daily

Primary hyperaldosteronism in patients awaiting surgery

- **BY MOUTH**
  - Adult: 100–400 mg daily, may be used for long-term maintenance if surgery inappropriate, use lowest effective dose

- **UNLICENSED USE** Resistant hypertension (adjunct) unlicensed indication.

- **CONTRA-INDICATIONS** Addison’s disease • anuria • hyperkalaemia

- **CAUTIONS** Acute porphyrias p. 1058 • elderly • potential metabolic products carcinogenic in rodents

- **INTERACTIONS** → Appendix 1: aldosterone antagonists

- **SIDE-EFFECTS** Acidosis hyperchloremic • acute kidney injury • agranulocytosis • alopecia • breast neoplasms benign • breast pain • confusion • dizziness • electrolyte imbalance • gastrointestinal disorder • gynaecomastia • hepatic function abnormal • hyperkalaemia (discontinue) • hypertrichosis • leg cramps • leucopenia • libido disorder • malaise • menstrual disorder • nausea • severe cutaneous adverse reactions (SCARs) • skin reactions • thrombocytopenia

- **PREGNANCY** Use only if potential benefit outweighs risk—feminisation of male fetus in animal studies.

- **BREAST FEEDING** Metabolites present in milk, but amount probably too small to be harmful.

- **RENAI IMPAIRMENT** Avoid in acute renal insufficiency or severe impairment.

- **MONITORING** Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

- **MONITORING REQUIREMENTS** Monitor electrolytes—discontinue if hyperkalaemia occurs (in severe heart failure monitor potassium and creatinine 1 week after initiation and after any dose increase, monthly for first 3 months, then every 3 months for 1 year, and then every 6 months).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Tablet

**CAUTIONARY AND ADVISORY LABELS 21**

## Drugs acting on the renin-angiotensin system → Angiotensin II receptor antagonists

### Sacubitril with valsartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, valsartan p. 179.

- **DRUG ACTION** Sacubitril (a prodrug) inhibits the breakdown of natriuretic peptides resulting in varied effects including increased diuresis, natriuresis, and vasodilation.

- **INDICATIONS AND DOSE** Symptomatic chronic heart failure with reduced ejection fraction (in patients not currently taking an ACE inhibitor or angiotensin II receptor antagonist, or stabilised on low doses of either of these agents)

  - **BY MOUTH**
    - Adult: Initially 24/26 mg twice daily for 3–4 weeks, increased if tolerated to 49/51 mg twice daily for 3–4 weeks, then increased if tolerated to 97/103 mg twice daily

Symptomatic chronic heart failure with reduced ejection fraction (in patients currently stabilised on an ACE inhibitor or angiotensin II receptor antagonist)

  - **BY MOUTH**
    - Adult: Initially 49/51 mg twice daily for 2–4 weeks, increased if tolerated to 97/103 mg twice daily, consider a starting dose of 24/26 mg if systolic blood pressure less than 110 mmHg

- **DOSE EQUIVALENCE AND CONVERSION**
  - → Entresto® tablets contain sacubitril and valsartan; the proportions are expressed in the form x/y where x and y are the strength in milligrams of sacubitril and valsartan respectively. Valsartan, in this formulation, is more bioavailable than other tablet formulations—26 mg, 51 mg, and 103 mg valsartan is equivalent to 40 mg, 80 mg and 160 mg, respectively. Furthermore, note that the 24/26 mg, 49/51 mg and 97/103 mg strengths are sometimes referred to as a total of both drug strengths, that is, 50 mg, 100 mg and 200 mg, respectively.

- **CONTRA-INDICATIONS** Concomitant use with an ACE inhibitor (do not initiate until at least 36 hours after discontinuing ACE inhibitor—risk of angioedema) • concomitant use with an angiotensin II receptor antagonist • systolic blood pressure less than 100 mmHg

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists • sacubitril

- **SIDE-EFFECTS**
  - Common or very common Anaemia • asthenia • cough • diarrhoea • dizziness • electrolyte imbalance • gastritis • headache • hypoglycaemia • hypotension • nausea • renal impairment • syncope • vertigo
  - Uncommon Angioedema • skin reactions

- **PREGNANCY** Manufacturer advises avoid—toxicity with sacubitril in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment or if hepatic transaminases exceed 2 times the upper limit of normal (limited information available); avoid in severe impairment, biliary cirrhosis or cholestasis (no information available).

- **Dose adjustments** Manufacturer advises initial dose reduction to 24/26 mg twice daily in moderate impairment or if hepatic transaminases exceed 2 times the upper limit of normal.

www.getintopharma.com
**PHOSPHODIESTERASE TYPE-3 INHIBITORS**

**Enoximone**

**DRUG ACTION** Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

**INDICATIONS AND DOSE** Congestive heart failure where cardiac output reduced and filling pressures increased

- **BY SLOW INTRAVENOUS INJECTION**
- Adult: Initially 0.5–1 mg/kg, rate not exceeding 12.5 mg minute, then 500 micrograms/kg every 30 minutes until satisfactory response or total of 3 mg/kg given; maintenance, initial dose of up to 3 mg/kg may be repeated every 3–6 hours as required
- **BY INTRAVENOUS INFUSION**
- Adult: Initially 90 micrograms/kg/minute, dose to be given over 10–30 minutes, followed by 5–20 micrograms/kg/minute, dose to be given as either a continuous or intermittent infusion; maximum 24 mg/kg per day

**CAUTIONS** Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**SIDE-EFFECTS**
- Common or very common Headache, hypotension, insomnia
- Uncommon Arrhythmias, diarrhea, dizziness, nausea, vomiting
- Rare or very rare Chills, fever, fluid retention, myalgia, oliguria, urinary retention
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk
- BREAST FEEDING Manufacturer advises caution—no information available

**Milrinone**

**DRUG ACTION** Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

**INDICATIONS AND DOSE** Short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction) / Acute heart failure, including low output states following heart surgery

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 50 micrograms/kg, given over 10 minutes, followed by (by intravenous infusion) 375–750 micrograms/kg/minute usually given following surgery for up to 12 hours or in congestive heart failure for 48–72 hours; maximum 1.13 mg/kg per day

**CONTRA-INDICATIONS** Severe hypovolaemia

**CAUTIONS** Correct hypokalaemia - heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**SIDE-EFFECTS**
- Common or very common Arrhythmias, supraventricular (increased risk in patients with pre-existing arrhythmias) - atrhythmias, headache, hypotension
- Uncommon Angina pectoris, chest pain, hypokalaemia, thrombocytopenia, tremor
- Rare or very rare Anaphylactic shock, bronchospasm, skin eruption
- Frequency not known Renal failure

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk

**BREAST FEEDING** Manufacturer advises avoid—no information available

**RENAL IMPAIRMENT** Dose adjustments Reduce dose and monitor response if eGFR less than 50 mL/minute/1.73 m²—consult product literature for details.

**MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

**DIRECTIONS FOR ADMINISTRATION** Avoid extravasation.

---

**Sacubitril valsartan for treating symptomatic chronic heart failure with reduced ejection fraction (April 2016) NICE TA388**

Sacubitril valsartan (Entresto®) is recommended as an option for treating symptomatic chronic heart failure with reduced ejection fraction, only in adults:

- with New York Heart Association class II to IV symptoms, and
- a left ventricular ejection fraction of 35% or less, and
- who are already taking a stable dose of an ACE inhibitor or angiotensin II receptor antagonist.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta388

**Sacubitril valsartan**

**INDICATIONS AND DOSE**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: 150 mg, given over 2 minutes (Hospital only)
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 50 mg, given over 1 minute (Hospital only)

**CONTRA-INDICATIONS**
- Anaphylactic shock
- Arrhythmia
- Cardiac output less than 40%, systolic blood pressure less than 90 mmHg
- Congestive heart failure
- Diabetic coma
- Hypotension
- Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction
- History of anaphylaxis
- History of severe angioedema
- Hypovolaemia
- Severe renal impairment
- Severe thrombocytopenia

**CAUTIONS**
- Hypotension
- Hypovolaemia
- Renal failure

**SIDE-EFFECTS**
- Common or very common Arrhythmia, bronchospasm, diarrhea, dizziness, hyponatraemia, hypotension, insomnia, nausea, vomiting
- Uncommon Acute heart failure, including low output states following heart surgery
- Rare or very rare Anaphylaxis, bronchospasm, hypokalaemia, hyponatraemia, skin eruption
- Frequency not known Renal failure

**PRESCRIBING AND DISPENSING INFORMATION** Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.
Hyperlipidaemia

7 Hyperlipidaemia

Dyslipidaemias

Hypercholesterolaemia and hypertriglyceridaemia

Statins are the drugs of first choice for treating hypercholesterolaemia and moderate hypertriglyceridaemia. Severe hypercholesterolaemia or hypertriglyceridaemia not adequately controlled with a maximal dose of a statin may require the use of an additional lipid-regulating drug such as ezetimibe p. 198; such treatment should generally be supervised by a specialist.

A number of conditions, some familial, are characterised by very high LDL-cholesterol concentration, high triglyceride concentration, or both. Although statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration, they are less effective than fibrates in reducing triglyceride concentration. Fenofibrate p. 199 may be added to statin therapy if triglycerides remain high even after the LDL-cholesterol concentration has been reduced adequately.

Familial hypercholesterolaemia

Patients with familial hypercholesterolaemia are at high risk of premature coronary heart disease. Lifelong lipid-modifying therapy and advice on lifestyle changes should be offered to all patients with familial hypercholesterolaemia.

A high-intensity statin, defined as the dose at which a reduction in LDL-cholesterol of greater than 40% is achieved, is recommended as first-line therapy in all patients with familial hypercholesterolaemia. The dose of the statin should be titrated to achieve a reduction in LDL-cholesterol concentration of greater than 50% from baseline.

Patients with primary heterozygous familial hypercholesterolaemia who have contra-indications to, or are intolerant of statins, can be considered for treatment with ezetimibe as monotherapy. A combination of a statin and ezetimibe is recommended if the maximum tolerated dose of a statin alone fails to provide adequate control of LDL-cholesterol, or a switch to an alternative statin is being considered. Treatment with a fibrate or a bile acid sequestrant (such as colestyramine p. 197 or colestipol hydrochloride p. 197) can be considered under specialist advice, in patients for whom statins or ezetimibe are inappropriate.

The combination of a statin with a fibrate carries an increased risk of muscle-related side-effects (including rhabdomyolysis) and should be used under specialist supervision. The concomitant administration of gemfibrozil with a statin increases the risk of rhabdomyolysis considerably—this combination should not be used. Alirocumab p. 206 and evolocumab p. 207 can be considered for patients with primary heterozygous familial hypercholesterolaemia whose LDL-cholesterol has not been adequately controlled on maximum tolerated lipid-lowering therapy. See National funding/access decisions information for alirocumab p. 206 and evolocumab p. 207.

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken in a specialist centre.

Advice from the MHRA: there is an increased risk of myopathy associated with high-dose (80 mg) simvastatin. The 80 mg dose should be considered only in patients with severe hypercholesterolaemia and high risk of cardiovascular complications who have not achieved their treatment goals on lower doses, when the benefits are expected to outweigh the potential risks.

Advanced Pharmacy Services

Patients with dyslipidaemia may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Other drugs used for Hyperlipidaemia

inositol nicotinate, p. 233

LIPID MODIFYING DRUGS

Bile acid sequestrants

- **DRUG ACTION** Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.

- **CAUTIONS** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).

www.getintopharma.com
Colestevelam hydrochloride

**INDICATIONS AND DOSE**

*Primary hypercholesterolaemia as an adjunct to dietary measures (monotherapy)*

- **BY MOUTH**
  - Adult: 3.75 g daily in 1–2 divided doses; maximum 4.375 g per day

*Primary hypercholesterolaemia as an adjunct to dietary measures, in combination with a statin* | Primary and familial hypercholesterolaemia, in combination with ezetimibe, either with or without a statin

- **BY MOUTH**
  - Adult: 2.5–3.75 g daily in 1–2 divided doses, may be taken at the same time as the statin and ezetimibe

**SIDE-EFFECTS**

- Common or very common: Constipation, gastrointestinal discomfort, headache, nausea, vomiting
- Uncommon: Appetite decreased, diarrhoea, gastrointestinal disorders
- PREGNANCY: Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.
- BREAST FEEDING: Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

**CONTRA-INDICATIONS**

- Biliary obstruction - bowel obstruction
- Gastro-intestinal motility disorders - inflammatory bowel disease - major gastro-intestinal surgery

**INTERACTIONS**

- Appendix 1: colestevelam

**SIDE-EFFECTS**

- Uncommon: Dysphagia, myalgia
- Rare or very rare: Pancreatitis

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in hepatic failure (no information available).

**MONITORING REQUIREMENTS**

- Patients receiving ciclosporin should have their blood-ciclosporin concentration monitored before, during, and after treatment with colestevelam.

**PATIENT AND CARER ADVICE**

- Patient counselling on administration is advised for colestevelam hydrochloride tablets (avoid other drugs at same time).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Granules**

**Colestipol hydrochloride**

**INDICATIONS AND DOSE**

**Hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures**

- **BY MOUTH**
  - Adult: Initially 5 g 1–2 times a day, increased in steps of 5 g every month if required, total daily dose may be given in 1–2 divided doses; maximum 30 g per day

**CONTRA-INDICATIONS**

- Complete biliary obstruction (not likely to be effective)

**INTERACTIONS**

- Appendix 1: colestipol

**SIDE-EFFECTS**

- Angina pectoris, arthralgia, arthritis, asthenia, burping, chest pain, dizziness, dyspnoea, gallbladder disorders, headaches, inflammation, insomnia, pain, peptic ulcer haemorrhage, tachycardia

**DIRECTIONS FOR ADMINISTRATION**

- The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice or skimmed milk; alternatively it can be mixed with thin soups, cereals, yoghurt, or pulpy fruits ensuring at least 100 mL of liquid is provided.

**MEDICATIONS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Ezetimibe, alone, is recommended as an option for the treatment of primary (heterozygous-familial or non-familial) hypercholesterolaemia in adults in whom initial statin therapy is contra-indicated, or who are intolerant of initial statin therapy.

Ezetimibe, in combination with initial statin therapy, is also recommended as an option for the treatment of primary (heterozygous-familial or non-familial) hypercholesterolaemia in adults when:

- serum total or low-density lipoprotein (LDL) cholesterol concentration is not appropriately controlled either after appropriate dose titration of initial statin therapy or because dose titration is limited by intolerance to the initial statin therapy, and
- a change from initial statin therapy to an alternative statin is being considered.

When prescribing ezetimibe in combination with a statin, ezetimibe should be prescribed on the basis of lowest acquisition cost.

www.nice.org.uk/guidance/ta385

**SIDE-EFFECTS**
- Uncommon Bleeding tendency - hypoprothrombinemia - night blindness - osteoporosis - skin reactions - tongue irritation - vitamin deficiencies

**DIRECTIONS FOR ADMINISTRATION** The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content.

**PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestyramine powder (avoid other drugs at same time).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution Powder

**CAUTIONARY AND ADVISORY LABELS** 13 EXCipients: May contain Aspartame, sucrose

- Questran (Bristol-Myers Squibb Pharmaceuticals Ltd)
- Colestyramine anhydrous 4 g
- Questran Light 4 g
- Questran Light 4 g oral powder sachets sugar-free | 50 sachet [PoS] £16.15 DT = £16.15

**INTERACTIONS**

- Lipid modifying drugs
- Cholesterol absorption inhibitors

**LIPID MODIFYING DRUGS**

**Ezetimibe**

**DRUG ACTION** Ezetimibe inhibits the intestinal absorption of cholesterol.

If used alone, it has a modest effect on lowering LDL-cholesterol, with little effect on other lipoproteins.

**INDICATIONS AND DOSE**

- Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia
- Adjunct to dietary measures and statin in homozgyous familial hypercholesterolaemia
- Primary hypercholesterolaemia (if statin inappropriate or not tolerated)

**SIDE-EFFECTS**
- Uncommon Bleeding tendency - hypoprothrombinemia - night blindness - osteoporosis - skin reactions - tongue irritation - vitamin deficiencies

**PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestyramine powder (avoid other drugs at same time).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| Ezetimibe (Non-proprietary) | Ezetimibe 10 mg | 28 tablet [PoS] £2.08–£26.31 DT = £2.17 |
| Ezetrol (Merck Sharp & Dohme Ltd) | Ezetimibe 10 mg | 28 tablet [PoS] £26.31 DT = £2.17 |

Combinations available: Simvastatin with ezetimibe, p. 205

**SIDE-EFFECTS**

- Uncommon Bleeding tendency - hypoprothrombinemia - night blindness - osteoporosis - skin reactions - tongue irritation - vitamin deficiencies

**PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestyramine powder (avoid other drugs at same time).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| Bezafibrate (Non-proprietary) | Bezafibrate 100 mg | 30 tablet [PoS] £2.08–£26.31 DT = £2.17 |
| Bezafibrate (Non-proprietary) | Bezafibrate 200 mg | 30 tablet [PoS] £26.31 DT = £2.17 |

**SIDE-EFFECTS**

- Uncommon Bleeding tendency - hypoprothrombinemia - night blindness - osteoporosis - skin reactions - tongue irritation - vitamin deficiencies

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| Bezafibrate (Non-proprietary) | Bezafibrate 100 mg | 30 tablet [PoS] £2.08–£26.31 DT = £2.17 |
| Bezafibrate (Non-proprietary) | Bezafibrate 200 mg | 30 tablet [PoS] £26.31 DT = £2.17 |

Combinations available: Simvastatin with bezafibrate, p. 205
● **Hepatic Impairment**: Manufacturer advises avoid—no information available.

● **Renal Impairment**: Avoid immediate-release preparations if eGFR less than 15 mL/minute/1.73 m². Avoid modified-release preparations if eGFR less than 60 mL/minute/1.73 m².

Myotoxicity: Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

Dose adjustments: Reduce dose to 400 mg daily if eGFR 40–60 mL/minute/1.73 m².

Reduce dose to 200 mg every 1–2 days if eGFR 15–40 mL/minute/1.73 m².

● **Monitoring Requirements**: Consider monitoring of liver function and creatine kinase when fibrates used in combination with a statin.

● **Prescribing and Dispensing Information**: Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

● **Medicinal Forms**: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension.

**Modified-release tablet**

---

**Fenofibrate**

**Drug Action**: Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**Indications and Dose**: Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated. Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia. Adjunct to statin in mixed hyperlipidaemia if triglycerides and HDL-cholesterol inadequately controlled in patients at high cardiovascular risk.

- **By Mouth Using Capsules**
  - Adult: Initially 100 mg daily, then increased if necessary to 267 mg daily, maximum 200 mg daily with concomitant statin, 267 mg capsules not appropriate for initial dose titration.

- **By Mouth Using Tablets**
  - Adult: 160 mg daily

**Dose Adjustments Due to Interactions**

- Manufacturer advises max. dose 200 mg daily with concurrent use of a statin.

- **Contra-Indications**: Gall bladder disease, pancreatitis (unless due to severe hypertriglyceridaemia), photosensitivity to ketoprofen

- **Caution**: Correct hypothyroidism before initiating treatment.

**Interactions**

- Appendix 1: fibrates

**Side-effects**

- Common or very common: Abdominal pain, diarrhea, dizziness, drowsiness, fatigue, gastrointestinal discomfort, headache, myalgia, nausea, skin reactions, vertigo, vomiting.

- Frequency not known: Cholelithiasis, erectile dysfunction, hepatic disorders, leucopenia, myopathy.
myopathy · pancreatitis · sexual dysfunction · skin reactions

- Rare or very rare Alopecia · hepatic disorders · photosensitivity reaction

- Frequency not known Fatigue · interstitial lung disease · rhabdomyolysis (increased risk in renal impairment) · severe cutaneous adverse reactions (SCARs)

- PREGNANCY Avoid—embryotoxicity in animal studies.
- BREST FEEDING Manufacturers advise avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises avoid —no information available.
- RENAL IMPAIRMENT Manufacturer advises use with caution in mild-to-moderate impairment; avoid if eGFR less than 30 mL/minute/1.73 m². Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

- MONITORING REQUIREMENTS Manufacturer advises monitor hepatic transaminases every 3 months during the first 12 months of treatment and periodically thereafter—interrupt treatment if creatinine level is 50% above the upper limit of normal.

- PRESCRIBING AND DISPENSING INFORMATION Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

**Combinations available:** Simvastatin with fenofibrate, p. 206

### Gemfibrozil

- **DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

- **INDICATIONS AND DOSE** Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated. Adjunct to diet and other appropriate measures in primary hypercholesterolaemia if statin contra-indicated or not tolerated. Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia. Adjunct to diet and other appropriate measures in primary prevention of cardiovascular disease in men with hyperlipidaemias if statin contra-indicated or not tolerated.

- **BY MOUTH**
  - Adult: 1.2 g daily in 2 divided doses, maintenance 0.9–1.2 g daily

- **CONTRA-INDICATIONS** History of gall-bladder or biliary tract disease including gallstones · photosensitivity to fibrates

- **CAUTIONS** Correct hypothyroidism before initiating treatment · elderly

- **INTERACTIONS** → Appendix 1: fibrates

- **SIDE-EFFECTS**
  - Common or very common Constipation · diarrhoea · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · vertigo · vomiting
  - Uncommon Atrial fibrillation
  - Rare or very rare Alopecia · anaemia · angioedema · appendicitis · bone marrow failure · depression · dizziness · drowsiness · eosinophilia · gallbladder disorders · hepatic disorders · joint disorders · laryngeal oedema · leucopenia · muscle weakness · myalgia · myopathy · pain in extremity · pancreatitis · paraesthesia · peripheral neuropathy · photosensitivity reaction · sexual dysfunction · thrombocytopenia · vision blurred

- **PREGNANCY** Manufacturers advise avoid unless essential— toxicity in animal studies.

- **BREST FEEDING** Manufacturers advise avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturers advise avoid.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m². Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

- **Dose adjustments** Initially 900 mg daily if eGFR 30–80 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor blood counts for thrombocytopenia for the first year.
  - Monitor liver-function (discontinue treatment if abnormalities persist).
  - Consider monitoring creatine kinase if used in combination with a statin.

- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

      - 90 capsule [PO]
      - £46.33 DT + £46.33

Nicotinic acid

- **DRUG ACTION**
  
  In doses of 1.5 to 3 g daily, it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol.

- **INDICATIONS AND DOSE**
  
  Adjunct to statin in dyslipidaemia or used alone if statin not tolerated
  
  - BY MOUTH
  - Adult: (consult product literature)

- **CONTRA-INDICATIONS**
  
  Active peptic ulcer disease - arterial bleeding

- **CAUTIONS**
  
  - Acute myocardial infarction - diabetes mellitus - gout - history of peptic ulceration - unstable angina
  
  - INTERACTIONS
    - Appendix 1: nicotinic acid

- **SIDE-EFFECTS**
  
  - Common or very common
    - Diarrhoea - flushing - gastrointestinal discomfort - nausea - skin reactions - vomiting
Hyperlipidaemia

Before starting treatment with statins, at least one full monitoring requirement is necessary.

**MONITORING REQUIREMENTS**
- **Liver function**
  - There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 [July 2014]). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease).
- **Creatine kinase** Before initiation of statin treatment, creatine kinase concentration should be measured in patients who have had persistent, generalised, unexplained muscle pain (whether associated or not with previous lipid-regulating drugs); if the concentration is more than 5 times the upper limit of normal, a repeat measurement should be taken after 7 days. If the repeat concentration remains above 5 times the upper limit, statin treatment should not be started; if concentrations are still raised but less than 5 times the upper limit, the statin should be started at a lower dose.
- **Diabetes** Patients at high risk of diabetes mellitus should have fasting blood-glucose concentration or HbA1c checked before starting statin treatment, and then repeated after 3 months.

**PATIENT AND CARER ADVICE** Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

### Atorvastatin

**INDICATIONS AND DOSE**
- **Primary hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures**
  - **BY MOUTH**
  - **Adult:** Usual dose 10 mg once daily; increased if necessary up to 80 mg once daily, dose to be increased at intervals of at least 4 weeks
- **Heterozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures**
  - **BY MOUTH**
  - **Adult:** 20 mg once daily, dose can be increased if necessary

**SIDE-EFFECTS**
- **Common or very common**
  - Epistaxis, hyperglycaemia, hyperglycaemia, laryngeal pain, muscle complaints, nasopharyngitis, pain
- **Uncommon**
  - Appetite decreased, burping, chest pain, fever, hypertrophic cardiovascular disease, malaise, numbness, peripheral oedema, taste altered, tinnitus, vision disorders, weight increased
- **Rare or very rare**
  - Angioedema, gynaecomastia, hearing loss, severe cutaneous adverse reactions (SCARs)
- **Breast feeding**
  - Manufacturer advises avoid—no information available.

**RENAI IMPAIRMENT**
- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises if concurrent use of ciclosporin is unavoidable, max. dose cannot exceed 10 mg daily.
  - Manufacturer advises max. dose 40 mg daily when combined with anion-exchange resin for heterozygous familial hypercholesterolaemia.
  - Manufacturer advises max. dose 20 mg daily with concurrent use of elbasvir with grazoprevir.
  - Manufacturer advises max. dose 20 mg daily with concurrent use of letemovir without ciclosporin.

**PATIENT AND CARER ADVICE**
- Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

**REFERENCES**
- [unlicensed starting dose in secondary prevention]
- [unlicensed starting dose in primary prevention]
- [unlicensed starting dose in secondary prevention], initially 20 mg once daily, increased if necessary up to 80 mg once daily, dose to be increased at intervals of at least 4 weeks

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Manufacturer advises if concurrent use of ciclosporin is unavoidable, max. dose cannot exceed 10 mg daily.
- Manufacturer advises max. dose 40 mg daily when combined with anion-exchange resin for heterozygous familial hypercholesterolaemia.
- Manufacturer advises max. dose 20 mg daily with concurrent use of elbasvir with grazoprevir.
- Manufacturer advises max. dose 20 mg daily with concurrent use of letemovir without ciclosporin.

**UNLICENSED USE**
- Not licensed for secondary prevention of cardiovascular events. Starting dose of 20 mg daily or more is not licensed for the primary prevention of cardiovascular events.

**CAUTIONS**
- Haemorrhagic stroke

**INTERACTIONS**
- Appendix 1: statins
Fluvastatin

08-Feb-2019

**INDICATIONS AND DOSE**

Adjunct to diet in primary hypercholesterolaemia or combined (mixed) hyperlipidaemia in patients who have not responded adequately to dietary control

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 20–40 mg daily, dose to be taken in the evening, increased if necessary up to 80 mg daily in 2 divided doses, dose to be adjusted at intervals of at least 4 weeks

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 80 mg daily

Prevention of coronary events after percutaneous coronary intervention

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 80 mg daily

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 80 mg daily, dose form is not appropriate for initial dose titration

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Max. dose 20 mg daily with concomitant elbasvir with grazoprevir.

**INTERACTIONS**

- Appendix 1: statins

**SIDE-EFFECTS**

- Rare or very rare Angioedema • face oedema • lupus-like syndrome • muscle weakness • sensation abnormal • vasculitis

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT**

  **Dose adjustments**

  Manufacturer advises doses above 40 mg daily should be initiated with caution if eGFR less than 30 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Patient counselling is advised for fluvastatin tablets/capsules (muscle effects).

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 76/04

The Scottish Medicines Consortium has advised (February 2004) that fluvastatin (Lescol 79) is accepted for restricted use for the secondary prevention of coronary events after percutaneous coronary angioplasty; if the patient has previously been receiving another statin, then there is no need to change the statin.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Lipitor** (Pfizer Ltd)
  - Atorvastatin (as Atorvastatin calcium trihydrate) 10 mg
  - Atorvastatin (as Atorvastatin calcium trihydrate) 20 mg
  - Atorvastatin (as Atorvastatin calcium trihydrate) 40 mg

Pravastatin sodium

08-Jun-2017

**INDICATIONS AND DOSE**

Adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control

- **BY MOUTH**
  - Adult: 10–40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks

Prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina

- **BY MOUTH**
  - Adult: 40 mg daily, dose to be taken at night

Reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation

- **BY MOUTH**
  - Adult: Initially 20 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, close medical supervision is required if dose is increased to maximum dose

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises reduce dose by half with concurrent use of omibitasvir with paritaprevir and ritonavir.

- Manufacturer advises max. 20 mg daily with concurrent use of glecaprevir with pibrentavir.

- Manufacturer advises max. 40 mg daily with concurrent use of sofosbuvir with velpatasvir and voxilaprevir.
Cardiovascular system

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, tablets, capsules, film-coated tablets, injectable, and ointment.

Tablet
- Pravastatin sodium (Non-proprietary)
  - Pravastatin sodium 10 mg: Pravastatin 10mg tablets [D][P] 28 tablet [P] £2.68 DT = £0.77
  - Pravastatin sodium 20 mg: Pravastatin 20mg tablets [D][P] 28 tablet [P] £3.05 DT = £0.96
  - Pravastatin sodium 40 mg: Pravastatin 40mg tablets [D][P] 28 tablet [P] £3.82 DT = £1.18

Rosuvastatin

INDICATIONS AND DOSE

Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures and who have risk factors for myopathy or rhabdomyolysis

BY MOUTH

Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks.

Severe primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients with high cardiovascular risk who have not responded adequately to diet and other appropriate measures, and who have risk factors for myopathy or rhabdomyolysis

BY MOUTH

Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks.

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event

BY MOUTH

Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks.

Dose adjustments due to interactions

- Manufacturer advises initially 5 mg daily with concurrent use of bezafibrate, ciprofibrate, and fenofibrate—40 mg dose is contra-indicated.
- Manufacturer advises initially 5 mg daily with concurrent use of clodipogrel—max. dose 20 mg daily.
- Manufacturer advises initially 5 mg daily with concurrent use of simprevir—max. dose 10 mg daily.
- Manufacturer advises max. dose 5 mg daily with concurrent omibitasvir, paritaprevir, and ritonavir given with dasabuvir, but max. 10 mg daily with concurrent omibitasvir, paritaprevir, and ritonavir given without dasabuvir.
- Manufacturer advises max. dose 10 mg daily with concurrent use of sofosbuvir with velpatasvir, or elbasvir with grazoprevir.
- Manufacturer advises reduce dose by half with concurrent use of glecaprevir with pibrentasvir.

INTERACTIONS

Appendix 1: statins

SIDE-EFFECTS

- Rare or very rare: Arthralgia; gynaecomastia; haematuria; polyneuropathy
- Frequency not known: Cough; dyspnoea; oedema; proteinuria; Stevens-Johnson syndrome; tendon disorders

BREAST FEEDING

Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT

Avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments

- Initially 5 mg once daily (do not exceed 20 mg daily) if eGFR 30–60 mL/minute/1.73 m².
Simvastatin

- **INDICATIONS AND DOSE**
  - Primary hypercholesterolaemia, or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures
    - **BY MOUTH**
      - Adult: 10–20 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications
  - Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures
    - **BY MOUTH**
      - Adult: Initially 40 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications
  - Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus
    - **BY MOUTH**
      - Adult: Initially 20–40 mg once daily, increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises max. 10 mg daily with concurrent use of bezafibrate or ciprofibrate.
  - Manufacturer advises max. 20 mg daily with concurrent use of amiodarone, amiodipine, or ranolazine.
  - Manufacturer advises reduce dose with concurrent use of some moderate inhibitors of CYP3A4 (max. 20 mg daily with verapamil and diltiazem).
  - Manufacturer advises max. 40 mg daily with concurrent use of elabavir with grazoprevir.

- **INTERACTIONS**
  - Appendix 1: statins

- **SIDE-EFFECTS**
  - Rare or very rare: Acute kidney injury, anaemia, muscle cramps

- **PATIENT AND CARER ADVICE**
  - Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).

- **INTERACTIONS**
  - Appendix 1: statins

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  - **Tablet**
    - Rosuvastatin (Non-proprietary) (AstraZeneca UK Ltd)
      - Adult: 5 mg; 10 mg; 20 mg; 40 mg tablets | 28 tablet | £18.03 DT = £1.44
      - Manufacturer advises max. daily dose.
      - Manufacturer advises use with caution if eGFR less than 30 mL/minute/1.73 m².
      - Patient and carer advice: Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).

- **EXCEPTIONS TO LEGAL CATEGORY**
  - Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15% risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  - **Oral suspension**
    - EXCIPIENTS: May contain Propylene glycol
      - Simvastatin (Non-proprietary)
        - Simvastatin 4 mg per 1 ml Simvastatin 20 mg/5 ml oral suspension sugar-free sugar-free | 150 PDP | £144.32
        - Simvastatin 8 mg per 1 ml Simvastatin 40 mg/5 ml oral suspension sugar-free | 150 PDP | £200.45

  - **Tablet**
    - Simvastatin (Non-proprietary)
      - Simvastatin 10 mg | 28 tablet | £14.42 DT = £0.64
      - Simvastatin 20 mg | 28 tablet | £23.75 DT = £0.75
      - Simvastatin 40 mg | 28 tablet | £23.75 DT = £0.87
      - Simvastatin 80 mg | 28 tablet | £6.00 DT = £1.49

      - Simvador (Discovery Pharmaceuticals)
        - Simvastatin 10 mg | 28 tablet | £0.52 DT = £0.64
        - Simvastatin 20 mg | 28 tablet | £0.67 DT = £0.75
        - Simvastatin 40 mg | 28 tablet | £0.65 DT = £0.87
        - Simvastatin 80 mg | 28 tablet | £1.31 DT = £1.49

      - Zocor (Merck Sharp & Dohme Ltd)
        - Simvastatin 10 mg | 28 tablet | £18.03 DT = £0.64
        - Simvastatin 20 mg | 28 tablet | £29.69 DT = £0.75
        - Simvastatin 40 mg | 28 tablet | £29.69 DT = £0.87
        - Simvastatin 80 mg | 28 tablet | £29.69 DT = £1.49

- **Simvastatin with ezetimibe**
  - The properties listed below are those particular to the combination only. For the properties of the components please consider, simvastatin above, ezetimibe p. 198.

  - **INDICATIONS AND DOSE**
    - Homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients over 10 years stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone
      - **BY MOUTH**
      - Adult: consult product literature

  - **INTERACTIONS**
    - Appendix 1: ezetimibe, statins
**LIPID MODIFYING DRUGS**

### Simvastatin with fenofibrate

The properties listed below are those particular to the combination only. For the properties of the components please consider, simvastatin p. 205, fenofibrate p. 199.

- **INDICATIONS AND DOSE**
  Adjunct to diet and exercise in mixed dyslipidaemia, when LDL-cholesterol levels are adequately controlled with the corresponding dose of simvastatin monotherapy in patients at high cardiovascular risk

  - **BY MOUTH**
    - Adult: 20/145 mg once daily, alternatively 40/145 mg once daily, dose should be based on previous simvastatin monotherapy dose

- **CAUTIONS**
  History of pulmonary embolism

- **INTERACTIONS**
  - Appendix 1: fibrates · statins

- **RENAI IMPAIRMENT**
  Manufacturer advises avoid if eGFR less than 60 mL/minute/1.73 m²; use with caution if eGFR 60–89 mL/minute/1.73 m²

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 25
- **EXCIPIENTS:** May contain Butylated hydroxyanisole, lecithin
  - **Cholib (Mylan)**
    - Simvastatin 20 mg, Fenofibrate 145 mg
    - 30 tablet (Pte) £3.42 DT + £33.42
    - Simvastatin 40 mg, Fenofibrate 145 mg
    - 30 tablet (Pte) £2.98 DT + £28.98

- **Ezetimibe 10 mg, Simvastatin 80 mg**
  - 28 tablet (Pte) £41.21 DT + £41.21

**Solution for injection**

- **Manufacturer advises store in a refrigerator (2–8 °C)–consult product literature for further information regarding storage outside refrigerator.**
- **Praluent (Sanofi)**
  - **Alirocumab 75 mg per 1 ml**
  - **Alirocumab 150 mg per 1 ml**

### Relevant Links

- **Scottish Medicines Consortium (SMC) decisions**
  - **SMC No. 1147/16**
  - The Scottish Medicines Consortium has advised (August 2016) that alirocumab (Praluent®) is accepted for restricted use within NHS Scotland for treatment of primary hypercholesterolaemia or mixed dyslipidaemia (alone or in combination with other lipid lowering therapies, as specified within it’s licence), for specialist use only and only in patients at high cardiovascular risk as follows:
    - patients with heterozygous familial hypercholesterolaemia (HeFH) and LDL-C ≥ 5.0mmol/L, for primary prevention of cardiovascular events, or
    - patients with HeFH and LDL-C ≥ 3.5mmol/L for secondary prevention of cardiovascular events, or
    - patients at high risk due to previous cardiovascular events and LDL-C ≥ 4.0mmol/L, or
    - patients with recurrent/polyvascular disease and LDL-C ≥ 3.5mmol/L.
  - This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **EXCIPIENTS:** May contain Polysorbates
  - **Praluent (Sanofi)**
    - **Alirocumab 75 mg per 1 ml**
      - Praluent 75mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection £168.00 | 2 pre-filled disposable injection £336.00
    - **Alirocumab 150 mg per 1 ml**
      - Praluent 150mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection £168.00 | 2 pre-filled disposable injection £336.00
Evolocumab
08-Feb-2019

**DRUG ACTION**
Evolocumab binds to a pro-protein involved in the regulation of LDL receptors on liver cells; receptor numbers are increased, which results in increased uptake of LDL-cholesterol from the blood.

**INDICATIONS AND DOSE**

Primary hypercholesterolaemia or mixed dyslipidaemia in patients who have not responded adequately to other appropriate measures (in combination with a statin, or with a statin and other lipid-lowering therapies, or with other lipid-lowering therapies alone or if a statin contra-indicated or not tolerated) | Established atherosclerotic cardiovascular disease (in combination with the maximum tolerated dose of a statin with or without other lipid-lowering therapies, or with other lipid-lowering therapies alone or if a statin contra-indicated or not tolerated)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 140 mg every 2 weeks, alternatively 420 mg every month, to be administered into the thigh, abdomen or upper arm

Homozygous familial hypercholesterolaemia | (in combination with other lipid-lowering therapies)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 420 mg every month; increased if necessary to 420 mg every 2 weeks, if inadequate response after 12 weeks of treatment, to be administered into the thigh, abdomen or upper arm

Homozygous familial hypercholesterolaemia in patients on apheresis | (in combination with other lipid-lowering therapies)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 420 mg every 2 weeks, to correspond with apheresis schedule, to be administered into the thigh, abdomen or upper arm

**SIDE-EFFECTS**

- Common or very common: Arthralgia - back pain - increased risk of infection - nausea - skin reactions
- Rare or very rare: Angioedema
- **PREGNANCY**: Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING**: Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT**: Manufacturer advises caution in moderate to severe impairment (risk of reduced efficacy; no information available in severe impairment).
- **RENAL IMPAIRMENT**: Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m²—no information available.
- **HANDLING AND STORAGE**: Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.
- **PATIENT AND CARER ADVICE**: Patients and their carers should be given training in subcutaneous injection technique.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**
  - Evolocumab for treating primary hypercholesterolaemia and mixed dyslipidaemia (June 2016) NICE TA4394
  - Evolocumab (Repatha®) is recommended as an option for treating primary hypercholesterolaemia or mixed dyslipidaemia, only if:
    - it is given at a dose of 140 mg every 2 weeks, and
    - low-density lipoprotein cholesterol (LDL-C) concentrations are persistently above the thresholds specified in the NICE documentation, and
  - the manufacturer provides evolocumab with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta4394

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1148/16
The Scottish Medicines Consortium has advised (February 2017) that evolocumab (Repatha®) is accepted for restricted use within NHS Scotland for the treatment of primary hypercholesterolaemia (heterozygous familial hypercholesterolaemia and non-familial) or mixed dyslipidaemia (alone or in combination with other lipid lowering therapies, as specified within its license), for specialist use only when administered at a dose of 140 mg every 2 weeks and only in patients at high cardiovascular risk as follows:

- patients with heterozygous familial hypercholesterolaemia (HeFH) and LDL-C 5 mmol/L or greater for primary prevention of cardiovascular events, or
- patients with HeFH and LDL-C 3.5 mmol/L or greater for secondary prevention of cardiovascular events, or
- patients with high risk due to previous cardiovascular events and LDL-C 4 mmol/L or greater, or
- patients with recurrent/polyvascular disease and LDL-C 3.5 mmol/L or greater.

This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Repatha SureClick (£60.98) | Evolocumab 140 mg per 1 ml
- Repatha SureClick 140mg/1ml solution for injection pre-filled pens | 2 pre-filled disposable injection vials £180.20

Lomitapide
01-Aug-2018

**DRUG ACTION**
Lomitapide, an inhibitor of microsomal triglyceride transfer protein (MTP), reduces lipoprotein secretion and circulating concentrations of lipoprotein-borne lipids such as cholesterol and triglycerides.

**INDICATIONS AND DOSE**

Adjunct to dietary measures and other lipid-lowering drugs with or without low-density lipoprotein apheresis in homozygous familial hypercholesterolaemia (under expert supervision)

- **BY MOUTH**
  - Adult: Initially 5 mg daily for 2 weeks, dose to be taken at least 2 hours after evening meal, then increased if necessary to 10 mg daily, for at least 4 weeks, then increased to 20 mg daily for at least 4 weeks, then increased in steps of 20 mg daily, adjusted at intervals of at least 4 weeks; maximum 60 mg per day

**CONTRA-INDICATIONS**
Significant or chronic bowel disease

**CAUTIONS**
Concomitant use of hepatotoxic drugs - lomitapide can interfere with the absorption of fat-soluble nutrients and supplementation of vitamin E and fatty acids is required - patients over 65 years

**INTERACTIONS**
→ Appendix 1: lomitapide

**SIDE-EFFECTS**

- Common or very common: Nausea - headache - muscle pain - increased liver enzymes
- Uncommon or rare: Appetite abnormal - constipation - dizziness - haemorrhage - jaundice - peripheral neuropathy - peripheral oedema - photosensitivity - pruritus - venous thromboembolism

www.getintopharma.com
risk of infection · muscle complaints · nausea · skin reactions · vomiting · weight decreased

- **Uncommon** Anaemia · chest pain · chills · dehydration · drowsiness · dry mouth · eye swelling · fever · gait abnormal · hyperhidrosis · joint disorders · malaise · pain in extremity · paraesthesia · throat lesion · upper-airway cough syndrome · vertigo

- **Frequency not known** Alopecia

**SIDE-EFFECTS, FURTHER INFORMATION** Reduce dose if serum transaminases raised during treatment (consult product literature).

**CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception used.

**PREGNANCY** Avoid—teratogenicity and embryotoxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment, or if unexplained persistent abnormal liver function tests.

**Dose adjustments** Manufacturer advises max. 40 mg daily in mild impairment.

**RENAL IMPAIRMENT**

**Dose adjustments** Max. 40 mg daily in end-stage renal disease.

**MONITORING REQUIREMENTS**

- Monitor liver function tests before treatment, then at least monthly and before each dose increase for first year, then at least every 3 months and before each dose increase thereafter.
- Screen for hepatic steatosis and fibrosis before treatment, then annually thereafter.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Lojuxta** (Amryt Pharma) ▼
  - Lomitapide 5 mg Lojuxta 5mg capsules | 28 capsule POM
  - Lomitapide 10 mg Lojuxta 10mg capsules | 28 capsule POM

8 Myocardial ischaemia

Stable angina

**Description of condition**

Stable angina is characterised by predictable chest pain or pressure, often precipitated by physical exertion or emotional stress causing an increase in myocardial oxygen demand. Although pain typically occurs in the front of the chest, it may also radiate to the neck, shoulders, jaw or arms; the pain is relieved with rest. Stable angina usually results from atherosclerotic plaques in the coronary arteries that restrict blood flow and oxygen supply to the heart; it can lead to cardiovascular complications such as stroke, unstable angina, myocardial infarction, and sudden cardiac death. For information about unstable angina and myocardial infarction, see Acute coronary syndromes.

Prinzmetal’s or vasospastic angina is a rare form of angina caused by narrowing or occlusion of proximal coronary arteries due to spasm, in which pain is experienced at rest rather than during activity.

**Aims of treatment**

Antianginal drug therapy and revascularisation aims to prevent or minimise angina symptoms, in order to improve quality of life and long-term morbidity and mortality. The aim of drug therapy for secondary prevention is to minimise the risk of cardiovascular events such as myocardial infarction and stroke.

**Drug treatment**

Antianginal drug therapy

Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate p. 218, which can also be used as a preventative measure immediately before performing activities that are known to bring on an attack.

For long-term prevention of chest pain in patients with stable angina, a beta-blocker (such as atenolol p. 152, bisoprolol fumarate p. 153, metoprolol tartrate p. 154 or propranolol hydrochloride p. 150) should be given as first-line therapy. A rate-limiting calcium-channel blocker (such
as verapamil hydrochloride p. 164 or diltiazem hydrochloride p. 157) should be considered as an alternative if beta-blockers are contra-indicated, for example in patients with Prinzmetal’s angina or decompensated heart failure. Dihydropyridine derivative calcium-channel blockers (such as amlodipine p. 156) may be effective in patients with Prinzmetal’s angina.

If a beta-blocker alone fails to control symptoms adequately, a combination of a beta-blocker and a calcium-channel blocker should be considered. If this combination is not appropriate due to intolerance of, or contra-indication to, either beta-blockers or calcium-channel blockers, NICE CG126 recommends to consider addition of either a long-acting nitrate, isosorbide dinitrate p. 211, nicorandil p. 212, or ranolazine p. 211.

A long-acting nitrate, isosorbide dinitrate p. 211, nicorandil p. 212, or ranolazine p. 211, should also be considered as monotherapy in patients who cannot tolerate beta-blockers and calcium-channel blockers, if both are contra-indicated, or when they both fail to adequately control angina symptoms.

Response to treatment should be assessed every 2–4 weeks following initiation or change of drug therapy; drug doses should be titrated to the maximum tolerated effective dose.

If a combination of two drugs at a maximum therapeutic dose fails to control angina symptoms, patients should be considered for referral to a specialist.

Secondary prevention of cardiovascular events

All patients with angina are assumed to be at high-risk for cardiovascular events. The occurrence of cardiovascular events can be prevented by management of cardiovascular risk factors through lifestyle changes (such as smoking cessation, weight management, increased physical activity), psychological support, and drug treatment. See also Secondary prevention in Cardiovascular disease risk assessment and prevention p. 189 for further information.

Non-drug treatment

Revascularisation by coronary artery bypass graft or percutaneous coronary intervention should be considered for patients with stable angina who remain symptomatic whilst on optimal drug therapy. See also Antiplatelet drugs and coronary stents in Antiplatelet drugs p. 121.

Advanced Pharmacy Services

Patients with stable angina may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Other drugs used for Myocardial ischaemia

间的羊村
**210 Myocardial ischaemia**

**ANTITHROMBOTIC DRUGS > GLYCOPROTEIN IIb/IIIa INHIBITORS**

---

**Eptifibatide**

**INDICATIONS AND DOSE**

In combination with aspirin and unfractionated heparin for the prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (specialist use only)

- Initially by intravenous injection
  - Adult: Initially 180 micrograms/kg, then (by intravenous infusion) 2 micrograms/kg for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

**CONTRA-INDICATIONS**

Abnormal bleeding within 30 days - aneurysm - arteriovenous malformation - haemorrhagic diathesis - history of haemorrhagic stroke - increased INR - increased prothrombin time - intracranial disease - major surgery or severe trauma within 6 weeks - neoplasm - severe hypertension - stroke within last 30 days - thrombocytopenia

**CAUTIONS**

Discontinue if emergency cardiac surgery necessary - discontinue if intra-aortic balloon pump necessary - discontinue if thrombolytic therapy necessary - risk of bleeding - discontinue immediately if uncontrolled serious bleeding

**INTERACTIONS**

Appendix 1: eptifibatide

**SIDE-EFFECTS**

- Common or very common
  - Arrhythmias - atrioventricular block - cardiac arrest - congestive heart failure - haemorrhage - hypotension - intracranial haemorrhage - procedural complications - shock

- Uncommon
  - Cerebral ischaemia - thrombocytopenia

- Rare or very rare
  - Rash

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk — no information available.

**BREAST FEEDING**

Manufacturer advises avoid — no information available.

**HEPATIC IMPAIRMENT**

Avoid in severe liver disease — increased risk of bleeding.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 30 mL/minute/1.73 m²

**Dose adjustments**

Reduce infusion to 1 microgram/kg/minute if eGFR 30–50 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine.

- Monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment, then at least once daily.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Eptifibatide (Non-proprietary)**

  | Eptifibatide 2 mg per 1 ml | Epifibatide 20mg/10ml solution for injection vials | 1 vial [PCE] | £5.14 (Hospital only) |

  | Integrisil (GlasoSmithKline UK Ltd) | Eptifibatide 2 mg per 1 ml | Integrisil 20mg/10ml solution for injection vials | 1 vial [PCE] | £13.61 (Hospital only) |

**Solution for infusion**

- **Eptifibatide (Non-proprietary)**

  | Eptifibatide 750 microgram per 1 ml | Eptifibatide 75mg/100ml solution for infusion vials | 1 vial [PCE] | £7.14 (Hospital only) |

  | Integrisil (GlasoSmithKline UK Ltd) | Eptifibatide 750 microgram per 1 ml | Integrisil 75mg/100ml solution for infusion vials | 1 vial [PCE] | £42.79 (Hospital only) |

---

**Tirofiban**

**INDICATIONS AND DOSE**

In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography planned for 4–48 hours after diagnosis) (initiated under specialist supervision)

- Initially by intravenous injection
  - Adult: Initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention), maximum duration of treatment 108 hours

In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography within 4 hours of diagnosis) (initiated under specialist supervision)

- Initially by intravenous injection
  - Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

In combination with unfractionated heparin, aspirin, and clopidogrel for reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction (STEMI) intended for primary percutaneous coronary intervention (PCI) (initiated under specialist supervision)

- Initially by intravenous injection
  - Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

**CONTRA-INDICATIONS**

Abnormal bleeding within 30 days - history of aneurysm - history of arteriovenous malformation - history of haemorrhagic stroke - history of intracranial disease - history of neoplasm - increased INR - increased prothrombin time - severe hypertension - stroke within 30 days - thrombocytopenia

**CAUTIONS**

- Active peptic ulcer (within 3 months) - acute pericarditis - anaemia - aortic dissection - cardiogenic shock - discontinue if intra-aortic balloon pump necessary - discontinue if thrombolytic therapy necessary - discontinue immediately if serious or uncontrollable bleeding occurs - discontinue if emergency cardiac surgery necessary - elderly - faecal occult blood - haematuria - haemorrhagic retinopathy - low body-weight - major surgery within 3 months (avoid if within 6 weeks) - organ biopsy or lithotripsy within last 2 weeks - puncture of non-compressible vessel within 24 hours - risk of bleeding (within 3 months) - severe heart failure - severe trauma within 3 months (avoid if within 6 weeks) - traumatic or protracted cardiopulmonary resuscitation within last 2 weeks - uncontrolled severe hypertension - vasculitis

**INTERACTIONS**

Appendix 1: tirofiban

**SIDE-EFFECTS**

- Common or very common

  - Ecchymosis - fever - haemorrhage - headache - nausea - thrombocytopenia

- Frequency not known

  - Intracranial haemorrhage

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk — no information available.

**BREAST FEEDING**

Manufacturer advises avoid — no information available.

---

www.getintopharma.com
**HEPATIC IMPAIRMENT** Manufacturer advises avoid unless essential—no information available.

**RENAL IMPAIRMENT** Increased risk of bleeding.

- **Dose adjustments** Use half normal dose if eGFR less than 30 mL/minute/1.73 m².
- **Monitoring** Monitor carefully if eGFR less than 60 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Aggrastat®), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 50 mL infusion fluid from 250 mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **ELECTROLYTES:** May contain Sodium
  - Aggrastat (Correvio UK Ltd)
    - Tirofiban 250 microgram per 1 ml Aggrastat 12.5mg/50ml concentrate for solution for infusion vials | 1 vial (Hospital only)
  - Infusion
    - Tirofiban (Non-proprietary)
      - Tirofiban 50 microgram per 1 ml Tirofiban 12.5mg/250ml infusion bags | 1 bag (Hospital only)
      - Aggrastat (Correvio UK Ltd)
        - Tirofiban 50 microgram per 1 ml Aggrastat 12.5mg/250ml infusion bags | 1 bag (Hospital only)

**PIPERAZINE DERIVATIVES**

### Ranolazine

- **INDICATIONS AND DOSE**
  - As adjunctive therapy in the treatment of stable angina in patients inadequately controlled or intolerant of first-line antianginal therapies
  - **BY MOUTH**
    - Adult: Initially 375 mg twice daily for 2–4 weeks, then increased to 500 mg twice daily, then adjusted according to response to 750 mg twice daily; reduced if not tolerated to 375–500 mg twice daily

- **CAUTIONS** Body-weight less than 60 kg - elderly - moderate to severe congestive heart failure - QT interval prolongation

- **INTERACTIONS** → Appendix 1: ranolazine

- **SIDE-EFFECTS**
  - Common or very common
    - Asthenia - constipation - headache - vomiting
  - Uncommon
  - Rare or very rare
    - Acute kidney injury - altered smell sensation - angioedema - consciousness impaired - coordination abnormal - erectile dysfunction - gait abnormal - hearing impairment - hypotension - memory loss - oral hypoesthesia - pancreatitis - peripheral coldness

**PREGNANCY** Manufacturer advises avoid unless essential—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Use with caution in mild impairment; avoid in moderate and severe impairment.

**RENAL IMPAIRMENT** Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE** Patient alert card to be provided.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **Scottish Medicines Consortium (SMC) decisions**
  - The Scottish Medicines Consortium has advised (October 2012) that ranolazine (Ranexa®) is not recommended for use within NHS Scotland.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Modified-release tablet**
  - Tirofiban (Non-proprietary)
    - Tirofiban 50 microgram per 1 ml Tirofiban 12.5mg/250ml infusion bags | 1 bag (Hospital only)
  - Aggrastat (Correvio UK Ltd)
    - Tirofiban 50 microgram per 1 ml Aggrastat 12.5mg/250ml infusion bags | 1 bag (Hospital only)

**SELECTIVE SINUS NODE I1 INHIBITORS**

- **Ivabradine**
  - **INDICATIONS AND DOSE**
    - Treatment of angina in patients in normal sinus rhythm
      - **BY MOUTH**
        - Adult 18–74 years: Initially 2.5–5 mg twice daily for 3–4 weeks, then increased if necessary up to 7.5 mg twice daily, dose to be increased gradually; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute, discontinue treatment if no improvement in symptoms within 3 months
        - Adult 75 years and over: Initially 2.5 mg twice daily for 3–4 weeks, then increased if necessary up to 7.5 mg twice daily, dose to be increased gradually; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute, discontinue treatment if no improvement in symptoms within 3 months
  - **Mild to severe chronic heart failure**
    - **BY MOUTH**
      - Adult 18–74 years: Initially 5 mg twice daily for 2 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute
      - Adult 75 years and over: Initially 2.5 mg twice daily for 2 weeks, then increased if necessary up to 7.5 mg twice daily, dose to be increased gradually; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute
  - **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
    - Manufacturer advises reduce initial dose to 2.5 mg twice daily with concurrent use of moderate CYP3A4 inhibitors (except diltiazem, erythromycin and verapamil where concurrent use is contra-indicated).

- **CONTRA-INDICATIONS** Acute myocardial infarction - cardiogenic shock - congenital QT syndrome - do not initiate for angina if heart rate below 70 beats per minute - do not initiate for chronic heart failure if heart rate below
Ivabradine for the treatment of chronic heart failure

CAUTIONS Atrial fibrillation or other arrhythmias (treatment ineffective) - elderly - in angina, consider stopping if there is no or limited symptom improvement after 5 months; intraventricular conduction defects - mild to moderate hypotension (avoid if severe). Retinitis pigmentosa

INTERACTIONS → Appendix 1: ivabradine

SIDE-EFFECTS

Common or very common Arrhythmias - atrioventricular block - diziness - headache - hypertension - vision disorders

Uncommon Abdominal pain - angioedema - constipation - diarrhoea - eosinophilia - hyperuricaemia - hypotension - muscle cramps - nausea - QT interval prolongation - skin reactions - syncope - vertigo

PREGNANCY Manufacturer advises avoid — toxicity in animal studies.

BREAST FEEDING Present in milk in animal studies — manufacturer advises avoid.

HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment; avoid in severe impairment — no information available.

RENAL IMPAIRMENT Manufacturer advises use with caution if eGFR less than 45 mL/minute/1.73 m² — no information available.

MONITORING REQUIREMENTS

Monitor regularly for atrial fibrillation (consider benefits and risks of continued treatment if atrial fibrillation occurs). Monitor for bradycardia, especially after any dose increase, and discontinue if resting heart rate persistently below 50 beats per minute or continued symptoms of bradycardia despite dose reduction.

NICE decisions

Ivabradine for the treatment of chronic heart failure (November 2012) NICE TA267

Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), an ACE inhibitor, and an aldosterone antagonist, is an option for treating mild to severe stable chronic heart failure in patients who:

- have a left ventricular ejection fraction of < 35%, and
- are in sinus rhythm with a heart rate of ≥75 beats per minute

Ivabradine should be initiated only by a heart failure specialist after 4 weeks of stable optimal standard therapy; monitoring and dose titration should be carried out by a heart failure specialist, or a GP with special interest in heart failure, or by a heart failure specialist nurse. www.nice.org.uk/TA267

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (September 2012) that ivabradine (Procoralan®) is accepted for restricted use within NHS Scotland in accordance with its licensed indication for heart failure only if resting heart rate remains ≥75 beats per minute despite optimal standard therapy.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Ivabradine (Non-proprietary)

Ivabradine (as ivabradine hydrochloride) 2.5 mg | 56 tablet pack £0.17-£3.26 DT = £0.92

Ivabradine (as ivabradine hydrochloride) 5 mg | 56 tablet pack £0.69-£4.10 DT = £6.09

Ivabradine (as ivabradine hydrochloride) 7.5 mg | 56 tablet pack £3.01-£4.10 DT = £5.01

Procoralan (Servier Laboratories Ltd) Ivabradine (as ivabradine hydrochloride) 5 mg | 56 tablet pack £4.10 DT = £6.09

Ivabradine (as ivabradine hydrochloride) 7.5 mg | 56 tablet pack £4.10 DT = £5.01

VASODILATORS → POTASSIUM-CHANNEL OPENERS

Nicorandil 24-Feb-2016

INDICATIONS AND DOSE

Prophylaxis and treatment of stable angina (second-line)

BY MOUTH

Adult: Initially 5–10 mg twice daily, then increased if tolerated to 40 mg twice daily; usual dose 10–20 mg twice daily, lower initial dose regimen if patient susceptible to headache

CONTRA-INDICATIONS Acute pulmonary oedema - cardiogenic shock - hypovolaemia - left ventricular failure with low filling pressures - severe hypotension

CAUTIONS Acute myocardial infarction with acute left ventricular failure and low filling pressures - diverticular disease - risk of fistula formation or bowel perforation - G6PD deficiency - heart failure (class III–IV) - hyperkalaemia - low systolic blood pressure

INTERACTIONS → Appendix 1: nicorandil

SIDE-EFFECTS

Common or very common Asthenia - dizziness - haemorrhage - headache (more common on initiation, usually transitory) - nausea - vasodilatation - vomiting

Rare or very rare Abdominal pain - angioedema - conjunctivitis - eye disorders - gastrointestinal disorders - genital ulceration - hepatic disorders - hyperkalaemia - mucosal ulceration - myalgia - oral disorders - skin reactions - skin ulcer

Frequency not known Diplopia

SIDE-EFFECTS, FURTHER INFORMATION Nicorandil can cause serious skin, mucosal, and eye ulceration; including gastrointestinal ulcers, which may progress to perforation, haemorrhage, fistula or abscess. Stop treatment if ulceration occurs and consider an alternative.

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk — no information available.

BREAST FEEDING No information available — manufacturer advises avoid.

PATIENT AND CARER ADVICE

Driving and skilled tasks Patients should be warned not to drive or operate machinery until it is established that their performance is unimpaired.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Nicorandil (Non-proprietary)

Nicorandil 10 mg | 60 tablet pack £7.71 DT = £4.29

Nicorandil 20 mg | 60 tablet pack £14.64 DT = £5.93

Ikerel (Sanofi)

Nicorandil 10 mg | 10mg Tablets 60 tablet pack £7.71 DT = £4.29

Nicorandil 20 mg | 20mg Tablets 60 tablet pack £14.64 DT = £5.93

www.getintopharma.com
8.1 Acute coronary syndromes

Acute coronary syndromes

Overview

Acute coronary syndromes encompass a spectrum of conditions which include unstable angina, and myocardial infarction with or without ST-segment elevation. Patients with different acute coronary syndromes may present similarly; definitive diagnosis is made on the basis of clinical presentation, ECG changes, and measurement of biochemical cardiac markers.

Unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These are related acute coronary syndromes that fall between the classifications of stable angina and ST-segment elevation myocardial infarction (STEMI). They usually occur as a result of atheromatous plaque rupture, and are often characterised by stable angina that suddenly worsens, recurring or prolonged angina at rest, or new onset of severe angina. Patients with unstable angina have no evidence of myocardial necrosis, whereas in NSTEMI, myocardial necrosis (less significant than with STEMI) will be evident. There is a risk of progression to STEMI or sudden death, particularly in patients who experience pain at rest.

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These conditions are managed similarly; the aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see below.

Initial management

Oxygen should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hypoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

Nitrates are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 218 is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate p. 220 is given. If pain continues, diamorphine hydrochloride p. 456 or morphine p. 463 can be given by slow intravenous injection; an antiemetic such as metoclopramide hydrochloride p. 432 should also be given.

Aspirin p. 121 (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 123 should also be given. Prasugrel p. 214 is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance). Ticagrelor p. 215 is also an alternative to clopidogrel (see NICE guidance). Patients should also receive either heparin (unfractionated) p. 133, a low molecular weight heparin, or fondaparinux sodium p. 127.

Patients without contra-indications should receive beta-blockers which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem hydrochloride p. 157 or verapamil hydrochloride p. 164 can be given.

The glycoprotein IIb/IIIa inhibitors eptifibatide p. 210 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 210 (in combination with heparin (unfractionated), aspirin, and clopidogrel) can be used for unstable angina or for NSTEMI in patients at a high risk of either myocardial infarction or death.

In intermediate- and high-risk patients, abciximab or eptifibatide (in combination with heparin (unfractionated) and aspirin), or tirofiban (in combination with heparin (unfractionated), aspirin, and clopidogrel) can also be used in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion. In intermediate- and high-risk patients in whom early intervention is planned, bivalirudin p. 136 can be considered as an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin.

Revascularisation procedures are often appropriate for patients with unstable angina or NSTEMI; see Antiplatelet drugs p. 121 for the use of antiplatelet drugs in patients undergoing coronary stenting.

Long-term management

The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment to prevent recurrence of symptoms.

ST-segment elevation myocardial infarction (STEMI)

This is an acute coronary syndrome where atheromatous plaque rupture leads to thrombosis and myocardial ischaemia, with irreversible necrosis of the heart muscle, often leading to long-term complications. STEMI can also occasionally occur as a result of coronary spasm or embolism, arteritis, spontaneous thrombosis, or sudden severe elevation in blood pressure.

Management of ST-segment elevation myocardial infarction (STEMI)

These notes give an overview of the initial and long-term management of myocardial infarction with ST segment elevation (STEMI). For advice on the management of non-ST-segment elevation myocardial infarction (NSTEMI) and unstable angina, see above. The aims of management of STEMI are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and diamorphine hydrochloride or morphine can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolitics promote reperfusion; anticoagulants help to reduce re-occlusion and systemic embolisation; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Local guidelines for the management of myocardial infarction should be followed where they exist.

Initial management

Oxygen should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hypoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of diamorphine hydrochloride or morphine; an antiemetic such as metoclopramide hydrochloride (or, if left ventricular function is not compromised, cyclizine p. 430) by intravenous injection should also be given.

Aspirin (chewed or dispersed in water) is given for its antplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 123 should also be given. Prasugrel p. 214 is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance). Ticagrelor p. 215 is also an alternative to clopidogrel (see NICE guidance). Patients should also receive either heparin (unfractionated) p. 133, a low molecular weight heparin, or fondaparinux sodium p. 127.

Patients without contra-indications should receive beta-blockers which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem hydrochloride p. 157 or verapamil hydrochloride p. 164 can be given.

The glycoprotein IIb/IIIa inhibitors eptifibatide p. 210 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 210 (in combination with heparin (unfractionated), aspirin, and clopidogrel) can be used for unstable angina or for NSTEMI in patients at a high risk of either myocardial infarction or death.
high-risk patients. Patients undergoing percutaneous coronary intervention should also receive either heparin (unfractionated) or a low molecular weight heparin (e.g. enoxaparin sodium p. 132); bivalirudin is an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin (see also NICE guidance). In patients who cannot be offered percutaneous coronary intervention within 90 minutes of diagnosis, a thrombolytic drug should be administrated along with either heparin (unfractionated) (for maximum 2 days), a low molecular weight heparin (e.g. enoxaparin sodium), or fondaparinux sodium. See use of antiplatelet drugs in patients undergoing coronary stenting in Antiplatelet drugs p. 121.

Patients who do not receive reperfusion therapy (with percutaneous coronary intervention or a thrombolytic) should be treated with either fondaparinux sodium, enoxaparin sodium, or heparin (unfractionated). Prescribers should consult product literature and local protocols (where they exist) for details of anticoagulant dose and duration.

**Nitrates** are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 218 is not effective, intravenous glyceryl trinitrate or isosorbide dinitrate p. 220 is given.

Early administration of some **beta-blockers** has been shown to be of benefit and should be given to patients within 24 hours of presentation.

**ACE inhibitors**, and angiotensin-II receptor antagonists if an ACE inhibitor cannot be used, are also of benefit to patients who have no contra-indications; in hypertensive and normotensive patients treatment with an ACE inhibitor, or an angiotensin-II receptor antagonist, can be started within 24 hours of the myocardial infarction and continued for at least 5–6 weeks (see below for long-term treatment). All patients should be closely monitored for hyperglycaemia; those with diabetes or raised blood-glucose concentration should receive insulin p. 712.

**Long-term management**

Long-term management following STEMI involves the use of several drugs which should ideally be started before the patient is discharged from hospital.

Aspirin p. 121 should be given to all patients, unless contra-indicated. The addition of clopidogrel p. 123 has been shown to reduce morbidity and mortality. Prasugrel below or ticagrelor p. 215 are alternatives to clopidogrel in certain patients. For those intolerant of clopidogrel, and who are at low risk of bleeding, the combination of warfarin sodium p. 140 and aspirin should be considered. In those intolerant of both aspirin and clopidogrel, warfarin sodium alone can be used. Warfarin sodium should be continued for those who are already being treated for another indication, such as atrial fibrillation, with the addition of aspirin if there is a low risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. Low-dose rivaroxaban p. 128, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following STEMI—see Prevention of cardiovascular events. For details of antiplatelet drug duration following coronary stenting—see also Antiplatelet drugs and coronary stents in Antiplatelet drugs p. 121.

**Beta-blockers** should be given to all patients in whom they are not contra-indicated. Acebutolol p. 152, metoprolol tartrate p. 154, propranolol hydrochloride p. 150 and timolol maleate p. 151 are suitable; for patients with left ventricular dysfunction, carvedilol p. 148, bisoprolol fumarate p. 153, or long-acting metoprolol tartrate may be appropriate.

Diltiazem hydrochloride p. 157 [unlicensed] or verapamil hydrochloride p. 164 can be considered if a beta-blocker cannot be used; however, they are contra-indicated in those with left ventricular dysfunction. Other calcium-channel blockers have no place in routine long-term management after a myocardial infarction.

An **ACE inhibitor** should be considered for all patients, especially those with evidence of left ventricular dysfunction. If an ACE inhibitor cannot be used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

**Nitrates** are used for patients with angina.

Eplerenone p. 193 is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure.

See also the role of **statins** in preventing recurrent cardiovascular events in Dyslipidaemias p. 196.

**Prevention of cardiovascular events**

Patients with stable angina, unstable angina, or NSTEMI should be given advice and treatments to reduce their cardiovascular risk. The importance of life-style changes, especially stopping smoking, should be emphasised. Aspirin should be given indefinitely. Antihypertensive treatment should be initiated if appropriate, and a **statin** should also be given.

In patients with stable angina, addition of an **ACE inhibitor** should be considered for patients with diabetes (and should be continued if indicated for a co-morbidity).

In patients with unstable angina or NSTEMI, clopidogrel is given, in combination with aspirin, for up to 12 months—most benefit occurs during the first 3 months. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients. An ACE inhibitor should also be given.

Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers.

### ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

#### Prasugrel

- **INDICATIONS AND DOSE**
  - **In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention**
  - **BY MOUTH**
    - Adult 18–74 years (body-weight up to 60 kg): Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months
    - Adult 18–74 years (body-weight 60 kg and above): Initially 60 mg for 1 dose, then 10 mg once daily usually for up to 12 months
    - Adult 75 years and over: Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months

- **Patients undergoing coronary angiography within 48 hours of admission for unstable angina or NSTEMI**
  - **BY MOUTH**
    - Adult: Loading dose 60 mg, not to be administered until the time of percutaneous coronary intervention in order to minimise the risk of bleeding, maintenance dose of 10 mg or 5 mg daily should then be selected as appropriate based on age and weight

- **CONTRA-INDICATIONS** Active bleeding · history of stroke or transient ischaemic attack
- **CAUTIONS** Body-weight less than 60 kg · discontinue at least 7 days before elective surgery if antiplatelet effect not
desirable - elderly - patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or active peptic ulcer disease)

- INTERACTIONS ➔ Appendix 1: prasugrel
- SIDE-EFFECTS
  - Common or very common Anaemia - haemorrhage - skin reactions
  - Uncommon Angioedema
  - Rare or very rare Thrombocytopenia
- ALLERGY AND CROSS-SENSITIVITY
  Caution in patients with history of hypersensitivity reactions to thienopyridines (e.g. clopidogrel).
- PREGNANCY
  Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING
  Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT
  Manufacturer advises caution in moderate impairment (increased risk of bleeding, limited information available); avoid in severe impairment (no information available).
- RENAL IMPAIRMENT
  Use with caution—increased risk of bleeding.
- NATIONAL FUNDING/ACCESS DECISIONS
  NICE decisions
  - Prasugrel with percutaneous coronary intervention for treating acute coronary syndromes (July 2014) NICE TA317
  Prasugrel 10 mg in combination with aspirin, within its marketing authorisation, for preventing atherothrombotic events in adults with acute coronary syndrome (unstable angina (UA), non-ST segment elevation myocardial infarction (NSTEMI) or ST segment elevation myocardial infarction (STEMI)) having primary or delayed percutaneous coronary intervention. www.nice.org.uk/TA317
  Scottish Medicines Consortium (SMC) decisions
  The Scottish Medicines Consortium has advised (August 2009) that prasugrel (Efient®), in combination with aspirin, be accepted for restricted use within NHS Scotland for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention who are eligible to receive the 10 mg dose of prasugrel.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

19-Oct-2018

- DRUG ACTION
  Ticagrelor is a P2Y12 receptor antagonist that prevents ADP-mediated P2Y12 dependent platelet activation and aggregation.

- INDICATIONS AND DOSE
  Prevention of atherothrombotic events in patients with acute coronary syndrome [in combination with aspirin]
  - BY MOUTH
    - Adult: Initially 180 mg for 1 dose, then 90 mg twice daily usually for up to 12 months

**Prevention of atherothrombotic events in patients with a history of myocardial infarction and a high risk of an atherothrombotic event [in combination with aspirin]**

- BY MOUTH
  - Adult: 60 mg twice daily, extended treatment may be started without interruption after the initial 12-month therapy for acute coronary syndrome. Treatment may also be initiated up to 2 years from the myocardial infarction, or within 1 year after stopping previous ADP receptor inhibitor treatment. There are limited data on the efficacy and safety of extended treatment beyond 3 years

- CONTRA-INDICATIONS
  Active bleeding - history of intracranial haemorrhage

- CAUTIONS
  Asthma - bradycardia (unless pacemaker fitted) - chronic obstructive pulmonary disease - discontinu
 along the [cerebral artery] — extensive information available. — moderate impairment (limited information available); avoid in severe impairment (no information available).

- PREGNANCY
  Manufacturer advises avoid—toxicity in animal studies.

- BREAST FEEDING
  Manufacturer advises avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT
  Manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).

- MONITORING REQUIREMENTS
  Manufacturer advises monitor renal function 1 month after initiation in patients with acute coronary syndrome.

- NATIONAL FUNDING/ACCESS DECISIONS
  NICE decisions
  - Ticagrelor for the treatment of acute coronary syndromes (October 2011) NICE TA236
  Ticagrelor, in combination with low-dose aspirin, is recommended for up to 12 months as a treatment option in adults with acute coronary syndromes, that is, people:
    - with ST-segment elevation myocardial infarction—defined as ST elevation or new left bundle branch block on electrocardiogram—that cardiologists intend to treat with primary percutaneous coronary intervention, or
    - with non-ST-segment elevation myocardial infarction (NSTEMI), or
  - admitted to hospital with unstable angina—defined as ST or T wave changes on electrocardiogram suggestive of ischaemia plus one of the characteristics defined below. Before ticagrelor is continued beyond the initial treatment, the diagnosis of unstable angina should first be confirmed, ideally by a cardiologist. Characteristics to be used in defining treatment with ticagrelor for unstable angina are:
    - age 60 years or older;
    - previous myocardial infarction or previous coronary artery bypass grafting;
    - coronary artery disease with stenosis of 50% or more in at least two vessels;
    - previous ischaemic stroke;
    - previous transient ischaemic attack, carotid stenosis of at least 50%, or cerebral revascularisation;
Cardiovascular system

Thrombolytic drugs can possibly lead to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation) - elderly - external chest compression - hypertension - risk of bleeding (including that from venepuncture or invasive procedures).

**SIDE-EFFECTS**

- **Common or very common** Anaphylactic reaction - angina pectoris - cardiac arrest - cardiogenic shock - chills - CNS haemorrhage - echocardiography - fever - haemorrhage - haemorrhagic stroke - heart failure - hypotension - ischaemia recurrent (when used in myocardial infarction) - nausea - pericarditis - pulmonary oedema - vomiting
- **Uncommon** Aphasis - mitral valve incompetence - myocardial rupture - pericardial disorders - reperfusion arrhythmia (when used in myocardial infarction) - seizure

Fibrinolytic drugs

**Overview**

The value of thrombolytic drugs for the treatment of myocardial infarction has been established. Streptokinase p. 217 and alteplase below have been shown to reduce mortality. Retepase and tenecteplase p. 217 are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients. Alteplase should be given within 6–12 hours of symptom onset, reteplase and streptokinase within 12 hours of symptom onset, but ideally all should be given within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase and urokinase p. 138 can be used for other thromboembolic disorders such as deep–vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke.

Urokinase is also licensed to restore the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.

Fibrinolytics

**DRUG ACTION** Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.

**CONTRA-INDICATIONS** Active pulmonary disease with cavitiation - acute pancreatitis - aneurysm - aortic dissection - bacterial endocarditis - bleeding diatheses - coagulation defects - coma - heavy vaginal bleeding - history of cerebrovascular disease (especially recent events or with any residual disability) - oesophageal varices - pericarditis - recent haemorrhage - recent surgery (including dental extraction) - recent symptoms of possible peptic ulceration - recent trauma - severe hypertension

**CAUTIONS** Conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation) - elderly - external chest compression - hypertension - risk of bleeding (including that from venepuncture or invasive procedures)

**ANTITHROMBOTIC DRUGS**

- Brilique
- Ticagrelor

**SIDE-EFFECTS**

- **Common or very common** Anaphylactic reaction - angina pectoris - cardiac arrest - cardiogenic shock - chills - CNS haemorrhage - echocardiography - fever - haemorrhage - haemorrhagic stroke - heart failure - hypotension - ischaemia recurrent (when used in myocardial infarction) - nausea - pericarditis - pulmonary oedema - vomiting
- **Uncommon** Aphasis - mitral valve incompetence - myocardial rupture - pericardial disorders - reperfusion arrhythmia (when used in myocardial infarction) - seizure

**INDICATIONS AND DOSE**

**Acute myocardial infarction, accelerated regimen**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult (body-weight up to 65 kg): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 0.75 mg/kg, to be given over 30 minutes, then (by intravenous infusion) 0.5 mg/kg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes
  - Adult (body-weight 65 kg and above): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 30 minutes, then (by intravenous infusion) 35 mg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes

**Acute myocardial infarction**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 10 mg, to be initiated within 6–12 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 60 minutes, then (by intravenous infusion) 10 mg for 4 infusions, each 10 mg infusion dose to be given over 30 minutes, total dose of 100 mg over 3 hours; maximum 1.5 mg/kg in patients less than 65 kg

**Pulmonary embolism**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 10 mg, to be given over 1–2 minutes, followed by (by intravenous infusion) 90 mg, to be given over 2 hours, maximum 1.5 mg/kg in patients less than 65 kg
Acute ischaemic stroke (under specialist neurology physician only)

- **BY INTRAVENOUS INFUSION**
- **Adult 18-79 years**: Initially 900 micrograms/kg (max. per dose 90 mg), treatment must begin within 4.5 hours of symptom onset, to be given over 60 minutes, the initial 10% of dose is to be administered by intravenous injection and the remainder by intravenous infusion

ACTILYSE CATHFLU®
Thrombolytic treatment of occluded central venous access devices (including those used for haemodialysis)
- **BY INTRAVENOUS INJECTION**
- **Adults**: (consult product literature)

### CONTRA-INDICATIONS
- When used for acute ischaemic stroke: Convulsion accompanying stroke, history of stroke in patients with diabetes, hyperglycaemia, hypoglycaemia, severe stroke, stroke in last 3 months

### INTERACTIONS
- Appendix 1: alteplase

### SIDE-EFFECTS
- Uncommon: Haemothorax
- Rare or very rare: Agitation, confusion, delirium, depression, epilepsy, psychosis, speech disorder
- Frequency not known: Brain oedema (caused by reperfusion)

### ALLERGY AND CROSS-SENSITIVITY
Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).

### MONITORING REQUIREMENTS
- When used for acute ischaemic stroke: Monitor for intracranial haemorrhage, and monitor blood pressure (antihypertensive recommended if systolic above 180 mmHg or diastolic above 105 mmHg).

### DIRECTIONS FOR ADMINISTRATION
- For intravenous infusion (Actilyse®), give intermittently or continuously in Sodium Chloride 0.9%; dissolve in water for injections to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution.

### NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions
- **Alteplase for treating acute ischaemic stroke (September 2012) NICE TA264**
  - Alteplase (Actilyse®) is recommended for the treatment of acute ischaemic stroke in adults in accordance with its licensed indication if:
    - treatment is started as early as possible within 4.5 hours of onset of stroke symptoms, and
    - intracranial haemorrhage has been excluded by appropriate imaging techniques.
  - www.nice.org.uk/guidance/ta264

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Powder and solvent for solution for injection**
- Actilyse (Boehringer Ingelheim Ltd)
  - Alteplase 10 mg Actilyse 10mg powder and solvent for solution for injection vials | 1 vial [PDP] £172.80
  - Alteplase 20 mg Actilyse 20mg powder and solvent for solution for injection vials | 1 vial [PDP] £259.20

**Powder and solvent for solution for infusion**
- Actilyse (Boehringer Ingelheim Ltd)
  - Alteplase 50 mg Actilyse 50mg powder and solvent for solution for infusion vials | 1 vial [PDP] £432.00

---

Streptokinase

- **INDICATIONS AND DOSE**
  - Acute myocardial infarction
    - **BY INTRAVENOUS INFUSION**
      - Adult: 1 500 000 units, to be initiated within 12 hours of symptom onset, dose to be given over 60 minutes
  - Acute arterial thromboembolism: Central retinal venous or arterial thrombosis
    - **BY INTRAVENOUS INFUSION**
      - Adult: 250 000 units, dose to be given over 30 minutes, then 100 000 units every 1 hour for up to 12–72 hours, duration is adjusted according to condition with monitoring of clotting parameters (consult product literature)

- **INTERACTIONS**
  - Appendix 1: streptokinase

- **SIDE-EFFECTS**
  - Common or very common: Arrhythmias, asthenia, diarrhoea, epigastric pain, headache, malaise, pain
  - Uncommon: Respiratory arrest, splenic rupture
  - Rare or very rare: Arthritis, eye inflammation, hypersensitivity, nephritis, nerve disorders, neurological effects, pulmonary oedema non-cardiogenic (caused by reperfusion), shock, vasculitis

### ALLERGY AND CROSS-SENSITIVITY
Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.

### DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Streptase®), give continuously or intermittently; reconstitute with sodium chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution.

#### MEDICINAL FORMS
No licensed medicines listed.

Tenecteplase

- **INDICATIONS AND DOSE**
  - Acute myocardial infarction
    - **BY INTRAVENOUS INJECTION**
      - Adult: 30–50 mg (max. per dose 50 mg), dose to be given over 10 seconds and initiated within 6 hours of symptom onset, dose varies according to body weight—consult product literature

- **INTERACTIONS**
  - Appendix 1: tenecteplase

- **SIDE-EFFECTS**
  - Uncommon: Drowsiness, hemiparesis, venous thrombosis

- **BREAST FEEDING**
  - Manufacturer advises avoid breast-feeding for 24 hours after dose (express and discard milk during this time).

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- Metalysse (Boehringer Ingelheim Ltd)
  - Tenecteplase 10000 unit Metalysse 10,000 unit powder and solvent for solution for injection vials | 1 vial [PDP] £602.70
NITRATES

Nitrates

Overview
Nitrates have a useful role in angina. Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially when angina is severe or when patients are unusually sensitive to the effects of nitrates.

Sublingual glyceryl trinitrate below is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The aerosol spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by transdermal preparations (but tolerance may develop).

Isosorbide dinitrate p. 220 is active sublingually and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for modified-release preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate p. 220. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available.

Glyceryl trinitrate or isosorbide dinitrate may be tried by intravenous injection when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

Nitrates

- **CONTRA-INDICATIONS** Aortic stenosis · cardiac tamponade · constrictive pericarditis · hypertrophic cardiomyopathy · hypotensive conditions · hypovolaemia · marked anemia · mitral stenosis · raised intracranial pressure due to cerebral haemorrhage · raised intracranial pressure due to head trauma · toxic pulmonary oedema

- **CAUTIONS** Heart failure due to obstruction · hypothermia · hypothyroidism · hypoxaemia · malnutrition · metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy · recent history of myocardial infarction · susceptibility to angle-closure glaucoma · tolerance · ventilation and perfusion abnormalities

**CAUTIONS, FURTHER INFORMATION**

- **Tolerance** Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 12 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for 8 to 12 hours (usually overnight) in each 24 hours; in the case of modified-release tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

**SIDE-EFFECTS**

- **Common or very common** Arrhythmias · asthenia · cerebral ischaemia · dizziness · drowsiness · flushing · headache · hypotension · nausea · vomiting

- **Uncommon** Circulatory collapse · diarrhoea · skin reactions · syncope

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in nitrate hypersensitivity.

- **BREAST FEEDING** No information available—manufacturers advise use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in severe impairment.

- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS** Monitor blood pressure and heart rate during intravenous infusion.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

Glyceryl trinitrate

**INDICATIONS AND DOSE**

**Prophylaxis of angina**

- **BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS**
  - Adult: 1 tablet, to be administered prior to activity likely to cause angina

**Treatment of angina**

- **BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS**
  - Adult: 1 tablet, dose may be repeated at 5 minute intervals if required; if symptoms have not resolved after 3 doses, medical attention should be sought

**Prophylaxis of angina**

- **BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY**
  - Adult: 400–800 micrograms, to be administered under the tongue and then close mouth prior to activity likely to cause angina

**Treatment of angina**

- **BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY**
  - Adult: 400–800 micrograms, to be administered under the tongue and then close mouth, dose may be repeated at 5 minute intervals if required; if symptoms have not resolved after 3 doses, medical attention should be sought

**Control of hypertension and myocardial ischaemia during and after cardiac surgery**

- **Induction of controlled hypotension during surgery**
  - **Congestive heart failure**
  - **Unstable angina**

- **BY INTRAVENOUS INFUSION**
  - Adult: 10–200 micrograms/minute (max. per dose 400 micrograms/minute), adjusted according to response, consult product literature for recommended starting doses specific to indication

**Anal fissure**

- **BY RECTUM USING OINTMENT**
  - Adult: Apply 2.5 centimetres every 12 hours until pain stops. Max. duration of use 6 weeks, apply to anal canal, 2.5 cm of ointment contains 1.5 mg of glyceryl trinitrate

**DEPONIT ®**

**Prophylaxis of angina**

- **BY TRANSDERMAL APPLICATION**
  - Adult: One ‘5’ or one ‘10’ patch to be applied to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two ‘10’ patches every 24 hours if necessary, to be replaced every 24 hours, siting replacement patch on different area
MINITRAN ®

**Prophylaxis of angina**
- **By transdermal application**
  - Adult: One ‘5’ patch to be applied to chest or upper arm; replace every 24 hours, sitting replacement patch on different area, dose to be adjusted according to response.

**Maintenance of venous patency (‘5’ patch only)**
- **By transdermal application**
  - Adult: (consult product literature)

**NITRO-DUR ®**

**Prophylaxis of angina**
- **By transdermal application**
  - Adult: One ‘0.2mg/h’ patch to be applied to chest or outer upper arm and replaced every 24 hours, sitting replacement patch on different area, dose adjusted according to response; maximum 15 mg per day

**PERCUTOL ®**

**Prophylaxis of angina**
- **To the skin**
  - Adult: Usual dose 1–2 inches every 3–4 hours as required, to be measured on to Applipule ® and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

**Prophylaxis of angina (to determine dose)**
- **To the skin**
  - Adult: ½ inch to be administered on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch, to be measured on to Applipule ® and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

**TRANSIDERM-NITRO ®**

**Prophylaxis of angina**
- **By transdermal application**
  - Adult: One ‘5’ or one ‘10’ patch to be applied to lateral chest wall and replaced every 24 hours, sitting replacement patch on different area, max. two ‘10’ patches daily

**Prophylaxis of phlebitis and extravasation (‘5’ patch only)**
- **By transdermal application**
  - Adult: (consult product literature)

**SIDE-EFFECTS**
- Interactions → Appendix 1: nitrates
- **Uncommon**
  - With parenteral use Cardiac disorder · cyanosis
  - With rectal use Anorectal disorder · anorectal haemorrhage · gastrointestinal discomfort
  - With sublingual use Cyanosis
  - Rare or very rare
  - With parenteral use Methaemoglobinemia · respiratory disorder · restlessness
  - With sublingual use Methaemoglobinemia · respiratory disorder · restlessness
  - With topical use Dyspepsia
  - Frequency not known
  - With parenteral use Hyperhidrosis
  - With rectal use Vertigo
  - With sublingual use Tongue blistering
  - With transdermal use Palpitations

**PREGNANCY** Not known to be harmful.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion (Nitrocine ®, Nitrenal ®), give continuously in Glucose 5% or Sodium Chloride 0.9%. For Nitrocine ®, suggested infusion concentration 100 micrograms/ml, incompatible with polyvinyl chloride infusion containers such as Vialflex ® or Steriflex ®; use glass or polyethylene containers or give via a syringe pump.
- With intravenous use Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. Glycerol trinitrate 1 mg/ml to be diluted before use or given undiluted with syringe pump. Glycerol trinitrate 5 mg/ml to be diluted before use.

**PRESCRIBING AND DISPENSING INFORMATION**
- With sublingual use Glycerol trinitrate tablets are available in strengths of 300-· 500- and 600-micrograms—manufacturer advises tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use.

**PATIENT AND CARER ADVICE** Rectal ointment should be discarded 8 weeks after first opening.

**PERCUTOL ®** Patients or carers should be given advice on how to administer glyceryl trinitrate ointment.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (January 2008) that glyceryl trinitrate 0.4% ointment (Rectigosic ®) is not recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Solution for infusion**

**EXCIPIENTS:** May contain Ethanol, propylene glycol
- Glycerol trinitrate (Non-proprietary) 0
  - Glycerol trinitrate 1 mg per 1 ml Glycerol trinitrate 50mg/50ml solution for infusion vials | 1 vial (Pipet) £15.90
  - Glycerol trinitrate 5 mg per 1 ml Glycerol trinitrate 50mg/10ml solution for infusion ampoules | 5 ampoule (Pipet) £64.90 (Hospital only)
  - Glycerol trinitrate 25mg/5ml solution for infusion ampoules | 5 ampoule (Pipet) £32.45 (Hospital only)
  - Nitrocine (Aspire Pharma Ltd) Glycerol trinitrate 1 mg per 1 ml Nitrocine 10mg/10ml solution for infusion ampoules | 10 ampoule (Pipet) £58.75 (Hospital only)
  - Nitronal (intrapharm Laboratories Ltd) Glycerol trinitrate 1 mg per 1 ml Nitronal 5mg/5ml solution for infusion ampoules | 10 ampoule (Pipet) £18.04
  - Nitronal 50mg/50ml solution for infusion vials | 1 vial (Pipet) £14.76

**Sublingual tablet**

**EXCIPIENTS:** May contain Propyleneglycol, woolfat and related substances (including lanolin)

**Transdermal patch**

**EXCIPIENTS:** May contain Propylene glycol, woolfat and related substances (including lanolin)
**Isosorbide dinitrate**

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of angina**

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Adult: 30–120 mg daily in divided doses
  - BY INTRAVENOUS INFUSION
    - Adult: 2–10 mg/hour, increased if necessary up to 20 mg/hour
  - BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY
    - Adult: 1–3 sprays, to be administered under tongue whilst holding breath, allow a 30 second interval between each dose

**Left ventricular failure**

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Adult: 40–160 mg daily in divided doses, increased if necessary up to 240 mg daily in divided doses
- BY INTRAVENOUS INFUSION
  - Adult: Initially 2–10 mg/hour, increased if necessary up to 20 mg/hour

**Prophylaxis of angina**

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Adult: 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses

**INTERACTIONS**

- Appendix 1: nitrates

**SIDE-EFFECTS**

- Common or very common
  - With oral use: Peripheral oedema
  - Rare or very rare
  - With oral use: Angioedema, angle closure glaucoma, hypoventilation, hypoxia, pituitary haemorrhage, Stevens-Johnson syndrome

**PREGNANCY**

- May cross placenta—manufacturers advise avoidance unless potential benefit outweighs risk.

**DIRECTIONS FOR ADMINISTRATION**

- For intravenous infusion (Isoket 0.05%, Isoket 0.1%), give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give via a syringe pump; Isoket 0.05% can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe. Glass or polyethylene infusion apparatus is preferable; loss of potency if PVC used.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**

- CAUTIONARY AND ADVISORY LABELS 25
  - Isoket Retard (Aspire Pharma Ltd)
    - Isosorbide dinitrate 20 mg: Isoket Retard 20 tablets | 56 tablet
    - £2.58 DT = £2.58
  - Isosorbide dinitrate 40 mg: Isoket Retard 40 tablets | 56 tablet
    - £6.36 DT = £6.36

**Tablet**

- Isosorbide dinitrate (Non-proprietary)
  - Isosorbide dinitrate 10 mg: Isosorbide dinitrate 10mg tablets | 56 tablet
    - £3.79 DT = £3.79
  - Isosorbide dinitrate 20 mg: Isosorbide dinitrate 20mg tablets | 56 tablet
    - £7.09 DT = £7.09

**Solution for injection**

- Isosorbide dinitrate (Non-proprietary)
  - Isosorbide dinitrate 1 mg per 1 ml: Isosorbide dinitrate 10mg/10ml concentrate for solution for injection ampoules | 10 ampoule
    - £27.00
  - Isoket (Aspire Pharma Ltd)
    - Isosorbide dinitrate 1 mg per 1 ml: Isoket 0.1% solution for injection 1ml ampoules | 10 ampoule
    - £26.93 (Hospital only)

**Solution for infusion**

- Isosorbide dinitrate (Non-proprietary)
  - Isosorbide dinitrate 500 microgram per 1 ml: Isosorbide dinitrate 25mg/50ml solution for infusion vials | 10 vial
    - £61.20
  - Isosorbide dinitrate 1 mg per 1 ml: Isosorbide dinitrate 50mg/50ml concentrate for solution for infusion vials | 10 vial
    - £79.10

**Isosorbide mononitrate**

**INDICATIONS AND DOSE**

**Prophylaxis of angina | Adjunct in congestive heart failure**

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Adult: Initially 40 mg twice daily, then increased if necessary up to 120 mg daily in divided doses

**Prophylaxis of angina (for patients who have not previously had a nitrate) | Adjunct in congestive heart failure (for patients who have not previously had a nitrate)**

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Adult: Initially 10 mg twice daily, increased if necessary up to 120 mg daily in divided doses

**CHEMODYR ® 60XL**

**Prophylaxis of angina**

- BY MOUTH
  - Adult: Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, dose to be taken in the morning

**ELANTAN ® LA**

**Prophylaxis of angina**

- BY MOUTH
  - Adult: 25–50 mg once daily, then increased if necessary to 50–100 mg once daily, dose to be taken in the morning, the lowest effective dose should be used

**IMDR ®**

**Prophylaxis of angina**

- BY MOUTH
  - Adult: Initially 0.5 tablet once daily, to minimise the occurrence of headache, then 1 tablet once daily, then increased if necessary to 2 tablets once daily, dose to be taken in the morning
**ISIB® 60XL**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet daily for 2–4 days, to minimise the occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, dose to be taken in the morning

**ISMO RETARD®**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** 1 tablet once daily, dose to be taken in the morning

**ISODUR®**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** 25–50 mg once daily, then increased if necessary to 50–100 mg once daily, dose to be taken in the morning

**ISOTARD®**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet daily for 2–4 days, to minimise the occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, dose to be taken in the morning

**MODISAL® XL**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet daily for 2–4 days, to minimise the occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, to be taken in the morning

**MONOMAX® XL**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet daily for 2–4 days, to minimise occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, dose to be taken in the morning

**MONOMIL® XL**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet daily for 2–4 days, to minimise occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, to be taken in the morning

**MONOSORB® XL 60**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets once daily, to be taken in the morning

**ZEMON®**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 30 mg once daily for 2–4 days, to minimise the occurrence of headache, then 40–60 mg once daily, increased if necessary to 80–120 mg once daily, dose to be taken in the morning

**INTERACTIONS** → Appendix 1: nitrates

**SIDE-EFFECTS**

- Rare or very rare: Myalgia

**PREGNANCY** Manufacturers advise avoid unless potential benefit outweighs risk.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Modified-release tablet

www.getintopharma.com
Dobutamine

**DRUG ACTION** Dobutamine is a cardiac stimulant which acts on beta receptors in cardiac muscle, and increases contractility.

**INDICATIONS AND DOSE**

**Inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, cardiogenic shock, and during positive end expiratory pressure ventilation**

- **Adult:** Usual dose 2.5–10 micrograms/kg/minute, adjusted according to response, alternatively 0.5–40 micrograms/kg/minute

**Cardiac stress testing**

- **Adult:** (consult product literature)

**CONTRA-INDICATIONS** Phaeochromocytoma

**CAUTIONS** Acute heart failure, acute myocardial infarction - arrhythmias - correct hypercapnia before starting and during treatment - correct hypovolaemia before starting and during treatment - correct hypoxia before starting and during treatment - correct metabolic acidosis before starting and during treatment - diabetes mellitus - elderly - extravasation may cause tissue necrosis - extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) - hyperthyroidism - ischaemic heart disease - oclusive vascular disease - severe hypotension - susceptibility to angle-closure glaucoma - tachycardia - tolerance may develop with continuous infusions longer than 72 hours

**INTERACTIONS** → Appendix 1: sympathomimetics, inotropic

**SIDE-EFFECTS**

- **Common or very common** Arrhythmias - bronchospasm - chest pain - dyspnoea - eosinophilia - fever - headache - inflammation localised - ischaemic heart disease - nausea - palpitations - platelet aggregation inhibition (on prolonged administration) - skin reactions - urinary urgency - vasoconstriction

- **Uncommon** Myocardial infarction

- **Rare or very rare** Atrioventricular block - cardiac arrest - coronary vasospasm - hypotension exacerbated - hypokalaemia - hypotension exacerbated

- **Frequency not known** Anxiety - cardiomyopathy - feeling hot - myoclonus - paraesthesia - tremor

**PREGNANCY** No evidence of harm in animal studies — manufacturers advise use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturers advise avoid — no information available.

**MONITORING REQUIREMENTS** Monitor serum-potassium concentration.

**DIRECTIONS FOR ADMINISTRATION** Dobutamine injection should be diluted before use or given undiluted with syringe pump. Dobutamine concentrate for intravenous infusion should be diluted before use.

For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 0.5–1 mg/mL and give via an infusion pump; give higher concentration (max. 5 mg/mL) through central venous catheter; incompatible with bicarbonate and other strong alkaline solutions.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for infusion**

- **EXCIPIENTS:** May contain Sulfites

  - Dobutamine (Non-proprietary)
  - Dobutamine (as Dobutamine hydrochloride) 5 mg per 1 ml Dobutamine 250mg/50ml solution for infusion vials | 1 vial (£50) £7.50
  - Dobutamine (as Dobutamine hydrochloride) 12.5 mg per 1 ml Dobutamine 250mg/20ml concentrate for solution for infusion ampoules | 5 ampoule (£50) £12.00-£29.25 | 10 ampoule (£50) £52.50

### 8.1 Cardiac arrest

**Cardiopulmonary resuscitation**

**Overview**

The algorithm for cardiopulmonary resuscitation (Life support algorithm (image) p. 1671) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at [www.resus.org.uk](http://www.resus.org.uk).

Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and pulseless electrical activity (electromechanical dissociation). Adrenaline/epinephrine 1 in 1000 (100 micrograms/mL) below is recommended by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL. Sodium Chloride 0.9% injection to aid entry into the central circulation. Intravenous injection of amiodarone hydrochloride p. 105 should be considered after adrenaline/epinephrine to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone hydrochloride can be given if necessary, followed by an intravenous infusion of amiodarone hydrochloride.

Lidocaine hydrochloride p. 103, is an alternative if amiodarone hydrochloride is not available. Atropine sulfate p. 1166 is no longer recommended in the treatment of asystole or pulseless electrical activity.

During cardiopulmonary arrest if intravenous access cannot be obtained, the intraosseous route can be used instead. Drug administration via the endotracheal route is no longer recommended.

For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 277.

**SYMPATHOMIMETICS**

**Vasocostrictor**

**Adrenaline/epinephrine**

**DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta₂ effects); it can cause peripheral vasodilation (a beta₁ effect) or vasoconstriction (an alpha effect).

**INDICATIONS AND DOSE**

**Cardiopulmonary resuscitation**

- **BY INTRAVENOUS INJECTION**
  - **Adult:** 1 mg every 3–5 minutes as required, a 1 in 10 000 (100 micrograms/mL) solution is recommended
Acute hypotension
► BY CONTINUOUS INTRAVENOUS INFUSION
  ► Neonate: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.
  ► Child: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.

Emergency treatment of acute anaphylaxis (under expert supervision) Angioedema (if laryngeal oedema is present) (under expert supervision)
► BY INTRAMUSCULAR INJECTION
  ► Child 1 month–5 years: 150 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, to be injected preferriably into the anterolateral aspect of the middle third of the thigh
  ► Child 6–11 years: 300 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, to be injected preferriably into the anterolateral aspect of the middle third of the thigh
  ► Child 12–17 years: 500 micrograms, to be injected preferriably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, 300 micrograms (0.3 mL) to be administered if child small or prepubertal
  ► Adult: 500 micrograms, to be injected preferriably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, 300 micrograms/kg, to be administered if child large or adult

Acute anaphylaxis when there is doubt as to the adequacy of the circulation (specialist use only) Angioedema (if laryngeal oedema is present) (specialist use only)
► BY SLOW INTRAVENOUS INFUSION
  ► Adult: 50 micrograms, using 0.5 mL of the dilute 1 in 10 000 adrenaline injection, dose to be repeated according to response, if multiple doses required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained

Control of bradycardia in patients with arrhythmias after myocardial infarction, if there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine
► BY INTRAVENOUS INFUSION
  ► Adult: 2–10 micrograms/minute, adjusted according to response

EMERADE® 150 MICROGRAMS
Acute anaphylaxis (for self-administration)
► BY INTRAMUSCULAR INJECTION
  ► Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  ► Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

EMERADE® 300 MICROGRAMS
Acute anaphylaxis (for self-administration)
► BY INTRAMUSCULAR INJECTION
  ► Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
  ► Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

EMERADE® 500 MICROGRAMS
Acute anaphylaxis (for self-administration for patients at risk of severe anaphylaxis)
► BY INTRAMUSCULAR INJECTION
  ► Child 12–17 years: 500 micrograms, then 500 micrograms after 5–15 minutes as required
  ► Adult: 500 micrograms, then 500 micrograms after 5–15 minutes as required

EPIPEN® AUTO-INJECTOR 0.3MG
Acute anaphylaxis (for self-administration)
► BY INTRAMUSCULAR INJECTION
  ► Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
  ► Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

EPIPEN® JR AUTO-INJECTOR 0.15MG
Acute anaphylaxis (for self-administration)
► BY INTRAMUSCULAR INJECTION
  ► Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  ► Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

JEXT® 150 MICROGRAMS
Acute anaphylaxis (for self-administration)
► BY INTRAMUSCULAR INJECTION
  ► Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  ► Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

JEXT® 300 MICROGRAMS
Acute anaphylaxis (for self-administration)
► BY INTRAMUSCULAR INJECTION
  ► Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
  ► Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

атель
> With intramuscular use for acute anaphylaxis in children Auto-injectors delivering 150-microgram dose of adrenaline may not be licensed for use in children with body-weight under 15 kg.
> With intravenous use for acute hypotension in children Adrenaline 1 in 1000 (1 mg/mL) solution is not licensed for intravenous administration.

IMPORTANT SAFETY INFORMATION
SAFE PRACTICE
Intravenous route should be used with extreme care by specialists only.

MHRA/CHM ADVICE: ADRENALINE AUTO-INJECTORS: UPDATED ADVICE AFTER EUROPEAN REVIEW (AUGUST 2017)
Following a European review of all adrenaline auto-injectors approved in the EU, the MHRA recommend that 2 adrenaline auto-injectors are prescribed, which patients should carry at all times. This is particularly important for patients with allergic asthma, who are at increased risk of a severe anaphylactic reaction. Patients with allergies and their carers should be trained to use the particular auto-injector they have been prescribed and encouraged to practise using a trainer device. Patients are advised to check the expiry date of the adrenaline auto-injectors and obtain replacements before they expire.
Cardiovascular system

DIRECTIONS FOR ADMINISTRATION

1. With intramuscular use in adults
   - Administer through a central line if possible.
   - The recommended dose is 1 mg/kg body weight or a maximum dose of 1 mg/kg body weight if the individual is over 60 kg or 0.5 mg/kg body weight if the individual is under 60 kg.
   - Do not exceed a maximum dose of 1 mg/kg body weight.

2. With intravenous use in adults
   - Administer through a central line if possible.
   - The recommended dose is 1 mg/kg body weight or a maximum dose of 1 mg/kg body weight if the individual is over 60 kg or 0.5 mg/kg body weight if the individual is under 60 kg.
   - Do not exceed a maximum dose of 1 mg/kg body weight.

MONITORING REQUIREMENTS

1. Monitor blood pressure and ECG continuously.
2. Monitor the patient for signs of shock or hypotension.
3. Monitor the patient for signs of cardiac arrest or respiratory arrest.
4. Monitor the patient for signs of arrhythmias.
5. Monitor the patient for signs of peripheral ischaemia.

INTERACTIONS

1. Adrenaline is a potent vasoconstrictor and can cause hypertension, tachycardia, and myocardial ischaemia.
2. Adrenaline can cause vasoconstriction in the peripheral circulation, leading to peripheral ischaemia.
3. Adrenaline can cause vasoconstriction in the cerebral circulation, leading to cerebral ischaemia.
4. Adrenaline can cause vasoconstriction in the coronary circulation, leading to myocardial ischaemia.

CAUTIONS

1. Arteriosclerosis (in adults) - arrhythmias, cerebrovascular disease, cor pulmonale, diabetes mellitus, elderly, hypercalcaemia, hyperreflexia, hypertension, hyperthyroidism, hypokalaemia, ischaemic heart disease, obstructive cardiomyopathy, oclusive vascular disease, organic brain damage, phaeochromocytoma, prostate disorders, psychoneurosis, severe angina, susceptibility to angle-closure glaucoma.

CAUTIONS, FURTHER INFORMATION

1. Cautions listed are only for non-life-threatening situations.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

1. Rare or very rare Cardiomyopathy
2. Frequency not known Angina pectoris, angle closure glaucoma, anxiety, appetite decreased, arrhythmias, asthenia, CNS haemorrhage, confusion, dizziness, dry mouth, dyspnoea, headache, hepatic necrosis, hyperglycaemia, hyperhidrosis, hypersalivation, hypertension (increased risk of cerebral haemorrhage), hypokalaemia, injection site necrosis, insomnia, intestinal necrosis, metabolic acidosis, mydriasis, myocardial infarction, nausea, pallor, palpitations, peripheral coldness, psychosis, pulmonary oedema (on excessive dosage or extreme sensitivity), renal necrosis, soft tissue necrosis, tremor, urinary disorders, vomiting.

SPECIFIC SIDE-EFFECTS

1. With intramuscular use
   - Muscle necrosis, necrotising fasciitis, peripheral ischaemia.
2. With intravenous use
   - Hemiplegia, muscle rigidity.

PREGNANCY

1. With intramuscular use or intravenous use
   - May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.

BREAST FEEDING

1. Present in milk but unlikely to be harmful as poor oral bioavailability.

RENAL IMPAIRMENT

1. Manufacturers advise use with caution in severe impairment.

MONITORING REQUIREMENTS

1. Monitor blood pressure and ECG.

DIRECTIONS FOR ADMINISTRATION

1. Acute hypotension
   - With intravenous use in adults
     - Adju administration through a central line if possible.
     - The recommended dose is 1 mg/kg body weight or a maximum dose of 1 mg/kg body weight if the individual is over 60 kg or 0.5 mg/kg body weight if the individual is under 60 kg.
     - Do not exceed a maximum dose of 1 mg/kg body weight.

2. With intravenous use in adults
   - Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL.
   - Sodium Chloride 0.9% injection to aid entry into the central circulation.

PRESCRIBING AND DISPENSING INFORMATION

1. With intramuscular use
   - It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access. Great vigilance is needed to ensure that the correct strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10 000 strength and the 1 in 1000 strength. Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection. Packs for self-administration need to be clearly labelled with instructions on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and their carers understand that:
     - two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first;
     - an ambulance should be called after every administration, even if symptoms improve;
     - the individual should lie down with their legs raised (unless they have breathing difficulties, in which case they should sit up) and should not be left alone.
   - Adrenaline for administration by intramuscular injection is available in ‘auto-injectors’ (e.g. Emerade®, EpiPen®, or Jext®), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.
   - To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed.

PATIENT AND CARER ADVICE

1. With intramuscular use
   - Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be instructed in advance when and how to inject it.
   - With intramuscular use
     - The MHRA has produced an advice sheet on the use of adrenaline auto-injectors, which should be provided to patients and their carers.

JEXT® 300 MICROGRAMS

1. 1.1 mL of the solution remains in the auto-injector device after use.

JEXT® 150 MICROGRAMS

1. 0.5 mL of the solution remains in the auto-injector device after use.

EMERADE® 150 MICROGRAMS

1. 0.35 mL of the solution remains in the auto-injector device after use.

EPIPEN® JR AUTO-INJECTOR 0.15MG

1. 1.7 mL of the solution remains in the auto-injector device after use.

EMERADE® 500 MICROGRAMS

1. No solution remains in the auto-injector device after use.

EMERADE® 300 MICROGRAMS

1. 0.2 mL of the solution remains in the auto-injector device after use.

EXCEPTIONS TO LEGAL CATEGORY

1. With intramuscular use
   - POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.

MEDICINAL FORMS

1. There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

Solution for injection

EXCIPIENTS: May contain Sulphites

Adrenaline/epinephrine (Non-proprietary)

1. Adrenaline 100 microgram per 1 ml
2. Adrenaline (base) 100 micrograms/ml (1 in 10,000) dilute solution for injection

ampoules | 10 ampoule | £67.34
Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection pre-filled syringes | 1 pre-filled disposable injection (PN) £6.87 | 1 pre-filled disposable injection (PN) £18.00 (Hospital only) | 10 pre-filled disposable injection (PN) £180.00 (Hospital only)
Adrenaline (as Adrenaline acid tartrate) 100 microgram per 1 ml Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection ampoules | 10 ampoule (PN) £8.48
Adrenaline (base) 500micrograms/5ml (1 in 10,000) dilute solution for injection ampoules | 10 ampoule (PN) £81.33
Adrenaline 1 mg per 1 ml Adrenaline (base) 10mg/10ml (1 in 1,000) solution for injection ampoules | 10 ampoule (PN) £96.38
Adrenaline (base) for anaesthesia 1mg/1ml (1 in 1,000) solution for injection pre-filled syringes | 1 pre-filled disposable injection (PN) £11.88 DT + £11.71

Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 ml Jext 150micrograms/0.15ml (1 in 1,000) solution for injection auto-injectors | 1 pre-filled disposable injection (PN) £23.99 DT + £23.99

9 Oedema

Diuretics

Overview
Thiazides are used to relieve oedema due to chronic heart failure and, in lower doses, to reduce blood pressure.

Loop diuretics are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure.

Combination diuretic therapy may be effective in patients with edema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

Thiazides and related diuretics
Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuretic does not interfere with sleep.

In the management of hypertension a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Chlortalidone p. 230 and indapamide p. 167 are the preferred diuretics in the management of hypertension. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 166 can be used for mild or moderate heart failure; it is licensed for the treatment of hypertension but is no longer considered the first-line diuretic for this indication, although patients with stable and controlled blood pressure currently taking bendroflumethiazide can continue treatment.

Chlortalidone, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics. Chlortalidone can also be used under close supervision for the treatment of ascites due to cirrhosis in stable patients.

Xipamide p. 231 and indapamide are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Metolazone p. 231 is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

The thiazide diuretics benzthiazide, clopamide, hydrochlorothiazide, and hydroflumethiazide do not offer any significant advantage over other thiazides and related diuretics.

Loop diuretics
Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces the need for load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and oedema due to peripheral venous stasis or calcium-channel blockers) can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendroflumethiazide or metolazone).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure.

Loop diuretics can exacerbate diabetes (but hyperglycaemia is less likely than with thiazides) and gout. If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially.

Furosemide p. 227 and bumetanide p. 227 are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration furosemide has a peak effect within 30 minutes. The diuresis associated with these drugs is dose related.

Torasemide p. 228 has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

Potassium-sparing diuretics and aldosterone antagonists
Amiloride hydrochloride p. 229 and triamterene p. 220 on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See compound preparations with thiazides or loop diuretics.
Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

**Aldosterone antagonists**
Spironolactone p. 193 potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure and when used in resistant hypertension [unlicensed indication].

Spironolactone is also used in primary hyperaldosteronism (Conn’s syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

Eplerenone p. 193 is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction; it is also licensed as an adjunct in chronic mild heart failure with left ventricular systolic dysfunction. Potassium supplements must not be given with aldosterone antagonists

**Potassium-sparing diuretics with other diuretics**
Although it is preferable to prescribe thiazides and potassium-sparing diuretics separately, the use of fixed combinations may be justified if compliance is a problem.

Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops.

**Other diuretics**
Mannitol p. 229 is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.

Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

The carbonic anhydrase inhibitor acetazolamide p. 1181 is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Eye drops of dorzolamide p. 1182 and brinzolamide p. 1181 inhibit the formation of aqueous humour and are used in glaucoma.

**Diuretics with potassium**
Many patients on diuretics do not need potassium supplements. For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should not usually be given together. Diuretics and potassium supplements should be prescribed separately for children.

**Advanced Pharmacy Services**
Patients taking diuretics may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

---

**SIDE-EFFECTS**
- **Common or very common** Dizziness · electrolyte imbalance · fatigue · headache · metabolic alkalosis · muscle spasms · nausea
- **Uncommon** Diarrhoea
- **Rare or very rare** Bone marrow depression · photosensitivity reaction
- **Frequency not known** Deafness (more common in renal impairment) · leucopenia · paraesthesia · rash · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tinnitus (more common with rapid intravenous administration, and in renal impairment) · vomiting
- **HEPATIC IMPAIRMENT** Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this. Diuretics can increase the risk of hypomagnesaemia in alcoholic cirrhosis, leading to arrhythmias.

**RENAL IMPAIRMENT** High doses or rapid intravenous administration can cause tinnitus and deafness.

**Dose adjustments** High doses of loop diuretics may occasionally be needed in renal impairment.

**MONITORING REQUIREMENTS** Monitor electrolytes during treatment.
Bumetanide

- **INDICATIONS AND DOSE**
  - **Oedema**
    - **BY MOUTH**
    - Adult: 1 mg, dose to be taken in the morning, then 1 mg after 6–8 hours if required
    - Elderly: 500 micrograms daily, this lower dose may be sufficient in elderly patients
  - **Oedema, severe cases**
    - **BY MOUTH**
    - Adult: Initially 5 mg daily, increased in steps of 5 mg every 12–24 hours, adjusted according to response

- **INTERACTIONS** → Appendix 1: loop diuretics
- **SIDE-EFFECTS**
  - **Common or very common** Dehydration, hypotension, skin reactions
  - **Uncommon** Breast pain, chest discomfort, ear pain, vertigo
  - **Rare or very rare** Hearing impairment
  - **Frequency not known** Arthralgia, encephalopathy, gastrointestinal discomfort, gynaecomastia, hyperglycaemia, hyperuricaemia, muscle cramps, musculoskeletal pain, (with high doses in renal failure)
  - **PREGNANCY** Bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.
  - **BREAST FEEDING** No information available. May inhibit lactation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
  - **Oral solution**
    - **Bumetanide (Non-proprietary)**
      - Bumetanide 200 microgram per 1 ml Bumetanide 1mg/5ml oral solution sugar free sugar-free | 150 ml (POS) £198.00 DT + £198.00
  - **Tablet**
    - **Bumetanide (Non-proprietary)**
      - Bumetanide 1 mg Bumetanide 1mg tablets | 28 tablet (POS) £7.35 DT £11.31
      - Bumetanide 5 mg Bumetanide 5mg tablets | 28 tablet (POS) £6.98 DT £16.98
    - Combinations available: Amiloride with bumetanide, p. 230
  - **Co-amilofruse**

Furosemide

(Frusemide)

- **INDICATIONS AND DOSE**
  - **Oedema**
    - **BY MOUTH**
    - Adult: Initially 40 mg daily, dose to be taken in the morning, then maintenance 20–40 mg daily
    - Initially by Intramuscular injection, or by slow intravenous injection, or by intravenous infusion
    - Adult: Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day
  - **Resistant oedema**
    - **BY MOUTH**
    - Adult: 80–120 mg daily
    - Initially by Intramuscular injection, or by slow intravenous injection, or by intravenous infusion
    - Adult: Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day
  - **Resistant hypertension**
    - **BY MOUTH**
    - Adult: 40–80 mg daily
    - Initially by Intramuscular injection, or by slow intravenous injection, or by intravenous infusion
    - Adult: Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

- **INTERACTIONS** → Appendix 1: loop diuretics
- **SIDE-EFFECTS**
  - **Common or very common** Dehydration, hypotension, skin reactions
  - **Uncommon** Breast pain, chest discomfort, ear pain, vertigo
  - **Rare or very rare** Hearing impairment
  - **Frequency not known** Arthralgia, encephalopathy, gastrointestinal discomfort, gynaecomastia, hyperglycaemia, hyperuricaemia, muscle cramps, musculoskeletal pain, (with high doses in renal failure)
  - **PREGNANCY** Furosemide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.
  - **BREAST FEEDING** No information available. May inhibit lactation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
  - **Tablet**
    - **Co-amilofruse (Non-proprietary)**
      - Amiloride hydrochloride 2.5 mg, Furosemide 20 mg Co-amilofruse 2.5mg/20mg tablets | 28 tablet (POS) £7.50 DT + £5.95 | 56 tablet (POS) £11.90–£14.50
      - Amiloride hydrochloride 5 mg, Furosemide 40 mg Co-amilofruse 5mg/40mg tablets | 28 tablet (POS) £9.13 DT + £5.29 | 56 tablet (POS) £10.58–£18.26
      - Amiloride hydrochloride 10 mg, Furosemide 80 mg Co-amilofruse 10mg/80mg tablets | 28 tablet (POS) £18.40 DT + £15.52
      - Frumil (Sanofi)
        - Amiloride hydrochloride 5 mg, Furosemide 20 mg Frumil L5 20mg/2.5mg tablets | 28 tablet (POS) £4.32 DT + £5.95
        - Amiloride hydrochloride 5 mg, Furosemide 40 mg Frumil 40mg/5mg tablets | 28 tablet (POS) £5.29 DT + £5.29

- **CONTRA-INDICATIONS** Addison’s disease, anuria, comatose or precomatose states associated with liver cirrhosis, dehydration, hyperkalaemia, hypovolaemia, renal failure, severe hypokalaemia, severe hypoproteinaemia
- **CAUTIONS** Correct hypovolaemia before using in oliguria, diabetes mellitus, elderly, gout, hepatorenal syndrome, hypoproteinaemia, hypotension, impaired micturition, prostatic enlargement
- **INTERACTIONS** → Appendix 1: loop diuretics
- **PREGNANCY** Not used to treat hypertension in pregnancy.

- **BREAST FEEDING** Manufacturers advise avoid — no information regarding amiloride component available. Amount of furosemide in milk too small to be harmful. Furosemide may inhibit lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic cirrhosis with renal impairment.
- **RENAL IMPAIRMENT** Risk of hyperkalaemia in renal impairment but may need higher doses. Avoid if eGFR less than 30 mL/minute/1.73 m².
  - **MONITORING** Monitor plasma-potassium concentration.
  - **MONITORING REQUIREMENTS** Monitor electrolytes.

www.getintopharma.com
**Furosemide with triamterene**

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide p. 227, triamterene p. 230.

### INDICATIONS AND DOSE

**Oedema**

- **BY MOUTH**
  - Adult: 0.5–2 tablets daily, to be taken in the morning

**CONTRA-INDICATIONS** Anuria – dehydration – hyperkalaemia – hypovolaemia – renal failure – severe hypokalaemia – severe hyponatraemia

**CAUTIONS** Diabetes mellitus – elderly – gout – hepatorenal syndrome – hypotension – impaired micturition – may cause blue fluorescence of urine – prostatic enlargement

**INTERACTIONS** → Appendix 1: loop diuretics – potassium-sparring diuretics

**BREAST FEEDING** Triamterene present in milk—manufacturer advises avoid. Furosemide may inhibit lactation.

**HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe hepatic failure or hepatic coma.

**Dose adjustments** Manufacturer advises initial dose reduction.

**RENAI IMPAIRMENT** Avoid in severe impairment. Dose adjustments May need high doses. Monitoring Monitor plasma-potassium concentration in renal impairment (high risk of hyperkalaemia).

**MONITORING REQUIREMENTS** Monitor electrolytes.

**PATIENT AND CARER ADVICE** Urine may look slightly blue in some lights.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Tablet

- **Furosemide (Non-proprietary)**
  - Furosemide 20 mg  [F] 28 tablet  **POT** £2.62 DT = £1.48 | 250 tablet  **POT** £5.08-$13.21
  - Furosemide 40 mg  [F] 28 tablet  **POT** £2.84 DT = £2.09 | 250 tablet  **POT** £5.50-$18.66 | 1000 tablet  **POT** £28.21-$92.15
  - Furosemide 500 mg  [F] 28 tablet  **POT** £7.00 DT = £3.94
  - Diureal (Emmogen Pharma Ltd)  Furosemide 500 mg  [tablet]  **POT** £0.99 DT = £3.94

### Solution for injection

- **Furosemide (Non-proprietary)**
  - Furosemide 10 mg per 1 ml  [F] 28 ampoule  **POT** £3.00-40.00
  - Furosemide 50 mg/5ml solution for injection ampoules  | 10 ampoule  **POT** £2.38-$50.00
  - Furosemide 20mg/2ml solution for injection ampoules  | 10 ampoule  **POT** £4.00 DT = £13.42

### Oral solution

- **Furosemide (Non-proprietary)**
  - Furosemide 4 mg per 1 ml  [F] 150 ml (PO) £14.81 DT = £14.81
  - Furosemide 8 mg per 1 ml  [F] 150 ml (PO) £19.53 DT = £19.53
  - Furosemide 10 mg per 1 ml  [F] 150 ml (PO) £20.21 DT = £20.21
  - Frusol (Rosemont Pharmaceuticals Ltd)  Furosemide 4 mg per 1 ml  [F] 150 ml (PO) £12.07 DT = £14.81
  - Frusol 8 mg per 1 ml  [F] 150 ml (PO) £15.58 DT = £19.53
  - Frusol 10 mg per 1 ml  [F] 150 ml (PO) £16.84 DT = £20.21

Combinations available: **Spironolactone with furosemide**, p. 229

---

**Torasemide**

### INDICATIONS AND DOSE

**Oedema**

- **BY MOUTH**
  - Adult: 5 mg once daily, to be taken preferably in the morning, then increased if necessary to 20 mg once daily; maximum 40 mg per day

**Hypertension**

- **BY MOUTH**
  - Adult: 2.5 mg daily, then increased if necessary to 5 mg once daily

**INTERACTIONS** → Appendix 1: loop diuretics

**SIDE-EFFECTS**

- **Common or very common** Asthenia – gastrointestinal disorder
- **Uncommon** Bladder dilatation – urinary retention
- **Rare or very rare** Allergic dermatitis

**PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

### Triamterene with chlortalidone

The properties listed below are those particular to the combination only. For the properties of the components please consider, triamterene above, chlortalidone below.

- **INDICATIONS AND DOSE**
  - **Hypertension / Oedema**
    - **BY MOUTH**
      - Adult: 50/50–100/100 mg once daily, dose to be taken in the morning

- **DOSE EQUIVALENCE AND CONVERSION**
  - Dose expressed as $x/y$ mg of triamterene/chlortalidone.

- **INTERACTIONS** → Appendix 1: potassium-sparing diuretics · thiazide diuretics

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 14, 21
      - Kalspare (DHP Healthcare Ltd)
        - Chlortalidone 50 mg, Triamterene 50 mg
        - Kalspare tablets
        - 28 tablet [Para] £9.90

### Diuretics >thiazides and related diuretics

### Chlortalidone

(Chlortalidone)

- **INDICATIONS AND DOSE**
  - **Aspects due to cirrhosis in stable patients (under close supervision)** Oedema due to nephrotic syndrome
    - **BY MOUTH**
      - Adult: Up to 50 mg daily

www.getintopharma.com
### Hypertension

- **BY MOUTH**
  - Adult: 25 mg daily, dose to be taken in the morning, then increased if necessary to 50 mg daily

### Mild to moderate chronic heart failure

- **BY MOUTH**
  - Adult: 25–50 mg daily, dose to be taken in the morning, then increased if necessary to 100–200 mg daily, reduce to lowest effective dose for maintenance

### Nephrogenic diabetes insipidus | Partial pituitary diabetes insipidus

- **BY MOUTH**
  - Adult: Initially 100 mg twice daily, then reduced to 50 mg daily

### INTERACTIONS

- Common or very common Appetite decreased · erectile dysfunction · gastrointestinal discomfort · hyperglycaemia · rash
- Uncommon Gout
- Rare or very rare Arrhythmia · diabetes mellitus exacerbated · eosinophilia · glycosuria · hepatic disorders · nephritis · tubulointerstitial · paraesthesia · pulmonary oedema · respiratory disorder · vomiting

### BREAST FEEDING

The amount present in milk is too small to be harmful. Large doses may suppress lactation.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

- **Chlortalidone (Non-proprietary)**
  - Chlortalidone 25 mg (Meda Pharmaceuticals Ltd)

- **Triamterene with chlortalidone**, p. 230

### Co-trimaterzide

The properties listed below are those particular to the combination only. For the properties of the components please consider, triamterene p. 230, hydrochlorothiazide p. 166.

#### INDICATIONS AND DOSE

- **Hypertension**
  - **BY MOUTH**
    - Adult: 50/25 mg daily, increased if necessary up to 200/100 mg daily, dose to be taken after breakfast
- **Oedema**
  - **BY MOUTH**
    - Adult: 50/25 mg twice daily, to be taken after breakfast and after midday meal, increased if necessary to 150/75 mg daily, to be taken as 100/50 mg after breakfast and 50/25 mg after midday meal; maintenance 50/25 mg daily, alternatively maintenance 100/50 mg once daily on alternate days; maximum 200/100 mg per day

#### DOSE EQUIVALENCEN AND CONVERSION

- Dose expressed as ×/y mg of triamterene/hydrochlorothiazide.

#### INTERACTIONS

- Appendix 1: potassium-sparing diuretics · thiazide diuretics

#### PATIENT AND CARER ADVICE

Urine may look slightly blue in some lights.

### Metolazone

#### INDICATIONS AND DOSE

- **Oedema**
  - **BY MOUTH**
    - Adult: 5–10 mg daily, dose to be taken in the morning; increased if necessary to 20 mg daily, dose increased in resistant oedema; maximum 80 mg per day
  - **Hypertension**
    - **BY MOUTH**
      - Adult: Initially 5 mg daily, dose to be taken in the morning; maintenance 5 mg once daily on alternate days

#### CAUTIONS

Acute porphyrias p. 1058

#### INTERACTIONS

Appendix 1: thiazide diuretics

#### SIDE-EFFECTS

Chest pain · chills

#### BREAST FEEDING

The amount present in milk is too small to be harmful. Large doses may suppress lactation.

#### DIRECTIONS FOR ADMINISTRATION

Tablets may be crushed and mixed with water immediately before use.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

#### Tablet

- **Zaroxolyn (Imported (Canada))**
  - Metolazone 2.5 mg Zaroxolyn 2.5mg tablets | 100 tablet £0.04 DT £9.58
  - Metolazone 5 mg Zaroxolyn 5mg tablets | 50 tablet £0.04 DT £9.58

### Xipamide

#### INDICATIONS AND DOSE

- **Oedema**
  - **BY MOUTH**
    - Adult: 50 mg per day, to be used in resistant cases; maintenance 20 mg daily, dose to be taken in the morning
  - **Hypertension**
    - **BY MOUTH**
      - Adult: Initially 40 mg daily, dose to be taken in the morning, increased if necessary to 80 mg daily, higher dose to be used in resistant cases; maintenance 20 mg daily, dose to be taken in the morning

#### CAUTIONS

Acute porphyrias p. 1058

#### INTERACTIONS

Appendix 1: thiazide diuretics

#### SIDE-EFFECTS

- Common or very common Anxiety · dry mouth · fatigue · gastrointestinal discomfort · gouty arthritis · hyperhidrosis · lethargy · muscle complaints · palpitations
  - Rare or very rare Cholecystitis acute · hyperlipidaemia · jaundice · nephritis acute interstitial · pancreatitis · haemorrhagic · skin reactions · vision disorders

#### BREAST FEEDING

No information available.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Diurexan** (Meda Pharmaceuticals Ltd)
  - Xipamide 20 mg Diurexan 20mg tablets | 140 tablet £13.46 DT £19.46

---

www.getintopharma.com
Peripheral vascular disease can be either occlusive (e.g. intermittent claudication) in which occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. Raynaud’s syndrome). Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as Smoking cessation p. 497, effective control of blood pressure, regulating blood lipids, optimising glycemic control in diabetes, taking aspirin p. 121 in a dose of 75 mg daily, and possibly weight reduction in obesity. Exercise training can improve symptoms of intermittent claudication; revascularisation procedures may be appropriate.

Nifidiprofuryl oxalate p. 233 can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking nifidiprofuryl oxalate should be assessed for improvement after 3–6 months. Cilostazol below is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest; use is restricted to second-line treatment where lifestyle modifications and other appropriate interventions have failed to improve symptoms. Cilostazol should be initiated by those experienced in the management of intermittent claudication. Patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance. Inositol nicotinate p. 233 and pentoxifylline p. 234 are not established as being effective for the treatment of intermittent claudication.

Intravenous iloprost p. 184 [unlicensed] is a treatment option for critical limb ischaemia in patients unsuitable for surgery. Management of Raynaud’s syndrome includes avoidance of exposure to cold and Smoking cessation p. 497. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud’s syndrome. Nifedipine p. 162 is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, nifidiprofuryl oxalate may produce symptomatic improvement; inositol nicotinate (a nicotinic acid derivative) may also be considered. Pentoxifylline, prazosin p. 784, and moxisylyte p. 233 are not established as being effective for the treatment of Raynaud’s syndrome. Vasodilator therapy is not established as being effective for chilblains.

Advanced Pharmacy Services
Patients with peripheral vascular disease may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

**Cilostazol**

- **INDICATIONS AND DOSE**
  - Intermittent claudication in patients without rest pain and no peripheral tissue necrosis
  - **BY MOUTH**
    - Adult: 100 mg twice daily, to be taken 30 minutes before food, cilostazol should be initiated by those experienced in the management of intermittent claudication; patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance
  - **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
    - Manufacturer advises reduce dose to 50 mg twice daily with concurrent use of potent inhibitors of CYP3A4, potent inhibitors of CYP2C19, omeprazole and erythromycin.

- **CONTRA-INDICATIONS**
  - Active peptic ulcer - congestive heart failure - coronary intervention in previous 6 months - haemorrhagic stroke in previous 6 months - history of severe tachyarrhythmia - myocardial infarction in previous 6 months - poorly controlled hypertension - predisposition to bleeding - proliferative diabetic retinopathy - prolongation of QT interval - severe atrial flutter - unstable angina

- **CAUTIONS**
  - Atrial fibrillation - atrial or ventricular ectopy - diabetes mellitus (higher risk of intracranial bleeding) - mild to moderate atrial flutter - stable coronary disease - surgery

- **INTERACTIONS** → Appendix 1: cilostazol

- **SIDE-EFFECTS**
  - Common or very common
    - Appetite decreased - arthralgias - diarrhoea - dizziness - gastrointestinal discomfort - gastrointestinal disorders - headache - increased risk of infection - nausea - oedema - palpitations - skin reactions - vomiting
  - Uncommon
    - Anaemia - anxiety - congestive heart failure - cough - dyspnoea - haemorrhage - hyperglycaemia - hypotension - sleep disorders - syncope
  - Rare or very rare
    - Renal impairment - thrombocytosis
  - Frequency not known
    - Agranulocytosis - bone marrow disorders - conjunctivitis - fever - granulocytopenia - hepatic disorders - hot flush - hypertension - intracranial haemorrhage - leukopenia - paresis - severe cutaneous adverse reactions (SCARs) - thrombocytopenia - tinnitus - urinary frequency increased

- **PREGNANCY**
  - Avoid—toxicity in animal studies.

- **BREAST FEEDING**
  - Present in milk in animal studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid in moderate-to-severe impairment—no information available.

- **RENAL IMPAIRMENT**
  - Avoid if eGFR less than 25 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE**
  - Blood disorders—Patients should be advised to report any unexplained bleeding, bruising, sore throat, or fever.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Cilostazol, nifidiprofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223
    - Cilostazol is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving this treatment...
should have the option to continue until they and their clinician consider it appropriate to stop.

Manufacturer advises avoid—no information available.

**BREAST FEEDING**
Present in milk—manufacturer advises use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in severe impairment.

**Dose adjustments**
Manufacturer advises consider dose reduction in severe impairment.

**RENAL IMPAIRMENT**
Dose adjustments
Reduce dose by 30–50% if eGFR less than 30 mL/minute/1.73 m².

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
Cilostazol, naftidrofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA232

Pentoxifylline is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving this treatment should have the option to continue until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA223
Chapter 3
Respiratory system

Respiratory system, drug delivery

Inhalation
This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced.

Inhaler devices
These include pressurised metered-dose inhalers, breath-actuated inhalers, and dry powder inhalers. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. Spacer devices can help such patients because they remove the need to co-ordinate actuation with inhalation. Dry powder inhalers may be useful in adults and children over 5 years who are unwilling or unable to use a pressurised metered-dose inhaler. Alternatively, breath-actuated inhalers are suitable for adults and older children provided they can use the device effectively.

Pressurised metered-dose inhalers are an effective and convenient method of drug administration in mild to moderate asthma.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

The patient should be instructed carefully on the use of the inhaler and it is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug.

MHRA/CHM advice: Pressurised metered dose inhalers (pMDI): risk of airway obstruction from aspiration of loose objects (July 2018)
The MHRA have received reports of patients who have inhaled objects into the back of the throat—some cases objects were aspirated, causing airway obstruction. Patients should be reminded to remove the mouthpiece cover fully, shake the device and check that both the outside and inside of the mouthpiece are clear and undamaged before inhaling a dose, and to store the inhaler with the mouthpiece cover on.

Spacer devices
Spacer devices remove the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacer devices are particularly useful for patients with poor inhalation technique, for children, for patients requiring high doses of inhaled corticosteroids, for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (Volumatic®) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

Use and care of spacer devices
Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleaned once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Respiratory drug delivery, nebulisers
Solutions for nebulisation are available for use in severe acute asthma. They are administered over 5–10 minutes from a nebuliser usually driven by oxygen in hospital. Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta, agonists can increase arterial hypoxaemia.

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are to deliver:
- a beta, agonist or ipratropium bromide p. 246 to a patient with an acute exacerbation of asthma or of chronic obstructive pulmonary disease;
- a beta, agonist, corticosteroid, or ipratropium bromide on a regular basis to a patient with severe asthma or reversible airways obstruction when the patient is unable to use other inhalational devices;
- an antibiotic (such as colistimethate sodium p. 556) or a mucolytic to a patient with cystic fibrosis;
- Budesonide p. 260 or adrenaline/epinephrine p. 222 to a child with severe croup;
- Pentamidine isethionate p. 602 for the prophylaxis and treatment of pneumocystis pneumonia.

The use of nebulisers in chronic persistent asthma and chronic obstructive pulmonary disease should be considered only:
- after a review of the diagnosis;
- after review of therapy (see also Chronic Obstructive Pulmonary Disease) and the patient’s ability to use handheld devices;
Respiratory system

- after increased doses of inhaled therapy from hand-held inhalers (with a spacer if necessary) have been tried for 2 weeks;
- if the patient remains breathless, despite correctly using optimal therapy.

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor response for up to 2 weeks on standard treatment and up to 2 weeks on nebulised treatment. If prescribed, patients must:
- have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (including maintenance and cleaning) and on peak-flow monitoring;
- be instructed not to treat acute attacks at home without also seeking help;
- have regular follow-up by a doctor, specialist nurse or physiotherapist after about 1 month and annually thereafter.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on the droplet size, pattern of breath inhalation, and condition of solution is deposited in the airways or alveoli depends on the mouthpiece and tubing. The extent to which the nebulised treatment. If prescribed, patients must:

Jet nebulisers
Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients at risk of hypercapnia, such as those with chronic obstructive pulmonary disease, oxygen can be dangerous and the nebuliser should be driven by air. If oxygen is required, it should be given simultaneously by nasal cannula.

Tubing
The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

Ultrasonic nebulisers
Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow; they are not suitable for the nebulisation of some drugs, such as dornase alfa p. 293 and nebulised suspensions.

Nebuliser diluent
Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline). In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

Oral
The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include beta2agonists, corticosteroids, theophylline p. 274, and leukotriene receptor antagonists.

Parenteral
Drugs such as beta, agonists, corticosteroids, and aminophylline p. 272 can be given by injection in acute severe asthma when administration by nebulisation is inadequate or inappropriate. If the patient is being treated in the community, urgent transfer to hospital should be arranged.

Peak flow meters
When used in addition to symptom-based monitoring, peak flow monitoring has not been proven to improve asthma control in either adults or children, however measurement of peak flow may be of benefit in adult patients who are ‘poor perceivers’ and hence slow to detect deterioration in their asthma, and for those with more severe asthma.

When peak flow meters are used, patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

Peak flow charts should be issued to patients where appropriate, and are available to purchase from:

NHS Hospitals can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com.

In Scotland, peak flow charts can be obtained by emailing stockorders.dppas@apsgroup.co.uk.

NICE decisions
Inhaler devices for children under 5 years with chronic asthma (August 2000) NICE TA10
When selecting inhaler devices for children under 5 years with chronic asthma, a child’s needs and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child’s condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered.

NICE TA10
Inhaler devices for children 5–15 years with chronic asthma (March 2002) NICE TA38
When selecting inhaler devices for children between 5–15 years with chronic asthma, a child’s needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- for other inhaled drugs, particularly bronchodilators, a wider range of devices should be considered;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

www.nice.org.uk/T10

www.nice.org.uk/T38
Airways disease, obstructive

1 Airways disease, obstructive

Asthma, chronic

Description of condition
Asthma is a common chronic inflammatory condition of the airways, associated with airway hyperresponsiveness and variable airflow obstruction. The most frequent symptoms of asthma are cough, wheeze, chest tightness, and breathlessness. Asthma symptoms vary over time and in intensity and can gradually or suddenly worsen, provoking an acute asthma attack that, if severe, may require hospitalisation.

Aims of treatment
The aim of treatment is to achieve control of asthma. Complete control of asthma is defined as no daytime symptoms, no night-time awakening due to asthma, no asthma attacks, no need for rescue medication, no limitations on activity including exercise, normal lung function (in practical terms forced expiratory volume in 1 second (FEV1) and/or peak expiratory flow (PEF) > 80% predicted or best), and minimal side-effects from treatment. In clinical practice, patients may choose to balance the aims of asthma management against the potential side-effects or inconvenience of taking medication necessary to achieve perfect control.

Lifestyle changes
Weight loss in overweight patients may lead to an improvement in asthma symptoms. Parents with asthma should be advised about the danger of smoking, to themselves and to their children with asthma, and be offered appropriate support to stop smoking. For further information, see Smoking cessation p. 457.

Breathing exercise programmes (including physiotherapist-taught methods) can be offered as an adjunct to drug treatment to improve quality of life and reduce symptoms.

Management
A stepwise approach aims to stop symptoms quickly and to improve peak flow. Treatment should be started at the level most appropriate to initial severity of asthma. The aim is to achieve early control and to maintain it by stepping up treatment as necessary and decreasing treatment when control is good. Before initiating a new drug or adjusting treatment consider whether diagnosis is correct, check adherence and inhaler technique, and eliminate trigger factors for acute attacks.

A self-management programme comprising of a written personalised action plan and education should be offered to all patients with asthma (and/or their family or carers).

Recommendations on the management of chronic asthma from the National Institute for Health and Care Excellence (NICE)—Asthma: diagnosis, monitoring and chronic asthma management guidelines (NG80, November 2017), and British Thoracic Society (BTS) and Scottish Intercollegiate Guidelines Network (SIGN)—British guideline on the management of asthma (SIGN 153, September 2016) differ significantly. Recommendations in BNF publications are based on NICE guidelines, and differences with BTS/SIGN (2016) have been highlighted.

Adult NICE (2017) treatment recommendations for adults apply to patients aged 17 years and over. BTS/SIGN (2016) treatment recommendations for adults apply to patients over 12 years.

Intermittent reliever therapy
Start an inhaled short-acting beta, agonist (such as salbutamol p. 252 or terbutaline sulfate p. 255), to be used as required, in all patients with asthma. For those with infrequent short-lived wheeze, occasional use of reliever therapy may be the only treatment required. Patients using more than one short-acting beta, agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.

Regular preventer (maintenance) therapy
NICE (2017) define inhaled corticosteroid doses for adults as low, moderate, or high. BTS/SIGN (2016) instead define inhaled corticosteroid doses for adults as low, medium or high (refer to individual guidelines for inhaled corticosteroid dosing information).

A low dose of inhaled corticosteroid should be started as maintenance therapy in patients who present with any one of the following features: using an inhaled short-acting beta, agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week. BTS/SIGN (2016) also recommend initiation in patients who have had an asthma attack in the last 2 years, and starting inhaled corticosteroids at a dose appropriate to the severity of asthma.

BTS/SIGN (2016) recommend that inhaled corticosteroids (except ciclesonide p. 262) should be initially taken twice daily, however, the same total daily dose, taken once a day, can be considered in patients with milder disease if good or complete control of asthma is established. The dose of inhaled corticosteroid should be adjusted over time to the lowest effective dose at which control of asthma is maintained.

BTS/SIGN (2016) recommend the prescribing of inhalers by brand.

Initial add-on therapy
If asthma is uncontrolled on a low dose of inhaled corticosteroid as maintenance therapy, a leukotriene receptor antagonist (such as montelukast p. 269) should be offered in addition to the inhaled corticosteroid, and the response to treatment reviewed in 4 to 8 weeks.

BTS/SIGN (2016) instead recommend a long-acting beta, agonist (LABA—such as salmeterol p. 252 or formoterol fumarate p. 250) as initial add-on therapy to inhaled corticosteroids if asthma is uncontrolled.

Additional add-on therapy
If asthma is uncontrolled on a low dose of inhaled corticosteroid and a leukotriene receptor antagonist as maintenance therapy, a LABA in combination with the inhaled corticosteroid should be offered with or without continued leukotriene receptor antagonist treatment, depending on the response achieved from the leukotriene receptor antagonist.

If asthma remains uncontrolled, offer to change the inhaled corticosteroid and LABA maintenance therapy to a MART regimen (Maintenance And Reliever Therapy—a combination of an inhaled corticosteroid and a fast-acting LABA such as formoterol in a single inhaler), with a low dose of inhaled corticosteroid as maintenance. See beclometasone with formoterol p. 259 and budesonide with formoterol p. 261.

If asthma remains uncontrolled on a MART regimen with a low dose of inhaled corticosteroid as maintenance with or without a leukotriene antagonist, consider increasing to a moderate dose of inhaled corticosteroid (either continuing a MART regimen or changing to a fixed-dose regimen of an inhaled corticosteroid and a LABA, with a short-acting beta, agonist as reliever therapy).
If asthma is still uncontrolled in patients on a moderate dose of inhaled corticosteroid as maintenance with a LABA (either as MART or a fixed-dose regimen), with or without a leukotriene receptor antagonist, consider the following options:

- increasing the inhaled corticosteroid dose to a high-dose as maintenance (this should only be offered as part of a fixed-dose regimen, with a short-acting beta, agonist used as a reliever therapy), or
- a trial of an additional drug, for example, a long-acting muscarinic receptor antagonist (such as tiotropium p. 247) or modified-release theophylline p. 274, or
- seek advice from an asthma specialist.

BTS/SIGN (2016) instead recommend that if the patient is gaining some benefit from addition of a LABA but control remains inadequate, that the LABA be continued and the dose of inhaled corticosteroid be increased to a medium-dose, if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing on a low dose of inhaled corticosteroid and a LABA and try adding a leukotriene receptor antagonist, or a long-acting muscarinic receptor antagonist, or modified-release theophylline p. 274.

If there is no response to the LABA, discontinue it and increase the dose of the inhaled corticosteroid to a medium-dose if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing on a low dose of inhaled corticosteroid and try adding a leukotriene receptor antagonist or a long-acting muscarinic receptor antagonist.

**High-dose inhaled corticosteroids and further add-on treatment**

BTS/SIGN (2016) recommend that if control remains inadequate on a combination of short-acting beta, agonist as required, a medium dose of inhaled corticosteroid, plus an additional drug, usually a LABA, to consider the following interventions:

- increase the inhaled corticosteroid to a high-dose—with high doses of inhaled corticosteroid via a pressurised metered dose inhaler (pMDI), a spacer should be used, or
- add a leukotriene receptor antagonist, or
- add modified-release theophylline p. 274, or
- add tiotropium p. 247.

If a trial of a further add-on treatment is ineffective, stop the drug (or in the case of increased dose of inhaled corticosteroid, reduce to the original dose) and refer to specialist care.

**Continuous or frequent use of oral corticosteroids**

BTS/SIGN (2016) recommend adding a regular oral corticosteroid (prednisolone p. 678) at the lowest dose to provide adequate control (under specialist care) in patients with very severe asthma uncontrolled on high-dose inhaled corticosteroids, and who have also tried (or are still receiving) a LABA, a leukotriene receptor antagonist, or modified-release theophylline p. 274.

**Monoclonal antibodies and immunosuppressants**

BTS/SIGN (2016) recommend, that under specialist initiation, immunosuppressants such as methotrexate p. 913 [unlicensed], and monoclonal antibodies such as omalizumab p. 267 (for severe persistent allergic asthma), and mepolizumab p. 267 and reslizumab p. 268 (in adults for severe eosinophilic asthma), may be considered in patients with severe asthma to achieve control and reduce the use of oral corticosteroids. See mepolizumab p. 267, omalizumab p. 267, reslizumab p. 268 National funding/access decisions.

**Child over 5 years**

For children under 5 years, NICE (2017) treatment recommendations for children apply to children aged 5–16 years and adult treatment recommendations apply to those aged 17 years and over. Whereas, for children over 5 years, BTS/SIGN (2016) treatment recommendations for children apply to children aged 5–12 years and adult treatment recommendations apply to those aged over 12 years.

**Intermittent reliever therapy**

BTS/SIGN (2016) instead define inhaled corticosteroids for children (5–12 years) as very low, low, or medium, and for children over 12 years as low, medium or high (refer to individual guidelines for inhaled corticosteroid dosing information).

A paediatric low dose of inhaled corticosteroid should be started as maintenance therapy in children who present with any one of the following features: using an inhaled short-acting beta, agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week.

BTS/SIGN (2016) instead recommend starting a very low dose (child 5–12 years) or a low dose (child over 12 years) of inhaled corticosteroid in children presenting with any one of the following features: using an inhaled short-acting beta, agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week, and starting inhaled corticosteroids at a dose appropriate to the severity of asthma.

BTS/SIGN (2016) recommend that inhaled corticosteroids (except ciclesonide p. 262) should be initially taken twice daily, however, the same total daily dose, taken once a day, can be considered in patients with milder disease if good or complete control of asthma is established. The dose of inhaled corticosteroid should be adjusted over time, to the lowest effective dose at which control of asthma is maintained.

BTS/SIGN (2016) recommend the prescribing of inhalers by brand.

**Initial add-on therapy**

If asthma is uncontrolled on a paediatric low dose of inhaled corticosteroid as maintenance therapy, consider a leukotriene receptor antagonist (such as montelukast p. 269) in addition to the inhaled corticosteroid, and review the response to treatment in 4 to 8 weeks.

BTS/SIGN (2016) instead recommend a long-acting beta, agonist (LABA—such as salmeterol p. 252 or formoterol fumarate p. 250) in children over 12 years, or a LABA or a leukotriene receptor antagonist in children 5–12 years, as initial add-on therapy to inhaled corticosteroids if asthma is uncontrolled.

**Additional add-on therapy**

If asthma is uncontrolled on a paediatric low dose of inhaled corticosteroid and a leukotriene receptor antagonist as maintenance therapy, consider discontinuation of the leukotriene receptor antagonist and initiation of a LABA in combination with the inhaled corticosteroid.

If asthma remains uncontrolled on a paediatric low dose of inhaled corticosteroid and a LABA as maintenance therapy, consider changing to a MART regimen (Maintenance And
Reliever Therapy—a combination of an inhaled corticosteroid and fast-acting LABA such as formoterol in a single inhaler) with a paediatric low dose of inhaled corticosteroid as maintenance. See budesonide with formoterol p. 261 [not licensed in all age groups].

If asthma remains uncontrolled on a MART regimen with a paediatric low dose of inhaled corticosteroid as maintenance, consider increasing to a paediatric moderate dose of inhaled corticosteroid (either continuing a MART regimen or changing to a fixed-dose regimen of an inhaled corticosteroid and a LABA, with a short-acting beta2-agonist as reliever therapy).

If asthma is still uncontrolled on a paediatric moderate dose of inhaled corticosteroid as maintenance with a LABA (either as MART or a fixed-dose regimen), consider seeking advice from an asthma specialist and the following options:

- increasing the inhaled corticosteroid dose to a paediatric high dose as maintenance (this should only be offered as part of a fixed-dose regimen, with a short-acting beta2-agonist as reliever therapy), or
- a trial of an additional drug, such as modified-release theophylline p. 274.

BTS/SIGN (2016) instead recommend that if the child is gaining some benefit from addition of a LABA but control remains inadequate, continue the LABA and increase the dose of the inhaled corticosteroid to a low-dose (child 5–12 years) or medium-dose (child over 12 years), if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing a very low dose (child 5–12 years) or low dose (child over 12 years) of inhaled corticosteroid and a LABA and try adding a leukotriene receptor antagonist, or modified-release theophylline p. 274, or long-acting muscarinic receptor antagonist (in children over 12 years).

If there is no response to the LABA, discontinue it and increase the dose of inhaled corticosteroid to a low-dose (child 5–12 years) or medium-dose (child over 12 years), if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing on a very low dose (child 5–12 years) or low dose (child over 12 years) of inhaled corticosteroid and try adding a leukotriene receptor antagonist or long-acting muscarinic receptor antagonist (in children over 12 years).

High-dose inhaled corticosteroids and further add-on treatment

BTS/SIGN (2016) recommend that if control remains inadequate on a combination of a short-acting beta2-agonist as required, a low dose (child 5–12 years) or medium dose (child over 12 years) of inhaled corticosteroid, plus an additional drug, usually a LABA, to consider the following interventions:

- increase the inhaled corticosteroid to a medium-dose (child 5–12 years) or high-dose (child over 12 years)—with high doses of inhaled corticosteroid via a pressurised metered dose inhaler (pMDI), a spacer should be used, or
- add a leukotriene receptor antagonist, or
- add modified-release theophylline p. 274, or
- add tiotropium p. 247 (in children over 12 years).

If a trial of a further add-on treatment is ineffective, stop the drug (or in the case of increased dose of inhaled corticosteroid, reduce to the original dose) and refer to specialist care.

Continuous or frequent use of oral corticosteroids

BTS/SIGN (2016) recommend adding a regular oral corticosteroid (prednisolone p. 678) at the lowest dose to provide adequate control (under specialist care) in children with very severe asthma uncontrolled on a medium dose (child 5–12 years) or high dose (child over 12 years) of inhaled corticosteroid, and who have also tried (or are still receiving) a LABA, a leukotriene receptor antagonist, or modified-release theophylline p. 274.

Monoclonal antibodies and immunosuppressants

BTS/SIGN (2016) recommend, that under specialist initiation, immunosuppressants such as methotrexate p. 913 [unlicensed], and monoclonal antibodies such as omalizumab p. 267 (child over 6 years for severe persistent allergic asthma) can be considered in children with severe asthma to achieve control and reduce the use of oral corticosteroids. See omalizumab p. 267 National funding/access decisions.

Child under 5 years

Intermittent reliever therapy

BTS/SIGN (2016) recommend that a short-acting beta2-agonist (such as salbutamol p. 252) as reliever therapy should be offered to children under 5 years with suspected asthma. A short-acting beta2-agonist should be used for symptom relief alongside maintenance treatment.

Children using more than one short-acting beta2-agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid doses for children under 5 years as paediatric low or moderate. BTS/SIGN (2016) instead define inhaled corticosteroid doses for children under 5 years as very low (refer to individual guidelines for inhaled corticosteroid dosing information).

Consider an 8-week trial of a paediatric moderate dose of inhaled corticosteroid in children presenting with any of the following features: asthma-related symptoms three times a week or more, experiencing night-time awakening at least once a week, or suspected asthma that is uncontrolled with a short-acting beta2-agonist alone.

BTS/SIGN (2016) recommend the prescribing of inhalers by brand.

After 8 weeks, stop inhaled corticosteroid treatment and continue to monitor the child’s symptoms:

- if symptoms did not resolve during the trial period, review whether an alternative diagnosis is likely;
- if symptoms resolved then reoccurred within 4 weeks of stopping inhaled corticosteroid treatment, restart the inhaled corticosteroid at a paediatric low-dose as first-line maintenance therapy;
- if symptoms resolved but reoccurred beyond 4 weeks after stopping inhaled corticosteroid treatment, repeat the 8-week trial of a paediatric moderate dose of inhaled corticosteroid.

BTS/SIGN (2016) instead recommend starting a very low dose of inhaled corticosteroid as initial regular preventer therapy in children presenting with any one of the following features: using an inhaled short-acting beta2-agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week. In children unable to take an inhaled corticosteroid, a leukotriene receptor antagonist (such as montelukast p. 269) may be used as an alternative.

Initial add-on therapy

If suspected asthma is uncontrolled in children under 5 years on a paediatric low dose of inhaled corticosteroid as maintenance therapy, consider a leukotriene receptor antagonist (such as montelukast p. 269) in addition to the inhaled corticosteroid.

If suspected asthma is uncontrolled in children under 5 years on a paediatric low dose of inhaled corticosteroid and a leukotriene receptor antagonist as maintenance therapy, stop the leukotriene receptor antagonist and refer the child to an asthma specialist.

Decreasing treatment

Consider decreasing maintenance therapy when a patient’s asthma has been controlled with their current
maintenance therapy for at least three months. When deciding which drug to decrease first and at what rate, the severity of asthma, the side-effects of treatment, duration on current dose, the beneficial effect achieved, and the patient’s preference, should be considered. Patients should be regularly reviewed when decreasing treatment.

Patients should be maintained at the lowest possible dose of inhaled corticosteroid. Reductions should be considered every three months, decreasing the dose by approximately 25–50% each time. Reduce the dose slowly as patients deteriorate at different rates. Only consider stopping inhaled corticosteroid treatment completely for people who are using a paediatric or adult low dose inhaled corticosteroid alone as maintenance therapy and are symptom-free.

Exercise-induced asthma

For most patients, exercise-induced asthma is an illustration of poorly controlled asthma and regular treatment including inhaled corticosteroids should therefore be reviewed. If exercise is a specific problem in patients already taking inhaled corticosteroids who are otherwise well controlled, consider adding either a leukotriene receptor antagonist, a long-acting beta agonist, an oral beta agonist, sodium cromoglicate p. 270 or nedocromil sodium p. 270, or theophylline p. 274. An inhaled short-acting beta agonist, agonists used immediately before exercise is the drug of choice.

Pregnancy

Women with asthma should be closely monitored during pregnancy. It is particularly important that asthma be well controlled during pregnancy; when this is achieved there is little or no increased risk of adverse maternal or fetal complications.

Women should be counselled about the importance and safety of taking their asthma medication during pregnancy to maintain good control. Women who smoke should be advised about the dangers to themselves and to their baby and be offered appropriate support to stop smoking. For further information, see Smoking cessation p. 497.

Short-acting beta agonists, LABAs, oral and inhaled corticosteroids, sodium cromoglicate p. 270 and nedocromil sodium p. 270, and oral and intravenous theophylline p. 274 (with appropriate monitoring) can be used as normal during pregnancy. There is limited information on use of a leukotriene receptor antagonist during pregnancy, however, where indicated to achieve adequate control, they should not be withheld.

Advanced Pharmacy Services

Patients with asthma may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Useful Resources

www.getintopharma.com
have not had a good initial response to inhaled bronchodilator therapy [unlicensed use]. In an acute asthma attack, intravenous aminophylline p. 272 is not likely to produce any additional bronchodilation compared to standard therapy with inhaled bronchodilators and corticosteroids. However, in some patients with near-fatal or life-threatening acute asthma with a poor response to initial therapy, intravenous aminophylline may provide some benefit. Magnesium sulfate by intravenous infusion or aminophylline should only be used after consultation with, or on the recommendation of, senior medical staff.

**Child over 2 years**

**Levels of severity**

The nature of treatment required for the management of acute asthma depends on the level of severity, described as follows:

- **Mild acute asthma**
  - Able to talk in sentences
  - Arterial oxygen saturation (SpO₂) ≥ 92%
  - Peak flow > 50% best or predicted
  - Heart rate ≤ 140/minute in children aged 2–5 years; heart rate ≤ 125/minute in children over 5 years
  - Respiratory rate ≤ 40/minute in children aged 2–5 years; respiratory rate ≤ 30/minute in children over 5 years

- **Severe acute asthma**
  - Can’t complete sentences in one breath or too breathless to talk or feed
  - SpO₂ < 92%
  - Peak flow 33–50% best or predicted
  - Heart rate > 140/minute in children aged 2–5 years; heart rate > 125/minute in children over 5 years
  - Respiratory rate > 40/minute in children aged 2–5 years; respiratory rate > 30/minute in children over 5 years

- **Life-threatening acute asthma**
  - Any one of the following in a child with severe asthma:
    - SpO₂ < 92%
    - Peak flow < 33% best or predicted
    - Silent chest
    - Cyanosis
    - Poor respiratory effort
    - Hypotension
    - Exhaustion
    - Confusion

**Management**

Following initial assessment, supplementary high flow oxygen should be given to all children with life-threatening acute asthma or SpO₂ < 94% to achieve normal saturations of 94–98%.

First-line treatment for acute asthma is an inhaled short-acting beta₂ agonist (salbutamol or terbutaline sulfate) given as soon as possible, ideally via a metered-dose inhaler and spacer device in mild to moderate acute asthma. Children with severe or life-threatening acute asthma should be transferred to hospital urgently.

In all cases of acute asthma, children should be prescribed an adequate once daily dose of oral prednisolone. Treatment for up to 3 days is usually sufficient, but the length of course should be tailored to the number of days necessary to bring about recovery. Intravenous hydrocortisone should be reserved for severely affected children who are unable to retain oral medication.

Nebulised ipratropium bromide can be combined with beta₂ agonist treatment for children with severe or life-threatening acute asthma or in those with a poor initial response to beta₂ agonist therapy to provide greater bronchodilation. Consider adding magnesium sulfate to nebulised salbutamol and ipratropium bromide in the first hour in children with a short duration of acute severe asthma symptoms presenting with an oxygen saturation less than 92%.

Children with continuing severe asthma despite frequent nebulised beta₂ agonists and ipratropium bromide plus oral corticosteroids, and those with life-threatening features, need urgent review by a specialist with a view to transfer to a high dependency unit or paediatric intensive care unit (PICU) to receive second-line intravenous therapies.

In a severe asthma attack where the child has not responded to initial inhaled therapy, early addition of a single bolus dose of intravenous salbutamol may be an option. Continuous intravenous infusion of salbutamol, administered under specialist supervision with continuous ECG and electrolyte monitoring, should be considered in children with unreliable inhalation or severe refractory asthma. Aminophylline may be considered in children with severe or life-threatening acute asthma unresponsive to maximal doses of bronchodilators and corticosteroids. Aminophylline is not recommended in children with mild to moderate acute asthma. Intravenous magnesium sulfate p. 1051 has been used for acute asthma [unlicensed use] although its place in management is not yet established.

**Child under 2 years**

- **Inhaled short-acting beta₂ agonists** are the initial treatment of choice for acute asthma in children under 2 years. For mild to moderate acute asthma attacks, a metered-dose inhaler with a spacer and mask is the optimal drug delivery device.

**Follow up in all cases**

- **Episodes of acute asthma** may be a failure of preventative therapy. Review is required to prevent further episodes. A careful history should be taken to establish the reason for the asthma attack. Inhaler technique should be checked and regular treatment should be reviewed. Patients should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future attacks. It is essential that the patient’s GP practice is informed within 24 hours of discharge from the emergency department or hospital following an asthma attack. Patients who have had a near-fatal asthma attack should be kept under specialist supervision indefinitely. A respiratory specialist should follow up all patients admitted with a severe asthma attack for at least one year after the admission.

---

**Bronchodilators**

**Adrenoceptor agonists (sympathomimetics)**

Selective beta₂ agonists produce bronchodilation. A short-acting beta₂ agonist (such as salbutamol p. 252 and terbutaline sulfate p. 255) is used for immediate relief of asthma symptoms while some long-acting beta₂ agonists are added to an inhaled corticosteroid in patients requiring prophylactic treatment.

Adrenaline/epinephrine p. 222 (which has both alpha- and beta-adrenoceptor agonist properties) is used in the emergency management of acute allergic and anaphylactic reactions, in angioedema, in cardiopulmonary resuscitation, and in the management of severe croup.

**Long-acting beta₂ agonists**

Formoterol fumarate p. 250 and salmeterol p. 252 are longer-acting beta₂ agonists which are administered by inhalation. They should be used for asthma only in patients who regularly use an inhaled corticosteroid.
Combination inhalers that contain a long-acting β₂ agonist and a corticosteroid ensure that long-acting β₂ agonists are not used without concomitant corticosteroids. Indacaterol p. 251 and olodaterol p. 251 are long-acting β₂ agonists licensed for chronic obstructive pulmonary disease in adults; they are not indicated for the relief of acute bronchospasm.

Vilanterol is a long-acting β₂ agonist, agonist available only in a combination inhaler with fluticasone furoate or/and with umeclidinium p. 249.

**Oral**

Oral preparations of β₂ agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled β₂ agonists are more effective and have fewer side-effects. The longer-acting oral preparations, including bamberterol hydrochloride p. 250, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting β₂ agonists are usually preferred.

**Parenteral**

Salmeterol or terbutaline sulfate can be given intravenously for severe or life-threatening acute asthma; patients should be carefully monitored and the dose adjusted according to response and heart rate. The regular use of β₂ agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started. In adults, β₂ agonists may also be given by intramuscular injection.

**Children**

A pressurised metered-dose inhaler should be used with a spacer device in children under 5 years. A β₂ agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled β₂ agonist may be used where appropriate. In severe attacks nebulisation using a selective β₂ agonist or ipratropium bromide p. 246 is advisable.

**Antimuscarinic bronchodilators**

Ipratropium bromide can provide short-term relief in chronic asthma, but short-acting β₂ agonists act more quickly and are preferred. Ipratropium bromide by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy. The aerosol inhalation of ipratropium bromide can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Acicline bromide p. 245, glycopyrronium bromide p. 246, tiotropium p. 247, and umeclidinium p. 249 are licensed for the maintenance treatment of adults with chronic obstructive pulmonary disease. They are not suitable for the relief of acute bronchospasm.

**Theophylline**

Theophylline p. 274 is a xanthine used as a bronchodilator in asthma and stable chronic obstructive pulmonary disease; it is not generally effective in exacerbations of chronic obstructive pulmonary disease. Theophylline may have an additive effect when used in conjunction with small doses of β₂ agonists; the combination may increase the risk of side-effects, including hypokalaemia.

Theophylline is given by injection as aminophylline p. 272, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe acute asthma.

**Compound bronchodilator preparations**

In general, patients are best treated with single-ingredient preparations, such as a selective β₂ agonist or ipratropium bromide, so that the dose of each drug can be adjusted. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

**Chronic obstructive pulmonary disease**

**Management**

Smoking cessation p. 497 reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1316 and influenza vaccine p. 1322).

A trial of a high-dose inhaled corticosteroid or an oral corticosteroid is recommended for patients with moderate or severe airflow obstruction in the absence of doubt. Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled short-acting β₂ agonist or a short-acting antimuscarinic bronchodilator used as required.

When the airflow obstruction is more severe, regular inhaled therapy should be used. It is important to check compliance and inhaler technique before initiating a new drug.

If the Forced Expiratory Volume in 1 second (FEV₁), is 50% of predicted or more, either a long-acting antimuscarinic bronchodilator or a long-acting β₂ agonist should be used. Short-acting antimuscarinic bronchodilators should be discontinued when a long-acting antimuscarinic bronchodilator is started. A long-acting β₂ agonist with a corticosteroid in a combination inhaler can be used for patients who remain symptomatic despite regular treatment with a long-acting β₂ agonist.

If FEV₁ is less than 50% of predicted, either a long-acting antimuscarinic bronchodilator or a long-acting β₂ agonist, with a corticosteroid in a combination inhaler should be used.

In any patient who remains breathless or continues to have exacerbations, triple therapy with a long-acting β₂ agonist and a corticosteroid in a combination inhaler plus a long-acting antimuscarinic bronchodilator should be used. If an inhaled corticosteroid is not appropriate, a long-acting antimuscarinic bronchodilator can be used with a long-acting β₂ agonist, (see Use of inhaled therapies in chronic obstructive pulmonary disease algorithm, below).

If symptoms persist or if the patient is unable to use an inhaler, oral modified-release aminophylline p. 272 or theophylline p. 274 can be used.

Indacaterol p. 251 is a long-acting β₂ agonist licensed for the maintenance treatment of chronic obstructive pulmonary disease.

In patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations, rolflumilast p. 271 is licensed as an adjunct to existing bronchodilator treatment.

A mucolytic drug may be considered for a patient with a chronic productive cough.

Long-term oxygen therapy prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia.

During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate.
Aminophylline can be given intravenously if response to nebulised bronchodilators is poor. A short course of oral corticosteroid, such as prednisolone for 7–14 days, should be given if increased breathlessness interferes with daily activities. Antibacterial treatment is required if sputum becomes more purulent than usual, or if there are other signs of infection. Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an oxygen alert card endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation.

Oxygen alert card based on British Thoracic Society guideline for emergency oxygen use in adult patients (October 2008)

Oxygen alert card

Name:

I am at risk of type II respiratory failure with a raised CO₂ level.

Please use my ____% Venturi mask to achieve an oxygen saturation of ____% to ____% during exacerbations.

Use compressed air to drive nebulisers (with nasal oxygen at 2 litres/minute). If compressed air not available, limit oxygen-driven nebulisers to 6 minutes.

Use compressed air to drive nebulisers (with nasal oxygen at 2 litres/minute). If compressed air not available, limit oxygen-driven nebulisers to 6 minutes.

Oxygen alert card is available at www.brit-thoracic.org.uk.

Advanced Pharmacy Services

Patients with chronic obstructive pulmonary disease may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Oxygen

Overview

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences. Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide (P₂CO₂), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure. High concentration oxygen therapy is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen (P₅O₂) is usually associated with low or normal arterial carbon dioxide (P₂CO₂), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In acute severe asthma, the arterial carbon dioxide (P₂CO₂) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide (P₂CO₂) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:

- chronic obstructive pulmonary disease;
- advanced cystic fibrosis;
- severe non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an oxygen alert card.

Domiciliary oxygen

Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts. Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy p. 497 should be recommended before home oxygen prescription.

Air travel

Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient’s requirement should be discussed with the airline before travel.

Long-term oxygen therapy

Long-term administration of oxygen (usually at least 15 hours daily) prolongs survival in some patients with chronic obstructive pulmonary disease. Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease. Long-term oxygen therapy should be considered for patients with:

- chronic obstructive pulmonary disease with P₂O₂<7.3 kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with P₂O₂ 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with P₂O₂<7.3 kPa or persistent disabling breathlessness;
- interstitial lung disease with P₂O₂<8 kPa and in patients with P₂O₂>8 kPa with disabling dyspnoea;
- cystic fibrosis when P₂O₂<7.3 kPa or if P₂O₂ 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, pulmonary hypertension, or peripheral oedema;
- pulmonary hypertension, without parenchymal lung involvement when P₂O₂<8 kPa;
- neuromuscular or skeletal disorders, after specialist assessment;
- obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;

In acute severe asthma, the arterial carbon dioxide (P₂CO₂) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide (P₂CO₂) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.
Use of inhaled therapies in chronic obstructive pulmonary disease

Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

Oxygen therapy equipment

Under the NHS oxygen may be supplied as oxygen cylinders. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with ‘medium’ (2 litres/minute) and ‘high’ (4 litres/minute) settings. Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

Oxygen concentrators are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a patient who

- pulmonary malignancy or other terminal disease with disabling dyspnoea;
- heart failure with daytime PaO₂ < 7.3 kPa when breathing air or with nocturnal hypoaxaemia;
- paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occur.

Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

www.getintopharma.com
requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a ‘Y’ connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

Arrangements for supplying oxygen
The following oxygen services may be ordered in England and Wales:
- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient or carers consent, to pass on the patient’s details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the patient no longer requires the home oxygen service.

- East of England, North East: BOC Medical: Tel: 0800 136 603 Fax: 0800 169 9989
- South West: Air Liquide: Tel: 0808 202 2229 Fax: 0191 497 4340
- London, East Midlands, North West: Air Liquide: Tel: 0800 823 773 Fax: 0800 781 4610
- Yorkshire and Humberside, West Midlands, Wales: Air Products: Tel: 0800 373 580 Fax: 0800 264 709
- South East Coast, South Central: Dolby Vivosol: Tel: 0843 814 402 Fax: 0800 781 4610

In Scotland refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. Prescribers should complete a Scottish Home Oxygen Order Form (SHOOF) and email it to Health Facilities Scotland. Health Facilities Scotland will then liaise with their consultant to arrange the supply of oxygen. Further information can be obtained at: www.dolbyvivosol.com/our-services/healthcare-professionals/home-oxygen-services-sco.aspx.

In Northern Ireland oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. Prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

Croup
Management
Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone p. 675) by mouth may be of benefit.

More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone or prednisolone p. 678 by mouth) should be administered before transfer to hospital. In hospital, dexamethasone (by mouth or by injection) or budesonide p. 260 (by nebulisation) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline/epinephrine p. 222 solution 1 in 1000 (1 mg/mL) should be given with close clinical monitoring; the effects of nebulised adrenaline/epinephrine last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

Antimuscarinics
Antimuscarinics (inhaled)

**Indications and dose**

Maintenance treatment of chronic obstructive pulmonary disease
- **By inhalation of powder**
  - Adult: 375 micrograms twice daily
- **Dose equivalence and conversion**
  - Each 375 microgram inhalation of aclidinium bromide delivers 322 micrograms of aclidinium.

**CAUTIONS**

- Arrhythmia (when newly diagnosed within last 12 months)
- Arrhythmia (when newly diagnosed within last 6 months)
- Arrhythmia (when newly diagnosed within last 3 months)
- Heart failure (hospitalisation with moderate or severe heart failure within last 12 months)
- Myocardial infarction within last 6 months
- Unstable angina
- Hypersensitivity
- Diarrhoea - nasopharyngitis
- Angioedema
- Rare or very rare
- Breastfeeding
- Patients or carers should be given advice on appropriate inhaler technique.

Glycopyrronium bromide (Glycopyrrolate)

13-Sep-2017

**INDICATIONS AND DOSE**

- Maintenance treatment of chronic obstructive pulmonary disease
  - By Inhalation of Powder
  - Adult: 1 capsule once daily

**DOSE EQUIVALENCE AND CONVERSION**

- Each capsule delivers 55 micrograms of glycopyrronium bromide (equivalent to 44 micrograms of glycopyrronium).

**CAUTIONS**

- Arrhythmia (excluding chronic stable atrial fibrillation) · history of myocardial infarction · history of QT-interval prolongation · left ventricular failure · unstable ischaemic heart disease

**SIDE-EFFECTS**

- Common or very common · Increased risk of infection · insomnia · pain

- Uncommon · Asthenia · cystitis · dental caries · dyspepsia · epistaxis · hyperglycaemia · hypersensitivity · numbness · respiratory disorders · throat irritation

**PREGNANCY**

- Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

- Manufacturer advises use only if potential benefit outweighs risk.

**RENAL IMPAIRMENT**

- Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 30 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

- Patients or carers should be given advice on appropriate inhaler technique.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

Ipratropium bromide

25-Jul-2018

**INDICATIONS AND DOSE**

- Reversible airways obstruction
  - By Inhalation of Aerosol

- Child 1 month-5 years: 20 micrograms 3 times a day
- Child 6-11 years: 20–40 micrograms 3 times a day
- Child 12-17 years: 20–40 micrograms 3–4 times a day

- Reversible airways obstruction, particularly in chronic obstructive pulmonary disease
  - By Inhalation of Aerosol

- Adult: 20–40 micrograms 3–4 times a day

**INHALATION SOLUTION**

- By Inhalation of Nebulised Solution

- Child 1 month-5 years: 125–250 micrograms as required; maximum 1 mg per day
- Child 6-11 years: 250 micrograms as required; maximum 1 mg per day
- Child 12-17 years: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day
- Adult: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day

### Tiotropium

**Maintenance treatment of chronic obstructive pulmonary disease**

- **By inhalation of powder**
- **Adult:** 1 capsule once daily

### Dose equivalence and conversion

- For Spiriva® inhalation powder, 1 capsule contains a metered dose of 18 micrograms tiotropium; for Braltau® inhalation powder, 1 capsule contains a metered dose of 13 micrograms tiotropium.
- The delivered dose of Spiriva® and Braltau® inhalation powder products are the same (10 micrograms); no dose adjustment is necessary when switching between brands.

**Spiriva Respimat®**

**Maintenance treatment of chronic obstructive pulmonary disease:** Severe asthma [add-on to inhaled corticosteroid (at least 500 micrograms budesonide daily or equivalent) and at least 1 controller in patients who have suffered one or more severe exacerbations in the last year]

- **By inhalation of aerosol**
- **Adult:** 5 micrograms once daily (continued)

---

[www.getintopharma.com](http://www.getintopharma.com)
Severe asthma [add-on to inhaled corticosteroid (over 400 micrograms budesonide daily or equivalent) and 1 controller, or inhaled corticosteroid (200–400 micrograms budesonide daily or equivalent) and 2 controllers, in patients who have suffered one or more severe exacerbations in the last year]

- By inhalation of aerosol
- Child 6–11 years: 5 micrograms once daily
- Severe asthma [add-on to inhaled corticosteroid (over 800 micrograms budesonide daily or equivalent) and 1 controller, or inhaled corticosteroid (400–800 micrograms budesonide daily or equivalent) and 2 controllers, in patients who have suffered one or more severe exacerbations in the last year]

- By inhalation of aerosol
- Child 12–17 years: 5 micrograms once daily

Dose equivalence and conversion
- For Spiriva Respimat®: 2 puffs is equivalent to 5 micrograms tiotropium.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) decisions
SMC No. 1028/15
- In adults The Scottish Medicines Consortium has advised (August 2015) that tiotropium (Spiriva Respimat®) is accepted for use within NHS Scotland as add-on maintenance bronchodilator treatment in adults with asthma who are currently treated with the maintenance combination of inhaled corticosteroids (≥800 micrograms budesonide/day or equivalent) and long-acting β₂-agonists and who experienced one or more severe exacerbations in the previous year.
SMC No. 411/07
- In adults The Scottish Medicines Consortium has advised (December 2017) that tiotropium (Spiriva Respimat®) is accepted for use within NHS Scotland as a maintenance bronchodilator treatment to relieve symptoms of patients with chronic obstructive pulmonary disease.
SMC No. SMC2118
- The Scottish Medicines Consortium has advised (January 2019) that tiotropium (Spiriva Respimat®) is accepted for use within NHS Scotland as add-on maintenance bronchodilator treatment in patients aged 6 years and older with severe asthma who experienced one or more severe asthma exacerbations in the preceding year.

All Wales Medicines Strategy Group (AWMSG) decisions
AWMSG No. 1882
The All Wales Medicines Strategy Group has advised (December 2018) that tiotropium (Spiriva Respimat®) is recommended as an option for use within NHS Wales as add-on maintenance bronchodilator treatment in patients aged 6 years and older with severe asthma who experienced one or more severe asthma exacerbations in the preceding year.

250

BETA2-ADRENOCEPTOR AGONISTS, SELECTIVE ▶ LONG-ACTING

Bambuterol hydrochloride

05-Jun-2018

DRUG ACTION Bambuterol is a pro-drug of terbutaline.

INDICATIONS AND DOSE

Asthma (patients who have previously tolerated beta2-agonists) | Other conditions associated with reversible airways obstruction (patients who have previously tolerated beta2-agonists)

- BY MOUTH
  - Adult: 20 mg once daily, dose to be taken at bedtime

Asthma (patients who have not previously tolerated beta2-agonists) | Other conditions associated with reversible airways obstruction (patients who have not previously tolerated beta2-agonists)

- BY MOUTH
  - Adult: Initially 10 mg once daily for 1–2 weeks, then increased if necessary to 20 mg once daily, dose to be taken at bedtime

INTERACTIONS ▶ Appendix 1: beta2 agonists

SIDE-EFFECTS

- Common or very common: Anxiety, behaviour abnormal, muscle cramps, sleep disorder
- Frequency not known: Akathisia, angioedema, bronchospasm, circulatory collapse, hypersensitivity, hypotension, skin reactions

PREGNANCY

Manufacturer advises avoid—no information available.

BREAST FEEDING

Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

Manufacturer advises avoid in severe impairment or cirrhosis (risk of unpredictable conversion to terbutaline; direct terbutaline use preferred).

RENAL IMPAIRMENT

Dose adjustments Reduce initial dose by half if eGFR less than 50 mL/minute/1.73 m².

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Bambec** (AstraZeneca UK Ltd)
  - Bambuterol hydrochloride 10 mg Bambec 10mg tablets | 30 tablet [PDF] £5.99 DT + £3.99

Formoterol fumarate
(Eformoterol fumarate)

INDICATIONS AND DOSE

Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nighttime asthma in patients requiring long-term regular bronchodilator therapy | Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma in patients who regularly use an inhaled corticosteroid

- BY INHALATION OF POWDER
- Child 6–11 years: 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
  - Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

- BY INHALATION OF AEROSOL
- Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

CHRONIC OBSTRUCTIVE PULMONARY DISEASE

- BY INHALATION OF POWDER
- Adult: 12 micrograms twice daily
- Adult: 12 micrograms twice daily (max. per dose 24 micrograms), for symptom relief additional doses may be taken to maximum daily dose; maximum 48 micrograms per day

PHARMACOKINETICS

At recommended inhaled doses, the duration of action of formoterol is about 12 hours.

OXIS ®

CHRONIC ASTHMA

- BY INHALATION OF POWDER
- Child 6–17 years: 6–12 micrograms 1–2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day
- Adult: 6–12 micrograms 1–2 times a day, increased if necessary up to 24 micrograms twice daily (max. per dose 36 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 72 micrograms per day

RELIEF OF BRONCHOSPASM

- BY INHALATION OF POWDER
- Child 6–17 years: 6–12 micrograms
- Adult: 6–12 micrograms

PROPHYLAXIS OF EXERCISE-INDUCED BRONCHOSPASM

- BY INHALATION OF POWDER
- Child 6–17 years: 6–12 micrograms, dose to be taken before exercise
- Adult: 12 micrograms, dose to be taken before exercise

CHRONIC OBSTRUCTIVE PULMONARY DISEASE

- BY INHALATION OF POWDER
- Adult: 12 micrograms 1–2 times a day (max. per dose 24 micrograms), for symptom relief additional doses up to maximum daily dose can be taken; maximum 48 micrograms per day

IMPORTANT SAFETY INFORMATION

CHM ADVICE

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta2 agonist (formoterol) should:
Indacaterol

Indications and Dose

Maintenance treatment of chronic obstructive pulmonary disease

By inhalation of powder

Adult: 150 micrograms once daily, then increased to 300 micrograms once daily.

Caution

Convulsive disorders

Interactions

Appendix 1: beta, agonists

Side-effects

Common or very common
- Chest pain
- Cough
- Increased risk of infection
- Muscle complaints
- Oropharyngeal pain
- Peripheral oedema
- Rhinorrhoea
- Throat irritation

Common
- Diabetes mellitus
- Hypersensitivity
- Musculoskeletal pain
- Paraesthesia
- Skin reactions

Pregnancy

Manufacturer advises use only if potential benefit outweighs risk.

Breast feeding

Manufacturer advises avoid—present in milk in animal studies.

Hepatic impairment

Use with caution in severe impairment—no information available.

Patient and carer advice

Patients or carers should be given advice on how to administer indacaterol inhalation powder.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

- Easyhaler (formoterol) (Orion Pharma (UK) Ltd)
  - Formoterol fumarate dihydrate 12 microgram per 1 dose
  - 246.00
  - Formoterol fumarate dihydrate 24 microgram per 1 dose
  - 492.00

- Foradil (Novartis Pharmaceuticals UK Ltd)
  - Formoterol fumarate dihydrate 12 microgram per 1 dose
  - 246.00

- Oxis Turbohaler (AstraZeneca UK Ltd)
  - Formoterol fumarate dihydrate 6 microgram per 1 dose
  - 120 capsule (POD) £23.75 DT = £23.75
  - Formoterol fumarate dihydrate 12 microgram per 1 dose
  - 60 capsule (POD) £28.06 DT = £28.06

- Atimos Modulite (Chiesi Ltd)
  - Formoterol fumarate dihydrate 12 microgram per 1 dose
  - 100 dose (POD) £30.06 DT = £30.06

Combination available: Glycopyrronium with indacaterol, p. 246

Olodaterol

Indications and Dose

Maintenance treatment of chronic obstructive pulmonary disease

By inhalation

Adult: 5 micrograms once daily

Dose equivalence and conversion

2 puffs is equivalent to 5 micrograms.

Caution

Aneurysm - convulsive disorders

Interactions

Appendix 1: beta, agonists

Side-effects

Common or very common
- Nasopharyngitis
- Rash
- Increased risk of infection

Rare or very rare
- Angina pectoris
- Arthralgia
- Hypotension
- Insomnia
- Malaise
- Metabolic acidosis
- Muscle spasms
- Nervousness

Pregnancy

Manufacturer advises avoid—no information available.

Breast feeding

Manufacturer advises avoid—present in milk in animal studies.
252 Airways disease, obstructive

Respiratory system

In children

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised inhalation**

- Salmeterol (as Salmeterol hydrochloride) 2.5 microgram per 1 dose
- Salmeterol (as Salmeterol hydrochloride) 50 microgram per 1 dose

Combinations available: Tiotropium with olodaterol, p. 249

**INDICATIONS AND DOSE**

Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy

- Child 12-17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily
- Adult: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily

**CHRONIC OBSTRUCTIVE PULMONARY DISEASE**

- Adult: 50 micrograms twice daily

**PHARMACOKINETICS**

- At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

**UNLICENSED USE**

- In children Neovent® not licensed for use in children under 12 years.

**IMPORTANT SAFETY INFORMATION**

**CHM ADVICE**

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (salmeterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

**MHRA/CHM ADVICE: PRESSURISED Metered Dose Inhalers (PMDIs) RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)**

See Respiratory system, drug delivery p. 235.

**INTERACTIONS**

→ Appendix 1: beta₂ agonists

**SIDE-EFFECTS**

- Common or very common Muscle cramps
- Uncommon Nervousness, skin reactions
- Rare or very rare Arthralgia, bronchospasm, chest pain, insomnia, oedema, ophthalmic irritation

**PREGNANCY**

Inhaled drugs for asthma can be taken as normal during pregnancy.

**BREAST FEEDING**

Inhaled drugs for asthma can be taken as normal during breast-feeding.

**PATIENT AND CARER ADVICE**

Advise patients that salmeterol should not be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible.

Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist.

Medicines for Children leaflet: Salmeterol inhaler for asthma www.medicinesforchildren.org.uk/salmeterol-inhaler-asthma

**INDICATIONS AND DOSE**

Inhaled short-acting beta₂ agonists are not recommended for use in children over 12 years.

**INDICATIONS AND DOSE**

**INTERACTIONS**

→ Appendix 1: beta₂ agonists

**SIDE-EFFECTS**

- Common or very common Muscle cramps
- Uncommon Nervousness, skin reactions
- Rare or very rare Arthralgia, bronchospasm, chest pain, insomnia, oedema, ophthalmic irritation

**PREGNANCY**

Inhaled drugs for asthma can be taken as normal during pregnancy.

**BREAST FEEDING**

Inhaled drugs for asthma can be taken as normal during breast-feeding.

**PATIENT AND CARER ADVICE**

Advise patients that salmeterol should not be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible.

Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist.

Airways disease, obstructive 253

Bronchospasm

Prophylaxis of allergen- or exercise-induced bronchospasm

BY INHALATION OF AEROSOL

Adult: 200 micrograms

Acute asthma

BY INHALATION OF AEROSOL

Child: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer, each puff is equivalent to 100 micrograms

Child: 2–10 years: 2.5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

Child 12–17 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

Moderate, severe, or life-threatening acute asthma

BY INHALATION OF NEBULISED SOLUTION

Child 1–2 years: 2.5 mg, repeated up to 4 times daily or more frequently in severe cases

Child 3–6 years: 5 mg, repeated every 4 hours

Child 7–11 years: 10 micrograms/kg (max. per dose 200 micrograms)

Child 12–17 years: 5 mg, repeated up to 4 times a day

Moderate and severe acute asthma

BY INHALATION OF AEROSOL

Child: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer, each puff is equivalent to 100 micrograms

Noveliser

Child 2–10 years: 200 micrograms daily for persistent symptoms

Child 11–12 years: 400 micrograms, up to 3 times daily for persistent symptoms

Child 13–17 years: 800 micrograms daily for persistent symptoms

Exacerbation of reversible airways obstruction (including nocturnal asthma) / Prophylaxis of allergen- or exercise-induced bronchospasm

BY INHALATION OF AEROSOL

Child: 100–200 micrograms, up to 4 times a day for persistent symptoms

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child: 3–11 years: 4 mg twice daily

Child 12–17 years: 8 mg twice daily

Child 12–17 years: 8 mg twice daily

Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist supervision in hospital)

BY INTRAVENOUS INFUSION

Adult: Initially 10 micrograms/minute, rate increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (maximum rate 45 micrograms/minute), maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours, maximum duration 48 hours

PHARMACOKINETICS

At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours.

EASYHALER® SALBUTAMOL

Acute bronchospasm

BY INHALATION OF POWDER

Child: Initially 100–200 micrograms, increased if necessary to 400 micrograms; maximum 800 micrograms per day

Prophylaxis of allergen- or exercise-induced bronchospasm

BY INHALATION OF POWDER

Adult: 200 micrograms

SALBULIN NOVOLIZER®

Acute bronchospasm

BY INHALATION OF POWDER

Adult: Initially 100–200 micrograms, up to 800 micrograms daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm

BY INHALATION OF POWDER

Adult: 200 micrograms

VENTOLIN ACCUHALER®

Acute bronchospasm

BY INHALATION OF POWDER

Adult: Initially 200 micrograms, up to 4 times daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm

BY INHALATION OF POWDER

Adult: 200 micrograms

UNLICENSED USE

With oral use in children Syrup and tablets not licensed for use in children under 2 years

With intravenous use in children Injection and solution for intravenous infusion not licensed for use in children under 12 years. Administration of undiluted salbutamol injection through a central venous catheter is not licensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 235.

CONTRA-INDICATIONS

When used for uncomplicated premature labour under specialist supervision Abruptio placenta · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia · significant risk factors for myocardial ischaemia · threatened miscarriage

CAUTIONS

GENERAL CAUTIONS High doses of beta₂ agonists can be dangerous in some children
Respiratory system

When used by inhalation

▶ With intravenous use in adults
▶ With intravenous use in children

BREAST FEEDING
▶ With parenteral use
▶ Frequency not known
▶ With parenteral use
▶ Frequency not known
▶ Rare or very rare

SIDE-EFFECTS
INTERACTIONS

With intravenous use

- glucose and lactate concentrations, and the patient normal during breast-feeding.

- cardiovascular disease (should be assessed by a

- Airways disease, obstructive

- bronchodilator by

- continuous intravenous infusion, dilute to a concentration of 200 micrograms/mL with glucose 5% or sodium chloride 0.9%. For premature labour by continuous intravenous infusion, dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably via controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient’s fluid and electrolyte status essential.

- When used by inhalation For inhalation by aerosol or dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible. For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

Terbutaline sulfate

- **INDICATIONS AND DOSE**
  - **Asthma** | Other conditions associated with reversible airways obstruction
  - **BY INHALATION OF POWDER**
    - Adult: Initially 2.5 mg 3 times a day 1 to 2 weeks, then increased to up to 5 mg 3 times a day, by use of inhalation preferred over by mouth
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
    - Adult: 250–500 micrograms up to 4 times a day, reserve intravenous beta2 agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
    - Child: 90–300 micrograms/hour for 8–10 hours, to be administered as a solution containing 3–5 micrograms/mL, high doses require close monitoring, reserve intravenous beta2 agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
  - **BY INHALATION OF POWDER**
    - Adult: 500 micrograms up to 4 times a day, for persistent symptoms
  - **BY INHALATION OF NEBULISED SOLUTION**
    - Adult: 5–10 mg 2–4 times a day, additional doses may be necessary in severe acute asthma

- **Acute asthma**
  - **BY SUBCUTANEOUS INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
    - Child 2–14 years: 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous beta2 agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
  - **Child 15–17 years**: 250–500 micrograms up to 4 times a day, reserve intravenous beta2 agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
    - Child: Loading dose 2–4 micrograms/kg, then 1–10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous beta2 agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

- **Moderate, severe, or life-threatening acute asthma**
  - **BY INHALATION OF NEBULISED SOLUTION**
    - Child 1 month–4 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
    - Child 5–11 years: 5–10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
    - Child 12–17 years: 10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
    - Adult: 10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

- **EXACERBATION OF REVERSIBLE AIRWAYS OBSTRUCTION (INCLUDING NOCTURAL ASTHMA)**
  - **BY INHALATION OF POWDER**
    - Child 5–17 years: 500 micrograms up to 4 times a day, for occasional use only
  - **BY MOUTH**
    - Child 1 month–6 years: 75 micrograms/kg 3 times a day (max. per dose 2.5 mg), administration by mouth is not recommended
    - Child 7–14 years: 2.5 mg 2–3 times a day, administration by mouth is not recommended
    - Child 15–17 years: Initially 2.5 mg 3 times a day, then increased if necessary to 5 mg 3 times a day, administration by mouth is not recommended

- **Uncomplicated premature labour (between 22 and 37 weeks of gestation) (Specialist supervision in hospital)**
  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 5 micrograms/minute for 20 minutes, then increased in steps of 2.5 micrograms/minute every 20 minutes until contractions have ceased (more than 10 micrograms/minute should seldom be given—20 micrograms/minute should not be exceeded), continue for 1 hour, then reduced in steps of 2.5 micrograms/minute every 20 minutes to lowest dose that maintains suppression (maximum total duration 48 hours)

- **PHARMACOKINETICS**
  - At recommended inhaled doses, the duration of action of terbutaline is about 3 to 5 hours.
**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

**Solution for injection**

- **Bricanyl** (AstraZeneca UK Ltd)
  - Terbutaline sulfate 500 microgram per 1 ml
  - Terbutaline sulfate 2.5mg/5ml solution for injection ampoules | 10 ampoule ($P$, £20) + £20.09
  - Bricanyl 500micrograms/1ml solution for injection ampoules | 5 ampoule ($P$, £6.48) + £6.48

**Inhalation powder**

- **Bricanyl Turbohaler** (AstraZeneca UK Ltd)
  - Terbutaline sulfate 500 microgram per 1 dose
  - Bricanyl 500micrograms/dose Turbohaler | 120 dose ($P$, £8.30) + £8.30

**Nebuliser liquid**

- **Terbutaline sulfate (Non-proprietary)**
  - Terbutaline sulfate 2.5 mg per 1 ml
  - Terbutaline 5mg/2ml nebuliser liquid unit dose vials | 20 unit dose ($P$, £4.04) + £4.04

- **Bricanyl Respules** (AstraZeneca UK Ltd)
  - Terbutaline sulfate 2.5 mg per 1 ml
  - Bricanyl 5mg/2ml Respules | 20 unit dose ($P$, £11.64) + £4.04

**Tablet**

- **Bricanyl** (AstraZeneca UK Ltd)
  - Terbutaline sulfate 5 mg
  - Bricanyl 5mg tablets | 100 tablet ($P$, £14.73) + £14.73

**DIRECTIONS FOR ADMINISTRATION**

- **With intravenous use in children** For *continuous intravenous infusion*, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL.

- **When used by inhalation** For *nebulisation*, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.

- **With intravenous use in adults** For *bronchodilation* by *continuous intravenous infusion*, dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours. For premature labour by *continuous intravenous infusion*, dilute in glucose 5% and give via controlled infusion device preferably a syringe pump; if syringe pump available dilute to a concentration of 100 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient’s fluid and electrolyte status essential.

**PATIENT AND CARER ADVICE**

- When used by inhalation For *inhalation by dry powder*, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible. For *inhalation by nebuliser*, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

**CORTICOSTEROIDS**

**Airways disease, use of corticosteroids**

**Asthma, use of corticosteroids**

**Inhaled corticosteroids**

Corticosteroids are effective in asthma; they reduce airway inflammation (and hence reduce oedema and secretion of mucus into the airway).

An inhaled corticosteroid is used regularly for prophylaxis of asthma. *Regular use* of inhaled corticosteroids reduces the risk of exacerbation of asthma.

Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary. Corticosteroid inhalers must be used regularly for maximum benefit. Beclomethasone dipropionate p. 257, budesonide p. 260, fluticasone p. 262, and mometasone furoate p. 265 appear to be equally effective.

In adults using an inhaled corticosteroid and a long-acting beta₂ agonist for the prophylaxis of asthma, but who are poorly controlled, ‘Symbicort®’ or ‘Duod Resp Spirax®’ (both containing budesonide with formoterol p. 261) or ‘Fostair®’ beclomethasone with formoterol p. 259 can be used as relievers (instead of a short-acting beta, agonist), in addition to their regular use for the prophylaxis of asthma.

**Oral corticosteroids**

Systemic corticosteroid therapy may be necessary during episodes of stress, such as severe infection, or when airway obstruction or mucus prevent drug access to smaller airways.

An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly; tapering is not needed provided that the patient receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid treatment or where oral corticosteroids are required for 3 or more weeks). In patients who have needed several courses of oral corticosteroids and in whom the possibility of a period on maintenance corticosteroids is being considered, it may be useful to taper the corticosteroid dose gradually to identify a threshold dose for asthma control. This should only be done after other standard options for controlling asthma have been tried.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Regular peak-flow measurements help to optimise the dose.

**Parenteral corticosteroids**

Hydrocortisone injection p. 676 has a role in the emergency treatment of acute severe asthma.

**Chronic obstructive pulmonary disease, use of corticosteroids**

**Inhaled corticosteroids**

In *chronic obstructive pulmonary disease* inhaled corticosteroid therapy may reduce exacerbations when given in combination with an inhaled long-acting beta, agonist.

**Oral corticosteroids**

During an acute exacerbation of chronic obstructive pulmonary disease, prednisolone p. 676 should be given; treatment can be stopped abruptly. Prolonged treatment with oral prednisolone is of no benefit and maintenance treatment is not normally recommended.

**Monitoring Requirements**

- In adults Uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient’s fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).
Corticosteroids (inhaled)

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

**SIDE-EFFECTS**

- **Common or very common** Headache, oral candidiasis, pneumonia (in patients with COPD) (in adults), taste altered, voice alteration
- **Uncommon** Anxiety, bronchospasm paradoxical, cataract, vision blurred
- **Rare or very rare** Adrenal suppression, behaviour abnormal, glaucoma, growth retardation (in children), sleep disorder

**SIDE-EFFECTS, FURTHER INFORMATION**

Systemic absorption may follow inhaled administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids.

- **Candidiasis** The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.
- **Paradoxical bronchospasm** The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind. Mild bronchospasm may be prevented by inhalation of a short-acting beta2 agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.
- **BREAST FEEDING** Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.

**MONITORING REQUIREMENTS**

- In children The height and weight of children receiving prolonged treatment with inhaled corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**
  - Inhaled corticosteroids for the treatment of chronic asthma in children under 12 years (November 2007) NICE TAs
  - In children For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual child (taking into consideration NICE TAs 38 and 10), within its marketing authorisation, is recommended. For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta2 agonist is considered appropriate, the following apply:
    - the use of a combination inhaler within its marketing authorisation is recommended as an option;
    - the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need and the likelihood of treatment adherence;
  - if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual child is recommended.
  - [www.nice.org.uk/TA131](http://www.nice.org.uk/TA131)
- Inhaled corticosteroids for the treatment of chronic asthma in adults and children over 12 years (March 2008) NICE TA138
  - For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual (taking into consideration NICE TAs 38 and 10), within its marketing authorisation is recommended.
  - For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta2 agonist is considered appropriate, the following apply:
    - the use of a combination inhaler within its marketing authorisation is recommended as an option;
    - the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need and the likelihood of treatment adherence;
    - if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual is recommended.

**Beclometasone dipropionate** (Beclomethasone dipropionate)

**INDICATIONS AND DOSE**

- **Prophylaxis of asthma**
  - **BY INHALATION OF POWDER**
    - Child 5–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
    - Child 12–17 years: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary
    - Adult: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary

**DOSE EQUIVALENTS AND CONVERSIONS**

- Dose adjustments may be required for some inhaler devices, see under individual preparations.

**CLENIL MODULITE ®**

- **Prophylaxis of asthma**
  - **BY INHALATION OF AEROSOL**
    - Child 2–11 years: 100–200 micrograms twice daily
    - Child 12–17 years: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily
    - Adult: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily

**KELHALE ®**

- **Prophylaxis of asthma**
  - **BY INHALATION OF AEROSOL**
    - Adult: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily

**POTENCY**

- Kelhale ® has extra-fine particles and is more potent than traditional beclomethasone dipropionate CFC-containing inhalers.
QVAR \textsuperscript{®} PREPARATIONS

Prophylaxis of asthma
- BY INHALATION OF AEROSOL
  - Child: 100 micrograms twice daily; increased if necessary up to 400 micrograms twice daily
  - Adult: 200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily

POTENCY
- Qvar\textsuperscript{®} has extra fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers and is approximately twice as potent as Clenil Modulite\textsuperscript{®}.

SOPROBEC \textsuperscript{®}

Prophylaxis of asthma
- BY INHALATION OF AEROSOL
  - Child: 100 micrograms twice daily; increased if necessary up to 400 micrograms daily in 2–4 divided doses
  - Adult: 200 micrograms twice daily, adjusted according to response; increased if necessary up to 2 mg daily in 2–4 divided doses

**UNLICENSED USE** Easyhaler\textsuperscript{®} Beclometasone Dipropionate is not licensed for use in children under 18 years. Clenil Modulite\textsuperscript{®} - 200 and - 250 are not licensed for use in children under 12 years.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (JULY 2008)
Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (Qvar\textsuperscript{®} and Clenil Modulite\textsuperscript{®}) are not interchangeable and should be prescribed by brand name; Qvar\textsuperscript{®} has extra fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as Clenil Modulite\textsuperscript{®}.

MHRA/CHM ADVICE: PRESSURISED Metered Dose Inhalers (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)
See Respiratory system, drug delivery p. 235.

**INTERACTIONS** \rightarrow Appendix 1: corticosteroids

**SIDE-EFFECTS**
- Common or very common Throat irritation
- Rare or very rare Wheezing

**PRESCRIBING AND DISPENSING INFORMATION**
The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name.

SOPROBEC \textsuperscript{®} Soprobec\textsuperscript{®} is not interchangeable with other CFC-free beclometasone dipropionate inhalers.

KELHALE \textsuperscript{®} Manufacturer advises when switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Kelhale\textsuperscript{®} should be prescribed for 200–250 micrograms of budesonide or 100 micrograms of fluticasone propionate; the dose of Kelhale\textsuperscript{®} should be adjusted according to response, up to a maximum of 800 micrograms daily. Manufacturer advises when switching a patient with poorly-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar\textsuperscript{®} should be prescribed for 200–250 micrograms of beclometasone dipropionate or budesonide and for 100 micrograms of fluticasone propionate. When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar\textsuperscript{®} should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of Qvar\textsuperscript{®} should be adjusted according to response.

CLENIL MODULITE \textsuperscript{®} Clenil Modulite\textsuperscript{®} is not interchangeable with other CFC-free beclometasone propionate inhalers.

**PATIENT AND CARER ADVICE** Steroid card should be issued with high doses of inhaled beclometasone dipropionate.

Medicines for Children leaflet: Beclometasone inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/beclometasone-inhaler-asthma-prevention-prophylaxis-0

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary
Clenil Modulite\textsuperscript{®} 50 micrograms metered inhalation may be prescribed.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment Inhalation powder

www.getintopharma.com
Beclometasone with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, beclometasone dipropionate p. 257, formoterol fumarate p. 250.

**INDICATIONS AND DOSE**

**FOSTAIR® NEXTThaler® 100/6**

**Asthma maintenance therapy**
- By inhalation of powder
- Adult: 1–2 inhalations twice daily; maximum 4 inhalations per day

**Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted**
- By inhalation of powder
- Adult: 2 inhalations twice daily

**DOSE EQUIVALENCE AND CONVERSION**
- For inhalation of powder, when switching patients from other beclometasone dipropionate formulations with non-extra-fine particle size distribution to Fostair NEXTThaler®, the dose should be adjusted according to response.
- 1 inhalation is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

**FOSTAIR® NEXTThaler® 200/6**

**Asthma maintenance therapy**
- By inhalation of powder
- Adult: 2 inhalations twice daily; maximum 4 inhalations per day

**DOSE EQUIVALENCE AND CONVERSION**
- For inhalation of powder, when switching patients from other beclometasone dipropionate formulations with non-extra-fine particle size distribution to Fostair NEXTThaler®, the dose should be adjusted according to response.
- 1 inhalation is equivalent to 200 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

**FOSTAIR® 100/6**

**Asthma maintenance therapy**
- By inhalation of aerosol
- Adult: 1–2 inhalations twice daily; maximum 4 inhalations per day

**Asthma, maintenance and reliever therapy**
- By inhalation of aerosol
- Adult: Maintenance 1 inhalation twice daily; 1 inhalation as required, for relief of symptoms; maximum 8 inhalations per day

**Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted**
- By inhalation of aerosol
- Adult: 2 inhalations twice daily

**DOSE EQUIVALENCE AND CONVERSION**
- For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, dose should be adjusted according to response—100 micrograms of beclometasone dipropionate extrane in Fostair® is equivalent to 250 micrograms of beclometasone dipropionate in a non-extrane formulation.
- 1 inhalation is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

**INDICATIONS AND DOSE**

**Moderate-to-severe chronic obstructive pulmonary disease**
- By inhalation of aerosol
- Adult: 2 inhalations twice daily

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (JULY 2008)**

Fostair® contains extra-fine particles of beclometasone dipropionate and is more potent than traditional beclometasone dipropionate CFC-free inhalers. The dose of beclometasone dipropionate in Fostair® should be lower than non-extra-fine formulations of beclometasone dipropionate and will need to be adjusted to the individual needs of the patient.

**INTERACTIONS**
- Appendix 1: beta-agonists: corticosteroids

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how to administer beclometasone with formoterol aerosol for inhalation. With high doses, a steroid card should be supplied.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (October 2017) that beclometasone with formoterol and glycopyrronium (Trimbow®) is accepted for restricted use within NHS Scotland for the maintenance treatment of adults with severe chronic obstructive pulmonary disease.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation

CAUTIONARY AND ADVISORY LABELS 8, 10

Trimbow (Chiesi Ltd)
Formoterol fumarate dihydrate 5 microgram per 1 dose, Glycopyrronium (as Glycopyrronium bromide) 9 microgram per 1 dose, Beclometasone dipropionate 87 microgram per 1 dose Trimbow 8micrograms/dose / 8micrograms/dose / 8micrograms/dose inhaler | 120 dose (PVP) £44.50

Budesonide

21-Dec-2017

DRUG ACTION Budesonide is a glucocorticoid, which exerts significant local anti-inflammatory effects.

INDICATIONS AND DOSE

Prophylaxis of mild to moderate asthma (in patients stabilised on twice daily dose)

BY INHALATION OF POWDER

Child 6-11 years: 200–400 micrograms once daily, dose to be given in the evening

Child 12-17 years: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening

Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening

Prophylaxis of asthma

BY INHALATION OF POWDER

Child 6-11 years: 100–400 micrograms twice daily, dose to be as necessary

Child 12-17 years: 100–800 micrograms twice daily, dose to be as necessary

Adult: 100–800 micrograms twice daily, dose to be as necessary

BY INHALATION OF NEBULISED SUSPENSION

Child 6 months-11 years: 125–500 micrograms twice daily, adjusted according to response; maximum 2 mg per day

Child 12-17 years: Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day

Adult: Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day

POTENCY

Dose adjustments may be required for some inhaler devices, see under individual preparations.

BUDELIN NOVOLIZER ®

Prophylaxis of asthma

BY INHALATION OF POWDER

Adult: 200–800 micrograms twice daily, dose is adjusted as necessary

Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose

BY INHALATION OF POWDER

Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

PULMICORT ® RESPULES

Prophylaxis of asthma

BY INHALATION OF NEBULISED SUSPENSION

Child 3 months-11 years: Initially 0.5–1 mg twice daily, reduced to 0.25–0.5 micrograms twice daily

Child 12-17 years: Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily

Adult: Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily

PULMICORT ® TURBOHALER

Prophylaxis of asthma

BY INHALATION OF POWDER

Adult: 100–800 micrograms twice daily, dose to be as necessary

Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose

BY INHALATION OF POWDER

Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

**Asthma, maintenance and reliever therapy**

- **BY INHALATION OF POWDER**
- **Adult:** Maintenance 2 inhalations daily in 1–2 divided doses, increased if necessary to 2 inhalations twice daily.
- **Child 6–17 years:** Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- **Adult:** Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

**FOBUMIX® 80/4.5 EASYHALER**

**Asthma, maintenance therapy**

- **BY INHALATION OF POWDER**
- **Adult:** 1–2–4 inhalations twice daily, increased if necessary up to 4 inhalations twice daily
- **Child 6–17 years:** Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- **Adult:** Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

**SYMBICORT 100/6 TURBOHALER®**

**Asthma, maintenance therapy**

- **BY INHALATION OF POWDER**
- **Child 6–17 years:** Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- **Adult:** Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

**SYMBICORT 200/6 TURBOHALER®**

**Asthma, maintenance therapy**

- **BY INHALATION OF POWDER**
- **Child 6–17 years:** Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- **Adult:** Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

**Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted (post-bronchodilator)**

- **BY INHALATION OF POWDER**
- **Adult:** 1 inhalation twice daily

**FOBUMIX® 320/9 EASYHALER**

**Asthma, maintenance therapy**

- **BY INHALATION OF POWDER**
- **Adult:** 1–2–4 inhalations twice daily, increased if necessary up to 4 inhalations twice daily
- **Child 6–17 years:** Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- **Adult:** Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

**Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted (post-bronchodilator)**

- **BY INHALATION OF POWDER**
- **Adult:** 2 puffs twice daily

**Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted (post-bronchodilator)**

- **BY INHALATION OF POWDER**
- **Adult:** 2 puffs twice daily
Ciclesonide

**INDICATIONS AND DOSE**

**Prophylaxis of asthma**

- **BY INHALATION OF AEROSOL**
  - Child 12–17 years: 160 micrograms once daily; reduced to 80 micrograms once daily, if control maintained; increased if necessary up to 320 micrograms twice daily, in severe asthma
  - Adult: 160 micrograms once daily; reduced to 80 micrograms once daily, if control maintained; increased if necessary up to 320 micrograms twice daily, in severe asthma

**SIDE-EFFECTS**

- Cushing’s syndrome

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in severe impairment (risk of increased exposure, no information available).

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer ciclesonide aerosol inhaler.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Fluticasone**

**INDICATIONS AND DOSE**

**Prophylaxis of asthma**

- **BY INHALATION OF POWDER**
  - Child 5–15 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
Fluticasone with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 262, formoterol fumarate p. 250.

- **INDICATIONS AND DOSE**
  - **FLUTIFORM® 125**
  - Prophylaxis of asthma
    - **BY INHALATION OF AEROSOL**
    - Child 12–17 years: 2 puffs twice daily
    - Adult: 2 puffs twice daily
  - **FLUTIFORM® 250**
  - Prophylaxis of asthma
    - **BY INHALATION OF AEROSOL**
    - Child 12–17 years: 2 puffs twice daily
    - Adult: 2 puffs twice daily

- **INTERACTIONS** → Appendix 1: beta, agonists - corticosteroids

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fluticasone with formoterol aerosol inhalation.
  - With high doses, a steroid card should be provided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Pressurised inhalation**
    - **CAUTIONARY AND ADVISORY LABELS 8, 10** (high doses)
      - Flutiform (Napp Pharmaceuticals Ltd)
      - Formoterol fumarate dihydrate 5 microgram per 1 dose, Fluticasone propionate 50 microgram per 1 dose Flutiform 50micrograms/dose / 5micrograms/dose inhaler | 120 dose PKS £14.40 DT = £14.40
      - Formoterol fumarate dihydrate 5 microgram per 1 dose, Fluticasone propionate 125 microgram per 1 dose Flutiform 125micrograms/dose / 5micrograms/dose inhaler | 120 dose PKS £28.00 DT = £28.00
      - Formoterol fumarate dihydrate 10 microgram per 1 dose, Fluticasone propionate 250 microgram per 1 dose Flutiform 250micrograms/dose / 10micrograms/dose inhaler | 120 dose PKS £45.56 DT = £45.56

Fluticasone with salmeterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 262, salmeterol p. 252.

- **INDICATIONS AND DOSE**
  - **AIRFLUSAL FORSPIRO®**
    - Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 60% of predicted
    - Prophylaxis of asthma
      - **BY INHALATION OF POWDER**
      - Adult: 1 inhalation twice daily
  - **AIRFLUSAL® 125**
  - Prophylaxis of moderate-to-severe asthma
    - **BY INHALATION OF AEROSOL**
    - Adult: 2 inhalations twice daily
  - **AIRFLUSAL® 250**
  - Prophylaxis of moderate-to-severe asthma
    - **BY INHALATION OF AEROSOL**
    - Adult: 2 inhalations twice daily
264 Airways disease, obstructive

Respiratory system

Fluticasone with umeclidinium and vilanterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 262, umeclidinium p. 249.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Inhalation powder**
    - **CAUTIONARY AND ADVISORY LABELS** 8, 10 (excluding Seretide 100 Accuhaler®)
      - AirFluSal Forspiro (Sandoz Ltd)
        - Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose, Fluticasone propionate 125 microgram per 1 dose AirFluSal Forspiro 50micrograms/dose / 250micrograms/dose dry powder inhaler | 60 dose (PO) £29.97 DT + £32.74
      - Seretide Accuhaler (GliazoSmithKline UK Ltd)
        - Salmeterol (as Salmeterol xinafoate) 50 microgram per 1 dose, Fluticasone propionate 100 microgram per 1 dose Seretide 100 Accuhaler | 60 dose (PO) £18.00 DT + £18.00
      - Salmeterol (as Salmeterol xinafoate) 50 microgram per 1 dose, Fluticasone propionate 250 microgram per 1 dose Seretide 250 Accuhaler | 60 dose (PO) £35.00 DT + £35.00
      - Salmeterol (as Salmeterol xinafoate) 50 microgram per 1 dose, Fluticasone propionate 500 microgram per 1 dose Seretide 500 Accuhaler | 60 dose (PO) £32.74 DT + £32.74

- **Pressurised inhalation**
  - **CAUTIONARY AND ADVISORY LABELS** 8, 10 (excluding Seretide 50 Evohaler®)
    - AirFluSal (Sandoz Ltd)
      - Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose, Fluticasone propionate 125 microgram per 1 dose AirFluSal 25micrograms/dose / 125micrograms/dose inhaler | 120 dose (PO) £18.50 DT + £23.45
      - Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose, Fluticasone propionate 250 microgram per 1 dose AirFluSal 25micrograms/dose / 250micrograms/dose inhaler | 120 dose (PO) £24.95 DT + £29.32
    - Serello (Cipla EU Ltd)
      - Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose, Fluticasone propionate 125 microgram per 1 dose Serello 25micrograms/dose / 125micrograms/dose inhaler | 120 dose (PO) £14.99 DT + £19.45
      - Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose, Fluticasone propionate 250 microgram per 1 dose Serello 25micrograms/dose / 250micrograms/dose inhaler | 120 dose (PO) £19.99 DT + £29.32
    - Seretide Evohaler (GliazoSmithKline UK Ltd)
      - Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose, Fluticasone propionate 50 microgram per 1 dose Seretide 50 Evohaler | 120 dose (PO) £18.00 DT + £18.00
      - Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose, Fluticasone propionate 125 microgram per 1 dose Seretide 125 Evohaler | 120 dose (PO) £23.45 DT + £23.45
      - Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose, Fluticasone propionate 250 microgram per 1 dose Seretide 250 Evohaler | 120 dose (PO) £29.32 DT + £29.32

- **Fluticasone with umeclidinium and vilanterol**

- **INDICATIONS AND DOSE**
  - **Maintenance of moderate-to-severe chronic obstructive pulmonary disease**
    - **BY INHALATION OF POWDER**
      - Adult: 1 inhalation once daily, dose should be taken at the same time each day

- **CAUTIONS**
  - Convulsive disorders • pulmonary tuberculosis • thyrotoxicosis
  - **INTERACTIONS** Appendix 1: beta·agonists · corticosteroids · umeclidinium
Fluticasone with vilanterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 262.

- **SIDE-EFFECTS**
  - Common or very common Back pain · increased risk of infection
  - Uncommon Oropharyngeal pain

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on appropriate inhaler technique.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) decisions**
    - In adults The Scottish Medicines Consortium has advised (March 2014) that fluticasone furoate/vilanterol (Relvar Ellipta®) is accepted for restricted use within NHS Scotland in patients with severe chronic obstructive pulmonary disease with a forced expiratory volume in one second (FEV1) less than 50% of the predicted normal value.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Inhalation powder**
    - Trelegy Ellipta® (GlaxoSmithKline UK Ltd)
      - Vilanterol (as Vilanterol trifenate) 22 microgram per 1 dose, Umeclidinium bromide 65 microgram per 1 dose, Fluticasone furoate 92 microgram per 1 dose. Trelegy Ellipta 92micrograms/dose / 55micrograms/dose / 22micrograms/dose dry powder inhaler | 30 dose | £44.50
    - Relvar Ellipta® (GlaxoSmithKline UK Ltd)
      - Vilanterol 22 microgram per 1 dose, Fluticasone furoate 92 microgram per 1 dose. Relvar Ellipta 92micrograms/dose / 22micrograms/dose dry powder inhaler | 30 dose | £22.00

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain · arthralgia · back pain · bone fracture · cough · dysphonia · fever · increased risk of infection · muscle spasms · oropharyngeal pain
  - Uncommon Vision blurred
  - Rare or very rare Angiodema · anxiety

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Dose adjustments Manufacturer advises maximum dose of 92 microgram/22 microgram once daily in moderate to severe impairment.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fluticasone with vilanterol powder for inhalation. A steroid card should be provided.
**ENZYME INHIBITORS**

**Human alpha₁-proteinase inhibitor**

**17-Aug-2017**

- **DRUG ACTION** Human alpha₁-proteinase inhibitor is a normal plasma constituent; it inhibits neutrophil elastase (an enzyme released in response to inflammation) in the lungs.

- **INDICATIONS AND DOSE**
  - Progression of emphysema in patients with severe alpha₁-proteinase inhibitor deficiency, despite optimal treatment with other standard therapies (specialist use only)
    - BY INTRAVENOUS INFUSION
      - Adult: 60 mg/kg once weekly

- **CONTRA-INDICATIONS**
  - IgA deficiency with confirmed antibodies against IgA—increased risk of severe hypersensitivity reactions

- **CAUTIONS**
  - Consider vaccination against hepatitis A and hepatitis B - hypersensitivity reactions - IgA deficiency (without known antibodies to IgA)—increased risk of hypersensitivity reactions
  - Hypersensitivity reactions. Hypersensitivity reactions may occur, even in patients who have previously tolerated treatment. Manufacturer advises close monitoring, including vital signs, during the first infusions. If a reaction occurs, manufacturer advises to decrease the rate of infusion or discontinue treatment; if symptoms improve promptly after stopping, the infusion may be resumed at a slower infusion rate.

- **SIDE-EFFECTS**
  - **Common or very common** Dizziness - headache - nausea
  - **Uncommon** Asthenia - confusion - flushing - hypersensitivity - hypotension - sensation abnormal - skin reactions - syncope - tachycardia - throat oedema
  - **Rare or very rare** Chest pain - chills - fever - hyperhidrosis
  - **Frequency not known** Eye swelling - facial swelling - lip swelling - lymph node pain

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Manufacturer advises to record the brand name and batch number after each administration (in case of transmission of infective agents).

- **PATIENT AND CARER ADVICE** Manufacturer advises patients receiving treatment at home should receive appropriate training regarding self-administration, and be informed of the signs of hypersensitivity reactions.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions
    - The Scottish Medicines Consortium has advised (August 2016) that human alpha₁-proteinase inhibitor (Respreeza®) is not recommended for use within NHS Scotland for maintenance treatment, to slow the progression of emphysema in adults with documented severe alpha₁-proteinase inhibitor deficiency. The manufacturer did not present a sufficiently robust clinical or economic analysis.

  - All Wales Medicines Strategy Group (AWMSG) decisions
    - The All Wales Medicines Strategy Group has advised (March 2017) that human alpha₁-proteinase inhibitor (Respreeza®) is not recommended for use within NHS Wales for maintenance treatment, to slow the progression of emphysema in adults with documented severe alpha₁-proteinase inhibitor deficiency. The case for clinical and cost-effectiveness has not been proven.

- **MATERIAL FORMS**
  - **Powder and solvent for solution for infusion**
    - **ELECTROLYTES:** May contain Sodium
      - *Respreeza* (CSL Behring UK Ltd)

- **DRUGS FOR RESPIRATORY DISEASES**

  - **MONOCLONAL ANTIBODIES**

  - **Benralizumab**
    - **DRUG ACTION** Benralizumab is a humanised monoclonal antibody that interferes with interleukin-5 receptor binding, thereby reducing the survival of eosinophils and basophils.

    - **INDICATIONS AND DOSE**
      - **Severe eosinophilic asthma** (specialist use only)
        - **BY SUBCUTANEOUS INJECTION**
          - **Adult:** Initially 30 mg every 4 weeks for the first 3 doses, then maintenance 30 mg every 8 weeks, to be administered into the thigh, abdomen or upper arm

    - **SIDE-EFFECTS**
      - **Common or very common** Fever - headache - hypersensitivity (may be delayed) - pharyngitis
      - **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited data available.

    - **CAUTIONS**
      - Pre-existing helminth infection

    - **PHARMACOKINETICS**
      - The half-life of benralizumab is approx. 15 days.

    - **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration, and to avoid injecting into areas of the skin that are tender, bruised, erythematous, or hardened—consult product literature for further information.

    - **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light.

    - **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be instructed to seek medical advice if their asthma remains uncontrolled or if symptoms worsen after initiation of treatment.

    - **NATIONAL FUNDING/ACCESS DECISIONS**
      - **NICE decisions**
        - **Benralizumab for treating severe eosinophilic asthma (March 2019)** NICE T565
          - Benralizumab (Fasenra®), as an add-on therapy, is recommended as an option for treating severe eosinophilic asthma that is inadequately controlled in adults despite maintenance therapy with high-dose inhaled corticosteroids and long-acting beta-agonists, only if:
            - the patient has agreed to and followed the optimised standard treatment plan, and
the blood eosinophil count has been recorded as
300 cells per microlitre or more and the patient has had 4
or more exacerbations needing systemic corticosteroids
in the previous 12 months, or has had continuous oral
corticosteroids of at least the equivalent of prednisolone
5 mg per day over the previous 6 months (that is, the
patient is eligible for mepolizumab), or
the blood eosinophil count has been recorded as
400 cells per microlitre or more with 3 or more
exacerbations needing systemic corticosteroids in the
past 12 months (that is, the patient is eligible for reslizumab).
Benralizumab is recommended only if the manufacturer
provides it according to the commercial arrangement.
At 12 months stop benralizumab if the asthma has not
responded adequately or continue benralizumab if the
asthma has responded adequately and assess response
each year.
Benralizumab is not recommended if neither
mepolizumab nor reslizumab are recommended (see NICE
technology appraisal guidances 431 and 479).
Patients whose treatment was started within the NHS
before this guidance was published should have the option
to continue treatment, without change to their funding
arrangements, until they and their NHS clinician consider
it appropriate to stop.
www.nice.org.uk/guidance/ta565

**MEDICINAL FORMS** There can be variation in the licensing of
different medicines containing the same drug.

**Solution for injection**
- Fasenra (AstraZeneca UK Ltd) ▼
- Benralizumab 30 mg per 1 ml Fasenra 30mg/1ml solution for
  injection pre-filled syringes | 1 pre-filled disposable injection
  (PoS) £1,955.00 (Hospital only)

**Mepolizumab** 08-May-2019

**DRUG ACTION** Mepolizumab is a humanised anti-
interleukin-5 (anti-IL-5) monoclonal antibody; it reduces
the production and survival of eosinophils

**INDICATIONS AND DOSE**

Add on treatment for severe refractory eosinophilic
asthma (under expert supervision)
- BY SUBCUTANEOUS INJECTION
  - Adults: 100 mg every 4 weeks

**CAUTIONS** Helminth infection

**CAUTIONS, FURTHER INFORMATION**

- Helminth infections. Manufacturer advises pre-existing
  helminth infections should be treated before initiation of
  therapy, if patients become infected during treatment and
  do not respond to anti-helmintic treatment, consider
  treatment interruption.

**SIDE-EFFECTS**

- Common or very common Abdominal pain upper -
  administration related reaction - back pain - eczema - fever
  - headache - hypersensitivity - increased risk of infection
  - nasal congestion

**PREGNANCY** Manufacturer advises avoid unless potential
benefit outweighs risk—limited data available.

**BREAST FEEDING** Manufacturer advises avoid—present in
milk in animal studies.

**PATIENT AND CARER ADVICE**

Asthma Patients and their carers should be advised to seek
medical advice if their asthma remains uncontrolled or
worsens after initiation of treatment.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Mepolizumab for treating severe refractory eosinophilic
  asthma (January 2017) NICE TA431

  Mepolizumab (Nucala®), as an add-on to optimised
  standard therapy, is recommended as an option for
treating severe refractory eosinophilic asthma in adults,
only if:

  - the blood eosinophil count is 300 cells/microlitre or
  more in the previous 12 months, and

  - the person has agreed to and followed the optimised
  standard treatment plan and has had 4 or more asthma
  exacerbations requiring systemic corticosteroids in the
  previous 12 months or had continuous oral
corticosteroids of at least the equivalent of prednisolone
  5 mg per day over the previous 6 months, and

  - the manufacturer provides mepolizumab with the
  discount agreed in the patient access scheme.

At 12 months of treatment:

- stop mepolizumab if the asthma has not responded
  adequately, or

- continue treatment if the asthma has responded
  adequately and assess response each year.

Patients whose treatment was started within the NHS
before this guidance was published should have the option
to continue treatment, without change to their funding
arrangements, until they and their NHS clinician consider
it appropriate to stop.
www.nice.org.uk/guidance/ta431

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1149/16

The Scottish Medicines Consortium has advised (June 2016)
that mepolizumab (Nucala®) is accepted for restricted use
within NHS Scotland as an add-on treatment for severe
refractory eosinophilic asthma in adults who have
eosinophils of at least 150 cells/microlitre (0.15 × 10^9/L) at
initiation of treatment and have had at least four asthma
exacerbations in the preceding year or are receiving
maintenance treatment with oral corticosteroids. This
advice is contingent upon the continuing availability of
the patient access scheme in NHS Scotland or a list price
that is equivalent or lower.

**MEDICINAL FORMS** There can be variation in the licensing of
different medicines containing the same drug.

**Powder for solution for injection**

EXCIPIENTS: May contain Polysorbates
- Nucala (GlaxoSmithKline UK Ltd) ▼
- Mepolizumab 100 mg Nucala 100mg powder for solution for
  injection vials | 1 vial (PoS) £840.00 (Hospital only)

**Omalizumab**

**INDICATIONS AND DOSE**

Prophylaxis of severe persistent allergic asthma
- BY SUBCUTANEOUS INJECTION
  - Adult: Dose according to immunoglobulin E
    concentration and body-weight (consult product
    literature)

Add-on therapy for chronic spontaneous urticaria in
patients who have had an inadequate response to H1
antihistamine treatment
- BY SUBCUTANEOUS INJECTION
  - Adult: 300 mg every 4 weeks

**CAUTIONS** Autoimmune disease - susceptibility to
helminth infection—discontinue if infection does not
respond to anthelmintic

**SIDE-EFFECTS**

- Common or very common Headache - skin reactions

www.getintopharma.com
Uncommon Cough • diarrhoea • dizziness • drowsiness • dyspnea • fatigue • flushing • increased risk of infection • influenza like illness • limb swelling • nausea • paraesthesia • photosensitivity reaction • postural hypotension • respiratory disorders • syncope • weight increased

Rare or very rare Angioedema • hypersensitivity • systemic lupus erythematosus (SLE)

Frequency not known Alopecia • eosinophilic granulomatosis with polyangiitis • immune thrombocytopenic purpura • joint disorders • lymphadenopathy • myalgia

SIDE-EFFECTS, FURTHER INFORMATION

Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy.

Hypersensitivity reactions Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

PREGNANCY Manufacturer advises avoid unless essential—crosses the placenta.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).

RENAL IMPAIRMENT Manufacturer advises caution—no information available.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Omalizumab for severe persistent allergic asthma (April 2013) NICE TA278 Omalizumab is recommended as an option for treating severe persistent confirmed allergic IgE-mediated asthma as an add-on to optimised standard therapy in patients aged 6 years and over:

• who need continuous or frequent treatment with oral corticosteroids (defined as 4 or more courses in the previous year), and

• only if the manufacturer makes omalizumab available with the discount agreed in the patient access scheme.

Optimised standard therapy is defined as a full trial of and, if tolerated, documented compliance with inhaled high-dose corticosteroids, long-acting beta, agonists, leukotriene receptor antagonists, theophyllines, oral corticosteroids, and smoking cessation if clinically appropriate.

Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA278

Omalizumab for previously treated chronic spontaneous urticaria (June 2015) NICE TA339 Omalizumab is an option as add-on therapy for the treatment of severe chronic spontaneous urticaria in patients 12 years and over, only if:

• the severity of the condition is assessed objectively, for example, using a weekly urticaria activity score of 28 or more,

• the patient’s condition has not responded to standard treatment with H1-antihistamines and leukotriene receptor antagonists,

• omalizumab is stopped at or before the fourth dose if the condition has not responded,

• omalizumab is stopped at the end of a course of treatment (6 doses) if the condition has responded and is restarted only if the condition relapses,

• omalizumab is administered under the management of a secondary care specialist in dermatology, immunology or allergy,

• the manufacturer provides omalizumab with the discount agreed in the patient access scheme.

Patients currently receiving omalizumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA339

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (December 2014) that omalizumab (Xolair®) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H1-antihistamines, leukotriene receptor antagonists and H1-antihistamines, used according to current treatment guidelines.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Xolair® (Novartis Pharmaceuticals UK Ltd)

Omalizumab 150 mg per 1 ml Xolair 150mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £256.15

Xolair® 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £128.07

Resilizumab

DRUG ACTION Resilizumab is a humanised monoclonal antibody that interferes with interleukin-5 receptor binding, thereby reducing the survival and activity of eosinophils.

INDICATIONS AND DOSE

Severe eosinophilic asthma (adjunctive therapy when inadequately controlled by high-dose corticosteroids plus another standard treatment) (specialist use only)

BY INTRAVENOUS INFUSION

Adult: (consult product literature)

PHARMACOKINETICS

• The half-life of reslizumab is approx. 24 days.

CAUTIONS

Hypersensitivity reactions • pre-existing helminth infection

CAUTIONS, FURTHER INFORMATION

Helminth infection Manufacturer advises to treat pre-existing helminth infections before starting reslizumab—consider temporarily discontinuing reslizumab if patient becomes infected during therapy and does not respond to anti-helminth treatment.

Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur and manufacturer advises to monitor closely during treatment and for at least 20 minutes after completion of infusion; in the event of a hypersensitivity reaction, treatment should be permanently discontinued.

SIDE-EFFECTS

Uncommon Anaphylactic reaction • myalgia

Frequency not known Secondary malignancy

PREGNANCY Manufacturer advises avoid—limited information available.

BREAST FEEDING Manufacturer advises avoid during first few days after birth—risk of transfer of antibodies to infant cannot be excluded; present in milk in animal studies.
Montelukast

- **INDICATIONS AND DOSE**
  - **Prophylaxis of asthma**
    - **BY MOUTH**
      - Child 6 months–5 years: 4 mg once daily, dose to be taken in the evening
      - Child 6–14 years: 5 mg once daily, dose to be taken in the evening
      - Adult: 10 mg once daily, dose to be taken in the evening

Symptomatic relief of seasonal allergic rhinitis in patients with asthma.

- **BY MOUTH**
  - Child 15–17 years: 10 mg once daily, dose to be taken in the evening
  - Adult: 10 mg once daily, dose to be taken in the evening

- **INTERACTIONS** → Appendix 1: montelukast
- **SIDE-EFFECTS**
  - Common or very common Diarrhoea · fever · gastrointestinal discomfort · headache · nausea · skin reactions · upper respiratory tract infection · vomiting
  - Uncommon Akathisia · anxiety · arthralgia · asthenia · behaviour abnormal · depression · dizziness · drowsiness · dry mouth · haemorrhage · irritability · malaise · muscle complaints · oedema · seizure · sensation abnormal · sleep disorders
  - Rare or very rare Angioedema · concentration impaired · disorientation · eosinophilic granulomatosis with polyangiitis · erythema nodosum · hallucination · hepatic disorders · memory loss · palpatations · pulmonary eosinophilia · suicidal tendencies · tremor
  - SIDE-EFFECTS, FURTHER INFORMATION Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

- **PREGNANCY** Manufacturer advises avoid unless essential. There is limited evidence for the safe use of montelukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.

- **BREAST FEEDING** Manufacturer advises avoid unless essential.

- **DIRECTIONS FOR ADMINISTRATION** Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include cherry.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer montelukast granules. Medicines for Children leaflet: Montelukast for asthma
  
  www.medicinesforchildren.org.uk/montelukast-asthma

- **NATIONAL FUNDING/ACCESS DECISIONS**

---

**LEUKOTRIENE RECEPTOR ANTAGONISTS**

Leukotriene receptor antagonists

**Overview**

The leukotriene receptor antagonist montelukast below blocks the effects of cysteinyl leukotrienes in the airways.

Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in those with severe asthma who are also receiving high doses of other drugs.
corticosteroid use and who are not capable of using inhaled corticosteroids; **Singulair**® granules should be initiated by a specialist in paediatric asthma.

**SINGULAIR® CHEWABLE TABLETS**

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (June 2007) that **SINGULAIR®** chewable tablets are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; **Singulair**® chewable tablets should be initiated by a specialist in paediatric asthma.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Granules

- **Montelukast (Non-proprietary)**
  - Montelukast (as Montelukast sodium) 4 mg, Montelukast 4mg granules sachets sugar free sugar-free | 28 sachet (PMD) £4.91–£19.99 DT = £5.25
- **Singulair** (Merck Sharp & Dohme Ltd)
  - Montelukast (as Montelukast sodium) 4 mg, Singulair Paediatric 4mg granules sachets sugar-free | 28 sachet (PMD) £25.69 DT = £5.25

#### Tablet

- **Montelukast (Non-proprietary)**
  - Montelukast (as Montelukast sodium) 10 mg, Montelukast 10mg tablets | 28 tablet (PMD) £26.97 DT = £1.17
  - **Singulair** (Merck Sharp & Dohme Ltd)
    - Montelukast (as Montelukast sodium) 10 mg, Singulair 10mg tablets | 28 tablet (PMD) £26.97 DT = £1.17

#### Chewable tablet

**CAUTIONARY AND ADVISORY LABELS**

- **EXCIPIENTS:** May contain Aspartame
  - **Montelukast (Non-proprietary)**
    - Montelukast (as Montelukast sodium) 4 mg, Montelukast 4mg chewable tablets sugar free sugar-free | 28 tablet (PMD) £25.69 DT = £1.14
    - Montelukast (as Montelukast sodium) 5 mg, Montelukast 5mg chewable tablets sugar free sugar-free | 28 tablet (PMD) £25.69 DT = £1.26
  - **Singulair** (Merck Sharp & Dohme Ltd)
    - Montelukast (as Montelukast sodium) 4 mg, Singulair Paediatric 4mg chewable tablets sugar-free | 28 tablet (PMD) £25.69 DT = £1.14
    - Montelukast (as Montelukast sodium) 5 mg, Singulair Paediatric 5mg chewable tablets sugar-free | 28 tablet (PMD) £25.69 DT = £1.26

### MAST-CELL STABILISERS

**Cromoglicate and related therapy**

**Overview**

The mode of action of sodium cromoglicate below and nedocromil sodium below is not completely understood. They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually 3 to 4 times a day initially; this may subsequently be reduced.

In general, prophylaxis with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations. There is evidence of efficacy of nedocromil sodium in children aged 5–12 years. Sodium cromoglicate and nedocromil sodium are of no value in the treatment of acute attacks of asthma.

Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be reassessed.

Sodium cromoglicate and nedocromil sodium may also have a role in allergic conjunctivitis; sodium cromoglicate is used also in allergic rhinitis and allergy-related diarrhoea.

### Nedocromil sodium

#### INDICATIONS AND DOSE

**Prophylaxis of asthma**

- **BY INHALATION OF AEROSOL**
  - Child 5–17 years: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily
  - Adult: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- 2 puffs = 4 mg.

#### UNLICENSED USE

- In children Not licensed for use in children under 6 years.

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)**

See Respiratory system, drug delivery p. 235.

**SIDE-EFFECTS**

- **Common or very common** Bronchospasm · cough · gastrointestinal discomfort · headache · nausea · taste altered · vomiting
- **Frequency not known** Pharyngitis · throat irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

If paradoxical bronchospasm occurs, a fast-acting inhaled bronchodilator such as salbutamol or terbutaline should be used to control symptoms; treatment with nedocromil should be discontinued.

**PREGNANCY**

Inhaled drugs can be taken as normal during pregnancy.

**BREAST FEEDING**

Inhaled drugs can be taken as normal during breast-feeding.

**TREATMENT CESSATION**

Withdrawal should be done gradually over a period of one week—symptoms of asthma may recur.

**PREScribing AND DISPensing INFORMATION**

Flavours of inhalers may include mint.

**PATIENT AND CARER ADVICE**

Regular use is necessary. Patient counselling is advised for Nedocromil aerosol for inhalation (administration).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised inhalation**

**CAUTIONARY AND ADVISORY LABELS**

- **Nedocromil sodium 2 mg per 1 dose**
  - Tilade 2mg/dose inhaler CFC free | 112 Dose (PMD) £39.94 DT = £39.94

### Sodium cromoglicate

(Sodium cromoglicate)

#### INDICATIONS AND DOSE

**Prophylaxis of asthma**

- **BY INHALATION OF AEROSOL**
  - Child 5–17 years: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff
  - Adult: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff

Airways disease, obstructive 271

PHOSPHODIESTERASE TYPE-4 INHIBITORS

Roflumilast 08-Feb-2019

- **DRUG ACTION** Roflumilast is a phosphodiesterase type-4 inhibitor with anti-inflammatory properties.

- **INDICATIONS AND DOSE** Adjunct to bronchodilators for the maintenance treatment of patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations.
  - **BY MOUTH**
    - Adult: Initially 250 micrograms once daily for 28 days, then maintenance 500 micrograms once daily

- **CONTRA-INDICATIONS** Cancer (except basal cell carcinoma) · concomitant treatment with immunosuppressive drugs (except short-term systemic corticosteroids) · history of depression associated with suicidal ideation or behaviour · moderate to severe cardiac failure · severe acute infectious disease · severe immunological disease

- **CAUTIONS** History of psychiatric illness (discontinue if new or worsening psychiatric symptoms occur) · latent infection (such as tuberculosis, viral hepatitis, herpes infection)

- **INTERACTIONS** → Appendix 1: roflumilast

- **SIDE-EFFECTS**
  - Common or very common Appetite decreased · diarrhea · gastrointestinal discomfort · headache · insomnia · nausea · weight decreased
  - Uncommon Anxiety · asthenia · back pain · dizziness · gastrointestinal disorders · malaise · muscle complaints · muscle weakness · palpitations · skin reactions · tremor · vertigo · vomiting
  - Rare or very rare Angioedema · constipation · depression · gynaecomastia · haematochezia · respiratory tract infection · suicidal tendencies · taste altered

- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception.

- **PREGNANCY** Manufacturer advises avoid—tocolytic in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

- **MONITORING REQUIREMENTS** Monitor body-weight.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be instructed to report changes in behaviour or mood and any suicidal ideation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

  - **Capsule**
    - **CAUTIONARY AND ADVISORY LABELS** 22
    - **Nalcrom** (Sanofi)
    - Sodium cromoglicate 100 mg. Nalcrom 100mg capsules | 100 capsule (POM) £41.14 DT = £41.14

  - **Pressurised inhalation**
    - **CAUTIONARY AND ADVISORY LABELS** 8
    - **Intal** (Sanofi)
    - Sodium cromoglicate 5 mg per 1 dose Intal 5mg/dose inhaler CFC free | 112 dose (POM) £18.33 DT = £18.33

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE decisions**
    - Roflumilast for treating chronic obstructive pulmonary disease (July 2017) NICE TA461 Roflumilast (Daxas®), as an add-on to bronchodilator therapy, is recommended as an option for treating severe chronic obstructive pulmonary disease in patients with chronic bronchitis, only if:
      - the disease is severe, defined as a forced expiratory volume in one second (FEV₁) after a bronchodilator of less than 50% of predicted normal, and
      - the person has had two or more exacerbations in the previous 12 months despite triple inhaled therapy with a long-acting muscarinic antagonist, a long-acting beta-2 agonist and an inhaled corticosteroid.

    Treatment with roflumilast should be started by a specialist in respiratory medicine.

www.getintopharma.com
Patients currently receiving roflumilast whose disease does not meet the above criteria should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta461

Scottish Medicines Consortium (SMC) decisions
SMC No. 635/10
The Scottish Medicines Consortium has advised (September 2017) that roflumilast (Daxas®) is not recommended for use within NHS Scotland for maintenance treatment of severe chronic obstructive pulmonary disease (forced expiratory volume in one second [FEV₁] after a bronchodilator of less than 50% predicted) associated with chronic bronchitis in adults with a history of frequent exacerbations as add on to bronchodilator treatment as there was insufficient evidence submitted and the economic case was not demonstrated.

**M EDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Daxas (AstraZeneca UK Ltd) ▼
- Roflumilast 250 microgram Daxas 250 microgram tablets | 28 tablet [PSD] £35.20
- Roflumilast 500 microgram Daxas 500 microgram tablets | 30 tablet [PSD] £37.71 DT = £37.71

**SIDE-EFFECTS**
- Frequency not known
  - With intravenous use Acute angle closure glaucoma · angina pectoris · appetite decreased · cardiac arrest · dizziness · hypokalaemia · intracranial haemorrhage · psychotic disorder · pulmonary oedema
  - With oral use Arrhythmias · circulation impaired · dry mouth · enuresis · hypertension · sedation

**PREGNANCY**
- With oral use Manufacturer advises avoid.
- With intravenous use Increased fetal heart rate reported with parenteral ephedrine.

**BREAST FEEDING**
Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.

**RENA L IMPAIRMENT**
Use with caution.

**LESS SUITABLE FOR PRESCR IETING**
- With oral use Ephedrine tablets are less suitable and less safe for use as a bronchodilator than the selective beta₂ agonists.

**EXCEPTIONS TO LEGAL CATEGORY**

**M EDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection.

**Tablet**
- Ephedrine hydrochloride (Non-proprietary)
  - Ephedrine hydrochloride 15 mg Ephedrine hydrochloride 15 mg tablets | 28 tablet [PSD] £56.98 DT = £58.33
  - Ephedrine hydrochloride 30 mg Ephedrine hydrochloride 30 mg tablets | 28 tablet [PSD] £94.49 DT = £88.37

**Solution for injection**
- Ephedrine hydrochloride (Non-proprietary)
  - Ephedrine hydrochloride 3 mg per 1 ml Ephedrine 30 mg/10 ml solution for injection ampoules | 10 ampoule [PSD] £1.93.02
  - Ephedrine 30 mg/10 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PSD] £7.59–£9.50 | 12 pre-filled disposable injection [PSD] £11.90
  - Ephedrine hydrochloride 30 mg per 1 ml Ephedrine 30 mg/1 ml solution for injection ampoules | 10 ampoule [PSD] £52.50–£60.28 DT = £60.28

**X ANTHINES**

**Aminophylline**

**INDICATIONS AND DOSE**
Severe acute asthma in patients not previously treated with theophylline
- By slow intravenous injection
  - Child: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion
  - Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

Severe acute asthma
- By intravenous infusion
  - Child 1 month–11 years: 1 mg/kg/hour, adjusted according to plasma-theophylline concentration
  - Child 12–17 years: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
  - Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
  - Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

www.getintopharma.com
Severe acute exacerbation of chronic obstructive pulmonary disease in patients not previously treated with theophylline

- **BY SLOW INTRAVENOUS INJECTION**
- Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

Severe acute exacerbation of chronic obstructive pulmonary disease

- **BY INTRAVENOUS INFUSION**
- Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

Chronic asthma

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

Reversible airway obstruction

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose adjustment may be necessary if smoking started or stopped during treatment.

DOSES AT EXTREMES OF BODY-WEIGHT

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

PHARMACOKINETICS

- Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water.
- Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of aminophylline are important because the toxic dose is close to the therapeutic dose.

PHYLLOCONTIN CONTINUUS® FORTE

Reversible airways obstruction

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult: Initially 350 mg twice daily for 1 week, then increased if necessary to 700 mg twice daily, increase dose according to plasma-theophylline concentration

UNLICENSED USE

- In children: Aminophylline injection not licensed for use in children under 6 months.

CAUTIONS

- Arrhythmias following rapid intravenous injection - cardiac arrhythmias or other cardiac disease - elderly (increased plasma-theophylline concentration) - epilepsy - fever - hypertension - hyperthyroidism - peptic ulcer - risk of hypokalaemia

INTERACTIONS

- Appendix 1: aminophylline

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Headache - nausea - palpitations - seizure (more common when given too rapidly by intravenous injection)

SPECIFIC SIDE-EFFECTS

- With intravenous use: Abdominal pain - anxiety - arrhythmia (more common when given too rapidly by intravenous injection) - confusion - delirium - diarrhoea - dizziness - electrolyte imbalance - gastrointestinal haemorrhage - gastrooesophageal refflux disease - hyperthermia - hyperventilation - hypotension (more common when given too rapidly by intravenous injection) - insomnia - mania - metabolic disorder - pain - skin reactions - tachycardia (more common when given too rapidly by intravenous injection) - thirst - tremor - vertigo - visual impairment - vomiting

- With oral use: Arrhythmias - central nervous system stimulation - epigastric discomfort

SIDE-EFFECTS, FURTHER INFORMATION

- Potentially serious hypokalaemia may result from beta-agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose

- Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

- For specific details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning p. 1359.

- **ALLERGY AND CROSS-SENSITIVITY** Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.

- **PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

- **BREASTFEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

- **HEPATIC IMPAIRMENT** Theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of aminophylline are important because the toxic dose is close to the therapeutic dose.

- **MONITORING REQUIREMENTS**

- Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations.

- Measurement of plasma-theophylline concentration may be helpful and is essential if a loading dose of intravenous aminophylline is to be given to patients who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.

- In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

- If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.

- With oral use: Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

DIRECTIONS FOR ADMINISTRATION

- With intravenous use: For intravenous injection, give very slowly over at least 20 minutes (with close monitoring).
With intravenous use in children For intravenous infusion, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%.

With intravenous use in adults For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride 0.9%.

With intramuscular use Aminophylline is too irritant for intramuscular use.

Prescribing and dispensing information Patients taking theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.

Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.

Modified release The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

Phyllocontin Continus® Forte Phyllocontin Continus® Forte tablets are for smokers and other patients where theophylline half-life is shorter.

Medicinal forms There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion pre-formed, modified-release, andophylline (Non-proprietary)

Aminophylline 25 mg per 1 ml Aminophylline 250mg/10ml solution for injection ampoules | 10 ampoule (BD) £8.50 DT + £8.50

Theophylline

indications and dose

Dose adjustment due to interactions Dose adjustment may be necessary if smoking started or stopped during treatment.

Pharmacokinetics Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of theophylline are important because the toxic dose is close to the therapeutic dose.

Nuelin SA® 175mg Tablets

Reversible airways obstruction | Severe acute asthma | Chronic asthma

By mouth using modified-release medicines

Adult: 175–350 mg every 12 hours

Chronic asthma

By mouth using modified-release medicines

Child 6–11 years: 175 mg every 12 hours

Child 12–17 years: 175–350 mg every 12 hours

Nuelin SA® 250 Tablets

Reversible airways obstruction | Severe acute asthma | Chronic asthma

By mouth using modified-release medicines

Adult: 250–500 mg every 12 hours

Chronic asthma

By mouth using modified-release medicines

Child 6–11 years: 250–500 mg every 12 hours

Child 12–17 years: 250–500 mg every 12 hours

Slo-Phyllin®

Chronic asthma

By mouth using modified-release medicines

Child: 2–5 years: 60–120 mg every 12 hours

Child 6–11 years: 125–250 mg every 12 hours

Child 12–17 years: 250–500 mg every 12 hours

Reversible airways obstruction | Severe acute asthma | Chronic asthma

By mouth using modified-release medicines

Adult: 250–500 mg every 12 hours

Uniphyllin Continus®

Chronic asthma

By mouth using modified-release medicines

Child 2–11 years: 9 mg/kg every 12 hours (max. per dose 200 mg), dose may be increased in some children with chronic asthma; increased to 10–16 mg/kg every 12 hours (max. per dose 400 mg), may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

Child 12–17 years: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

Reversible airways obstruction | Severe acute asthma

Chronic asthma

By mouth using modified-release medicines

Adult: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

Caution Cardiac arrhythmias or other cardiac disease, elderly (increased plasma-theophylline concentration), epilepsy, fever, hyperthyroidism, peptic ulcer - risk of hypokalaemia

Interactions Appendix 1: theophylline

Side-effects Anxiety, arthralgia, diarrhoea, dizziness, gastrointestinal discomfort, gastrooesophageal reflux disease, headache, hypouricaemia, nausea, palpitations, seizure, skin reactions, sleep disorders, tremor, urinary disorders, vomiting

Side-effects, Further information Potentially serious hypokalaemia may result from beta-agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose Theophylline in overdose can cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis,
convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning p. 1359.

- **PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

- **BREAST FEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure). 

  **Dose adjustments** Manufacturer advises consider dose reduction.

- **MONITORING REQUIREMENTS**

  ▶ In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

  ▶ Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

- **DIRECTIONS FOR ADMINISTRATION**

  **SLO-PHYLLIN®**

  ▶ In adults Swallow whole with fluid or swallow enclosed granules with soft food (e.g. yoghurt).

  ▶ In children Contents of the capsule (enteric-coated granules) may be sprinkled on to a spoonful of soft food (e.g. yoghurt) and swallowed without chewing.

- **PRESCRIBING AND DISPENSING INFORMATION**

  The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral theophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

- **PATIENT AND CARER ADVICE**

  **SLO-PHYLLIN®** Patient or carer should be given advice on how to administer theophylline modified release capsules.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Modified-release tablet**

**Respiratory system**

- **Nebuliser solutions**

  **HYPERTONIC SODIUM CHLORIDE SOLUTIONS**

  **INDICATIONS AND DOSE**

  **MUCOCLEAR® 3%**

  Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis) | Mild to moderate acute viral bronchiolitis in infants

  ▶ By Inhalation of Nebulised Solution

    ▶ Adult: 4 mL 2–4 times a day, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

  **MUCOCLEAR® 6%**

  Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis) | By Inhalation of Nebulised Solution

  ▶ Adult: 4 mL twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

  **NEBUSAL®**

  Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis) | By Inhalation of Nebulised Solution

  ▶ Adult: 4 mL up to twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

  **Resp-Ease® 6%**

  Mobilise lower respiratory tract secretions and prevent drying of bronchial mucous. | By Inhalation of Nebulised Solution

  ▶ Adult: (consult product literature)

  ▶ Resp-Ease 6% inhalation solution 4 ml ampoules (Venture Healthcare Ltd)

    - 1 device • NHS indicative price = £6.06 • Drug Tariff (Part IXa)
  - **Optichamber® DIAMOND**
    - For use with all pressurised (aerosol) inhalers.
  - **Optichamber Diamond (Respironics (UK) Ltd)**
    - 1 device • NHS indicative price = £7.49 • Drug Tariff (Part IXa)
Allergic conditions

2 Allergic conditions

Antihistamines, allergen immunotherapy and allergic emergencies

Antihistamines

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hayfever), and they may be of some value in vasomotor rhinitis. They reduce rhinorrhea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye, in the nose, and on the skin.

Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rashes, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine maleate p. 283 or promethazine hydrochloride p. 286 are used as an adjunct to adrenaline/epinephrine p. 222 in the emergency treatment of anaphylaxis and angioedema. Antihistamines (including cinnarizine p. 438, cyclizine p. 430, and promethazine teoclate p. 438) may also have a role in nausea and vomiting. Buclizine is included as an anti-emetic in a preparation for migraine. Antihistamines may also have a role in occasional insomnia.

All older antihistamines cause sedation but amin嗪azine tartrate p. 282 and promethazine may be more sedating whereas chlorphenamine maleate and cyclizine may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, ‘sedating’ antihistamines is superior to another and patients vary widely in their response.

Non-sedating antihistamines such as acrivastine p. 279, bilastine p. 279, cetirizine hydrochloride p. 279, desloratadine p. 280 (an active metabolite of loratadine p. 281), fexofenadine hydrochloride p. 280 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 281 (an isomer of cetirizine hydrochloride), loratadine and mizolastine p. 282 cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

Allergen immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (Graza®) is also licensed for disease-modifying treatment of grass pollen–induced rhinitis and conjunctivitis. Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 267 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high dose inhaled corticosteroid together with a long-acting beta, agonist. Omalizumab should be initiated by physicians in specialist centres experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to H1 antihistamine treatment.

Anaphylaxis and allergic emergencies

Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow’s milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis (see Food allergy p. 84). Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal

www.getintopharma.com
products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

**Treatment of anaphylaxis**

Adrenaline/epinephrine provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as anaphylaxis and angioedema.

First-line treatment includes:

- securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering adrenaline/epinephrine (by intramuscular injection in a dose of 300 micrograms may be appropriate for immediate self-administration); the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Patients receiving beta-blockers require special consideration;
- administering high-flow oxygen and intravenous fluids is also of primary importance;
- administering an antihistamine, such as chlorphenamine maleate, by slow intravenous injection or intramuscular injection is a useful adjunctive treatment, given after adrenaline.
- Administering an intravenous corticosteroid such as hydrocortisone p. 676 (preferably as sodium succinate) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients.

**Continuing respiratory deterioration** requires further treatment with bronchodilators including inhaled or intravenous salbutamol p. 252, inhaled ipratropium bromide p. 246, intravenous aminophylline p. 272, or intravenous magnesium sulfate p. 1051 [unlicensed indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a dilute solution by the intravenous route.

Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately. On discharge, patients should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. Patients should be instructed to return to hospital if symptoms recur and to contact their general practitioner if necessary.

Patients who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine auto-injector should be given for self-administration or a replacement supplied.

**Intramuscular adrenaline (epinephrine)**

The intramuscular route is the first choice route for the administration of adrenaline/epinephrine in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Patients with severe allergy should be instructed in the self-administration of adrenaline/epinephrine p. 222 by intramuscular injection.

Prompt injection of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

**Intravenous adrenaline (epinephrine)**

Intravenous adrenaline/epinephrine should be given only by those experienced in its use, in a setting where patients can be carefully monitored.

When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline/epinephrine can be given by slow intravenous injection repeated according to response; if multiple doses are required, adrenaline/epinephrine should be given as a slow intravenous infusion stopping when a response has been obtained.

It is important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

The intravenous route is also used for cardiac resuscitation.

**Angioedema**

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline/epinephrine injection and oxygen should be given as described under **Anaphylaxis**; antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.

**Hereditary angioedema**

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 289, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of hereditary angioedema; it can also be used for short-term prophylaxis before dental, medical or surgical procedures. Conestat alfa p. 290 and icatibant p. 290 are licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

Tranexamic acid p. 110 and danazol p. 742 [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis with tranexamic acid or danazol is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

---

**Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals**

<table>
<thead>
<tr>
<th>Age</th>
<th>Dose</th>
<th>Volume of adrenaline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Child 1 month-5 years</td>
<td>150 micrograms</td>
<td>0.15 mL 1 in 1000 (1 mg/mL) adrenaline¹</td>
</tr>
<tr>
<td>Child 6-11 years</td>
<td>300 micrograms</td>
<td>0.3 mL 1 in 1000 (1 mg/mL) adrenaline</td>
</tr>

</table>

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse and respiratory function.

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal
ANTIHISTAMINES › NON-SEDATING

Acrivastine 19-May-2017  
- INDICATIONS AND DOSE  
Symptomatic relief of allergy such as hayfever, chronic idiopathic urticaria
  - BY MOUTH  
    - Child 12-17 years: 8 mg 3 times a day  
    - Adult: 8 mg 3 times a day
- CONTRA-INDICATIONS  
  Avoid in Acute porphyrias p. 1058 - elderly
- INTERACTIONS  
  → Appendix 1: antihistamines, non-sedating
- SIDE-EFFECTS  
  - Common or very common  
    Drowsiness, dry mouth
  - Frequency not known  
    Dizziness, rash
- SIDE-EFFECTS, FURTHER INFORMATION  
  Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.
- ALLERGY AND CROSS-SENSITIVITY  
  Contra-indicated if history of hypersensitivity to triprolidine.
- PREGNANCY  
  Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
- BREAST FEEDING  
  Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- PATIENT AND CARER ADVICE  
  Patients or carers should be given advice on how to administer bilastine tablets.
  - Driving and skilled tasks  
    Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.
- MEDICINAL FORMS  
  There can be variation in the licensing of different medicines containing the same drug.
  - Tablet  
    CAUTIONARY AND ADVISORY LABELS  
    23  
    - Ilaxten (A. Menarini Farmaceutica Internazionale SRL)  
      Bilastine 20 mg  
      Ilaxten 20mg tablets  |  30 tablet [POM] £15.09

Bilastine 22-May-2007  
- INDICATIONS AND DOSE  
Symptomatic relief of allergic rhinoconjunctivitis and urticaria
  - BY MOUTH  
    - Child 12-17 years: 20 mg once daily  
    - Adult: 20 mg once daily
- CONTRA-INDICATIONS  
  Avoid in Acute porphyrias p. 1058
- INTERACTIONS  
  → Appendix 1: antihistamines, non-sedating
- SIDE-EFFECTS  
  - Common or very common  
    Drowsiness, headache
  - Uncommon  
    Anxiety, appetite increased, asthenia, bundle branch block, diarrhoea, dry mouth, dyspnoea, fever, gastritis, gastrointestinal discomfort, insomnia, nasal complaints, nausea, oral herpes, pre-existing condition improved, pruritus, QT interval prolongation, sinus arrhythmia, thirst, tinnitus, vertigo, weight increased
- SIDE-EFFECTS, FURTHER INFORMATION  
  Non-sedating antihistamines such as bilastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.
- PREGNANCY  
  Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

INTERACTIONS

PATIENT AND CARER ADVICE

Driving and skilled tasks Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary
Cetirizine Tablets 10 mg may be prescribed.

Cetirizine Oral Solution 5 mg/5 mL may be prescribed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

EXCIPIENTS: May contain Propylene glycol
- Cetirizine hydrochloride (Non-proprietary)
  Cetirizine hydrochloride 1 mg per 1 ml Cetirizine 1 mg/ml oral solution sugar-free 300 mL (PO) £1.12 DT = £1.12
- Cetirizine hydrochloride 10 mg Cetirizine 10 mg tablets 30 tablet (PO) £0.85–£0.86 DT = £0.86
- Cetirizine hydrochloride 10 mg (Merck Sharp & Dohme Ltd) Cetirizine hydrochloride 10 mg Benadryl Allergy Liquid 10 mL Flavours of 200 mL (PO) £3.09 DT = £3.09

Tablet
- Cetirizine hydrochloride (Merck Sharp & Dohme Ltd) Cetirizine Tablets 10 mg 30 tablet (PO) £0.85–£0.86 DT = £0.86

Capsule
- Cetirizine hydrochloride (McNeil Products Ltd) Cetirizine Tablets 10 mg 30 tablet (PO) £0.85–£0.86 DT = £0.86

Fexofenadine hydrochloride

INDICATIONS AND DOSE

Symptomatic relief of seasonal allergic rhinitis
- BY MOUTH
  - Child 6-11 years: 30 mg twice daily
  - Child 12-17 years: 120 mg once daily
  - Adult: 120 mg once daily
Symptomatic relief of chronic idiopathic urticaria
- BY MOUTH
  - Child 6-11 years: 180 mg once daily
  - Adult: 180 mg once daily

PHARMACOKINETICS

Desloratadine is a metabolite of loratadine.

INTERACTIONS

Appendix 1: antihistamines, non-sedating

SIDE-EFFECTS

Common or very common Asthenia · dry mouth · headache
Rare or very rare Akathisia · arrhythmias · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · hallucination · hepatic disorders · insomnia · myalgia · nausea · palpitations · seizure · vomiting

Frequency not known Behaviour abnormal · photosensitivity reaction · QT interval prolongation

SIDE-EFFECTS, FURTHER INFORMATION
Non-sedating antihistamines such as fexofenadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

ALLERGY AND CROSS-SENSITIVITY
Contra-indicated if history of hypersensitivity to loratadine.
Levocetirizine hydrochloride

**INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, urticaria

- **BY MOUTH**
  - Child 6–17 years: 5 mg once daily
  - Adult: 5 mg once daily

**PHARMACOKINETICS**

- Levocetirizine is an isomer of cetirizine.

**CONTRA-INDICATIONS**

Avoid in Acute porphyrias p. 1058

**INTERACTIONS**

→ Appendix 1: antihistamines, non-sedating

**SIDE-EFFECTS**

- **Common**
  - Asthenia, constipation (in children), drowsiness, dry mouth
- **Uncommon**
  - Abdominal pain
- **Frequency not known**
  - Agitation, angioedema, appetite increased, arthralgia, depression, dizziness (very common in children), dyspnoea, hallucination, hepatitis, myalgia, nausea, oedema, palpitations, paraesthesia, seizure, skin reactions, sleep disorders (very common in children), suicidal ideation, syncope, tachycardia, taste altered, tremor, urinary disorders, vertigo, vision disorders, vomiting, weight increased

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as levocetirizine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

**PREGNANCY**

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

**BREAST FEEDING**

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**RENAL IMPAIRMENT**

- In adults Avoid if eGFR less than 10 mL/minute/1.73 m².
- In children Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**Dose adjustments**

- In adults 5 mg on alternate days if eGFR 30–50 mL/minute/1.73 m³. 5 mg every 3 days if eGFR 10–30 mL/minute/1.73 m³.

**INTERACTIONS**

→ Appendix 1: antihistamines, non-sedating

**SIDE-EFFECTS**

- **Common or very common**
  - Drowsiness, nervousness (in children)
- **Uncommon**
  - Appetite increased, headache (very common in children), insomnia
- **Rare or very rare**
  - Alopecia, angioedema, dizziness, dry mouth, fatigue (very common in children), gastritis, hepatic function abnormal, oedema, palpitations, rash, seizure, tachycardia

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as loratadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

**PREGNANCY**

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

**BREAST FEEDING**

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in severe impairment (risk of increased exposure).

**Dose adjustments**

Manufacturer advises initial dose reduction to alternate days in severe impairment.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Loratadine for allergy symptoms www.medicinesforchildren.org.uk/loratadine-allergy-symptoms

Driving and skilled tasks

Although drowsiness is rare, nevertheless patients and their carers should be advised.
that it can occur and may affect performance of skilled
tasks (e.g. cycling or driving); alcohol should be avoided.

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Loratadine 10 mg tablets may be prescribed.
  - Loratadine syrup 5 mg/5 mL may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Oral solution**
  - **EXCIPIENTS:** May contain Propylene glycol
  - Loratadine (Non-proprietary)
    - **Loratadine 1 mg per 1 mL**
      - Loratadine 5mg/5ml oral solution | 100 ml (pump) £1.90 DT = £1.55
      - Loratadine 5mg/5ml oral solution sugar free sugar-free | 100 ml (pump)
  - Clarityn (Loratadine)
  - Mizollen (Sanofi)
  - Rupatadine (Non-proprietary)

MEDICINAL FORMS

PROFESSION SPECIFIC INFORMATION

DIRECTIONS FOR ADMINISTRATION

HEPATIC IMPAIRMENT

BREAST FEEDING

PREGNANCY

With parenteral use

With oral use

Drowsiness

Frequency not known

Agitation • appetite decreased • blood disorder • bronchial secretion viscosity increased • depression • diarrhoea • haemolytic anaemia • hypotension • irritability • muscle twitching • muscle weakness • nightmare • palpitations • photosensitivity reaction • skin reactions • tinnitus • urinary retention • vomiting

SPECIFIC SIDE-EFFECTS

Common or very common

With oral use

Drowsiness

Frequency not known

With oral use

Angioedema • arrhythmias • chest tightness • confusion • gastrointestinal discomfort • hepatic disorders

With parenteral use

Central nervous system stimulation • confusional psychosis (in adults) • dyspepsia • gastrointestinal disorder • hepatitis • sedation

SIDE-EFFECTS, FURTHER INFORMATION

Children and elderly patients are more susceptible to side-effects.

PREGNANCY

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

BREAST FEEDING

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT

Manufacturer advises caution.

DIRECTIONS FOR ADMINISTRATION

For intravenous injection, give over 1 minute; if small dose required, dilute with Sodium Chloride 0.9%.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Chlorphenamine maleate for allergy symptoms www.medicinesforchildren.org.uk/chlorphenamine-maleate-allergy-symptoms-0

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary

With oral use

Chlorphenamine tablets may be prescribed. Chlorphenamine oral solution may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY

With intramuscular use or intravenous use

Prescription only medicine restriction does not apply to chlorphenamine injection where administration is for saving life in emergency.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection

Chlorphenamine maleate (Non-proprietary)

Chlorphenamine maleate 10 mg per 1 ml Chlorphenamine 10mg/1ml solution for injection ampoules | 5 ampoule [PO] £22.48–£22.50 DT + £22.50

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

Clemastine

09-Jul-2018

INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever, urticaria

BY MOUTH

Adult: 1 mg twice daily, increased if necessary up to 6 mg daily

CONTRA-INDICATIONS

Avoid in Acute porphyrias p. 1058

CAUTIONS

Elderly • epilepsy • prostatic hypertrophy • pyloroduodenal obstruction • stenosing peptic ulcer • susceptibility to angle-closure glaucoma • urinary retention

INTERACTIONS

Appendix 1: antihistamines, sedating

SIDE-EFFECTS

Common or very common

Asthma • sedation

Uncommon

Dizziness

Rare or very rare

Abdominal pain • agitation • constipation • dry mouth • dyspnoea • headache • nausea • palpitations • rash • tachycardia

PREGNANCY

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

BREAST FEEDING

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); sedating effects enhanced by alcohol.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2

Tavegil (GlaxoSmithKline Consumer Healthcare)

Clemastine (as Clemastine hydrogen fumarate) 1 mg Tavegil 1mg tablets | 60 tablet [P] £6.66 DT = £6.66

Cyproheptadine hydrochloride

30-Jun-2018

INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever, urticaria

Pruritus

BY MOUTH

Adult: 4 mg 3 times a day, usual dose 4–20 mg daily; maximum 32 mg per day

CONTRA-INDICATIONS

Avoid in Acute porphyrias p. 1058

CAUTIONS

Epilepsy • prostatic hypertrophy • pyloroduodenal obstruction • susceptibility to angle-closure glaucoma • urinary retention

INTERACTIONS

Appendix 1: antihistamines, sedating
Hydroxyzine hydrochloride 30-Mar-2017

**DRUG ACTION**

Hydroxyzine is a sedating antihistamine which exerts its actions by antagonising the effects of histamine.

**INDICATIONS AND DOSE**

- **Pruritus**
  - **By mouth**
    - Child 6 months-5 years: 5–15 mg daily in divided doses, dose adjusted according to weight; maximum 2 mg/kg per day.
    - Child 6–17 years (body-weight up to 40 kg): Initially 15–25 mg daily in divided doses, dose increased as necessary, adjusted according to weight; maximum 2 mg/kg per day.
    - Child 6–17 years (body-weight >40 kg and above): Initially 15–25 mg daily in divided doses, increased if necessary to 50–100 mg daily in divided doses, dose adjusted according to weight.
    - Adult: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg 3–4 times a day.
    - Elderly: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg twice daily.

**SIDE-EFFECTS**

**PREGNANCY**

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

**CAUTIONS**

- Elderly: Elderly patients are particularly susceptible to side-effects, particularly CNS effects.
- Children: Children have an increased susceptibility to side-effects; manufacturers advise avoid or reduce dose.
- Interaction: Appendix 1: antihistamines, sedating
- Side-effects: Rare or very rare: Severe cutaneous adverse reactions (SCARs): skin reactions

**SIDE-EFFECTS**

- Paradoxical stimulation may occur rarely, especially with high doses or in the elderly. Drowsiness may diminish after a few days of treatment.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTE (APRIL 2015)

Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and torsade de pointes; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT-interval, cardiovascular disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant bradycardia. To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:

- Hydroxyzine is contra-indicated in patients with prolonged QT-interval or who have risk factors for QT-interval prolongation;
- Avoid use in the elderly due to increased susceptibility to the side-effects of hydroxyzine;
- Consider the risks of QT-interval prolongation and torsade de pointes before prescribing to patients taking drugs that lower heart rate or plasma-potassium concentration;
- In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg;
- In adults, the maximum daily dose is 100 mg;
- In the elderly, the maximum daily dose is 50 mg (if use of hydroxyzine cannot be avoided);
- The lowest effective dose for the shortest period of time should be prescribed.

**CONTRA-INDICATIONS**

Acquired or congenital QT interval prolongation - predisposition to QT interval prolongation

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- QT interval prolongation: Risk factors for QT interval prolongation include significant electrolyte imbalance, bradycardia, cardiovascular disease, and family history of sudden cardiac death.
- Caution: Bladder outflow obstruction - breathing problems - cardiovascular disease - children - decreased gastrointestinal motility - dementia - elderly - epilepsy - hypertension - hyperthyroidism - myasthenia gravis - prostatic hypertrophy (in adults) - pyloroduodenal obstruction - stenosing peptic ulcer - susceptibility to angle-closure glaucoma - urinary retention

**CAUTIONS, FURTHER INFORMATION**

- Elderly: Elderly patients are particularly susceptible to side-effects; manufacturers advise avoid or reduce dose.
- Children: Children have an increased susceptibility to side-effects, particularly CNS effects.
286 Allergic conditions

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises hydroxyzine should be avoided in patients with previous hypersensitivity to cetirizine or other piperazine derivatives, and aminophylline.

- **PREGNANCY** Manufacturers advise avoid—toxicity in animal studies with higher doses. Use in the latter part of the third trimester may cause irritability, paradoxical excitation, and tremor in the neonate.

- **BREAST FEEDING** Manufacturer advises avoid—expected to be present in milk but effect unknown.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (increased risk of accumulation); avoid in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises dose reduction of 33% in mild to moderate impairment.

- **EFFECT ON LABORATORY TESTS** May interfere with methacholine test—manufacturer advises stop treatment 96 hours prior to test. May interfere with skin testing for allergy—manufacturer advises stop treatment one week prior to test.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving or cycling); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## Promethazine hydrochloride

- **INDICATIONS AND DOSE**
  - **Symptomatic relief of allergy such as hay fever and urticaria**
  - **Insomnia associated with urticaria and pruritus**
  - **BY MOUTH**
    - Child 2–4 years: 5 mg twice daily, alternatively 5–15 mg once daily, dose to be taken at night
    - Child 5–9 years: 5–10 mg twice daily, alternatively 10–25 mg once daily, dose to be taken at night
    - Child 10–17 years: 10–20 mg 2–3 times a day, alternatively 25 mg once daily, dose to be taken at night, increased if necessary to 25 mg twice daily
  - **Adult:** 10–25 mg 2–3 times a day
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult: 25–50 mg (max. per dose 100 mg)

- **Emergency treatment of anaphylactic reactions**
  - **BY SLOW INTRAVENOUS INJECTION**
    - Adult: 25–50 mg, to be administered as a solution containing 2.5 mg/mL in water for injections; maximum 100 mg per course

- **Sedation (short-term use)**
  - **BY MOUTH**
    - Child 2–4 years: 15–20 mg
    - Child 5–9 years: 20–25 mg
    - Child 10–17 years: 25–50 mg
    - Adult: 25–50 mg
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult: 25–50 mg

- **Nausea** | **Vomiting** | **Vertigo** | **Labyrinthine disorders** | **Motion sickness**
  - **BY MOUTH**
    - Child 2–4 years: 5 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
    - Child 5–9 years: 10 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

- **SIDE-EFFECTS**
  - **Common or very common** Anxiety, insomnia, irritability
  - **Uncommon** Cystitis, dizziness, dry mouth, skin reactions
  - **Rare or very rare** Hepatitis, Stevens-Johnson syndrome, weight increased

- **SIDE-EFFECTS, FURTHER INFORMATION** Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.
**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**

EXCIPIENTS: May contain Sulfites

**VACCINES**

> **ALLERGEN-TYPE VACCINES**

**Bee venom extract**

**INDICATIONS AND DOSE**

Hypersensitivity to bee venom

- **BY SUBCUTANEOUS INJECTION**
  - Adult: (consult product literature)

**DESENSITISING VACCINES**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- Seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- Hypersensitivity to wasp and bee venoms.

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

**CONTRA-INDICATIONS** Consult product literature

**CAUTIONS** Consult product literature

**INTERACTIONS** → Appendix 1: bee venom extract

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION** Life-threatening hypersensitivity reactions can occur. Cardiopulmonary resuscitation must be immediately available. Manufacturer advises monitoring for at least 1 hour after injection.

**PREGNANCY** Avoid.

**PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

CONTRA-INDICATIONS

- Should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established

CAUTIONS

GENERAL CAUTIONS

- Epilepsy - prostatic hypertrophy (in adults) - pyloroduodenal obstruction - severe coronary artery disease - susceptibility to angle-closure glaucoma - urinary retention

SPECIFIC CAUTIONS

- With intravenous use: Avoid extravasation with intravenous injection

INTERACTIONS → Appendix 1: antihistamines, sedating

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Arrhythmia - blood disorder - confusion - dizziness - drowsiness - dry mouth - headache - hypotension - jaundice - movement disorders - palpitations - photosensitivity reaction - urinary retention - vision blurred

SPECIFIC SIDE-EFFECTS

- With parenteral use: Appetite decreased - epigastric discomfort - fatigue - haemolytic anaemia - hypersensitivity - muscle spasms - nightmare - restlessness - skin reactions

SIDE-EFFECTS, FURTHER INFORMATION

Elderly patients are more susceptible to anticholinergic side-effects.

PREGNANCY

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

BREAST FEEDING

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT

Manufacturer advises caution.

RENAL IMPAIRMENT

Use with caution.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary

Promethazine Hydrochloride Tablets 10 mg or 25 mg may be prescribed.

Promethazine Hydrochloride Oral Solution (elixir) 5 mg/5 mL may be prescribed.

LESS SUITABLE FOR PRESCRIBING

Promethazine is less suitable for prescribing for sedation.

EXCEPTIONS TO LEGAL CATEGORY

Prescription only medicine restriction does not apply to promethazine hydrochloride injection where administration is for saving life in emergency.
Grass pollen extract

**INDICATIONS AND DOSE**
Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs
- **BY SUBCUTANEOUS INJECTION**
  - Adult: (consult product literature)
Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs (initiated under specialist supervision)
- **BY MOUTH**
  - Adult: 1 tablet daily, treatment to be started at least 4 months before start of pollen season and continue for up to 3 years

**IMPORTANT SAFETY INFORMATION**
**DESENSITISING VACCINES**
In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:
- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergy drugs;
- hypersensitivity to wasp and bee venoms.
Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

**CONTRA-INDICATIONS**
Consult product literature
**CAUTIONS**
Consult product literature
**INTERACTIONS**
Appendix 1: grass pollen extract
**SIDE-EFFECTS**
**SIDE-EFFECTS, FURTHER INFORMATION**
Hypersensitivity reactions to immunotherapy can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

**PREGNANCY**
Should be avoided in pregnant women—consult product literature.

**Tree pollen extract**

**INDICATIONS AND DOSE**
Treatment of seasonal allergic hay fever due to tree pollen in patients who have failed to respond to anti-allergy drugs
- **BY SUBCUTANEOUS INJECTION**
  - Adult: (consult product literature)

Wasp venom extract

INDICATIONS AND DOSE

Hypersensitivity to wasp venom
- BY SUBCUTANEOUS INJECTION
- Adults: (consult product literature)

Contra-indications Consult product literature

Cautions Consult product literature

Interactions Appendix 1: wasp venom extract

Side-effects
SIDE-EFFECTS, FURTHER INFORMATION
Hypersensitivity reactions to wasp venom extracts can be life-threatening;
cardiovascular and respiratory symptoms must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

Pregnancy Avoid.

Prescribing and dispensing information Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing desensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions
- Pharmalgen® for bee and wasp venom allergy (February 2012) NICE TA246
- Pharmalgen® is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:
  - a severe systemic reaction to bee or wasp venom;
  - a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Other drugs used for Angioedema Adrenaline/epinephrine, p. 222

Medicines used in hereditary angioedema > Complement regulatory proteins

C1-esterase inhibitor

INDICATIONS AND DOSE
BERINERT®
- Acute attacks of hereditary angioedema (under expert supervision)
- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 20 units/kg

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)
- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 1000 units for 1 dose, to be administered less than 6 hours before procedure

CINRYZE®
- Acute attacks of hereditary angioedema (under expert supervision)
- BY SLOW INTRAVENOUS INJECTION
- Adult: 1000 units, repeated if necessary for 1 dose, dose may be repeated if necessary after 60 minutes (or sooner for patients experiencing laryngeal attacks or if treatment initiation is delayed)

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)
- BY SLOW INTRAVENOUS INJECTION
- Adult: 1000 units for 1 dose, to be administered up to 24 hours before procedure

Long-term prophylaxis of severe, recurrent attacks of hereditary angioedema where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated (under expert supervision)
- BY SLOW INTRAVENOUS INJECTION
- Adult: 1000 units every 3–4 days, interval between doses to be adjusted according to response

CAUTIONS Vaccination against hepatitis A and hepatitis B may be required
290  Allergic conditions

- **SIDE-EFFECTS**
  - Rare or very rare  Dizziness · dyspnoea · flushing · headache · hypersensitivity · hypertension · hypotension · nausea · tachycardia · thrombosis (with high doses) · urticaria

- **PREGNANCY**  Manufacturer advises avoid unless essential.

- **PRESCRIBING AND DISPENSING INFORMATION**  C1-esterase inhibitor is prepared from human plasma.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **SIDE-EFFECTS**
  - uncommon
  - common or very common

- **SIDE-EFFECTS**
  - **CONTRA-INDICATIONS**  Rabbit allergy

- **SIDE-EFFECTS**
  - **COMMON**  Headache
  - **UNCOMMON**  Abdominal discomfort · diarrhoea · nausea · oral paraesthesia · paraesthesia · throat irritation · urticaria · vertigo

- **PREGNANCY**  Use only if potential benefit outweighs risk—toxicity in animal studies.

- **PREGNANCY**  Use only if potential benefit outweighs risk—no information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

### All Wales Medicines Strategy Group (AWMSG) decisions

**AWMSG No. 786**  The All Wales Medicines Strategy Group has advised (November 2018) that conestat alfa (Ruconest®) is recommended as an option for use within NHS Wales for the treatment of acute angioedema attacks in adults and adolescents with hereditary angioedema due to C1 esterase inhibitor deficiency. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for injection**
    - **Conestat alfa 2100 unit**  Ruconest 21,000 unit powder for solution for injection vials  |  1 vial (POD) £75.00

### Drugs used in hereditary angioedema

#### Selective Bradykinin B2 Antagonists

- **Icatibant**

  - **INDICATIONS AND DOSE**
    - **Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency**
      - **BY SUBCUTANEOUS INJECTION**
      - **Adult**  30 mg for 1 dose, then 30 mg after 6 hours if required, then 30 mg after 6 hours if required; maximum 3 doses per day

  - **CAUTIONS**  Ischaemic heart disease · stroke

  - **INTERACTIONS**  → Appendix 1: Icatibant

  - **SIDE-EFFECTS**
    - **Common or very common**  Dizziness · fever · headache · nausea · skin reactions

  - **PREGNANCY**  Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

  - **BREAST FEEDING**  Manufacturer advises avoid for 12 hours after administration.

  - **NATIONAL FUNDING/ACCESS DECISIONS**

- **Scottish Medicines Consortium (SMC) decisions**
  - **SMC No. 476/08**  The Scottish Medicines Consortium has advised (March 2012) that icatibant (Firazyr®) is accepted for use within NHS Scotland for the treatment of acute attacks of hereditary angioedema (HAE) in adults with C1-esterase-inhibitor deficiency. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland.

- **All Wales Medicines Strategy Group (AWMSG) decisions**
  - **AWMSG No. 3293**  The All Wales Medicines Strategy Group has advised (June 2018) that icatibant acetate (Firazyr®) is recommended as an option for use within NHS Wales for the treatment of acute angioedema attacks in adults and adolescents with hereditary angioedema due to C1 esterase inhibitor deficiency. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - **Icatibant (as icatibant acetate)**  10 mg per 1 ml  Firazyr 30 mg/3 ml solution for injection pre-filled syringes  |  1 pre-filled disposable injection (POD) £1,395.00

---

### Conestat alfa

**20-Feb-2019**

- **INDICATIONS AND DOSE**
  - **Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency**
    - **BY SLOW INTRAVENOUS INJECTION**
    - **Adult**  (body-weight up to 84 kg): 50 units/kg for 1 dose, to be administered over 5 minutes, dose may be repeated if necessary; maximum 2 doses per day
    - **Adult**  (body-weight 84 kg and above): 4200 units for 1 dose, to be administered over 5 minutes, dose may be repeated if necessary; maximum 2 doses per day

- **SIDE-EFFECTS**
  - **CONTRA-INDICATIONS**  Rabbit allergy

- **SIDE-EFFECTS**
  - **COMMON**  Headache
  - **UNCOMMON**  Abdominal discomfort · diarrhoea · nausea · oral paraesthesia · paraesthesia · throat irritation · urticaria · vertigo

- **PREGNANCY**  Use only if potential benefit outweighs risk—animal studies.

- **BREAST FEEDING**  Use only if potential benefit outweighs risk—no information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

---

### Scottish Medicines Consortium (SMC) decisions

**SMC No. 745/11**  The Scottish Medicines Consortium has advised (August 2018) that conestat alfa (Ruconest®) is accepted for use within NHS Scotland for the treatment of acute angioedema attacks in adults and adolescents with hereditary angioedema due to C1 esterase inhibitor deficiency. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.
3 Conditions affecting sputum viscosity

MUCOLYTICS

Acetylcysteine

- **INDICATIONS AND DOSE**
  - **NACSYS® EFFERVESCENT TABLETS**
    - **REDUCTION OF SPUTUM VISCOITY**
      - **BY MOUTH**
      - Adult: 600 mg once daily

- **CAUTIONS**
  - History of peptic ulceration

- **SIDE-EFFECTS**
  - **Uncommon**
    - Diarrhoea, fever, gastrointestinal discomfort, headache, hypotension, nausea, stomatitis, tinnitus, vomiting
  - **Rare or very rare**
    - Haemorrhage
  - **Frequency not known**
    - Face oedema

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: effervescent tablet, granules, effervescent tablet.

  **ELECTROLYTES:** May contain Sodium

  **Acetylcysteine 600 mg NACSYS 600mg effervescent tablets sugar-free** | 30 tablet [POM] £5.50 DT = £89.50

Carbocisteine

- **INDICATIONS AND DOSE**
  - **REDUCTION OF SPUTUM VISCOITY**
    - **BY MOUTH**
    - Adult: Initially 2.25 g daily in divided doses, then reduced to 1.5 g daily in divided doses, as condition improves

- **CONTRA-INDICATIONS**
  - Active peptic ulceration

- **CAUTIONS**
  - History of peptic ulceration (may disrupt the gastric mucosal barrier)

- **SIDE-EFFECTS**
  - Gastrointestinal haemorrhage, skin reactions, Stevens-Johnson syndrome, vomiting

- **PREGNANCY**
  - Manufacturer advises avoid in first trimester.

- **BREAST FEEDING**
  - No information available.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of oral liquid formulations may include cherry, raspberry, cinnamon, or rum.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Oral solution**
  - **Carbocisteine (Non-proprietary)**
    - Carbocisteine 50 mg per 1 ml Carbocisteine 250mg/5ml oral solution | 300 ml [POM] £18.55 DT = £8.55
    - Carbocisteine 75 mg per 1 ml Carbocisteine 750mg/10ml oral solution 10ml sachets sugar free sugar-free | 15 sachet [POM] £3.85 DT = £3.85
  - **Mucodyne (Sanofi)**
    - Carbocisteine 50 mg per 1 ml Mucodyne Paediatric 250mg/5ml syrup | 125 ml [POM] £12.60
    - Mucodyne 250mg/5ml syrup | 300 ml [POM] £8.39 DT = £8.55

  **Capsule**
  - **Carbocisteine (Non-proprietary)**
    - Carbocisteine 375 mg Carbocisteine 375mg capsules | 120 capsule [POM] £18.98 DT = £4.60

---

Erdotin

- **INDICATIONS AND DOSE**
  - Symptomatic treatment of acute exacerbations of chronic bronchitis
  - **BY MOUTH**
  - Adult: 300 mg twice daily for up to 10 days

- **CAUTIONS**
  - History of peptic ulceration (may disrupt the gastric mucosal barrier)

- **SIDE-EFFECTS**
  - Common or very common
    - Epigastric pain, taste altered
  - Uncommon
    - Allergic dermatitis, angioedema, common cold, diarrhoea, dysphagia, headache, nausea, vomiting

- **PREGNANCY**
  - Manufacturer advises avoid—no information available.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in mild to moderate hepatic failure; avoid in severe hepatic failure.

- **Dose adjustments**
  - Manufacturer advises max. 300 mg daily in mild to moderate hepatic failure.

- **RENAL IMPAIRMENT**
  - Avoid if eGFR less than 25 mL/minute/1.73 m²—no information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) decisions**
  - SMC No. 415/07
  - The Scottish Medicines Consortium (November 2007) has advised that erdotine (Erdotin®) is not recommended for use within NHS Scotland for the symptomatic treatment of acute exacerbations of chronic bronchitis as the economic case was not demonstrated.

  **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - **Erdotin (Galen Ltd)**
    - Erdotin 300 mg Erdotin 300mg capsules | 20 capsule [POM] £5.00 DT = £5.00

3.1 Cystic fibrosis

Cystic fibrosis

**Description of condition**

Cystic fibrosis is a genetic disorder affecting the lungs, pancreas, liver, intestine, and reproductive organs. The main clinical signs are pulmonary disease, with recurrent infections and the production of copious viscous sputum, and malabsorption due to pancreatic insufficiency. Other complications include hepatobiliary disease, osteoporosis, cystic fibrosis-related diabetes, and distal intestinal obstruction syndrome.

**Aims of treatment**

The aim of treatment includes preventing and managing lung infections, loosening and removing thick, sticky mucus from the lungs, preventing or treating intestinal obstruction, and providing sufficient nutrition and hydration.

Lung function is a key predictor of life expectancy in people with cystic fibrosis and optimising lung function is a major aim of care.
Non-drug treatment
Specialist physiotherapists should assess patients with cystic fibrosis and provide advice on airway clearance, nebuliser use, musculoskeletal disorders, physical activity, and urinary incontinence. The importance of airway clearance techniques should be discussed with patients and their parents or carers and appropriate training provided. Patients should be advised that regular exercise improves both lung function and overall fitness.

Drug treatment
Treatment for cystic fibrosis lung disease is based on the prevention of lung infection and the maintenance of lung function. In patients with cystic fibrosis, who have clinical evidence of lung disease, the frequency of routine review should be based on their clinical condition, but adults should be reviewed at least every 3 months. More frequent review is required immediately after diagnosis.

Mucolytics
Patients with cystic fibrosis who have evidence of lung disease should be offered a mucolytic. Dornase alfa p. 293 is the first choice mucolytic. If there is an inadequate response, dornase alfa p. 293 and hypertonic sodium chloride p. 275, or hypertonic sodium chloride p. 275 alone should be considered.

Mannitol dry powder for inhalation p. 295 is recommended as an option when dornase alfa p. 293 is unsuitable (because of ineligibility, intolerance, or inadequate response), when lung function is rapidly declining, and if other osmotic drugs are not considered appropriate (see mannitol p. 295 National funding/access decisions).

Lumacaftor with ivacaftor p. 294 is not recommended for treating cystic fibrosis within its marketing authorisation (see lumacaftor with ivacaftor p. 294 National funding/access decisions).

Pulmonary infection
Staphylococcus aureus
Patients who are not taking prophylaxis and have a new Staphylococcus aureus infection can be given an oral antibiotic. If they are clinically well and if they are clinically well and have pulmonary disease, oral or intravenous (depending on infection severity) broad-spectrum antibacterials with activity against Staph. aureus should be considered (consult local protocol).

A long-term antibacterial should be considered to suppress chronic Staph. aureus respiratory infections in patients whose pulmonary disease is stable. In patients with chronic Staph. aureus respiratory infections who become clinically unwell with pulmonary disease, oral or intravenous (depending on infection severity) broad-spectrum antibacterials with activity against Staph. aureus should be given. In those patients with new evidence of meticillin-resistant Staphylococcus aureus (MRSA) respiratory infection (with or without pulmonary exacerbation), specialist microbiological advice should be sought.

Antibacterials should not be routinely used to suppress MRSA in patients with stable pulmonary disease. If a patient with cystic fibrosis and chronic MRSA respiratory infection becomes unwell with a pulmonary exacerbation or shows a decline in pulmonary function, specialist microbiological advice should be sought.

Pseudomonas aeruginosa
If a patient with cystic fibrosis develops a new Pseudomonas aeruginosa infection, eradication therapy with a course of oral antibacterial should be started (by intravenous injection, if they are clinically unwell), in combination with an inhaled antibacterial. An extended course of oral and inhaled antibacterial should follow (consult local protocol).

If eradication therapy is not successful, sustained treatment with an inhaled antibacterial should be offered. Nebulised colistimethate sodium p. 556 should be considered as first-line treatment (but see also colistimethate sodium by dry powder inhalation p. 556 National funding/access decisions).

In patients with chronic Ps. aeruginosa infection (when treatment has not eradicated the infection) who become clinically unwell with pulmonary exacerbations, an oral antibacterial or a combination of two intravenous antibacterial drugs of different classes (depending on infection severity) should be used. Changing antibacterial regimens should be considered to treat exacerbations (consult local protocol).

Nebulised aztreonam p. 541, nebulised tobramycin, or tobramycin dry powder for inhalation (see tobramycin p. 520 National funding/access decisions) should be considered for those who are deteriorating despite regular inhaled colistimethate sodium p. 556.

Burkholderia cepacia complex
Patients who develop a new Burkholderia cepacia complex infection, should be given eradication therapy with a combination of intravenous antibacterial drugs (specialist microbiological advice should be sought on the choice of antibacterials). There is no evidence to support using antibacterials to suppress chronic Burkholderia cepacia complex infection in patients with cystic fibrosis who have stable pulmonary status.

Specialist microbiological advice should be sought for patients with chronic Burkholderia cepacia complex infection (when treatment has not eradicated the infection) and who become clinically unwell with a pulmonary disease exacerbation.

An inhaled antibacterial should be considered for those who have chronic Burkholderia cepacia complex infection and declining pulmonary status; treatment should be stopped if there is no observed benefit.

Haemophilus influenzae
Haemophilus influenzae infection in the absence of clinical evidence of pulmonary infection should be treated with an appropriate oral antibacterial drug. In those who are unwell with clinical evidence of pulmonary infection, an appropriate antibacterial should be given by mouth or intravenously depending on the severity of the illness (consult local protocol).

Non-tuberculous mycobacteria
Non-tuberculous mycobacterial eradication therapy should be considered for patients with cystic fibrosis who are clinically unwell and whose pulmonary disease has not responded to other recommended treatments. Specialist microbiological advice should be sought on the choice of antibacterial and on the duration of treatment.

Aspergillus fumigatus complex
Treatment with an antifungal drug should only be considered to suppress chronic Aspergillus fumigatus complex respiratory infection in patients with declining pulmonary status. Specialist microbiological advice should be sought on the choice of antifungal drug.

Unidentified infections
An oral or intravenous (depending on the exacerbation severity) broad-spectrum antibacterial should be used for patients who have a pulmonary disease exacerbation and no clear cause. If a causative pathogen is identified, an appropriate treatment should be selected (consult local protocol).

Immunomodulatory drugs
Long-term treatment with azithromycin p. 536 [unlicensed indication], at an immunomodulatory dose, should be offered to patients with deteriorating lung function or repeated pulmonary exacerbations. In those patients with continued deterioration in lung function or continuing pulmonary exacerbations, long-term

www.getintopharma.com
azithromycin p. 536 should be discontinued and the use of an oral corticosteroid considered. 

**Nutrition and exocrine pancreatic insufficiency**

The cystic fibrosis specialist dietitian should offer advice on optimal nutrition. Pancreatin p. 96 should be offered to patients with exocrine pancreatic insufficiency. Dose should be adjusted as needed to minimise any symptoms or signs of malabsorption (see Exocrine pancreatic insufficiency p. 95). An acid-suppressing drug, such as an H2 receptor antagonist or a proton pump inhibitor [unlicensed indications] can be considered for patients who have persistent symptoms or signs of malabsorption.

A short-term trial of an appetite stimulant (for example up to 3 months) [unlicensed indication] can be considered in adult patients if attempts to increase calorie intake are not effective.[8]

**Distal intestinal obstruction syndrome**

Oral or intravenous fluids should be offered to ensure adequate hydration for patients with distal intestinal obstruction syndrome. Meglumine amidotrizoate with sodium amidotrizoate solution (orally or via an enteral tube) should be considered as first-line treatment for distal intestinal obstruction syndrome. An iso-osmotic polyethylene glycol solution (orally or via an enteral tube) can be considered as a second-line treatment. Surgery is a last resort, if prolonged treatment with a polyethylene glycol solution is not effective. Suspected distal intestinal obstruction syndrome should be managed in a specialist cystic fibrosis centre.[9]

**Liver disease**

If liver function blood tests are abnormal in patients with cystic fibrosis, ursodeoxycholic acid p. 89 [unlicensed indication] can be given until liver function is restored.[9]

**Bone mineral density**

Patients should be monitored for cystic fibrosis-related low bone mineral density.[9]

**Cystic fibrosis-related diabetes**

Patients should be monitored for cystic fibrosis-related diabetes.[9]

| Ivacaftor | 10-Apr-2019 |
| **Drug Action** | Ivacaftor is a cystic fibrosis transmembrane conductance regulator (CFTR) protein potentiator that increases chloride transport in the abnormal CFTR protein. |
| **Indications and Dose** |
| Cystic fibrosis (specialist use only) |
| ▶ By Mouth |
| ▶ Adult: 150 mg every 12 hours |
| **Dose Adjustments Due to Interactions** |
| ▶ Manufacturer advises reduce dose to 150 mg twice a week with concurrent use of potent inhibitors of CYP3A4. |
| ▶ Manufacturer advises reduce dose to 150 mg once daily with concurrent use of moderate inhibitors of CYP3A4. |
| **Contra-Indications** | Organ transplantation (no information available) |
| **Interactions** | → Appendix 1: ivacaftor |
| **Side-effects** |
| Common or very common |
| ▶ Breast abnormalities · diarrhoea · dizziness · ear discomfort · headache · ototoxicity · rash · tympanic membrane haemorrhage |
| Uncommon |
| ▶ Gynaecomastia |
| Frequency not known |
| Hepatic function abnormal |
| Side-Effects, further information |
| Manufacturer advises interrupt treatment if transaminase levels more than 5 times the upper limit of normal or transaminase levels more than 3 times the upper limit of normal and blood bilirubin more than twice the upper limit of normal—consult product literature. |
| **Pregnancy** | Manufacturer advises use only if potential benefit outweighs risk—limited information available. |
| **Breast Feeding** | Manufacturer advises avoid—present in milk in animal studies. |
| **Hepatic Impairment** | Manufacturer advises caution in moderate to severe impairment (limited information available). |
| **Dose Adjustments** | Manufacturer advises reduce dose to 150 mg once daily in moderate impairment; in severe impairment reduce starting dose to 150 mg on alternate days, adjust dosing interval according to clinical response and tolerability. |
| **Renal Impairment** | Caution in severe impairment. |
| **Monitoring Requirements** | Manufacturer advises monitor liver function before treatment, every 3 months during the first year of treatment, then annually thereafter |

The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor p. 253.

- **INDICATIONS AND DOSE**
  - Cystic fibrosis (specialist use only)
    - **BY MOUTH**
      - Adult: 400/250 mg every 12 hours
  - **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
    - Manufacturer advises reduce initial dose to 200/125 mg daily for the first week in those also taking a potent inhibitor of CYP3A4.
  - **DOSE EQUIVALENCE AND CONVERSION**
    - Dose expressed as x/y mg of lumacaftor/ivacaftor.
  - **CAUTIONS**
    - Forced expiratory volume in 1 second (FEV1) less than 40% of the predicted normal value—additional monitoring required at initiation of treatment—pulmonary exacerbation—no information available
  - **INTERACTIONS**
    - Appendix 1: ivacaftor - lumacaftor
  - **SIDE-EFFECTS**
    - **Common or very common**
      - Breast abnormalities, diarrhoea, dizziness, ear discomfort, flatulence, headache, menstrual cycle irregularities, nausea, ototoxicity, rash, tympanic membrane hyperaemia, vomiting
    - **Uncommon**
      - Gynaecomastia, hepatic encephalopathy, hepatitis cholestatic, hypertension
    - **Frequency not known**
      - Cataract, chest pain
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Manufacturer advises interrupt treatment if transaminase levels more than 5 times the upper limit of normal or transaminase levels more than 3 times the upper limit of normal and blood bilirubin more than twice the upper limit of normal—consult product literature.
  - **HEPATIC IMPAIRMENT**
    - Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).
  - **DOSE ADJUSTMENTS**
    - Manufacturer advises dose reduction of evening dose to 200/125 mg in moderate impairment; in severe impairment, dose reduction to 200/125 mg every 12 hours is advised.
  - **PRE-TREATMENT SCREENING**
    - If the patient’s genotype is unknown, a validated genotyping method should be performed to confirm the presence of the F508del mutation on both alleles of the CFTR gene before starting treatment.
  - **MONITORING REQUIREMENTS**
    - Manufacturer advises monitor blood pressure periodically during treatment.
  - **EFFECT ON LABORATORY TESTS**
    - False positive urine screening tests for tetrahydrocannabinol have been reported—manufacturer advises consider alternative confirmatory method.
  - **DIRECTIONS FOR ADMINISTRATION**
    - Tablets should be taken with fat-containing food.
  - **PATIENT AND CARER ADVICE**
    - Patients or carers should be given advice on how to administer ivacaftor tablets.

24 Apr 2019
Mannitol

- **INDICATIONS AND DOSE**
  - Treatment of cystic fibrosis as an add-on therapy to standard care
    - **BY INHALATION OF POWDER**
    - Adult: Maintenance 400 mg twice daily, an initiation dose assessment must be carried out under medical supervision, for details of the initiation dose regimen, consult product literature

- **CONTRA-INDICATIONS**
  - Bronchial hyperresponsiveness to inhaled mannitol - impaired lung function (forced expiratory volume in 1 second < 50% of predicted) - non-CF bronchiectasis

- **CAUTIONS**
  - Asthma - haemoptysis

- **SIDE-EFFECTS**
  - Common or very common Chest discomfort - condition aggravated - cough - haemoptysis - headache - respiratory disorders - throat complaints - vomiting

- **PREGNANCY**
  - Manufacturer advises avoid.

- **BREAST FEEDING**
  - Manufacturer advises avoid.

- **PRE-TREATMENT SCREENING**
  - Patients must be assessed for bronchial hyperresponsiveness to inhaled mannitol before starting the therapeutic dose regimen; an initiation dose assessment must be carried out under medical supervision—for details of the initiation dose regimen, consult product literature.

- **DIRECTIONS FOR ADMINISTRATION**
  - The dose should be administered 5–15 minutes after a bronchodilator and before physiotherapy; the second daily dose should be taken 2–3 hours before bedtime.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer mannitol inhalation powder.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Mannitol dry powder for inhalation for treating cystic fibrosis (November 2012) NICE TA266
      - Mannitol (Bronchitol®) dry powder for inhalation is recommended as an option for treating cystic fibrosis in adults:
        - who cannot use dornase alfa (rhDNase) because of ineligibility, intolerance or inadequate response to rhDNase, and
        - whose lung function is rapidly declining (forced expiratory volume in 1 second decline greater than 2% annually), and
        - for whom other osmotic agents are not considered appropriate.
      - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, until they and their NHS clinician consider it appropriate to stop.
      - www.nice.org.uk/guidance/ta266

- **Scottish Medicines Consortium (SMC) decisions**
  - SMC No. 83/13
    - The Scottish Medicines Consortium has advised (December 2013) that mannitol (Bronchitol®) is accepted for restricted use within NHS Scotland for the treatment of cystic fibrosis in adults as an add-on therapy to best standard of care. Mannitol is restricted to patients who are not currently using dornase alfa due to lack of response, intolerance, or ineligibility and have rapidly declining lung function and in whom other osmotic agents are considered unsuitable.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Inhalation powder**
    - Osmohale (Mawdsley-Brooks & Company Ltd)
      - Mannitol 5 mg Osmohale 5mg inhalation powder capsules
        - 1 capsule £0.11
      - Mannitol 10 mg Osmohale 10mg inhalation powder capsules
        - 1 capsule £0.22
      - Mannitol 20 mg Osmohale 20mg inhalation powder capsules
        - 1 capsule £0.22
      - Mannitol 40 mg Osmohale 40mg inhalation powder capsules
        - 15 capsule £0.65
    - Bronchitol (Chiesi Ltd)
      - Mannitol 40 mg Bronchitol 40mg inhalation powder capsules with two devices
        - 280 capsule £23.16
    - Bronchitol 40mg inhalation powder capsules with device
      - 10 capsule £0.95

Tezacaftor with ivacaftor

- **INDICATIONS AND DOSE**
  - Cystic fibrosis (in combination with ivacaftor) (specialist use only)
    - **BY MOUTH**
      - Adult: 100/150 mg, to be taken in the morning and, ivacaftor 150 mg to be taken in the evening

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - With concurrent use of potent CYP3A4 inhibitors, manufacturer advises reduce dose to 100/150 mg tezacaftor/ivacaftor twice a week, taken approximately 3–4 days apart; the evening dose of ivacaftor should not be taken.
  - With concurrent use of moderate CYP3A4 inhibitors, manufacturer advises reduce dose to 100/150 mg tezacaftor/ivacaftor every other morning, with ivacaftor 150 mg taken in the mornings alternate to tezacaftor/ivacaftor; the evening dose of ivacaftor should not be taken.

- **DOSE EQUIVALENCE AND CONVERSION**
  - Combination dose expressed as x/y mg of tezacaftor/ivacaftor.

- **INTERACTIONS**
  - **Appendix 1: ivacaftor - tezacaftor**

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - breast abnormalities - diarrhoea - dizziness - ear discomfort - headache - nausea - ototoxicity - rash - tympanic membrane hyperaemia
  - Uncommon Gynaecostasia
  - Frequency not known Hepatic function abnormal

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Manufacturer advises interrupt treatment if transaminase levels more than 3 times the upper limit of normal or transaminase levels more than 3 times the upper limit of normal and blood bilirubin more than twice the upper limit of normal—consult product literature.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).
  - **Dose adjustments**
    - Manufacturer advises omit evening dose of ivacaftor in moderate to severe impairment; in severe impairment, adjust dosing interval according to clinical response and tolerability.
4 Cough and congestion

Aromatic inhalations, cough preparations and systemic nasal decongestants

Aromatic inhalations in adults

Inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be used owing to the risk of scalding. In practice, inhalations are also used for the relief of nasal obstruction in acute rhinitis or sinusitis.

Cough preparations in adults

Cough suppressants

Cough may be a symptom of an underlying disorder, such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor, or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis.

There is some evidence to suggest that codeine phosphate p. 454 provides no benefit for symptoms of acute cough. Codeine phosphate is also constipating and can cause dependence; dextromethorphan and pholcodine below have fewer side-effects.

Sedating antihistamines are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

Palliative care

Diamorphine hydrochloride p. 456 and methadone hydrochloride p. 502 have been used to control distressing cough in terminal lung cancer although morphine p. 463 is now preferred. In other circumstances they are contra-indicated because they induce sputum retention and ventilatory failure as well as causing opioid dependence. Methadone hydrochloride linctus should be avoided because it has a long duration of action and tends to accumulate.

Demulcent and expectorant cough preparations

Demulcent cough preparations contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. Preparations such as simple linctus have the advantage of being harmless and inexpensive; paediatric simple linctus is particularly useful in children.

Expectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

COUGH AND COLD PREPARATIONS

Pholcodine

- INDICATIONS AND DOSE

Dry cough

- BY MOUTH USING LINCTUS

- Child 6–11 years: 2–5 mg 3–4 times a day

- Child 12–17 years: 5–10 mg 3–4 times a day

An over-the-counter cough medicine containing the expectorant guaifenesin may be used for acute cough; there is some evidence to suggest it may reduce symptoms.

Compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

Nasal decongestants, systemic

Nasal decongestants for administration by mouth may not be as effective as preparations for local application but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine hydrochloride p. 1202 is available over the counter; it has few sympathomimetic effects.

Aromatic inhalations in children

The use of strong aromatic decongestants (applied as rubs or to pillows) is not advised for infants under the age of 3 months. Carers of young infants in whom nasal obstruction with mucus is a problem can readily be taught appropriate techniques of suction aspiration but sodium chloride 0.9% p. 1040 given as nasal drops is preferred; administration before feeds may ease feeding difficulties caused by nasal congestion.

Cough preparations in children

The use of over-the-counter cough suppressants containing codeine phosphate should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers. Cough suppressants containing similar opioid analogues such as dextromethorphan and pholcodine are not generally recommended in children and should be avoided in children under 6 years; dextromethorphan should be avoided in children under 12 years.

MHRA/CHM advice (March 2008 and February 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine maleate p. 283, diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);
- Phenylephrine hydrochloride p. 189, pseudoephedrine hydrochloride, ephedrine hydrochloride p. 1202, oxymetazoline, or xylometazoline hydrochloride p. 1203 (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.
**COUGH AND COLD PREPARATIONS > OTHER**

**Citric acid**

(Formulated as Simple Linctus)

- **INDICATIONS AND DOSE**
  - Cough
    - **BY MOUTH**
      - Adult: 5 mL 3–4 times a day, this dose is for Simple Linctus, BP (2.5%)

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of oral liquid formulations may include anise.
  - When prepared extemporaneously, the BP states Simple Linctus, BP consists of citric acid monohydrate 2.5%, in a suitable vehicle with an anise flavour.

**MENTHOL AND DERIVATIVES**

**Eucalyptus with menthol**

- **INDICATIONS AND DOSE**
  - Aromatic inhalation for relief of nasal congestion
    - **BY INHALATION**
      - Adult: Add one teaspoonful to a pint of hot, not boiling, water and inhale the vapour

- **PRESCRIBING AND DISPENSING INFORMATION**
  - When prepared extemporaneously, the BP states Menthol and Eucalyptus Inhalation, BP 1980 consists of racementhol or levomenthol 2 g, eucalyptus oil 10 mL, light magnesium carbonate 7 g, water to 100 mL

**RESINS**

**Benzoin tincture, compound**

(Friars’ Balsam)

- **INDICATIONS AND DOSE**
  - Aromatic inhalation for relief of nasal congestion
    - **BY INHALATION**
      - Child: Add 5 mL to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary
      - Adult: Add 5 mL to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary

- **SIDE-EFFECTS**
  - Skin sensitisation

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Not recommended (applied as a rub or to pillows) for infants under 3 months.
5 Idiopathic pulmonary fibrosis

Other drugs used for idiopathic pulmonary fibrosis
Nintedanib, p. 991

ANTIFIBROTICS

Pirfenidone

02-Feb-2019

- **DRUG ACTION** The exact mechanism of action of pirfenidone is not yet understood, but it is believed to slow down the progression of idiopathic pulmonary fibrosis by exerting both antifibrotic and anti-inflammatory properties.

- **INDICATIONS AND DOSE**
  Treatment of mild to moderate idiopathic pulmonary fibrosis (initiated under specialist supervision)

  ▶ **BY MOUTH**
  - Adult: Initially 267 mg 3 times a day for 7 days, then increased to 534 mg 3 times a day for 7 days, then increased to 801 mg 3 times a day

  **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Caution with concomitant use with ciprofloxacin—reduce dose of pirfenidone to 534 mg three times daily with high-dose ciprofloxacin (750 mg twice daily).

- **CONTRA-INDICATIONS** Cigarette smoking

- **CAUTIONS**
  - Photosensitivity Avoid exposure to direct sunlight—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).
  - Treatment interruption If treatment is interrupted for 14 consecutive days or more, the initial 2 week titration regimen should be repeated; if treatment is interrupted for less than 14 consecutive days, the dose can be resumed at the previous daily dose without titration.

- **INTERACTIONS** → Appendix 1: pirfenidone

- **SIDE-EFFECTS**
  - **Common or very common** Appetite decreased · arthralgia · asthenia · constipation · cough · diarrhoea · dizziness · drowsiness · dyspnoea · gastrointestinal discomfort · gastrointestinal disorders · headache · hot flush · increased risk of infection · insomnia · musculoskeletal chest pain · myalgia · nausea · photosensitivity reaction · skin reactions · sunburn · taste altered · vomiting · weight decreased
  - **Uncommon** Angioedema
  - **Rare or very rare** Agranulocytosis

  SIDE-EFFECTS, FURTHER INFORMATION Gastrointestinal side-effects may require dose reduction or treatment interruption—consult product literature.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (risk of increased exposure); avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Avoid use if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor for weight loss.
  - Test liver function before treatment, then at monthly intervals for the next 6 months, and then every 3 months thereafter; review if abnormal liver function tests—dose reduction, treatment interruption or discontinuation may be required (consult product literature).

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks Dizziness or malaise may affect performance of skilled tasks (e.g. driving).

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE decisions**
  - Pirfenidone for treating idiopathic pulmonary fibrosis (February 2018) NICE TA504
  - Pirfenidone (Esbriet®) is recommended as an option for treating idiopathic pulmonary fibrosis in adults only if:
    - the patient has a forced vital capacity (FVC) between 50% and 80% predicted, and
    - the manufacturer provides pirfenidone with the discount agreed in the patient access scheme, and
    - treatment is stopped if there is evidence of disease progression (an absolute decline of 10% or more in predicted FVC within any 12-month period).
  - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

  www.nice.org.uk/guidance/ta504

  **Scottish Medicines Consortium (SMC) decisions**
  - SMC No. 835/13
  - The Scottish Medicines Consortium has advised (August 2013) that pirfenidone (Esbriet®) is accepted for restricted use within NHS Scotland for the treatment of mild to moderate idiopathic pulmonary fibrosis. Pirfenidone is restricted for use in patients with a predicted forced vital capacity less than or equal to 50%, and only whilst pirfenidone is available at the price agreed in the patient access scheme.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - **Esbriet** (Roche Products Ltd)
    - Pirfenidone 267 mg Esbriet 267mg tablets | 63 tablet POM £501.92 | 252 tablet POM £2,007.70
    - Pirfenidone 801 mg Esbriet 801mg tablets | 84 tablet POM £2,007.70

  **Capsule**
  - **Esbriet** (Roche Products Ltd)
    - Pirfenidone 267 mg Esbriet 267mg capsules | 63 capsule POM £501.92 | 252 capsule POM £2,007.70 | 270 capsule POM £2,151.10

  www.getintopharma.com
Respiratory depression, respiratory distress syndrome and apnoea

Overview
Respiratory stimulants (analeptic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation. However, occasionally when ventilatory support is contra-indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may arouse patients sufficiently to co-operate and clear their secretions.

Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under expert supervision in hospital and must be combined with active physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.

Respiratory stimulants

Doxapram hydrochloride

**INDICATIONS AND DOSE**

**Postoperative respiratory depression**
- **INITIALLY BY INTRAVENOUS INJECTION**
- **Adult:** Initially 1–1.5 mg/kg, to be administered over at least 30 seconds, repeated if necessary after intervals of one hour, alternatively (by intravenous infusion) 2–3 mg/minute, adjusted according to response

**Acute respiratory failure**
- **BY INTRAVENOUS INFUSION**
- **Adult:** 1.5–4 mg/minute, adjusted according to response, to be given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions

**CONTRA-INDICATIONS**
Cerebral oedema · cerebrovascular accident · coronary artery disease · epilepsy and other convulsive disorders · hyperthyroidism · physical obstruction of respiratory tract · severe hypertension · status asthmaticus

**CAUTIONS**
Give with beta₂ agonist in bronchoconstriction · give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing) · hypertension · impaired cardiac reserve · phaeochromocytoma

**INTERACTIONS**
Appendix 1: doxapram

**SIDE-EFFECTS**
Arrhythmias · chest discomfort · confusion · cough · dizziness · dyspnoea · fever · flushing · hallucination · headache · hyperhidrosis · movement disorders · nausea · neuromuscular dysfunction · oral disorders · perineal warmth · reflexes abnormal · respiratory disorders · seizure · urinary disorders · vomiting

**PREGNANCY**
No evidence of harm, but manufacturer advises avoid unless benefit outweighs risk.

**HEPATIC IMPAIRMENT**
Manufacturer advises use with caution.

**MONITORING REQUIREMENTS**
Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Doxapram hydrochloride (Non-proprietary)**
  - Doxapram hydrochloride 20 mg per 1 ml
  - Doxapram 100mg/5ml solution for injection ampoules · 5 ampoule £12.65

**Infusion**
- **Doxapram hydrochloride (Non-proprietary)**
  - Doxapram hydrochloride 2 mg per 1 ml
  - Doxapram 1g/500ml infusion bags · 1 bag £0.94

1 Dementia

Description of condition
Dementia is a progressive clinical syndrome characterised by a range of cognitive and behavioural symptoms that can include memory loss, problems with reasoning and communication, a change in personality, and a reduced ability to carry out daily activities such as washing or dressing. Alzheimer’s disease is the most common type of dementia; other common types of dementia include vascular dementia (due to cerebrovascular disease), dementia with Lewy bodies, mixed dementia, and frontotemporal dementia.

Aims of treatment
The aim of treatment is to promote independence, maintain function, and manage symptoms of dementia.

Non-drug treatment
Patients with all types of mild-to-moderate dementia presenting with cognitive symptoms should be given the opportunity to participate in a structured group cognitive stimulation programme. Group reminiscence therapy (use of life stories to improve psychological well-being), and cognitive rehabilitation or occupational therapy to support daily functional ability, should also be considered.

Management of cognitive symptoms
Some commonly prescribed drugs are associated with increased antimuscarinic (anticholinergic) burden, and therefore cognitive impairment; their use should be minimised. Drugs with antimuscarinic effects include some antidepressants (e.g. amitriptyline hydrochloride p. 372, paroxetine p. 366), antihistamines (e.g. chlorphenamine maleate p. 283, promethazine hydrochloride p. 286), antipsychotics (e.g. olanzapine p. 398, quetiapine p. 401), and urinary antispasmodics (e.g. solifenacin succinate p. 779, tolerodine tartrate p. 780).

Alzheimer’s disease
In newly diagnosed patients, drug treatment should only be initiated under the advice of a specialist clinician experienced in the management of Alzheimer’s disease. In patients with mild-to-moderate Alzheimer’s disease, monotherapy with donepezil hydrochloride p. 301, galantamine p. 302, or rivastigmine p. 303 (acetylcholinesterase inhibitors) are first-line treatment options. If acetylcholinesterase inhibitors are not tolerated or contra-indicated, memantine hydrochloride p. 304 is a suitable alternative in patients with moderate Alzheimer’s disease. Memantine hydrochloride is the drug of choice in patients with severe Alzheimer’s disease.

In patients already receiving an acetylcholinesterase inhibitor to treat Alzheimer’s disease, the addition of memantine hydrochloride should be considered if they develop moderate or severe disease; in this case, memantine hydrochloride can be initiated in primary care without advice from a specialist clinician.

In patients with moderate Alzheimer’s disease, discontinuing acetylcholinesterase inhibitor treatment can cause a substantial worsening in cognitive function; treatment discontinuation should not be based on disease severity alone.

Non-Alzheimer’s dementia
Donepezil hydrochloride [unlicensed indication] or rivastigmine [unlicensed indication] should be given to patients with mild-to-moderate dementia with Lewy bodies; galantamine [unlicensed indication] can be considered only if treatment with both donepezil hydrochloride or rivastigmine is not tolerated. Donepezil hydrochloride [unlicensed indication] or rivastigmine [unlicensed indication] can also be considered in patients with severe dementia with Lewy bodies. Memantine hydrochloride [unlicensed indication] can be considered as an alternative in patients with dementia with Lewy bodies in whom acetylcholinesterase inhibitors are contra-indicated or not tolerated.

Acetylcholinesterase inhibitors [unlicensed indication] or memantine hydrochloride [unlicensed indication] should only be considered in patients with vascular dementia if they have suspected co-morbid Alzheimer’s disease, Parkinson’s disease dementia, or dementia with Lewy bodies.
Acetylcholinesterase inhibitors and memantine hydrochloride are not recommended in patients with frontotemporal dementia or cognitive impairment caused by multiple sclerosis.

For management of Parkinson’s disease dementia see Parkinson’s disease p. 409.

Management of non-cognitive symptoms

Agitation, aggression, distress and psychosis

Patients with dementia should be offered psychosocial and environmental interventions such as counselling and management of pain and delirium to reduce distress.

Antipsychotic drugs should only be offered to patients with dementia if they are either at risk of harming themselves or others, or experiencing agitation, hallucinations or delusions that are causing them severe distress. The CHM/MHRA has reported (2009) an increased risk of stroke and a small increased risk of death when antipsychotic drugs are used in elderly patients with dementia. The balance of risks and benefits should be carefully assessed, including any previous history of stroke or transient ischaemic attack and any risk factors for cerebrovascular disease such as hypertension, diabetes, smoking, and atrial fibrillation.

Antipsychotic drugs should be used at the lowest effective dose and for the shortest time possible, with a regular review at least every 6 weeks.

In patients who have dementia with Lewy bodies or Parkinson’s disease dementia, antipsychotic drugs can worsen the motor features of the condition, and in some cases cause severe antipsychotic sensitivity reactions. See also management of psychotic symptoms in Parkinson’s disease p. 409.

Depression and anxiety

Psychological treatments (e.g. cognitive behavioural therapy (CBT), multisensory stimulation, relaxation, or animal-assisted therapies) should be considered for patients with mild-to-moderate dementia who have mild to moderate depression or anxiety; antidepressants should be reserved for pre-existing severe mental health problems.

Sleep disturbances

Patients should be offered non-drug treatment approaches to manage sleep problems and insomnia, including sleep hygiene education, exposure to daylight, and increasing exercise and activity.

Useful Resources

Other drugs used for Dementia Risperidone, p. 402

ANTICHLINOSTERASES CENTRALLY ACTING

Donepezil hydrochloride

25-Jul-2018

● INDICATIONS AND DOSE Mild to moderate dementia in Alzheimer’s disease

▶ BY MOUTH

Adults: Initially 5 mg once daily for one month, then increased if necessary up to 10 mg daily, doses to be given at bedtime

● CAUTIONS Asthma - chronic obstructive pulmonary disease - sick sinus syndrome - supraventricular conduction abnormalities - susceptibility to peptic ulcers

● INTERACTIONS Appendix 1: anticholinesterases, centrally acting

● SIDE-EFFECTS

▶ Common or very common: Aggression - agitation - appetite decreased - common cold - diarrhoea - dizziness - fatigue - gastrointestinal disorders - hallucination - headache - injury - muscle cramps - nausea - pain - skin reactions - sleep disorders - syncope - urinary incontinence - vomiting

▶ Uncommon: Bradycardia - gastrointestinal haemorrhage - hyposalivation - seizure

▶ Rare or very rare: Cardiac conduction disorders – extrapyramidal symptoms – hepatic disorders – neuroleptic malignant syndrome – rhabdomyolysis

SIDE-EFFECTS FURTHER INFORMATION

Dose should be started low and increased if tolerated and necessary.

● HEPATIC IMPAIRMENT

Manufacturer advises caution (risk of increased exposure in mild to moderate impairment; no information available in severe impairment).

Dose adjustments

Manufacturer advises dose escalation should be performed according to individual tolerability in mild to moderate impairment.

● DIRECTIONS FOR ADMINISTRATION

Donepezil orodispersible tablet should be placed on the tongue, allowed to disperse, and swallowed.

● PATIENT AND CARER ADVICE

Patient or carers should be given advice on how to administer donepezil hydrochloride orodispersible tablets.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer’s disease (updated June 2018)

NICE TA217

The three acetylcholinesterase (AChE) inhibitors donepezil, galantamine, and rivastigmine as monotherapies are recommended as options for managing mild to moderate Alzheimer’s disease under all of the conditions specified below and in recommendation 1.5.5 of the NICE guideline on dementia.

If prescribing an AChE inhibitor (donepezil, galantamine, or rivastigmine), treatment should normally be started with the drug with the lowest acquisition cost (taking into account required daily dose and the price per dose once shared care has started). However, an alternative AChE inhibitor could be prescribed if it is considered appropriate when taking into account adverse event profile, expectations about adherence, medical comorbidity, possibility of drug interactions and dosing profiles.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer’s disease when the patient has learning or other disabilities, or other communication difficulties.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral solution

Donepezil hydrochloride (Non-proprietary) Donepezil hydrochloride 1 mg per 1 ml Donepezil 1mg/ml oral solution sugar free sugar-free £1.00 50p

Orodispersible tablet

Donepezil hydrochloride (Non-proprietary) Donepezil hydrochloride 5 mg Donepezil 5mg orodispersible tablets sugar free sugar-free £7.29–£8.87 7.36

Donepezil hydrochloride 10 mg Donepezil 10mg orodispersible tablets sugar free sugar-free £7.95–£8.73 8.26

Aricept Evess (Eisai Ltd)

Donepezil hydrochloride 5 mg Aricept Evess 5mg orodispersible tablets sugar-free £9.85 9.85

Donepezil hydrochloride 10 mg Aricept Evess 10mg orodispersible tablets sugar-free £8.89 8.89

www.getintopharma.com
Nervous system

HEPATIC IMPAIRMENT

Breast feeding

DRUG ACTION
Galantamine is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties.

INDICATIONS AND DOSE
Mild to moderately severe dementia in Alzheimer’s disease

Adult: 4 mg twice daily for 4 weeks, increased to 8 mg twice daily for at least 4 weeks; maintenance 8–12 mg twice daily

CAUTIONS
Avoid in gastro-intestinal obstruction, avoid in urinary outflow obstruction, avoid whilst recovering from bladder surgery, avoid whilst recovering from gastrointestinal surgery, cardiac disease, chronic obstructive pulmonary disease, congestive heart failure, electrolyte disturbances, history of seizures, history of severe asthma, pulmonary infection, sick sinus syndrome, supraventricular conduction abnormalities, susceptibility to peptic ulcers, unstable angina

INTERACTIONS
Appendix 1: anticholinesterase, centrally acting

SIDE-EFFECTS

Common or very common
- Appetite decreased
- Arrhythmias
- Asthenia
- Depression
- Diarrhoea
- Dizziness
- Drowsiness
- Fall
- Gastrointestinal discomfort
- Hallucinations
- Headache
- Hypertension
- Malaise
- Muscle spasms
- Nausea
- Skin reactions
- Syncope
- Tremor
- Vomiting
- Weight decreased

Uncommon
- Atrioventricular block
- Bradycardia
- Flushing
- Hyperhidrosis
- Hypersomnia
- Hypotension
- Muscle weakness
- Palpitations
- Paraesthesia
- Seizure
- Taste altered
- Tinnitus
- Vision blurred

Rare or very rare
- Hepatitis
- Severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION
Manufacturer advises increasing dose according to response and tolerability.

Serious skin reactions
Serious skin reactions (including Stevens–Johnson syndrome and acute generalized exanthematous pustulosis) have been reported—manufacturer advises discontinue at the first appearance of skin rash.

Pregnancy
Use with caution—toxicity in animal studies.

Breast feeding
Avoid—no information available.

Hepatic impairment
Manufacturer advises caution in moderate impairment (risk of increased plasma concentrations); avoid in severe impairment (no information available).

Dose adjustments
Manufacturer advises for immediate-release preparations in moderate impairment, initially 4 mg once daily (preferably in the morning) for at least 7 days, then 4 mg twice daily for at least 4 weeks; maximum 8 mg twice daily.

Manufacturer advises for modified-release preparations in moderate impairment, initially 8 mg on alternate days (preferably in the morning) for 7 days, then 8 mg once daily for 4 weeks; maximum 15 mg daily.

Renal impairment
Avoid if eGFR less than 30 mL/minute/1.73 m².

Patient and carer advice
Manufacturer recommends that patients are warned of the signs of serious skin reactions; they should be advised to stop taking galantamine immediately and seek medical advice if symptoms occur.

Rivastigmine

**DRUG ACTION** Rivastigmine is a reversible non-competitive inhibitor of acetylcholinesterases.

**INDICATIONS AND DOSE**

**Mild to moderate dementia in Alzheimer’s disease**

_**BY MOUTH**_

- **Adult:** Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, retitrate from 1.5 mg twice daily

_**BY TRANSDERMAL APPLICATION USING PATCHES**_

- **Adult:** Apply 4.6 mg/24 hours daily for at least 4 weeks, increased if tolerated to 9.5 mg/24 hours daily for a further 6 months, then increased if necessary to 13.3 mg/24 hours daily, increase to 13.3 mg/24 hours patch if well tolerated and cognitive deterioration or functional decline demonstrated; use caution in patients with body-weight less than 50 kg, if treatment interrupted for more than 3 days, retitrate from 4.6 mg/24 hours patch

**Mild to moderate dementia in Parkinson’s disease**

_**BY MOUTH**_

- **Adult:** Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, retitrate from 1.5 mg twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 9 mg by mouth daily should switch to 9.5 mg/24 hours patch if oral dose stable and well tolerated; if oral dose not stable or well tolerated, patients should switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 12 mg by mouth daily should switch to 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose

**CAUTIONS** Bladder outflow obstruction - bowel abnormalities - duodenal ulcers - gastric ulcers - history of asthma - history of chronic obstructive pulmonary disease - history of seizures - risk of fatal overdose with patch administration errors - sick sinus syndrome - susceptibility to ulcers

**INTERACTIONS** → Appendix 1: anticholinesterases, centrally acting

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Anxiety, appetite decreased, arrhythmias, asthenia, dehydration, depression, diarrhoea, dizziness, drowsiness, fall, gastrointestinal discomfort, headache, hyperhidrosis, hypersalivation, hypertension, movement disorders, nausea, skin reactions, syncope, tremor, urinary incontinence, urinary tract infection, vomiting, weight decreased

- **Uncommon** Aggression, atrophicventricular block

- **Rare or very rare** Pancreatitis, seizure

- **Frequency not known** Hepatitis

**SPECIFIC SIDE-EFFECTS**

- **Common or very common**
  - With oral use: Confusion, gait abnormal, hallucinations, malaise, parkinsonism, sleep disorders
  - With oral use: Hypotension
304 Dementia

Nervous System

- With transdermal use Gastric ulcer
- Rare or very rare
- With oral use Angina pectoris, gastrointestinal disorders, gastrointestinal haemorrhage
- Frequency not known
- With transdermal use Hallucination, nightmare

SIDE-EFFECTS, FURTHER INFORMATION Dose should be started low and increased according to response if tolerated. Treatment should be interrupted if dehydration resulting from prolonged vomiting or diarrhoea occurs and withheld until resolution—retitrate dose if necessary.

Transdermal administration is less likely to cause side-effects.

HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure; no information available in severe impairment).

Dose adjustments Manufacturer advises cautious dose titration according to individual tolerability.

RENAL IMPAIRMENT Dose adjustments Titrate according to individual tolerability.

MONITORING REQUIREMENTS Monitor body-weight.

DIRECTIONS FOR ADMINISTRATION
- With transdermal use Apply patches to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and sating a replacement patch on a different area (avoid using the same area for 14 days).

PATIENT AND CARER ADVICE

EXELOM™ PATCHES Advise patients and carers of patch administration instructions, particularly to remove the previous day’s patch before applying the new patch—consult product literature.

www.getintopharma.com
Epilepsy and other seizure disorders

2 Epilepsy and other seizure disorders

Epilepsy

Epilepsy control

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The dosage frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, can be given...
twice daily. Lamotrigine p. 318, perampanel p. 322, phenobarbital p. 335, and phenytoin p. 323, which have long half-lives, can be given once daily at bedtime. However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration.

Management

When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible.

MHRA/CHM advice: Antiepileptic drugs: updated advice on switching between different manufacturers’ products (November 2017)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers’ products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer’s product. These categories are listed below;
- If it is felt desirable for a patient to be maintained on a specific manufacturer’s product this should be prescribed either by specifying a brand name, or the generic drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

Category 2

Clobazam p. 336, clonazepam p. 337, eslicarbazepine acetate p. 313, lamotrigine, oxcarbazepine p. 321, perampanel, rufinamide p. 326, topiramate p. 331, valproate, zonisamide p. 334. For these drugs, the need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency, treatment history, and potential implications to the patient of having a breakthrough seizure. Non-clinical factors as for Category 3 drugs should also be considered.

Category 3

Brivaracetam p. 310, ethosuximide p. 314, gabapentin p. 315, lacosamide p. 317, levetiracetam p. 320, pregabalin p. 324, tiagabine p. 331, vigabatrin p. 333. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer’s product as therapeutic equivalence can be assumed, however, other factors are important when considering whether switching is appropriate. Differences between alternative products (e.g. product name, packaging, appearance, and taste) may be perceived negatively by patients and/or carers, and may lead to dissatisfaction, anxiety, confusion, dosing errors, and reduced adherence. In addition, difficulties for patients with co-morbid autism, mental health problems, or learning disability should also be considered.

Antiepileptic hypersensitivity syndrome

Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (carbamazepine, lacosamide, lamotrigine, oxcarbazepine, phenobarbital, phenytoin, primidone, and rufinamide); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (eslicarbazepine, stiripentol, and zonisamide) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the patient must not be re-exposed, and expert advice should be sought.

Risk of suicidal thoughts and behaviour

The MHRA has advised (August 2008) that all antiepileptic drugs are associated with a small increased risk of suicidal thoughts and behaviour. Symptoms may occur as early as one week after starting treatment. Patients should be advised to seek medical advice if they develop any mood changes, distressing thoughts, or feelings about suicide or harming themselves, and should be referred for appropriate treatment if necessary.

Interactions

Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

Withdrawal

Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant
Epilepsy and other seizure disorders

...risk of seizure recurrence on drug withdrawal. In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

Driving
If a driver has a seizure (of any type) they must stop driving immediately and inform the Driver and Vehicle Licensing Agency (DVLA).

- Patients who have had a first unprovoked epileptic seizure or a single isolated seizure must not drive for 6 months; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive and investigations do not suggest a risk of further seizures.
- Patients with established epilepsy may drive a motor vehicle provided they are not a danger to the public and are compliant with treatment and follow up. To continue driving, these patients must be seizure-free for at least one year (or have a pattern of seizures established for one year where there is no influence on their level of consciousness or the ability to act); also, they must not have a history of unprovoked seizures.

Note: additional criteria apply for drivers of large goods or passenger carrying vehicles—consult DVLA guidance.

- Patients who have had a seizure while asleep are not permitted to drive for one year from the date of each seizure, unless:
  - a history or pattern of sleep seizures occurring only ever while asleep has been established over the course of at least one year from the date of the first sleep seizure; or
  - an established pattern of purely asleep seizures can be demonstrated over the course of three years if the patient has previously had seizures whilst awake (or awake and asleep).

The DVLA recommends that patients should not drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months after their last dose. If a seizure occurs due to a prescribed change or withdrawal of epilepsy treatment, the patient will have their driving license revoked for 1 year; relicensing may be considered earlier if treatment has been reinstated for 6 months and no further seizures have occurred.

Pregnancy
Women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of serious developmental disorders (up to 30–40% risk) and congenital malformations (approx. 10% risk). Valproate must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated; during pregnancy, it must not be used for epilepsy, unless it is the only possible treatment. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital, lamotrigine, and carbamazepine. Topiramate carries an increased risk of congenital malformations (including cleft palate, hypospadias, and anomalies involving various body systems) if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Women of child-bearing potential who take antiepileptic drugs should be given advice about the need for an effective contraception method to avoid unplanned pregnancy—for further information, see Conception and contraception in the individual drug monographs. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester.

If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that women do not stop taking essential treatment because of concern over harm to the fetus. To reduce the risk of neural tube defects, folate supplementation is advised before conception and throughout the first trimester. In the case of sodium valproate p. 327 and valproic acid p. 354 an urgent consultation is required to reconsider the benefits and risks of valproate therapy.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin, carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored.

Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol. Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics.

Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital.

Epilepsy and Pregnancy Register
All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

Breast-feeding
Women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant’s drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.
Focal seizures with or without secondary generalisation
Carbamazepine p. 311 and lamotrigine p. 318 are first-line options for newly diagnosed focal seizures; oxcarbazepine p. 321, sodium valproate p. 327 and levetiracetam p. 320 may be used if carbamazepine or lamotrigine are unsuitable or not tolerated. If monotherapy is unsuccessful with two of these first-line antiepileptic drugs, adjunctive treatment may be considered. Options for adjunctive treatment include carbamazepine, clobazam p. 336, gabapentin p. 315, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, or topiramate p. 331. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted who may consider eslicarbazepine acetate p. 313, lacosamide p. 317, phenobarbital p. 335, phenytoin p. 323, pregabalin p. 324, tiagabine p. 331, vigabatrin p. 333 and zonisamide p. 334.

Generalised seizures
Tonic-clonic seizures
Sodium valproate is the first-line treatment for newly diagnosed generalised tonic-clonic seizures (except in female patients who are premenopausal, see Valproate below). Lamotrigine is the alternative choice if sodium valproate is not suitable, but may exacerbate myoclonic seizures. In those with established epilepsy with generalised tonic-clonic seizures only, lamotrigine or sodium valproate may be prescribed as the first-line treatment. Carbamazepine and oxcarbazepine may also be considered in newly diagnosed and established tonic-clonic seizures, but may exacerbate myoclonic and absence seizures. Clobazam, lamotrigine, levetiracetam, sodium valproate or topiramate may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

Absence seizures
Ethosuximide p. 314, or sodium valproate (except in female patients who are premenopausal, see Valproate below), are the drugs of choice in absence seizures and syndromes; lamotrigine is a suitable alternative when ethosuximide and sodium valproate are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Clobazam, clonazepam p. 337, levetiracetam, topiramate or zonisamide may be considered by a tertiary epilepsy specialist if adjunctive treatment fails. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended in absence seizures or syndromes.

Myoclonic seizures
Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice in newly diagnosed myoclonic seizures (except in female patients who are premenopausal, see Valproate below); topiramate and levetiracetam are alternative options if sodium valproate is unsuitable but consideration should be given to the less favourable side-effect profile of topiramate. A combination of two of these drugs may be used if monotherapy is ineffective or not tolerated. If adjunctive treatment fails, a tertiary epilepsy specialist should be consulted and may consider clobazam, clonazepam, zonisamide or piracetam p. 406. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended for the treatment of myoclonic seizures.

Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that coexist with myoclonic seizures in idiopathic generalised epilepsy.

Anticonvulsants
Carbamazepine and lamotrigine are alternative options if sodium valproate is not suitable, but may exacerbate myoclonic seizures due to the risk of seizure exacerbation. They may respond poorly to the traditional drugs. Sodium valproate is the drug of choice (except in female patients who are premenopausal, see Valproate below); lamotrigine can be added as adjunctive treatment. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted, and may consider rufinamide p. 325 or topiramate. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine and vigabatrin are not recommended in atonic and tonic seizures.

Epilepsy syndromes
Some drugs are licensed for use in particular epilepsy syndromes. The epilepsy syndromes are specific types of epilepsy that are characterised according to the number of features including seizure type, age of onset, and EEG characteristics. For more information on epilepsy syndromes in children see BNF for children.

Dravet syndrome
A tertiary specialist should be involved in decisions regarding treatment of Dravet syndrome. Sodium valproate (except in pregnancy or females of childbearing potential, see Valproate below) or topiramate are first-line treatment options in children with Dravet syndrome. Clobazam or stiripentol p. 330 may be considered as adjunctive treatment in children and adults if first-line treatments are ineffective or not tolerated. Carbamazepine, gabapentin, lamotrigine, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin should not be used as they may exacerbate myoclonic seizures.

Lennox-Gastaut syndrome
A tertiary specialist should be involved in decisions regarding treatment of Lennox-Gastaut syndrome. Sodium valproate is the first-line drug for treating children with Lennox-Gastaut syndrome (except in pregnancy or females of childbearing potential, see Valproate below); lamotrigine can be used as adjunctive treatment in children and adults if sodium valproate is unsuitable, ineffective or not tolerated. If adjunctive treatment is ineffective or not tolerated, rufinamide and topiramate may be considered by tertiary specialists. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine, and vigabatrin should not be used. Felbamate [unlicensed] may be used in tertiary specialist centres when all other treatment options have failed.

Antiepileptic drugs
Carbamazepine and related antiepileptics
Carbamazepine is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly. Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures. It can also be considered for the treatment of primary generalised tonic-clonic seizures [unlicensed]. Oxcarbazepine is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation.

Eslicarbazepine acetate p. 313 is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation.
Epilepsy and other seizure disorders

Ethosuximide
Ethosuximide p. 314 is a first-line treatment option for absence seizures. It may also be prescribed as adjunctive treatment for absence seizures when monotherapy is ineffective. Ethosuximide is also licensed for myoclonic seizures.

Gabapentin and pregabalin
Gabapentin p. 315 and pregabalin p. 324 are used for the treatment of focal seizures with or without secondary generalisation. They are not recommended if tonic, atonic, absence or myoclonic seizures are present. Both are also licensed for the treatment of neuropathic pain. Pregabalin is licensed for the treatment of generalised anxiety disorder.

Lamotrigine
Lamotrigine p. 318 is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed for typical absence seizures in children (but efficacy may not be maintained in all children) and is an unlicensed treatment option in adults if first-line treatments have been unsuccessful. Lamotrigine can also be used as adjunctive treatment in atonic or tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

Levetiracetam and brivaracetam
Levetiracetam p. 320 is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in patients with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

Brivaracetam p. 310 is used as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation.

Phenobarbital and primidone
Phenobarbital p. 335 is effective for tonic-clonic and focal seizures but may be sedative in adults. It may be tried for atypical absence, tonic, and tonic seizures. Rebound seizures may be a problem on withdrawal.

Primidone p. 336 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A low initial dose of primidone is essential.

Phenytoin
Phenytoin p. 323 is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 314, a pro-drug of phenytoin, may be convenient to give. Unlike phenytoin (which should only be given intravenously), fosphenytoin sodium may also be given by intramuscular injection.

Rufinamide
Rufinamide p. 326 is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

Topiramate
Topiramate p. 331 can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome and for absence, tonic and atonic seizures under specialist supervision [unlicensed]. It can also be considered as an option in myoclonic seizures [unlicensed]. Female patients should be fully informed of the risks related to the use of topiramate during pregnancy and the need to use effective contraception—for further information, see Conception and contraception and Pregnancy in the topiramate drug monograph.

Valproate
Sodium valproate p. 327 is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures. Sodium valproate has widespread metabolic effects and monitoring of liver function tests and full blood count is essential. Because of its high teratogenic potential, valproate must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated. During pregnancy, it must not be used for epilepsy unless it is the only possible treatment. For further information see Important safety information, Conception and contraception, and Pregnancy in the sodium valproate and valproate drug p. 354 drug monographs.

Valproic acid (as semisodium valproate) is licensed for acute mania associated with bipolar disorder.

Zonisamide
Zonisamide p. 334 can be used alone for the treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy, and as adjunctive treatment for refractory focal seizures with or without secondary generalisation in adults and children aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

Benzodiazepines
Clobazam p. 336 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 337 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

Other drugs
Acetazolamide p. 1181, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam p. 406 is used as adjunctive treatment for cortical myoclonus.

Status epilepticus
Convulsive status epilepticus
Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine p. 1080 should be considered if alcohol
abuse is suspected; pyridoxine hydrochloride p. 1080 should be given if the status epilepticus is caused by pyridoxine hydrochloride deficiency.

Seizures lasting longer than 5 minutes should be treated urgently with intravenous lorazepam p. 339 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 343 is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Patients should be monitored for respiratory depression and hypotension.

Where facilities for resuscitation are not immediately available, diazepam p. 343 can be administered as a rectal solution or midazolam p. 340 oromucosal solution can be given into the buccal cavity.

**Important**

If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium, fosphenytoin sodium p. 314, or phenobarbital sodium should be used; contact intensive care unit if seizures continue. If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 338, midazolam, or a non-barbiturate anaesthetic such as propofol p. 1330 (unlicensed indication), should be instituted with full intensive care support.

**Phenytoin sodium** can be given by slow intravenous injection, followed by the maintenance dosage if appropriate.

Alternatively, fosphenytoin sodium (a pro-drug of phenytoin), can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin sodium. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin sodium should be expressed in terms of phenytoin sodium.

**Non-convulsive status epilepticus**

The urgency to treat non-convulsive status epilepticus depends on the severity of the patient’s condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

**Febrile convulsions**

*Brief febrile convulsions* need no specific treatment; antipyretic medication (e.g. paracetamol p. 444), is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. *Prolonged febrile convulsions* (those lasting 5 minutes or longer), or *recurrent febrile convulsions* without recovery must be treated actively (as for convulsive status epilepticus). Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

**Other drugs used for Epilepsy and other seizure disorders** Magnesium sulfate, p. 1051

### ANTIEPILEPTICS

#### Brivaracetam

**INDICATIONS AND DOSE**

Adjunctive therapy of focal seizures with or without secondary generalisation

- **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- Adult: Initially 25–50 mg twice daily, adjusted according to response; usual maintenance 25–100 mg twice daily (max. per dose 100 mg twice daily)

**INTERACTIONS** → Appendix 1: antiepileptics

**SIDE-EFFECTS**

- **Common or very common**
  - Anxiety
  - Appetite decreased
  - Constipation
  - Cough
  - Depression
  - Dizziness
  - Drowsiness
  - Fatigue
  - Increased risk of infection
  - Insomnia
  - Irritability
  - Nausea
  - Vertigo
  - Vomiting
- **Uncommon**
  - Aggression
  - Psychotic disorder
- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—limited information available. See also Pregnancy in Epilepsy p. 305.
- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution (risk of increased exposure).
- **DOSAGE ADJUSTMENTS**
  - Manufacturer advises consider initial dose of 25 mg twice daily; max. maintenance dose of 75 mg twice daily (limited information available).
- **TREATMENT CESSATION**
  - Manufacturer advises avoid abrupt withdrawal—reduce daily dose in steps of 50 mg at weekly intervals, then reduce to 20 mg daily for a final week.

**DIRECTIONS FOR ADMINISTRATION**

- **With intravenous use**
  - For intermittent *intravenous infusion*, manufacturer advises dilute in *Glucose* 5% or *Sodium Chloride* 0.9% or *Lactated Ringer’s solution*; give over 15 minutes.
- **With oral use**
  - Manufacturer advises oral solution can be diluted in water or juice shortly before swallowing.

**PREScribing and dispensing information**

Manufacturer advises if switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the total daily dose and the frequency of administration should be maintained.

**PATIENT AND CARER ADVICE**

- **Missed doses**
  - Manufacturer advises if one or more doses are missed, a single dose should be taken as soon as possible and the next dose should be taken at the usual time.
- **Driving and skilled tasks**
  - Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1160/16

The *Scottish Medicines Consortium* has advised (July 2016) that *Brivaracetam* is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation in patients from 16 years of age with refractory epilepsy. Treatment should be initiated by physicians who have appropriate experience in the treatment of epilepsy.

**All Wales Medicines Strategy Group (AWMSG) decisions**

AWMSG No. 3387

The *All Wales Medicines Strategy Group* has advised (December 2018) that *Brivaracetam* is recommended as an option for restricted use within NHS Wales. *Brivaracetam* should be restricted for
use in the treatment of patients with refractory epilepsy, who remain uncontrolled with, or are intolerant to, other adjunctive anti-epileptic medicines, within its licensed indication as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation in patients from 4 years of age with epilepsy. Brivaracetam (Briviact®) is not recommended for use within NHS Wales outside of this subpopulation.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Carbamazepine

26-Jun-2018

● INDICATIONS AND DOSE
Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: Initially 100–200 mg 1–2 times a day, increased gradually according to response; usual dose 200 mg 3–4 times a day, increased if necessary up to 1.6 g daily

Focal and generalised tonic-clonic seizures
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

DOSE EQUIVALENCE AND CONVERSION
Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

CARBAGEN® SR
Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures
▶ BY MOUTH
Adult: Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 1–2 divided doses, increased if necessary up to 1.6–2 g daily in 1–2 divided doses
Elderly: Reduce initial dose

Trigeminal neuralgia
▶ BY MOUTH
Adult: Initially 100–200 mg daily in 1–2 divided doses, some patients may require higher initial dose, increase gradually according to response; usual dose 600–800 mg daily in 1–2 divided doses, increased if necessary up to 1.6 g daily in 1–2 divided doses

Prophylaxis of bipolar disorder unresponsive to lithium
▶ BY MOUTH
Adult: Initially 400 mg daily in 1–2 divided doses, increased until symptoms controlled; usual dose 400–600 mg daily in 1–2 divided doses; maximum 1.6 g per day

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder
▶ BY MOUTH
Child 5–11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required, dose should be increased slowly; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses
Child 12–17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

TEGRETOL® PROLONGED RELEASE
Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures
▶ BY MOUTH
Adult: Initially 100–400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 2 divided doses, increased if necessary up to 1.6–2 g daily in 2 divided doses
Epilepsy and other seizure disorders

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

**BY MOUTH**

- Child 5–11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses.
- Child 12–17 years: Initially 100–400 mg daily in 2 divided doses, dose should be increased slowly; maintenance 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses.

**Trigeminal neuralgia**

- **BY MOUTH**
  - Child: Initially 400 mg daily in 2 divided doses, increased until symptoms controlled; usual dose 400–600 mg daily in 2 divided doses; maximum 1.6 g per day.

**INTERACTIONS**

- **Blood, hepatic, or skin disorders**
  - Carbamazepine should be avoided unless no alternative (such as phenytoin).
  - Cross-sensitivity reported with oxcarbazepine and with hypersensitivity syndrome associated with carbamazepine.
  - Monitoring blood counts and hepatic and renal function tests (but evidence of practical value uncertain).

**CONTRA-INDICATIONS**

- Acute porphyrias.
- Severe, progressive, or associated with clinical symptoms of porphyria cutanea tarda.

**UNLICENSED USE**

- In adults Not licensed for use in adult alcohol withdrawal. Use off-label neuropathy is an unlicensed indication.

**CAUTIONS**

- **Cardiac disease**
  - Use in diabetic neuropathy is an unlicensed indication.
  - Cardiac disease.

**CONTRA-INDICATIONS**

- Acute porphyrias p. 1058.
- AV conduction abnormalities (unless paced).
- History of bone-marrow depression.

**SIDE-EFFECTS**

- **Common or very common**
  - Dizziness, drowsiness, dry mouth, eosinophilia, fatigue, fluid imbalance, gastrointestinal discomfort, headache, hypotension, leucopenia, movement disorders, nausea, oedema, skin reactions, thrombocytopenia, vision disorders, vomiting, weight increased.

- **Uncommon**
  - Constipation, diarrhoea, eye disorders, tic, tremor.

- **Rare or very rare**
  - Aggression, agranulocytosis, albuminuria, alopecia, anaemia, angioedema, anxiety, appetite decreased, arthralgias, arthritides, azotaemia, bone disorders, bone marrow disorders, cardiac conduction disorders, circulatory collapse, confusion, congestive heart failure, conjunctivitis, coronary artery disease aggravated, depression, dyspepsia, embolism and thrombosis, erythema nodosum, fever, folate deficiency, galactorrhoea, gynaecomastia, haematuria, haemolytic anaemia, hallucinations, hearing impairment, hepatic disorders, hirsutism, hyperacidity, hyperhidrosis, hypersensitivity, hypertension, hypogammaglobulinaemia, hypotension, lens opacity, leucocytosis, lymphadenopathy, meningitis, muscle complaints, muscle weakness, nephritis, tubulointerstitial, nervous system disorder, neuroleptic malignant syndrome, oral disorders, pancreatitis, paraesthesia, paresis, peripheral neuropathy, photosensitivity reaction, pneumonia, pneumonitis, pseudolymphoma, psychosis, red blood cell abnormalities, renal impairment, severe cutaneous adverse reactions (SCARs), sexual dysfunction, speech impairment, spermatogenesis abnormal, syncope, systemic lupus erythematosus (SLE), taste altered, tinnitus, urinary disorders, vanishing bile duct syndrome, vasculitis.

**FREQUENCY not known**

- Bone fracture, colitis, human herpesvirus 6 infection reactivation, memory loss, nail loss.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly.

**OVERDOSE**

- For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1395.

**ALLERGY AND CROSS-SENSITIVITY**

- Antiepileptic hypersensitivity syndrome associated with carbamazepine.

**PREGNANCY**

- See Pregnancy in Epilepsy p. 305.

**MONITORING**

- Doses should be adjusted on the basis of plasma drug concentration monitoring.

**BREAST FEEDING**

- Amount probably too small to be harmful.

**HEPATIC IMPAIRMENT**

- Manufacture advises caution and close monitoring—no information available.

**RENAL IMPAIRMENT**

- Use with caution.

**PRE-TREATMENT SCREENING**

- Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

**MONITORING REQUIREMENTS**

- Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.

**Manufacturers**

- Blood counts and hepatic and renal function tests (but evidence of practical value uncertain).

**TREATMENT CESSATION**

- When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.

**DIRECTIONS FOR ADMINISTRATION**

- In children Oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect).

**TREGRETOL® PROLONGED RELEASE**

- Tegretol® Prolonged Release tablets can be halved but should not be chewed.

**PRESCRIBING AND DISPENSING INFORMATION**

- Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

**PATIENT AND CARER ADVICE**

- Blood, hepatic, or skin disorders.

- Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.

- Carbamazepine 20 mg per 1 ml Carbamazepine 100mg/5ml oral suspension sugar free sugar-free | 300 ml | £8.25 DT = £8.04
- Tegretol (Novartis Pharmaceuticals UK Ltd)
- Carbamazepine 20 mg per 1 ml Tegretol 100mg/5ml liquid sugar-free | 300 ml | £6.12 DT = £8.04

---

**Eliscarbazepine acetate**

20-Nov-2018

**INDICATIONS AND DOSE**

Monotherapy of focal seizures with or without secondary generalisation

- **BY MOUTH**
  - Adult: Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily, then increased if necessary to 1.2 g once daily (max. per dose 1.6 g)
  - Elderly: Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

Adjuvative therapy of focal seizures with or without secondary generalisation

- **BY MOUTH**
  - Adult: Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

**CONTRA-INDICATIONS** Second- or third-degree AV block

**CAUTIONS** Elderly · hyponatraemia · PR-interval prolongation

---

**INTERACTIONS** → Appendix 1: antiepileptics

**SIDE-EFFECTS**

- Common or very common Appetite decreased · asthenia · concentration impaired · diarrhoea · dizziness · drowsiness · electrolyte imbalance · gait abnormal · headaches · movement disorders · nausea · skin reactions · sleep disorders · vertigo · vision disorders · vomiting

- Uncommon Alopecia · anaemia · anxiety · bradycardia · chest pain · chills · confusion · constipation · depression · dry mouth · eye disorders · flushing · gastritis · gastrointestinal discomfort · haemorrhage · hearing impairment · hyperhidrosis · hypertension · hypotension · hypothyroidism · increased risk of infection · liver disorder · malaise · mood altered · muscle weakness · myalgia · pain in extremity · palpitations · peripheral coldness · peripheral neuropathy · peripheral oedema · psychomotor retardation · psychotic disorder · sensation abnormal · speech impairment · tinnitus · toothache · weight decreased

- Frequency not known Angioedema · leucopenia · pancreatitis · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

**ALLERGY AND CROSS-SENSITIVITY**

Antiepileptic hypersensitivity syndrome theoretically associated with eslicarbazepine. See under Epilepsy p. 305 for more information.

**PREGNANCY**

Manufacturer advises minimum effective doses and monotherapy if possible—reproductive toxicity in animal studies.

Monitoring. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in mild to moderate impairment—limited information; avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**

Manufacturer advises avoid if creatinine creatinine clearance less than 30 mL/minute.

Dose adjustments. Manufacturer advises reduce initial dose to 200 mg once daily or 400 mg every other day for 2 weeks, then increase to 400 mg once daily if creatinine clearance 30–60 mL/minute. The dose may be further increased based on individual response.

**PRE-TREATMENT SCREENING**

Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

**MONITORING REQUIREMENTS**

Monitor plasma-sodium concentration in patients at risk of hyponatraemia and discontinue treatment if hyponatraemia occurs.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations. Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks. Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness, somnolence and visual disorders.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 592/09

The Scottish Medicines Consortium has advised (November 2010) that eslicarbazepine (Zebinix®) is accepted for restricted use within NHS Scotland as adjuvant therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy.
Epilepsy and other seizure disorders

314

in patients who have been heavily pre-treated and remain uncontrolled with existing anti-epileptic drugs. This advice is contingent upon the continuing availability of the patient access scheme in Scotland.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **CAUTIONARY AND ADVISORY LABELS**: B
- Zebinix (Eisai Ltd)
- Eslicarbazepine acetate 50 mg per 1 ml Zebinix 50mg/1ml oral suspension sugar-free | 200 ml | £56.67

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**: B
- Zebinix (Eisai Ltd)
- Eslicarbazepine acetate 200 mg Zebinix 200mg tablets | 60 tablet | £68.00 DT = £68.00
- Eslicarbazepine acetate 800 mg Zebinix 800mg tablets | 30 tablet | £136.00 DT = £136.00

**SIDE-EFFECTS**

- **Absence seizures**: Atypical absence seizures (adjunct)
- **Myoclonic seizures**
  
  - **By mouth**
  
  - **Child 1 month–5 years**: Initially 5 mg/kg twice daily (max. per dose 125 mg), dose to be increased every 5–7 days; maintenance 10–20 mg/kg twice daily (max. per dose 500 mg), total daily dose may rarely be given in 3 divided doses.
  
  - **Child 6–17 years**: Initially 250 mg twice daily, then increased in steps of 250 mg every 5–7 days; usual dose 500–750 mg twice daily, increased if necessary up to 1 g twice daily.
  
  - **Adult**: Initially 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 5–7 days; usual dose 1–1.5 g daily in 2 divided doses, increased if necessary up to 2 g daily.

**CAUTIONS**

Avoid in Acute porphyrias p. 1058

**INTERACTIONS** Appendix 1: antiepileptics

**SIDE-EFFECTS**

- Aggression, agranulocytosis, appetite decreased, blood disorder, bone marrow disorders, concentration impaired, depression, diarrhoea, dizziness, drowsiness, erythema nodosum, fatigue, gastrointestinal discomfort, generalised tonic-clonic seizure, headache, hiccups, leucopenia, libido increased, lupus-like syndrome, mood altered, movement disorders, nausea, nephrotic syndrome, oral disorders, psychosis, rash, sleep disorders, Stevens–Johnson syndrome, vaginal haemorrhage, vision disorders, vomiting, weight decreased

**SIDE-EFFECTS, FURTHER INFORMATION**

Blood counts required if features of fever, sore throat, mouth ulcers, bruising or bleeding.

**PREGNANCY**

See also Pregnancy in Epilepsy p. 305.

**Monitoring**

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Present in milk. Hyperexcitability and sedation reported.

**HEPATIC IMPAIRMENT**

Use with caution.

**RENA L IMPAIRMENT**

Use with caution.

**PATIENT AND CARER ADVICE**

Blood disorders. Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop.

**INTERACTIONS**

Appendix 1: antiepileptics

**SIDE-EFFECTS**

- Common or very common: Asthenia, chills, dizziness, drowsiness, dry mouth, dysarthria, euphoric mood, headache, hypotension, movement disorders, nausea, nystagmus, sensation abnormal, skin reactions, stupor.

**MEDI CINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **CAUTIONARY AND ADVISORY LABELS**: B
- Ethosuximide (Non-proprietary)
- Ethosuximide 50 mg per 1 ml Ethosuximide 250mg/5ml syrup | 200 ml | £173.00 DT = £173.00
- Ethosuximide 250mg/5ml oral solution sugar free sugar-free | 125 ml | £108.12–108.13 sugar-free | 250 ml | £216.25

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS**: B
- Ethosuximide (Non-proprietary)
- Ethosuximide 250 mg Ethosuximide 250mg capsules | 36 capsule | £173.00 DT = £173.00

**DRUG ACTION**

Fosphenytoin is a pro-drug of phenytoin.
taste altered - tinnitus - tremor - vasodilation - vertigo - vision disorders - vomiting

- **Uncommon** Cardiac arrest - confusion - hearing impairment - muscle complaints - muscle weakness - nervousness - oral disorders - reflexes abnormal - severe cutaneous adverse reactions (SCARs) - systemic lupus erythematosus (SLE) - thinking abnormal

- **Frequency not known** Acute psychosis - agranulocytosis - appetite disorder - atrial conduction depression (more common if injection too rapid) - atrioventricular block - bone disorders - bone fracture - bone marrow disorders - bradycardia - cardiotoxicity - cerebrovascular insufficiency - circulatory collapse (more common if injection too rapid) - coarsening of the facial features - constipation - delirium - Dupuytren's contracture - encephalopathy - granulocytopenia - groin tingling - hair changes - hepatic disorders - hyperglycaemia - hypersensitivity - insomnia - leucopenia - lymphadenopathy - nephritis - tubulointerstitial - Peyronie's disease - polyarteritis nodosa - polynephritis - purple glove syndrome - thrombocytopenia - toxic seizure - ventricular conduction depression (more common if injection too rapid) - ventricular fibrillation (more common if injection too rapid)

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Fosphenytoin** has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following reactions are recommended: monitor heart rate, blood pressure, and respiratory function for duration of infusion; observe patient for at least 30 minutes after infusion; if hypotension occurs, reduce infusion rate or discontinue; reduce dose or infusion rate in elderly, and in renal or hepatic impairment.

- **Allergy and cross-sensitivity** Cross-sensitivity reported with carbamazepine.

- **Pregnancy** See also Pregnancy in Epilepsy p. 305. Changes in plasma-protein binding may cause interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **Breast feeding** Small amounts present in milk, but not known to be harmful.

- **Hepatic impairment** Manufacturer advises caution—monitor free plasma-phenytoin concentration (rather than total plasma-phenytoin concentration) in hepatic impairment or hypoalbuminaemia and in hyperbilirubinaemia.

- **Dose adjustments** Manufacturer advises a 10–25% reduction in dose or infusion rate (except in the treatment of status epilepticus) in hepatic impairment or hypoalbuminaemia.

- **Renal impairment** Dose adjustments Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).

- **Pre-treatment screening** HLA-B*1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

- **Monitoring requirements** Manufacturer recommends blood counts (but evidence of practical value uncertain).

- With intravenous use Monitor heart rate, blood pressure, ECG, and respiratory function for duration of infusion.

- **Directions for administration** For intermittent intravenous infusion (Pro-Epanutin®), give in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent (PE))/mL.

---

**Epilepsy and other seizure disorders**

- **Prescribing and dispensing information** Prescriptions for fosphenytoin should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Electrolytes:** May contain phosphate
- **Pro-Epanutin (Pfizer Ltd)**

Fosphenytoin sodium 75 mg per 1 ml Pro-Epanutin 750mg/10ml concentrate for solution for injection vials | 10 vial | £400.00

(Hospital only)

---

**Gabapentin**

- **Indications and dose** Adjunctive treatment of focal seizures with or without secondary generalisation

  - **by mouth**

    - Child 6–11 years: 10 mg/kg once daily (max. per dose 300 mg) on day 1, then 10 mg/kg twice daily (max. per dose 300 mg) on day 2, then 10 mg/kg 3 times a day (max. per dose 300 mg) on days 3; usual dose 25–35 mg/kg daily in 3 divided doses; some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate. Daily dose maximum to be given in 3 divided doses; maximum 70 mg/kg per day.

    - Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate.

    - Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate.

    - Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day).

**Monotherapy for focal seizures with or without secondary generalisation**

- **by mouth**

    - Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate.

    - Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day).

**Peripheral neuropathic pain**

- **by mouth**

    - Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg.

---

www.getintopharma.com
316  Epilepsy and other seizure disorders

Migraine prophylaxis
- **BY MOUTH**
  - Adult: Initially 300 mg daily, then increased to up to 2.4 g daily in divided doses, adjusted according to response

Menopausal symptoms, particularly hot flushes, in women with breast cancer
- **BY MOUTH**
  - Adult: 300 mg 3 times a day, initial dose should be lower and titrated up over three days

**UNLICENSED USE**
- In children  Not licensed at doses over 50 mg/kg daily in children under 12 years.
- In adults  Not licensed for migraine prophylaxis. **(Caution)** Not licensed for menopausal symptoms.

**IMPORTANT SAFETY INFORMATION**

The levels of propylene glycol, saccharin and aspartame in some products may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (39.50 kg) — consult product literature.

MHRA/CHM ADVICE: GABAPENTIN (NEURONTIN®): RISK OF SEVERE RESPIRATORY DEPRESSION (OCTOBER 2017)

Gabapentin has been associated with a rare risk of severe respiratory depression even without concomitant opioid medicines. Patients with compromised respiratory function, respiratory or neurological disease, renal impairment, concomitant use of central nervous system (CNS) depressants, and elderly people might be at higher risk of experiencing severe respiratory depression and dose adjustments may be necessary in these patients.

MHRA/CHM ADVICE: GABAPENTIN (NEURONTIN®) AND RISK OF ABUSE AND DEPENDENCE: NEW SCHEDULING REQUIREMENTS FROM 1 APRIL (APRIL 2019)

Following concerns about abuse, gabapentin has been reclassified as a Class C controlled substance and is now a Schedule 3 drug, but is exempt from safe custody requirements. Healthcare professionals should evaluate patients carefully for a history of drug abuse before prescribing gabapentin, and observe patients for signs of abuse and dependence. Patients should be informed of the potential risks of interactions between gabapentin and alcohol, and with other medicines that cause CNS depression, particularly opioids.

**CAUTIONS**
- Diabetes mellitus - elderly (in adults) - high doses of oral solution in adolescents and adults with low body-weight - history of psychotic illness - history of substance abuse - mixed seizures (including absences)

**INTERACTIONS**  → Appendix 1: Antiepileptics

**SIDE-EFFECTS**
- **Uncommon** Cognitive impairment - palpitations
- **Frequency not known** Acute kidney injury - alopecia - angioedema - breast enlargement - drug use disorders - gynaecomastia - hallucination - hepatic disorders - hyponatraemia - pancreatitis - rhombomylolysis - severe cutaneous adverse reactions (SCARs) - thrombocytopena - tinnitus - urinary incontinence
- **PREGNANCY**  Manufacturer advises avoid unless benefit outweighs risk — toxicity reported. See also Pregnancy in Epilepsy p. 305.
- **BREAST FEEDING**  Present in milk — manufacturer advises use only if potential benefit outweighs risk. See also Breast-feeding in Epilepsy p. 305.

**RENAI IMPAIRMENT**
- **Dose adjustments**  → in adults  Manufacturer advises reduce dose to 600–1800 mg daily in 3 divided doses if creatinine clearance 50–79 ml/minute. Manufacturer advises reduce dose to 300–900 mg daily in 3 divided doses if creatinine clearance 30–49 ml/minute. Manufacturer advises reduce dose to 150–600 mg daily in 3 divided doses if creatinine clearance 15–29 ml/minute (150 mg daily dose to be given as 300 mg in 3 divided doses on alternate days).

Manufacturer advises reduce dose to 150–300 mg daily in 3 divided doses if creatinine clearance is less than 15 ml/minute (150 mg daily dose to be given as 300 mg in 3 divided doses on alternate days) — further dose reductions may be required in proportion to creatinine clearance, consult product literature.
- **In children** Reduce dose if estimated glomerular filtration rate less than 80 ml/minute/1.73 m²; consult product literature.

**MONITORING REQUIREMENTS**  Monitor for signs of gabapentin abuse.

**EFFECT ON LABORATORY TESTS**  False positive readings with some urinary protein tests.

**DIRECTIONS FOR ADMINISTRATION** Capsules can be opened but the bitter taste is difficult to mask.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Gabapentin for neuropathic pain; www.medicinesforchildren.org.uk/gabapentin-neuropathic-pain

Medicines for Children leaflet: Gabapentin for preventing seizures; www.medicinesforchildren.org.uk/gabapentin-preventing-seizures

Patient leaflet: NHS England has produced a patient leaflet with information on the reclassification of gabapentin.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Lacosamide**

22-Feb-2018

- **INDICATIONS AND DOSE**
  - **Monotherapy of focal seizures with or without secondary generalisation**
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
      - Child (body-weight 50 kg and above): Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week, alternatively initially 100 mg twice daily; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
      - Child 4-17 years (body-weight up to 50 kg): (consult product literature)
      - Adult: Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week, alternatively initially 100 mg twice daily; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
      - Adult: Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
    - **Adjunctive treatment of focal seizures with or without secondary generalisation**
      - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
      - Child (body-weight 50 kg and above): Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
      - Child 4-17 years (body-weight up to 50 kg): (consult product literature)
      - Adult: Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
    - **Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)**
      - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
      - Child (body-weight 50 kg and above): Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 200 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

- **SIDE-EFFECTS**
  - Common or very common: Asthenia, concentration impaired, confusion, constipation, depression, diarrhea, dizziness, drowsiness, dry mouth, dysarthria, dyspepsia, flatulence, gait abnormal, headache, insomnia, mood altered, movement disorders, muscle spasms, nausea, vertigo, vision disorders, vomiting
  - Uncommon: Aggression, agitation, angioedema, arrhythmias, atrioventricular block, hallucination, psychotic disorder, suicidal tendencies, syncope
  - Frequency not known: Agranulocytosis

- **ALLERGY AND CROSS-SENSITIVITY**
  - Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 305 for more information.
  - **PREGNANCY**
  - See also Pregnancy in Epilepsy p. 305.
  - Monitoring: The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution (risk of increased exposure), particularly in severe impairment (no information available).

- **SIDE-EFFECTS**
  - **ASTHENIA**
  - **CONFUSION**
  - **DEPRESSION**
  - **DIZZINESS**
  - **DYSPEPSIA**

- **INTERACTIONS**
  - **CONTRA-INDICATIONS**: Second- or third-degree AV block
  - **CAUTIONS**: Conduction problems - elderly (in adults) - risk of PR-interval prolongation - severe cardiac disease

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) decisions**
    - **SMC No. 532/09**
      - The Scottish Medicines Consortium has advised (February 2009) that lacosamide (Vimpat®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.
    - **SMC No. 1301/18**
      - The Scottish Medicines Consortium has advised (February 2018) that lacosamide (Vimpat®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in adolescents and children from 4 years of age with epilepsy. It is restricted for specialist use in refractory epilepsy.
  - **All Wales Medicines Strategy Group (AWMSG) decisions**
    - **AWMSG No. 3343**
      - The All Wales Medicines Strategy Group has advised (March 2018) that lacosamide (Vimpat®) is recommended as an option for use within NHS Wales as adjunctive therapy in

- **Flavours of syrup may include strawberry.**

  | Monotherapy of seizures associated with Lennox-Gastaut syndrome |

  | BY MOUTH |
  | Child 12-17 years: Initially 25 mg once daily for 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses; dose titration should be repeated if restarting after interval of more than 5 days |
  | Adult: Initially 25 mg once daily for 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days |

  **Adjunctive therapy of focal seizures**

  | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures with valproate |
  | Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate |

  | BY MOUTH |
  | Child 2-11 years: Initially 300 micrograms/kg daily in 1–2 divided doses for 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day |
  | Adult: Initially 25 mg once daily for 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days |

  **Adjunctive therapy of focal seizures without enzyme inducing drugs**

  | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures without enzyme inducing drugs |
  | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes without enzyme inducing drugs |

  | BY MOUTH |
  | Child 2-11 years: Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day |
  | Child 2-11 years (body-weight up to 13 kg): Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days |
  | Child 2-11 years (body-weight 13 kg and above): Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days |
  | Child 12-17 years: Initially 25 mg once daily for 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days |
  | Adult: Initially 25 mg once daily for 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days |

  **Epilepsy and other seizure disorders**

  | Monotherapy of seizures associated with Lennox-Gastaut syndrome |
  | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures |

  | BY MOUTH |
  | Child 12-17 years: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days |
  | Adult: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days |
Monotherapy or adjunctive therapy of bipolar disorder (without enzyme inducing drugs) without valproate

- **BY MOUTH**
- **Adult:** Initially 25 mg once daily for 14 days, then 50 mg daily in 1–2 divided doses for further 14 days, then 100 mg daily in 1–2 divided doses for further 7 days; maintenance 200 mg daily in 1–2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day

**Adjuvant therapy of bipolar disorder with valproate**

- **BY MOUTH**
- **Adult:** Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then 50 mg daily in 1–2 divided doses for further 7 days; maintenance 100 mg daily in 1–2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

**Adjuvant therapy of bipolar disorder (with enzyme inducing drugs) without valproate**

- **BY MOUTH**
- **Adult:** Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased to 100 mg twice daily for further 7 days, then increased to 150 mg twice daily for further 7 days; maintenance 200 mg twice daily, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

---

**SAFE PRACTICE**

Do not confuse the different combinations or indications.

- **CAUTIONS**
  - Myoclonic seizures (may be exacerbated). Parkinson’s disease (may be exacerbated)(in adults)
- **INTERACTIONS**
  - Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - Common or very common: Aggression, agitation, arthralgia, diarrhoea, dizziness, drowsiness, dry mouth, fatigue, headache, irritability, nausea, pain, rash, sleep disorders, tremor, vomiting
  - Uncommon: Alopecia, movement disorders, vision disorders
  - Rare or very rare: Confusion, conjunctivitis, disseminated intravascular coagulation, face oedema, fever, hallucination, hepatitis, herpes infection, hypersensitivity syndrome, lymphadenopathy, meningitis, aseptic, multi-organ failure, nystagmus, seizure, severe cutaneous adverse reactions (SCARs), tic

**SIDE-EFFECTS, FURTHER INFORMATION**

Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed (especially in children); most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 305 for more information.
- **PREGNANCY**
  - See also Pregnancy in Epilepsy p. 305.
- **Monitoring**
  - Doses should be adjusted on the basis of plasma-drug concentration monitoring.
- **BREAST FEEDING**
  - Present in milk, but limited data suggest no harmful effect on infant.
- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in moderate to severe impairment.
  - Dose adjustments: Manufacturer advises dose reduction of approx. 50% in moderate impairment, and approx. 75% in severe impairment; adjust according to response.
- **RENAL IMPAIRMENT**
  - Caution in renal failure; metabolite may accumulate.
  - Dose adjustments: Consider reducing maintenance dose in significant impairment.
- **TREATMENT CESSATION**
  - Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic lamotrigine product.
  - Switching between formulations: Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
- **PATIENT AND CARER ADVICE**
  - Skin reactions: Warn patients and carers to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop.
  - Blood disorders: Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine.
  - Medicines for Children leaflet: Lamotrigine for preventing seizures www.medicinesforchildren.org.uk/lamotrigine-preventing-seizures

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Dispersible tablet**

**CAUTIONARY AND ADVISORY LABELS 8, 13**

- **Lamotrigine (Non-proprietary)**
  - Lamotrigine 5 mg: Lamotrigine 5mg dispersible tablets sugar-free
  - 28 tablet (PSt) £15.00 DT + £6.86
  - Lamotrigine 25 mg: Lamotrigine 25mg dispersible tablets sugar-free
  - 56 tablet (PSt) £20.00 DT + £2.20
  - Lamotrigine 100 mg: Lamotrigine 100mg dispersible tablets sugar-free
  - 56 tablet (PSt) £58.68 DT + £3.99
- **Lamictal** (GlaxoSmithKline UK Ltd)
  - Lamotrigine 2 mg: Lamictal 2mg dispersible tablets sugar-free
  - 30 tablet (PSt) £18.81 DT + £18.81
  - Lamotrigine 5 mg: Lamictal 5mg dispersible tablets sugar-free
  - 28 tablet (PSt) £9.38 DT + £6.86
  - Lamotrigine 25 mg: Lamictal 25mg dispersible tablets sugar-free
  - 56 tablet (PSt) £23.53 DT + £2.20
  - Lamotrigine 100 mg: Lamictal 100mg dispersible tablets sugar-free

Adjunctive therapy of focal seizures with or without seizures

Adjunctive therapy of myoclonic seizures and tonic-clonic seizures

Adult:

- Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

**INDICATIONS AND DOSE**

**Monotherapy of focal seizures with or without secondary generalisation**

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child 12–17 years: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks
  - Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

**Adjunctive therapy of focal seizures with or without secondary generalisation**

- **BY MOUTH**
  - Child 1–5 months: Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 6 months–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 12–17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
  - Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

- **BY INTRAVENOUS INFUSION**
  - Child 4–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 12–17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
  - Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

**Adjunctive therapy of myoclonic seizures and tonic-clonic seizures**

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child 12–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 12–17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

**SIDE-EFFECTS**

- Common or very common: Anxiety, appetite decreased, asthenia, behaviour abnormal, cough, depression, diarrhoea, dizziness, drowsiness, gastrointestinal discomfort, headache, increased risk of infection, insomnia, mood altered, movement disorders, nausea, skin reactions, vertigo, vomiting

- Uncommon: Alopecia, concentration impaired, confusion, hallucination, leucopenia, muscle weakness, myalgia, paraesthesia, psychotic disorder, suicidal tendencies, thrombocytopenia, vision disorders, weight changes

- Rare or very rare: Acute kidney injury, agranulocytosis, haematopoietic disorders, hyponatraemia, neutropenia, pancreatitis, pancytopenia, personality disorder, rhabdomyolysis, severe cutaneous adverse reactions (SCARs), thinking abnormal

**PREGNANCY**

See also Pregnancy in Epilepsy p. 305.

**Monitoring**

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

It is recommended that the fetal growth should be monitored.

**BREAST FEEDING**

Present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

- In adults: Halve dose in severe hepatic impairment if eGFR less than 60 mL/minute/1.73 m².
- In children: Halve dose in severe hepatic impairment if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

**RENAL IMPAIRMENT**

- **Dose adjustments**
  - In children: Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m² (consult product literature).
  - In adults: Maximum 2 g daily if eGFR 50–80 mL/minute/1.73 m², Maximum 1.5 g daily if eGFR 30–50 mL/minute/1.73 m², Maximum 1 g daily if eGFR less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

- In intravenous use: For intravenous infusion (Kepra®), dilute requisite dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9%; give over 15 minutes.
- With oral use: For administration of oral solution, requisite dose may be diluted in a glass of water.

**PRESCRIBING AND DISPENSING INFORMATION**

If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Levetiracetam for preventing seizures www.medicinesforchildren.org.uk/levetiracetam-preventing-seizures
Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

**BY MOUTH**
- Child 6-17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 15 mg/kg twice daily; maximum 46 mg/kg per day
- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

**Treatment of primary generalised tonic-clonic seizures**

**BY MOUTH**
- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

**SIDE-EFFECTS**
- In adults
  - Not licensed for the treatment of primary generalised tonic-clonic seizures.

**UNLICENSED USE**
- In adults
  - Not licensed for the treatment of primary generalised tonic-clonic seizures.

**CAUTIONS**
- Avoid in Acute porphyrias p. 1058 • Cardiac conduction disorders • Heart failure • Hyponatraemia

**INTERACTIONS**
- Appendix 1: Antiepileptics

**PRE-TREATMENT SCREENING**
- Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

**INDICATIONS AND DOSE**

Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

**BY MOUTH**
- Child 6-17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day
- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

**OXCARBAZEPINE**

**Epilepsy and other seizure disorders**

**MEDIINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Granules**

**CAUTIONARY AND ADVISORY LABELS**
- Adult:
  - Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**
- Adult:
  - Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

**Solution for infusion**

**ELECTROLYTES**: May contain Sodium
- Adult:
  - Initially 300 mg/kg twice daily; maximum 46 mg/kg per day
  - Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS**
- Adult:
  - Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses
MONITORING REQUIREMENTS
- Monitor plasma-sodium concentration in patients at risk of hyponatraemia.
- Monitor body-weight in patients with heart failure.

PRESCRIBING AND DISPENSING INFORMATION
Patients may need to be maintained on a specific manufacturer’s branded or generic oxcarbazepine product.

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

PATIENT AND CARER ADVICE
Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.

Medicines for Children: Oxcarbazepine for preventing seizures see medicinesforchildren.org.uk/oxcarbazepine-preventing-seizures

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

- Tripteral (Novartis Pharmaceuticals UK Ltd)

Oxcarbazepine 60 mg per 1 ml Trileptal 60mg/ml oral suspension sugar-free | 250 ml (POM) £46.96 DT = £48.96

Tablet

- Oxcarbazepine (Non-proprietary)

Oxcarbazepine 150 mg Oxcarbazepine 150mg tablets | 50 tablet (POM) £12.42 DT = £13.37

Oxcarbazepine 300 mg Oxcarbazepine 300mg tablets | 50 tablet (POM) £24.88 DT = £26.87

Oxcarbazepine 600 mg Oxcarbazepine 600mg tablets | 50 tablet (POM) £48.96 DT = £53.71

Tripteral (Novartis Pharmaceuticals UK Ltd)

Oxcarbazepine 150 mg Trileptal 150mg tablets | 50 tablet (POM) £12.24 DT = £13.37

Oxcarbazepine 300 mg Trileptal 300mg tablets | 50 tablet (POM) £24.48 DT = £26.87

Oxcarbazepine 600 mg Trileptal 600mg tablets | 50 tablet (POM) £48.96 DT = £53.71

MANUFACTURERS
- Fycompa (Eisai Ltd)

Perampanel 2 mg Fycompa 2mg tablets | 7 tablet (POM) £35.00 DT = £36.00

Perampanel 4 mg Fycompa 4mg tablets | 28 tablet (POM) £40.00 DT = £41.00

Perampanel 6 mg Fycompa 6mg tablets | 28 tablet (POM) DT = £40.00

Perampanel 8 mg Fycompa 8mg tablets | 28 tablet (POM) £40.00 DT = £42.00

Perampanel 10 mg Fycompa 10mg tablets | 28 tablet (POM) £40.00 DT = £42.00

Perampanel 12 mg Fycompa 12mg tablets | 28 tablet (POM) £40.00 DT = £42.00

INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalised seizures

BY MOUTH

Child 12–17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day.

Adult: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day.

Adjunctive treatment of primary generalised tonic-clonic seizures

BY MOUTH

Child 12–17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response, maintenance up to 8 mg once daily; maximum 12 mg per day.

Adult: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response, maintenance up to 8 mg once daily; maximum 12 mg per day.

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Titrate at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

INTERACTIONS

Appendix 1: antiepileptics

SIDE-EFFECTS

- Common or very common Anxiety - appetite abnormal - back pain - behaviour abnormal - confusion - dizziness - drowsiness - dysarthria - fatigue - gait abnormal - irritability - movement disorders - nausea - vertigo - vision disorders - weight increased

PREGNANCY

Manufacturer advises avoid. See also Pregnancy in Epilepsy p. 305.

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING

Avoid — present in milk in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

Dose adjustments Manufacturer advises maximum 8 mg per day in mild to moderate impairment.

RENAL IMPAIRMENT

Avoid in moderate or severe impairment.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer’s branded or generic perampanel product.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
Epilepsy and other seizure disorders 323

Phenytoin 19-Apr-2017

- **INDICATIONS AND DOSE**
  - **Tonic-clonic seizures** | Focal seizures
    - **BY MOUTH**
      - Child 1 month–11 years: Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
      - Child 12–17 years: Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration
  - **Loading dose**
    - **BY MOUTH**
      - Child: Initially 2.5 mg/kg twice daily, then adjusted according to response to 4–8 mg/kg daily, dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
  - **Status epilepticus** | Acute symptomatic seizures associated with head trauma or neurosurgery
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Child 1 month–11 years: Loading dose 20 mg/kg, then (by slow intravenous injection or by intravenous infusion) 2.5–5 mg/kg twice daily
      - Child 12–17 years: Loading dose 20 mg/kg, then (by intravenous infusion or by slow intravenous injection) up to 100 mg 3–4 times a day
      - Adult: Loading dose 20 mg/kg (max. per dose 2 g), then (by intravenous infusion or by slow intravenous injection or by mouth) maintenance 100 mg every 6–8 hours adjusted according to plasma-phenytoin concentration monitoring

- **DOSE EQUIVALENT AND CONVERSION**
  - Preparations containing phenytoin sodium are not bioequivalent to those containing phenytoin base (such as Epanutin Infatabs® and Epanutin® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy. However, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

- **UNLICENSED USE**

- **SIDE-EFFECTS**
  - With intravenous use. Phenytoin doses in BNF publications may differ from those in product literature.

- **INTERACTIONS**
  - **Appendix 1: antiepileptics**

- **CONTRA-INDICATIONS**
  - **GENERAL CONTRA-INDICATIONS**
    - Acute porphyrias p. 1058
  - **SPECIFIC CONTRA-INDICATIONS**
    - With intravenous use
      - Second- and third-degree heart block.
      - Sino-atrial block.
      - Atrioventricular conduction depression (more common if injection too rapid).
      - Tonic seizure (more common if injection too rapid).
      - Ventricular conduction depression (more common if injection too rapid).
      - Ventricular fibrillation (more common if injection too rapid).
      - With oral use
        - Electrolyte imbalance.
        - Pneumonitis.
        - Vitamin D deficiency.
      - With parenteral use
        - Arrhythmias.
        - Atrial conduction depression (more common if injection too rapid).
        - Cardiac arrest.
        - Extravasation necrosis.
        - Hypotension.
        - Injection site necrosis.
        - Purpura.
        - Respiratory arrest.
        - Respiratory disorders.
        - Seizure (more common if injection too rapid).
        - Venricular conduction depression.

- **SAFETY INFORMATION**
  - **NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF DEATH AND SEVERE HARM FROM ERROR WITH INJECTABLE PHENYTOIN (NOVEMBER 2016)**
    - Use of injectable phenytoin is error-prone throughout the prescribing, preparation, administration and monitoring processes; all relevant staff should be made aware of appropriate guidance on the safe use of injectable phenytoin to reduce the risk of error.
324 Epilepsy and other seizure disorders

**Bradycardia and hypotension** With intravenous use; reduce rate of administration if bradycardia or hypotension occurs.

**Overdose** Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

- **ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 305 for more information.

- **PREGNANCY** See also Pregnancy in Epilepsy p. 305.

- **MONITORING REQUIREMENTS**

- **PRE-TREATMENT SCREENING** HLAB*^®^ 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

- **MONITORING REQUIREMENTS**

- **Blood counts** Manufacturer recommends blood counts (but evidence of practical value uncertain).

- **Adults** The usual total plasma-phenytoin concentration for optimum response is 10–20 mg/litre (or 40–80 micromol/litre). In pregnancy, the elderly, and certain disease states where protein binding may be reduced, careful interpretation of total plasma-phenytoin concentration is necessary; it may be more appropriate to measure free plasma-phenytoin concentration.

- **Children** Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding. Trough plasma concentration for optimum response: neonate—3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).

- **With intravenous use** Monitor ECG and blood pressure.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises each injection or infusion should be preceded and followed by an injection of Sodium Chloride 0.9% through the same needle or catheter to avoid local venous irritation.

- **Intravenous injection** Give into a large vein at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). Manufacturer advises for intravenous infusion, dilute to a concentration not exceeding 10 mg/ml with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron). Give at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). Complete administration within 1 hour of preparation.

- **PREGNANCY** See also Pregnancy in Epilepsy p. 305.

- **Monitoring** Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction.

- **Doses** Should be adjusted on the basis of plasma-drug concentration monitoring.

- **BREAST FEEDING** Small amounts present in milk, but not known to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of accumulation and toxicity due to decreased protein binding in hepatic impairment, hypoalbuminaemia, or hyperbilirubinaemia).

- **Dose adjustments** • With oral use Manufacturer advises consider dose reduction.

- **With intravenous use** Manufacturer advises consider maintenance dose reduction.

- **PRE-TREATMENT SCREENING** HLAB*^®^ 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

- **MONITORING REQUIREMENTS**

- **Blood counts** Manufacturer recommends blood counts (but evidence of practical value uncertain).

- **In adults** The usual total plasma-phenytoin concentration for optimum response is 10–20 mg/litre (or 40–80 micromol/litre). In pregnancy, the elderly, and certain disease states where protein binding may be reduced, careful interpretation of total plasma-phenytoin concentration is necessary; it may be more appropriate to measure free plasma-phenytoin concentration.

- **In children** Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding. Trough plasma concentration for optimum response: neonate—3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).

- **With intravenous use** Monitor ECG and blood pressure.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises each injection or infusion should be preceded and followed by an injection of Sodium Chloride 0.9% through the same needle or catheter to avoid local venous irritation.

- **With intravenous use in children** For intravenous injection, give into a large vein at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). Manufacturer advises for intravenous infusion, dilute to a concentration not exceeding 10 mg/ml with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron). Give at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). Complete administration within 1 hour of preparation.

- **With intravenous use in adults** Manufacturer advises for intravenous infusion, give into a large vein at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute) or lower may be more appropriate in some patients (including the elderly and those with heart disease). Manufacturer advises for intravenous infusion, dilute in 50–100 ml Sodium Chloride 0.9% (final concentration not to exceed 10 mg/ml) and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute) or lower may be more appropriate in some patients (including the elderly and those with heart disease). Complete administration within 1 hour of preparation.

- **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

- **PATIENT AND CARER ADVICE** Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

| Pregabalin | 22-May-2019 |

- **INDICATIONS AND DOSE**

- **Peripheral and central neuropathic pain**

- **BY MOUTH**

- **Adults** Initially 150 mg daily in 2–3 divided doses, then increased if necessary to 300 mg daily in 2–3 divided doses, dose to be increased after 3–7 days, then increased if necessary up to 600 mg daily in 2–3 divided doses, dose to be increased after 7 days

---

www.getintopharma.com
Adju~nctive therapy for focal seizures with or without secondary generalisation

BY MOUTH

Adult: Initially 25 mg twice daily, then increased in steps of 50 mg daily, dose to be increased at 7 day intervals, increased to 300 mg daily in 2–3 divided doses for 7 days, then increased if necessary up to 600 mg daily in 2–3 divided doses

Generalised anxiety disorder

BY MOUTH

Adult: Initially 150 mg daily in 2–3 divided doses, then increased in steps of 150 mg daily if required, dose to be increased at 7 day intervals, increased if necessary up to 600 mg daily in 2–3 divided doses

UNLICENSED USE Pregabalin doses in BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PREGABALIN (LYRICA)® AND RISK OF ABUSE AND DEPENDENCE: NEW SCHEDULING REQUIREMENTS FROM 1 APRIL (2019)

Following concerns about abuse, pregabalin has been reclassified as a Class C controlled substance and is now a Schedule 3 drug, but is exempt from safe custody requirements. Healthcare professionals should evaluate patients carefully for a history of drug abuse before prescribing pregabalin, and observe patients for signs of abuse and dependence. Patients should be informed of the potentially fatal risks of interactions between pregabalin and alcohol, and with other medicines that cause CNS depression, particularly opioids.

CAUTIONS Conditions that may precipitate encephalopathy: history of substance abuse – severe congestive heart failure

INTERACTIONS → Appendix 1: antiepileptics

SIDE-EFFECTS

Common or very common Abdominal distension • appetite abnormal • asthenia • cervical spasm • concentration impaired • confusion • constipation • diarrhoea • dizziness • drowsiness • dry mouth • feeling abnormal • gait abnormal • gastrointestinal disorders • headache • increased risk of infection • joint disorders • memory loss • mood altered • movement disorders • muscle complaints • nausea • oedema • pain • sensation abnormal • sexual dysfunction • sleep disorders • speech impairment • vertigo • vision disorders • vomiting • weight changes

Uncommon Aggression • anxiety • arrhythmias • atrioventricular block • breath abnormalities • chest tightness • chills • consciousness impaired • cough • depression • dry eye • dysphoria • epistaxis • eye discomfort • eye disorders • eye inflammation • fever • hallucination • hyperacusia • hypertension • hypoglycaemia • hypotension • malaise • menstrual cycle irregularities • nasal complaints • neutropenia • oral disorders • peripheral coldness • psychiatric disorders • reflexes decreased • skin reactions • sneezing • sweat changes • syncope • taste loss • thirst • urinaiy disorders • vasodilatation

Rare or very rare Altered smell sensation • ascites • dysgraphia • dysphagia • gynaecomastia • hepatic disorders • pancreatitis • QT interval prolongation • renal impairment • rhabdomyolysis • Stevens-Johnson syndrome • throat tightness

Frequency not known Drug use disorders

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk → toxicity in animal studies. See also Pregnancy in Epilepsy p. 305.

BREAST FEEDING See Breast-feeding in Epilepsy p. 305.

RENAL IMPAIRMENT

Dose adjustments Initially 75 mg daily and maximum 300 mg daily if eGFR 30–60 mL/minute/1.73 m². Initially 25–50 mg daily and maximum 150 mg daily in 1–2 divided doses if eGFR 15–30 mL/minute/1.73 m². Initially 25 mg once daily and maximum 75 mg once daily if eGFR less than 15 mL/minute/1.73 m².

MONITORING REQUIREMENTS Monitor for signs of pregabalin abuse.

TREATMENT CESSATION Avoid abrupt withdrawal (taper over at least 1 week).

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include strawberry.

PATIENT AND CARER ADVICE Patient leaflet. NHSE England has produced a patient leaflet with information on the reclassiﬁcation of pregabalin.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (July 2007) that pregabalin (Lyrica)® is not recommended for the treatment of central neuropathic pain. The Scottish Medicines Consortium has advised (April 2009) that pregabalin (Lyrica)® is accepted for restricted use within NHS Scotland for the treatment of peripheral neuropathic pain in adults who have not achieved adequate pain relief with, or have not tolerated, first- or second-line treatments; discontinue treatment if sufﬁcient benefit is not achieved within 8 weeks of reaching the maximum tolerated dose.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Epilepsy and other seizure disorders

**By mouth**

- **Lyrica** (Pfizer Ltd)
- **Axalid** (Kent Pharmaceuticals Ltd)

**Rufinamide**

15-May-2019

**Indications and dose**

**Adjuvant treatment of seizures in Lennox-Gastaut syndrome without valproate (initiated by a specialist)**

- **By mouth**
  - Child 1-3 years: Initially 5 mg/kg twice daily, then increased in steps of up to 5 mg/kg twice daily (max. per dose 22.5 mg/kg twice daily), adjusted according to response, dose to be increased at intervals of not less than 3 days to the target dose (maximum dose), each dose should be given to the nearest 0.5 mL.
  - Child 4-7 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 3 days.
  - Child 4-17 years (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days.
  - Adult (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 800 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days.
  - Adult (body-weight 50-100 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 800 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days.
  - Adult (body-weight >100 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 800 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days.
Epilepsy and other seizure disorders

- **CAUTIONS** Patients at risk of further shortening of QTc interval
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety, appetite decreased, back pain, constipation, diarrhoea, dizziness, drowsiness, eating disorder, epistaxis, fatigue, gait abnormal, gastrointestinal discomfort, headache, increased risk of infection, insomnia, movement disorders, nausea, nystagmus, oligomenorrhoea, seizures, skin reactions, tremor, vertigo, vision disorders, vomiting, weight decreased
  - **Uncommon** Hypersensitivity
  - **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with Rufinamide. See under Epilepsy p. 305 for more information.
  - **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy in Epilepsy p. 305.
  - **BREAST FEEDING** Manufacturer advises avoid—no information available.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
  - **Dose adjustments** Manufacturer advises cautious dose titration in mild to moderate impairment.
  - **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets may be crushed and given in half a glass of water.
  - **PRESCRIBING AND DISPENSING INFORMATION**
    - **Switching between formulations** Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
    - **Patients may need to be maintained on a specific manufacturer’s branded or generic Rufinamide product.**
  - **PATIENT AND CARER ADVICE** Counselling on antiepileptic hypersensitivity syndrome is advised.
    - Medicines for Children leaflet: Rufinamide for preventing seizures
      - www.medicinesforchildren.org.uk/rufinamide-preventing-seizures
    - **Driving and skilled tasks** Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness, somnolence and blurred vision.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - **Scottish Medicines Consortium (SMC) decisions**
      - SMC No. 416/07
        - The Scottish Medicines Consortium has advised (November 2008) that Rufinamide (Inovelon®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox–Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.
      - SMC No. 795/12
        - The Scottish Medicines Consortium has advised (July 2012) that Rufinamide 40 mg/ml oral suspension (Inovelon®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox–Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.
      - SMC No. SMC2146
        - In children The Scottish Medicines Consortium has advised (April 2019) that Rufinamide (Inovelon®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox–Gastaut syndrome in patients aged 1 year up to 4 years. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
    - **Oral suspension**
      - CAUTIONARY AND ADVISORY LABELS 8, 21
      - EXCIPIENTS: May contain Propylene glycol
        - Inovelon (Eisai Ltd)
          - Rufinamide 40 mg per 1 ml Inovelon 40mg/ml oral suspension sugar-free | 460 ml [PSM] £94.71 DT = £94.71
    - **Tablet**
      - CAUTIONARY AND ADVISORY LABELS 8, 21
        - Inovelon (Eisai Ltd)
          - Rufinamide 100 mg Inovelon 100mg tablets | 10 tablet [PSM] £5.15 DT = £5.15
          - Rufinamide 200 mg Inovelon 200mg tablets | 60 tablet [PSM] £61.77 DT = £61.77
          - Rufinamide 400 mg Inovelon 400mg tablets | 60 tablet [PSM] £102.96 DT = £102.96

---

**Sodium valproate**

- **INDICATIONS AND DOSE**
  - **All forms of epilepsy**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 1–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 3 days; maximum 2.5 g daily
      - Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day
      - Adult: Initially 600 mg daily in 1–2 divided doses, then increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day
  - **INITIATION of valproate treatment**
    - Initially by intravenous injection
      - Adult: Initially 10 mg/kg, (usually 400–800 mg), followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 1–2 g daily, alternatively (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 20–30 mg/kg daily, intravenous injection to be administered over 3–5 minutes
  - **Continuation of valproate treatment**
    - **BY INTRAVENOUS INJECTION**
      - Adult: If switching from oral therapy to intravenous therapy give the same dose as current oral daily dose, give over 3–5 minutes by intravenous injection or in 2–4 divided doses by intravenous infusion
  - **Migraine prophylaxis**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Adult: Initially 200 mg twice daily, then increased if necessary to 1.2–1.5 g daily in divided doses

  - Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

**SIDE-EFFECTS**

- Not licensed for migraine prophylaxis.

**CONTRA-INDICATIONS**

- Acute porphyrias p. 1058 - known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths)
- Personal or family history of severe hepatic dysfunction
- Systemic lupus erythematosus CAUTIONS, FURTHER INFORMATION

- Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.
- Liver toxicity - Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy.
- Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

**INTERACTIONS** → Appendix 1: antiepileptics

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common: Abdominal pain - agitation - alopecia (regrowth may be curly) - anemia - behaviour abnormal - concentration impaired - confusion - deafness - diarrhoea - drowsiness - haemorrhage - hallucination -
headache • hepatic disorders • hypersensitivity • hyponatraemia • memory loss • menstrual cycle irregularities • movement disorders • nail disorder • nausea • nystagmus • oral disorders • seizures • stupor • thrombocytopenia • tremor • urinary disorders • vomiting • weight increased

Uncommon Androgenetic alopecia • angioedema • bone disorders • bone fracture • bone marrow disorders • coma • encephalopathy • hair changes • hypothyroidism • leucopenia • pancreatitis • paraesthesia • Parkinsonism • peripheral oedema • pleural effusion • renal failure • SIADH • skin reactions • vasculitis • virilism

Rare or very rare Agranulocytosis • cerebral atrophy • cognitive disorder • dementia • diplopia • gynaecomastia • hyperammonaemia • hypothyroidism • infertility male • learning disability • myelodysplastic syndrome • nephritis • tubulointerstitial • polycystic ovaries • red blood cell abnormalities • rhabdomyolysis • severe cutaneous adverse reactions (SCARs) • systemic lupus erythematosus (SLE) • urine abnormalities

Frequency not known Alertness increased

Specific side-effects

Common or very common

With intravenous use Dizziness

Side-effects, further information

Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

Conception and contraception The MHRA advises that all women and girls of childbearing potential being treated with valproate medicines must be supported on a Pregnancy Prevention Programme—pregnancy should be excluded before treatment initiation and highly effective contraception must be used during treatment.

Pregnancy For migraine prophylaxis [unlicensed] and bipolar disorder, the MHRA advises that valproate must not be used. For epilepsy, the MHRA advises valproate must not be used unless there is no suitable alternative treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinemia) reported. Neonatal hepatotoxicity also reported. See also Pregnancy in Epilepsy p. 305.

Monitoring Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

Breast feeding Present in milk—risk of haematological disorders in breast-fed newborns and infants.

Hepatic impairment Manufacturer advises avoid.

Renal impairment Dose adjustments Reduce dose.

Monitoring requirements Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.

Monitor liver function before therapy and during first 6 months especially in patients most at risk.

Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.
**Epilepsy and other seizure disorders**

Medicines for Children leaflet: Sodium valproate and pregnancy - information for parents and carers www.medicinesforchildren.org.uk/sodium-valproate-and-pregnancy-information-parents-and-carers

**EPILIM® CAPSULES** Patients and carers should be counselled on the administration of capsules.

**EPISENTA®** Patients and carers should be counselled on the administration of capsules.

**EPISENTA® GRANULES** Patients and carers should be counselled on the administration of granules.

*● MEDICINAL FORMS* There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral solution sugar free, gastro-resistant tablets, gastro-resistant tablets resistant.

### Modified-release tablet

**CAUTIONARY AND ADVISORY LABELS 8, 10, 21, 25**

- **Epilim Chrono®**
  - Sodium valproate 200 mg Epilim Chrono 200 tablets | 30 tablet [PoS] £3.50 | 100 tablet [PoS] £11.65 DT = £11.65
  - Sodium valproate 300 mg Epilim Chrono 300 tablets | 30 tablet [PoS] £5.24 | 100 tablet [PoS] £17.47 DT = £17.47
  - Sodium valproate 500 mg Epilim Chrono 500 tablets | 30 tablet [PoS] £8.73 | 100 tablet [PoS] £28.10 DT = £28.10
  - Epival CR (Chanelle Medical UK Ltd)
  - Sodium valproate 300 mg Epival CR 300mg tablets | 100 tablet [PoS] £17.47 DT = £17.47
  - Sodium valproate 500 mg Epival CR 500mg tablets | 100 tablet [PoS] £25.10 DT = £25.10

### Gastro-resistant tablet

**CAUTIONARY AND ADVISORY LABELS 5, 8, 10, 25**

- **Sodium valproate (non-proprietary)**
  - Sodium valproate 200 mg Sodium valproate 200mg gastro-resistant tablets | 100 tablet [PoS] £2.40 DT = £2.40
  - Sodium valproate 500 mg Sodium valproate 500mg gastro-resistant tablets | 100 tablet [PoS] £4.76 DT = £4.76
  - Epilim®
    - Sodium valproate 200 mg Epilim 200 gastro-resistant tablets | 30 tablet [PoS] £2.31 | 100 tablet [PoS] £7.70 DT = £7.70
    - Sodium valproate 500 mg Epilim 500 gastro-resistant tablets | 30 tablet [PoS] £5.78 | 100 tablet [PoS] £15.25 DT = £15.25

### Tablet

**CAUTIONARY AND ADVISORY LABELS 8, 10, 21**

- **Epilim®**
  - Sodium valproate 100 mg Epilim 100mg tablets | 30 tablet [PoS] £1.68 | 100 tablet [PoS] £5.60 DT = £5.60

### Solution for injection

**CAUTIONARY AND ADVISORY LABELS 8, 10, 21**

- **Sodium valproate (non-proprietary)**
  - Sodium valproate 100 per 1 ml Sodium valproate 400mg/4ml solution for injection ampoules | 5 ampoule [PoS] £73.90 DT = £73.90
  - Episenta (Desitin Pharma Ltd)
  - Sodium valproate 100 per 1 ml Episenta 300mg/3ml solution for injection ampoules | 5 ampoule [PoS] £35.00 DT = £35.00

### Modified-release capsule

**CAUTIONARY AND ADVISORY LABELS 8, 10, 21**

- **Episenta®** (Desitin Pharma Ltd)
  - Sodium valproate 150 mg Episenta 150mg modified-release capsules | 100 capsule [PoS] £7.00 DT = £7.00
  - Sodium valproate 300 mg Episenta 300mg modified-release capsules | 100 capsule [PoS] £13.00 DT = £13.00

### Oral solution

**CAUTIONARY AND ADVISORY LABELS 8, 10, 21**

- **Sodium valproate (non-proprietary)**
  - Sodium valproate 40 per 1 ml Sodium valproate 200mg/5ml oral solution sugar free | 300 ml [PoS] £3.97 DT = £3.97
  - Epilim®
    - Sodium valproate 40 per 1 ml Epilim 200mg/5ml oral solution sugar-free | 300 ml [PoS] £3.80 DT = £3.80
    - Epilim 200mg/5ml syrup | 300 ml [PoS] £3.93 DT = £3.93

### Modified-release granules

**CAUTIONARY AND ADVISORY LABELS 8, 10, 21**

- **Epilim Chronosphere®**
  - Sodium valproate 50 mg Epilim Chronosphere MR 50mg granules | 30 sachet [PoS] £30.00 DT = £30.00

Sodium valproate 100 mg Epilim Chronosphere MR 100mg granules sachets sugar-free | 30 sachet [PoS] £30.00 DT = £30.00

Sodium valproate 250 mg Epilim Chronosphere MR 250mg granules sachets sugar-free | 30 sachet [PoS] £30.00 DT = £30.00

Sodium valproate 500 mg Epilim Chronosphere MR 500mg granules sachets sugar-free | 30 sachet [PoS] £30.00 DT = £30.00

Sodium valproate 1 gram Epilim Chronosphere MR 1000mg granules sachets sugar-free | 30 sachet [PoS] £30.00 DT = £30.00

- **Episenta®** (Desitin Pharma Ltd)
  - Sodium valproate 500 mg Episenta 500mg modified-release granules sachets sugar-free | 100 sachet [PoS] £21.00 DT = £21.00

Sodium valproate 1 gram Episenta 1000mg modified-release granules sachets sugar-free | 100 sachet [PoS] £41.00 DT = £41.00

**Stiripentol**

**INDICATIONS AND DOSE**

Adjunctive therapy of refractory generalised tonic-clonic seizures in patients with severe myoclonic epilepsy in infancy (Dravet syndrome) in combination with clobazam and valproate (under expert supervision)

- **BY MOUTH**
  - Adult: Doses of up to 50 mg/kg daily in 2–3 divided doses should be continued for as long as efficacy is observed.

**DOSE EQUIVALENCE AND CONVERSION**

Stiripentol capsules and oral powder sachets are not bioequivalent. If a switch of formulation is required, manufacturer advises this is done under clinical supervision in case of intolerance.

**CONTRA-INDICATIONS** History of psychosis in the form of episodes of delirium.

**INTERACTIONS** → Appendix 1: antiepileptics

**SIDE-EFFECTS**

- Common or very common: Agitation, appetite decreased, behaviour abnormal, drowsiness, irritability, movement disorders, muscle tone decreased, nausea, neutropenia, sleep disorders, vomiting, weight decreased.

- Uncommon: Diplopia, fatigue, photosensitivity reaction, skin reactions.

- Rare or very rare: Thrombocytopenia.

**ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome theoretically associated with stiripentol. See under Epilepsy p. 305 for more information.

**PREGNANCY** See also Pregnancy in Epilepsy p. 305. Monitoring: The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid (no information available).

**RENAL IMPAIRMENT** Avoid—no information available.

**MONITORING REQUIREMENTS** Perform full blood count and liver function tests prior to initiating treatment and every 6 months thereafter.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (September 2017) that stiripentol (Diacomit®) is accepted for use within NHS Scotland in conjunction with clobazam and valproate as adjunctive therapy of refractory generalised tonic-clonic seizures in patients with severe myoclonic epilepsy in infancy whose seizures are not adequately controlled with clobazam and valproate.
**Epilepsy and other seizure disorders**

**Monitoring** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (risk of increased exposure); avoid in severe impairment.

- **Dose adjustments** Manufacturer advises dose reduction and/or longer dose interval with careful titration in mild to moderate impairment.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Tiagabine for preventing seizures
  - Driving and skilled tasks May impair performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Powder**
  - CAUTIONARY AND ADVISORY LABELS: 1, 8, 13, 21
  - EXCIPIENTS: May contain Aspartame
  - **Diacomit** (Alan Pharmaceuticals)
  - Stripentol 250 mg: Diacomit 250mg oral powder sachets | 60 sachet [POM] £284.00 DT = £284.00
  - Stripentol 500 mg: Diacomit 500mg oral powder sachets | 60 sachet [POM] £493.00 DT = £481.00

- **Capsule**
  - CAUTIONARY AND ADVISORY LABELS: 1, 8, 21
  - **Diacomit** (Alan Pharmaceuticals)
  - Stripentol 250 mg: Diacomit 250mg capsules | 60 capsule [POM] £284.00 DT = £284.00
  - Stripentol 500 mg: Diacomit 500mg capsules | 60 capsule [POM] £493.00 DT = £481.00

**Topiramate**

**INDICATIONS AND DOSE**

Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

- **BY MOUTH**
  - Child 6-17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used; maximum 500 mg per day.
  - Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 100–200 mg daily in 2 divided doses, adjusted according to response, doses of 1 g daily have been used in refractory epilepsy; maximum 500 mg per day.

**Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation**

- **BY MOUTH**
  - Child 2–17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 400 mg per day.
  - Adult: Initially 25–50 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 200–400 mg daily in 2 divided doses; maximum 400 mg per day.

**Adverse effects**

- **Common or very common** Abdominal pain - behaviour abnormal - concentration impaired - depression - diarrhoea - dizziness - emotional lability - fatigue - gait abnormal - insomnia - nausea - nervousness - speech disorder - tremor - vision disorders - vomiting
- **Uncommon** Drowsiness - psychosis - skin reactions
- **Rare or very rare** Delusions - hallucination
- **PREGNANCY** See also Pregnancy in Epilepsy p. 305.

**Medicines for Children leaflet: Tiagabine for preventing seizures**

- Driving and skilled tasks May impair performance of skilled tasks (e.g. driving).

332 Epilepsy and other seizure disorders

Migraine prophylaxis

BY MOUTH

Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every week; usual dose 50–100 mg daily in 2 divided doses; maximum 200 mg per day.

CAUTIONS Avoid in Acute porphyrias p. 1058. risk of metabolic acidosis - risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment).

INTERACTIONS → Appendix 1: antiepileptics.

SIDE-EFFECTS

Common or very common Alopecia, anaemia, anxiety, appetite abnormal, asthenia, behaviour abnormal, cognitive impairment, confusion, constipation, cough, depression, diarrhoea, dizziness, drowsiness, dry mouth, dypsnoea, ear discomfort, eye disorders, feeling abnormal, fever (in children), gait abnormal, gastrointestinal discomfort, gastrointestinal disorders, haemorrhage, hypersensitivity, joint disorders, malaise, memory loss, mood altered, movement disorders, muscle complaints, muscle weakness, nasal complaints, nasopharyngitis, nausea, oral disorders, pain, seizures, sensation abnormal, skin reactions, sleep disorders, speech impairment, taste altered, tinnitus, tremor, urinary disorders, vertigo (in children), vision disorders, vomiting (in children), weight changes.

Uncommon Abnormal sensation in eye, anhidrosis, arrhythmias, aura, cerebellar syndrome, consciousness impaired, crying, drooling, dry eye, dysgraphia, dysphonia, eosinophilia (in children), facial swelling, hallucinations, hearing impairment, hyperthermia (in children), hypokalaemia, hypertension, influenza like illness, learning disability (in children), leucopenia, lymphadenopathy, metabolic acidosis, musculoskeletal stiffness, palpitations, pancreatitis, paranasal sinus hypersecretion, peripheral coldness, peripheral neuropathy, polydipsia, psychotic disorder, renal pain, sexual dysfunction, smell altered, suicidal tendencies, syncope, thinking abnormal, thirst, thrombocytopenia, vasodilation.

Rare or very rare Eye inflammation, face oedema, glaucoma, hepatic disorders, limb discomfort, neutropenia, Raynaud’s phenomenon, renal tubular acidosis, severe cutaneous adverse reactions (SCARs), unresponsive to stimulants.

SIDE-EFFECTS, FURTHER INFORMATION Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intra-ocular pressure occurs: seek specialist ophthalmological advice; use appropriate measures to reduce intra-ocular pressure and stop topiramate as rapidly as feasible.

CONCEPTION AND CONTRACEPTION Manufacturer advises perform pregnancy test before the initiation of treatment—a highly effective contraceptive method is advised in women of child-bearing potential; patients should be fully informed of the risks related to the use of topiramate during pregnancy.

PREGNANCY Increased risk of major congenital malformations following exposure during the first trimester. For migraine prophylaxis manufacturer advises avoid. For epilepsy manufacturer advises consider alternative treatment options. See also Pregnancy in Epilepsy p. 305.

Monitoring Manufacturer advises in case of administration during first trimester, careful prenatal monitoring should be performed.

It is recommended that the fetal growth should be monitored.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING Manufacturer advises avoid—present in milk.

HEPATIC IMPAIRMENT Use with caution in moderate to severe impairment—clearance may be reduced.

Renal Impairment Use with caution.

Dose adjustments In adults Half usual starting and maintenance dose if eGFR less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration.

In children Half usual starting and maintenance dose if estimated glomerular filtration less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration.

DIRECTIONS FOR ADMINISTRATION TOPAMAX® CAPSULES Swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing.

PRESCRIBING AND DISPENSING INFORMATION Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic topiramate product.

TOPAMAX® CAPSULES Patients or carers should be given advice on how to administer Topamax® Sprinkle capsules.

M EDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Oral suspension

Topiramate (Non-proprietary)

Topiramate 10 mg per 1 ml Topiramate 50mg/5ml oral suspension sugar free sugar-free | 150 ml P MS £12.99 + VAT £14.98

### Vigabatrin

**INDICATIONS AND DOSE**
Adjuvantive treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)

- **BY MOUTH**
  - Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)
  - Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)
  - Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily
  - Adult: Initially 1 g once daily, alternatively initially 1 g daily in 2 divided doses, then increased in steps of 500 mg every week, adjusted according to response; usual dose 2–3 g daily; maximum 3 g per day

- **BY RECTUM**
  - Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)
  - Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)
  - Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

**SIDE-EFFECTS**

- **Elderly** Myoclonus, tonic and atonic seizures.
- **Visual** Deterioration after discontinuation cannot be excluded. Defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

**INTERACTIONS** → Appendix 1: antiepileptics

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Encephalopathic symptoms** Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely - reduce dose or withdraw.
- **Visual field defects** About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required.
- **PREGNANCY** See also Pregnancy in Epilepsy p. 305. Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.

**RENAI IMPAIRMENT**
Dose adjustments → In adults Consider reduced dose or increased dose interval if eGFR less than 60 mL/minute/1.73 m².
- In children Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Closely monitor neurological function.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.
- With rectal use Dissolve contents of sachet in small amount of water and administer rectally [unlicensed use]

**PATIENT AND CARER ADVICE** Patients and their carers should be warned to report any new visual symptoms that develop.

Medicines for Children leaflit: Vigabatrin for preventing seizures www.medicinesforchildren.org.uk/vigabatrin-preventing-seizures

**UNLICENSED USE** Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF publications may differ from those in product literature.

**CONTRA-INDICATIONS** Visual field defects

**CAUTIONS**

- Elderly history of behavioural problems • history of depression • history of psychosis
- General FURTHER INFORMATION Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.
- Visual field defects Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

Zonisamide

20-Feb-2009

INDICATIONS AND DOSE

Monotherapy for treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy

BY MOUTH

Adult: Initially 100 mg once daily for 2 weeks, then increased in steps of 100 mg every 2 weeks, usual maintenance dose 300 mg once daily; maximum 500 mg per day

Adjunctive treatment for refractory focal seizures with or without secondary generalisation

BY MOUTH

Child 6-17 years (body-weight 20-54 kg): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 6-8 mg/kg once daily (max. per dose 500 mg once daily), dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

Child 6-17 years (body-weight 55 kg and above): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300-500 mg once daily, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

Adult: Initially 50 mg daily in 2 divided doses for 7 days, then increased to 100 mg daily in 2 divided doses, then increased in steps of 100 mg every 7 days, usual maintenance 300-500 mg daily in 1-2 divided doses, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

Patient and carer advice

Appendix 1: antiepileptics

Side-effects

Common or very common
- Alopecia
- Anxiety
- Appetite decreased
- Ataxia
- Bradynephrenia
- Concentration impaired
- Confusion
- Constipation
- Depression
- Diarrhoea
- Dizziness
- Drowsiness
- Fatigue
- Fever
- Gastrointestinal discomfort
- Hypersensitivity
- Influenza like illness
- Insomnia
- Memory loss
- Mood altered
- Nausea
- Nystagmus
- Parasthesia
- Peripheral oedema
- Psychosis
- Rash (consider discontinuation)
- Skin reactions
- Speech disorder
- Tremor
- Urticaria
- Vision disorders
- Vomiting
- Weight decreased

Uncommon
- Behaviour abnormal
- Gallbladder disorders
- Hallucination
- Hypokalaemia
- Increased risk of infection
- Leucopenia
- Respiratory disorders
- Seizures
- Suicidal tendencies
- Thrombocytopenia

Rare or very rare
- Agranulocytosis
- Angle closure glaucoma
- Anhidrosis
- Bone marrow disorders
- Coma
- Dyspnorea
- Eye pain
- Heat stroke
- Hepatocellular injury
- Hydronephrosis
- Leucocytosis
- Lymphadenopathy

Metabolic acidosis
- Myasthenic syndrome
- Neuroleptic malignant syndrome
- Pancreatitis
- Renal failure
- Renal tubular acidosis
- Rhabdomyolysis
- Severe cutaneous adverse reactions (SCARs)
- Urine abnormal

Frequency not known
- Sudden unexplained death in epilepsy
- Allergy and cross-sensitivity
- Contra-indicated in sulphonamide hypersensitivity.

Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 305 for more information.

Conception and contraception
- Manufacturer advises women of childbearing potential should use effective contraception during treatment and for one month after last dose—avoid in women of childbearing potential not using effective contraception unless clearly necessary and the potential benefit outweighs risk; patients should be fully informed of the risks related to the use of zonisamide during pregnancy.

Pregnancy
- Manufacturer advises use only if clearly necessary and the potential benefit outweighs risk—toxicity in animal studies; patients should be fully informed of the risks related to the use of zonisamide during pregnancy. See also Pregnancy in Epilepsy p. 305.

Monitoring
- The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

Breast feeding
- Manufacturer advises avoid for 4 weeks after last dose.

Hepatic impairment
- Avoid in severe impairment.

Dose adjustments
- Initially increase dose at 2-week intervals if mild or moderate impairment.

Renal impairment
- Dose adjustments
- Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.

Treatment cessation
- Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).

Prescribing and dispensing information
- Switching between formulations
- Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients and carer advice
- Children and their carers should be made aware of how to prevent and recognise overheating and dehydration.

Medicines for Children leaflet: Zonisamide for preventing seizures

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 949/14

The Scottish Medicines Consortium has advised (March 2014) that zonisamide (Zonegran®) is accepted for restricted use within NHS Scotland as an adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.
Epilepsy and other seizure disorders

SPECIFIC SIDE-EFFECTS
- With oral use: Anxiety, hallucination, hypotension, megaloblastic anaemia, severe cutaneous adverse reactions (SCARs), thrombocytopenia
- With parental use: Agitation, anaemia, aplastic anaemia, Dupuytren’s contracture, hypocalcaemia, irritability, toxic epidermal necrolysis

Overdose: For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1359.

ALLERGY AND CROSS-SENSITIVITY: Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 305 for more information.

PREGNANCY
Monitoring: The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING: Avoid if possible; drowsiness may occur.

HEPATIC IMPAIRMENT: Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

RENAL IMPAIRMENT: Use with caution.

MONITORING REQUIREMENTS
- Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre); however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs.

TREATMENT CESSATION: Avoid abrupt withdrawal (dependence with prolonged use).

DIRECTIONS FOR ADMINISTRATION
- With oral use: For administration by mouth, tablets may be crushed.
- With intravenous use in adults: Solution for injection must be diluted before intravenous administration.
- With intravenous use in children: For intravenous injection, dilute to a concentration of 20 mg/ml with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute).

PRESCRIBING AND DISPENSING INFORMATION
Some hospitals supply alcohol-free formulations of varying phenobarbital strengths.

The RCPCH and NPPG recommend that, when a liquid special of phenobarbital is required, the following strength is used: 50 mg/5 ml.

Switching between formulations: Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer’s product.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Phenobarbital for preventing seizures www.medicinesforchildren.org.uk/phenobarbital-preventing-seizures

MEDI CINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Tablet
CAUTIONARY AND ADVISORY LABELS 2, 8
- Phenobarbital (Non-proprietary)
  - Phenobarbital 15 mg Phenobarbital 15 mg tablets | 28 tablet (P) £24.95 DT + £16.71 (D)
  - Phenobarbital 30 mg Phenobarbital 30 mg tablets | 28 tablet (P) £5.99 DT + £0.69 (D)
  - Phenobarbital 60 mg Phenobarbital 60 mg tablets | 28 tablet (P) £7.99 DT + £6.67 (D)

Solution for injection
EXCIPIENTS: May contain Propylene glycol.
- Phenobarbital (Non-proprietary)
  - Phenobarbital sodium 30 mg per 1 ml Phenobarbital 30 mg/1 ml solution for injection ampoules | 10 ampoule (P) £98.42 DT + £98.42 (D)

Antiepileptics

BARBITURATES

Phenobarbital (Phenobarbitone)

INDICATIONS AND DOSE
All forms of epilepsy except typical absence seizures
- By mouth
  - Child 1 month–11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2 mg/kg as daily as required; maintenance 2.5–4 mg/kg 1–2 times a day
  - Child 12–17 years: 60–180 mg once daily
  - Adult: 60–180 mg once daily, dose to be taken at night

Status epilepticus
- By intravenous injection
  - Adult: 10 mg/kg (max. per dose 1 g), dose to be administered at a rate not more than 100 mg/minute, injection to be diluted 1 in 10 with water for injections
  - By slow intravenous injection

Neonate: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day.

Child 1 month–11 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day

Child 12–17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 300 mg twice daily

DOSE EQUIVALENCE AND CONVERSION
- For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

CAUTIONS
- Avoid in Acute porphyrias p. 1058.
- Children: debilitated elderly: history of alcohol abuse: history of drug abuse: respiratory depression (avoid if severe)

CAUTIONS: FURTHER INFORMATION
Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

INTERATIONS
- Appendix 1: antiepileptics

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
Phenobarbital sodium 60 mg per 1 ml

INDICATIONS AND DOSE

All forms of epilepsy except typical absence seizures

▶ BY MOUTH

▶ Adult:

• Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 125–250 mg twice daily

• Child 2–4 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily

• Child 5–8 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per dose 750 mg twice daily), adjusted according to response

• Child 9–17 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per dose 750 mg twice daily)

Essential tremor

▶ BY MOUTH

• Adult: Initially 50 mg daily, then adjusted according to response to up to 750 mg daily, dose to be increased over 2–3 weeks

CAUTIONS

Avoid in Acute porphyrias p. 1058 • children • debilitated • elderly • history of alcohol abuse • history of drug abuse • respiratory depression (avoid if severe)

CAUTIONS, FURTHER INFORMATION

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

SIDE-EFFECTS

▶ Indications and dose

ADJUNCT IN EPILEPSY

▶ Child 6–17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day

▶ Adult: 20–30 mg daily, then increased if necessary up to 60 mg daily

ANXIETY (SHORT-TERM USE)

▶ By mouth

▶ Adult: 20–30 mg daily in divided doses, alternatively 20–30 mg once daily, dose to be taken at bedtime; increased if necessary up to 60 mg daily in divided doses, dose only increased in severe anxiety (in hospital patients), for debilitated patients, use elderly dose

▶ Elderly: 10–20 mg daily

UNLICENSED USE

▶ In children

Not licensed as monotherapy.

CONTRA-INDICATIONS

Chronic psychosis (in adults) • hyperekinesia • not for use alone to treat anxiety associated with depression (in adults) • obsessive states • phobic states • respiratory depression

CAUTIONS

Muscle weakness • organic brain changes
### Clonazepam

**INDICATIONS AND DOSE**

**All forms of epilepsy**

- **BY MOUTH**
  - Child 1–11 months: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 0.5–1 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary.
  - Child 1–4 years: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 1–3 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary.
  - Child 5–11 years: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 3–6 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary.
  - Child 12–17 years: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, dose usually taken at night; may be given in 3–4 divided doses if necessary.

**All forms of epilepsy / Myoclonus**

- **BY MOUTH**
  - Adult: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary.
  - Elderly: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary.

**Panic disorders (with or without agoraphobia) resistant to antidepressant therapy**

- **BY MOUTH**
  - Adult: 1–2 mg daily

**UNLICENSED USE** Clonazepam doses in BNF may differ from those in product literature. Use for panic disorders (with or without agoraphobia) resistant to antidepressant therapy is an unlicensed indication.

### Important Safety Information

**Safe Practice**

Clonazepam has been confused with clobazam; care must be taken to ensure the correct drug is prescribed and dispensed.

</tr>
</tbody>
</table>

**NHS restrictions**

Clobazam is not prescribable in NHS primary care except for the treatment of epilepsy; endorse prescription ‘SLS’.

**NATIONAL FUNDING / ACCESS DECISIONS**

**Renal impairment**

Dose adjustments Start with small doses in severe impairment.

**MONITORING REQUIREMENTS**

- In children Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic clobazam product.

2.1 Status epilepticus

Other drugs used for Status epilepticus: Diazepam, p. 343 - Fosphenytoin sodium, p. 314 - Phenoobarbital, p. 335 - Phenytoin, p. 323

ANTIEPILEPTICS > BARBITURATES

Thiopental sodium
(Thiopentone sodium)

- INDICATIONS AND DOSE
  Status epilepticus (only if other measures fail)
  ▶ BY SLOW INTRAVENOUS INJECTION
    Adult: 75–125 mg for 1 dose, to be administered as a 2.5% (25 mg/mL) solution

  Induction of anaesthesia
  ▶ BY SLOW INTRAVENOUS INJECTION
    Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

  Anaesthesia of short duration
  ▶ BY SLOW INTRAVENOUS INJECTION
    Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

  Reduction of raised intracranial pressure if ventilation controlled
  ▶ BY SLOW INTRAVENOUS INJECTION
    Adult: 1.5–3 mg/kg, repeated if necessary

- IMPORTANT SAFETY INFORMATION
  Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CONTRA-INDICATIONS
  Acute porphyrias p. 1058 - myotonic dystrophy

- CAUTIONS
  Acute circulatory failure (shock) - avoid intravenous injection - cardiovascular disease - elderly - fixed cardiac output - hypovolaemia - reconstituted solution is highly alkaline (extravasation causes tissue necrosis and severe pain)

- INTERACTIONS
  → Appendix 1: thiopental

- SIDE-EFFECTS
  Common or very common
  Arrhythmia - myocardial contractility decreased

- Frequency not known
  Appetite decreased - circulatory collapse - cough - electrolyte imbalance - extravasation necrosis - hypotension - respiratory disorders - skin erosion - sneezing

- PREGNANCY
  May depress neonatal respiration when used during delivery.

- BREAST FEEDING
  Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- HEPATIC IMPAIRMENT
  Manufacturer advises caution.

- Dose adjustments
  Manufacturer advises dose reduction.

- RENAL IMPAIRMENT
  Caution in severe impairment.

- PATIENT AND CARER ADVICE
  Driving and skilled tasks
  Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general
HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

Lorazepam

INDICATIONS AND DOSE

Short-term use in anxiety
> BY MOUTH
  - Adult: 1–4 mg daily in divided doses, for debilitated patients, use elderly dose
  - Elderly: 0.5–2 mg daily in divided doses

Short-term use in insomnia associated with anxiety
> BY MOUTH
  - Adult: 1–2 mg daily, to be taken at bedtime

Acute panic attacks
> BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
  - Adult: 25–30 micrograms/kg every 6 hours if required; usual dose 1.5–2.5 mg every 6 hours if required, intravenous injection to be administered into a large vein, only use intramuscular route when oral and intravenous routes not possible

Conscious sedation for procedures
> BY MOUTH
  - Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation
  - BY SLOW INTRAVENOUS INJECTION
  - Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation
  - BY INTRAMUSCULAR INJECTION
  - Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

PREMEDICATION
> BY MOUTH
  - Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation
  - BY SLOW INTRAVENOUS INJECTION
  - Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation
  - BY INTRAMUSCULAR INJECTION
  - Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

Status epilepticus | Febrile convulsions | Convulsions caused by poisoning
> BY SLOW INTRAVENOUS INJECTION
  - Child 1 month-11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes if required for 1 dose, to be administered into a large vein
  - Child 12-17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein
  - Adult: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein

UNLICENSED USE

IMPORTANT SAFETY INFORMATION

ANAESTHESIA
Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

CONTRA-INDICATIONS
Avoid injections containing benzyl alcohol in neonates – chronic psychosis (in adults) – CNS depression – compromised airway – hyperkinesia – not for use alone to treat depression (or anxiety associated with depression) in adults – obsessional states – phobic states – respiratory depression

CAUTIONS
Muscle weakness – organic brain changes – parenteral administration

CAUTIONS, FURTHER INFORMATION
Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

Special precautions for parenteral administration When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.

INTERACTIONS
> Appendix 1: lorazepam

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Uncommon Allergic dermatitis – constipation – sexual dysfunction

Rare or very rare Agranulocytosis – hyponatraemia – pancytopenia – SIADH – thrombocytopenia

SPECIFIC SIDE-EFFECTS

Rare or very rare
> With oral use Saliva altered
> Frequency not known
> With parenteral use Leucopenia

BREAST FEEDING
Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

RENAI IMPAIRMENT
Dose adjustments Start with small doses in severe impairment.

DIRECTIONS FOR ADMINISTRATION
With intravenous use in children For intravenous injection, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.

With intramuscular use in adults For intramuscular injection, solution for injection should be diluted with an equal volume of water for injections or sodium chloride 0.9% (but only use when oral and intravenous routes not possible).

With intravenous use in adults For slow intravenous injection, solution for injection should preferably be diluted with an equal volume of water for injections or sodium chloride 0.9%.

PATIENT AND CARER ADVICE
Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking
340  Epilepsy and other seizure disorders

Nervous system

Premedication

after administration. Responsible persons should be

 Conscious sedation for procedures

BY SLOW INTRAVENOUS INJECTION

Adult: Initially 2–2.5 mg, to be administered
5–10 minutes before procedure at a rate of
approximately 2 mg/minute, increased in steps of 1 mg
if required, usual total dose is 3.5–5 mg; maximum
7.5 mg per course

Elderly: Initially 0.5–1 mg, to be administered
5–10 minutes before procedure at a rate of
approximately 2 mg/minute, increased in steps of
0.5–1 mg if required; maximum 3.5 mg per course

Sedative in combined anaesthesia

Adult: 30–100 micrograms/kg, repeated if necessary,
alternatively (by continuous intravenous infusion)
30–100 micrograms/kg/hour

Elderly: Lower doses needed

Premedication

BY DEEP INTRAMUSCULAR INJECTION

Adult: 70–100 micrograms/kg, to be administered
20–60 minutes before induction, for debilitated
patients, use elderly dose

Benzodiazepines should only be administered for
anaesthesia by, or under the direct supervision of,
personnel experienced in their use, with adequate
training in anaesthesia and airway management.

PREScribing of Midazolam in Palliative CARE

The use of high-strength midazolam (5 mg/mL in 2 mL
and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules)
should be considered in palliative care and other
situations where a higher strength may be more
appropriate to administer the prescribed dose, and
where the risk of overdosage has been assessed. It is
advised that flumazenil is available when midazolam is
used, to reverse the effects if necessary.

CONTRA-indICATIONS  CNS depression • compromised
airway • severe respiratory depression

CAUTIONS  Cardiac disease • children (particularly if
cardiovascular impairment) • concentration of midazolam
in children under 15 kg not to exceed 1 mg/mL • debilitated
patients (reduce dose) in children • hypothermia •
hypovolaemia (risk of severe hypotension) · neonates · risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation) · vasoconstriction

**CAUTIONS, FURTHER INFORMATION**
- Recovery when used for sedation. Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.
- **INTERACTIONS** → Appendix 1: midazolam
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common: Level of consciousness decreased · vomiting
    - Uncommon: Skin reactions
    - **Frequency not known**: Appetite increased · disinhitation (severe; with sedative and peri-operative use) (in children) · fall · saliva altered
  - **SPECIFIC SIDE-EFFECTS**
    - With buccal use: Thrombosis
    - With parenteral use: Angioedema · drug abuse · drug withdrawal seizure · embolism and thrombosis
  - **SIDE-EFFECTS, FURTHER INFORMATION**: Higher doses are associated with prolonged sedation and risk of hypoventilation. The co-administration of midazolam with other sedative, hypnotic, or CNS-depressant drugs results in increased sedation. Midazolam accumulates in adipose tissue, which can significantly prolong sedation, especially in patients with obesity, hepatic impairment or renal impairment.

- **Overdose**: There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5mg/mL in 2mL and 10mL ampoules, or 2mg/mL in 5mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

- **BREAST FEEDING**: Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).

- **HEPATIC IMPAIRMENT** For parenteral preparations: manufacturer advises caution in all degrees of impairment. **Dose adjustments**: For parenteral preparations: manufacturer advises consider dose reduction in all degrees of impairment.

- **RENAL IMPAIRMENT**: Use with caution in chronic renal failure.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in adults: For intravenous infusion (Hypnovel®), give continuously in Glucose 5% or Sodium chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Palliative care: For further information on the use of midazolam in palliative care, see www.medicinescomplete.com/#/content/palliative/benzodiazepines-and-z-drugs.
  - **PATIENT AND CARER ADVICE**: Patients or carers should be given advice on how and when to administer midazolam oromucosal solution.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration.

Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

Medicines for Children leaflet: Midazolam for stopping seizures www.medicinesforchildren.org.uk/midazolam-stopping-seizures

- **EPISATUS OROMUCOSAL SOLUTION**

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (November 2017) that midazolam oromucosal solution (Epistatus®) is accepted for use within NHS Scotland for the treatment of prolonged, acute, convulsive seizures in patients aged 10 years to less than 18 years.

- **MEDICINAL FORMS**: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oromucosal solution, solution for injection, solution for infusion

**Solution for injection**

- **Midazolam (Non-proprietary)**
  - Midazolam (as Midazolam hydrochloride) 1 mg per 1 mL Midazolam 5mg/5mL solution for injection ampoules | 10 ampoule (Pom) £16.89 DT = £9.63 (C01)
  - Midazolam 2mg/2mL solution for injection ampoules | 10 ampoule (Pom) £4.50–6.00 DT = £5.00 (C03)
  - **Midazolam (as Midazolam hydrochloride) 2 mg per 1 mL Midazolam 10mg/5mL solution for injection ampoules | 10 ampoule (Pom) £6.75 DT = £6.86 (Hospital only) (C03)
  - 10 ampoule (Pom) £7.60 DT = £6.86 (C03)
  - **Midazolam (as Midazolam hydrochloride) 5 mg per 1 mL Midazolam 50mg/10mL solution for injection ampoules | 10 ampoule (Pom) £33.77 DT = £27.93 (C03)
  - Midazolam 10mg/2mL solution for injection ampoules | 10 ampoule (Pom) £16.55 DT = £16.13 (C03)
  - **Hypnovel (Roche Products Ltd)**
  - Midazolam (as Midazolam hydrochloride) 5 mg per 1 mL Hypnovel 10mg/2mL solution for injection ampoules | 10 ampoule (Pom) £7.11 DT = £6.13 (C03)

**Solution for infusion**

- **Midazolam (Non-proprietary)**
  - Midazolam (as Midazolam hydrochloride) 1 mg per 1 mL Midazolam 50mg/50mL solution for infusion vials | 1 vial (Pom) £3.56–11.00 (C01)
  - **Midazolam (as Midazolam hydrochloride) 2 mg per 1 mL Midazolam 100mg/50mL solution for infusion vials | 1 vial (Pom) £9.05–11.50 (C03)

**Oromucosal solution**

- **CAUTIONARY AND ADVISORY LABELS 2**
  - **EXCIPIENTS**: May contain Ethanol
  - **Buccolam** (Shire Pharmaceuticals Ltd)
  - **Midazolam (as Midazolam hydrochloride) 5 mg per 1 mL Buccolam 10mg/2mL oromucosal solution pre-filled oral syringes sugar-free | 4 unit dose (Pom) £101.50 DT = £91.50 (C03)
  - Buccolam 7.5mg/1.5mL oromucosal solution pre-filled oral syringes sugar-free | 4 unit dose (Pom) £83.00 DT = £80.00 (C03)
  - Buccolam 5mg/1mL oromucosal solution pre-filled oral syringes sugar-free | 4 unit dose (Pom) £65.50 DT = £65.50 (C03)
  - Buccolam 2.5mg/0.5mL oromucosal solution pre-filled oral syringes sugar-free | 4 unit dose (Pom) £50.00 DT = £50.00 (C03)
  - **Epistatus (Veriton Pharma Ltd)**
  - **Midazolam (as Midazolam maleate) 10 mg per 1 mL Epistatus 10mg/1mL oromucosal solution pre-filled oral syringes sugar-free | 1 unit dose (Pom) £45.76 DT = £45.76 (C03)

3 Mental health disorders

3.1 Anxiety

Other drugs used for Anxiety

## Antidepressants > Serotonin Receptor Agonists

### Buspirone hydrochloride

**Indications and Dose**

- **Anxiety (short-term use)**
  - **By mouth**
  - **Adults:** 5 mg 2–3 times a day, increased if necessary up to 45 mg daily, dose to be increased at intervals of 2–3 days; usual dose 15–30 mg daily in divided doses

**Dose Adjustments Due to Interactions**
- Manufacturer advises reduce dose to 2.5 mg twice daily with concurrent use of potent inhibitors of CYP3A4.

### Contra-Indications

- Epilepsy

### Cautions

- Does not alleviate symptoms of benzodiazepine withdrawal

### Contraindications

- A patient taking a benzodiazepine still needs to have the benzodiazepine solution different from other medicines containing the same drug. Forms available

### Mediations and Forms

- Tablet
  - Buspirone hydrochloride (non-proprietary)
  - Buspirone hydrochloride 5 mg
    - 30 tablet(s) (£11.30 DT) x £3.70
  - Buspirone hydrochloride 10 mg
    - 30 tablet(s) (£15.62 DT) x £3.66

## Hypnotics, Sedatives and Anxiolytics > Benzodiazepines

### Benzodiazepines

#### Contra-Indications

- Acute pulmonary insufficiency
- Marked neuromuscular respiratory weakness
- Sleep apnoea syndrome
- Unstable myasthenia gravis

#### Cautions

- Avoid prolonged use (and abrupt withdrawal thereafter), debilitated patients (reduce dose) (in adults).

### Indications and Dose

- **Short-term use in anxiety**
  - **By mouth**
  - **Adults:** 250–500 micrograms 3 times a day, increased if necessary up to 3 mg daily, for debilitated patients, use elderly dose

---

*www.getintopharma.com*
Chlordiazepoxide hydrochloride

29-Mar-2019

- **INDICATIONS AND DOSE**
  - **Short-term use in anxiety**
    - **BY MOUTH**
      - Adult: 10 mg 3 times a day, increased if necessary to 60–100 mg daily in divided doses, for debilitated patients, use elderly dose
      - Elderly: 5 mg 3 times a day, increased if necessary to 30–50 mg daily in divided doses
  - **Treatment of alcohol withdrawal in moderate dependence**
    - **BY MOUTH**
      - Adult: 10–30 mg 4 times a day, dose to be gradually reduced over 5–7 days, consult local protocols for titration regimens
  - **Treatment of alcohol withdrawal in severe dependence**
    - **BY MOUTH**
      - Adult: 10–50 mg 4 times a day and 10–40 mg as required for the first 2 days, dose to be gradually reduced over 7–10 days, consult local protocols for titration regimens; maximum 250 mg per day

- **CONTRA-INDICATIONS** Chronic psychosis, hyperkinesia, not for use alone to treat depression (or anxiety associated with depression) - obsessional states - phobic states - respiratory depression
- **CAUTIONS** Muscle weakness, organic brain changes
- **INTERACTIONS** → Appendix 1: alprazolam
- **SIDE-EFFECTS**
  - **Common or very common** Appetite decreased, concentration impaired, constipation, dermatitis, dry mouth, memory loss, movement disorders, sexual dysfunction, weight changes
  - **Uncommon** Menstruation irregular
  - **Frequency not known** Angioedema, autonomic dysfunction, hepatic disorders, hyperprolactinaemia, peripheral oedema, photosensitivity reaction, suicide, thinking abnormal

Diazepam

28-Jun-2018

- **INDICATIONS AND DOSE**
  - **Muscle spasm of varied aetiology**
    - **BY MOUTH**
      - Adult: 2–15 mg daily in divided doses, then increased if necessary to 60 mg daily, adjusted according to response, dose only increased in spastic conditions
      - **Acute muscle spasm**
        - **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRavenous INJECTION**
          - Adult: 10 mg, then 10 mg after 4 hours if required, intravenous injection to be administered into a large vein at a rate of no more than 5 mg/minute
      - **Tetanus**
        - **BY INTRavenous INJECTION**
          - Child: 100–300 micrograms/kg every 1–4 hours
          - Adult: 100–300 micrograms/kg every 1–4 hours
          - **BY INTRavenous INFUSION, OR BY NASODuodenAL TUBE**
            - Child: 3–10 mg/kg, adjusted according to response, to be given over 24 hours
            - Adult: 3–10 mg/kg, adjusted according to response, to be given over 24 hours
      - **Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm**
        - **BY MOUTH**
          - Child 1–11 months: Initially 250 micrograms/kg twice daily
          - Child 1–4 years: Initially 2.5 mg twice daily
          - Child 5–11 years: Initially 5 mg twice daily
          - Child 12–17 years: Initially 10 mg twice daily; maximum 40 mg per day; continued →
Anxiety
▶ BY MOUTH
- Adult: 2 mg 3 times a day, then increased if necessary to 15–30 mg daily in divided doses, for debilitated patients, use elderly dose
- Elderly: 1 mg 3 times a day, then increased if necessary to 7.5–15 mg daily in divided doses

Insomnia associated with anxiety
▶ BY MOUTH
- Adult: 5–15 mg daily, to be taken at bedtime

Severe acute anxiety | Control of acute panic attacks |
Acute alcohol withdrawal
▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION
- Adult: 10 mg, then 10 mg after at least 4 hours if required, intravenous injection to be administered into a large vein, at a rate of not more than 5 mg/minute

Acute drug-induced dystonic reactions
▶ BY INTRAVENOUS INJECTION
- Adult: 5–10 mg, then 5–10 mg after at least 10 minutes as required, to be administered into a large vein, at a rate of not more than 5 mg/minute

Acute anxiety and agitation
▶ BY MOUTH
- Adult: 500 micrograms/kg, then 500 micrograms/kg after 12 hours as required
- Elderly: 250 micrograms/kg, then 250 micrograms/kg after 12 hours as required

Premedication
▶ BY MOUTH
- Adult: 5–10 mg, to be given 1–2 hours before procedure, for debilitated patients, use elderly dose
- Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

Sedation in dental procedures carried out in hospital
▶ BY MOUTH
- Adult: Up to 20 mg, to be given 1–2 hours before procedure

Conscious sedation for procedures, and in conjunction with local anaesthesia
▶ BY MOUTH
- Adult: 5–10 mg, to be given 1–2 hours before procedure, for debilitated patients, use elderly dose
- Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

Sedative cover for minor surgical and medical procedures
▶ BY INTRAVENOUS INJECTION
- Adult: 10–20 mg, to be administered into a large vein over 2–4 minutes, immediately before procedure

Status epilepticus | Febrile convulsions | Convulsions due to poisoning
▶ BY INTRAVENOUS INJECTION
- Neonate: 300–400 micrograms/kg, then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes.
- Child 1 month-1 year: 300–400 micrograms/kg (max. per dose 10 mg), then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes
- Child 12-17 years: 10 mg, then 10 mg after 10 minutes if required, to be given over 3–5 minutes
- Adult: 10 mg, then 10 mg after 10 minutes if required, administered at a rate of 1 mL (5 mg) per minute
PROFESSIONAL AND PUBLIC INFORMATION

Dental practitioners’ formulation
Diazepam Tablets may be prescribed.
Diazepam Oral Solution 2 mg/5 mL may be prescribed.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

Tablet

Mental health disorders

346

CAUTIONS, FURTHER INFORMATION

- Paradoxical effects: A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.
- INTERACTIONS: Appendix 1: oxazepam
- SIDE-EFFECTS: Fever, leucopenia, memory loss, oedema, salivary altered speech, slurred, syncope, urticaria
- BREAST FEEDING: Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- RENAL IMPAIRMENT: Dose adjustments: Start with small doses in severe impairment.
- MEDICINAL FORMS: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2
- Oxazepam (Non-proprietary)
  - Oxazepam 10 mg: Oxazepam 10mg tablets | 28 tablet (Pkt) £13.73
  - Oxazepam 15 mg: Oxazepam 15mg tablets | 28 tablet (Pkt) £13.44
  - DT = £7.38 (04–1)

HYPNOTICS, SEDATIVES AND ANXIOLYTIKS

NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

Meprobamate

INDICATIONS AND DOSE

Short-term use in anxiety—not recommended
- BY MOUTH
- Adult: 400 mg 3–4 times a day
- Elderly: Up to 200 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: MEPROBAMATE: LICENCE TO BE CANCELLED (APRIL 2016)

Following an EU-wide review of meprobamate, the UK licence holder has ceased manufacturing and the licence is due to be cancelled by December 2016. No new stock will be released into the normal distribution chain after 31 December 2016, although existing stock placed on the market before that date is likely to be dispensed until the products approach their expiry date.

Prescribers should review the treatment of any patient who is currently receiving a meprobamate-containing medicine with a view to switching them to an alternative treatment, and not start any new patients on medicines that contain meprobamate.

CONTRA-INDICATIONS: Acute porphyrias p. 1058 • acute pulmonary insufficiency • respiratory depression

CAUTIONS: Abrupt withdrawal (may precipitate convulsions) • avoid prolonged use • debilitated • elderly • emotionally unstable personality (if taken over long periods) • increased risk of dependence • epilepsy (may induce seizures) • history of alcohol dependence • history of drug dependence • muscle weakness • respiratory disease

INTERACTIONS: Appendix 1: meprobamate

SIDE-EFFECTS: Agitation • agranulocytosis • anal inflammation • ataxia • blood disorder • bone marrow disorders • dizziness • drowsiness • hypersensitivity • hypotension • nausea • paraesthesia • purpura non-thrombocytopenic • skin reactions • Stevens-Johnson syndrome • stomatitis • thrombocytopenia • vomiting • withdrawal syndrome

PREGNANCY: Avoid if possible.

BREAST FEEDING: Avoid. Concentration in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in infant.

HEPATIC IMPAIRMENT: Elimination may be prolonged in chronic impairment.

RENAI IMPAIRMENT: Increased cerebral sensitivity. Dose adjustments: Start with small doses in severe impairment.

PATIENT AND CARER ADVICE: Driving and skilled tasks: Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

LESS SUITABLE FOR PRESCRIBING: Meprobamate is less suitable for prescribing.

Meprobamate (Non-proprietary)

Tablet

CAUTIONARY AND ADVISORY LABELS 2
- Meprobamate (Non-proprietary)
  - Meprobamate 400 mg: Meprobamate 400mg tablets | 84 tablet (Pkt) £197.63 DT = £319.63 (04–1)

3.2 Attention deficit hyperactivity disorder

Attention deficit hyperactivity disorder

04-Aug-2018

Description of condition

Attention deficit hyperactivity disorder (ADHD) is a behavioural disorder characterised by hyperactivity, impulsivity and inattention, which can lead to functional impairment such as psychological, social, educational or occupational difficulties. While these symptoms tend to co-exist, some patients are predominantly hyperactive and impulsive, while others are principally inattentive. Symptoms typically appear in children aged 3–7 years, but may not be recognised until after 7 years of age, especially if hyperactivity is not present. ADHD is more commonly diagnosed in males than in females. ADHD is usually a persisting disorder and some children continue to have symptoms throughout adolescence and into adulthood, where inattentive symptoms tend to persist, and hyperactive-impulsive symptoms tend to recede over time. ADHD is also associated with an increased risk of disorders such as oppositional defiant disorder (ODD), conduct disorder, and possibly mood disorders such as depression, mania, and anxiety, as well as substance misuse.

Aims of treatment

The aims of treatment are to reduce functional impairment, severity of symptoms, and to improve quality of life.

Non-drug treatment

Patients should be advised about the importance of a balanced diet, good nutrition and regular exercise.

Environmental modifications are changes made to the physical environment that can help reduce the impact of ADHD symptoms on a person’s day-to-day life. The modifications should be specific to the person’s circumstances, and may involve changes to seating arrangements, lighting and noise, reducing distractions,
optimising work or education by having shorter periods of focus with movement breaks, and reinforcing verbal requests with written instructions. These changes should form part of the discussion at the time of diagnosis of ADHD and be trialled and reviewed for effectiveness before drug treatment is started.

ADHD focused psychological interventions which may involve elements of, or a complete course of cognitive behavioural therapy (CBT) may be effective in patients who have refused drug treatment, have difficulty with adherence, are intolerant of, or unresponsive to drug treatment. In patients who have benefited from drug treatment, but whose symptoms are still causing significant impairment in at least one area of function (such as interpersonal relationships, education and occupational attainment, and risk awareness), consider a combination of non-drug treatment with drug treatment.

### Drug treatment

**Drug treatment** should be initiated by a specialist trained in the diagnosis and management of ADHD. Following dose stabilisation, continuation and monitoring of drug treatment can be undertaken by the patient’s general practitioner under a shared care arrangement. Treatment should be started in patients with ADHD whose symptoms are still causing significant impairment in at least one area of function, despite environmental modifications. Patients with ADHD and anxiety disorder, tic disorder, or autism spectrum disorder should be offered the same treatment options as other patients with ADHD.

Lisdexamfetamine mesilate p. 351 or methylphenidate hydrochloride p. 348 are recommended as first-line treatment. If symptoms have not improved following a 6-week trial of either drug, switching to the alternative first-line treatment should be considered. Dexamfetamine sulphate p. 350 (unlicensed) can be tried if the patient is having a beneficial response to lisdexamfetamine mesilate but cannot tolerate its longer duration of effect.

Modified-release preparations of stimulants are preferred because of their pharmacokinetic profile, convenience, improved adherence, reduced risk of drug diversion (drugs being forwarded to others for non-prescription use or misuse), and the lack of need to be taken to work. Immediate-release preparations can be given when more flexible dosing regimens are required, or during initial dose titration. A combination of modified-release and immediate-release preparations taken at different times of the day can be used to extend the duration of effect. The magnitude, duration of effect, and side-effects of stimulants vary between patients.

In patients who are intolerant to both methylphenidate hydrochloride p. 348 and lisdexamfetamine mesilate, or who have not responded to separate 6-week trials of both drugs, treatment with the non-stimulant atomoxetine below can be considered.

Advice from, or referral to a tertiary specialist ADHD service should be considered if the patient is unresponsive to one or more stimulant drugs (e.g. methylphenidate hydrochloride p. 348 and lisdexamfetamine mesilate) and atomoxetine below. A specialist service should also be consulted for advice before starting treatment with guanfacine p. 352 (unlicensed), or an atypical antipsychotic in addition to stimulants in patients with ADHD and co-existing pervasive aggression, rages or irritability. If sustained orthostatic hypotension or fainting episodes occur with guanfacine p. 352 treatment, the dose should be reduced or an alternative treatment offered.

Other treatment options such as buproprion hydrochloride p. 498, modafinil p. 492, tricyclic antidepressants, and venlafaxine p. 368 (all unlicensed) have been used in the management of ADHD, but due to limited evidence their use is not recommended without specialist advice.
### Methylenidate hydrochloride

#### INDICATIONS AND DOSE

**Attention deficit hyperactivity disorder (initiated under specialist supervision)**

* By mouth using immediate-release medicines

  **Child 6–17 years:** Initially 5 mg 1–2 times a day, increased in steps of 5–10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2–3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2–3 divided doses, the licensed maximum dose is 60 mg daily in 2–3 doses, higher dose (up to a maximum of 90 mg daily) under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation

  **Adult:** Initially 5 mg 2–3 times a day, dose is increased if necessary at weekly intervals according to response, increased if necessary up to 100 mg daily in 2–3 divided doses, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation

**Narcolepsy**

* By mouth using immediate-release medicines

  **Adult:** 10–60 mg daily in divided doses; usual dose 20–30 mg daily in divided doses, dose to be taken before meals

#### DOSE EQUIVALENCE AND CONVERSION

- When switching from immediate-release preparations to modified-release preparations—consult product literature.

**CONCERTA® XL**

**Attention deficit hyperactivity disorder**

* By mouth

  **Child 6–17 years:** Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response; increased if

  - Sudden cardiac death

#### PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risks.

#### BREAST FEEDING

Avoid present in milk in animal studies.

#### HEPATIC IMPAIRMENT

- **Dose adjustments**
  - Manufacturer advises halve dose in moderate impairment and quarter dose in severe impairment.

- **Monitoring requirements**
  - Monitor for appearance or worsening of anxiety, depression or tics.
  - Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

#### PATIENT AND CARER ADVICE

- **Suicidal ideation**
  - Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression.

- **Hepatic impairment**
  - Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or jaundice.

Medicines for Children leaflet: Atomoxetine for attention deficit hyperactivity disorder (ADHD) [www.medicinesforchildren.org.uk/atomoxetine-attention-deficit-hyperactivity-disorder-adhd](http://www.medicinesforchildren.org.uk/atomoxetine-attention-deficit-hyperactivity-disorder-adhd)

#### NATIONAL FUNDING/ACCESS DECISIONS

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1107/15

The Scottish Medicines Consortium has advised (December 2015) that atomoxetine oral solution (Strattera®) is accepted for restricted use within NHS Scotland for the treatment of attention deficit hyperactivity disorder (ADHD) in children of 6 years and older, in adolescents and in adults. It is restricted to patients who are unable to swallow capsules.
Attention deficit hyperactivity disorder

**DOSE EQUIVALENCE AND CONVERSION**
- Total daily dose of 15 mg of standard-release formulation is considered equivalent to Concerta® XL 18 mg once daily.
- Total daily dose of 15 mg of standard-release formulation is considered equivalent to Delmosart® 18 mg once daily.
- Total daily dose of 15 mg of standard-release formulation is considered equivalent to Xaggitin® XL 18 mg once daily.
- Total daily dose of 15 mg of standard-release formulation is considered equivalent to Equisym® XL 18 mg once daily.

**EQUIVALENTS**
- Concerta® XL
- Delmosart® Prolonged-Release Tablet
- Xaggitin® XL
- Equisym®

**PRESCRIBING AND DISPENSING INFORMATION**
- Concerta® XL Contains of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose).
- Equisym®

**SIDE-EFFECTS**
- Uncommon: Chest discomfort - constipation - dysphonia - fatigue - haematuria - hallucinations - muscle complaints - psychotic disorder - suicidal tendencies - tic - tremor - vision disorders
- Rare or very rare: Anaemia - angina pectoris - cardiac arrest - cerebrovascular insufficiency - confusion - gynaecomastia - hepatic coma - hyperfocus - hyperhidrosis - leucopenia - mydriasis - myocardial infarction - neuroleptic malignant syndrome - peripheral coldness - Raynaud’s phenomenon - seizures - sexual dysfunction - skin reactions - sudden cardiac death - thinking abnormal - thrombocytopenia
- Frequency not known: Delusions - drug dependence - hyperpyrexia - intracranial haemorrhage - logorrhea - pancytopenia - vasculitis
- Pregnancy: Limited experience—avoid unless potential benefit outweighs risk
- Breast feeding: Limited information available—avoid.

**DIRECTIONS FOR ADMINISTRATION**
- Medikinet® XL
- Medikinet®
- Equisym®

**TREATMENT CESSATION**
- Avoid abrupt withdrawal.

**MONITORING REQUIREMENTS**
- Monitor for psychiatric disorders.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**UNLICENSED USE**
- Doses over 60 mg daily not licensed; doses of Concerta® XL over 54 mg daily not licensed.
- Not licensed for use in narcolepsy. Not licensed for use in adults for attention deficit hyperactivity disorder.

**CONTRA-INDICATIONS**
- Anorexia nervosa - arrhythmias - cardiomyopathy - cardiovascular disease - cerebrovascular disorders - heart failure - hyperthyroidism - phaeochromocytoma - psychosis - severe depression - severe hypertension - structural cardiac abnormalities - suicidal ideation - uncontrolled bipolar disorder - vasculitis

**CAUTIONS**
- Agitation - alcohol dependence - anxiety - drug dependence - epilepsy (discontinue if increased seizure frequency) - family history of Tourette syndrome - susceptibility to angle-closure glaucoma - tics

**CONCERTA® XL, DELMOSART® PROLONGED-RELEASE TABLET**
- Dysphagia (dose form not appropriate) restricted gastro-intestinal lumen (dose form not appropriate)
- Xaggitin® XL Dysphagia (dose form not appropriate)

**INTERACTIONS**
- Appendix 1: methylphenidate

**Nervous System**

**DOSE EQUIVALENCE AND CONVERSION**
- Total daily dose of 15 mg of standard-release formulation is considered equivalent to Xaggitin® XL 18 mg once daily.

**Attention deficit hyperactivity disorder (under expert supervision)**
- **BY MOUTH**
  - Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day
  - Adult: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; maximum 100 mg per day

**Attention deficit hyperactivity disorder (under expert supervision)**
- **BY MOUTH**
  - Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day
  - Adult: Initially 10 mg once daily, dose to be taken in the morning before breakfast; adjusted at weekly intervals according to response; maximum 100 mg per day

**Attention deficit hyperactivity disorder**
- **BY MOUTH**
  - Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day
  - Adult: Initially 10 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response, discontinue if no response after 1 month; maximum 54 mg per day

**Attention deficit hyperactivity disorder**
- **BY MOUTH**
  - Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response, discontinue if no response after 1 month; maximum 54 mg per day
  - Adult: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response, discontinue if no response after 1 month; maximum 54 mg per day

**Attention deficit hyperactivity disorder**
- **BY MOUTH**
  - Child 6-17 years: Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day
  - Adult: Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day

**Attention deficit hyperactivity disorder**
- **BY MOUTH**
  - Child 6-17 years: Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 108 mg per day
MEDICATIONS

**MEDICINAL FORMS**

- **MEDICATIONS**
  - Methylphenidate hydrochloride (Non-proprietary)
  - Methylphenidate hydrochloride 5 mg Tablets
  - Methylphenidate hydrochloride 10 mg Tablets
  - Methylphenidate hydrochloride 15 mg Tablets
  - Methylphenidate hydrochloride 20 mg Tablets
  - Methylphenidate hydrochloride 30 mg Tablets
  - Methylphenidate hydrochloride 40 mg Tablets
  - Methylphenidate hydrochloride 50 mg Tablets
  - Methylphenidate hydrochloride 60 mg Tablets
  - Methylphenidate hydrochloride 60 mg modified-release Tablets
  - Methylphenidate hydrochloride 75 mg Tablets
  - Methylphenidate hydrochloride 80 mg Tablets

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Methylphenidate for attention deficit hyperactivity disorder (ADHD) www.medicinesforchildren.org.uk/methylphenidate-attention-deficit-hyperactivity-disorder-adhd

Driving and skilled tasks - Drugs and Driving

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see Drugs and driving under Guidance on prescribing p. 1.

CONCERTA® XL	Consists of an immediate-release component (70% of the dose).

DELMOSART® PROLONGED-RELEASE TABLET	Manufacturer advises tablet membrane may pass through gastrointestinal tract unchanged.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Modified-release tablet**

**Dexamfetamine sulfate**

(Dexamphetamine sulfate)

**INDICATIONS AND DOSE**

Narcolepsy

- Adult: Initially 10 mg daily in divided doses, increased in steps of 10 mg every week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day
  - Elderly: Initially 5 mg daily in divided doses, increased in steps of 5 mg every week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)

- By mouth
  - Adult: Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg once weekly if required; usual maximum 1 mg/kg daily, up to 20 mg daily (40 mg daily has been required in some children); maintenance dose to be given in 2–4 divided doses
  - Adult: Initially 5 mg twice daily, dose is increased at weekly intervals according to response, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day

**UNLICENSED USE**

Not licensed for use in adults for refractory attention deficit hyperactivity disorder.

**CONTRA-INDICATIONS**

Advanced arteriosclerosis (in adults) - agitation states - cardiovascular disease - history of alcohol abuse - history of drug abuse - hyperexcitability - hypertyroidism - moderate hypertension - severe hypertension - structural cardiac abnormalities

**CAUTIONS**

Anorexia - bipolar disorder - history of epilepsy - discontinue if seizures occur - mild hypertension - psychosis - susceptibility to angle-closure glaucoma - tics - Tourette syndrome

**Lisdexamfetamine mesilate**

- **Drug Action** Lisdexamfetamine is a prodrug of dexamfetamine.

- **indications and Dose** Attention deficit hyperactivity disorder (initiated by a specialist)
  - **by Mouth**
    - Child 6–17 years: Initially 30 mg once daily, alternatively initially 20 mg once daily, increased in steps of 10–20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day
    - Adult: Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

- **Contra-indications** Advanced arteriosclerosis - agitated states - hyperthyroidism - moderate hypertension - severe hypertension - symptomatic cardiovascular disease

- **Caution** Bipolar disorder - history of cardiovascular disease - history of substance abuse - may lower seizure threshold (discontinue if seizures occur) - psychotic disorders - susceptibility to angle-closure glaucoma - tics - Tourette syndrome

- **Caution, Further Information** Cardiovascular disease Manufacturer advises caution in patients with underlying conditions that might be compromised by increases in blood pressure or heart rate; see also Contra-indications.

- **Interactions** Appendix 1: amphetamines

- **Side-effects**
  - **Common or very common** Abdominal pain - anxiety - appetite decreased - behavioural abnormal - constipation - diarrhoea - dizziness - dry mouth - dysphoria - fatigue - feeling jittery - headache - hyperdysidrosis (uncommon in children) - insomnia - mood altered - movement disorders (uncommon in children) - nausea - palpitations - sexual dysfunction (uncommon in children) - tachycardia - tremor - weight decreased
  - **Uncommon** Depression (very common in children) - drowsiness (very common in children) - fever (very
common in children) - logorrhoea - psychiatric disorders (very common in children) - skin reactions (very common in children) - taste altered - vision blurred - vomiting (very common in children)

- **Frequency not known** Angioedema - cardiomyopathy (uncommon in children) - drug dependence - hallucination (uncommon in children) - hepatitis - myasthenia (uncommon in children) - psychotic disorder - Raynaud's phenomenon (uncommon in children) - seizure - Stevens-Johnson syndrome

**Overdose** Amfetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency Treatment of poisoning p. 1359.

- **PREGNANCY** Manufacturer advises monitor for aggressive behaviour or hostility during initial treatment.

**Dose adjustments**

Manufacturer advises avoid amfetamines, see Drugs and driving legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see Drugs and driving under Guidance on prescribing p. 1

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.

- **RENAI IMPAIRMENT**

**Dose adjustments** Manufacturer advises max. dose 50 mg daily in severe impairment.

**Monitoring requirements**

- Manufacturer advises monitor for aggressive behaviour or hostility during initial treatment.
- Manufacturer advises monitor pulse, blood pressure, and for psychiatric symptoms before treatment initiation, following each dose adjustment, and at least every 6 months thereafter. Monitor weight in adults before treatment initiation and during treatment; in children, height and weight should be recorded before treatment initiation, and height, weight and appetite monitored at least every 6 months during treatment.

- **TREATMENT CESSION** Avoid abrupt withdrawal.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises swallow whole or mix contents of capsule with soft food such as yoghurt or in a glass of water or orange juice; contents should be dispersed completely and consumed immediately.

- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of capsules.

- **Driving and skilled tasks** Drugs and Driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

- **For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amfetamines, see Drugs and driving under Guidance on prescribing p. 1.**

- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (May 2013) that lisdexamfetamine dimesylate (Elvanse®) is accepted for use within NHS Scotland as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in children aged 6 years and over when response to previous methylphenidate treatment is considered clinically inadequate.

- **In adults** The Scottish Medicines Consortium has advised (September 2015) that lisdexamfetamine dimesylate (Elvanse Adult®) is accepted for use within NHS Scotland as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in adults. Based on clinical judgment, patients should have ADHD of at least moderate severity.

---

**All Wales Medicines Strategy Group (AWMSG) decisions**

The All Wales Medicines Strategy Group has advised (December 2013) that lisdexamfetamine dimesylate (Elvanse®) is recommended as an option for use within NHS Wales as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in children aged six years and over when response to previous methylphenidate treatment is considered clinically inadequate. Treatment must be under the supervision of a specialist in childhood and/or adolescent behavioural disorders.

- **In adults** The All Wales Medicines Strategy Group has advised (October 2015) that lisdexamfetamine dimesylate (Elvanse Adult®) is recommended as an option for use within NHS Wales as part of a comprehensive treatment programme for attention deficit hyperactivity disorder (ADHD) in adults.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**SYMPATHOMIMETICS > ALPHA1-ADRENOCEPTOR AGONISTS**

Guanfacine

- **INDICATIONS AND DOSE** Attention deficit hyperactivity disorder in children for whom stimulants are not suitable, not tolerated or ineffective (initiated under specialist supervision)

  - **BY MOUTH**

    - Child 6-12 years (body-weight 25 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature

    - Child 13-17 years (body-weight 34–41.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature

    - Child 13-17 years (body-weight 41.5–49.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 5 mg), for optimal weight-adjusted dose titrations, consult product literature

    - Child 13-17 years (body-weight 49.5–58.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 6 mg), for
optimal weight-adjusted dose titrations, consult product literature

» Child 13–17 years (body-weight 58.5 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 7 mg), for optimal weight-adjusted dose titrations, consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

» Manufacturer advises reduce dose by half with concurrent use of moderate and potent inhibitors of CYP3A4.

» Manufacturer advises increase dose up to max. 7 mg daily with concurrent use of potent inducers of CYP3A4—no specific recommendation made for children.

● CAUTIONS
  » Bradycardia (risk of torsade de pointes) - heart block (risk of torsade de pointes) - history of cardiovascular disease - history of QT-interval prolongation - hypokalaemia (risk of torsade de pointes)

● INTERACTIONS → Appendix 1: guanfacine

● SIDE-EFFECTS
  » Common or very common
    » Anxiety, appetite decreased, arrhythmias, asthenia, constipation, depression, diarrhoea, dizziness, drowsiness, dry mouth, gastrointestinal discomfort, headache, hypotension, mood altered, nausea, skin reactions, sleep disorders, urinary disorders, vomiting, weight increased
  » Uncommon
    » Asthma, atrioventricular block, chest pain, hallucination, loss of consciousness, pallor, seizure, syncope
  » Rare or very rare
    » Hypertension, hypertensive encephalopathy, malaise
  » Frequency not known
    » Erectile dysfunction

SIDE-EFFECTS, FURTHER INFORMATION

Somnolence and sedation may occur, predominantly during the first 2–3 weeks of treatment and with dose increases; manufacturer advises to consider dose reduction or discontinuation of treatment if symptoms are clinically significant or persistent.

Overdose

Features may include hypotension, initial hypertension, bradycardia, lethargy, and respiratory depression. Manufacturer advises that patients who develop lethargy should be observed for development of more serious toxicity for up to 24 hours.

» CONCEPTION AND CONCEPTION

Manufacturer recommends effective contraception in females of childbearing potential.

» PREGNANCY

Manufacturer advises avoid—toxicity in animal studies.

» BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

» HEPATIC IMPAIRMENT

Manufacturer advises caution (pharmacokinetics have not been assessed in paediatric patients with hepatic impairment).

» RENAL IMPAIRMENT

Manufacturer advises consider dose reduction.

» MONITORING REQUIREMENTS

Manufacturer advises to conduct a baseline evaluation to identify patients at risk of somnolence, sedation, hypotension, bradycardia, QT-prolongation, and arrhythmia; this should include assessment of cardiovascular status. Monitor for signs of these adverse effects weekly during dose titration and then every 3 months during the first year of treatment, and every 6 months thereafter. Monitor BMI prior to treatment and then every 3 months for the first year of treatment, and every 6 months thereafter. More frequent monitoring is advised following dose adjustments.

» Monitor blood pressure and pulse during dose downward titration and following discontinuation of treatment.

» TREATMENT CESSATION

Manufacturer advises avoid abrupt withdrawal; consider dose tapering to minimise potential withdrawal effects.

» DIRECTIONS FOR ADMINISTRATION

Manufacturer advises avoid administration with high fat meals (may increase absorption).

» PATIENT AND CARER ADVICE

Patients or carers should be counselled on administration of guanfacine modified-release tablets.

Missed doses

Manufacturer advises that patients and carers should inform their prescriber if more than one dose is missed; consider dose re-titration.

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness and syncope.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 2, 25

Intuniv (Shire Pharmaceuticals Ltd)

Guanfacine (as Guanfacine hydrochloride) 1 mg Intuniv 1mg modified-release tablets | 28 tablet £56.00 DT = £56.00
Guanfacine (as Guanfacine hydrochloride) 2 mg Intuniv 2mg modified-release tablets | 28 tablet £55.52 DT = £55.52
Guanfacine (as Guanfacine hydrochloride) 3 mg Intuniv 3mg modified-release tablets | 28 tablet £55.52 DT = £55.52
Guanfacine (as Guanfacine hydrochloride) 4 mg Intuniv 4mg modified-release tablets | 28 tablet £76.16 DT = £76.16

3.3 Bipolar disorder and mania

Mania and hypomania

Overview

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse.

An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

Benzodiazepines

Use of benzodiazepines (such as lorazepam p. 339) may be helpful in the initial stages of treatment for behavioral disturbance or agitation; they should not be used for long periods because of the risk of dependence.

Antipsychotic drugs

Antipsychotic drugs (normally olanzapine p. 398, quetiapine p. 401, or risperidone p. 402) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania. See Important safety information, Conception and contraception, and Pregnancy in the valproic acid p. 354 and sodium valproate p. 327 monographs.

Olanzapine can be used for the long-term management of bipolar disorder in patients whose manic episode responded to olanzapine therapy. It can be given either as monotherapy, or in combination with lithium or valproate if...
the patient has frequent relapses or continuing functional impairment.

Asenapine p. 356, a second-generation antipsychotic, is licensed for the treatment of moderate to severe manic episodes associated with bipolar disorder.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the patient is continuing with other antimanic drugs; if the patient is not continuing with other antimanic drugs or if there is a history of manic relapse, a withdrawal period of up to 3 months should be considered.

**Carbamazepine**

Carbamazepine p. 311 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine should not normally be increased if an acute episode of mania occurs.

**Valproate**

Valproate (valproic acid (as the semisodium salt) and sodium valproate) is used for the treatment of manic episodes associated with bipolar disorder. It must be started and supervised by a specialist experienced in managing bipolar disorder. Valproate (valproic acid and sodium valproate) is also used for the prophylaxis of bipolar disorder. Because of its high teratogenic risk, valproate must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated. Valproic acid and sodium valproate must not be used during pregnancy in bipolar disorder. The benefit and risk of valproate therapy should be carefully reconsidered at regular treatment reviews. For further information, see Important safety information, Conception and contraception, and Pregnancy in the valproic acid and sodium valproate monographs.

In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or olanzapine, or adding lithium or olanzapine to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine, or risperidone.

**Lithium**

Lithium salts are used in the prophylaxis and treatment of mania, hypomania and depression in bipolar disorder (manic-depressive disorder), and in the prophylaxis and treatment of recurrent unipolar depression. Lithium is also used as concomitant therapy with antidepressant medication in patients who have had an incomplete response to treatment for acute bipolar depression and to augment other antidepressants in patients with treatment-resistant depression [unlicensed indication]. It is also licensed for the treatment of aggressive or self-harming behaviour.

The decision to give prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual patient, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. Olanzapine or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

## Other drugs used for Bipolar disorder and mania

### ANTIEPILEPTICS

#### Valproic acid

**INDICATIONS AND DOSE**

**Treatment of manic episodes associated with bipolar disorder**

- **BY MOUTH**
  - Adult: Initially 750 mg daily in 2–3 divided doses, then increased to 1–2 g daily, adjusted according to response, doses greater than 45 mg/kg daily require careful monitoring.

#### Migraine prophylaxis

- **BY MOUTH**
  - Adult: Initially 250 mg twice daily, then increased if necessary to 1 g daily in divided doses

#### DOSE EQUIVALENCE AND CONVERSION

- Semisodium valproate comprises equimolar amounts of sodium valproate and valproic acid.

#### Epilepsy

- **BY MOUTH**
  - Adult: Initially 600 mg daily in 2–4 divided doses, increased in steps of 150–300 mg every 3 days; usual maintenance 1–2 g daily in 2–4 divided doses, max. 2.5 g daily in 2–4 divided doses

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: VALPROATE MEDICATIONS: CONTRA-INDICATED IN WOMEN AND GIRLS OF CHILDBEARING POTENTIAL UNLESS CONDITIONS OF PREGNANCY PREVENTION PROGRAMME ARE MET (APRIL 2018)**

Valproate is highly teratogenic and evidence supports that use in pregnancy leads to neurodevelopmental disorders (approx. 30–40% risk) and congenital malformations (approx. 10% risk). Valproate must not be used in women and girls of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met (see Conception and contraception) and only if other treatments are ineffective or not tolerated, as judged by an experienced specialist.

Use of valproate in pregnancy is contra-indicated for migraine prophylaxis [unlicensed] and bipolar disorder; it must only be considered for epilepsy if there is no suitable alternative treatment (see Pregnancy). Women and girls (and their carers) must be fully informed of the risks and the need to avoid exposure to valproate medicines in pregnancy; supporting materials have been provided to use in the implementation of the Pregnancy Prevention Programme (see Prescribing and dispensing information). The MHRA advises that:

- GPs must recall all women and girls who may be of childbearing potential, provide the Patient Guide, check they have been reviewed by a specialist in the last year and are on highly effective contraception;

- Specialists must book in review appointments at least annually with women and girls under the Pregnancy Prevention Programme, re-evaluate treatment as required, and provide the Pregnancy Prevention Programme Patient Guide.
Liver toxicity

CAUTIONS

- Pharmacists must ensure valproate medicines are dispensed in whole packs whenever possible—all packs dispensed to women and girls of childbearing potential should have a warning label either on the carton or via a sticker. They must also discuss risks in pregnancy with female patients each time valproate medicines are dispensed, ensure they have the Patient Guide and have seen their GP or specialist to discuss their treatment and the need for contraception.

MHRA/CHM ADVICE: VALPROATE MEDICINES: ARE YOU ACTING IN COMPLIANCE WITH THE PREGNANCY PREVENTION MEASURES? (DECEMBER 2018)

The MHRA advises that all healthcare professionals must continue to identify and review all female patients on valproate, including when used outside licensed indications (off-label use) and provide them with the patient information materials every time they attend appointments or receive their medicines.

Guidance for psychiatrists on the withdrawal of, and alternatives to, valproate in women of child-bearing potential who have a psychiatric illness is available from the Royal College of Psychiatrists.

MHRA/CHM ADVICE: VALPROATE MEDICINES AND SERIOUS HARM IN PREGNANCY: NEW ANNUAL RISK ACKNOWLEDGEMENT FORM AND CLINICAL GUIDANCE FROM PROFESSIONAL BODIES TO SUPPORT COMPLIANCE WITH THE PREGNANCY PREVENTION PROGRAMME (APRIL 2019)

The Annual Risk Acknowledgement Form has been updated and should be used for all future reviews of female patients on valproate. Specialists should comply with guidance given on the form if they consider the patient is not at risk of pregnancy, including the need for review in case her risk status changes.

Guidance has been published to support healthcare professionals with the use of valproate. These include a summary by NICE of their guidance and safety advice, pan-college guidance by national healthcare bodies, and paediatric guidance by the British Paediatric Neurology Association and the Royal College of Paediatrics and Child Health.

CONTRA-INDICATIONS

- Acute porphyrias p. 1058 - known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) - personal or family history of severe hepatic dysfunction

SAFETY

- Systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION

- Liver toxicity: Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

- Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

INTERACTIONS

- Appendix 1: antiepileptics

SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

- Hepatic dysfunction

Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

- Pancreatitis

Discontinue treatment if symptoms of pancreatitis develop.

CONCEPTION AND CONTRACEPTION

- The MHRA advises that all women and girls of childbearing potential being treated with valproate medicines must be supported on a Pregnancy Prevention Programme—pregnancy should be excluded before treatment initiation and highly effective contraception must be used during treatment.

- PREGNANCY

- For migraine prophylaxis [unlicensed] and bipolar disorder, the MHRA advises that valproate must not be used. For epilepsy, the MHRA advises valproate must not be used unless there is no suitable alternative treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrinemia). Neonatal hepatotoxicity also reported. See also Pregnancy in Epilepsy p. 305.

MONITORING

- Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

- The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- BREAST FEEDING

- Present in milk—risk of haematological disorders in breast-fed newborns and infants.

- HEPATIC IMPAIRMENT

- Manufacturer advises avoid.

- RENAL IMPAIRMENT

- Dose adjustments Reduce dose.

- MONITORING REQUIREMENTS

- Monitor closely if dose greater than 45 mg/kg daily.

- Monitor liver function before therapy and during first 6 months especially in patients most at risk.

- Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

- EFFECT ON LABORATORY TESTS

- False-positive urine tests for ketones.

- TREATMENT CESSATION

- In bipolar disorder, avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

- PRESCRIBING AND DISPENSING INFORMATION

- The Pregnancy Prevention Programme is supported by the following materials provided by the manufacturer: Patient Guide, Guide for Healthcare Professionals, Risk Acknowledgement Form, and for pharmacists, Patient Cards and Stickers with warning symbols; the MHRA has also produced a patient information sheet providing advice for women and girls taking valproate medicines.

CONVULEX® Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral valproic acid product.
PATIENT AND CARER ADVICE
Valproate use by women and girls. The MHRA advises women and girls should not stop taking valproate without first discussing it with their doctor.

Blood or hepatic disorders. Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

Pregnancy Protection Programme. Pharmacists must ensure that female patients have a patient card—see also Important safety information.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution gastro-resistant capsule.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 8, 10, 21, 25

- Convulex (Pfizer Ltd)▼
  - Valproic acid 150 mg Convulex 150mg gastro-resistant capsules | 100 capsule POM £3.68 DT = £3.68
  - Valproic acid 300 mg Convulex 300mg gastro-resistant capsules | 100 capsule POM £7.35 DT = £7.35
  - Valproic acid 500 mg Convulex 500mg gastro-resistant capsules | 100 capsule POM £11.25 DT = £11.25

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 10, 21, 25

- Depakote (Sanofi)▼
  - Valproic acid (as Valproate semisodium) 250 mg Depakote 250mg gastro-resistant tablets | 30 tablet POM £3.69 | 90 tablet POM £9.08 DT = £9.08
  - Valproic acid (as Valproate semisodium) 500 mg Depakote 500mg gastro-resistant tablets | 30 tablet POM £11.37 | 90 tablet POM £34.11 DT = £34.11

ANTIPSYCHOTICS > SECOND-GENERATION

Asenapine

INDICATIONS AND DOSE
Monotherapy for the treatment of moderate to severe manic episodes associated with bipolar disorder

- BY MOUTH
  - Adult: Initially 10 mg twice daily, reduced to 5 mg twice daily, adjusted according to response

Combination therapy for the treatment of moderate to severe manic episodes associated with bipolar disorder

- BY MOUTH
  - Adult: Initially 5 mg twice daily, increased if necessary to 10 mg twice daily, adjusted according to response

CAUTIONS
Dementia with Lewy Bodies

INTERACTIONS → Appendix 1: asenapine

SIDE-EFFECTS
- Common or very common: Anxity, appetite increased, fatigue, muscle rigidity, nausea, oral disorders, taste altered
- Uncommon: Bundle branch block, dysarthria, dysphagia, hyperglycaemia, sexual dysfunction, syncope
- Rare or very rare: Accommodation disorder, rhadomyolysis

PREGNANCY
Use only if potential benefit outweighs risk—toxicity in animal studies.

BREAST FEEDING
Avoid—no information available.

HEPATIC IMPAIRMENT
Manufacturer advises caution in moderate impairment; avoid in severe impairment (risk of increased exposure).

RENAL IMPAIRMENT
Use with caution if eGFR less than 15 mL/minute/1.73 m²—no information available.

PATIENT AND CARER ADVICE
Patient or carer should be given advice on how to administer asenapine sublingual tablet.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

CAUTIONARY AND ADVISORY LABELS 2, 26

- Sycrest (Lundbeck Ltd)
  - Asenapine (as Asenapine maleate) 5 mg Sycrest 5mg sublingual tablets sugar-free | 60 tablet POM DT £102.60 DT + £102.60
  - Asenapine (as Asenapine maleate) 10 mg 20 mg sublingual tablets sugar-free | 60 tablet POM DT £102.60 DT + £102.60

ANTIPSYCHOTICS > LITHIUM SALTS

Lithium salts

CONTRA-INDICATIONS
Addison’s disease, cardiac insufficiency, dehydration, family history of Brugada syndrome, low sodium diets, personal history of Brugada syndrome, rhythm disorder, untreated hyperthyroidism

CAUTIONS
Avoid abrupt withdrawal, cardiac disease, concurrent ECT (may lower seizure threshold), diuretic treatment (risk of toxicity), elderly (reduce dose), epilepsy (may lower seizure threshold), myasthenia gravis, psoriasis (risk of exacerbation), QT interval prolongation, review dose as necessary in diarrhoea, review dose as necessary in intercurrent infection (especially if sweating profusely), review dose as necessary in vomiting, surgery.

CAUTIONS, FURTHER INFORMATION
- Long-term use: Long-term use of lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with monitoring of thyroid function every 6 months (more often if there is evidence of deterioration).

The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.

SIDE-EFFECTS
- Rare or very rare: Nephropathy
- Frequency not known: Abdominal discomfort, alopecia, angioedema, appetite decreased, arrhythmias, atrioventricular block, cardiomyopathy, cerebellar syndrome, circulatory collapse, coma, delirium, diarrhoea, dizziness, dry mouth, electrolyte imbalance, encephalopathy, foliniculitis, gastritis, goitre, hyperglycaemia, hyperparathyroidism, hypersalivation, hypotension, hypothyroidism, idiopathic intracrinal hypertension, leucocytosis, memory loss, movement disorders, muscle weakness, myasthenia gravis, nausea, neoplasms, nystagmus, peripheral neuropathy, peripheral oedema, polyuria, QT interval prolongation, reflexes abnormal, renal disorders, renal impairment, rhadomyolysis, seizure, sexual dysfunction, skin reactions, skin ulcer, speech impairment, taste altered, thyrotoxicosis, tremor, vertigo, vision disorders, vomiting, weight increased

SIDE-EFFECTS, FURTHER INFORMATION
Overdose: Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances, polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hypernatraemia. With severe overdose seizures, cardiac arrhythmias (including sinoatrial block, bradycardia and first-degree heart block),
blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 1359.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment for women of child bearing potential.

- **PREGNANCY** Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).

- **Dose adjustments** Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal).

- **Monitoring** Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).

- **BREAST FEEDING** Present in milk and risk of toxicity in infant—avoid.

- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

- **Monitoring requirements** Serum concentrations. Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available.

A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient. Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months thereafter.

Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient’s sodium or fluid intake.

- **Manufacturer advises to assess renal, cardiac, and thyroid function before treatment initiation.** An ECG is recommended in patients with cardiovascular disease or risk factors for it. Body-weight or BMI, serum electrolytes, and a full blood count should also be measured before treatment initiation.

- **Monitor body-weight or BMI, serum electrolytes, eGFR, and thyroid function every 6 months during treatment, and more often if there is evidence of impaired renal or thyroid function, or raised calcium levels.** Manufacturer also advises to monitor cardiac function regularly.

- **Treatment Cessation** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.

- **Patient and carer advice** Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance). Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.

Lithium treatment packs A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from 3M 0845 610 1112 nhsforms@mmm.uk.com

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving, operating machinery).
Lithium carbonate (Non-proprietary)
Lithium carbonate 250 mg Lithium carbonate 250mg tablets | 100 tablet £87.00 DT = £87.00

INDICATIONS AND DOSE
Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

BY MOUTH
Adult: Initially 450–675 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Elderly: Initially 225 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

DOSE EQUIVALENCE AND CONVERSION
Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

LI-LIQUID
Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

BY MOUTH
Adult (body-weight up to 50 kg): Initially 509 mg daily in 2 divided doses, dose adjusted according to serum-lithium concentration

Adult (body-weight 50 kg and above): Initially 0.4–1.2 g once daily, alternatively initially 0.4–1.2 g daily in 2 divided doses, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Elderly: Initially 200–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

DOSE EQUIVALENCE AND CONVERSION
Fox Li-Liquid®: Lithium citrate tetrahydrate 509 mg is equivalent to lithium carbonate 200 mg.

PRIADEL® LIQUID
Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

BY MOUTH
Adult (body-weight up to 50 kg): Initially 520 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Adult (body-weight 50 kg and above): Initially 1.04–3.12 g daily in 2 divided doses, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Elderly: Initially 520 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

INTERACTIONS
Appendix 1: lithium

Antidepressant drugs

Overview
Antidepressant drugs are effective for treating moderate to severe depression associated with psychomotor and physiological changes such as loss of appetite and sleep disturbance; improvement in sleep is usually the first benefit of therapy. Ideally, patients with moderate to severe depression should be treated with psychological therapy in addition to drug therapy. Antidepressant drugs are also effective for dysthymia (lower grade chronic depression typically of at least 2 years duration). Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in patients with a history of moderate or severe depression.

Choice
The major classes of antidepressant drugs include the tricyclic and related antidepressants, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs). A number of antidepressant drugs cannot be accommodated easily into this classification.

There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient’s requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable. During the first few weeks of treatment, there is an increased potential for agitation, anxiety, and suicidal ideation.

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline p. 367 has been shown to be safe.

Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdose is also a problem. SSRIs are less sedating and have fewer antimuscarinic and cardio toxic effects than tricyclic antidepressants.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists.

Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics or antipsychotic drugs should therefore be used with caution in depression but they are useful adjuncts in agitated patients. Augmenting antidepressants with antipsychotics under specialist supervision may also be necessary in patients who have depression with psychotic symptoms.

St John’s wort (Hypericum perforatum) is a popular herbal remedy on sale to the public for treating mild depression. It should not be prescribed or recommended for depression because St John’s wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified. Furthermore, the amount of active ingredient varies between different preparations of St John’s wort and switching from one to another can change the degree of enzyme induction. If a patient stops taking St John’s wort, the concentration of interacting drugs may increase, leading to toxicity.

Management
Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks (elderly patients may take longer to respond).

Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly), or for at least 12 months in patients receiving treatment for generalised anxiety disorder (as the likelihood of relapse is high). Patients with a history of recurrent depression should receive maintenance treatment for at least 2 years.

Hyponatraemia and antidepressant therapy
Hyponatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. Hyponatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

Suicidal behaviour and antidepressant therapy
The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

Serotonin syndrome
Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of symptoms, which range from mild to lifethreatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually occurs with a combination of serotonergic drugs, one of which is generally an MAOI.

The characteristic symptoms of serotonin syndrome fall into 3 main areas, although features from each group may not be seen in all patients—neuromuscular hyperactivity (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diarrhoea), and altered mental state (agitation, confusion, mania).
Mental health disorders

Treatment consists of withdrawal of the serotonergic medication and supportive care; specialist advice should be sought.

Failure to respond
Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine p. 372. Other second-line choices include lofepramine p. 377, moclobemide p. 362, and reboxetine p. 363. Other tricyclic antidepressants and venlafaxine p. 368 should be considered for more severe forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium, aripiprazole p. 395 [unlicensed], olanzapine p. 398 [unlicensed], quetiapine p. 401, or risperidone p. 402 [unlicensed]), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Anxiety disorders and obsessive-compulsive disorder
Management of acute anxiety generally involves the use of a benzodiazepine or buspirole hydrochloride p. 342. For chronic anxiety (of longer than 4 weeks’ duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Patients with generalised anxiety disorder, a form of chronic anxiety, should be offered psychological treatment before initiating an antidepressant. If drug treatment is needed, an SSRI such as escitalopram p. 365, paroxetine p. 366, or sertraline p. 367 [unlicensed], can be used. Duloxetine p. 367 and venlafaxine p. 368 (serotonin and noradrenaline reuptake inhibitors) are also recommended for the treatment of generalised anxiety disorder; if the patient cannot tolerate SSRIs or serotonin and noradrenaline reuptake inhibitors (or if treatment has failed to control symptoms), pregabalin p. 324 can be considered.

Panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder, and phobic states such as social anxiety disorder are treated with SSRIs. Clomipramine hydrochloride p. 373 or imipramine hydrochloride p. 376 can be used second-line in panic disorder [unlicensed]; clomipramine hydrochloride can also be used second-line for obsessive-compulsive disorder. Moclobemide p. 362 is licensed for the treatment of social anxiety disorder.

Tricyclic and related antidepressant drugs
Choice
Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine hydrochloride is more selective for serotonergic transmission, and imipramine hydrochloride is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with sedative properties include amitriptyline hydrochloride p. 372, clomipramine hydrochloride, dosulepin hydrochloride p. 374, doxepin p. 375, mianserin hydrochloride p. 371, trazodone hydrochloride p. 370, and trimipramine p. 378. Those with less sedative properties include imipramine hydrochloride, lofepramine p. 377, and nortriptyline p. 378.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardiotoxicity in overdose, which may be important in individual patients. Lofepramine has a lower incidence of side-effects and is less dangerous in overdose but is infrequently associated with hepatic toxicity. Imipramine hydrochloride is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. Amitriptyline hydrochloride and dosulepin hydrochloride are effective but they are particularly dangerous in overdose and are not recommended for the treatment of depression; dosulepin hydrochloride should be initiated by a specialist.

Dosage
About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the elderly. In most patients the long half-life of tricyclic antidepressant drugs allows once-daily administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Some tricyclic antidepressants are used in the management of panic and other anxiety disorders. Some tricyclic antidepressants may also have a role in some forms of neuralgia and in nocturnal enuresis in children.

Children and adolescents
Studies have shown that tricyclic antidepressants are not effective for treating depression in children.

Monoamine-oxidase inhibitors
Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa.

Tranylcypromine p. 362 has a greater stimulant action than phenelzine p. 362 or isocarboxazid p. 362 and is more likely to cause a hypertensive crisis. Isocarboxazid and phenelzine are more likely to cause hepatotoxicity than tranylcypromine.

Moclobemide should be reserved as a second line treatment.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to the sedative compounds. Some tricyclic antidepressants and related antidepressants (for example, amitriptyline, doxepin, imipramine) may be more effective than MAOIs and such patients may be better treated with them.

Other antidepressants should not be started for at least 2 weeks if starting clomipramine or imipramine. Conversely, an MAOI should not be started until:

- at least 2 weeks after a previous MAOI has been stopped (then started at a reduced dose)
- at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped
- at least a week after an SSRI or related antidepressant (at least 5 weeks in the case of fluoxetine) has been stopped

Other antidepressant drugs
The thioxanthene fluoxetine p. 385 (Fluanxol®) has antidepressant properties when given by mouth in low doses. Fluoxetine is also used for the treatment of psychoses.

Vortioxetine p. 380, an antidepressant thought to directly modulate serotonergic receptor activity and inhibit the re-uptake of serotonin, is recommended in patients whose condition has responded inadequately to 2 antidepressants within the current episode.
Tryptophan is licensed for use in treatment-resistant depression, used as monotherapy and as an adjunct to other antidepressant drugs; it should be initiated by hospital specialists.

**Antidepressants** ➔ **Melatonin Receptor Agonists**

<table>
<thead>
<tr>
<th>Agomelatine</th>
</tr>
</thead>
</table>

**Drug action**: A melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

**Indications and Dose**

- **Major depression**
  - Adult: 25 mg daily, dose to be taken at bedtime. Dose to be increased if necessary after 2 weeks, increased if necessary to 50 mg daily, dose to be taken at bedtime.

**Contra-Indications**: Dementia, patients over 75 years of age.

**Caution**: Alcoholism, bipolar disorder, diabetes, excessive alcohol consumption, hypomania, mania, non-alcoholic fatty liver disease, obesity.

**Interactions**: Appendix 1: agomelatine

**Side-Effects**

- Common or very common: Abdominal pain, anxiety, back pain, constipation, diarrhoea, dizziness, drowsiness, fatigue, headaches, nausea, sleep disorders, vomiting, weight changes.
- Uncommon: Aggression, confusion, hyperhidrosis, mood altered, movement disorders, paraesthesia, skin reactions, suicidal tendencies, tinnitus, vision blurred.
- Rare or very rare: Angioedema, face oedema, hallucination, hepatic disorders, urinary retention.

**Side-Effects, Further Information**: The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

**Pregnancy**: Manufacturer advises avoid.

**Breast Feeding**: Avoid—present in milk in animal studies.

**Hepatic Impairment**: Manufacturer advises caution if transaminases are elevated; avoid in hepatic impairment or if transaminases exceed 3 times the upper limit of normal.

**Renal Impairment**: Caution in moderate to severe impairment.

**Monitoring Requirements**: Test liver function before treatment and after 3, 6, 12 and 24 weeks of treatment, and then regularly thereafter when clinically indicated (restart monitoring schedule if dose increased); discontinue if serum transaminases exceed 3 times the upper limit of reference range or symptoms of liver disorder.

**Patient and Carer Advice**: Hepatotoxicity. Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as dark urine, light coloured stools, jaundice, bruising, fatigue, abdominal pain, or pruritus develop.

Patients should be given a booklet with more information on the risk of hepatic side-effects.

---

**Monoamine-oxidase inhibitors**

**Drug action**: MAOIs inhibit monamine oxidase, thereby causing an accumulation of amine neurotransmitters.

**Contra-Indications**: Cerebrovascular disease, not indicated in manic phase, phaeochromocytoma.

**Caution**: Acute liver disease, p. 1058—avoid in agitated patients; blood disorders, cardiovascular disease; concurrent electroconvulsive therapy, diabetes mellitus, elderly (great caution), epilepsy, severe hypertensive reactions to certain drugs and foods, surgery.

**Side-Effects**: Akathisia, anxiety, appetite increased, arrhythmia, asthenia, behaviour abnormal, blood disorder, confusion, constipation, dizziness, drowsiness, dry mouth, dysuria, hallucination, headache, hyperhidrosis, insomnia, jaundice, nausea, paraesthesia, peripheral neuritis, postural hypotension, more common in elderly—reflexes increased, skin reactions, suicidal tendencies, tremor, vision blurred, vomiting, weight increased.

**Side-Effects, Further Information**: Risk of postural hypotension and hypertensive responses. Discontinue if palpitations or frequent headaches occur.

**Pregnancy**: Increased risk of neonatal malformations—manufacturer advises avoid unless there are compelling reasons.

**Hepatic Impairment**: In general, manufacturers advise avoid.

**Monitoring Requirements**: Monitor blood pressure (risk of postural hypotension and hypertensive responses).

**Treatment Cessation**: Withdrawal. If possible avoid abrupt withdrawal.

MAOIs are associated with withdrawal symptoms on cessation of therapy. Symptoms include agitation, irritability, ataxia, movement disorders, insomnia, drowsiness, vivid dreams, cognitive impairment, and slowed speech. Withdrawal symptoms occasionally experienced when discontinuing MAOIs include hallucinations and paranoid delusions. If possible MAOIs should be withdrawn slowly.

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

**Patient and Carer Advice**: Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or ‘going off’. This is especially important with meat, fish, poultry or offal; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Patients should also be advised to avoid alcoholic drinks or de-alcoholised (low alcohol) drinks.

Driving and skilled tasks  Drowsiness may affect performance of skilled tasks (e.g. driving).

**ANTIDEPRESSANTS › MONOAMINE-OXIDASE A AND B INHIBITORS, IRREVERSIBLE**

### Isocarboxazid  
30-Mar-2017

**INDICATIONS AND DOSE**

**Depressive illness**

- **BY MOUTH**
  - Adult: Initially 30 mg daily until improvement occurs, initial dose may be given in single or divided doses, dose may be increased if necessary after 4 weeks, increased to 60 mg daily for 4–6 weeks, dose to be increased under close supervision only, then reduced to 10–20 mg daily, usual maintenance dose, but up to 40 mg daily may be required.
  - Elderly: 5–10 mg daily

**INTERACTIONS**  → Appendix 1: monoamine-oxidase A and B inhibitors, irreversible

**SIDE-EFFECTS**  Granulocytopenia - peripheral oedema - sexual dysfunction

**BREAST FEEDING**  Avoid.

**RENAL IMPAIRMENT**  Use with caution.

**LESS SUITABLE FOR PRESCRIBING**  Less suitable for prescribing.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension. There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS  3, 10

- **Isocarboxazid (Non-proprietary)**
  - Isocarboxazid 10 mg  Isocarboxazid 10mg tablets  | 56 tablet  [PO][M]  £239.52 DT = £228.64

### Phenelzine

**INDICATIONS AND DOSE**

**Depressive illness**

- **BY MOUTH**
  - Adult: Initially 15 mg 3 times a day, response is usually seen within first week; dose may be increased if necessary after 2 weeks if response is not evident, increased if necessary to 15 mg 4 times a day, doses up to 30 mg three times a day may be used in hospital patients; response may not become apparent for up to 4 weeks; once satisfactory response has been achieved, reduce dose gradually to lowest suitable maintenance dose (15 mg on alternate days may be adequate)

**INTERACTIONS**  → Appendix 1: monoamine-oxidase A and B inhibitors, irreversible

**BREAST FEEDING**  Avoid—no information available.

**LESS SUITABLE FOR PRESCRIBING**  Less suitable for prescribing.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS  3, 10

- **Nardil (Kyowa Kirin Ltd)**
  - Phenelzine (as Phenelzine sulfate) 15 mg  Nardil 15mg tablets  | 100 tablet  [PO][M]  £22.50 DT = £22.50

### Tranylcypromine

**INDICATIONS AND DOSE**

**Depressive illness**

- **BY MOUTH**
  - Adult: Initially 10 mg twice daily, dose to be taken at a time no later than 3 p.m., dose may be increased if necessary after 1 week, increased if necessary to 10 mg daily, dose to be taken in the morning and 20 mg daily, dose to be taken in the afternoon, doses above 30 mg daily, under close supervision only; maintenance 10 mg daily

**CONTRA-INDICATIONS**  Congestive heart failure - history of hepatic disease - hyperthyroidism

**INTERACTIONS**  → Appendix 1: monoamine-oxidase A and B inhibitors, irreversible

**SIDE-EFFECTS**

- Rare or very rare  Hepatocellular injury
- Frequency not known  Chest pain - diarrhoea - drug dependence - extrasytrole - flushing - hypertension - hypomania - mydriasis - pain - pallor - photophobia - sleep disorder - throbbing headache

**BREAST FEEDING**  Present in milk in animal studies.

**LESS SUITABLE FOR PRESCRIBING**  Less suitable for prescribing.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS  3, 10

- **Tranylcypromine (Non-proprietary)**
  - Tranylcypromine (as Tranylcypromine sulfate) 10 mg  Tranylcypromine 10mg tablets  | 28 tablet  [PO][M]  £311.18 DT = £287.07

### ANTIDEPRESSANTS › MONOAMINE-OXIDASE A INHIBITORS, REVERSIBLE

**Moclobemide**

**DRUG ACTION**  Moclobemide is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA).

**INDICATIONS AND DOSE**

**Depressive illness**

- **BY MOUTH**
  - Adult: Initially 300 mg daily in divided doses, adjusted according to response; usual dose 150–600 mg daily, dose to be taken after food

**SOCIAL ANXIETY DISORDER**

- **BY MOUTH**
  - Adult: Initially 300 mg daily for 3 days, then increased to 600 mg daily in 2 divided doses continued for 8–12 weeks to assess efficacy

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises reduce dose to half or one-third of the usual dose with concurrent use of cimetidine.

**CONTRA-INDICATIONS**  Acute confusional states - phaeochromocytoma

www.getintopharma.com
CAUTIONS Avoid in agitated or excited patients (or give with sedative for up to 2–3 weeks) may provoke manic episodes in bipolar disorders • thyrotoxicosis

INTERACTIONS • Appendix 1: moclobemide

SIDE-EFFECTS

Common or very common Anxiety • constipation • diarrhoea • dizziness • dry mouth • headache • hypotension • irritability • nausea • paraesthesia • skin reactions • sleep disorder • vomiting

Uncommon Asthenia • confusion • flushing • oedema • suicidal tendencies • taste altered • visual impairment

Rare or very rare Appetite decreased • delusions • hyponatraemia • serotonin syndrome

PREGNANCY Safety in pregnancy has not been established—manufacturer advises avoid unless there are compelling reasons.

BREAST FEEDING Amount too small to be harmful, but patient information leaflet advises avoid.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (risk of decreased metabolism). Dose adjustments Manufacturer advises dose reduction to half or one-third of the daily dose in severe impairment,

TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

PATIENT AND CARER ADVICE Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich food (such as mature cheese, yeast extracts and fermented soya bean products).

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet CAUTIONARY AND ADVISORY LABELS 10, 21

Moclobemide (Non-proprietary)

Moclobemide 150 mg Moclobemide 150mg tablets 30 tablet £22.12 DT + £22.10

ANTIDEPRESSANTS • NORADRENERGIC REUPTAKE INHIBITORS

Reboxetine

DRUG ACTION Reboxetine is a selective inhibitor of noradrenaline re-uptake.

INDICATIONS AND DOSE

Major depression

BY MOUTH

Adult: 4 mg twice daily for 3–4 weeks, then increased if necessary to 10 mg daily in divided doses; maximum 12 mg per day

CAUTIONS Bipolar disorder • history of cardiovascular disease • history of epilepsy • prostatic hypertrophy • susceptibility to angle-closure glaucoma • urinary retention

INTERACTIONS • Appendix 1: reboxetine

SIDE-EFFECTS

Common or very common Accommodation disorder • akathisia • anxiety • appetite decreased • chills • constipation • dizziness • dry mouth • headache • hyperhidrosis • hypertension • hypotension • insomnia • nausea • palpitations • paraesthesia • sexual dysfunction • skin reactions • tachycardia • taste altered • urinary disorders • urinary tract infection • vasodilation • vomiting

Uncommon Mydriasis • vertigo

Rare or very rare Glaucoma

Frequency not known Aggression • hallucination • hyponatraemia • irritability • peripheral coldness • potassium depletion (long term use) • Raynaud’s phenomenon • suicidal tendencies • testicular pain

PREGNANCY Use only if potential benefit outweighs risk— limited information available.

BREAST FEEDING Small amount present in milk—use only if potential benefit outweighs risk.

HEPATIC IMPAIRMENT Manufacturer advises caution (risk of increased exposure). Dose adjustments Manufacturer advises initial dose reduction to 2 mg twice daily, increased according to tolerance.

RENAL IMPAIRMENT Dose adjustments Initial dose 2 mg twice daily, increased according to tolerance.

TREATMENT CESSATION Caution—avoid abrupt withdrawal.

PATIENT AND CARER ADVICE Driving and skilled tasks Counselling advised.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Edronax (Pfizer Ltd) Reboxetine (as Reboxetine mesilate) 4 mg Edronax 4mg tablets 18 DT £18.91

60 tablet £9.91

ANTIDEPRESSANTS • SELECTIVE SEROTONIN REUPTAKE INHIBITORS

Selective serotonin re-uptake inhibitors

DRUG ACTION Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).

CONTRA-INDICATIONS Poorly controlled epilepsy • SSRIs should not be used if the patient enters a manic phase.

CAUTIONS Cardiac disease • concurrent electroconvulsive therapy • diabetes mellitus • epilepsy (discontinue if convulsions develop) • history of bleeding disorders (especially gastro-intestinal bleeding) • history of mania • susceptibility to angle-closure glaucoma

SIDE-EFFECTS

Common or very common Anxiety • appetite abnormal • arthralgia • asthenia • concentration impaired • confusion • constipation • depersonalisation • diarrhoea • dizziness • drowsiness • dry mouth • fever • gastrointestinal discomfort • haemorrhage • headache • hyperhidrosis • malaise • memory loss • menstrual cycle irregularities • myalgia • mydriasis • nausea (dose-related) • palpitations • paraesthesia • QT interval prolongation • sexual dysfunction • skin reactions • sleep disorders • taste altered • tinnitus • tremor • urinary disorders • visual impairment • vomiting • weight changes • yawning

Uncommon Alopecia • angioedema • behaviour abnormal • hallucination • mania • movement disorders

www.getintopharma.com
photosensitivity reaction - postural hypotension - seizure - suicidal tendencies - syncope

- Rare or very rare: Galactorrhoea - hepatitis - hyperprolactinaemia - hypotrichia - serotonin syndrome - severe cutaneous adverse reactions (SCARs) - SIADH - thrombocytopenia

- Frequency not known: Withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION

Overdose

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nyctagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 1359.

- PREGNANCY: Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.

- RENAL IMPAIRMENT: In general, manufacturers advise caution (prolonged half-life).

- TREATMENT CESSATION: Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist.

- Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more.

- PATIENT AND CARER ADVICE: Driving and skilled tasks: May also impair performance of skilled tasks (e.g. driving, operating machinery).

- CONTRA-INDICATIONS: QT-interval prolongation

- CAUTIONS: Susceptibility to QT-interval prolongation

- INTERACTIONS: Appendix 1: SSRIs

- SIDE-EFFECTS: Common or very common: Acute angle closure glaucoma - apathy - flatulence - hypersalivation - migraine - rhinitis

- Rare or very rare: Cough - generalised tonic-clonic seizure

- Frequency not known: Hypokalaemia

- BREAST FEEDING: Present in milk—with use caution.

- HEPATIC IMPAIRMENT

- Dose adjustments: For tablets, manufacturer advises initial dose of 10 mg daily for the first two weeks in mild to moderate impairment—dose may be increased to max. 20 mg daily; use with extra caution and careful dose titration in severe impairment.

- For oral drops, manufacturer advises initial dose of 8 mg daily for the first two weeks in mild to moderate impairment—dose may be increased to max. 16 mg daily; use with extra caution and careful dose titration in severe impairment.

- RENAL IMPAIRMENT: No information available for eGFR less than 20 mL/minute/1.73 m².

- TREATMENT CESSATION: The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

- DIRECTIONS FOR ADMINISTRATION: Cipramil® oral drops should be mixed with water, orange juice, or apple juice before taking.

- PATIENT AND CARER ADVICE: Counselling on administration of oral drops is advised. Driving and skilled tasks: Patients should be advised of the effects of citalopram on driving and skilled tasks.

- MEDICINAL FORMS: There can be variation in the licensing of different medicines containing the same drug.

Oral drops

- EXCIPIENTS: May contain Alcohol

Escitalopram

**DRUG ACTION** Escitalopram is the active enantiomer of citalopram.

**INDICATIONS AND DOSE**

- **Depressive illness**
  - Generalised anxiety disorder
  - Obsessive-compulsive disorder

  - **BY MOUTH**
    - Adult: 10 mg once daily; increased if necessary up to 20 mg daily
    - Elderly: Initially 5 mg once daily; maximum 10 mg per day

- **Panic disorder**
  - **BY MOUTH**
    - Adult: Initially 5 mg once daily for 7 days, then increased to 10 mg daily; maximum 20 mg per day
    - Elderly: Initially 2.5 mg once daily; maximum 10 mg per day

- **Social anxiety disorder**
  - **BY MOUTH**
    - Adult: Initially 10 mg once daily for 2–4 weeks, dose to be adjusted after 2–4 weeks of treatment; usual dose 5–20 mg daily

**CONTRA-INDICATIONS** QT-interval prolongation

**CAUTIONS** Susceptibility to QT-interval prolongation

**INTERACTIONS** → Appendix 1: SSRIs

**SIDE-EFFECTS**

- Common or very common
  - Sinusitis

- Uncommon
  - Oedema

**BREAST FEEDING** Present in breast milk; avoid.

**HEPATIC IMPAIRMENT**

- **Dose adjustments** Manufacturer advises initially 5 mg once daily for 2 weeks in mild to moderate impairment, thereafter increased to 10 mg once daily according to response; titrate dose with extra caution in severe impairment.

- **RENAL IMPAIRMENT** Caution if eGFR less than 30 ml/minute/1.73m².

- **TREATMENT CESSATION** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

**DIRECTIONS FOR ADMINISTRATION** Oral drops can be mixed with water, orange juice, or apple juice before taking.

**PATIENT AND CARER ADVICE** Counselling on administration of oral drops advised. Driving and skilled tasks Patients should be counselled about the effects on driving.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral drops**

- **Cipralex** (Lundbeck Ltd)
  - Escitalopram (as Escitalopram oxalate) 20 mg per 1 ml

**Tablet**

- **Escitalopram (Non-proprietary)**
  - Escitalopram (as Escitalopram oxalate) 5 mg
  - Escitalopram 5mg tablets | 28 tablet (POD) £8.97 DT + £0.91

  - Escitalopram (as Escitalopram oxalate) 10 mg
  - Cipralex 10mg tablets | 28 tablet (POD) £14.91 DT + £1.13

Fluoxetine

**INDICATIONS AND DOSE**

- **Major depression**
  - **BY MOUTH**
    - Adult: Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose; maximum 60 mg per day
    - Elderly: Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

- **Bulimia nervosa**
  - **BY MOUTH**
    - Adult: 60 mg daily, daily dose may be administered as a single or divided dose
    - Elderly: Up to 40 mg daily, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

- **Obsessive-compulsive disorder**
  - **BY MOUTH**
    - Adult: 20 mg daily, increased if necessary up to 60 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks; maximum 60 mg per day
    - Elderly: 20 mg daily, increased if necessary up to 40 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

- **Menopausal symptoms, particularly hot flushes, in women with breast cancer (except those taking tamoxifen)**
  - **BY MOUTH**
    - Adult: 20 mg once daily

**PHARMACOKINETICS**

- Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage).

**UNLICENSED USE**

- Fluoxetine is used for menopausal symptoms, but it is not licensed for this indication.

**INTERACTIONS** → Appendix 1: SSRIs

**SIDE-EFFECTS**

- **Common or very common**
  - Chills · feeling abnormal · postmenopausal haemorrhage · uterine disorder · vasodilation · vision blurred

- **Uncommon**
  - Cold sweat · dysphagia · dyspnoea · hypotension · mood altered · muscle twitching · self-injurious behaviour · temperature sensation altered · thinking abnormal

- **Rare or very rare**
  - Buccoglossal syndrome · leucopenia · neutropenia · esophageal pain · pharyngitis · respiratory disorders · serum sickness · speech disorder · vasculitis

- **Frequency not known**
  - Bone fracture

**BREAST FEEDING** Present in milk—avoid.

**HEPATIC IMPAIRMENT**

- **Dose adjustments** Manufacturer advises dose reduction or increasing dose interval.

**DIRECTIONS FOR ADMINISTRATION** Dispersible tablets can be dispersed in water for administration or swallowed whole with plenty of water.

**PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of dispersible tablets.
Driving and skilled tasks Patients should be counselled about the effects on driving and skilled tasks.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- Fluoxetine (Non-proprietary)
  - Fluoxetine (as Fluoxetine hydrochloride) 10 mg: 30 tablet (£44.00 DT = £44.00)

**Dispersible tablet**
- Olena (Fluoxetine hydrochloride) 10 mg: 28 tablet (£3.44 DT = £3.44)

**Oral solution**
- Fluoxetine (Non-proprietary)
  - Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml: 20mg/5ml oral solution | 70 ml (£12.75 DT = £2.93)
  - Fluoxetine (as Fluoxetine hydrochloride) 20 mg: 20mg/5ml oral solution sugar-free | 70 ml (£12.95 DT = £2.95)
  - Prozac (Eli Lilly and Company Ltd)

**Capsule**
- Fluoxetine (Non-proprietary)
  - Fluoxetine (as Fluoxetine hydrochloride) 10 mg: 30 capsule (£57.34 DT = £44.68)
  - Fluoxetine (as Fluoxetine hydrochloride) 20 mg: 30 capsule (£2.51 DT = £0.93)
  - Faverin (Schering-Plough Ltd)

**Fluoxetine maleate**
- Fluoxetine maleate 100 mg: 30 capsule (£64.00 DT = £2.10)
  - Fluoxetine maleate 50 mg: 30 capsule (£54.36 DT = £1.83)
  - Oxactin (Discovery Pharmaceutical Ltd)

**Fluoxetine**
- Fluoxetine (as Fluoxetine hydrochloride) 20 mg: 30 capsule (£0.72 DT = £0.93)
  - Prozac (Eli Lilly and Company Ltd)

**Interactions**
- Appendix 1: SSRIs
- Appendix 1: SSRI

**Side-effects**
- Rare or very rare: Hepatic function abnormal (discontinue)
- Frequency not known: Bone fracture - glaucoma - neuroleptic malignant-like syndrome - withdrawal syndrome neonatal

**Breast feeding** Present in milk — avoid.

**HEPATIC IMPAIRMENT**
- Dose adjustments: Manufacturer advises low initial dose.

**RENAL IMPAIRMENT**
- Dose adjustments: Start with low dose.

**TREATMENT CESSATION** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

**Patient and carer advice**
- Driving and skilled tasks: Patients should be counselled about the effects on driving and skilled tasks.

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**
- Fluoxetine maleate (Non-proprietary)
  - Fluoxetine maleate 50 mg: 60 tablet (£20.98 DT = £17.54)
  - Fluoxetine maleate 100 mg: 30 tablet (£20.98 DT = £17.69)
  - Faverin (Mylan)

**Capsule**
- Fluoxetine maleate 50 mg: 30 tablet (£11.10 DT = £17.54)

**Paroxetine**
- **Indications and Dose**
  - Major depression | Social anxiety disorder | Post-traumatic stress disorder | Generalised anxiety disorder
  - **By mouth**
    - Adult: 20 mg daily, dose to be taken in the morning, no evidence of greater efficacy at higher doses; maximum 50 mg per day
    - Elderly: 20 mg daily, dose to be taken in the morning, no evidence of greater efficacy at higher doses; maximum 40 mg per day

**Obsessive-compulsive disorder**
- **By mouth**
  - Adult: Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
  - Elderly: Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

**Panic disorder**
- **By mouth**
  - Adult: Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day

**Menopausal symptoms, particularly hot flushes, in women with breast cancer (except those taking tamoxifen)**
- **By mouth**
  - Adult: 10 mg once daily

**Unlicensed use** Paroxetine is used for menopausal symptoms, but it is not licensed for this indication.

**Caution** Achlorhydria - high gastric pH

**Caution** Achlorhydria or high gastric pH Causes reduced absorption of the oral suspension.

**Interactions**
- Appendix 1: SSRIs

Sertraline

19-Mar-2018

Sertraline (as Sertraline hydrochloride) 10 mg
Paroxetine (as Paroxetine hydrochloride) 20 mg
Paroxetine (as Paroxetine hydrochloride) 30 mg
Paroxetine (as Paroxetine hydrochloride) 40 mg
Paroxetine (as Paroxetine hydrochloride) 20 mg
Paroxetine (as Paroxetine hydrochloride) 30 mg
Paroxetine (as Paroxetine hydrochloride) 40 mg
Paroxetine (as Paroxetine hydrochloride) 20 mg
Paroxetine (as Paroxetine hydrochloride) 30 mg
Paroxetine (as Paroxetine hydrochloride) 40 mg

INDICATIONS AND DOSE

Depressive illness
- Adult: Initially 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maintenance 50 mg daily; maximum 200 mg per day

Obsessive-compulsive disorder
- Adult: Initially 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day

Panic disorder | Post-traumatic stress disorder | Social anxiety disorder
- Adult: Initially 25 mg daily for 1 week, then increased to 50 daily, then increased in steps of 50 mg at intervals of at least 1 week if required, increase only if response is partial and if drug is tolerated; maximum 200 mg per day

INTERACTIONS
- Appendix 1: SSRIs

SIDE-EFFECTS
- Common or very common: Chest pain, depression, gastrointestinal disorders, increased risk of infection, neumosuscular dysfunction, vasodilation
- Uncommon: Back pain, buping, chills, cold sweat, dysphagia, dyspnea, ear pain, euphoric mood, hypertention, hypothyroidism, migraine, muscle complaints, muscle weakness, oedema, oral disorders, osteoarthritiis, peripheral oedema, respiratory disorders, sensation abnormal, speech disorder, thinking abnormal, thirst
- Rare or very rare: Balanoposthitis, bone disorder, cardiac disorder, coma, conversion disorder, diabetes mellitus, drug dependence, dysphonia, eye disorders, gait abnormal, genital discharge, glaucoma, hair texture abnormal, hepatic disorders, hiccups, hypercholesterolaemia, hypoglycaemia, injury, lymphadenopathy, myocardial infarction, neoplasm, oliguria, peripheral ischaemia, psychotic disorder, vasodilation procedure, vision disorders, vulvovaginal atrophy
- Frequency not known: Cerebrovascular insufficiency, gynaecomastia, hyperglycaemia, leucopenia, neuroleptic malignant syndrome, pancreatitis

BREAST FEEDING
- Not known to be harmful but consider discontinuing breast-feeding.

HEPATIC IMPAIRMENT
- Manufacturer advises avoid in severe impairment (no information available).

RENAL IMPAIRMENT
- Use with caution.

TREATMENT CESSATION
- The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

PATIENT AND CARER ADVICE
- Driving and skilled tasks: Patients should be counselled about the effects on driving.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

CAUTIONARY AND ADVISORY LABELS
- 5, 21

Sertraline (as Sertraline hydrochloride) 50 mg/10 ml liquid sugar-free | 150 ml (Pfizer) £3.12 DT = £9.12

Tablet

CAUTIONARY AND ADVISORY LABELS
- 21

Paroxetine (as Paroxetine hydrochloride) 10 mg Paroxetine 10mg tablets | 28 tablet (Pfizer) £1.03 DT = £5.69
Paroxetine (as Paroxetine hydrochloride) 20 mg Paroxetine 20mg tablets | 30 tablet (Pfizer) £1.17 DT = £5.12
Paroxetine (as Paroxetine hydrochloride) 30 mg Paroxetine 30mg tablets | 30 tablet (Pfizer) £1.26 DT = £6.79
Paroxetine (as Paroxetine hydrochloride) 40 mg Paroxetine 40mg tablets | 28 tablet (Pfizer) £1.39 DT = £6.03 DT = £17.03 | 30 tablet (Pfizer) £18.25-25.07
Sertraline (as Sertraline hydrochloride) 10 mg Seroxat 10mg tablets | 28 tablet (Pfizer) £1.42 DT = £5.69
Sertraline (as Sertraline hydrochloride) 20 mg Seroxat 20mg tablets | 30 tablet (Pfizer) £1.52 DT = £6.12
Sertraline (as Sertraline hydrochloride) 30 mg Seroxat 30mg tablets | 30 tablet (Pfizer) £2.74 DT = £7.79
Generalised mental health disorders

368 Mental health disorders

### Generalised anxiety disorder

- **BY MOUTH**
- Adult: Initially 30 mg once daily, increased if necessary to 60 mg once daily; maximum 120 mg per day

### Diabetic neuropathy

- **BY MOUTH**
- Adult: 60 mg once daily, discontinue if inadequate response after 2 months; review treatment at least every 3 months, maximum dose to be given in divided doses; maximum 120 mg per day

### Moderate to severe stress urinary incontinence

- **BY MOUTH**
- Adult (female): 40 mg twice daily, patient should be assessed for benefit and tolerability after 2–4 weeks, alternatively initially 20 mg twice daily for 2 weeks, this can minimise side effects, then increased to 40 mg twice daily, the patient should be assessed for benefit and tolerability after 2–4 weeks.

#### CAUTIONS
- Bleeding disorders - cardiac disease - elderly - history of seizures - hypertension (avoid if uncontrolled) - raised intra-ocular pressure - susceptibility to angle-closure glaucoma

#### INTERACTIONS
- Appendix 1: duloxetine

#### SIDE-EFFECTS
- Common or very common
  - Anxiety, appetite decreased - constipation - diarrhoea - dizziness - drowsiness - dry mouth - fall - fatigue - flushing - gastrointestinal discomfort - gastrointestinal disorders - headache - muscle complaints - nausea - pain - palpitations - paraesthesia - sexual dysfunction - skin reactions - sleep disorders - sweat changes - tinnitus - tremor - urinary disorders - vision disorders - vomiting - weight changes - yawning
- Uncommon
- Rare or very rare

#### PREGNANCY
- Toxicity in animal studies—avoid in patients with stress urinary incontinence; in other conditions use only if potential benefit outweighs risk. Risk of neonatal withdrawal symptoms if used near term.

#### BREAST FEEDING
- Present in milk—manufacturer advises avoid.

#### HEPATIC IMPAIRMENT
- Manufacturer advises avoid.

#### RENAL IMPAIRMENT
- Avoid if eGFR less than 30/minute/1.73 m²

#### TREATMENT CESSATION
- Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks.

#### NATIONAL FUNDING/ACCESS DECISIONS
- Cymbalta®

**Scottish Medicines Consortium (SMC) decisions**

- With oral use for Diabetic neuropathy The Scottish Medicines Consortium has advised (September 2006) that duloxetine (Cymbalta®) should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate.

#### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

1. **Gastro-resistant capsule**
   - **Duloxetine (Non-proprietary)**
   - Duloxetine (as Duloxetine hydrochloride) 20 mg: Duloxetine 20 mg gastro-resistant capsules | 28 capsule (DT = £3.53)
   - Duloxetine (as Duloxetine hydrochloride) 30 mg: Duloxetine 30 mg gastro-resistant capsules | 28 capsule (DT = £3.53)
   - Duloxetine (as Duloxetine hydrochloride) 40 mg: Duloxetine 40 mg gastro-resistant capsules | 56 capsule (DT = £5.40)
   - Duloxetine (as Duloxetine hydrochloride) 60 mg: Duloxetine 60 mg gastro-resistant capsules | 28 capsule (DT = £2.37)

2. **Cymbalta® (Eli Lilly and Company Ltd)**
   - Duloxetine (as Duloxetine hydrochloride) 30 mg: Cymbalta 30 mg gastro-resistant capsules | 28 capsule (DT = £1.68)
   - Duloxetine (as Duloxetine hydrochloride) 60 mg: Cymbalta 60 mg gastro-resistant capsules | 28 capsule (DT = £2.37)

3. **Depalta® (Disposable Medical Equipment Ltd)**
   - Duloxetine (as Duloxetine hydrochloride) 30 mg: Depalta 30 mg gastro-resistant capsules | 28 capsule (DT = £1.68)
   - Duloxetine (as Duloxetine hydrochloride) 60 mg: Depalta 60 mg gastro-resistant capsules | 28 capsule (DT = £2.37)

4. **Duciltia® (Aristo Pharma Ltd)**
   - Duloxetine (as Duloxetine hydrochloride) 30 mg: Duciltia 30 mg gastro-resistant capsules | 28 capsule (DT = £1.68)
   - Duloxetine (as Duloxetine hydrochloride) 60 mg: Duciltia 60 mg gastro-resistant capsules | 28 capsule (DT = £2.37)

5. **Dutor® (Torrent Pharma (UK) Ltd)**
   - Duloxetine (as Duloxetine hydrochloride) 20 mg: Dutor 20 mg gastro-resistant capsules | 28 capsule (DT = £3.53)
   - Duloxetine (as Duloxetine hydrochloride) 30 mg: Dutor 30 mg gastro-resistant capsules | 28 capsule (DT = £1.68)
   - Duloxetine (as Duloxetine hydrochloride) 40 mg: Dutor 40 mg gastro-resistant capsules | 28 capsule (DT = £2.37)

6. **Yentreve® (Eli Lilly and Company Ltd)**
   - Duloxetine (as Duloxetine hydrochloride) 20 mg: Yentreve 20 mg gastro-resistant capsules | 28 capsule (DT = £3.53)
   - Duloxetine (as Duloxetine hydrochloride) 40 mg: Yentreve 40 mg gastro-resistant capsules | 56 capsule (DT = £5.40)

### Venlafaxine

- **DRUG ACTION** A serotonin and noradrenaline re-uptake inhibitor.

1. **INDICATIONS AND DOSE**

#### Major depression

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 75 mg daily in 2 divided doses, then increased if necessary up to 375 mg daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Initially 75 mg once daily, increased if necessary up to 375 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

#### Generalised anxiety disorder

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 75 mg once daily, increased if necessary up to 225 mg once daily, dose to be increased at intervals of at least 2 weeks; maximum 225 mg per day

#### Social anxiety disorder

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 75 mg once daily, there is no evidence of greater efficacy at higher doses, increased if necessary up to 225 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks; maximum 225 mg per day

www.getintopharma.com
Menopausal symptoms, particularly hot flushes, in women with breast cancer

- **UNLICENSED USE** Venlafaxine is used for menopausal symptoms, but it is not licensed for this indication.
- **CONTRA-INDICATIONS** Conditions associated with high risk of cardiac arrhythmia - uncontrolled hypertension
- **CAUTIONS** Diabetes - heart disease (monitor blood pressure) - history of bleeding disorders - history of epilepsy - history or family history of mania - susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: venlafaxine
- **SIDE-EFFECTS**
  - **Common or very common** Anxiety - appetite decreased - arrhythmias - asthenia - chills - confusion - constipation - depersonalisation - diarrhea - diziness - dry mouth - dysphoria - headache - hot flush - hypertension - menstrual cycle irregularities - movement disorders - muscle tone increased - mydriasis - nausea - palpitations - paroxysmal sympathetic hyperhidrosis - parasomnia - personality disorders - sleep disorders - sweat changes - taste altered - tinnitus - tremor - urinary disorders - vision disorders - vomiting - weight changes - yawning
  - **Uncommon** Alopecia - angioedema - apathy - behaviour abnormal - derealisation - haemorrhage - hallucination - hypotension - mood altered - photosensitivity reaction - syncope
- **Rare or very rare** Agranulocytosis - angle closure glaucoma - bone marrow disorders - delirium - hepatitis - hyponatraemia - neuroleptic malignant syndrome - neutropenia - pancreatitis - QT interval prolongation - respiratory disorders - rhabdomyolysis - seizure - serotonin syndrome - severe cutaneous adverse reactions (SCARs) - SIADH - thrombocytopenia
- **FREQUENCY NOT KNOWN** Suicidal tendencies - vertigo - withdrawal syndrome
- **PREGNANCY** Avoid unless potential benefit outweighs risk - toxicity in animal studies. Risk of withdrawal effects in neonate.
- **BREAST FEEDING** Present in milk - avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (inter-individual variability in clearance; limited information available in severe impairment).
- **Dose adjustments** Manufacturer advises consider dose reduction of 50% in mild to moderate impairment and of more than 50% in severe impairment.
- **RENAL IMPAIRMENT** Use with caution.
- **TREATMENT CESSION** Associated with a higher risk of withdrawal effects compared with other antidepressants. Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.
- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** May affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Modiﬁed-release tablet**

- **CAUTIONARY AND ADVISORY LABELS** 3, 21, 25
  - **Sunveniz XL** (Sun Pharmaceutical Industries Europe B.V.)
    - Venlafaxine (as Venlafaxine hydrochloride) 75 mg Sunveniz XL
      - 75 mg tablets | 30 tablet [PST] £11.10 DT = £2.60

ANTIDEPRESSANTS > SEROTONIN UPTAKE INHIBITORS

Trazodone hydrochloride

INDICATIONS AND DOSE
Depressive illness (particularly where sedation is required)

BY MOUTH
Adult: Initially 150 mg daily in divided doses, dose to be taken after food, alternatively initially 150 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only
Elderly: Initially 100 mg daily in divided doses, dose to be taken after food, alternatively initially 100 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only

Anxiety

BY MOUTH
Adult: 75 mg daily, increased if necessary to 300 mg daily

CONTRA-INDICATIONS Arhythmias; during the manic phase of bipolar disorder; heart block; immediate recovery period after myocardial infarction

CAUTIONS Cardiovascular disease; chronic constipation; diabetes; epilepsy; history of bipolar disorder; history of psychosis; hyperthyroidism (risk of arrhythmias); increased intra-ocular pressure; patients with a significant risk of suicide; phaeochromocytoma (risk of arrhythmias); prostatic hypertrophy; susceptibility to angle-closure glaucoma; urinary retention

CAUTIONS, FURTHER INFORMATION Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

INTERACTIONS Appendix 1: trazodone

SIDE-EFFECTS Agitation; agranulocytosis; alertness decreased; anaemia; anxiety; apathy; appetite abnormal; arrhythmias; arthralgia; asthenia; blood disorder; chest pain; confusion; constipation; delirium; delusions; diarrhoea; dizziness; drowsiness; dry mouth; dyspnoea; eosinophilia; fever; gastroenteritis; gastrointestinal discomfort; hallucination; headache; hepatic disorders; hyperhidrosis; hypersalivation; hypertension; hypogonadism; influenza like illness; jaundice (discontinue); leucopenia; libido decreased; mania; memory loss; movement disorders; myalgia; nasal congestion; nausea; neuroleptic malignant syndrome; oedema; pain; palpitations; paraesthesia; paralytic ileus; postural hypotension; priapism (discontinue); QT interval prolongation; seizure; serotonin syndrome; SIADH; skin reactions; sleep disorders; suicidal tendencies; syncope; taste altered; thrombocytopenia; tremor; urinary disorder; vertigo; vision blurred; vomiting; weight decreased; withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdose.

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1359.

PREGNANCY Avoid during first trimester—limited information available. Monitor infant for signs of withdrawal if used until delivery.

BREAST FEEDING The amount secreted into breast milk is too small to be harmful.

HEPATIC IMPAIRMENT Manufacturer advises caution, particularly in severe impairment (increased risk of side-effects).

RENAL IMPAIRMENT Use with caution in severe impairment.

TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is
increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricylic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Drowsiness may affect the performance of skilled tasks (e.g. driving).
  - Effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral solution**

- **CAUTIONARY AND ADVISORY LABELS** 3, 21
  - **Trazodone hydrochloride (Non-proprietary)**
    - **Trazodone hydrochloride 10 mg per 1 ml** Tracodone 50mg/5ml oral solution sugar free sugar-free | 120 ml (POM) £37.09–£80.00 DT + £37.09
    - **Trazodone hydrochloride 20 mg per 1 ml** Trazodone 100mg/5ml oral solution sugar free sugar-free | 120 ml (POM) £55.00–£195.60 DT + £175.30

**Antidepressants**

- **Tetracyclic Antidepressants**

  - **Mianserin hydrochloride**

    - **INDICATIONS AND DOSE**
      - **Depressive illness (particularly where sedation is required)**
        - **By mouth**
          - **Adult:** Initially 30–40 mg daily in divided doses, alternatively initially 30–40 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg
          - **Elderly:** Initially 30 mg daily in divided doses, alternatively initially 30 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg

    - **Contra-Indications**
      - Acute porphyrias p. 1058 • arrhythmias • during the manic phase of bipolar disorder • heart block • immediate recovery period after myocardial infarction

    - **CAUTIONS**
      - Cardiovascular disease • chronic constipation • diabetes • epilepsy • history of bipolar disorder • history of psychosis • hyperthyroidism (risk of arrhythmias) • increased intra-ocular pressure • patients with a significant risk of suicide • phaeochromocytoma (risk of arrhythmias) • prostatic hypertrophy • susceptibility to angle-closure glaucoma • urinary retention

Caution: Further information

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS**
  - Acid-base balance

- **SIDE-EFFECTS**
  - Agranulocytosis • arthritis • bone marrow disorders • breast abnormalities • diziness • granulocytopenia • gynaecomastia • hepatic disorders • hyperhidrosis • hyponatraemia • joint disorders • lactation in absence of pregnancy • leucopenia • mood altered • neuromuscular irritability • oedema • paranoid delusions • postural hypotension • psychosis • rash • seizure • sexual dysfunction • suicidal tendencies • tremor • withdrawal syndrome

Caution: Further information

The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

**Overdose**

The tricyclic-related antidepressant drugs may be associated with a lower risk of cardioexcitotoxicity in overdosage.

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypoesthesia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1359.

- **Pregnancy**

  - Avoid.

- **Breastfeeding**

  - The amount secreted into breast milk is too small to be harmful.

- **Hepatic Impairment**

  - Manufacturer advises caution; avoid in severe impairment.

- **Renal Impairment**

  - Dose adjustments Caution in renal impairment.

- **Monitoring Requirements**

  - A full blood count is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if fever, sore throat, stomatitis, or other signs of infection develop.

  - **Treatment Cessation**

    - Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

  - **Prescribing and Dispensing Information** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

  - **Patient and Carer Advice**

    - **Driving and skilled tasks** Drowsiness may affect the performance of skilled tasks (e.g. driving).

    - Effects of alcohol enhanced.

Mianserin hydrochloride 30 mg Mianserin 30mg tablets
28 tablet (PO) £33.45 DT + £30.82

Mirtazapine

DRUG ACTION Mirtazapine is a presynaptic alpha₂-adrenoreceptor antagonist which increases central noradrenergic and serotonergic neurotransmission.

INDICATIONS AND DOSE

Major depression

BY MOUTH

Adult: Initially 15–30 mg daily for 2–4 weeks, dose to be taken at bedtime, then adjusted according to response to up to 45 mg once daily, alternatively up to 45 mg daily in 2 divided doses

Caution

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

ANTIDEPRESSANTS TRICYCLIC

Antidepressants

Amitriptyline hydrochloride

INDICATIONS AND DOSE

Abdominal pain or discomfort (in patients who have not responded to laxatives, loperamide, or antispasmodics)

BY MOUTH

Adult: Initially 5–10 mg daily, to be taken at night; increased in steps of 10 mg at least every 2 weeks as required; maximum 30 mg per day

Major depressive disorder [not recommended—increased risk of fatality in overdose]

BY MOUTH

Adult: Initially 50 mg daily in 2 divided doses, then increased in steps of 25 mg once daily on alternate days if required, maximum 150 mg daily in 2 divided doses

Major depressive disorder in patients with cardiovascular disease [not recommended—increased risk of fatality in overdose]

BY MOUTH

Adult: Initially 10–25 mg daily, increased if necessary up to 100–150 mg daily in 2 divided doses, dose increases dependent on individual patient response and tolerability—doses above 100 mg should be used with caution

www.getintopharma.com
Neuropathic pain | Migraine prophylaxis | Chronic tension-type headache prophylaxis

- **BY MOUTH**
- **Adult:** Initially 10–25 mg daily, dose to be taken in the evening, then increased, if tolerated, in steps of 10–25 mg every 3–7 days in 1–2 divided doses; usual dose 25–75 mg daily, dose to be taken in the evening, doses above 100 mg should be used with caution (doses above 75 mg should be used with caution in the elderly and in patients with cardiovascular disease); maximum per dose 75 mg

- **UNLICENSED USE** Not licensed for use in abdominal pain or discomfort in patients who have not responded to laxatives, loperamide, or antispasmodics
- **CONTRA-INDICATIONS** Arrhythmias - during manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction
- **CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

**CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

**INTERACTIONS** → Appendix 1: tricyclic antidepressants

**SIDE-EFFECTS**

- **Common or very common** Anticholinergic syndrome · drowsiness · QT interval prolongation
- **Frequency not known** Agranulocytosis · alopecia · anxiety · appetite abnormal · arrhythmias · asthma · bone marrow depression · breast enlargement · cardiac conduction disorders · coma · concentration impaired · confusion · constipation · delirium · delusions · diarrhea · diziness · dry mouth · dysarthria · eosinophilia · epigastric distress · face oedema · galactorrhoea · gynaecomastia · hallucination · headache · hepatic disorders · hyperhidrosis · hyperepyrexia · hypertension · hypoponataemia · hypotension · leucopenia · mood altered · movement disorders · mydriasis · myocardial infarction · nausea · neuroleptic malignant syndrome · oral disorders · palpitations · paralytic ileus · peripheral neuropathy · photosensitivity reaction · seizure · sensation abnormal · sexual dysfunction · SIADH · skin reactions · sleep disorders · stroke · sudden cardiac death · suicidal tendencies · syncpe · taste altered · testicular swelling · thrombocytopenia · tinnitus · tremor · urinary disorders · urinary tract dilatation · vision disorders · vomiting · weight changes · withdrawal syndrome

**SIDE-EFFECTS, FURTHER INFORMATION** The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

**Overdose** Overdosage with amitriptyline is associated with a relatively high rate of fatality. Symptoms of overdosage may include dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning, see Tricyclic and related antidepressants, under Emergency treatment of poisoning p. 1359.

**PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment.
- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

**PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

**PATIENT AND CARER ADVICE** Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).

- Effects of alcohol enhanced.

**LESS SUITABLE FOR PRESCRIBING** Amitriptyline hydrochloride is less suitable for prescribing, see Tricyclic and related antidepressant drugs in Antidepressant drugs p. 359.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **INDICATIONS AND DOSE**
  - **Depressive illness**
    - **BY MOUTH**
      - **Adult:** Initially 10 mg daily, then increased if necessary to 30–150 mg daily in divided doses, dose to be increased gradually, alternatively increased if necessary to 30–150 mg once daily, dose to be taken at bedtime; maximum 250 mg per day
      - **Elderly:** Initially 10 mg daily, then increased to 30–75 mg daily, dose to be increased carefully over approximately 10 days
  - **Phobic and obsessional states**
    - **BY MOUTH**
      - **Adult:** Initially 25 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day
Mental health disorders

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058 - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intraocular pressure - patients with a significant risk of suicide - pheochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

- **CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.

- **INTERACTIONS** 
  - Appendix 1: tricyclic antidepressants

- **SIDE-EFFECTS**
  - Uncommon: Psychosis - seizure
  - Rare or very rare: Agranulocytosis - alopecia - cardiac conduction disorders - eosinophilia - glaucoma - hepatic disorders - hyperpyrexia - leucopenia - neuroleptic malignant syndrome - oedema - Q-T interval prolongation - respiratory disorders - thrombocytopenia - vaginal haemorrhage
  - Frequency not known: Rhabdomyolysis - serotonin syndrome - suicidal tendencies - withdrawal syndrome

- **SIDE-EFFECTS, FURTHER INFORMATION** The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop.

  The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 3 days). Consider using a lower starting dose in elderly patients.

- **OVERDOSE** Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hyperthermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1399.

- **PREGNANCY** Neonatal withdrawal symptoms reported if used during third trimester.

- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in severe impairment (risk of hypertensive crisis).

- **MONITORING REQUIREMENTS** Manufacturer advises monitor cardiac and hepatic function during long-term use.

- **TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

- **PATIENT AND CARER ADVICE** Driving and skilled tasks: Drowsiness may affect the performance of skilled tasks (e.g. driving).

  Effects of alcohol enhanced.

  - Clomipramine hydrochloride 10 mg
    - 28 capsule £6.72 OT £1.47
  - Clomipramine hydrochloride 25 mg
    - 28 capsule £9.36 OT £1.62
  - Clomipramine hydrochloride 50 mg
    - 28 capsule £11.76 OT £3.66

**Dosulepin hydrochloride**

- **INDICATIONS AND DOSE** Depressive illness, particularly where sedation is required (not recommended — increased risk of fatality in overdose) (initiated by a specialist)

  - **BY MOUTH**

    - Adult: Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)

    - Elderly: Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 75–150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058 - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intraocular pressure - patients with a significant risk of suicide - pheochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

- **CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.
Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1: tricyclic antidepressants

**SIDE-EFFECTS, FURTHER INFORMATION** The risk of side-effects are reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

**Overdose** Overdose with dosulepin is associated with a relatively high rate of fatality.

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **TREATMENT CESSION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 3 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge. (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

A maximum prescription equivalent to 2 weeks’ supply of 75 mg daily should be considered in patients with increased risk factors for suicide at initiation of treatment, during any dose adjustment, and until improvement occurs.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Drowsiness may affect the performance of skilled tasks (e.g. driving).
  - Effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Dosulepin hydrochloride is less suitable for prescribing, see Tricyclic and related antidepressant drugs in Antidepressant drugs p. 359.

**INDICATIONS AND DOSE** Depressive illness (particularly where sedation is required)

- **BY MOUTH**
  - Adult: Initially 75 mg daily in divided doses, alternatively 75 mg once daily, adjusted according to response, dose to taken at bedtime; maintenance 25–300 mg daily, doses above 100 mg given in 3 divided doses
  - Elderly: Start with lower doses and adjust according to response

**CONTRA-INDICATIONS** Acute porphyrias p. 1058 - arrhythmias - during manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

**CAUTIONS** Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperpyrexia (risk of arrhythmias) - increased intra-ocular pressure - patients with significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

**CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.

- Elderly Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1: tricyclic antidepressants

**SIDE-EFFECTS, FURTHER INFORMATION** The risk of side-effects is reduced by titrating slowly to the minimum effective dose.
effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

**Overdose** Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1359.

- **PREGNANCY** Use with caution—limited information available.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful. Accumulation of metabolite may cause sedation and respiratory depression in neonate.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. Dose adjustments Manufacturer advises consider dose reduction in mild to moderate impairment.
- **RENAI IMPAIRMENT** Use with caution.
- **TREATMENT CESSION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

**PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

    - tricyclic antidepressants
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

**Contra-indications** Immediate recovery period after myocardial infarction (in adults). Acute porphyria p. 1058 - arrhythmia - during the manic phase of bipolar disorder - heart block

- **CAUTIONS**
  - Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure (in adults) - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy (in adults) - susceptibility to angle-closure glaucoma - urinary retention

**CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS**
  - Appendix 1: tricyclic antidepressants

**SIDE-EFFECTS**

- **Common or very common** Anxiety - appetite decreased - arrhythmias - ashen skin - cardiac conduction disorders - confusion - delirium - depression - dizziness - drowsiness - epilepsy - hallucination - headache - hepatic disorders - hypotension - mood altered - nausea - palpitations - paraesthesia - sexual dysfunction - skin reactions - sleep disorder - tremor - vomiting - weight changes

- **Rare or very rare** Anticholinergic syndrome - cardiovascular effects - drug fever - hypotension - increased risk of fracture - neurological effects - paranoid delusions exacerbated - psychiatric disorder - suicidal tendencies - tinnitus - urinary disorder - withdrawal syndrome

**SIDE-EFFECTS, FURTHER INFORMATION** The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

**Overdose** Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1359.

- **PREGNANCY** Colic, tachycardia, dyspnoea, irritability, muscle spasms, respiratory depression and withdrawal
symptoms reported in neonates when used in the third trimester.

- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.

**TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic antidepressants should be withdrawn slowly.

**PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Imipramine for various conditions [www.medicinesforchildren.org.uk/imipramine-various-conditions](http://www.medicinesforchildren.org.uk/imipramine-various-conditions)

**Driving and skilled tasks** Drowsiness may affect the performance of skilled tasks (e.g. driving).

Effects of alcohol enhanced.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral solution**

### Lofepramine

**INDICATIONS AND DOSE**

**Depressive illness**

- **BY MOUTH**
  - Adult: 140–210 mg daily in divided doses
  - Elderly: May respond to lower doses

**CONTRA-INDICATIONS** Acute porphyrias p. 1058, arrhythmias · during the manic phase of bipolar disorder · heart block · immediate recovery period after myocardial infarction

**CAUTIONS** Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · increased intra-ocular pressure · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · prostatic hypertrophy · susceptibility to angle-closure glaucoma · urinary retention

**CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

**INTERACTIONS** → Appendix I: tricyclic antidepressants

**SIDE-EFFECTS** Accommodation disorder · agitation · agranulocytosis · arhythmias · bone marrow disorders · cardiac conduction disorder · confusion · constipation · coordination abnormal · dizziness · drowsiness · dry mouth · eosinophilia · face oedema · galactorrhoea · glaucoma · granulocytopenia · gynaecomastia · hallucination · headache · heart failure aggravated · hepatic disorders · hyperhidrosis (on discontinuation) · hypnataemia · hypotension · increased risk of fracture · leucopenia · malaise · mood altered · mucositis · nausea · paraesthesia · paranoid delusions · photosensitivity reaction · psychosis · respiratory depression · seizure · sexual dysfunction · SIADH · skin haemorrhage · skin reactions · sleep disorder · suicidal tendencies · taste altered · testicular disorders · thrombocytopenia · tinnitus · tremor · urinary disorders · vomiting · withdrawal syndrome

**SIDE-EFFECTS, FURTHER INFORMATION** The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

**Overdose** Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hyperthermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Lofepramine is associated with the lowest risk of fatality in overdose, in comparison with other tricyclic antidepressant drugs. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 3359.

**PREGNANCY** Neonatal withdrawal symptoms and respiratory depression reported if used during third trimester.

**BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT** Avoid in severe impairment.

**TREATMENT CESSATION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

**PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

Contraindications

Unlicensed use

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

Lofepramine (as Lofepramine hydrochloride) 14 mg per 1 ml Lofepramine 70mg/Sml oral suspension sugar free sugar-free | 150 ml PDP £30.00 DT £30.00

Tablet

Lofepramine (as Lofepramine hydrochloride) 70 mg Lofepramine 70mg tablets | SE tablet PDP £39.97 DT £117.41

Nortriptyline

INDICATIONS AND DOSE

Depressive illness

BY MOUTH

Adult: To be initiated at a low dose, then increased if necessary to 75–100 mg daily in divided doses, alternatively increased if necessary to 75–100 mg once daily; maximum 150 mg per day

Elderly: To be initiated at a low dose, then increased if necessary to 30–50 mg daily in divided doses

Neuropathic pain

BY MOUTH

Adult: Initially 10 mg once daily, to be taken at night, increased if necessary to 75 mg daily, dose to be increased gradually; higher doses to be given under specialist supervision

Unlicensed use

Not licensed for use in neuropathic pain.

Contra-indications

Arrhythmias during the manic phase of bipolar disorder; heart block; immediate recovery period after myocardial infarction

Cautions

Cardiovascular disease; chronic constipation; diabetes; epilepsy; history of bipolar disorder; history of psychosis; hyperthyroidism (risk of arrhythmias); increased intra-ocular pressure; patients with a significant risk of suicide; phaeochromocytoma (risk of arrhythmias); prostatic hypertrophy; susceptibility to angle-closure glaucoma; urinary retention

Cautions, further information

Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

Interactions

Appendix 1: tricyclic antidepressants

Side-effects

Agranulocytosis; alopecia; anxiety; appetite decreased; arrhythmias; asthenia; atroventricular block; bone marrow disorders; breast enlargement; confusion; constipation; delusions; diarrhoea; dizziness; drowsiness; drug cross-reactivity; drug fever; dry mouth; eosinophilia; fever; flushing; galactorrhoea; gastrointestinal discomfort; gynaecomastia; hallucination; headache; hepatic disorders; hyperhidrosis; hypertension; hypomania; hypotension; increased risk of fracture; increased risk of infection; malaise; movement disorders; mydriasis; myocardial infarction; nausea; oedema; oral disorders; palpitations; paralytic ileus; peripheral neuropathy; photophobia; photosensitivity reaction; psychosis exacerbated; seizure; sensation abnormal; sexual dysfunction; SIADH; skin reactions; sleep disorders; stroke; suicidal tendencies; taste altered; testicular swelling; thrombocytopenia; tinnitus; tremor; urinary disorders; urinary tract dilation; vision disorders; vomiting; weight changes

Side-effects, further information

The risk of side-effects is reduced by titrating slowly to the minimum effective dose (every 2–3 days). Consider using a lower starting dose in elderly patients.

Overdose

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1359.

Pregnancy

Use only if potential benefit outweighs risk.

Breast feeding

The amount secreted into breast milk is too small to be harmful.

Hepatic impairment

Manufacturer advises avoid in severe impairment.

Monitoring requirements

Manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain.

Treatment cessation

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

Prescribing and dispensing information

Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

Patient and carer advice

Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

Medicinal forms

Nortriptyline (as Nortriptyline hydrochloride) 50 mg Nortriptyline 50mg tablets | 30 tablet PDP £24.86 DT = £24.86

Trimipramine

INDICATIONS AND DOSE

Depressive illness (particularly where sedation required)

BY MOUTH

Adult: Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–300 mg daily

Elderly: Initially 10–25 mg 3 times a day, maintenance 75–150 mg daily

Contra-indications

Acute porphyrias p. 1058; arrhythmias during the manic phase of bipolar disorder

www.getintopharma.com
heart block - immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease • chronic constipation • diabetes • epilepsy • history of bipolar disorder • history of psychosis • hyperthyroidism (risk of arrhythmias) • increased intra-ocular pressure • patients with a significant risk of suicide • phaeochromocytoma (risk of arrhythmias) • prostatic hypertrophy • susceptibility to angle-closure glaucoma • urinary retention

**CAUTIONS, FURTHER INFORMATION** Treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

| CAUTIONARY AND ADVISORY LABELS 2 | Tramiprimine (as Tramiprimine maleate) 10 mg Tramiprimine 10mg tablets | 28 tablet | £19.18 DT = £17.95 |

**Capsule**

| CAUTIONARY AND ADVISORY LABELS 2 | Trimipramine (Non-proprietary) Tramiprimine (as Trimipramine maleate) 25 mg | Tramiprimine 25mg tablets | 28 tablet | £20.44 DT = £19.00 |

**Other Antidepressants**

**Tryptophan**

(L-Tryptophan)

- **DRUG ACTION** Tryptophan is an essential dietary amino acid, and is a precursor of serotonin; it re-establishes the inhibitory action of serotonin on the amygdaloid nuclei, thereby reducing feelings of anxiety and depression.

- **INDICATIONS AND DOSE** Treatment-resistant depression (used alone or as adjunct to other antidepressant drugs) (initiated under direction of hospital consultant)

  - **BY MOUTH**
    - Adult: 3 g 3 times a day; maximum 6 g per day

- **CONTRA-INDICATIONS** History of eosinophilia myalgia syndrome following use of tryptophan

- **INTERACTIONS** → Appendix 1: tryptophan

- **SIDE-EFFECTS** Asthenia • dizziness • drowsiness • eosinophilia myalgia syndrome • headache • myalgia • myopathy • nausea • oedema • suicidal tendencies

  - **SIDE-EFFECTS, FURTHER INFORMATION** If patients experience any symptoms of eosinophilia myalgia syndrome (EMS), manufacturer advises to withhold treatment until possibility of EMS is excluded.

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Manufacturer advises close monitoring for signs of suicidal thoughts, particularly in patients at high risk and during early treatment and dose changes.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be advised to seek medical advice immediately if any clinical worsening, suicidal thoughts, or unusual behaviour develops.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

**Capsule**

- **Optimax** (Intrapharm Laboratories Ltd) Tryptophan 500 mg Optimax 500mg capsules | 84 capsule | £42.00
**Vortioxetine**

**INDICATIONS AND DOSE**

- **Major depression**
  - Adult: Initially 10 mg once daily; adjusted according to response to 5–20 mg once daily
  - Elderly: Initially 5 mg once daily; increased if necessary up to 20 mg once daily

- **SIDE-EFFECTS**
  - **Common or very common** Abnormal dreams · constipation · diarrhoea · dizziness · nausea · pruritus · vomiting
  - **Uncommon** Flushing · night sweats
  - **Frequency not known** Hyponatraemia · neuroleptic malignant syndrome (discontinue if patient entering manic phase) · history of seizures · unstable epilepsy

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk — toxicity in animal studies. If used during the later stages of pregnancy, there is a risk of neonatal withdrawal symptoms and persistent pulmonary hypertension in the newborn.

- **BREAST FEEDING**
  - There is limited information available on breast feeding.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in severe impairment (no information available).

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution in severe impairment — limited information available.

- **TREATMENT CESSION**
  - Manufacturer advises treatment can be stopped abruptly, without need for gradual dose reduction.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Manufacturing advises patients and carers should be counselled on the effects on driving and performance of skilled tasks, especially when starting treatment or changing the dose.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Vortioxetine for treating major depressive episodes (November 2015) NICE TA367

Vortioxetine (Brintellix®) is recommended as an option for treating major depressive episodes in adults whose condition has responded inadequately to 2 antidepressants within the current episode.

Patients currently receiving vortioxetine whose disease does not meet the above criteria should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta367

**INTERACTIONS**

- **Frequency not known** Side-effects · serotonin (anxiolytic-like effects).

- **INTERACTIONS** → Appendix 1: vortioxetine

**CAUTIONS**

- Bleeding disorders · cirrhosis of the liver (risk of hyponatraemia) · elderly (risk of hyponatraemia) · history of mania (discontinue if patient entering manic phase) · history of seizures · unstable epilepsy

**MEDICINAL FORMS**

- **Tablet**
  - Brintellix (Lundbeck Ltd)
    - Vortioxetine (as Vortioxetine hydrobromide) 5 mg
      - 28 tablet (P) £27.72 OT = £27.72
    - Vortioxetine (as Vortioxetine hydrobromide) 10 mg
      - 28 tablet (P) £27.72 OT = £27.72
    - Vortioxetine (as Vortioxetine hydrobromide) 20 mg
      - 28 tablet (P) £27.72 OT = £27.72

**3.5 Inappropriate sexual behaviour**

**ANTIPSYCHOTICS > FIRST-GENERATION**

**Benperidol**

- **INDICATIONS AND DOSE**
  - Control of deviant antisocial sexual behaviour
    - **BY MOUTH**
      - Adult: 0.25–1.5 mg daily in divided doses, adjusted according to response, for debilitated patients, use elderly dose
      - Elderly: Initially 0.125–0.75 mg daily in divided doses, adjusted according to response

- **CONTRA-INDICATIONS**
  - CNS depression · comatose states · phaeochromocytoma

- **CAUTIONS**
  - Risk factors for stroke

- **INTERACTIONS** → Appendix 1: benperidol

- **SIDE-EFFECTS**
  - Appetite decreased · blood disorder · cardiac arrest · confusion · depression · dyspepsia · headache · hepatic disorders · hyperhidrosis · hypersalivation · hypertension · muscle rigidity · nausea · oculogyric crisis · oedema · oligomenorrhoea · paradoxical drug reaction · pruritus · psychiatric disorder · temperature regulation disorders · weight change

- **PREGNANCY**
  - Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary.

- **BREAST FEEDING**
  - There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution.

- **RENAL IMPAIRMENT**
  - **Dose adjustments** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises regular blood counts and liver function tests during long-term treatment.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - The proprietary name Benquil® has been used for benperidol tablets.

www.getintopharma.com
Psychoses and schizophrenia

3.6 Psychoses and schizophrenia

discussion and related disorders

Advice of Royal College of Psychiatrists on doses of antipsychotic drugs above BNF upper limit

Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is therefore unlicensed

Consider alternative approaches including adjuvant therapy and newer or second-generation antipsychotic drugs such as clozapine.

Bear in mind risk factors, including obesity; particular caution is indicated in older patients, especially those over 70.

Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).

Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse cardiac abnormality develops.

Increase dose slowly and not more often than once weekly.

Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.

Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

Important: When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be lower than the corresponding oral dose (owing to absence of first-pass effect), particularly if the patient is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for each route and should not imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least daily.

Antipsychotic drugs

Antipsychotic drugs are also known as ‘neuroleptics’ and (misleadingly) as ‘major tranquilisers’.

In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

Schizophrenia

The aim of treatment is to alleviate the suffering of the patient (and carer) and to improve social and cognitive functioning. Many patients require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Patients with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a patient with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

First-generation antipsychotic drugs

The first-generation antipsychotic drugs act predominantly by blocking dopamine D₂ receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The phenothiazine derivatives can be divided into 3 main groups:

Group 1: chlorpromazine hydrochloride p. 384, levomepromazine p. 441, and promazine hydrochloride p. 406, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.

Group 2: pericyazine p. 388, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.

Group 3: fluphenazine decanoate p. 392, perphenazine, prochlorperazine p. 389, and trifluoperazine p. 390, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

Butyrophenones (benperidol p. 380 and haloperidol p. 386) resemble the group 3 phenothiazines in their clinical properties. Thioxanthenes (flupentixol p. 385 and zuclopenthixol p. 391) have moderate sedative, antimuscarinic effects, and extrapyramidal effects.

Diphenylbutylpiperidines (pimozide p. 388) and the substituted benzamides (sulpiride p. 390) have reduced sedative, antimuscarinic, and extrapyramidal effects.

Second-generation antipsychotic drugs

The second-generation antipsychotic drugs (sometimes referred to as ‘atypical antipsychotic drugs’) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

Prescribing for the elderly

The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack (see Dementia p. 300). Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather.

It is recommended that:

Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.

Initial doses of antipsychotic drugs in elderly patients should be reduced (to half the adult dose or less), taking into account factors such as the patient’s weight, comorbidity, and concomitant medication.

Treatment should be reviewed regularly.

Prescribing of antipsychotic drugs in patients with learning disabilities

When prescribing for patients with learning disabilities who are prescribed antipsychotic drugs and who are not experiencing psychotic symptoms, the following considerations should be taken into account:

A reduction in dose or the discontinuation of long-term antipsychotic treatment;

Review of the patient’s condition after dose reduction or discontinuation of an antipsychotic drug;
• referral to a psychiatrist experienced in working with patients who have learning disabilities and mental health problems;
• annual documentation of the reasons for continuing a prescription if the antipsychotic is not reduced in dose or discontinued.

Side-effects of antipsychotic drugs
Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

Extrapyramidal symptoms
Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:
• parkinsonian symptoms (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
• dystonia (abnormal face and body movements) and dyskinesia, which occur more commonly in children or young adults and appear after only a few doses;
• akathisia (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
• tardive dyskinesia (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

Parkinsonian symptoms remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may unmask or worsen tardive dyskinesia.

Tardive dyskinesia is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

Hyperprolactinaemia
Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhea.

Sexual dysfunction
Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and alpha-1-adrenoceptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered.

Cardiovascular side-effects
Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred.

Hyperglycaemia and weight gain
Hyperglycaemia, and sometimes diabetes, can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain.

Hypotension and interference with temperature regulation
Hypotension and interference with temperature regulation are dose-related side-effects that are liable to cause dangerous falls and hypothermia or hyperthermia in the elderly. Clozapine, chlorpromazine, lurasidone, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients.

Neuroleptic malignant syndrome
Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

Blood dyscrasias
Perform blood counts if unexplained infection or fever develops.

Choice
There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 396), and response and tolerability to each antipsychotic drug varies markedly. There is no first-line antipsychotic drug which is suitable for all patients. Choice of antipsychotic medication is influenced by the patient’s medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects, weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

Negative symptoms
Second-generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

Extrapyramidal side-effects
Second-generation antipsychotic drugs should be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 395, clozapine, olanzapine p. 398, and quetiapine p. 401 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 394 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

QT interval
Aripiprazole has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride, clozapine, fluoxetine p. 385,
Diabetes
Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in patients with schizophrenia who take antipsychotic drugs. First-generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, fluphenazine decanoate and haloperidol p. 386 are lowest risk. Aminopropazine and pimiprazole have the lowest risk of diabetes of the second-generation antipsychotic drugs. Aminopropazine, aripiprazole, haloperidol, sulpiride, and trifluoperazine p. 390 are least likely to cause weight gain.

Sexual dysfunction and prolactin
The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole and quetiapine. Olanzapine may be considered if sexual dysfunction is judged to be secondary to hyperprolactinaemia. Hyperprolactinaemia is usually not clinically significant with aripiprazole, clozapine, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility.

Patients should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death.

Clozapine is licensed for the treatment of schizophrenia in patients unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks’ treatment to assess response. Patients must be registered with a clozapine patient monitoring service.

Monitoring
Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly.

Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs.

Other uses
Some antipsychotic drugs can be used for the treatment of nausea and vomiting, choreas, and motor tics. Chlorpromazine hydrochloride p. 384 and haloperidol p. 386 can be used for intractable hiccup. Benperidol p. 380 is used in deviant antisocial sexual behaviour but its value is not established.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine hydrochloride or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly.

Equivalent doses of oral antipsychotics
These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication. Equivalent daily dose of antipsychotic drug:

- Chlorpromazine 100 mg
- Clozapine 50 mg
- Haloperidol 2–3 mg
- Pimozide 2 mg
- Risperidone 0.5–1 mg
- Sulpiride 200 mg
- Trifluoperazine 5 mg

Important: These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

Dosage
After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. The Royal College of Psychiatrists has published advice on doses of antipsychotic drugs above BNF upper limit.

Antipsychotic depot injections
Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with second-generation antipsychotic depot preparations, such as risperidone p. 402 and olanzapine embonate p. 404.

Choice
There is no clear-cut division in the use of the conventional antipsychotics, but zuclopenthixol p. 391 may be suitable for the treatment of agitated or aggressive patients whereas flupenthixol decanoate p. 392 can cause over-excitement in such patients. Zuclopenthixol decanoate p. 394 may be more effective in preventing relapses than other conventional antipsychotic depot preparations. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

Dosage
Individual responses to neuroleptic drugs are variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient’s response.

Equivalent doses of depot antipsychotics

<table>

Important: These equivalences must not be extrapolated beyond the maximum dose for the drug.

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.
ANTIPSYCHOTICS

Antipsychotic drugs

- **CAUTIONS** Blood dyscrasias - cardiovascular disease - conditions predisposing to seizures - depression - diabetes (may raise blood glucose) - epilepsy - history of jaundice - myasthenia gravis - Parkinson’s disease (may be exacerbated) (in adults) - photosensitisation (may occur with higher dosages) - prostatic hypertrophy (in adults) - severe respiratory disease - susceptibility to angle-closure glaucoma

- **SIDE-EFFECTS**
  - Common or very common Agitation - amenorrhoea - arrhythmias - constipation - dizziness - drowsiness - dry mouth - erectile dysfunction - galactorrhoea - gynaecomastia - hyperprolactinaemia - hypertension (dose-related) - insomnia - leucopenia - movement disorders - neutropenia - parkinsonism - QT interval prolongation - rash - seizure - tremor - urinary retention - vomiting - weight increased
  - Uncommon Agranulocytosis - embolism and thrombosis - neuroleptic malignant syndrome (discontinue—potentially fatal)
  - Rare or very rare Sudden death - withdrawal syndrome neonatal

- **SIDE-EFFECTS, FURTHER INFORMATION**
  For depot antipsychotics—side-effects may persist until the drug has been cleared from its depot site.

- **Overdose** Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. For details on the management of poisoning see Antipsychotics under Emergency treatment of poisoning p. 1359.

- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypotonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.

- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.

- **MONITORING REQUIREMENTS**
  - It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).
  - Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.
  - In children Regular clinical monitoring of endocrine function should be considered when children are taking an antipsychotic drug known to increase prolactin levels; this includes measuring weight and height, assessing sexual maturation, and monitoring menstrual function.

- **TREATMENT CESSATION** There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.

- **PATIENT AND CARER ADVICE** As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

**Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

---

**ANTIPSYCHOTICS › FIRST-GENERATION**

| Chlorpromazine hydrochloride | 09-Jul-2018 |

- **INDICATIONS AND DOSE**
  - Schizophrenia and other psychoses | Mania | Short-term adjunctive management of severe anxiety | Psychomotor agitation, excitement, and violent or dangerously impulsive behaviour
  - **BY MOUTH**
    - Adult: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily, this dose may be required in psychoses; use a third to half adult dose in the elderly or debilitated patients
  - **BY RECTUM**
    - Adult: 100 mg every 6–8 hours, dose expressed as chlorpromazine base

  - **Intractable hiccup**
    - **BY MOUTH**
      - Adult: 25–50 mg 3–4 times a day
    - **Relief of acute symptoms of psychoses (under expert supervision)**
      - **BY DEEP INTRAMUSCULAR INJECTION**
        - Adult: 25–50 mg every 6–8 hours
    - **Nausea and vomiting in palliative care (where other drugs have failed or are not available)**
      - **BY MOUTH**
        - Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day
        - Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day
        - Child 12–17 years: 10–25 mg every 4–6 hours
        - Adult: 10–25 mg every 4–6 hours
      - **BY DEEP INTRAMUSCULAR INJECTION**
        - Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day
        - Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day
        - Child 12–17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops
        - Adult: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops
      - **BY RECTUM**
        - Adult: 100 mg every 6–8 hours
  - **DOSE EQUIVALENCE AND CONVERSION**
    - For equivalent therapeutic effect 100 mg chlorpromazine base given rectally as a suppository ≡ 20–25 mg chlorpromazine hydrochloride by intramuscular injection ≡ 40–50 mg of chlorpromazine base or hydrochloride given by mouth.
Psychoses and schizophrenia 385

Flupentixol
(Flupentixol)

23-Jul-2018

Nervous System

Flupentixol

INDICATIONS AND DOSE

Schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity

BY MOUTH

Adult: Initially 3–9 mg twice daily, adjusted according to response, for debilitated patients, use elderly dose; maximum 18 mg per day

Elderly: Initially 0.75–4.5 mg twice daily, adjusted according to response

Depressive illness

BY MOUTH

Adult: Initially 1 mg once daily, dose to be taken in the morning, increased if necessary to 2 mg after 1 week, doses above 2 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 3 mg per day

Elderly: Initially 500 micrograms daily, dose to be taken in the morning, then increased if necessary to 1 mg after 1 week, doses above 1 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 1.5 mg per day

CONTRA-INDICATIONS

Circulatory collapse - CNS depression - comatose states - excitable patients - impaired consciousness - overactive patients - pheochromocytoma

CAUTIONS

Cardiac disorders - cardiovascular disease - cerebral arteriosclerosis - elderly - hyperthyroidism - hypothyroidism - parkinsonism - QT-interval prolongation - senile confusional states

INTERATIONS

Appendix 1: flupentixol

SIDE-EFFECTS

Common or very common

- Anxiety - glucose tolerance impaired - mood altered - muscle tone increased

Frequency not known

- Accommodation disorder - angioedema - atroventricular block - cardiac arrest - eye deposit - eye disorders - gastrointestinal disorders - hepatic disorders - hyperglycaemia - hypertglycicrideriaemia - hyponatraemia - photosensitivity reaction - respiratory disorders - sexual dysfunction - SIADH - skin reactions - systemic lupus erythematosus (SLE) - temperature regulation disorder - trismus

SIDE-EFFECTS, FURTHER INFORMATION

Acute dystonic reactions may occur; children are particularly susceptible.

HEPATIC IMPAIRMENT

Manufacturer advises caution in severe hepatic failure (increased risk of accumulation).

RENAI IMPAIRMENT

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MONITORING REQUIREMENTS

With intramuscular use Patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection.

PARIS CRITICATING INFORMATION

Palliative care For further information on the use of chlorpromazine hydrochloride in palliative care, see www.medicinescomplete.com/#content/palliative/antipsychotics.

HANDLING AND STORAGE

Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

MEDIHCIAL FORMS
