There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, suppository

Tablet

CAUTIONARY AND ADVISORY LABELS

BY MOUTH

Chlorpromazine hydrochloride (Non-proprietary)

Chlorpromazine hydrochloride 25 mg Chlorpromazine 25mg tablets | 28 tablet (Pres) £4.78 DT = £41.72
Chlorpromazine hydrochloride 50 mg Chlorpromazine 50mg tablets | 28 tablet (Pres) £48.00 DT = £41.81
Chlorpromazine hydrochloride 100 mg Chlorpromazine 100mg tablets | 28 tablet (Pres) £46.25 DT = £41.56

Solution for injection

Largactil (Sanofi)

Chlorpromazine hydrochloride 25 mg per 1 ml Largactil 50mg/2ml solution for injection ampoules | 10 ampoule (Pres) £7.51

Oral solution

CAUTIONARY AND ADVISORY LABELS

Largactil (Sanofi)

Chlorpromazine hydrochloride 5 mg per 1 ml Chlorpromazine 25mg/5ml syrup | 150 ml (Pres) £2.35 DT = £3.35
Chlorpromazine hydrochloride 25mg/5ml oral solution sugar free - sugar free | 150 ml (Pres) £2.35 DT = £2.35
Chlorpromazine hydrochloride 25mg/5ml oral solution | 150 ml (Pres) £2.35 DT = £2.35
Chlorpromazine hydrochloride 20 mg per 1 ml Chlorpromazine 100mg/5ml oral solution | 150 ml (Pres) £5.50 DT = £5.50

www.getintopharma.com
Haloperidol

**INDICATIONS AND DOSE**

**Prophylaxis of postoperative nausea and vomiting [in patients at moderate to high risk and when alternatives ineffective or not tolerated]**
- By Intramuscular Injection
  - Adult: 1–2 mg, to be given at induction or 30 minutes before the end of anaesthesia
  - Elderly: 500 micrograms, to be given at induction or 30 minutes before the end of anaesthesia

**Combination treatment of postoperative nausea and vomiting [when alternatives ineffective or not tolerated]**
- By Intramuscular Injection
  - Adult: 1–2 mg
  - Elderly: 500 micrograms

**Nausea and vomiting in palliative care**
- By Mouth
  - Adult: Initially 1.5 mg 1–2 times a day, increased if necessary to 5–10 mg daily in divided doses
  - By Subcutaneous Infusion
    - Adult: 2.5–10 mg/24 hours

**Schizophrenia and schizoaffective disorder**
- By Mouth
  - Adult: 2–10 mg daily in 1–2 divided doses; usual dose 2–4 mg daily, in first-episode schizophrenia, up to 10 mg daily, in multiple-episode schizophrenia, dose adjusted according to response at intervals of 1–7 days. Individual benefit-risk should be assessed when considering doses above 10 mg daily; maximum 20 mg per day
  - Elderly: Initially, use half the lowest adult dose, then adjust gradually according to response up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk

**Acute delirium [when non-pharmacological treatments ineffective]**
- By Mouth
  - Adult: 1–10 mg daily in 1–3 divided doses, treatment should be started at the lowest possible dose and adjusted in increments at 2–4 hourly intervals if required; maximum 10 mg per day
  - Elderly: Initially, use half the lowest adult dose, then adjust gradually according to response up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk
- By Intramuscular Injection
  - Adult: 1–10 mg, treatment should be started at the lowest possible dose and adjusted in increments at 2–4 hourly intervals if required; maximum 10 mg per day
  - Elderly: Initially 500 micrograms, dose adjusted gradually according to response up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk

**Moderate to severe manic episodes associated with bipolar I disorder**
- By Mouth
  - Adult: 2–10 mg daily in 1–2 divided doses, dose adjusted according to response at intervals of 1–3 days.
Mild to moderate chorea in Huntington’s disease [when alternatives ineffective or not tolerated and oral therapy inappropriate]
- **BY INTRAMUSCULAR INJECTION**
  - Adult: 2–5 mg, dose may be repeated hourly if required; maximum 10 mg per day.
  - Elderly: Initially 1 mg, dose may be repeated hourly if required up to maximum 5 mg daily, doses above 5 mg daily should only be considered in patients who have tolerated higher doses and after reassessment of the individual benefit-risk

### Restlessness and confusion in palliative care
- **BY MOUTH**
  - Adult: 2 mg, then 2 mg every 2 hours if required
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 2.5 mg, then 2.5 mg every 2 hours if required
  - **BY SUBCUTANEOUS INFUSION**
  - Adult: 5–15 mg/24 hours

### UNLICENSED USE
Not licensed for use in palliative care.

### IMPORTANT SAFETY INFORMATION
When prescribing, dispensing or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

### CONTRA-INDICATIONS
- CNS depression - comatose states - congenital long QT syndrome - dementia with Lewy bodies - history of torsade de pointes - history of ventricular arrhythmia - Parkinson’s disease - progressive supranuclear palsy - QTC-interval prolongation - recent acute myocardial infarction - uncompensated heart failure - uncorrected hypokalaemia

### CAUTIONS
- Bradycardia - electrolyte disturbances (correct before treatment initiation) - family history of QTC-interval prolongation - history of heavy alcohol exposure - hyperthyroidism - hypotension (including orthostatic hypotension) - lactation - dependent tumours - prolactin - risk factors for stroke

### INTERACTIONS
- Appendix 1: haloperidol

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS
- Common or very common Depression - eye disorders - headache - hypersalivation - nausea - neuromuscular dysfunctions - psychiatric disorder - vision disorders - weight decreased

#### Uncommon
- Breast abnormalities - confusion - dysphoria - gait abnormal - hepatic disorders - hyperhidrosis - menstrual cycle irregularity - muscle complaints - musculoskeletal stiffness - oedema - photosensitivity - reaction - restlessness - sexual dysfunction - skin reactions - temperature regulation disorders

#### Rare or very rare
- Hypoglycaemia - respiratory disorders - SIADH - tinnitus

#### Frequency not known
- Hypersensitivity vasculitis - pancytopenia - rhabdomyolysis - thrombocytopenia

### SPECIFIC SIDE-EFFECTS
- With oral use Angioedema
- With parenteral use Hypertension - severe cutaneous adverse reactions (SCARs)

### SIDE-EFFECTS, FURTHER INFORMATION
Haloperidol is a less sedating antipsychotic.

### PREGNANCY
Manufacturer advises it is preferable to avoid—moderate amount of data indicate no malformative or fetal/neonatal toxicity, however there are isolated case reports of birth defects following fetal exposure, mostly in combination with other drugs; reproductive toxicity shown in animal studies.

### HEPATIC IMPAIRMENT
Manufacturer advises caution.

#### Dose adjustments
Manufacturer advises halve initial dose and then adjust if necessary with smaller increments and at longer intervals.

### RENAL IMPAIRMENT
Manufacturer advises use with caution.

#### Dose adjustments
Manufacturer advises consider lower initial dose in severe impairment and then adjust if necessary with smaller increments and at longer intervals.

### MONITORING REQUIREMENTS
- Manufacturer advises monitor electrolytes before treatment initiation and periodically during treatment.
- Manufacturer advises perform ECG before treatment initiation and assess need for further ECGs during treatment on an individual basis; continuous ECG monitoring is recommended for repeated intramuscular doses, and for up to 6 hours after administration of intramuscular doses for prophylaxis or treatment of postoperative nausea and vomiting.

### PRESCRIBING AND DISPENSING INFORMATION

#### Palliative Care
For further information on the use of haloperidol in palliative care, see www.medicinescomplete.com/#/content/palliative/haloperidol.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Tablet

#### CAUTIONARY AND ADVISORY LABELS
- Haloperidol (Non-proprietary)
  - Haloperidol 500 microgram Haloperidol 500microgram tablets | 28 tablet (Pst) £22.05-$30.00 DT = £29.59
  - Haloperidol 1.5 mg Haloperidol 1.5mg tablets | 28 tablet (Pst) £15.10 DT = £15.10
  - Haloperidol 5 mg Haloperidol 5mg tablets | 28 tablet (Pst) £16.58 DT = £16.50
  - Haloperidol 10 mg Haloperidol 10mg tablets | 28 tablet (Pst) £19.85 DT = £19.36

### Solution for injection
- Haloperidol (Non-proprietary)
  - Haloperidol 5 mg per 1 ml Haloperidol 5mg/1ml solution for injection ampoules | 10 ampoule (Pst) £35.00 DT = £35.00

### Oral solution

#### CAUTIONARY AND ADVISORY LABELS
- Haloperidol (Non-proprietary)
  - Haloperidol 1 mg per 1 ml Haloperidol 5mg/5ml oral solution sugar free sugar free | 100 ml (Pst) £35.99 DT = £8.47 sugar-free | 500 ml (Pst) £20.25
  - Haloperidol 2 mg per 1 ml Haloperidol 10mg/5ml oral solution sugar free sugar-free | 100 ml (Pst) £46.75 DT = £10.29 sugar-free | 500 ml (Pst) £55.50
  - Haldol (Janssen-Cilag Ltd)
    - Haloperidol 2 mg per 1 ml Haldol 2mg/ml oral solution sugar-free | 100 ml (Pst) £4.45 DT = £7.10
  - Halkid (Thame Laboratories Ltd)
    - Haloperidol 200 microgram per 1 ml Halkid 200micrograms/ml oral solution sugar-free | 100 ml (Pst) £89.90

### Capsule

#### CAUTIONARY AND ADVISORY LABELS
- Haloperidol (Non-proprietary)
  - Haloperidol 500 microgram Serenace 500microgram capsules | 30 capsule (Pst) £1.18 DT = £1.18

www.getintopharma.com
Loxapine

**DRUG ACTION** Loxapine is a dopamine D₂, and serotonin 5-HT₂A receptor antagonist. It also binds to noradrenergic, histaminergic, and cholinergic receptors.

**INDICATIONS AND DOSE** Rapid control of mild-to-moderate agitation in patients with schizophrenia or bipolar disorder (specialist supervision in hospital)

- **BY INHALATION**
  - Adult: 9.1 mg as a single dose, followed by 9.1 mg after 2 hours if required, alternatively 4.5 mg as a single dose, followed by 4.5 mg after 2 hours if required, lower dose may be given if more appropriate or if the higher dose not previously tolerated

**CONTRA-INDICATIONS** Acute respiratory symptoms - asthma - cardiovascular disease - cerebrovascular disease - chronic obstructive pulmonary disease - dehydradergic disease - hypotension - elderly patients (especially those with dementia-related psychosis) - hypovolaemia - risk of hypotension

**CAUTIONS** Bronchodilator treatment should be available during this time

**INTERACTIONS** → Appendix 1: loxapine

**SIDE-EFFECTS**
- **Common or very common** Fatigue - taste altered - throat irritation
- **Uncommon** Bronchospasm - ocugleryation - restlessness
- **Frequency not known** Dry eye - hyperpnea - syncope - vision blurred

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises to avoid for 48 hours after dose (express and discard milk produced during this time) - present in milk in animal studies.

**MONITORING REQUIREMENTS** Manufacturer advises to observe patient during the first hour after each dose for signs and symptoms of bronchospasm.

**DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to remove pull-tab and wait for green light to turn on (product must be used within 15 minutes of pulling tab); instruct patient to inhale through mouthpiece and then hold breath briefly. When green light turns off, this indicates the dose has been delivered.

**PRESCRIBING AND DISPENSING INFORMATION** Educational risk minimisation materials are available for health care professionals.

Adasuve® 4.5 mg inhalation powder may be difficult to obtain.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**
- **Adasuve (Galen Ltd)**
  - **Loxapine 9.1 mg** Adasuve 9.1mg/dose inhalation powder
    - 1 dose £6.30 (Hospital only)

Pericyazine (Pericazine)

**INDICATIONS AND DOSE**

**Schizophrenia | Psychoses**

- **BY MOUTH**
  - Adult: Initially 75 mg daily in divided doses, then increased in steps of 25 mg every week, adjusted according to response; maximum 300 mg per day
  - Elderly: Initially 15–30 mg daily in divided doses, then increased in steps of 25 mg every week, adjusted according to response; maximum 300 mg per day

**Short-term adjunctive management of severe anxiety, psychomotor agitation, and violent or dangerously impulsive behaviour**

- **BY MOUTH**
  - Adult: Initially 15–30 mg daily in 2 divided doses, adjusted according to response, larger dose to be taken at bedtime
  - Elderly: Initially 5–10 mg daily in 2 divided doses, adjusted according to response, larger dose to be taken at bedtime

**CONTRA-INDICATIONS** CNS depression - comatos states - phaeochromocytoma

**CAUTIONS** Hypothyroidism

**INTERACTIONS** → Appendix 1: phenothiazines

**SIDE-EFFECTS** Atioventricular block - cardiac arrest - consciousness impaired - contact dermatitis - glucose tolerance impaired - hepatic disorders - hyperglycaemia - hyperthermia - nasal congestion - priapism - respiratory depression

**HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

**RENAL IMPAIRMENT** Avoid in renal impairment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral solution**

Pimozide

**INDICATIONS AND DOSE**

**Schizophrenia**

- **BY MOUTH**
  - Adult: Initially 2 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily
  - Elderly: Initially 1 mg daily, adjusted according to response, increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily
**Prochlorperazine**

**INDICATIONS AND DOSE**

- **Schizophrenia and other psychoses** | **Mania**
  - **BY MOUTH**
    - Adult: 12.5 mg twice daily for 7 days, dose to be adjusted at intervals of 4–7 days according to response; usual dose 75–100 mg daily
    - **BY DEEP INTRAMUSCULAR INJECTION**
      - Adult: 12.5–25 mg 2–3 times a day

- **Short-term adjunctive management of severe anxiety**
  - **BY MOUTH**
    - Adult: 15–20 mg daily in divided doses; maximum 40 mg per day

- **Nausea and vomiting, acute attack**
  - **BY MOUTH**
    - Adult: Initially 20 mg, then 10 mg after 2 hours

- **SIDE-EFFECTS**

  - **Rare or very rare**
    - Muscle rigidity
    - Photosensitivity reaction
    - Skin

  - **Common or very common**
    - Appetite decreased
    - Depression
    - Fatigue
    - Headache
    - Hyperhidrosis
    - Hypersalivation
    - Muscle complaints
    - Restlessness
    - Sebaceous gland overactivity
    - Urinary disorders
    - Vision blurred

- **Frequency not known**

  - Cardiac arrest
  - Generalised tonic-clonic seizure
  - Glucose tolerance impaired
  - Muscle rigidity
  - Neuroleptic malignant syndrome
  - Orthostatic hypotension
  - Photosensitivity reaction
  - Skin
  - Sudden unexplained death

**CONTRA-INDICATIONS**

- CNS depression
- Comatose states
- History of arrhythmias
- History or family history of congenital QT prolongation
- Phaeochromocytoma

**INTERACTIONS**

- Appendix 1: phenothiazines

**SIDE-EFFECTS**

- **Common or very common**
  - Appetite decreased
  - Depression
  - Fatigue
  - Headache
  - Hyperhidrosis
  - Hypersalivation
  - Muscle complaints
  - Restlessness
  - Sebaceous gland overactivity
  - Urinary disorders
  - Vision blurred

- **Uncommon**
  - Dysarthria
  - Face oedema
  - Oclocyric crisis
  - Skin reactions

- **Frequency not known**

  - Cardiac arrest
  - Generalised tonic-clonic seizure
  - Glucose tolerance impaired
  - Muscle rigidity
  - Neuroleptic malignant syndrome
  - Orthostatic hypotension
  - Photosensitivity reaction
  - Skin
  - Sudden unexplained death

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution.

**RENAAL IMPAIRMENT**

- Dose adjustments: Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**MONITORING REQUIREMENTS**

- ECG monitoring: Following reports of sudden unexplained death, an ECG is recommended before treatment. It is also recommended that patients taking pimozide should have an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimalarials, antiarthymic drugs and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Tablet**

  - **CAUTIONARY AND ADVISORY LABELS**
    - 2
    - **Orap** (Eumedica Pharmaceuticals)

- **Pimozide 4 mg**
  - Orap 4 mg tablets | 100 tablet | £40.31 DT = £60.31

  - Orap 20 mg tablets | 100 tablet | £60.31 DT = £80.41

**REFERENCES**

- **BNF 78**

**PSYCHOTIC DISORDERS**

- **Nausea and vomiting, prevention**
  - **BY MOUTH**
    - Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

- **Nausea and vomiting, prevention**
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: 5–10 mg 2–3 times a day

- **Prevention and treatment of nausea and vomiting**
  - **BY MOUTH**
    - Child 1–4 years (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
    - Child 12–17 years: 5–10 mg up to 3 times a day if required

- **PROPHYLACTIC MANAGEMENT**
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Child 2–4 years: 1.25–2.5 mg up to 3 times a day if required
    - Child 5–11 years: 5–6.25 mg up to 3 times a day if required
    - Child 12–17 years: 12.5 mg up to 3 times a day if required

- **Labyrinthine disorders**
  - **BY MOUTH**
    - Adult: 5 mg 3 times a day, increased if necessary to 30 mg daily in divided doses, dose to be increased gradually, then reduced to 5–10 mg daily, dose is reduced after several weeks

- **Nausea and vomiting in previously diagnosed migraine**
  - **BY MOUTH USING BUCCAL TABLET**
    - Child 12–17 years: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve
    - Adult: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

- **DOSE EQUIVALENCE AND CONVERSION**
  - Doses are expressed as prochlorperazine maleate or prochlorperazine mesilate.
  - 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate

- **UNLICENSED USE**

- **CONTRA-INDICATIONS**
  - Avoid oral route in child under 10 kg
  - Children (in psychotic disorders) CNS depression
  - Comatose states
  - Phaeochromocytoma

- **CAUTIONS**

  - **GENERAL CAUTIONS**
    - Elderly: hypotension (more likely after intramuscular injection)

  - **SPECIFIC CAUTIONS**
    - With systemic use Hypothyroidism (in adults)

- **INTERACTIONS**
  - Appendix 1: phenothiazines

- **SIDE-EFFECTS**

  - **General side-effects**
    - Photosensitivity reaction
    - Skin

  - **Rare or very rare**
    - Glucose tolerance impaired
    - Hyperglycaemia
    - Hypoglycaemia
    - SIADH

  - **Frequency not known**

    - Photosensitivity reaction
    - Skin

  - **Specific side-effects**

    - Photosensitivity reaction
    - Skin
hyperthermia, jaundice, muscle rigidity, nasal congestion, oculogyric crisis, respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION

Acute dystonias are more common with potent first-generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naive patients, rapid dose escalation, and abrupt treatment discontinuation.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT**

  **Dose adjustments** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **DIRECTIONS FOR ADMINISTRATION**

  - With buccal use Buccal tablets are placed high between upper lip and gum and left to dissolve.
  - **PATIENT AND CARER ADVICE**

    - With buccal use Patients or carers should be given advice on how to administer prochlorperazine buccal tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - **CAUTIONARY AND ADVISORY LABELS 2**
    - Prochlorperazine (Non-proprietary) Prochlorperazine maleate 5 mg Prochlorperazine 5mg tablets | 28 tablet PG £1.98 DT = £0.73 | 84 tablet PG £2.10 DT = £0.58
    - Stemetil (Sanofi) Prochlorperazine maleate 5 mg Stemetil 5mg tablets | 28 tablet PG £1.98 DT = £0.73 | 84 tablet PG £5.94

  **Solution for injection**

    - Stemetil (Sanofi) Prochlorperazine mesilate 12.5 mg per 1 ml Stemetil 12.5mg/1ml solution for injection ampoules | 10 ampoule PG £5.23 DT = £5.23

      - Stemetil (Sanofi) Prochlorperazine mesilate 1 mg per 1 ml Stemetil 5mg/5ml syrup | 100 ml PG £3.34 DT = £3.34

**Sulpiride**

- **INDICATIONS AND DOSE**

  **Schizophrenia with predominantly negative symptoms**

    - **BY MOUTH**
      - Adult: 200–400 mg twice daily; maximum 800 mg per day
      - Elderly: Lower initial dose to be given, increased gradually according to response

  **Schizophrenia with mainly positive symptoms**

    - **BY MOUTH**
      - Adult: 200–400 mg twice daily; maximum 2.4 g per day
      - Elderly: Lower initial dose to be given, increased gradually according to response

- **CONTRA-INDICATIONS** CNS depression, comatose states, phaeochromocytoma

- **CAUTIONS** Aggressive patients (even low doses may aggravate symptoms) - agitated patients (even low doses may aggravate symptoms) - excited patients (even low doses may aggravate symptoms)

- **INTERACTIONS** Appendix 1: sulpiride

- **SIDE-EFFECTS**

  - **Common or very common** Breast abnormalities

  - **Uncommon**

    - Hypersalivation - muscle tone increased - orgasm abnormal

- **RARE OR VERY RARE**

  - Oculogyric crisis

  - Frequency not known Cardiac arrest - confusion - dyspnoea - hyponatraemia - SIADH - trismus - urticaria

- **RENAI IMPAIRMENT**

  **Dose adjustments** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MONITORING REQUIREMENTS** Sulpiride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include lemon and aniseed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Oral solution**

    - **CAUTIONARY AND ADVISORY LABELS 2**
      - Sulpiride (Non-proprietary) Sulpiride 40 mg per 1 ml Sulpiride 200mg/5ml oral solution sugar free sugar-free | 150 ml PG £31.00 DT = £31.00

  **Tablet**

    - **CAUTIONARY AND ADVISORY LABELS 2**
      - Sulpiride (Non-proprietary) Sulpiride 200 mg Sulpiride 200mg tablets | 30 tablet PG £8.70 DT = £4.40
      - Sulpiride 400 mg Sulpiride 400mg tablets | 30 tablet PG £23.50 DT = £11.80
      - Dolmatil (Sanofi) Sulpiride 200 mg Dolmatil 200mg tablets | 100 tablet PG £6.00
      - Sulpiride 400 mg Dolmatil 400mg tablets | 100 tablet PG £19.00

**Trifluoperazine**

- **INDICATIONS AND DOSE**

  **Schizophrenia and other psychoses: Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour**

    - **BY MOUTH**
      - Adult: Initially 5 mg twice daily, daily dose may be increased by 5 mg after 1 week. If necessary, dose may be further increased in steps of 5 mg at intervals of 3 days. When satisfactory control has been achieved, reduce gradually until an effective maintenance level has been established
      - Elderly: Initially up to 2.5 mg twice daily, daily dose may be increased by 5 mg after 1 week. If necessary, dose may be further increased in steps of 5 mg at intervals of 3 days. When satisfactory control has been achieved, reduce gradually until an effective maintenance level has been established

  **Short-term adjunctive management of severe anxiety**

    - **BY MOUTH**
      - Adult: 2–4 mg daily in divided doses, increased if necessary to 6 mg daily
      - Elderly: Up to 2 mg daily in divided doses, increased if necessary to 6 mg daily

  **Severe nausea and vomiting**

    - **BY MOUTH**
      - Adult: 2–4 mg daily in divided doses; maximum 6 mg per day

- **CONTRA-INDICATIONS** CNS depression, comatose states, phaeochromocytoma

- **INTERACTIONS** Appendix 1: phenothiazines

- **SIDE-EFFECTS** Alertness decreased - anxiety - appetite decreased - blood disorder - cardiac arrest - confusion - fatigue - hyperpyrexia - jaundice cholestatic - lens opacity - muscle weakness - oedema - pancytopenia - photosensitivity reaction - postural hypotension (dose-
related) · skin reactions · thrombocytopenia · urinary hesitation · vision blurred · withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION Extra pyramidal symptoms are more frequent at doses exceeding 6mg daily. Acute dystonias are more common with potent first generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naive patients, rapid dose escalation, and abrupt treatment discontinuation.

● HEPATIC IMPAIRMENT Manufacturer advises avoid.

● RENAL IMPAIRMENT
  Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● MONITORING REQUIREMENTS Trifluoperazine does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

  Trifluoperazine (Non-proprietary)
  Trifluoperazine (as Trifluoperazine hydrochloride) 1 mg Trifluoperazine 1mg tablets | 112 tablet £59.12–£99.80
  DT + £59.12
  Trifluoperazine (as Trifluoperazine hydrochloride) 5 mg Trifluoperazine 5mg tablets | 112 tablet £134.89–£165.00 DT + £134.89

Zuclopenthixol

● INDICATIONS AND DOSE
  Psychoses and schizophrenia
  | Short-term management of acute psychosis | Short-term management of mania | Short-term management of exacerbation of chronic psychosis

  BY MOUTH
  Adult: Initially 20–30 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg), for debilitated patients, use elderly dose
  Elderly: Initially 5–15 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg)

  CONTRA-INDICATIONS Apathetic states · CNS depression · comatose states · phaeochromocytoma · withdrawn states
  CAUTIONS Hyperthyroidism · hypothyroidism
  INTERACTIONS → Appendix 1: zuclopenthixol
  SIDE-EFFECTS Anxiety · appetite abnormal · asthenia · concentration impaired · confusion · depression · diarrhoea · dysphoria · eye disorders · fever · flatulence · gait abnormal · gastrointestinal discomfort · glucose tolerance impaired · headaches · hepatic disorders · hot flush · hyperacusia · hyperglycaemia · hyperhidrosis · hyperlipidaemia · hypersalivation · hypothermia · malaise · memory loss · muscle complaints · nasal congestion · nausea · neuromuscular dysfunction · pain · palpitations · paraesthesia · photosensitivity reaction · reflexes increased · seborrhoea · sexual dysfunction · skin reactions · sleep disorders · speech disorder · syncope · thirst · thrombocytopenia · tinnitus · urinary disorders · vertigo · vision disorders · vulvovaginal dryness · weight decreased · withdrawal syndrome
  HEPATIC IMPAIRMENT Can precipitate coma.

Dose adjustments Halve dose.
Monitoring Consider serum-level monitoring in patients with hepatic impairment.

● RENAL IMPAIRMENT
  Dose adjustments Halve dose in renal failure; smaller starting doses used in severe renal impairment because of increased cerebral sensitivity.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet
  CAUTIONARY AND ADVISORY LABELS 2
  Clopixol (Lundbeck Ltd)
  Zuclopenthixol (as Zuclopenthixol dihydrochloride) 2 mg Clopixol 2mg tablets | 100 tablet £3.14 DT + £3.14
  Zuclopenthixol (as Zuclopenthixol dihydrochloride) 10 mg Clopixol 10mg tablets | 100 tablet £8.06 DT + £8.06
  Zuclopenthixol (as Zuclopenthixol dihydrochloride) 25 mg Clopixol 25mg tablets | 100 tablet £16.13 DT + £16.13

Zuclopenthixol acetate

● INDICATIONS AND DOSE
  Short-term management of acute psychosis · Short-term management of mania · Short-term management of exacerbation of chronic psychosis

  BY DEEP INTRAMUSCULAR INJECTION
  Adult: 50–150 mg, then 50–150 mg after 2–3 days if required, (1 additional dose may be needed 1–2 days after the first injection); maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections; maximum duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate; to be administered into the gluteal muscle or lateral thigh
  Elderly: 50–100 mg, then 50–100 mg after 2–3 days if required, (1 additional dose may be needed 1–2 days after the first injection); maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections; maximum duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate; to be administered into the gluteal muscle or lateral thigh

IMPORTANT SAFETY INFORMATION
When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is usually used in hospital for an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

SAFE PRACTICE
Zuclopenthixol acetate has been confused with zuclopenthixol decanoate; care must be taken to ensure the correct drug is prescribed and dispensed.

● CONTRA-INDICATIONS CNS depression · comatose states · phaeochromocytoma
  CAUTIONS Hyperthyroidism · hypothyroidism
  INTERACTIONS → Appendix 1: zuclopenthixol
  SIDE-EFFECTS Anxiety · appetite abnormal · asthenia · concentration impaired · confusion · depression · diarrhoea · dysphoria · eye disorders · fever · flatulence · gait abnormal · gastrointestinal discomfort · glucose tolerance impaired · headaches · hepatic disorders · hot flush · hyperacusia · hyperglycaemia · hyperhidrosis · hyperlipidaemia · hypersalivation · hypothermia · malaise · memory loss · muscle complaints · nasal congestion · nausea · neuromuscular dysfunction · pain · palpitations · paraesthesia · photosensitivity reaction · reflexes increased · seborrhoea · sexual dysfunction · skin reactions · sleep disorders · speech disorder · syncope · thirst · thrombocytopenia · tinnitus · urinary disorders · vertigo · vision disorders · vulvovaginal dryness · weight decreased · withdrawal syndrome

HEPATIC IMPAIRMENT Can precipitate coma.

hyperglycaemia · hyperhidrosis · hyperlipidaemia · hypersalivation · hyperthermia (dose-related) · malaise · memory loss · muscle complaints · nasal congestion · nausea · neuromuscular dysfunction · pain · palpitations · paraesthesia · photosensitivity reaction · reflexes increased · seborrhoea · sexual dysfunction · skin reactions · sleep disorders · speech disorder · syncope · thirst · thrombocytopenia · tinnitus · urinary disorders · vertigo · vision disorders · vulvovaginal dryness · weight decreased · withdrawal syndrome

- **HEPATIC IMPAIRMENT** Can precipitate coma.

- **RENAL IMPAIRMENT** Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Clopiexol Acuphase (Lundbeck Ltd)
  - Flupentixol decanoate 20 mg per 1 ml
  - Flupentixol decanoate 50 mg per 1 ml
  - Flupentixol decanoate 100 mg per 1 ml
  - Flupentixol decanoate 200 mg per 1 ml

  **Flupentixol decanoate**

  (Flupentixol Decanoate)

  **INDICATIONS AND DOSE**

  Maintenance in schizophrenia and other psychoses

  - By deep intramuscular injection
    - Adult: Test dose 20 mg, dose to be injected into the upper outer buttock or lateral thigh, then 20–40 mg after at least 7 days, then 20–40 mg every 2–4 weeks, adjusted according to response, usual maintenance dose 50 mg every 4 weeks to 300 mg every 2 weeks; maximum 400 mg per week
    - Elderly: Dose is initially quarter to half adult dose

  **CONTRA-INDICATIONS** Children · CNS depression · comatose states · excitable patients · overactive patients · phaeochromocytoma

  **CAUTIONS** An alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear · hyperthyroidism · hypothyroidism · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

  **SIDE-EFFECTS**

  - Common or very common Appetite abnormal · asthenia · concentration impaired · depression · diarrhoea · dyspnoea · gastrointestinal discomfort · headache · hyperhidrosis · hypersalivation · muscle complaints · nervousness · palpitations · sexual dysfunction · skin reactions · urinary disorder · vision disorders
    - Uncommon Confusion · flatulence · hot flush · nausea · oculogyric reaction · photosensitivity reaction · speech disorder
    - Rare or very rare Glucose tolerance impaired · hyperglycaemia · jaundice · thrombocytopenia
    - Frequency not known Suicidal tendencies

  **SIDE-EFFECTS, FURTHER INFORMATION** Side-effects may persist until the drug has been cleared from its depot site.

  **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor serum drug concentration.

  **Dose adjustments** Manufacturer advises initiate at low dose orally to check for tolerability before switching to depot formulation.

- **RENAI IMPAIRMENT** Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MONITORING REQUIREMENTS** Treatment requires careful monitoring for optimum effect.

- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3 ml of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained—release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**

  - Depixol (Lundbeck Ltd)
  - Psytixol (Mylan)

  **Fluphenazine decanoate**

  (Fluphenazine Decanoate)

  **INDICATIONS AND DOSE**

  Maintenance in schizophrenia and other psychoses

  - By deep intramuscular injection
    - Adult: Test dose 12.5 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg after 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response
    - Elderly: Test dose 6.25 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg after 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response

  **CONTRA-INDICATIONS** Children · CNS depression · comatose states · marked cerebral atherosclerosis · phaeochromocytoma

  **CAUTIONS** Hypothyroidism · QT-interval prolongation · when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

  **INTERACTIONS** → Appendix 1: phenothiazines

  **SIDE-EFFECTS** Acute kidney injury · blood disorder · cognitive impairment · epileptiform seizure · headache · hepatic disorders · hyponatraemia · lens opacity · leucocytosis · nasal congestion · oculogyric crisis · oedema · oligomenorrhoea · sexual dysfunction · SADH · skin pigmentation change · systemic lupus erythematosus (SLE) · temperature regulation disorder · thrombocytopenia · urinary disorders · vision blurred

  **SIDE-EFFECTS, FURTHER INFORMATION** Side-effects may persist until the drug has been cleared from its depot site.

- **RENAL IMPAIRMENT** Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **HEPATIC IMPAIRMENT** Can precipitate coma.

- **RENAI IMPAIRMENT** Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

    - Frequency not known Suicidal tendencies

  **SIDE-EFFECTS, FURTHER INFORMATION** Side-effects may persist until the drug has been cleared from its depot site.

  **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor serum drug concentration.

  **Dose adjustments** Manufacturer advises initiate at low dose orally to check for tolerability before switching to depot formulation.
DOSE EQUIVALENCE AND CONVERSION

- A range of equivalent doses is quoted in the literature; the consensus is that 2 mg per day of oral haloperidol is approximately equivalent to 15 mg per week of haloperidol decanoate depot injection.

IMPORTANT SAFETY INFORMATION

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode.

CONTRA-INDICATIONS
- Children: CNS depression; comatose states; congenital long QT syndrome; dementia with Lewy bodies; history of torsade de pointes; history of ventricular arrhythmia; Parkinson’s disease; progressive supranuclear palsy; QT-interval prolongation; recent acute myocardial infarction; uncompensated heart failure; uncorrected hypokalaemia
- Bradycardia; electrolyte disturbances (correct before treatment initiation); family history of QTc-interval prolongation; history of heavy alcohol exposure; hyperthyroidism; hypothermia (including orthostatic hypotension); prolactin-dependent tumours; prolactinaemia; risk factors for stroke; when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

INTERACTIONS
- Appendix A: haloperidol
- Appendix B: further information

SIDE-EFFECTS
- Common or very common: Depression; hypersalivation; muscle complaints; sexual dysfunction
- Uncommon: Eye disorders; headache; neuromuscular dysfunction; vision disorders
- Frequency not known: Angioedema; breast abnormalities; cardiac arrest; confusion; dyspnoea; gait abnormal; hepatic disorders; hypoglycaemia; menorrhagia; menstrual cycle irregularities; musculoskeletal stiffness; nausea; oedema; pancytopenia; photosensitivity reaction; psychotic disorder; respiratory disorders; restlessness; rhabdomyolysis; SIADH; skin reactions; temperature regulation disorders; thrombocytopenia; trismus; weight decreased

SIDE-EFFECTS, FURTHER INFORMATION

Haloperidol is a less sedating antipsychotic.
- Pregnancy
  - Manufacturer advises caution.
  - Dose adjustments
    - Manufacturer advises halve initial dose and then adjust if necessary with smaller increments and at longer intervals.
- Hepatic impairment
  - Manufacturer advises caution.
  - Dose adjustments
    - Manufacturer advises consider lower initial dose in severe impairment and then adjust if necessary with smaller increments and at longer intervals.
- Renal impairment
  - Manufacturer advises use with caution.
  - Dose adjustments
    - Manufacturer advises consider lower initial dose in severe impairment and then adjust if necessary with smaller increments and at longer intervals.
- Monitoring requirements
  - Manufacturer advises perform ECG before treatment initiation and assess need for further ECGs during treatment on an individual basis.
  - Manufacturer advises monitor electrolytes before treatment initiation and periodically during treatment.
- Directions for administration
  - In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

**ANTIPSYCHOTICS > SECOND-GENERATION**

**Amisulpride**

- **DRUG ACTION** Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D₄ and D₃ receptors.

**INDICATIONS AND DOSE**

- **Acute psychotic episode in schizophrenia**
  - **BY MOUTH**
  - Adult: 400–800 mg daily in 2 divided doses, adjusted according to response; maximum 1.2 g per day

- **Schizophrenia with predominantly negative symptoms**
  - **BY MOUTH**
  - Adult: 50–300 mg daily

**CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma · prolactin-dependent tumours

**INTERACTIONS** → Appendix 1: amisulpride

**SIDE-EFFECTS**

- Common or very common
  - Anxiety · breast pain · hypersalivation · muscle rigidity · nausea · oculogyric crisis · orgasm abnormal · trismus
- Uncommon
  - Hyperglycaemia
- Frequency not known
  - Angioedema · bone disorders · cardiac arrest · confusion · dyslipidaemia · hyponatraemia · nasal congestion · neoplasms · SIADH · urticaria · vision blurred

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—no information available.

**RENAL IMPAIRMENT** No information available if eGFR less than 10 mL/minute/1.73 m².

**Dose adjustments** Halve dose if eGFR 30–60 mL/minute/1.73 m². Use one-third dose if eGFR 10–30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include caramel.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS** 2

- **Amisulpride (Non-proprietary)**
  - **Amisulpride 100 mg per 1 ml** Amisulpride 100mg/ml oral solution sugar free sugar-free | 60 ml £87.48 DT + £40.64

www.getintopharma.com
**Aripiprazole**

**DRUG ACTION** Aripiprazole is a dopamine D₂ partial agonist with weak 5-HT₁A partial agonism and 5-HT₂A receptor antagonism.

**INDICATIONS AND DOSE**

- **Maintenance of schizophrenia in patients stabilised with oral aripiprazole (CYP2D6 poor metabolisers)**
  - **By intramuscular injection**
    - Adult: 300 mg every month, to be injected into the gluteal or deltoid muscle, minimum of 26 days between injections, treatment with 10–20 mg oral aripiprazole daily should be continued for 14 consecutive days after the first injection, for dose adjustment due to side-effects and for advice on missed doses, consult product literature

- **Maintenance of schizophrenia in patients stabilised with oral aripiprazole**
  - **By intramuscular injection**
    - Adult: 400 mg every month, to be injected into the gluteal or deltoid muscle, minimum of 26 days between injections, treatment with 10–20 mg oral aripiprazole daily should be continued for 14 consecutive days after the first injection, for dose adjustment due to side-effects and for advice on missed doses, consult product literature

- **Schizophrenia**
  - **By mouth**
    - Adult: 10–15 mg once daily; usual dose 15 mg once daily (max. per dose 30 mg once daily)

- **Treatment and recurrence prevention of mania**
  - **By mouth**
    - Adult: 15 mg once daily, increased if necessary up to 30 mg once daily

- **Control of agitation and disturbed behaviour in schizophrenia**
  - **By intramuscular injection**
    - Adult: Initially 5.25–15 mg for 1 dose, alternatively usual dose 9.75 mg for 1 dose, followed by 5.25–15 mg after 2 hours if required, maximum 3 injections daily; maximum daily combined oral and parenteral dose 30 mg

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- With oral use Manufacturer advises reduce dose by half with concurrent use of potent inhibitors of CYP3A4 or CYP2D6.

- With intramuscular use For dose adjustments due to concurrent use of interacting drugs—consult product literature.

**IMPORTANT SAFETY INFORMATION**

When prescribing, dispensing, or administering, check that the correct preparation is used—the preparation usually used in hospital for the rapid control of an acute episode (solution for injection containing aripiprazole 7.5 mg/mL) should not be confused with depot preparations (aripiprazole 400-mg vial with solvent), which are usually used in the community or clinics for maintenance treatment.

- **CONTRA-INDICATIONS** CNS depression - comatose state - phaeochromocytoma

- **CAUTIONS**
  - **GENERAL CAUTIONS** Cerebrovascular disease - elderly (reduce initial dose)

- **SPECIFIC CAUTIONS**
  - With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

- **INTERACTIONS** → Appendix 1: aripiprazole

- **SIDE-EFFECTS**
  - **Common or very common** Anxiety - appetite abnormal - diabetes mellitus - fatigue - gastrointestinal discomfort - headache - hypersalivation - nausea - vision disorders
  - **Uncommon** Depression - hiccups - hyperglycaemia - sexual dysfunction

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (oral treatment preferred to intramuscular administration; limited information available).

- **MONITORING REQUIREMENTS**
  - Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
  - With intramuscular use Treatment requires careful monitoring for optimum effect.

- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
  - With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

- **PATIENT AND CARER ADVICE**
  - With oral use Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets.
Concepcion and contraception Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for at least 10 weeks after the last dose; addition of barrier method recommended in women using systemically-acting hormonal contraceptives.

Pregnancy Manufacturer advises avoid—toxicity in animal studies.

Breastfeeding Manufacturer advises avoid—present in milk in animal studies.

Hepatic impairment Manufacturer advises avoid in severe impairment (no information available).

Renal impairment Manufacturer advises avoid in severe impairment (no information available).

Medicinal forms There can be variation in the licensing of different medicines containing the same drug.

Clozapine

• Drug action Clozapine is a dopamine D2, dopamine D4, 5-HT2A, alpha-adrenoceptor, and muscarinic-receptor antagonist.

• Indications and dose Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

- By mouth
  - Adult 18–59 years: 12.5 mg 1–2 times a day for day 1, then 25–50 mg for day 2, then increased, if tolerated, in steps of 25–50 mg daily, up to 300 mg daily in divided doses, larger dose at bedtime; in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing
  - Adult 60 years and over: 12.5 mg once daily for day 1, then increased to 25–37.5 mg for day 2, then increased, if tolerated, in steps of up to 25 mg daily, up to 300 mg daily in divided doses, larger dose at bedtime; in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

Psychosis in Parkinson’s disease

- By mouth
  - Adult: 12.5 mg once daily, dose to be taken at bedtime, then increased in steps of 12.5 mg up to twice weekly, adjusted according to response; usual dose 25–37.5 mg
Psychoses and schizophrenia

once daily, dose to be taken at bedtime; increased in steps of 12.5 mg once weekly, this applies only in exceptional cases, increased if necessary up to 100 mg daily in 1–2 divided doses; Usual maximum 50 mg/24 hours

IMPORTANT SAFETY INFORMATION

Clozapine has been associated with varying degrees of impairment of intestinal peristalsis—see Cautions and Contra-indications for further information. Patients and their carers should be advised to seek immediate medical advice before taking the next dose of clozapine if constipation develops.

- **CONTRA-INDICATIONS**
  - Alcoholic and toxic psychoses
  - bone-marrow disorders - coma - drug intoxication - history of agranulocytosis - history of circulatory collapse - history of neuropaenia - paralytic ileus - severe cardiac disorders (e.g. myocarditis) - severe CNS depression - uncontrolled epilepsy

- **CAUTIONS**
  - Age over 60 years - prostatic hypertrophy - susceptibility to angle-closure glaucoma - taper off other antipsychotics before starting

**CAUTIONS, FURTHER INFORMATION**

- **Agranulocytosis** Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm$^3$ or if absolute neutrophil count below 1500/mm$^3$ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropaenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.
  - **Myocarditis and cardiomyopathy** Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.
  - Perform physical examination and take full medical history before starting
  - Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
  - Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
  - If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist
  - Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy
  - **Intestinal obstruction** Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

- **INTERACTIONS** → Appendix 1: clozapine
- **SIDE-EFFECTS**
  - **Common or very common** Appetite decreased - eosinophilia - fatigue - fever - headache - hypertension - leucocytosis - muscle complaints - nausea - oral disorders - postural hypotension (dose-related) - speech impairment - sweating abnormal - syncope - temperature regulation disorders - urinary disorders - vision blurred
  - **Rare or very rare** Anaemia - cardiac arrest - cardiac inflammation - cardiomyopathy - circulatory collapse - confusion - delirium - diabetes mellitus - dyslipidaemia - dysphagia - gastrointestinal disorders - glucose tolerance impaired - hepatic disorders - hyperglycaemia - increased risk of infection - intestinal obstruction (including fatal cases) - ketoadicosis - nephritis tubulointerstitial - obsessive-compulsive disorder - pancreatitis - pericardial effusion - respiratory disorders - restlessness - sexual dysfunction - skin reactions - thrombocytopenia - thrombocytosis
  - **Frequency not known** Angina pectoris - angiodema - chest pain - cholinergic syndrome - diarrhoea - gastrointestinal discomfort - hypersensitivity vasculitis - muscle weakness - myocardial infarction - nasal congestion - pseudopheochromocytoma - renal failure - systemic lupus erythematosus (SLE)

**SIDE-EFFECTS, FURTHER INFORMATION**

Hypersalivation associated with clozapine therapy can be treated with hycosine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hycosine and clozapine.

- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor liver function (discontinue if liver enzymes are greater than 3 times the upper limit of normal or jaundice occurs); avoid in symptomatic or progressive impairment and in hepatic failure.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
  - Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.
  - Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).
  - Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
  - Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4–6 months.
  - Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.

**TREATMENT CESSATION**

On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.

**DIRECTIONS FOR ADMINISTRATION**

Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.

**PRESCRIBING AND DISPENSING INFORMATION**

Clozapine has been used for psychosis in Parkinson’s disease in children aged 16 years and over.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer clozapine oral suspension.
Dose adjustments Manufacturer advises initially 18.5 mg once daily in moderate to severe impairment, increased if necessary up to 74 mg once daily in moderate impairment, or up to max. 37 mg once daily in severe impairment.

Renal impairment Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 15 mL/minute/1.73 m². Dose adjustments Initially 18.5 mg once daily, up to max. 74 mg once daily if eGFR less than 50 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION Patients on doses higher than 111 mg once daily whose treatment is interrupted for longer than 3 days should restart on 111 mg once daily and titrate to usual dose; for all other doses, restart on usual dose.

MEDICAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet CAUTIONARY AND ADVISORY LABELS 2, 10
- Lurasidone (as Lurasidone hydrochloride) 18.5 mg Latura 18.5mg tablets | 28 tablet (PO) £90.72 DT | £90.72
- Lurasidone (as Lurasidone hydrochloride) 37 mg Latura 37mg tablets | 28 tablet (PO) £90.72 DT | £90.72
- Lurasidone (as Lurasidone hydrochloride) 74 mg Latura 74mg tablets | 28 tablet (PO) £90.72 DT | £90.72

Olanzapine

DRUG ACTION Olanzapine is a dopamine D₆, D₇, 5-HT₁b, histamine-1-, and muscarinic-receptor antagonist.

INDICATIONS AND DOSE Schizophrenia | Combination therapy for mania
- BY MOUTH
  - Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Preventing recurrence in bipolar disorder
- BY MOUTH
  - Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Monotherapy for mania
- BY MOUTH
  - Adult: 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Control of agitation and disturbed behaviour in schizophrenia or mania
- BY INTRAMUSCULAR INJECTION
  - Adult: Initially 5–10 mg for 1 dose; usual dose 10 mg for 1 dose, followed by 5–10 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase
Elderly: Initially 2.5–5 mg, followed by 2.5–5 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase.

**CONTRA-INDICATIONS**
- With intramuscular use: Acute myocardial infarction - bradycardia - recent heart surgery - severe hypotension - sickle cell anemia - cor pulmonale - unstable angina

**CAUTIONS**
- Bone-marrow depression - hypersesosinophilic disorders - low leucocyte count - low neutrophil count - myeloproliferative disease - paralytic ileus

**FREQUENCY NOT KNOWN**
- With oral use
- With intramuscular use

**SPECIFIC SIDE-EFFECTS**
- CNS and respiratory depression
- With intramuscular use: Blood pressure, pulse and respiratory rate should be monitored for at least one hour between administration of olanzapine intramuscular injection and parenteral benzodiazepines.

**GENERAL SIDE-EFFECTS**
- Common or very common: Appetite increased - arthralgia - oedema
- Uncommon: Alopecia - epistaxis - memory loss
- Rare or very rare: Hepatic disorders - pancreatitis - rhabdomyolysis

**CAUTIONARY AND ADVISORY LABELS**
- Prescribing and dispensing information
- With intramuscular use: When prescribing, dispensing, or administering, check that this injection is the correct preparation — this preparation is usually used in hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

**PATIENT AND CARER ADVICE**
- Patients or carers should be given advice on how to administer orodispersible tablets.

**MEDITCINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2**

**Olanzapine (Non-proprietary)**
- Olanzapine 2.5 mg: Olanzapine 2.5 mg tablets | 28 tablet £\( \text{12.15} \times 28 \text{ (£0.437)} \)

Paliperidone

**DRUG ACTION** Paliperidone is a metabolite of risperidone.

### INDICATIONS AND DOSE

#### SCHIZOPHRENIA | Psychotic or manic symptoms of schizoaffective disorder

- **BY MOUTH**
  - Adult: 6 mg once daily, dose to be taken in the morning, then adjusted in steps of 3 mg if required, dose to be adjusted over at least 5 days; usual dose 3–12 mg daily

**ZALASTA** PRE-FILLED SYRINGES

Maintenance of schizophrenia in patients who are clinically stable on once-monthly intramuscular paliperidone

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: Initially 175–525 mg every 3 months, adjusted according to response, to be administered into the deltoid or gluteal muscle, dose is based on previous once-monthly intramuscular paliperidone and should be initiated in place of the next scheduled dose—consult product literature

**XEPLION** PRE-FILLED SYRINGES

Maintenance in schizophrenia in patients previously responsive to paliperidone or risperidone

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 150 mg for 1 dose on day 1, then 100 mg for 1 dose on day 8, to be injected into the deltoid muscle, dose subsequently adjusted at monthly intervals according to response; maintenance 75 mg once a month, alternatively maintenance 25–150 mg once a month, following the second dose, monthly maintenance doses can be administered into either the deltoid or gluteal muscle

### CAUTIONS

#### GENERAL CAUTIONS
Cataract surgery (risk of intraoperative floppy iris syndrome) • dementia with Lewy bodies • elderly patients with dementia • elderly patients with risk factors for stroke • predisposition to gastrointestinal obstruction • prolactin-dependent tumours

#### SPECIFIC CAUTIONS
- With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

### INTERACTIONS
- Appendix 1: paliperidone

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS
- Common or very common: Anxiety • appetite abnormal • asthenia • cardiac conduction disorders • cough • depression • diarrhoea • fever • gastrointestinal discomfort • headache • hyperglycaemia • hypertension • increased risk of infection • joint disorders • laryngeal pain • mood altered • nasal congestion • nausea • oral disorders • pain • skin reactions • vision disorders
- Uncommon: Alopecia • anaemia • breast abnormalities • chest discomfort • chills • conjunctivitis • cystitis • dry eye • dysarthria • dysphagia • dyspnoea • ear pain • epistaxis • fall • gait abnormal • gastrointestinal disorders • generalised tonic-clonic seizure • hypoglycaemia • induration • malaise • menstrual cycle irregularities • muscle spasms • muscle weakness • oedema • palpitations • respiratory disorders • sensation abnormal • sexual dysfunction • sleep disorders • syncope • taste altered • thirst • thombocytopenia • tinnitus • urinary disorders • vertigo
- Rare or very rare: Angioedema • cerebrovascular insufficiency • coma • consciousness impaired • dandruff • diabetic ketoacidosis • dysphonia • eye disorders • flushing • glaucoma • hypothermia • ischaemia • jaundice • pancreatitis • polydipsia • posture abnormal • rhabdomyolysis • SIADH • sleep apnoea • vaginal discharge • water intoxication • withdrawal syndrome

#### SPECIFIC SIDE-EFFECTS
- Common or very common:
  - With oral use: Weight decreased
  - Uncommon:
    - With oral use: Concentration impaired • confusion • diabetes mellitus
    - Frequency not known:
      - With intramuscular use: Injection site necrosis
      - PREGNANCY
        - Use only if potential benefit outweighs risk—toxicity in animal studies; if discontinuation during pregnancy is necessary, withdraw gradually
      - **TREVICTA** PRE-FILLED SYRINGES
        - Manufacturer advises to consider long-acting nature of formulation—paliperidone detected in plasma up to 18 months after single dose
      - **BREAST FEEDING**
        - Manufacturer advises avoid—present in milk
      - **TREVICTA** PRE-FILLED SYRINGES
        - Manufacturer advises to consider long-acting nature of formulation—paliperidone detected in plasma up to 18 months after single dose
      - **HEPATIC IMPAIRMENT**
        - Manufacturer advises caution in severe impairment (no information available)
      - **RENAL IMPAIRMENT**
        - With oral use: Manufacturer advises avoid if creatinine clearance less than 10 mL/minute
        - With intramuscular use: Manufacturer advises avoid if creatinine clearance less than 50 mL/minute
        - Dose adjustments:
          - With oral use: Manufacturer advises reduce initial dose to 3 mg once daily if creatinine clearance 50–80 mL/minute (max. 6 mg once daily). Manufacturer advises reduce initial dose to 1.5 mg once daily if creatinine clearance 10–50 mL/minute (max. 3 mg once daily)
      - **TREVICTA** PRE-FILLED SYRINGES
        - **DOSE ADJUSTMENTS**
          - Manufacturer advises initial dose 100 mg on day 1 and then 75 mg on day 8 if creatinine clearance 50–80 mL/minute; recommended maintenance dose 50 mg (range 25–100 mg) monthly if creatinine clearance 50–80 mL/minute

### MONITORING REQUIREMENTS
- With intramuscular use: Treatment requires careful monitoring for optimum effect

### DIRECTIONS FOR ADMINISTRATION
- With intramuscular use: Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential
With oral use. Always take with breakfast or always take on an empty stomach.

**PRESCRIBING AND DISPENSING INFORMATION**

**NEPHROLOGICAL FORMS**

With oral use. Always take with breakfast or always take on an empty stomach.

**PATIENT AND CARER ADVICE**

With oral use. Patients or carers should be given advice on how to administer paliperidone tablets.

**Missed doses**

With intramuscular use. For missed doses see product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

TREVICITA® PRE-FILLED SYRINGES

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium (SMC) has advised (September 2016) that paliperidone palmitate (Trevicta®) is accepted for use within NHS Scotland for the maintenance treatment of schizophrenia in patients who are clinically stable on one-monthly paliperidone palmitate injectable product.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Prolonged-release suspension for injection**

**Trevicta** (Janssen-Cilag Ltd)

Paliperidone (as Paliperidone palmitate) 200 mg per 1 ml Trevicta 175mg/0.875ml prolonged-release suspension for injection pre-filled syringes | 1 pre-filled disposable injection

Brazil: $51.76 DT + $551.76

Trevicta 263mg/1.315ml prolonged-release suspension for injection pre-filled syringes | 1 pre-filled disposable injection

Brazil: $734.70 DT + $734.70

Trevicta 350mg/1.75ml prolonged-release suspension for injection pre-filled syringes | 1 pre-filled disposable injection

Brazil: $942.21 DT + $942.21

Trevicta 525mg/2.625ml prolonged-release suspension for injection pre-filled syringes | 1 pre-filled disposable injection

Brazil: $1,177.77 DT + $1,177.77

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 2, 25

**Invega** (Janssen-Cilag Ltd)

Paliperidone 3 mg

Invega 3mg modified-release tablets | 28 tablet

Brazil: $97.28 DT + $97.28

Paliperidone 6 mg

Invega 6mg modified-release tablets | 28 tablet

Brazil: $97.28 DT + $97.28

**Invega** (Janssen-Cilag Ltd)

Paliperidone 9 mg

Invega 9mg modified-release tablets | 28 tablet

Brazil: $145.92 DT + $145.92

**Suspension for injection**

**Xeplion** (Janssen-Cilag Ltd)

Paliperidone (as Paliperidone palmitate) 100 mg per 1 ml Xeplion 150mg/1.5ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection

Brazil: $392.59 DT + $392.59

Xeplion 75mg/0.75ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection

Brazil: $244.90 DT + $244.90

Xeplion 100mg/1ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection

Brazil: $314.07 DT + $314.07

Xeplion 50mg/0.5ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection

Brazil: $183.92 DT + $183.92

**Quetiapine**

**DRUG ACTION**

Quetiapine is a dopamine D1, dopamine D2, 5-HT2, alpha-adrenergic, and histamine-1 receptor antagonist.

**INDICATIONS AND DOSE**

**Schizophrenia**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

Adult: 25 mg twice daily for day 1, then 50 mg twice daily for day 2, then 100 mg twice daily for day 3, then 150 mg twice daily for day 4, then, adjusted according to response, usual dose 300–450 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 750 mg per day.

**DOSE EQUIVALENCE AND CONVERSION**

Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

**CAUTIONS**

Cerebrovascular disease - elderly - patients at risk of aspiration pneumonia - treatment of depression in patients under 25 years (increased risk of suicide)

**INTERACTIONS**

Appendix 1: quetiapine

**Treatment of mania in bipolar disorder**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

Adult: 50 mg twice daily for day 1, then 100 mg twice daily for day 2, then 150 mg twice daily for day 3, then 200 mg twice daily for day 4, then adjusted in steps of up to 200 mg daily, adjusted according to response, usual dose 400–800 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 800 mg per day.

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 600 mg once daily, maximum dose under specialist supervision; maximum 800 mg per day.

Elderly: Initially 50 mg once daily, adjusted according to response, adjusted in steps of 50 mg daily.

**Treatment of depression in bipolar disorder**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

Adult: 50 mg once daily for day 1, then 100 mg once daily for day 2, then 150 mg twice daily for day 3, then 200 mg twice daily for day 4, then adjusted in steps of up to 200 mg daily, adjusted according to response, usual dose 400–800 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 800 mg per day.

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 400–800 mg once daily.

Elderly: Initially 50 mg once daily, adjusted according to response, adjusted in steps of 50 mg daily.

**Prevention of mania and depression in bipolar disorder**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg daily in 2 divided doses.

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg once daily.

**Adjuventive treatment of major depression**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

Adult: 50 mg once daily for 2 days, dose to be taken at bedtime, then 150 mg once daily for 2 days, then, adjusted according to response, usual dose 300–800 mg once daily.

Elderly: Initially 50 mg once daily for 3 days, then increased if necessary to 100 mg once daily for 4 days, then adjusted in steps of 50 mg, adjusted according to response, usual dose 50–300 mg once daily, dose of 300 mg should not be reached before day 22 of treatment.

**DOSE EQUIVALENCE AND CONVERSION**

Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

**CAUTIONS**

Cerebrovascular disease - elderly - patients at risk of aspiration pneumonia - treatment of depression in patients under 25 years (increased risk of suicide)

**INTERACTIONS**

Appendix 1: quetiapine
SIDE-EFFECTS

- Common or very common: Appetite increased, asthenia, dysarthria, dyspepsia, dysphonia, fever, headache, hyperglycaemia, irritability, palpititations, peripheral oedema, rhinitis, sleep disorders, suicidal behaviour (particularly on initiation), suicidal ideation (particularly on initiation), syncope, vision blurred, withdrawal syndrome

- Uncommon: Anaemia, diabetes mellitus, dysphagia, hypoglycaemia, hypotension, hyperthyroidism, sexual dysfunction, skin reactions, thrombocytopenia

- Rare or very rare: Angio-oedema, breast swelling, gastrointestinal disorders, hepatic disorders, hypothermia, menorrhagia, menstrual disorder, metabolic syndrome, pancreatitis, rhabdomyolysis, severe cutaneous adverse reactions (SCARs), SIADH

PREGNANCY

Use only if potential benefit outweighs risk.

BREAST FEEDING

Manufacturer advises avoid.

HEPATIC IMPAIRMENT

Manufacturer advises caution (risk of increased plasma concentrations).

Dose adjustments

Manufacturer advises for immediate-release tablets, initially 25 mg daily, increased daily in steps of 25–50 mg.

Manufacturer advises for modified-release tablets, initially 50 mg daily, increased daily in steps of 50 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder.

Modified-release tablet

Risperidone

- DRUG ACTION
  - Risperidone is a dopamine D2, 5-HT2A, alpha-, adrenoreceptor, and histamine-1 receptor antagonist.

- INDICATIONS AND DOSE
  - Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone up to 4 mg daily
  - By deep intramuscular injection
  - Adult: Initially 25 mg every 2 weeks, to be administered into the deltoid or gluteal muscle, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation
Psychoses and schizophrenia

Risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection.

Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone over 4 mg daily

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adults: Initially 37.5 mg every 2 weeks, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection.

Acute and chronic psychosis

- **BY MOUTH**
  - Adults: 2 mg daily in 1–2 divided doses for day 1, then 4 mg daily in 1–2 divided doses for day 2, slower titration is appropriate in some patients, usual dose 4–6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day.
  - Elderly: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily.

Mania

- **BY MOUTH**
  - Adults: Initially 2 mg once daily, then increased in steps of 1 mg daily if required; usual dose 1–6 mg daily.
  - Elderly: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily.

Short-term treatment (up to 6 weeks) of persistent aggression in patients with moderate to severe Alzheimer’s dementia unresponsive to non-pharmacological interventions and when there is a risk of harm to self or others

- **BY MOUTH**
  - Adults: Initially 250 micrograms twice daily, then increased in steps of 250 micrograms twice a day on alternate days, adjusted according to response; usual dose 500 micrograms twice daily (max. per dose 1 mg twice daily).

**IMPORTANT SAFETY INFORMATION**

SAFE PRACTICE

Risperidone has been confused with ropinirole; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS**
  - **GENERAL CAUTIONS** Avoid in Acute porphyrias p. 1058 - cataract surgery (risk of intra-operative floppy iris syndrome) - dehydration - dementia with Lewy bodies - prolactin-dependent tumours.
  - **SPECIFIC CAUTIONS**
    - With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually.
  - **INTERACTIONS**
    - **Appendix 1:** risperidone
  - **SIDE-EFFECTS**
    - **Common or very common** Anemia - anxiety - appetite abnormal - asthenia - chest discomfort - conjunctivitis - cough - depression - diarrhoea - dyspepsia - epistaxis - fall - fever - gastrointestinal discomfort - headache - hyperglycaemia - hypertension - increased risk of infection - joint disorders - laryngeal pain - muscle spasms - nasal congestion - nausea - oedema - oral disorders - pain - sexual dysfunction - skin reactions - sleep disorders - urinary disorders - vision disorders - weight decreased
    - **Uncommon** Alopecia - breast abnormalities - cardiac conduction disorders - cerebrovascular insufficiency - chills - coma - concentration impaired - confusion
    - **Rare or very rare** Angioedema - anaphylaxis - phlebitis - allergic drug reaction - agranulocytosis - aplastic anaemia - cyanosis - drowsiness - eczema - fever - gynecomastia - hives - transitory - hypoglycaemia - hyperthermia - jaundice - pancreatitis - peripheral coldness - rhabdomyolysis - SIADH - sleep apnoea - water intoxication - withdrawal syndrome.
    - **Frequency not known** Cardiac arrest.
    - **PREGNANCY** Use only if potential benefit outweighs risk.
    - **BREAST FEEDING** Use only if potential benefit outweighs risk—small amount present in milk.
    - **HEPATIC IMPAIRMENT** Manufacturer advises caution.
    - **Dose adjustments** With intramuscular use Manufacturer advises if an oral dose of at least 2 mg daily tolerated, 25 mg as a depot injection can be given every 2 weeks (no information available).
    - **With oral use** Manufacturer advises dose reduction to half the usual dose, and slower dose titration.
    - **RENAL IMPAIRMENT**
    - **Dose adjustments** Initial and subsequent oral doses should be reduced to half.
    - **MONITORING REQUIREMENTS**
    - **With intramuscular use** Treatment requires careful monitoring for optimum effect.
    - **DIRECTIONS FOR ADMINISTRATION**
    - **With oral use** Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed. Oral liquid may be diluted with any non-alcoholic drink, except tea.
    - **With intramuscular use** Correct injection technique (including the use of 2-track technique) and rotation of injection sites are essential.
    - **PATIENT AND CARER ADVICE**
    - **With oral use** Patients or carers should be given advice on how to administer risperidone orodispersible tablets and oral liquid (counselling on use of dose syringe advised).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2**

- **Risperidone (Non-proprietary)**

Olanzapine embonate

**INDICATIONS AND DOSE**

**Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 10 mg oral olanzapine daily)**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult 18-75 years: Initially 210 mg every 2 weeks, alternately initially 405 mg every 4 weeks, then maintenance 150 mg every 2 weeks, alternatively maintenance 300 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

**Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 20 mg oral olanzapine daily)**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: Initially 300 mg every 2 weeks, then maintenance 300 mg every 2 weeks (max. per dose 300 mg every 2 weeks), adjusted according to response, dose to be administered into the gluteal muscle,

**Consult product literature if supplementation with oral olanzapine required**

**IMPORTANT SAFETY INFORMATION**

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for **maintenance** treatment and should not be used for the rapid control of an acute episode.

- **CONTRA-INDICATIONS** Children
- **CAUTIONS** Bone-marrow depression - hyper eosinophilic disorders - low leucocyte count - low neutrophil count - myeloproliferative disease - paralytic ileus - when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** → Appendix 1: olanzapine
- **SIDE-EFFECTS**
  - Common or very common Anticholinergic syndrome - appetite increased - arthralgia - asthenia - eosinophilia - fever - glycosuria - oedema - sexual dysfunction
  - Rare or very rare Drug reaction with eosinophilia and systemic symptoms (DRESS) - hepatic disorders - hypothermia - pancreatitis - rhabdomyolysis - thrombocytopenia
  - Frequency not known Erythema - gait abnormal - increased risk of fall - pneumonia - visual hallucinations
  - **SIDE-EFFECTS, FURTHER INFORMATION** Side-effects may persist until the drug has been cleared from its depot site.

**Overdose** Post-injection reactions have been reported leading to signs and symptoms of overdose.

- **PREGNANCY** Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **Dose adjustments** Manufacturer advises consider initial dose of 150 mg every 4 weeks.

- **RENAL IMPAIRMENT**

- **Dose adjustments** Initially 150 mg every 4 weeks.

- **MONITORING REQUIREMENTS**

- **OBSERVE patient for at least 3 hours after injection.**

- **TREATMENT requires careful monitoring for optimum effect.**

- **Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.**

- **Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one months' treatment, then every 4–6 months.**

- **DIRECTIONS FOR ADMINISTRATION** Correct injection technique (including use of z-track technique) and rotation of injection sites are essential.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for suspension for injection**

  - **Zypadhera** (Eli Lilly and Company Ltd)
    - Olanzapine (as Olanzapine embonate monohydrate)
      - 210 mg Zypadhera 210mg powder and solvent for suspension for injection vials | 1 vial £142.76 DT = £142.76
      - Olanzapine (as Olanzapine embonate monohydrate)
      - 300 mg Zypadhera 300mg powder and solvent for suspension for injection vials | 1 vial £222.64 DT = £222.64

**www.getintopharma.com**
4 Movement disorders

Motor neurone disease

Description of condition
Motor neurone disease is a neurodegenerative condition affecting the brain and spinal cord. Degeneration of motor neurones leads to progressive muscle weakness; resulting symptoms include muscle cramps, wasting and stiffness, loss of dexterity, reduced respiratory function and cognitive dysfunction. The most common form is amyotrophic lateral sclerosis.

Patients suspected of having developed motor neurone disease should be referred to a neurologist without delay.

Aims of treatment
As there is no cure, treatment focuses on maintaining functional ability and managing symptoms.

Non-drug treatment
Non-drug treatment includes nutrition, psychosocial support, physiotherapy, exercise programmes and use of special equipment or mobility aids.

Management of symptoms

Muscular symptoms
Quinine p. 619 [unlicensed indication] is recommended as first line treatment for muscle cramps. If quinine is ineffective, not tolerated or contra-indicated, baclofen p. 1128 [unlicensed indication] should be considered as second line treatment. Subsequent treatment options include tizanidine p. 1129 [unlicensed indication], dantrolene sodium p. 1346 [unlicensed indication] or gabapentin p. 315 [unlicensed indication].

Symptoms of muscle stiffness, spasticity or increased tone can be managed with baclofen, tizanidine, dantrolene sodium or gabapentin [unlicensed indication]. Treatment of severe spasticity may require specialist referral.

Saliva problems
A trial of an antimuscarinic drug [unlicensed indication] can be considered for excessive drooling of saliva. Glycopyrronium bromide p. 1335 is recommended in patients who have cognitive impairment as it has fewer central nervous system side-effects. If initial treatment is ineffective, not tolerated or contra-indicated, referral for specialist administration of botulinum toxin type A p. 407 [unlicensed indication] may be required.

Humidification, nebulisers and carbocisteine p. 291 can be used to treat patients with thick, tenacious saliva.

Respiratory symptoms
Reversible causes of worsening respiratory impairment (such as respiratory tract infections or secretion problems) should be treated before considering other options.

Patients experiencing breathlessness can be treated with opioids [unlicensed indication], or benzodiazepines [unlicensed indication] if the patient’s symptoms are exacerbated by anxiety. Non-invasive ventilation should be considered in patients with respiratory impairment.

Amyotrophic lateral sclerosis
Riluzole p. 1123 is licensed for use in patients with amyotrophic lateral sclerosis to extend life or to extend the time to mechanical ventilation—see National funding/access decisions under riluzole.

Useful Resources

4.1 Dystonias and other involuntary movements

Essential tremor, chorea, tics, and related disorders

Drugs used in essential tremor, chorea, tics, and related disorders
Tetrabenazine p. 406 is mainly used to control movement disorders in Huntington’s chorea and related disorders. Tetrabenazine can also be prescribed for the treatment of tardive dyskinesia if switching or withdrawing the causative antipsychotic drug is not effective. It acts by depleting nerve endings of dopamine. It is effective in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol p. 386 [unlicensed indication], olanzapine p. 398 [unlicensed indication], risperidone p. 402 [unlicensed indication], and quetiapine p. 401 [unlicensed indication], can also be used to suppress chorea in Huntington’s disease.

Haloperidol can also improve motor tics and symptoms of Tourette syndrome and related choras. Other treatments for Tourette syndrome include pimozide p. 388 [unlicensed indication] (important: ECG monitoring required), clonidine hydrochloride p. 145 [unlicensed indication], and sulpiride p. 390 [unlicensed indication]. Trihexyphenidyl hydrochloride p. 412 in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks. Chlorpromazine hydrochloride p. 384 and haloperidol are used to relieve intractable hiccup. Propranolol hydrochloride p. 150 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis.

Primidone p. 336 in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

Piracetam p. 406 is used as an adjunctive treatment for myoclonus of cortical origin. After an acute episode, attempts should be made every 6 months to decrease or discontinue treatment.

Riluzole p. 1123 is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

Torsion dystonia and other involuntary movements

Treatment with botulinum toxin type A p. 407 can be considered after an acquired non-progressive brain injury if rapid-onset spasticity causes postural or functional difficulties.

Other drugs used for Dystonias and other involuntary movements
Clozapine, p. 396 • Diazepam, p. 343 • Orphenadrine hydrochloride, p. 411 • Pericyazine, p. 388 • Pramipexole, p. 422 • Prochlorperazine, p. 389 • Procyclidine hydrochloride, p. 411 • Rolipram, p. 424 • Rotigotine, p. 426 • Trifluoperazine, p. 390

www.getintopharma.com
**Antipsychotics > First-Generation**

**Promazine hydrochloride**

- **Indications and Dose**
  - Short-term adjunctive management of psychomotor agitation
    - **By Mouth**
      - Adult: 100–200 mg 4 times a day
      - Elderly: 25–50 mg 4 times a day

- **Contra-Indications**
  - CNS depression - comatose states - phaeochromocytoma

- **Caution**
  - Cerebral arteriosclerosis

- **Interactions**
  - Appendix 1: Phenothiazines

- **Side-Effects**

- **Hepatic Impairment**
  - Manufacturer advises caution.

- **Renal Impairment**
  - Dose adjustments: Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **Less Suitable for Prescribing**
  - Promazine hydrochloride is less suitable for prescribing.

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

  **Oral Solution**

  - Cautionary and Advisory Labels 2
    - Promazine hydrochloride (Non-proprietary)
    - Promazine hydrochloride 5 mg per 1 ml Promazine 25mg/5ml syrup | 150 ml £15.00 DT + £15.00
    - Promazine 25mg/5ml oral solution | 150 ml £15.00 DT + £15.00
    - Promazine hydrochloride 10 mg per 1 ml Promazine 50mg/5ml syrup | 150 ml £30.00 DT + £30.00
    - Promazine 50mg/5ml oral solution | 150 ml £30.00 DT + £30.00

  - Cautionary and Advisory Labels 2
    - Promazine hydrochloride (Non-proprietary)
    - Promazine hydrochloride 25 mg Promazine 25mg tablets | 100 tablet £49.99 DT + £45.34
    - Promazine hydrochloride 50 mg Promazine 50mg tablets | 100 tablet £78.49 DT + £76.18

**CNS Stimulants**

**Piracetam**

- **Indications and Dose**
  - Adjunctive treatment of cortical myoclonus
    - **By Mouth**
      - Adult: Initially 7.2 g daily in 2–3 divided doses, then increased in steps of 4.8 g every 3–4 days, adjusted according to response, subsequently, attempts should be made to reduce dose of concurrent therapy; maximum 24 g per day

  - **Contra-Indications**
    - Cerebral haemorrhage
    - Huntington’s chorea

**Monoamine Depleting Drugs**

**Tetrabenazine**

- **Indications and Dose**
  - Movement disorders due to Huntington’s chorea, hemiballismus, senile chorea, and related neurological conditions
    - **By Mouth**
      - Adult: Initially 25 mg 3 times a day, then increased, in steps of 25 mg every 3–4 days; maximum 200 mg per day
      - Elderly: Lower initial dose may be necessary
      - Moderate to severe tardive dyskinesia
        - **By Mouth**
          - Adult: Initially 12.5 mg daily, dose to be gradually increased according to response

- **Contra-Indications**
  - Depression - parkinsonism - phaeochromocytoma - prolactin-dependent tumours

- **Caution**
  - Susceptibility to QT-interval prolongation

- **Interactions**
  - Appendix 1: Tetrabenazine
Dystonias and other involuntary movements

- **SIDE-EFFECTS**

  - **Common or very common** Anxiety, confusion, constipation, depression, diarrhoea, drowsiness, hypotension, insomnia, nausea, parkinsonism, vomiting
  - **Uncommon** Consciousness impaired, hyperthermia
  - **Rare or very rare** Neuroleptic malignant syndrome, skeletal muscle damage
  - **Frequency not known** Bradycardia, dizziness, dry mouth, epigastric pain, suicidal ideation

- **PREGNANCY** Avoid unless essential—toxicity in animal studies.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of exposure), particularly in severe impairment (no information available).

- **RENAL IMPAIRMENT** Use with caution.

- **TREATMENT CESSION** Avoid abrupt withdrawal.

- **PATIENT AND CARER ADVICE** Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension Tablet

  **CAUTIONARY AND ADVISORY LABELS** 2

  - **Tetrabenazine (Non-proprietary)**
    - Tetrabenazine 25 mg: Tablet 112 tablet £107.69 DT = £107.69
    - Tetrabenazine 25 mg: Tablet 112 tablet PSL £100.00 DT = £107.69
  - **Xenazine (Alliance Pharmaceuticals Ltd)**
    - Tetrabenazine 25 mg: Tablet 112 tablet PSL £100.00 DT = £107.69

- **MUSCLE RELAXANTS** PERIPHERALLY ACTING NEUROTOXINS (BOUTULINUM TOXINS)

### Botulinum toxin type A

- **INDICATIONS AND DOSE**

  Treatment of focal spasticity (including hand and wrist disability associated with stroke) (specialist use only) • Blepharospasm (specialist use only) • Hemifacial spasm (specialist use only) • Spasmodic torticollis (specialist use only) • Severe hyperhidrosis of the axillae (specialist use only) • Prophylaxis of headaches in adults with chronic migraine (specialist use only) • Temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (specialist use only) • Ankle disability due to lower limb spasticity associated with stroke (specialist use only) • Management of bladder dysfunctions (specialist use only) • Temporary improvement of moderate to severe crow's feet (specialist use only)

  - **BY SUBCUTANEOUS INJECTION, OR BY INTRADERMAL INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - **Adults** (consult product literature)

  **DOSE EQUIVALENCE AND CONVERSION**

  **Important:** information is specific to each individual preparation.

- **CONTRA-INDICATIONS** Acute urinary retention (specific to use in bladder disorders only) • cathectisation difficulties (specific to use in bladder disorders only) • generalised disorders of muscle activity • infection at injection site • myasthenia gravis • presence of bladder calculi (specific to use in bladder disorders only) • urinary tract infection (specific to use in bladder disorders only)

- **CAUTIONS**

  **GENERAL CAUTIONS** Atrophy in target muscle • chronic respiratory disorder • elderly • excessive weakness in target muscle • history of aspiration • history of dysphagia • inflammation in target muscle • neurological disorders • neuromuscular disorders • off-label use (fateful adverse events reported)

  **SPECIFIC CAUTIONS**

  - When used for blepharospasm or hemifacial spasm Risk of angle-closure glaucoma

  **CAUTIONS, FURTHER INFORMATION** Neuromuscular or neurological disorders can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise.

- **Botulinum toxin type A for the prevention of headaches in adults with chronic migraine (June 2012)** NICE TA260

  Botulinum toxin type A is recommended as an option for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per
Nervous system

INTERACTIONS

CAUTIONS

CONTRA-INDICATIONS

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Azzalure® (Galderma (UK) Ltd)
  Botulinum toxin type A 125 unit Azzalure® 125unit powder for solution for injection vials | 1 vial (Prs) £64.00 | 2 vial (Prs) £128.00
- Bocouture® (Merz Pharma UK Ltd)
  Botulinum toxin type A 50 unit Bocouture® 50unit powder for solution for injection vials | 1 vial (Prs) £72.00
- Bocouture® (Allergan Ltd)
  Botulinum toxin type A 100 unit Bocouture® 100unit powder for solution for injection vials | 1 vial (Prs) £229.00
- Botox® (Allergan Ltd)
  Botulinum toxin type A 50 unit Botox® 50unit powder for solution for injection vials | 1 vial (Prs) £77.50
  Botulinum toxin type A 100 unit Botox® 100unit powder for solution for injection vials | 1 vial (Prs) £138.20
- Botulinum toxin type A 200 unit Botox® 200unit powder for solution for injection vials | 1 vial (Prs) £276.40
- Dysport® (Ipsen Ltd)
  Botulinum toxin type A 300 unit Dysport® 300unit powder for solution for injection vials | 1 vial (Prs) £92.40
  Botulinum toxin type A 500 unit Dysport® 500unit powder for solution for injection vials | 2 vial (Prs) £308.00
- Xeomin® (Merz Pharma UK Ltd)
  Botulinum toxin type A 50 unit Xeomin® 50unit powder for solution for injection vials | 1 vial (Prs) £72.00
  Botulinum toxin type A 100 unit Xeomin® 100unit powder for solution for injection vials | 1 vial (Prs) £129.90
  Botulinum toxin type A 200 unit Xeomin® 200unit powder for solution for injection vials | 1 vial (Prs) £259.80 (Hospital only)

BREAST FEEDING

Low risk of systemic absorption but avoid unless essential.

DIRECTIONS FOR ADMINISTRATION

Injection may be diluted with sodium chloride 0.9%.

PRESCRIBING AND DISPENSING INFORMATION

Important: not interchangeable with other botulinum toxin preparations.

PATIENT AND CARER ADVICE

Patients should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- NeuroBloc® (Sloan Pharma Sarl)
  Botulinum toxin type B 5000 unit per 1 ml NeuroBloc® 5,000units/1ml solution for injection vials | 1 vial (POM) £148.27 (Hospital only)
  NeuroBloc® 10,000units/2ml solution for injection vials | 1 vial (POM) £197.69 (Hospital only)
  NeuroBloc® 2,500units/0.5ml solution for injection vials | 1 vial (POM) £111.20 (Hospital only)

NEUROPROTECTIVE DRUGS

Inotersen

24-Apr-2019

DRUG ACTION

Inotersen is an antisense oligonucleotide inhibitor which inhibits transthyretin production.

INDICATIONS AND DOSE

Stage 1 or stage 2 polyneuropathy in patients with hereditary transthyretin amyloidosis (hATTR) (initiated by a specialist)

BY SUBCUTANEOUS INJECTION

Adult: 284 mg once weekly, for dose adjustments due to side-effects and information on Vitamin A supplementation—consult product literature

CONTRA-INDICATIONS

Patients undergoing liver transplantation (no information available) - platelet count less than 100x10^9/litre before starting treatment - urine protein to creatinine ratio (UPCR) greater than or equal to 115 mg/mmol before starting treatment

CAUTIONS

Concomitant administration with nephrotoxic drugs - elderly - history of major bleeding

INTERACTIONS

Appendix 1: inotersen

SIDE-EFFECTS

Common or very common
- Dry mouth - dysphagia - dysphonia - headache - influenza-like illness - muscle weakness - neck pain - taste altered - vision disorders
- Frequency not known
  - Angioedema - arthralgia - axillary oedema - dyspnoea - pneumoconiosis - ptosis - skin reactions - vomiting

PREGNANCY

Low risk of systemic absorption but avoid unless essential.

CONCEPTION AND CONTRACEPTION

Manufacturer advises women of childbearing potential should use effective contraception during treatment; if conception is planned, inotersen and vitamin A supplementation should be avoided unless essential.

Appendix
stopped and vitamin A levels monitored—consult product literature.

- **PREGNANCY** Manufacturer advises avoid unless essential (limited information available)—potentially teratogenic risk due to unbalanced vitamin A levels, consult product literature.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 45 mL/minute/1.73 m².

- **PRE-TREATMENT SCREENING** Manufacturer advises plasma vitamin A levels below the lower limit of normal should be corrected and any ocular symptoms or signs of vitamin A deficiency should have resolved before starting treatment.

- **MONITORING REQUIREMENTS**
  - Manufacturers advise monitor platelet count before starting treatment, every 2 weeks during treatment, and for 8 weeks after stopping treatment—consult product literature.
  - Manufacturer advises monitor UPCR and eGFR before starting treatment, every 3 months or more frequently as clinically indicated during treatment, and for 8 weeks after stopping treatment—consult product literature.
  - Manufacturer advises monitor hepatic enzymes before starting treatment, then 4 months after starting treatment, and annually thereafter or more frequently as clinically indicated.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration. Patients may self-administer Tegsedi® after appropriate training in subcutaneous injection technique.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

- **PATIENT AND CARER ADVICE**
  - Manufacturer advises patients should immediately report any signs of unusual or prolonged bleeding, neck stiffness, or atypical severe headache.
  - Self-administration: Manufacturer advises patients and carers should be given training in subcutaneous injection technique.

- **Missed doses**
  - If a dose is missed, the next dose should be administered as soon as possible, unless the next scheduled dose is within 2 days, in which case the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - Tegsedi (Akeso Therapeutics UK Ltd) ▼
    - Inotersen (as Inotersen sodium) 189.33 mg per 1 ml Tegsedi 284mg/1.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £33.035.00

---

### Parkinson’s disease

**4.2 Parkinson’s disease**

**Description of condition**

Parkinson’s disease is a progressive neurodegenerative condition resulting from the death of dopaminergic cells of the substantia nigra in the brain. Patients with Parkinson’s disease classically present with motor symptoms including hypokinesia, bradykinesia, rigidity, rest tremor, and postural instability.

Non-motor symptoms include dementia, depression, sleep disturbances, bladder and bowel dysfunction, speech and language changes, swallowing problems, and weight loss. Patients with suspected Parkinson’s disease should be referred to a specialist and reviewed every 6 to 12 months.

When Parkinson’s disease diagnosis is confirmed, patients should be advised to inform the DVLA and their car insurer.

**Aims of treatment**

Parkinson’s disease is an incurable progressive condition, and the aim of treatment is to control the symptoms and to improve the patient’s quality of life.

**Non-drug treatment**

Parkinson’s disease patients should be offered physiotherapy if balance or motor function problems are present, speech and language therapy if they develop communication, swallowing or saliva problems, and occupational therapy if they experience difficulties with their daily activities. Dietitian referral should be considered.

**Drug treatment**

**Drug management of motor symptoms in Parkinson’s disease**

**First-line treatment**

In early stages of Parkinson’s disease, patients whose motor symptoms decrease their quality of life should be offered levodopa combined with carbidopa (co-careldopa p. 415) or benserazide (co-beneldopa p. 414).

Parkinson’s disease patients whose motor symptoms do not affect their quality of life, could be prescribed a choice of levodopa, non-ergot-derived dopamine-receptor agonists (pramipexole p. 422, ropinirole p. 424 or rotigotine p. 426) or monoamine-oxidase-B inhibitors (rasagiline p. 427 or selegiline hydrochloride p. 428).

---

### Tafamidis

**INDICATIONS AND DOSE**

Treatment of transthyretin familial amyloid polyneuropathy (TTR-FAP) in patients with stage 1 symptomatic polyneuropathy to delay peripheral neurological impairment (initiated under specialist supervision)

- **By mouth**
  - Adult: 20 mg once daily
Before starting antiparkinsonian treatment, the patient’s individual circumstances, including symptoms, comorbidities and preferences, should be discussed together with the potential benefits and harms from the different drugs available.

Patients and their carers should be informed about the risk of adverse reactions from antiparkinsonian drugs, including psychotic symptoms, excessive sleepiness and sudden onset of sleep with dopamine-receptor agonists, and impulse control disorders with all dopaminergic therapy (especially dopamine-receptor agonists). For further information see Impulse control disorders.

Levodopa treatment is associated with motor complications, including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the ‘on’ period, and weakness and restricted mobility during the ‘off’ period. ‘End-of-dose’ deterioration with progressively shorter duration of benefit can also occur. Modified-release preparations may help with ‘end-of-dose’ deterioration or nocturnal immobility.

The overall improvement in motor performance is more noticeable with levodopa than with dopamine-receptor agonists, and motor complications are less likely to occur with dopamine-receptor agonists when used alone long-term. Conversely, excessive sleepiness, hallucinations, and impulse control disorders are more likely to occur with dopamine-receptor agonists than with levodopa.

To avoid the potential for acute akinesia or neuroleptic malignant syndrome, antiparkinsonian drug concentrations should not be allowed to fall suddenly due to poor absorption or abrupt withdrawal.

**Adjuvant therapy**

If a patient with Parkinson’s disease develops dyskinesia or motor fluctuations, specialist advice should be sought before modifying antiparkinsonian drug therapy.

Patients who develop dyskinesia or motor fluctuations despite optimal levodopa therapy should be offered a choice of non-ergot dopamine-receptor agonists (pramipexole, ropinirole, rotigotine), monoamine oxidase B inhibitors (rasagiline or selegiline hydrochloride) or COMT inhibitors (entacapone p. 412 or tolcapone p. 413) as an adjunct to levodopa.

An ergot-derived dopamine-receptor agonist (bromocriptine p. 419, cabergoline p. 421 or pergolide p. 422) should only be considered as an adjunct to levodopa if symptoms are not adequately controlled with a non-ergot-derived dopamine-receptor agonist.

If dyskinesia is not adequately managed by modifying existing therapy, amantadine hydrochloride p. 418 should be considered.

**Drug management of non-motor symptoms in Parkinson’s disease**

**Daytime sleepiness and sudden onset of sleep**

Patients who experience daytime sleepiness or sudden onset of sleep, should have their Parkinson’s drug treatment adjusted under specialist medical guidance. If reversible pharmacological and physical causes have been excluded, modafinil p. 492 should be considered to treat excessive daytime sleepiness, and treatment should be reviewed at least every 12 months.

Patients with Parkinson’s disease who have daytime sleepiness or sudden onset of sleep should be advised not to drive, to inform the DVLA about their symptoms, and to think about any occupational hazards.

**Nocturnal akinesia**

When treating nocturnal akinesia in patients with Parkinson’s disease, levodopa or oral dopamine-receptor agonists should be considered as first-line options and rotigotine p. 426 as second-line (if both levodopa or oral dopamine-receptor agonists are ineffective).

**Postural hypotension**

Patients with Parkinson’s disease who develop postural hypotension should have their drug treatment reviewed to address any pharmacological cause. If drug therapy is required, midodrine hydrochloride p. 188 should be considered as the first option and fluocortolone acetate p. 676 [unlicensed indication] as an alternative.

**Depression**

See Antidepressant drugs p. 359.

**Psychotic symptoms**

Hallucinations and delusions need not be treated if they are well tolerated. Otherwise, the dosage of any antiparkinsonism drugs that might have triggered hallucinations or delusions should be reduced, taking into account the severity of symptoms and possible withdrawal effects. Specialist advice should be sought before modifying drug treatment.

In Parkinson’s disease patients with no cognitive impairment, quetiapine p. 401 [unlicensed indication] can be considered to treat hallucinations and delusions. If standard treatment is not effective, clozapine p. 396 should be offered to treat hallucinations and delusions in patients with Parkinson’s disease.

It is important to acknowledge that other antipsychotic medicines (such as phenothiazines and butyrophenones) can worsen the motor features of Parkinson’s disease.

**Rapid eye movement sleep behaviour disorder**

Clonazepam p. 337 [unlicensed indication] or melatonin p. 489 [unlicensed indication] should be considered to treat rapid eye movement sleep behaviour disorder in Parkinson’s patients once possible pharmacological causes have been addressed.

**Drooling of saliva**

Drug treatment for drooling of saliva in patients with Parkinson’s disease should only be considered if non-drug treatment such as speech and language therapy is not available or is ineffective.

Other antimuscarinic drugs, should only be considered if the risk of cognitive adverse effects is thought to be minimal; topical preparations, such as atropine [unlicensed indication], should be used if possible to reduce the risk of adverse events.

**Parkinson’s disease dementia**

An acetylcholinesterase inhibitor should be offered to patients with mild-to-moderate Parkinson’s disease dementia and considered for patients with severe Parkinson’s disease dementia [unlicensed indications apart from rivastigmine capsules and oral solution p. 303 for the treatment of mild-to-moderate dementia in patients with Parkinson’s disease]. If acetylcholinesterase inhibitors are not tolerated or contra-indicated, memantine hydrochloride p. 304 [unlicensed indication] should be considered.

For further information see Dementia p. 300

**Advanced Parkinson’s disease**

Patients with advanced Parkinson’s disease can be offered apomorphine hydrochloride p. 418 as intermittent injections or continuous subcutaneous infusions. To control nausea and vomiting associated with apomorphine, administration of domperidone p. 431 is usually started two days before apomorphine therapy, and then discontinued as soon as possible. To reduce the risk of serious arrhythmia due to QT prolongation associated to the concomitant use of domperidone p. 431 and apomorphine hydrochloride p. 418, the MHRA recommends an assessment of cardiac risk factors and ECG monitoring and to ensure that the benefits outweighs the risks when initiating treatment.

Levodopa-carbidopa intestinal gel is used for the treatment of advanced levodopa-responsive Parkinson’s disease dementia.

**Dementia**

See Dementia p. 300
disease with severe motor fluctuations and hyperkinesia or dyskinesia. The gel is administered with a portable pump directly into the duodenum or upper jejunum. Deep brain stimulation should only be considered for patients with advanced Parkinson’s disease whose symptoms are not adequately controlled by best drug therapy. A

**Impulse control disorders**

Impulse control disorders (compulsive gambling, hypersexuality, binge eating, or obsessive shopping) can develop in a person with Parkinson’s disease who is on any dopaminergic therapy at any stage in the disease course particularly if the patient has a history of previous impulsive behaviours, alcohol consumption, or smoking. Patients should be informed about the different types of impulse control disorders and that dopamine-receptor agonist withdrawal may be reduced or stopped if problematic impulse control disorders develop.

When managing impulse control disorders, dopamine-receptor agonist doses should be reduced gradually and patients should be monitored for symptoms of dopamine agonist withdrawal. Specialist cognitive behavioural therapy should be offered if modifying dopaminergic therapy is not effective. A

**Useful Resources**

**Antimuscarinics**

**Orphenadrine hydrochloride**

- **Drug action** Orphenadrine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

- **Indications and dose**

  **Parkinsonism** Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)

  > By mouth
  > Adult: Initially 150 mg daily in divided doses, then increased in steps of 50 mg every 2–3 days, adjusted according to response; usual dose 150–300 mg daily in divided doses; maximum 400 mg per day
  > Elderly: Preferably dose at lower end of range

- **Contra-indications** Acute porphyrias p. 1058 - gastro-intestinal obstruction - myasthenia gravis

- **CAUTIONS** Cardiovascular disease - elderly - hypertension - in patients susceptible to angle-closure glaucoma - liable to abuse - prostatic hypertrophy - psychotic disorders - pyrexia

- **Interactions** → Appendix 1: orphenadrine

- **Side-effects**

  - Common or very common Accommodation disorder - anxiety - dizziness - dry mouth - gastrointestinal disorder - nausea
  - Uncommon Confusion - constipation - coordination abnormal - euphoric mood - hallucination - insomnia - sedation - seizure - tachycardia - urinary retention
  - Rare or very rare Memory loss

- **Pregnancy** Caution.

- **Breast Feeding** Caution.

- **Hepatic Impairment** Manufacturer advises caution.

- **Renal Impairment** Use with caution.

- **Treatment Cessation** Avoid abrupt withdrawal in patients taking long-term treatment.

- **Patient and carer advice**

  - Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

- **Medicinal forms**

  - **Oral solution**

    - Orphenadrine hydrochloride (Non-proprietary)

    - Orphenadrine hydrochloride 10 mg per 1 ml Orphenadrine 50mg/5ml oral solution sugar free sugar-free | 150 ml (Use) £40.00 DT = £40.00

- **Procyclidine hydrochloride**

  - **Drug action** Procyclidine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

  - **Indications and dose**

    - Parkinsonism: Extrapyramidal symptoms (but not tardive dyskinesia)

    > By mouth

    - Adult: 2.5 mg 3 times a day, then increased in steps of 2.5–5 mg daily if required; increased if necessary up to 30 mg daily in 2–4 divided doses, to be increased at 2–3 day intervals. Maximum daily dose only to be used in exceptional circumstances; maximum 60 mg per day

    - Elderly: Lower end of range preferable

  - **Acute dystonia**

    - By intramuscular injection, or by intravenous injection

    - Adult: 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief

    - Elderly: Lower end of range preferable

  - **Contra-indications** Gastro-intestinal obstruction - myasthenia gravis

  - **CAUTIONS** Cardiovascular disease - elderly - hypertension - liable to abuse - prostatic hypertrophy - psychotic disorders - pyrexia - those susceptible to angle-closure glaucoma

  - **Interactions** → Appendix 1: procyclidine

  - **Side-effects**

    - Common or very common Constipation - dry mouth - urinary retention - vision blurred

    - Uncommon Anxiety - cognitive impairment - confusion - dizziness - gingivitis - hallucination - memory loss - nausea - rash - vomiting

    - Rare or very rare Psychotic disorder

  - **Pregnancy** Use only if potential benefit outweighs risk.

  - **Breast Feeding** No information available.

  - **Hepatic Impairment** Manufacturer advises caution.

  - **Renal Impairment** Use with caution.

  - **Treatment Cessation** Avoid abrupt withdrawal in patients taking long-term treatment.

  - **Patient and carer advice**

    - Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

  - **Medicinal forms**

    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

      - **Orphenadrine hydrochloride** (Non-proprietary)

      - Procyclidine hydrochloride 5 mg per 1 ml Procyclidine 10mg/2ml solution for injection ampoules | 5 ampoule (Use) £60.00–£78.75 DT = £72.50

www.getintopharma.com
### Trihexyphenidyl hydrochloride (Benzhexol hydrochloride)

**DRUG ACTION** Trihexyphenidyl exerts its effects by reducing the effects of the relative central cholinergic excess that occurs as a result of dopaminergic deficiency.

**INDICATIONS AND DOSE**

- **Parkinson's disease (if used in combination with co-careldopa or co-beneldopa)**
  - **BY MOUTH**
    - Adult: Maintenance 2–6 mg daily in divided doses, use not recommended because of toxicity in the elderly and the risk of aggravating dementia.

- **Parkinsonism | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)**
  - **BY MOUTH**
    - Adult: 1 mg daily, then increased in steps of 2 mg every 3–5 days, adjusted according to response; maintenance 5–15 mg daily in 3–4 divided doses, not recommended for use in Parkinson’s disease because of toxicity in the elderly and the risk of aggravating dementia; maximum 20 mg per day.
    - Elderly: Lower end of range preferable, not recommended for use in Parkinson’s disease because of toxicity in the elderly and the risk of aggravating dementia.

**CONTRA-INDICATIONS**

- Gastro-intestinal obstruction - myasthenia gravis
- Cardiovascular disease - elderly - hypertension - liable to abuse - prostatic hypertrophy - psychotic disorders - pyrexia - those susceptible to angle-closure glaucoma.

**INTERACTIONS** → Appendix 1: trihexyphenidyl

**SIDE-EFFECTS**

**PREGNANCY**

- Use only if potential benefit outweighs risk.

**BREAST FEEDING**

- Avoid.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution.

**RENAL IMPAIRMENT**

- Use with caution.

**TREATMENT CESSATION**

**DIRECTIONS FOR ADMINISTRATION**

- Tablets should be taken with or after food.

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks: May affect performance of skilled tasks (e.g. driving).

---

### DOPAMINERGIC DRUGS > CATECHOL-O-METHYLTRANSFERASE INHIBITORS

#### Entacapone

**DRUG ACTION** Entacapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

**INDICATIONS AND DOSE**

- Adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations (under expert supervision)
  - **BY MOUTH**
    - Adult: 200 mg, dose to be given with each dose of levodopa with dopa-decarboxylase inhibitor; maximum 2 g per day.

**CONTRA-INDICATIONS**

- History of neuroleptic malignant syndrome - history of non-traumatic rhabdomyolysis - phaeochromocytoma.

**CAUTIONS**

- Concurrent levodopa dose may need to be reduced by about 10–30% - ischaemic heart disease.

**INTERACTIONS** → Appendix 1: entacapone

**SIDE-EFFECTS**

- Uncommon: Myocardial infarction.

- Rare or very rare: Agitation - appetite decreased - skin reactions - weight decreased.

**FREQUENCY NOT KNOWN**

- Colitis - hair colour changes - hepatic disorders - impulse-control disorder - nail discoloration - neuroleptic malignant syndrome - rhabdomyolysis.

**PREGNANCY**

- Avoid—no information available.

**BREAST FEEDING**

- Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

- Manufacturer advises avoid.

**TREATMENT CESSATION**

- Avoid abrupt withdrawal.

**PATIENT AND CARER ADVICE**

- Patient counselling is advised (may cause urine reddish-brown, concomitant iron containing products).

---

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Oral solution**

- **Trihexyphenidyl hydrochloride (Non-proprietary)**
  - **Procyclidine hydrochloride 500 microgram per 1 ml**
    - Procyclidine 2.5mg/5ml oral solution sugar free sugar-free | 150 ml £11.00 - £14.63 DT = £14.01
  - **Procyclidine hydrochloride 1 mg per 1 ml**
    - Procyclidine 5mg/5ml oral solution sugar free sugar-free | 150 ml £17.00 - £21.68 DT = £21.66

**Tablet**

- **Trihexyphenidyl hydrochloride (Non-proprietary)**
  - **Procyclidine hydrochloride 5 mg**
    - Procyclidine 5mg tablets | 28 tablet £12.05 DT = £2.94 | 100 tablet £8.94-£14.89 | 500 tablet £44.63-£74.46
  - **Kemadrin (Aspen Pharma Trading Ltd)**
    - Procyclidine hydrochloride 5 mg | 100 tablet £4.72 | 500 tablet £23.62

**Oral solution**

- **Entacapone (Non-proprietary)**
  - **Entacapone 200 mg**
    - Entacapone 200mg tablets | 30 tablet £16.38 DT = £3.49 | 100 tablet £21.47-£54.58
Opicapone

**DRUG ACTION** Opicapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

**INDICATIONS AND DOSE**

**Adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations (under expert supervision)**

- **BY MOUTH**
  - Adult: 50 mg once daily, dose to be taken at bedtime, at least one hour before or after levodopa combinations

**CONTRA-INDICATIONS**

- Catecholamine-secreting neoplasms - history of neuroleptic malignant syndrome - history of non-traumatic rhabdomyolysis - paraganglioma - phaeochromocytoma

**CAUTIONS**

- Concurrent levodopa dose may need to be reduced - elderly over 85 years (limited information available)

**INTERACTIONS** → Appendix 1: opicapone

**SIDE-EFFECTS**

- **Common or very common**
  - Constipation - dizziness - drowsiness - dry mouth - hallucinations - headache - hypotension - movement disorders - muscle complaints - sleep disorders - vomiting

- **Uncommon**
  - Anxiety - appetite decreased - depression - dry eye - dysphoria - ear congestion - gastrointestinal discomfort - hypertension - hypertriglyceridaemia - musculoskeletal stiffness - nocturia - pain in extremity - palpitations - syncope - taste altered - urine discolouration - weight decreased

**SIDE-EFFECTS, FURTHER INFORMATION**

Manufacturer advises consider liver function tests in patients who experience progressive anorexia, asthenia and weight decrease within a relatively short period of time.

**PREGNANCY**

Manufacturer advises avoid—limited information available.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid in severe impairment.

**Dose adjustments**

Manufacturer advises use with caution in moderate impairment—dose adjustment may be necessary.

**MEDICINAL FORMS**

- **Capsule**
  - **Ongentys (BIAL Pharma UK Ltd)**
    - Opicapone 50 mg: Ongentys 50mg capsules | 30 capsule £93.90

**INDICATIONS AND DOSE**

Adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase is inappropriate (under expert supervision)

- **BY MOUTH**
  - Adult: 100 mg 3 times a day (max. per dose 200 mg 3 times a day) continuing beyond 3 weeks only if substantial improvement, leave 6 hours between each dose; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor, dose maximum only in exceptional circumstances

**CONTRA-INDICATIONS**

- Phaeochromocytoma - previous history of hyperthermia - previous history of neuroleptic malignant syndrome - previous history of rhabdomyolysis - severe dyskinesia

**CAUTIONS**

- Most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%

**CAUTIONS, FURTHER INFORMATION**

- Hepatotoxicity Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported; discontinue if abnormal liver function tests or symptoms of liver disorder; do not re-introduce tolcapone once discontinued.

**INTERACTIONS** → Appendix 1: tolcapone

**SIDE-EFFECTS**

- **Common or very common**

- **Uncommon**
  - Hepatocellular injury

- **Rare or very rare**
  - Eating disorders - neuroleptic malignant syndrome (reported on dose reduction or withdrawal) - neurological disorders - pathological gambling - psychiatric disorders - sexual dysfunction

**PREGNANCY**

Toxicity in animal studies—use only if potential benefit outweighs risk.

**BREAST FEEDING**

Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid.

**RENAL IMPAIRMENT**

Caution if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

Test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased).

**TREATMENT CESSATION**

Avoid abrupt withdrawal.

**PATIENT AND CARER ADVICE**

Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

**DOPAMINERGIC DRUGS**

**DOPAMINE PRECURSORS**

| Co-beneldopa Q2-Mar-2017 |

**INDICATIONS AND DOSE**

**Parkinson’s disease**

- **Adult:** Initially 50 mg 3–4 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses
- **Elderly:** Initially 50 mg 1–2 times a day, then increased in steps of 50 mg daily, dose to be increased every 3–4 days according to response

**Parkinson’s disease (in advanced disease)**

- **Adult:** Initially 100 mg 3 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

**Parkinson’s disease (patients not taking levodopa/dopa-decarboxylase inhibitor therapy)**

- **Adult:** Initially 1 capsule 3 times a day; maximum 6 capsules per day

**Parkinson’s disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)**

- **Adult:** Initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks, supplementary dose of immediate-release Madopar® may be needed with first morning dose; if response still poor to total daily dose of Madopar® CR plus Madopar® corresponding to 1.2 g levodopa—consider alternative therapy.

**DOSE EQUIVALENCE AND CONVERSION**

- Dose is expressed as levodopa.

**IMPORTANT SAFETY INFORMATION**

**IMPULSE CONTROL DISORDERS**

Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

**CAUTIONS** Cushing’s syndrome · diabetes mellitus · endocrine disorders · history of convulsions · history of myocardial infarction with residual arrhythmia · history of peptic ulcer · hyperthyroidism · osteomalacia · phaeochromocytoma · psychiatric illness (avoid if severe and discontinue if deterioration) · severe cardiovascular disease · severe pulmonary disease · susceptibility to angle-closure glaucoma

**INTERACTIONS** → Appendix 1: levodopa

**SIDE-EFFECTS**

- **Common or very common** Anxiety · appetite decreased · arrhythmia · depression · diarrhoea · hallucination · movement disorders · nausea · parkinsonism · postural hypotension · sleep disorders · taste altered · vomiting
- **Rare or very rare** Leucopenia
- **Frequency not known** Aggression · compulsions · confusion · delusions · dopamine dysregulation syndrome · drowsiness · eating disorders · euphoric mood · flushing · gastrointestinal haemorrhage · haemolytic anaemia · hyperhidrosis · oral disorders · pathological gambling · psychosis · sexual dysfunction · skin reactions · thrombocytopenia · tongue discoloration · tooth discoloration · urine discolouration

**PREGNANCY** Caution in pregnancy—toxicity has occurred in animal studies.

**BREAST FEEDING** May suppress lactation; present in milk—avoid.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in decompensated hepatic function.

**RENAL IMPAIRMENT** Use with caution.

**EFFECT ON LABORATORY TESTS** False positive tests for urinary ketones have been reported.

**TREATMENT CESSATION** Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).

**DIRECTIONS FOR ADMINISTRATION** The dispersible tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole.

**PRESCRIBING AND DISPENSING INFORMATION**

Co-beneldopa is a mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa. When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter).

When switching from modified-release levodopa to dispersible co-beneldopa, reduce dose by approximately 30%.

When administered as an adjunct to other antiparkinsonian drugs, once therapeutic effect apparent, the other drugs may be reduced or withdrawn.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer co-beneldopa dispersible tablets.

Dopamine dysregulation syndrome Manufacturer advises patients and their carers should be informed of the risk of developing dopamine dysregulation syndrome; addiction-like symptoms should be reported.

Driving and skilled tasks Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-beneldopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

www.getintopharma.com
DOSE EQUIVALENCE AND CONVERSION
- The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.
- 2 tablets Sinemet® 12.5 mg/50 mg is equivalent to 1 tablet Sinemet® Plus 25 mg/100 mg.

CARMET® CR
Parkinson’s disease (patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa)
- BY MOUTH USING MODIFIED-RELEASE TABLETS
  - Adult: Initially 100–200 mg twice daily, dose to be given at least 6 hours apart; dose adjusted according to response at intervals of at least 2 days

Parkinson’s disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)
- BY MOUTH USING MODIFIED-RELEASE TABLETS
  - Adult: Discontinue previous preparation at least 12 hours before first dose of Caramet® CR; substitute Caramet® CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; dose then adjusted according to response at intervals of at least 2 days.

DUODOPA®
Severe Parkinson’s disease inadequately controlled by other preparations
- Adult: Administered as intestinal gel, for use with enteral tube (consult product literature)

HALF SINEMET® CR
Parkinson’s disease (for fine adjustment of Sinemet® CR dose)
- BY MOUTH
- Adult: (consult product literature)

SINEMET® CR
Parkinson’s disease (patients not receiving levodopa/dopa-decarboxylase inhibitor therapy)
- BY MOUTH
  - Adult: Initially 1 tablet twice daily, both dose and interval then adjusted according to response at intervals of not less than 3 days

Parkinson’s disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)
- BY MOUTH
  - Adult: 1 tablet twice daily, dose can be substituted for a daily dose of levodopa 300–400 mg in immediate-release Sinemet® tablets (substitute Sinemet® CR to provide approximately 10% more levodopa per day and extend dosing interval by 30–50%); dose and interval then adjusted according to response at intervals of not less than 3 days.

IMPORANT SAFETY INFORMATION
IMPULSE CONTROL DISORDERS
Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

CAUTIONS
- Cushing’s syndrome
- diabetes mellitus
- endocrine disorders
- history of convulsions
- history of myocardial infarction with residual arrhythmia
- history of peptic ulcer
- hyperthyroidism
- osteomalacia
- phaeochromocytoma
- psychiatric illness (avoid if severe and discontinue if deterioration)
- severe cardiovascular
disease - severe pulmonary disease - susceptibility to angle-closure glaucoma

- **INTERACTIONS** ▶ Appendix 1: carbidopa - levodopa

- **SIDE-EFFECTS** ▶ Rare or very rare

  - Drowsiness - seizure - sleep disorders
  - Frequency not known

- **PREGNANCY** Use with caution — toxicity has occurred in animal studies.

- **BREAST FEEDING** May suppress lactation; present in milk — avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in hepatic disease.

- **DOSE ADJUSTMENTS** Manufacturer advises titrate dose with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

- **EFFECT ON LABORATORY TESTS** False positive tests for malaise.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).

- **PRESCRIBING AND DISPENSING INFORMATION** Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

  - When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before.

  - Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be informed of the risk of developing dopamine dysregulation syndrome; addiction-like symptoms should be reported.

- **Driving and skilled tasks** Sudden onset of sleep

  - Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa.

  - Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

  - Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **DUODOPA®**

    - **Scottish Medicines Consortium (SMC) decisions**

      - SMC No. 316/06

        - The Scottish Medicines Consortium has advised (June 2016) that co-careldopa (Duodopa®) intestinal gel is accepted for restricted use within NHS Scotland, for the treatment of advanced levodopa-responsive Parkinson’s disease with severe motor fluctuations and hyper-/dyskinesia when available combinations of Parkinson medicinal products have not given satisfactory results, only in patients not eligible for deep brain stimulation. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

    - **All Wales Medicines Strategy Group (AWMSG) decisions**

      - AWMSG No. 3397

        - The All Wales Medicines Strategy Group has advised (March 2018) that Duodopa® intestinal gel is recommended as an option for restricted use within NHS Wales, for the treatment of advanced levodopa-responsive Parkinson’s disease with severe motor fluctuations and hyper-/dyskinesia when available combinations of Parkinson medicinal products have not given satisfactory results, only in patients not eligible for deep brain stimulation. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Modified-release tablet** CAUTIONARY AND ADVISORY LABELS 10, 14, 25

  - **Caretom CR** (Teva UK Ltd)

Levodopa with carbidopa and entacapone

The properties listed below are those particular to the combination only. For the properties of the components please consider, co-carbidopa p. 415, entacapone p. 412.

**INDICATIONS AND DOSE**

**STALEVO® 100/25/200**

Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

- **BY MOUTH**
- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 125/31.25/200**

Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

- **BY MOUTH**
- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 150/37.5/200**

Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

- **BY MOUTH**
- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 175/43.75/200**

Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

- **BY MOUTH**
- Adult: 1 tablet for each dose; maximum 7 tablets per day

**STALEVO® 200/50/200**

Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

- **BY MOUTH**
- Adult: 1 tablet for each dose; maximum 8 tablets per day

**STALEVO® 250/62.5/200**

Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

- **BY MOUTH**
- Adult: 1 tablet for each dose; maximum 7 tablets per day

**INTERACTIONS**

Appendix 1: carbidopa - entacapone - levodopa

**PRESCRIBING AND DISPENSING INFORMATION**

Patients receiving standard-release co-carbidopa or co-beneldopa alone, initiate Stalevo® at a dose that provides similar (or slightly lower) amount of levodopa.

Patients with dyskinesia or receiving more than 800 mg levodopa daily, introduce entacapone before transferring to Stalevo® (levodopa dose may need to be reduced by 10–30% initially).

Patients receiving entacapone and standard-release co-carbidopa or co-beneldopa, initiate Stalevo® at a dose that provides similar (or slightly higher) amount of levodopa.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks  Sudden onset of sleep  Excessive daytime sleepiness and sudden onset of sleep can occur with carbidopa with entacapone and levodopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

Amantadine hydrochloride 08-Feb-2019

- **DRUG ACTION** Amantadine is a weak dopamine agonist with modest antiparkinsonian effects.

- **INDICATIONS AND DOSE**
  - Parkinson’s disease
    - **BY MOUTH**
      - Adult: 100 mg daily for 1 week, then increased to 100 mg twice daily, usually administered in conjunction with other treatment. Some patients may require higher doses; maximum 400 mg per day
      - Elderly: 100 mg daily, adjusted according to response
  - Post-herpetic neuralgia
    - **BY MOUTH**
      - Adult: 100 mg twice daily for 14 days (continued for another 14 days if necessary)

- **TREATMENT OF INFLUENZA A (but not recommended)**
  - **BY MOUTH**
    - Adult: 100 mg daily 4–5 days

- **SIDE-EFFECTS**
  - Common or very common
    - Anxiety, appetite decreased, concentration impairment, confusion, constipation, depression, dizziness, dry mouth, hallucination, headache, hyperhidrosis, lethargy, mood altered, movement disorders, myalgia, nausea, palpitations, peripheral oedema, postural hypotension, skin reactions, sleep disorders, speech slurred, vision disorders, vomiting

- **CONTRA-INDICATIONS** Epilepsy, history of gastric ulceration

- **CAUTIONS** Confused or hallucinatory states, congestive heart disease (may exacerbate oedema), elderly, tolerance to the effects of amantadine may develop in Parkinson’s disease

- **INTERACTIONS** Appendix 1: dopamine receptor agonists

- **MEDICINAL FORMS**
  - Capsule Amantadine hydrochloride 100 mg Amantadine 100mg capsule | 14 capsule (£0.12–£0.24) | £41.00 DT = £40.93

Apomorphine hydrochloride 13-Jun-2018

- **INDICATIONS AND DOSE**
  - Refractory motor fluctuations in Parkinson’s disease (‘off’ episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (for capable and motivated patients) (under expert supervision)
    - **BY CONTINUOUS SUBCUTANEOUS INFUSION**
      - Adult: Initially 1 mg, dose to be administered at the first sign of ‘off’ episode, then 2 mg after 30 minutes, dose to be given if inadequate or no response following initial dose, thereafter increase dose at minimum 40-minute intervals until satisfactory response obtained, this determines threshold dose; usual dose 3–30 mg daily in divided doses (max. per dose 10 mg), subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses; maximum 100 mg per day

  - Refractory motor fluctuations in Parkinson’s disease (‘off’ episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (in patients requiring division into more than 10 injections daily) (under expert supervision)
    - **BY CONTINUOUS SUBCUTANEOUS INFUSION**
      - Adult: Initially 1 mg/hour, adjusted according to response, then increased in steps of up to 500 micrograms/hour, dose to be increased at intervals not more often than every 4 hours; usual dose 1–4 mg/hour, alternatively usual dose 15–60 micrograms/kg/hour, change infusion site every 12 hours and give during waking hours only (tolerance may occur unless there is a 4-hour treatment-free period at night—24-hour infusions not recommended unless severe night time symptoms); intermittent bolus doses may be needed; maximum 100 mg per day

- **IMPORTANT SAFETY INFORMATION**
  - **IMPULSE CONTROL DISORDERS**
    - Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.
CONTRA-INDICATIONS Avoid if ‘on’ response to levodopa marred by severe dyskinesia or dystonia • dementia • psychosis • respiratory depression

CAUTIONS Cardiovascular disease • history of postural hypotension (special care on initiation) • neuropsychiatric conditions • pulmonary disease • susceptibility to QT-interval prolongation

INTERACTIONS • Appendix 1: dopamine receptor agonists

SIDE-EFFECTS

Common or very common Confusion • dizziness • drowsiness • hallucinations • nausea • psychiatric disorders • subcutaneous nodule • vomiting • yawning

Uncommon Dyskinesia (may require discontinuation) • dyspnoea • haemolytic anaemia • injection site necrosis • postural hypotension • skin reactions • sudden onset of sleep • thrombocytopenia

Rare or very rare Bronchospasm • eosinophilia • hypersensitivity

Frequency not known Agitation • agitation • dopamine dysregulation syndrome • eating disorders • pathological gambling • peripheral oedema • sexual dysfunction • syncope

ALLERGY AND CROSS-SENSITIVITY Contra-indicated if history of hypersensitivity to opioids.

PREGNANCY Avoid unless clearly necessary.

BREAST FEEDING No information available; may suppress lactation.

HEPATIC IMPAIRMENT Manufacturer advises avoid in hepatic insufficiency.

RENAL IMPAIRMENT Use with caution.

MONITORING REQUIREMENTS

Monitor hepatic, haemopoietic, renal, and cardiovascular function.

With concomitant levodopa test initially and every 6 months for haemolytic anaemia and thrombocytopenia (development calls for specialist haematological care with dose reduction and possible discontinuation).

TREATMENT CESSION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE Manufacturer advises patients and their carers should be informed of the risk of developing dopamine dysregulation syndrome; addiction-like symptoms should be reported.

Driving and skilled tasks Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Drugs and driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to apomorphine, see Drugs and driving under Guidance on prescribing p. 1.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10 EXCIPIENTS: May contain Sulphites

APO-go (Britannia Pharmaceuticals Ltd)

Apomorphine hydrochloride 10 mg per 1 ml APO-go 50mg/5ml solution for injection ampoules | 5 ampoule (£73.11 £73.11 £73.11

APO-go Pen (Britannia Pharmaceuticals Ltd)

Apomorphine hydrochloride 10 mg per 1 ml APO-go PEN 30mg/3ml solution for injection | 5 pre-filled disposable injection (£38 £123.91 DT £123.91

Dacepton (Ever Pharma UK Ltd)

Apomorphine hydrochloride hemihydrate 10 mg per 1 ml Dacepton 30mg/3ml solution for injection cartridges | 5 cartridge (£113.00

Solution for infusion

CAUTIONARY AND ADVISORY LABELS 10 EXCIPIENTS: May contain Sulphites

APO-go PFS (Britannia Pharmaceuticals Ltd)

Apomorphine hydrochloride 5 mg per 1 ml APO-go PFS 50mg/10ml solution for infusion pre-filled syringes | 5 pre-filled disposable injection (£38 £73.11 £73.11

Dacepton (Ever Pharma UK Ltd)

Apomorphine hydrochloride hemihydrate 5 mg per 1 ml Dacepton 100mg/20ml solution for infusion vials | 5 vial (£145.00

Bromocriptine

DRUG ACTION Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary.

INDICATIONS AND DOSE

Prevention of lactation

BY MOUTH

Adult: Initially 2.5 mg daily for 1 day, then 2.5 mg twice daily for 14 days

 Suppression of lactation

BY MOUTH

Adult: Initially 2.5 mg daily for 2–3 days, then 2.5 mg twice daily for 14 days

Hypogonadism | Galactorrhoea | Infertility

BY MOUTH

Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, increase dose gradually; usual dose 7.5 mg daily in divided doses, increased if necessary up to 30 mg daily, usual dose in infertility without hyperprolactinaemia is 2.5 mg twice daily

Acromegaly

BY MOUTH

Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually

Prolactinoma

BY MOUTH

Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually. Occasionally patients may require up to 30 mg daily

Parkinson’s disease

BY MOUTH

Adult: Initially 1–1.25 mg daily for 1 week, dose to be taken at night, then 2–2.5 mg daily for 1 week, dose to be taken at night, then 2.5 mg twice daily for 1 week, then 2.5 mg 3 times a day for 1 week, then continued →

Nervous system

IMPORTANT SAFETY INFORMATION

FIBROTIC REACTIONS

Bromocriptine has been associated with pulmonary, retropertioneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful.

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

CONTRA-INDICATIONS

Avoid in pre-eclampsia - cardiac valvulopathy (exclude before treatment) - hypertension in postpartum women or in puerperium

CONTRA-INDICATIONS, FURTHER INFORMATION

Postpartum or puerperium Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women.

INTERACTIONS

→ Appendix 1: dopamine receptor agonists

SIDE-EFFECTS

Common or very common Constipation - drowsiness - headache - nasal congestion - nausea

Uncommon Allergic dermatitis - alopecia - confusion - dizziness - dry mouth - fatigue - hallucination - hypotension - leg cramps - movement disorders - vomiting

Rare or very rare Abdominal pain - arthralgias - cardiac valvulopathy - diarrhoea - dyspnoea - gastrointestinal disorders - gastrointestinal haemorrhage - neuroleptic malignant-like syndrome - pallor - paraesthesia - pericardial effusion - pericarditis - peripheral oedema - psychotic disorder - respiratory disorders - sleep disorders - tinnitus - vision disorders

Frequency not known Eating disorders - hypertension - myocardial infarction - pathological gambling - psychiatric disorders - seizure - sexual dysfunction - stroke

SIDE-EFFECTS, FURTHER INFORMATION

Treatment should be withdrawn if gastro-intestinal bleeding occurs.

ALLERGY AND CROSS-SENSITIVITY

Bromocriptine should not be used in patients with hypersensitivity to ergot alkaloids.

CONCEPTION AND CONTRACEPTION

Caution—provide contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration).

BREAST FEEDING

Suppress lactation; avoid breast feeding for about 5 days if lactation prevention fails.

HEPATIC IMPAIRMENT

Dose adjustments Manufacturer advises dose adjustment may be necessary—risk of increased plasma concentration.

MONITORING REQUIREMENTS

Specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinaemia.

Monitor for fibrotic disease.

Monitor blood pressure for a few days after starting treatment and following dosage increase.

TREATMENT CESSATION

Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

Driving and skilled tasks Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions

Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**Prevention of lactation**
- **BY MOUTH**
- Adult: 1 mg, to be taken as a single dose on the first day postpartum.

**Suppression of established lactation**
- **BY MOUTH**
- Adult: 250 micrograms every 12 hours for 2 days.

**Hyperprolactinaemic disorders**
- **BY MOUTH**
- Adult: Initially 500 micrograms once weekly, dose may be increased to 1 mg every 7–14 days, maximum 2 mg per week.

**Alone or as adjunct to co-beneldopa or co-careldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate**
- **BY MOUTH**
- Adult: Initially 1 mg daily, then increased in steps of 0.5–1 mg every 7–14 days, maximum 3 mg per day.

**IMPORANT SAFETY INFORMATION**

**FIBROTIC REACTIONS**
Cabergoline has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**IMPULSE CONTROL DISORDERS**
Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

**CONTRA-INDICATIONS** Avoid in pre-eclampsia - cardiac valvulopathy (exclude before treatment) - history of pericardial fibrotic disorders - history of puerperal psychosis - history of pulmonary fibrotic disorders - history of retroperitoneal fibrotic disorders.

**CAUTIONS** Cardiovascular disease - history of peptic ulcer (particularly in acromegalic patients) - history of serious mental disorders (especially psychotic disorders) - Raynaud’s syndrome.

**CAUTIONS, FURTHER INFORMATION**
- Hyperprolactinaemic patients: In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

**INTERACTIONS**
- **Appendix 1:** dopamine receptor agonists.

**SIDE-EFFECTS**
- **Common or very common** Angina pectoris - asthenia - cardiac valvulopathy - confusion - constipation - dizziness - drowsiness - dyspepsia - dysphoria - gastritis - hallucination - headache - hypotension - movement disorders - nausea - oedema - pericardial effusion - pericarditis - sexual dysfunction - sleep disorders - vertigo - vomiting.
- **Uncommon** Delusions - erythromelalgia - hepatic function abnormal - psychotic disorder - rash - respiratory disorders.
- **Rare or very rare** Fibrosis.
- **Frequency not known** Aggression - alopecia - chest pain - digital vasospasm - leg cramps - pathological gambling - syncope - tremor - visual impairment.
- **ALLERGY AND CROSS-SENSITIVITY** Cabergoline should not be used in patients with hypersensitivity to ergot alkaloids.

**CONCEPTION AND CONTRACEPTION** Exclude pregnancy before starting and perform monthly pregnancy tests during the amenorrhoeic period. Caution—advise non-hormonal contraception if pregnancy not desired. Discontinue 1 month before intended conception (ovulatory cycles persist for 6 months).

**PREGNANCY** Discontinue if pregnancy occurs during treatment (specialist advice needed).

**BREAST FEEDING**Suppresses lactation; avoid breast-feeding if lactation prevention fails.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased exposure).

**Dose adjustments** Manufacturer advises consider dose reduction in severe impairment.

**MONITORING REQUIREMENTS**
- Monitor for fibrotic disease.
- Monitor blood pressure for a few days after starting treatment and following dosage increase.

**TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

**PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**
- **Driving and skilled tasks** Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine–receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine–receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Monotherapy in Parkinson

INDICATIONS AND DOSE

Dostinex
Cabaser

CAUTIONARY AND ADVISORY LABELS

Tablet

There can be variation in the licensing of different medicines containing the same drug.

Pergolide

INDICATIONS AND DOSE

Monotherapy in Parkinson disease where dopamine-receptor agonists other than ergot derivative not appropriate

BY MOUTH

Adult: Initially 50 micrograms once daily for day 1, dose to be taken at bedtime, then 50 micrograms twice daily for days 2–4, then increased in steps of 100–250 micrograms daily, dose to be increased at intervals of 3–4 days, increased to 1.5 mg daily in 3 divided doses at day 28, then increased in steps of up to 250 micrograms every 3–4 days, this increase to be started after day 30; maintenance 2.1–2.5 mg daily; maximum 3 mg per day

Adjuvative therapy with co-beneldopa or co-careldopa in Parkinson's disease where dopamine-receptor agonists other than ergot derivative not appropriate

BY MOUTH

Adult: Initially 50 micrograms daily for 2 days, then increased in steps of 100–150 micrograms every 3 days, dose to be adjusted over next 12 days following initial dose and usually given in 3 divided doses, then increased in steps of 250 micrograms every 3 days, during pergolide titration, levodopa dose may be reduced cautiously; maximum 3 mg per day

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

CONTRA-INDICATIONS

Cardiac valvulopathy (exclude before treatment) • history of fibrotic disorders

CAUTIONS

Acute porphyrias p. 1058 • arrhythmias • dyskinesia (may exacerbate) • hallucinations • history of confusion • psychosis • underlying cardiac disease

INTERACTIONS

Appendix 1: dopamine receptor agonists

SIDE-EFFECTS

Cardiovascular disorders • compulsions • confusion • constipation • diarrhoea • diplopia • dizziness • drowsiness • dyskinesia • dry mouth • eating disorders • erythromelalgia • gastrointestinal discomfort • hallucinations • hiccup • nausea • neuroleptic malignant syndrome • pain • palpitations • pathological gambling • pericardial effusion • pericarditis • postural hypotension • pulmonary hypertension • rash • Raynaud’s phenomenon • respiratory disorders • retroperitoneal fibrosis • rhinitis • sexual dysfunction • sleep disorders • syncope • vomiting

PREGNANCY

Use only if potential benefit outweighs risk.

BREAST FEEDING

May suppress lactation.

TREATMENT CESSATION

Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PARKINSON'S DISEASE

Driving and skilled tasks • Sudden onset of sleep

Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions

Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Meditical forms

260 microgram Pramipexole 260microgram modified-release tablets £8.50–£10.87 DT = £41.74

520 microgram Pramipexole 520microgram modified-release tablets £20.00–£61.73 DT = £30.74

1.05 mg Pramipexole 1.05mg modified-release tablets £80.94–£192.24 DT = £126.82

2.1 mg Pramipexole 2.1mg modified-release tablets £50.00–£246.91 DT = £110.97

1.57 mg Pramipexole 1.57mg modified-release tablets £113.95–£320.41 DT = £222.06

BNF 73

PARKINSON’S DISEASE 423

INDICATIONS Antiparkinsonian drug therapy can be particularly problematic during the rst few days of treatment and care should be exercised when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identiﬁcation of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine receptor agonists; these can be particularly problematic during the rst few days of treatment and care should be exercised when driving or operating machinery.

MEDICATIONS There can be variation in the licensing of different medicines containing the same drug.

Modiﬁed-release tablet

CAUTIONARY AND ADVISORY LABELS 10, 25

Pramipexole (Non-proprietary)

Pramipexole (as Pramipexole dihydrochloride monohydrate)

260 microgram Pramipexole 260microgram modified-release tablets £8.50–£10.87 DT = £41.74

520 microgram Pramipexole 520microgram modified-release tablets £20.00–£61.73 DT = £30.74

1.05 mg Pramipexole 1.05mg modified-release tablets £80.94–£192.24 DT = £126.82

2.1 mg Pramipexole 2.1mg modified-release tablets £50.00–£246.91 DT = £110.97

1.57 mg Pramipexole 1.57mg modified-release tablets £113.95–£320.41 DT = £222.06

Levodopa dose may be reduced, maximum daily dose to be given in 3 divided doses; maximum 3.3 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: Initially 260 micrograms once daily, dose to be increased by doubling dose every 5–7 days, increased to 1.05 mg once daily, then increased in steps of 250 micrograms every week if required, during dose titration and maintenance, levodopa dose may be reduced according to response; maximum 3.15 mg per day

Moderate to severe restless legs syndrome

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 88 micrograms once daily, dose to be taken 2–3 hours before bedtime, dose to be increased by doubling dose every 4–7 days if necessary, repeat dose titration if restarting treatment after an interval of more than a few days; maximum 540 micrograms per day

DOSE EQUIVALENCE AND CONVERSION

Doses and strengths are stated in terms of pramipexole (base).

Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for immediate-release preparations are as follows:

88 micrograms base = 125 micrograms salt;
180 micrograms base = 250 micrograms salt;
350 micrograms base = 500 micrograms salt;
700 micrograms base = 1 mg salt.

Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for modified-release preparations are as follows:

250 micrograms base = 375 micrograms salt;
520 micrograms base = 750 micrograms salt;
1.05 mg base = 1.5 mg salt;
1.57 mg base = 2.25 mg salt;
2.1 mg base = 3 mg salt;
2.62 mg base = 3.75 mg salt;
3.15 mg base = 4.5 mg salt.

IMPORTANT SAFETY INFORMATION

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

CAUTIONS

Psychotic disorders · risk of visual disorders (ophthalmological testing recommended) · severe cardiovascular disease

INTERACTIONS Appendix 1: dopamine receptor agonists

SIDE-EFFECTS

Common or very common Appetite abnormal · behaviour abnormal · confusion · constipation · dizziness · drowsiness · fatigue · hallucination · headache · hypotension · movement disorders · nausea · peripheral oedema · psychiatric disorders · sleep disorders · vision disorders · vomiting · weight changes

Uncommon Anxiety · binging eating · delirium · delusions · dyskinesia · heart failure · hiccups · mania · memory loss · pathological gambling · pneumonia · sexual dysfunction · SIADH · skin reactions · syncpe

Frequency not known Depression · dopamine agonist withdrawal syndrome · generalised pain · sweating abnormal

PREGNANCY

Use only if potential beneﬁt outweighs risk—no information available.

BREAST FEEDING

May suppress lactation; avoid—present in milk in animal studies.

RENAL IMPAIRMENT

For modiﬁed-release tablets, avoid if eGFR less than 30 mL/minute/1.73 m².

Dose adjustments For immediate-release tablets in Parkinson’s disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/minute/1.73 m²; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m². If renal function declines during treatment, reduce dose by the same percentage as the decline in eGFR.

For immediate-release tablets in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m².

For modiﬁed-release tablets, initially 260 micrograms on alternate days if eGFR 30–50 mL/minute/1.73 m²; increased to 260 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily.

MONITORING REQUIREMENTS Risk of postural hypotension (especially on initiation)—monitor blood pressure.

TREATMENT CESSATION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

Driving and skilled tasks Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

**INDICATIONS AND DOSE**

**Parkinson's disease, either used alone or as adjunct to carbidopa or co-carbidopa**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

**Adults:** Initially 750 micrograms daily in 3 divided doses, then increased in steps of 750 micrograms daily, dose to be increased at weekly intervals, increased to 3 mg daily in 3 divided doses, then increased in steps of 1.5–3 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 9–16 mg daily in 3 divided doses, higher doses may be required if used with levodopa, when administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%, daily maximum dose to be given in 3 divided doses; maximum 24 mg per day.

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

**Adults:** Initially 2 mg once daily for 1 week, then 4 mg once daily, increased in steps of 2 mg at intervals of at least 1 week, adjusted according to response, increased up to 8 mg once daily, dose to be increased further if still no response; increased in steps of 2–4 mg at intervals of at least 2 weeks if required, consider slower titration in patients over 75 years, when administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%; maximum 24 mg per day.

**PARKINSON'S DISEASE IN PATIENTS TRANSFERRING FROM ROPINIROLE IMMEDIATE-RELEASE TABLETS**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

**Adults:** Initially ropinirole modified-release once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, titrate dose as above.

**Mild to severe restless legs syndrome**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

**Adults:** Initially 250 micrograms once daily for 2 days, increased if tolerated to 500 micrograms once daily for 5 days, then increased if tolerated to 1 mg once daily.
TREATMENT CESSATION

RENAL IMPAIRMENT
▶ When used for Restless legs syndrome

HEPATIC IMPAIRMENT
▶ When used for eating disorders
▶ May suppress lactation
▶ Uncommon Hypotension — sexual dysfunction
▶ Rare or very rare — Hepatic reaction
▶ Frequency not known — Behaviour abnormal — compulsions — delirium — delusions — dopamine dysregulation syndrome — eating disorders — pathological gambling — psychotic disorder
▶ Pregnancy — Avoid unless potential benefit outweighs risk — toxicity in animal studies.
▶ Breast feeding — May suppress lactation — avoid.
▶ Hepatic Impairment — When used for Parkinson’s disease Manufacturer advises avoid (no information available).
▶ When used for restless legs syndrome Manufacturer advises caution in moderate impairment; avoid in severe impairment.
▶ Renal Impairment — Avoid if eGFR less than 30 mL/minute/1.73 m².
▶ Treatment Cessation — Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
▶ Patient and Carer Advice — Manufacturer advises patients and their carers should be informed of the risk of developing dopamine dysregulation syndrome; addiction-like symptoms should be reported.
▶ Missed doses —
  ▶ When used for Parkinson’s disease Manufacturer advises if treatment is interrupted for more than a few days, re-initiation by dose titration is recommended.
  ▶ Driving and skilled tasks
  ▶ Sudden onset of sleep — Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.
  ▶ Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. **IMPORATNT SAFETY INFORMATION**

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Avoid exposure of patch to heat - remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion

- **INTERACTIONS** ≥ Appendix 1: dopamine receptor agonists

- **SIDE-EFFECTS**

  - **Common or very common** Asthenia - behaviour abnormal - constipation - dizziness - drowsiness - dry mouth - dyskinesia - eating disorders - fall - gastrointestinal discomfort - hallucinations - headache - hiccups - hyperhidrosis - hypertension - hypotension - loss of consciousness - malaise - nausea - palpitations - pathological gambling - perception altered - peripheral oedema - psychiatric disorders - skin reactions - sleep disorders - syncope - vertigo - vomiting - weight changes

  - **Uncommon** Agitation - angioedema - arrhythmias - confusion - sexual dysfunction - vision disorders

  - **Rare or very rare** Delirium - delusions - irritability - psychotic disorder - seizure

  - **Frequency not known** Dopamine dysregulation syndrome

- **PREGNANCY** Avoid—no information available.

- **BREAST FEEDING** May suppress lactation; avoid—present in milk in animal studies

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

- **Dose adjustments** Manufacturer advises consider dose reduction in severe impairment.

- **MONITORING REQUIREMENTS** Ophthalmic testing recommended.

- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises apply patch to clean, dry, intact, healthy and non-irritated skin on torso, thigh, hip, shoulder or upper arm by pressing the patch firmly against the skin for about 30 seconds. Patches should be removed after 24 hours and the replacement patch applied on a different area (avoid using the same area for 14 days)—consult product literature for further information.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be informed of the risk of
developing dopamine dysregulation syndrome; addiction-like symptoms should be reported.

**Driving and skilled tasks**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

### NATIONAL FUNDING/ACCESS DECISIONS

**Scottish Medicines Consortium (SMC) decisions**

The **Scottish Medicines Consortium** has advised that **Neupro** is accepted for restricted use for the treatment of advanced Parkinson’s disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007).

The **Scottish Medicines Consortium** has advised that **Neupro** is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson’s disease (June 2007).

The **Scottish Medicines Consortium** has advised (April 2009) that rotigotine (Neupro) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in adults with a baseline score of 15 points or more on the International Restless Legs Scale.

### MEDICINAL FORMS

## SAFINAMIDE

**Drug action** Safinamide is a monoamine-oxidase-B inhibitor.

### INDICATIONS AND DOSE

**Parkinson’s disease, as an adjunct to levodopa alone or in combination with other antiparkinsonian drugs, for mid- to late-stage fluctuations**

- **By mouth**
  - Adult: 50 mg once daily, increased if necessary to 100 mg once daily

### CONTRA-INDICATIONS

Active retinopathy - albinism - family history of hereditary retinal disease - retinal degeneration - uveitis

### CAUTIONS

Hypertension (may raise blood pressure) - may exacerbate pre-existing dyskinesia (requiring levodopa dose reduction)

### INTERACTIONS

> Appendix 1: monoamine-oxidase B inhibitors

### SIDE-EFFECTS

- **Common or very common** Abdominal pain - angina pectoris - arthralgia - arthritis - conjunctivitis - depression - dermatitis - dry mouth - fall - fever - flatulence - hallucination - headache - increased risk of infection - leucopenia - malaise - nausea - neoplasms - pain - postural hypotension - sleep disorders - urinary urgency - vertigo - vomiting - weight decreased

- **Uncommon** Appetite decreased - confusion

- **Frequency not known** Dopamine dysregulation syndrome - drowsiness - eating disorders - pathological gambling - psychiatric disorders - sexual dysfunction

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Use with caution—may suppress lactation.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (risk of increased exposure).

### TREATMENT CESSATION

Avoid abrupt withdrawal.
Nausea and labyrinth disorders

Selegiline hydrochloride

**DRUG ACTION** Selegiline is a monoamine-oxidase B inhibitor.

**INDICATIONS AND DOSE** Parkinson’s disease, used alone or as adjunct to co-beneldopa or co-careldopa to reduce ‘end of dose’ deterioration; Symptomatic parkinsonism

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Initially 5 mg once daily for 2–4 weeks, then increased if tolerated to 10 mg daily, dose to be taken in the morning
- Adult: 1.25 mg once daily, dose to be taken before breakfast

**DOSE EQUIVALENCE AND CONVERSION**
- 1.25-mg oral lyophilisate is equivalent to 10-mg tablet.
- Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to oral lyophilisates (Zelapar®) 1.25 mg.

**CONTRA-INDICATIONS** Active duodenal ulceration, active gastric ulceration, avoid or use with great caution in postural hypotension (when used in combination with levodopa)

**CAUTIONS** Angina, arrhythmias; duodenal ulceration; gastric ulceration; history of hepatic dysfunction; patients predisposed to confusion and psychosis; psychoses; uncontrolled hypertension

**INTERACTIONS** → Appendix 1: monoamine-oxidase B inhibitors

**SIDE-EFFECTS**
- **Common or very common** Arrhythmias, arthralgia, back pain, confusion, constipation, depression, diarrhoea, dizziness, dry mouth, fall, fatigue, hallucination, headache, hyperhidrosis, hypertension, hypotension, movement disorders, muscle cramps, nasal congestion, nausea, oral disorders, sleep disorders, throat pain, tremor, vertigo
- **Uncommon** Alopecia, angina pectoris, anxiety, appetite decreased, chest pain, dysphoria, leukopenia, mood altered, myopathy, palpitations, peripheral oedema, pharyngitis, psychosis, skin eruption, thrombocytopenia, urinary disorders, vision blurred
- **Frequency not known** Hypersexuality

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects of levodopa may be increased—concurrent levodopa dosage can be reduced by 10–30% in 10% every 3–4 days.

- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.
- **TREATMENT CESSATION** Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed on the tongue and allowed to dissolve. Advise patient not to drink, rinse, or wash mouth out for 5 minutes after taking the tablet.

- **PATIENT AND CARER ADVICE** Patients or carers should be advised on how to administer selegiline hydrochloride oral lyophilisates.
- **Driving and skilled tasks**
  - Drugs and driving: Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at [www.dvla.gov.uk](http://www.dvla.gov.uk).
  - 2015 legislation regarding driving whilst taking certain drugs, may also apply to selegiline, see [Drugs and driving](#) under Guidance on prescribing p. 1.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

5 Nausea and labyrinth disorders

**Nausea and labyrinth disorders**

**Drug treatment** Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 109 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

**Antihistamines** are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.
The **phenothiazines** are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytoxotics. Prochlorperazine p. 385, perphenazine, and trifluoperazine p. 390 are less sedating than chlorpromazine hydrochloride p. 384; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 386 and levomepromazine p. 441 are used for the relief of nausea and vomiting in terminal illness.

Metoclopramide hydrochloride p. 432 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease.

Domperidone p. 431 acts at the chemoreceptor trigger zone; it is licensed only for the relief of nausea and vomiting. It has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson’s disease, it can be used to treat nausea caused by dopaminergic drugs.

Granisetron p. 435 and ondansetron p. 436 are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. Palonosetron p. 437 is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy. Palonosetron is also available in combination with netupitant, a neurokinin 3-receptor antagonist, for the prevention of acute and delayed nausea and vomiting associated with moderately emetogenic chemotherapy and highly emetogenic cisplatin-based chemotherapy.

Dexamethasone p. 675 has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide hydrochloride, prochlorperazine, lorazepam p. 339, or a 5HT3-receptor antagonist.

Aprepitant p. 433, fosaprepitant p. 434, and rolepitant p. 434 are neurokinin 1-receptor antagonists. Aprepitant is licensed for the prevention of nausea and vomiting associated with highly and moderately emetogenic chemotherapy; fosaprepitant is licensed for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy and the prevention of nausea and vomiting associated with moderately emetogenic chemotherapy; rolepitant is licensed for the prevention of delayed nausea and vomiting associated with highly and moderately emetogenic chemotherapy. These drugs are given with dexamethasone and a 5HT3-receptor antagonist.

Nabilone p. 431 is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics.

**Vomiting during pregnancy**

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as promethazine, may be required. Prochlorperazine or metoclopramide hydrochloride are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 1080 must be considered in order to reduce the risk of Wernicke’s encephalopathy.

**Postoperative nausea and vomiting**

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. Drugs used include 5HT3-receptor antagonists, droperidol p. 440, dexamethasone, some phenothiazines (e.g. prochlorperazine), and antihistamines (e.g. cyclizine p. 430). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

**Motion sickness**

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hyoscine hydrobromide p. 439. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired promethazine is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine p. 438 is preferred. Domperidone, metoclopramide hydrochloride, 5HT3-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are ineffective in motion sickness.

**Other vestibular disorders**

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière’s disease and middle-ear surgery can be difficult to treat.

Betahistine dihydrochloride p. 441 is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Betahistine dihydrochloride is licensed for vertigo, tinnitus, and hearing loss associated with Ménière’s disease.

A diuretic alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière’s disease; antihistamines (such as cinnarizine), and phenothiazines (such as prochlorperazine) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

**Nausea caused by cytotoxic chemotherapy, palliative care, and migraine**

Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

**Other drugs used for Nausea and labyrinth disorders**

Paracetamol with metoclopramide, p. 476 · Promethazine hydrochloride, p. 286
### Cyclizine

**INDICATIONS AND DOSE**
- Nausea or vomiting due to cause other than motion sickness
- Nausea and vomiting associated with vestibular disorders
- Vertigo

**ADULT: BY MOUTH**
- 25 mg up to 3 times daily, for motion sickness, take 1–2 hours before departure.
- Intravenous injection or by intramuscular injection
- 50 mg up to 3 times daily.

**CHILD: BY MOUTH OR BY INTRAVENOUS INJECTION**
- Child 1 month–5 years: 0.5–1 mg/kg up to 3 times daily (max. per dose 25 mg).
- Intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure.
- Child 6–11 years: 25 mg up to 3 times daily, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure.
- Child 12–17 years: 50 mg up to 3 times daily, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure.
- By continuous intravenous infusion, or by subcutaneous infusion
- Child 1–2 months: 3 mg/kg, dose to be given over 24 hours.
- Child 2–5 years: 50 mg, dose to be given over 24 hours.
- Child 6–11 years: 75 mg, dose to be given over 24 hours.
- Child 12–17 years: 150 mg, dose to be given over 24 hours.

**Nausea and vomiting in palliative care**
- Child 1–2 months: 3 mg/kg, dose to be given over 24 hours.
- Child 2–5 years: 50 mg, dose to be given over 24 hours.
- Child 6–11 years: 75 mg, dose to be given over 24 hours.
- Child 12–17 years: 150 mg, dose to be given over 24 hours.
- Adult: 150 mg, dose to be given over 24 hours.

**By mouth**
- Child 1 month–5 years: 0.5–1 mg/kg up to 3 times daily (max. per dose 25 mg).
- Child 6–11 years: 25 mg up to 3 times daily.
- Child 12–17 years: 50 mg up to 3 times daily.
- Adult: 50 mg up to 3 times daily.

**By intravenous injection**
- Child 1 month–5 years: 0.5–1 mg/kg up to 3 times daily (max. per dose 25 mg).
- Intravenous injection to be given over 3–5 minutes.
- Child 6–11 years: 25 mg up to 3 times daily, intravenous injection to be given over 3–5 minutes.
- Child 12–17 years: 50 mg up to 3 times daily, intravenous injection to be given over 3–5 minutes.

**By continuous intravenous infusion**
- Child 1–2 months: 3 mg/kg, dose to be given over 24 hours.
- Child 2–5 years: 50 mg, dose to be given over 24 hours.
- Child 6–11 years: 75 mg, dose to be given over 24 hours.
- Child 12–17 years: 150 mg, dose to be given over 24 hours.
- Adult: 150 mg, dose to be given over 24 hours.

**Specified side-effects**
- Rare or very rare: agitation (more common at high doses), angle closure glaucoma, depression.

**Special side-effects**
- With oral use: level of consciousness decreased.
- With parenteral use: Chills, consciousness impaired, injection site necrosis, pain, paralysis, sensation of pressure, thrombophlebitis.

**Pregnancy**
- Manufacturer advises avoid; however, there is no evidence of teratogenicity.

**Breast-feeding**
- No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**Hepatic impairment**
- Manufacturer advises caution.

**Directions for administration**
- By mouth, tablets may be crushed.
- For administration by mouth, tablets may be crushed.
- For further information on the use of cyclizine in palliative care, see [www.medicinescomplete.com](http://www.medicinescomplete.com/)

**Prescribing and dispensing information**
- Palliative care: For further information on the use of cyclizine in palliative care, see [www.medicinescomplete.com](http://www.medicinescomplete.com/).
Nausea and labyrinth disorders 431

ANTIEMETICS AND ANTINAUSEANTS

CANNABINOIDS

Nabilone

INDICATIONS AND DOSE
Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision)

BY MOUTH
• Adult: Initially 1 mg twice daily, increased if necessary to 2 mg twice daily throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle, the first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug, daily dose maximum should be given in 3 divided doses; maximum 6 mg per day

CAUTIONS
Adverse effects on mental state can persist for 48–72 hours after stopping. Elderly, heart disease, history of psychiatric disorder, hypertension

INTERACTIONS
Appendix 1: nabilone

SIDE-EFFECTS
Abdominal pain, appetite decreased, concentration impaired, confusion, depression, dizziness, drowsiness, drug use disorders, dry mouth, euphoric mood, feeling of relaxation, hallucination, headache, hypotension, movement disorders, nausea, psychosis, sleep disorder, tachycardia, tremor, vertigo, visual impairment

SIDE-EFFECTS, FURTHER INFORMATION
Drowsiness and dizziness occur frequently with standard doses.

PREGNANCY
Avoid unless essential.

Breast Feeding
Avoid—no information available.

HEPATIC IMPAIRMENT
Manufacturer advises avoid in severe impairment (primarily biliary excretion).

PATIENT AND CARER ADVICE
Behavioural effects. Patients should be made aware of possible changes of mood and other adverse behavioural effects.

Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see Drugs and driving under Guidance on prescribing p. 1.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Capsule

Metoclopramide hydrochloride

INDICATIONS AND DOSE

Symptomatic treatment of nausea and vomiting including that associated with acute migraine | Delayed (but not acute) chemotherapy-induced nausea and vomiting | Radiotherapy-induced nausea and vomiting | Prevention of postoperative nausea and vomiting

BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

Adult (body-weight up to 60 kg): Up to 500 micrograms/kg daily in 3 divided doses, when administered by slow intravenous injection, to be given over at least 3 minutes

Adult (body-weight 60 kg and above): 10 mg up to 3 times a day, when administered by slow intravenous injection, to be given over at least 3 minutes

Hiccups in palliative care

BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

Adult: 10 mg every 6–8 hours

Nausea and vomiting in palliative care

BY MOUTH

Adult: 10 mg 3 times a day

BY SUBCUTANEOUS INFUSION

Adult: 30–100 mg/24 hours

Acute migraine

BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

Adult: 10 mg for 1 dose, to be administered as soon as migraine symptoms develop; intravenous injection to be given over at least 3 minutes

www.getintopharma.com
Nausea and labyrinth disorders

Metoclopramide is used for the treatment of acute migraine, but is not licensed for this indication.

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND DURATION OF USE (AUGUST 2013)

The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency’s Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose, and duration of use have been made:

- **In adults over 18 years,** metoclopramide should only be used for prevention of postoperative nausea and vomiting, radiotherapy-induced nausea and vomiting, delayed (but not acute) chemotherapy-induced nausea and vomiting, and symptomatological treatment of nausea and vomiting, including that associated with acute migraine (where it may also be used to improve absorption of oral analgesics);
- **Metoclopramide should only be prescribed for short-term use (up to 5 days);**
- **Usual dose is 10 mg,** repeated up to 3 times daily; max. daily dose is 500 micrograms/kg;
- **Intravenous doses should be administered as a slow bolus over at least 3 minutes;**
- **Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.**

This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).

### CONTRA-INDICATIONS

- **3–4 days after gastrointestinal surgery,** gastro-intestinal haemorrhage, gastro-intestinal obstruction, gastro-intestinal perforation, phaeochromocytoma
- **Asthma,** atopic allergy, bradycardia, cardiac conduction disturbances, children, elderly, epilepsy, may mask underlying disorders such as cerebral irritation, Parkinson’s disease, uncorrected electrolyte imbalance—young adults (15–19 years old)

### INTERACTIONS

- Appendix 1: metoclopramide

### SIDE-EFFECTS

- **GENERAL SIDE-EFFECTS**
  - **Common or very common** Asthenia, depression, diarrhoea, drowsiness, hypotension, menstrual cycle irregularities, movement disorders, parkinsonism
  - **Uncommon** Arrhythmias, hallucination, hyperprolactinaemia, level of consciousness decreased
  - **Rare or very rare** Confusion, galactorrhoea, seizure, frequency not known, atrioventricular block, blood disorders, cardiac arrest, gynaecomastia, hypertension, neuroleptic malignant syndrome, QT interval prolongation, shock, syncope, tremor

### SPECIFIC SIDE-EFFECTS

- With parenteral use: anxiety, dizziness, dysphoria, oedema, skin reactions, visual impairment

**SIDE-EFFECTS**, **FURTHER INFORMATION**

Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine will abort dystonic attacks.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Small amount present in milk; avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of accumulation).

### Dose adjustments

- **Manufacturer advises dose reduction of 50% in severe impairment.**
- **RENAI IMPAIRMENT**
  - **Dose adjustments** Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.

### DIRECTIONS FOR ADMINISTRATION

Oral liquid preparation to be given via a graduated oral dosing syringe.

**PRESCRIBING AND DISPENSING INFORMATION**

**Palliative care** For further information on the use of metoclopramide hydrochloride in palliative care, see www.medicinescomplete.com/#/content/palliative/metoclopramide.

**PATIENT AND CARER ADVICE** Counselling on use of pipette advised with oral solution.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Solution for injection**

- **Metoclopramide hydrochloride (Non-proprietary)**
  - Metoclopramide hydrochloride 5 mg per 1 ml Metoclopramide 10mg/2ml solution for injection ampoules | 3 ampoule [£1.31-£15.00] 10 ampoule [£25.00 DT + £2.65]
  - **Maxolon** (Advanz Pharma)
    - Metoclopramide hydrochloride 5 mg per 1 ml Maxolon 10mg/2ml solution for injection ampoules | 12 ampoule [£21]
    - Maxolon High Dose 100mg/20ml solution for injection ampoules | 10 ampoule [£26.68]

**Oral solution**

- **Metoclopramide hydrochloride (Non-proprietary)**
  - Metoclopramide hydrochloride 1 mg per 1 ml Metoclopramide 5mg/5ml oral solution sugar free sugar-free | 150 ml [£19.77 DT + £19.77]

**Tablet**

- **Metoclopramide hydrochloride (Non-proprietary)**
  - Metoclopramide hydrochloride 10 mg Metoclopramide 10mg tablets | 28 tablet [£1.40 DT + £0.61]
  - **Maxolon** (Advanz Pharma)
    - Metoclopramide hydrochloride 10 mg Maxolon 10mg tablets | 84 tablet [£5.24]

**Combinations available:** Paracetamol with metoclopramide, p. 476

### ANTIEMETICS AND ANTINAUSEANTS

#### NEUROKININ RECEPTOR ANTAGONISTS

**Aprepitant**

**INDICATIONS AND DOSE**

Adjunct treatment to prevent nausea and vomiting associated with moderately and highly emetogenic chemotherapy

- **BY MOUTH**
  - Adult: Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days, consult product literature for dose of concomitant dexamethasone and 5HT3-antagonist

**CONTRA-INDICATIONS**

Acute porphyrias p. 1058

**INTERACTIONS**

- Appendix 1: aprepitant

**SIDE-EFFECTS**

- **Common or very common** Appetite decreased, asthenia, constipation, gastrointestinal discomfort, headache, hiccup

- **Uncommon** Anaemia, anxiety, burping, dizziness, drowsiness, dry mouth, febrile neutropenia.
Nervous system

Rare or very rare

Uncommon

Common or very common

CONTRA-INDICATIONS

DRUG ACTION

Fosaprepitant

29-Aug-2018

INDICATIONS AND DOSE

Adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

BY INTRAVENOUS INFUSION

Adult: 150 mg, dose to be administered over 20–30 minutes and given 30 minutes before chemotherapy on day 1 of cycle only, consult product literature for dose of concomitant corticosteroid and 5HT3-receptor antagonist

CONTRA-INDICATIONS

Acute porphyrias p. 1058

INTERACTIONS

Appendix J: fosaprepitant

SIDE-EFFECTS

Common or very common

Appetite decreased - asthena - constipation - gastrointestinal discomfort - headache - hiccups

Uncommon

Rare or very rare

Bradycardia - cardiovascular disorder - chest discomfort - cognitive disorder - conjunctivitis - cough - disorientation - euphoric mood - gait abnormal - hyperhidrosis - increased risk of infection - muscle spasms - muscle weakness - oedema - oropharyngeal pain - photosensitivity reaction - polydipsia - seborrhoea - severe cutaneous adverse reactions (SCARs) - sneezing - stomatitis - taste altered - throat irritation - tinnitus - weight decreased

Fosaprepitant is a prodrug of aprepitant.

Rolapitant

26-Oct-2017

INDICATIONS AND DOSE

Adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing delayed nausea and vomiting associated with moderately and highly emetogenic chemotherapy

BY MOUTH

Adult: 180 mg as a single dose, dose should be administered up to 2 hours before chemotherapy. Interval between repeated doses must be at least 2 weeks, consult product literature for dose of concomitant corticosteroid and 5HT3-receptor antagonist

INTERACTIONS

Appendix J: rolapitant

SIDE-EFFECTS

Common or very common

Asthena - constipation - headache

Uncommon

Appetite decreased - concentration impaired - diarrhoea - dizziness - drowsiness - gastrointestinal discomfort - hiccups - increased risk of infection - insomnia - myalgia - nausea - neutropenia - stomatitis - taste altered

Rare or very rare

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—limited information available.

BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

Manufacturer advises caution in concomitant treatment with an antiarrhythmic drug.

For intravenous infusion (Ivemend®), manufacturer advises give intermittently in Sodium chloride 0.9%; reconstitute each 150 mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes.

The Scottish Medicines Consortium (SMC) decisions

SCMC No. 678/11

Scottish Medicines Consortium has advised (March 2011) that fosaprepitant (Ivemend®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy in adults.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule

- Emend (Merck Sharp & Dohme Ltd)
  - Aprepitant 80 mg
  - Aprepitant 125 mg

Powder for solution for infusion

- Ivemend (Merck Sharp & Dohme Ltd)
  - Fosaprepitant (as Fosaprepitant dimeglumine) 150 mg

BY MOUTH

Aprepitant 125 mg (Merck Sharp & Dohme Ltd)

- Rolapitant 150 mg powder for solution for infusion vials 1 vial

Manufacturer advises caution in concomitant treatment with an antiarrhythmic drug.

Manufacturer advises avoid unless potential benefit outweighs risk—limited information available.

BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

Manufacturer advises avoid unless potential benefit outweighs risk—limited information available.

BREAST FEEDING

Avoid—present in milk in animal studies.

Manufacturer advises caution in concomitant treatment with an antiarrhythmic drug.

Manufacturer advises avoid—present in milk in animal studies.

Manufacturer advises caution in concomitant treatment with an antiarrhythmic drug.
Granisetron

**DRUG ACTION**
Granisetron is a specific SHT3-receptor antagonist which blocks SHT3 receptors in the gastrointestinal tract and in the CNS.

**INDICATIONS AND DOSE**
Nausea and vomiting induced by cytotoxic chemotherapy for planned duration of 3–5 days where oral antiemetics cannot be used

- BY TRANSDERMAL APPLICATION USING PATCHES
  - Adult: 1 mg, to be administered before induction of anaesthesia, dose to be diluted to 5 mL and given over 30 seconds

Treatment of postoperative nausea and vomiting

- BY INTRAVENOUS INJECTION
  - Adult: 1 mg, dose to be diluted to 5 mL and given over 30 seconds; maximum 3 mg per day

Management of nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy

- BY MOUTH
  - Adult: 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following treatment, when intravenous route also used, maximum combined total dose 9 mg in 24 hours

- BY INTRAVENOUS INJECTION
  - Adult: 10–40 micrograms/kg (max. per dose 3 mg), to be given 5 minutes before start of treatment, dose may be repeated if necessary, further maintenance doses must not be given less than 10 minutes apart, for intravenous injection, each 1 mg granisetron diluted to 5 mL and given over not less than 30 seconds, for intravenous infusion, to be given over 5 minutes; maximum 9 mg per day

**CAUTIONS**
- Subacute intestinal obstruction - susceptibility to QT-interval prolongation (including electrolyte disturbances)
- Interactions
  - With intravenous use or oral use Diarrhoea - insomnia
  - With intravenous use or oral use Extrapyramidal symptoms - QT interval prolongation - serotonin syndrome
  - With transdermal use Appetite decreased - arthralgia - dry mouth - flushing - generalised oedema - vertigo
  - Rare or very rare
    - With transdermal use Dystonia
  - Pregnancy
    - Avoid - no information available.
  - Hepatic impairment
    - Manufacturer advises caution.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion, give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute up to 3 mL in 20–50 mL infusion fluid; give over 5 minutes.

**PATIENT AND CARER ADVICE**
- With transdermal use Patients should be advised not to expose the site of the patch to sunlight during use and for 10 days after removal.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- CAUTIONARY AND ADVISORY LABELS: 3
- EXCIPIENTS: May contain Polysorbates
  - Varuby (Tosaro UK Ltd)
  - Rolapitant (as Rolapitant hydrochloride monohydrate)
  - 90 mg Varuby 90mg tablets | 2 tablet [PSt] £47.42

**ANTIEMETICS AND ANTINAUSEANTS**

**SEROTONIN (5HT3) RECEPTOR ANTAGONISTS**

**Granisetron**

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- Adult: 10–40 micrograms/kg (max. per dose 3 mg), to be given 5 minutes before start of treatment, dose may be repeated if necessary, further maintenance doses must not be given less than 10 minutes apart, for intravenous injection, each 1 mg granisetron diluted to 5 mL and given over not less than 30 seconds, for intravenous infusion, to be given over 5 minutes; maximum 9 mg per day

- **CAUSATIONS**
  - Subacute intestinal obstruction - susceptibility to QT-interval prolongation (including electrolyte disturbances)
  - **INTERACTIONS**
    - Appendix 1: granisetron
  - **SIDE-EFFECTS**
    - **GENERAL SIDE-EFFECTS**
      - Constipation - headache
  - **SPECIFIC SIDE-EFFECTS**
    - Constipation - headache
  - **DIRECTIONS FOR ADMINISTRATION**
    - With intravenous use For intravenous infusion, give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute up to 3 mL in 20–50 mL infusion fluid; give over 5 minutes.
  - **PATIENT AND CARER ADVICE**
    - With transdermal use Patients should be advised not to expose the site of the patch to sunlight during use and for 10 days after removal.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Granisetron (Non-proprietary)
  - Granisetron (as Granisetron hydrochloride) 1 mg per 1 mL Granisetron 3mg/3ml concentrate for solution for injection ampoules | 5 ampoule [PSt] £24.00–£30.00 | 10 ampoule [PSt] £48.00
  - Granisetron 1mg/1ml concentrate for solution for injection ampoules | 5 ampoule [PSt] £18.00–£10.00 | 10 ampoule [PSt] £36.00

**Tablet**

- Granisetron (Non-proprietary)
  - Granisetron (as Granisetron hydrochloride) 1 mg Granisetron 1mg tablets | 10 tablet [PSt] £51.20 DT = £40.79
  - Granisetron (as Granisetron hydrochloride) 2 mg Granisetron 2mg tablets | 5 tablet [PSt] £52.39
  - Kytril (Atnahs Pharma UK Ltd)
    - Granisetron (as Granisetron hydrochloride) 1 mg Kytril 1mg tablet | 10 tablet [PSt] £52.39 DT = £40.79
    - Kytril (as Granisetron hydrochloride) 2 mg Kytril 2mg tablets | 5 tablet [PSt] £52.39 DT = £52.39

**Transdermal patch**
- Sancuso (Kyowa Kirin Ltd)
  - Granisetron 3.1 mg per 24 hour Sancuso 3.1mg/24hours transdermal patches | 1 patch [PSt] £56.00 DT = £56.00

www.getintopharma.com
**DRUG ACTION** Ondansetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

**INDICATIONS AND DOSE**

**Moderately emetogenic chemotherapy or radiotherapy**
- **BY MOUTH**
  - Adult: Initially 8 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days
  - **BY RECTUM**
  - Adult: Initially 16 mg, dose to be taken 1–2 hours before treatment, then 16 mg daily for up to 5 days
  - **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Adult: Initially 8 mg, dose to be administered immediately before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
  - **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
  - Elderly: Initially 8 mg, dose to be administered immediately before treatment, intravenous infusion to be given over at least 15 minutes, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**Severely emetogenic chemotherapy (consult product literature for dose of concomitant corticosteroid)**
- **BY MOUTH**
  - Adult: 24 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days
  - **BY RECTUM**
  - Adult: 16 mg, dose to be administered 1–2 hours before treatment, then 16 mg daily for up to 5 days
  - **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Adult: Initially 8 mg, dose to be administered immediately before treatment, followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
  - **INITIALLY BY INTRAVENOUS INFUSION**
  - Adult: Initially 16 mg, immediately before treatment (over at least 15 minutes), followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
  - Adult 65–74 years: Initially 8 mg, to be given immediately before treatment, followed by (by intramuscular injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**Prevention of postoperative nausea and vomiting**
- **INITIALLY BY MOUTH**
- Adult: 16 mg, dose to be taken 1 hour before anaesthesia, alternatively (by intramuscular injection or by slow intravenous injection) 4 mg, dose to be administered at induction of anaesthesia

**TREATMENT OF POSTOPERATIVE NAUSEA AND VOMITING**
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
- Adult: 4 mg for 1 dose

**CONTRA-INDICATIONS** Congenital long QT syndrome

**CAUTIONS**
- Adenontsillar surgery, subacute intestinal obstruction, susceptibility to QT-interval prolongation (including electrolyte disturbances)

**INTERACTIONS**
- Appendix 1: ondansetron

**SIDE-EFFECTS**
- **Common or very common** Constipation, feeling hot, headache, sensation abnormal
- **Uncommon** Arrhythmias, chest pain, hiccup, hypotension, movement disorders, oculogyric crisis, seizure
- **Rare or very rare** Dizziness, QT interval prolongation, vision disorders

**PREGNANCY** No information available; avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Present in milk in animal studies—avoid

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (decreased clearance). Dose adjustments Manufacturer advises maximum 8 mg daily in moderate to severe impairment.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion (Zofran®), give continuously or intermittently in Glucose 5% or Glucose 5% with Potassium chloride 0.3% or Sodium chloride 0.9% or Sodium chloride 0.9% with Potassium chloride 0.3% or Mannitol 10% or Ringers solution; for intermittent infusion, dilute the required dose in 50–100 mL of infusion fluid and give over at least 15 minutes.
- With oral use Orodispersible films and lyophilisates should be placed on the tongue, allowed to disperse and swallowed.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- **Ondansetron (Non-proprietary)**
  - **Ondansetron (as Ondansetron hydrochloride) 4 mg** Ondansetron 4mg tablets | 10 tablet (£0.81–£25.46 DT = £9.94) | 30 tablet (£3.15–£76.38)
  - **Ondansetron (as Ondansetron hydrochloride) 8 mg** Ondansetron 8mg tablets | 10 tablet (£4.79–£10.31)
- **Ondemet (Alliance Pharmaceuticals Ltd)**
  - **Ondansetron (as Ondansetron hydrochloride) 8 mg** Ondemet 8mg tablets | 10 tablet (£3.54–£10.31) (Hospital only)
- **Zofran (Novartis Pharmaceuticals UK Ltd)**
  - **Ondansetron (as Ondansetron hydrochloride) 4 mg** Zofran 4mg tablets | 30 tablet (£0.91–£10.75)
  - **Ondansetron (as Ondansetron hydrochloride) 8 mg** Zofran 8mg tablets | 10 tablet (£1.94–£10.31)

**Suppository**
- **Zofran (Novartis Pharmaceuticals UK Ltd)**
  - **Ondansetron 16 mg** Zofran 16mg suppositories | 1 suppository (£4.39)

Nervous System
Nausea and labyrinth disorders

Solution for injection

- Ondansetron (Non-proprietary)
  - Ondansetron (as Ondansetron hydrochloride) 2 mg per 1 ml Ondansetron 8mg/4ml solution for injection ampoules
  - 5 ampoule (Po) £11.80–£18.45 DT = £93.95
  - Ondansetron 4mg/2ml solution for injection ampoules
  - 5 ampoule (Po) £5.00–£29.97 DT = £22.97
  - 10 ampoule (Po) £15.00

- Zofer Flexi-amp (Novartis Pharmaceuticals UK Ltd)
  - Ondansetron (as Ondansetron hydrochloride) 2 mg per 1 ml Zofer Flexi-amp 8mg/4ml solution for injection

  - Ondansetron 4 mg Ondansetron 4mg orodispersible tablets
  - 10 tablet (Po) £43.46 DT = £43.46

- Ondansetron 8 mg Ondansetron 8mg orodispersible tablets
  - 10 tablet (Po) £85.43 DT = £85.43

Palonosetron

- **DRUG ACTION** Palonosetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

- **INDICATIONS AND DOSE**
  - **Moderately emetogenic chemotherapy**
    - **INITIALLY BY MOUTH**
    - Adult: 500 micrograms, dose to be taken 1 hour before treatment, alternatively (by intravenous injection) 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment
  - **Severely emetogenic chemotherapy**
    - **BY INTRAVENOUS INJECTION**
    - Adult: 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

- **CAUTIONS** History of constipation - intestinal obstruction - susceptibility to QT-interval prolongation (including electrolyte disturbances)

- **INTERACTIONS**
  - Appendix 1: palonosetron

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common Constipation - headache
  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use Diarrhoea - dizziness - electrolyte imbalance - metabolic disorder

- **INDICATIONS AND DOSE**
  - **Moderately emetogenic chemotherapy**
  - **Highly emetogenic cisplatin-based chemotherapy**
    - **BY MOUTH**
      - Adult: 1 capsule, to be taken approximately 1 hour before the start of each chemotherapy cycle

- **CAUTIONS**
  - Patients over 75 years

- **INTERACTIONS**
  - Appendix 1: netupitant - palonosetron

- **SIDE-EFFECTS**
  - Common or very common Asthenia - constipation - headache

- **UNCOMMON**
  - Alopecia - cardiac conduction disorders - cardiomyopathy - diarrhoea - dizziness - flatulence - gastrointestinal discomfort - hiccups - hypertension - increased leucocytes - neutropenia - QT interval prolongation - sleep disorders - urticaria - vertigo

- **RARE or very rare**
  - Acute psychosis - arrhythmias - conjunctivitis - cystitis - dizziness - euphoria - feeling hot - hypokalaemia - hypertension - leucopenia - mirtal valve incompetence - mood altered - myocardial ischaemia - numbness - pain - tongue coated - vision blurred

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer recommends exclude pregnancy before treatment in females of childbearing age; ensure effective contraception during treatment and for one month after treatment.

Palonosetron with netupitant

The properties listed below are those particular to the different medicines containing the same drug.

- **NETUPITANT**
  - **Palonosetron (Non-proprietary)**
    - Palonosetron (as Palonosetron hydrochloride) 50 microgram per 1 ml Palonosetron 250micrograms/5ml solution for injection vials
      - 1 vial (Po) £53.10–£55.89
      - 10 vial (Po) £561.10
    - Palonosetron (as Palonosetron hydrochloride) 50 microgram per 1 ml Palonosetron 250micrograms/5ml solution for injection vials
      - 1 vial (Po) £55.89
    - **Capsule**
      - Palonosetron (as Palonosetron hydrochloride) 500 microgram
        - 1 capsule (Po) £55.89

www.getintopharma.com
**Antihistamines**

**Cinnarizine**

- **Indications and dose**
  - Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière’s disease
  - **By mouth**
    - Child 5–11 years: 15 mg 3 times a day
    - Child 12–17 years: 30 mg 3 times a day
    - Adult: 30 mg 3 times a day

- **Motion sickness**
  - **By mouth**
    - Child 5–11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
    - Child 12–17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey
    - Adult: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

- **Contra-indications**
  - Avoid in Acute porphyrias p. 1058

- **Cautions**
  - Epilepsy, glaucoma (in children), Parkinson’s disease (in adults), prostatic hypertrophy (in adults), pyloroduodenal obstruction, susceptibility to angle-closure glaucoma (in adults), urinary retention

- **Interactions**
  - Appendix 1: antihistamines, sedating

- **Side-effects**
  - Common or very common: Drowsiness, gastrointestinal discomfort, nausea, weight increased

- **Frequency not known**
  - Dry mouth, gastrointestinal disorder, headache, jaundice cholestatic, movement disorders, muscle rigidity, parkinsonism, skin reactions, subacute cutaneous lupus erythematosus, tremor

- **Pregnancy**
  - Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **Breast feeding**
  - Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**Promethazine teoclate**

- **Indications and dose**
  - Nausea or vomiting, Labyrinthine disorders
  - **By mouth**
    - Child 5–9 years: 12.5–37.5 mg daily
    - Child 10–17 years: 25–75 mg daily; maximum 100 mg per day
    - Adult: 25–75 mg daily; maximum 100 mg per day

  - **Motion sickness prevention (acts longer than promethazine hydrochloride)**
    - **By mouth**
      - Child 5–9 years: 12.5 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
      - Child 10–17 years: 25 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
      - Adult: 25 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel

  - **Motion sickness treatment (acts longer than promethazine hydrochloride)**
    - **By mouth**
      - Child 5–9 years: 12.5 mg, dose to be taken at onset of motion sickness, then 12.5 mg daily for 2 days, dose to be taken at bedtime
PATIENT AND CARER ADVICE

RENAL IMPAIRMENT

Child 10-17 years: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime

Adult: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

CAUTIONS

Asthma • bronchiectasis • bronchitis • epilepsy • prostatic hypertrophy (in adults) • pyloroduodenal obstruction • Reye’s syndrome • severe coronary artery disease • susceptibility to angle-closure glaucoma • urinary retention

INTERACTIONS → Appendix 1: antihistamines, sedating

SIDE-EFFECTS

Anticholinergic syndrome • anxiety • appetite decreased • arrhythmia • blood disorder • bronchial secretion viscosity increased • confusion • dizziness • drowsiness • dry mouth • epigastric discomfort • fatigue • haemolytic anaemia • headache • hypotension • jaundice • movement disorders • muscle spasms • nightmare • palpitations • photosensitivity reaction • urinary retention • vision blurred

SIDE-EFFECTS, FURTHER INFORMATION

Elderly patients are more susceptible to anticholinergic side-effects. In children paradoxical stimulation may occur, especially with high doses.

PREGNANCY

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

BREAST FEEDING

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT

Manufacturer advises caution.

RENAL IMPAIRMENT

Use with caution.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

ANTIMUSCARINICS

Hyoscine hydrobromide

(Scopolamine hydrobromide)

INDICATIONS AND DOSE

Motion sickness

→ BY MOUTH

Child 4-9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then

75–150 micrograms every 6 hours if required; maximum 450 micrograms per day

Child 10-17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day

Adult: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day

BY TRANSDERMAL APPLICATION

Child 10-17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

Adult: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

Hypersalivation associated with clozapine therapy

→ BY MOUTH

Adult: 300 micrograms up to 3 times a day; maximum 900 micrograms per day

Excessive respiratory secretion in palliative care

→ BY SUBCUTANEOUS INJECTION

Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary, particularly in excessive respiratory secretions

→ BY CONTINUOUS SUBCUTANEOUS INFUSION

Adult: 1.2–2 mg/24 hours

Bowel colic in palliative care

→ BY MOUTH USING SUBLINGUAL TABLETS

Adult: 300 micrograms 3 times a day, as Kwells®

Premedication

→ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

Adult: 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

UNLICENSED USE

Not licensed for hypersalivation associated with clozapine therapy.

IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

CAUTIONS

Epilepsy

CAUTIONS, FURTHER INFORMATION

Anticholinergic syndrome

In adults In some patients, especially the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

In children In some children hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

INTERACTIONS → Appendix 1: hyoscine

SIDE-EFFECTS

→ Common or very common

With transdermal use Eye disorders • eyelid irritation

Nervous system

PATIENT AND CARER ADVICE

PRESCRIBING AND DISPENSING INFORMATION

With transdermal use in children

HEPATIC IMPAIRMENT

BREAST FEEDING

PREGNANCY

With transdermal use

Use with caution.

Use only if potential bene

DRUG ACTION

Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

INDICATIONS AND DOSE

Prevention and treatment of postoperative nausea and vomiting

BY INTRAVENOUS INJECTION

Adult: 0.625–1.25 mg, dose to be given 30 minutes before end of surgery, then 0.625–1.25 mg every 6 hours as required

Elderly: 625 micrograms, dose to be given 30 minutes before end of surgery, then 625 micrograms every 6 hours as required

Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia (PCA)

BY INTRAVENOUS INJECTION

Adult: 15–50 micrograms of droperidol for every 1 mg of morphine in PCA, reduce dose in elderly; maximum 5 mg per day

CONTRA-INDICATIONS

Bradycardia · CNS depression · comatose states · hypokalaemia · hypomagnesaemia · phaeochromocytoma · QT-interval prolongation

CAUTIONS

Chronic obstructive pulmonary disease · electrolyte disturbances · history of alcohol abuse · respiratory failure

INTERACTIONS

Appendix 1: droperidol

SIDE-EFFECTS

Uncommon Anxiety · oculogyration

Rare or very rare Blood disorder · cardiac arrest · confusion · dysphoria

Frequency not known Coma · epilepsy · hallucination · oligomenorhoea · respiratory disorders · SIADH · syncpe

BREAST FEEDING

Limited information available—avoid repeated administration.

HEPATIC IMPAIRMENT

Manufacturer advises caution.

Dose adjustments

When used for Prevention and treatment of postoperative nausea and vomiting Manufacturer advises maximum 625 micrograms repeated every 6 hours as required.

When used for Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia Manufacturer advises dose reduction (no information available).

RENAL IMPAIRMENT

Dose adjustments

In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.

For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.

MONITORING REQUIREMENTS

Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**BNF 78**

**www.getintopharma.com**
Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

Temporomandibular dysfunction can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, diazepam p. 343, which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin or ibuprofen may also be required.

**Nervous system**

Benzydamine hydrochloride mouthwash or spray p. 120 (and other NSAIDs), are particularly suitable for pain in mucosal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

**Pain in sickle-cell disease**

The pain of mild sickle-cell crises is managed with paracetamol, a NSAID, codeine phosphate p. 454, or dihydrocodeine tartrate p. 456. Severe crises may require the use of morphine p. 463 or diamorphine hydrochloride p. 455; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine hydrochloride p. 470 should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine hydrochloride necessitates frequent injections.

**Dental and orofacial pain**

Analgesics should be used judiciously in dental care as a temporary measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscesses, reliance on analgesics alone is usually inappropriate. Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by paracetamol or diclofenac sodium p. 1135, and aspirin.

Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect. Opioid analgesics such as dihydrocodeine tartrate act on the central nervous system and are traditionally used for moderate to severe pain. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

**Analgesics**

**Pain relief**

The non-opioid drugs, paracetamol p. 444 and aspirin p. 121 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

Aspirin is indicated for headache, transient musculoskeletal pain, dysmenorrhoea, and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties. Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly.

Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain). Aspirin interacts significantly with a number of other drugs and its interaction with warfarin sodium p. 140 is a special hazard.

Paracetamol is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irritant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. Overdosage with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

Nefopam hydrochloride p. 446 may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

**Non-steroidal anti-inflammatory analgesics (NSAIDs)** are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly. They are also suitable for the relief of pain in dysmenorrhoea and to treat pain caused by secondary bone tumours, many of which produce lysis of bone and release prostaglandins. Selective inhibitors of cyclo-oxgenase-2 may be used in preference to non-selective NSAIDs for patients at risk of developing serious gastro-intestinal side-effects. Several NSAIDs are also used for postoperative analgesia.
A non-opioid analgesic administered by intrathecal infusion (ziconotide (Prialt®), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.

**Compound analgesic preparations**

Compound analgesic preparations that contain a simple analgesic (such as aspirin or paracetamol p. 444) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol or aspirin p. 121 with a low dose of an opioid analgesic (e.g. 8 mg of codeine phosphate p. 454 per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of overdosage yet may not provide significant additional relief of pain.

A full dose of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration).

**Important:** the elderly are particularly susceptible to opioid side-effects and should receive lower doses.

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

**Caffeine** is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable. Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

**Co-proxamol** tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets [unlicensed] may still be prescribed for patients who find it difficult to change, because alternatives are not effective or suitable.

**Opioid analgesics and dependence**

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

**Strong opioids**

Morphine p. 463 remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of severe pain in palliative care. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 447 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 1369.

Dipipanone hydrochloride used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in palliative care.

**Diamorphine hydrochloride** p. 456 (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In *palliative care* the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Alfentanil p. 1343, fentanyl p. 458 and remifentanil p. 1344 are used by injection for intra-operative analgesia; fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 502 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone hydrochloride may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone hydrochloride p. 466 has an efficacy and side-effect profile similar to that of morphine. It is commonly used as a second-line drug if morphine is not tolerated or does not control the pain.

Papaveretum p. 469 is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine p. 469 has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine tartrate p. 456 or codeine phosphate, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine hydrochloride p. 470 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride, are often preferred for obstetric pain.

Tapentadol p. 471 produces analgesia by two mechanisms. It is an opioid-receptor agonist and it also inhibits noradrenaline reuptake. Nausea, vomiting, and constipation are less likely to occur with tapentadol than with other strong opioid analgesics.

Tramadol hydrochloride p. 471 produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

**Weak opioids**

Codeine phosphate can be used for the relief of mild to moderate pain where other painkillers such as paracetamol or ibuprofen p. 1141 have proved ineffective.

Dihydrocodeine tartrate has an analgesic efficacy similar to that of codeine phosphate. Higher doses may provide some additional pain relief but this may be at the cost of more nausea and vomiting.

Meptazinol p. 463 is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

**Postoperative analgesia**

A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A
postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine is used most widely. Tramadol hydrochloride is not as effective in severe pain as other opioid analgesics. Buprenorphine may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine hydrochloride is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine p. 463. Patient-controlled analgesia (PCA) can be used to relieve postoperative pain—consult individual hospital protocols.

Pain management and opioid dependence
Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

Patient-controlled analgesia (PCA) can be used to relieve postoperative pain—consult individual hospital protocols.

### Pain management and opioid dependence

**Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need.** Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

- **Frequency not known** Consciousness impaired - disorientation - dissociation - hypoxia - nystagmus - renal failure - vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to fluorinated anaesthetics.
- **PREGNANCY** Manufacturer advises use with caution—limited information available.
- **BREAST FEEDING** Manufacturer advises use with caution—limited information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of Penthrox® has provided an Administration Checklist and an Administration Guide for healthcare professionals.
- **HANDLING AND STORAGE** Manufacturer advises exposure of healthcare professionals to methoxyflurane should be minimised—risk of serious side-effects.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsiness.

### Methoxyflurane

**INDICATIONS AND DOSE**

**Moderate to severe pain associated with trauma (under close medical supervision)**

- **BY INHALATION**
  - Adult: 3–6 mL as required, avoid administration on consecutive days; administer using inhaler device; maximum 15 mL per week

**IMPORTANT SAFETY INFORMATION**

Manufacturer advises methoxyflurane should only be self-administered under the supervision of personnel experienced in its use, using a hand-held Penthrox® inhaler device.

- **CONTRA-INDICATIONS** Cardiovascular disease · history of liver damage associated with use of methoxyflurane or other halogenated anaesthetics · impaired consciousness · respiratory depression · susceptibility to malignant hyperthermia
- **CAUTIONS** Elderly—increased risk of hypotension—repeated administration more than once every 3 months—increased risk of hepatic injury · risk factors for hepatic impairment · risk factors for renal impairment
- **INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics
- **SIDE-EFFECTS**
  - Common or very common Anxiety · cough · depression · dizziness · drowsiness · dry mouth · dysarthria · headache · hyperhidrosis · hypotension · memory loss · mood altered · nausea · neuropathy sensory · taste altered
  - Uncommon Appetite increased · chills · fatigue · oral discomfort · paraesthesia · vision disorders
  - Rare or very rare Hepatic disorders

**ANALGESICS > NON-OPIOID**

**Paracetamol**

*(Acetaminophen)*

**INDICATIONS AND DOSE**

**Mild to moderate pain** | **Pyrexia**

- **BY MOUTH**
  - Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

- **BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
  - Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 4 g per day

- **BY RECTUM**
  - Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

**Mild to moderate pain in patients with risk factors for hepatotoxicity** | **Pyrexia in patients with risk factors for hepatotoxicity**

- **BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
  - Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 3 g per day

**Pain** | **Pyrexia with discomfort**

- **BY MOUTH**
  - Child 3–5 months: 60 mg every 4–6 hours; maximum 4 doses per day
INTERACTIONS

POST-IMMUNISATION PYREXIA IN INFANTS
BY MOUTH
Child 2-3 months: 60–125 mg every 4–6 hours as required; maximum 4 doses per day
Child 4–6 months: 125–250 mg every 4–6 hours as required; maximum 4 doses per day
Child 6 months onwards: 250–500 mg every 4–6 hours as required; maximum 4 doses per day
Child 12–17 years: 500 mg every 4–6 hours

ACUTE MIGRAINE
BY MOUTH
Adult: 1 g for 1 dose, to be taken as soon as migraine symptoms develop

UNLICENSED USE
In children Paracetamol oral suspension 500 mg/5 mL not licensed for use in children under 16 years. Not licensed for use as prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine.

CAUTIONS
Before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours. Body weight under 50 kg, chronic alcohol consumption, chronic dehydration, chronic malnutrition, hepatocellular insufficiency, long-term use (especially in those who are malnourished).

CAUTIONS, FURTHER INFORMATION
Some patients may be at increased risk of experiencing toxicity at therapeutic doses, particularly those with a body weight under 50 kg and those with risk factors for hepatotoxicity. Clinical judgement should be used to adjust the dose of oral and intravenous paracetamol in these patients.

Co-administration of enzyme-inducing antiepileptic medications may increase toxicity; doses should be reduced.

INTERACTIONS
Appendix 1: paracetamol

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
Rare or very rare: Thrombocytopenia
SPECIFIC SIDE-EFFECTS
Common or very common
With rectal use: Anorectal erythema
Rare or very rare
With intravenous use: Hypersensitivity, hypotension, leucopenia, malaise, neutropenia
With rectal use: Angioedema, liver injury, skin reactions
Frequency not known
With intravenous use: Flushing, skin reactions, tachycardia

With oral use: Agranulocytosis, bronchospasm, hepatic function abnormal, rash, severe cutaneous adverse reactions (SCARs)
With rectal use: Agranulocytosis, blood disorder, severe cutaneous adverse reactions (SCARs)

OVERDOSE
Liver damage and less frequently renal damage can occur following overdose.
Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning, p. 1359.

PREGNANCY
Not known to be harmful.

BREAST FEEDING
Amount too small to be harmful.

HEPATIC IMPAIRMENT
Dose-related toxicity—avoid large doses.

RENAL IMPAIRMENT
Dose adjustments
In adults Increase infusion dose interval to every 6 hours if eGFR less than 30 mL/minute/1.73 m².
In children Increase infusion dose interval to every 6 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION
With intravenous use For intravenous infusion (Perfalgal®), give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL.vial.

PRESCRIBING AND DISPENSING INFORMATION
BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-mild-moderate-pain

PROFESSIONAL INFORMATION
Dental practitioners’ formulary
Paracetamol Tablets may be prescribed.
Paracetamol Soluble Tablets 500 mg may be prescribed.
Paracetamol Oral Suspension may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY
Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository, powder.

Combinations available: Co-codamol, p. 453 - Dihydrocodeine with paracetamol, p. 457

ANALGESICS > NON-OPIOID, CENTRALLY ACTING

Nefopam hydrochloride

- INDICATIONS AND DOSE

Moderate pain

> BY MOUTH

- Adult: Initially 60 mg 3 times a day, adjusted according to response; usual dose 30–90 mg 3 times a day

- Elderly: Initially 30 mg 3 times a day, adjusted according to response; usual dose 30–90 mg 3 times a day

- CONTRA-INDICATIONS Convulsive disorders - not indicated for myocardial infarction

- CAUTIONS Elderly - urinary retention

- INTERACTIONS > Appendix 1: nefopam

- SIDE-EFFECTS

  > Uncommon Coma - drowsiness - headache - hyperhidrosis - insomnia - tachycardia - vision blurred - vomiting

  > Rare or very rare Urine red

  > Frequency not known Abdominal pain - angioedema - confusion - diarrhoea - dizziness - dry mouth - gastrointestinal disorder - hallucination - hypeension - nausea - nervousness - palpitations - paraesthesia - seizure - syncope - tremor - urinary retention

- PREGNANCY No information available—avoid unless no safer treatment.

- HEPATIC IMPAIRMENT Manufacturer advises caution.

- RENAL IMPAIRMENT Caution.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
ANALGESICS > NON-Steroidal Anti-INFLAMMATORY DRUGS

Aspirin with codeine

The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 121, codeine phosphate p. 454.

- **INDICATIONS AND DOSE**
  - Mild to moderate pain / Pyrexia
  - **BY MOUTH**
  - Adult: 1–2 tablets every 4–6 hours as required, dose to be dispensed in water; maximum 8 tablets per day

- **INTERACTIONS** → Appendix 1: aspirin - opioids
- **PRESCRIBING AND DISPENSING INFORMATION** When co-codaprin tablets or dispersible tablets are prescribed and no strength is stated, tablets or dispersible tablets, respectively, containing codeine phosphate 8 mg and aspirin 400 mg should be dispensed.
- **LESS SUITABLE FOR PRESCRIBING** Aspirin with codeine is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** Aspirin with codeine can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Dispersible tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 13, 21, 32
  - **Aspirin with codeine (Non-proprietary)**
    - Codeine phosphate 8 mg, Aspirin 400 mg
    - **Codaprin 8 mg/400 mg** dispersible tablets | 100 tablet [US] £97.55 DT = £93.41 [GB]
    - **Codis** (Reckitt Benckiser Healthcare (UK) Ltd)
      - **Codine phosphate 8 mg, Aspirin 500 mg** Codis 50 dispersible tablets sugar-free | 32 tablet [P] £3.23 [GB]
  - **Tablet**
    - **Aspirin with codeine (Non-proprietary)**
      - Codeine phosphate 8 mg, Aspirin 400 mg
      - Aspirin and Codeine tablets | 32 tablet [P] £0.95

ANALGESICS > OPIOIDS

Opioids

- **CONTRA-INDICATIONS** Acute respiratory depression - comatose patients - head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment) - raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurological assessment) - risk of paralytic ileus

- **CAUTIONS** Adrenocortical insufficiency (reduced dose is recommended) - asthma (avoid during an acute attack) - convulsive disorders - debilitated patients (reduced dose is recommended) (in adults) - diseases of the biliary tract - elderly (reduced dose is recommended) - hypotension - hypothyroidism (reduced dose is recommended) - impaired respiratory function (avoid in chronic obstructive pulmonary disease) - inflammatory bowel disorders - myasthenia gravis - obstructive bowel disorders - prostatic hypertrophy (in adults) - shock - urethral stenosis (in adults)

**CAUTIONS, FURTHER INFORMATION**

- Dependence Repeat use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence.

- **SIDE-EFFECTS**
  - **Common or very common** Arrhythmias - confusion - constipation - dizziness - drowsiness - dry mouth - euphoric mood - flushing - hallucination - headache - hyperhidrosis - hypotension (with high doses) - miosis - nausea (more common on initiation) - palpitations - respiratory depression (with high doses) - skin reactions - urinary retention - vertigo - visual impairment - vomiting (more common on initiation) - withdrawal syndrome (in adults)

- **Uncommon** Drug dependence - dysphoria

**SIDE EFFECTS, FURTHER INFORMATION**

**Respiratory depression** Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone.

**Dependence and withdrawal** Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief), but tolerance can develop during long-term treatment.

**Overdose** Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 1359 and consider the specific antidote, naloxone hydrochloride.

**PREGNANCY** Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.

**TREATMENT CESSATION** Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.

**PRESCRIBING AND DISPENSING INFORMATION** The Faculty of Pain Medicine has produced resources for healthcare professionals around opioid prescribing: www.fpm.ac.uk/ faculty-of-pain-medicine/opioids-aware

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see Drugs and driving under Guidance on prescribing p. 1.

**Buprenorphine**

**DRUG ACTION** Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

**INDICATIONS AND DOSE**

**Moderate to severe pain**

- **BY SUBLINGUAL ADMINISTRATION**
  - Child (body-weight 16–25 kg): 100 micrograms every 6–8 hours
  - Child (body-weight 25–37.5 kg): 100–200 micrograms every 6–8 hours
  - Child (body-weight 37.5–50 kg): 200–300 micrograms every 6–8 hours
  - Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours
  - Adult: 200–400 micrograms every 6–8 hours

- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Child 6 months–11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
Nervous system

Adult:

BY TRANSDERMAL APPLICATION USING PATCHES

Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic—If necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches applied in different places (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time.

PHARMACOKINETICS

For Buprenorphine®: It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUPLAST®

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic—Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

BY TRANSDERMAL APPLICATION USING PATCHES

Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time.

PHARMACOKINETICS

For Buplast®: It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUPRAMYL®

Moderate, non-malignant pain unresponsive to non-opioid analgesics—Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic—Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic

BY TRANSDERMAL APPLICATION USING PATCHES

Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time.

PHARMACOKINETICS

For Bupramyl®: It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.
Moderate, non-malignant pain unresponsive to non-opioid analgesics

**BY TRANSDERMAL APPLICATION USING PATCHES**

- **Adult:** Initially 5 micrograms/hour up to every 7 days, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time.

**PHARMACOKINETICS**

- For **Bute®:** It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**BUVIDAL®**

**Adjunct in the treatment of opioid dependence**

- **BY SUBCUTANEOUS INJECTION**
- **Adult:** (consult product literature)

**PHARMACOKINETICS**

- Weekly **Buvidal®** has a terminal half-life ranging from 3 to 5 days.
- Monthly **Buvidal®** has a terminal half-life ranging from 19 to 25 days.

**HAPOCATIN®**

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic

- **Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic**

  **BY TRANSDERMAL APPLICATION USING PATCHES**

  - **Adult:** Initially 35 micrograms/hour up to every 72 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually.

**Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic**

- **Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic**

  **BY TRANSDERMAL APPLICATION USING PATCHES**

  - **Adult:** The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually.

**PHARMACOKINETICS**

- For **Hapocatin®:** It may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**PANITAZ®**

Moderate, non-malignant pain unresponsive to non-opioid analgesics

- **BY TRANSDERMAL APPLICATION USING PATCHES**

  - **Adult:** Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time.

**PHARMACOKINETICS**

- For **Panitaz®:** It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**PRENOTRIX®**

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic

- **Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic**

  **BY TRANSDERMAL APPLICATION USING PATCHES**

  - **Adult:** Initially 35 micrograms/hour up to every 72 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time.

**PRENOTRIX®**

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic

- **Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic**

  **BY TRANSDERMAL APPLICATION USING PATCHES**

  - **Adult:** The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time.

**PHARMACOKINETICS**

- For **Prenotrix®:** It may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**RELETRANS®**

Moderate, non-malignant pain unresponsive to non-opioid analgesics

- **BY TRANSDERMAL APPLICATION USING PATCHES**

  - **Adult:** Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time.
PHARMACOKINETICS
- For Reletrans®: It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

RELEVTEC®
Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic: Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic
- BY TRANSDERMAL APPLICATION USING PATCHES
  - Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic: Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic
- BY TRANSDERMAL APPLICATION USING PATCHES
  - Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS
- For Relevtec®: It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

SEVODYNE®
Moderate, non-malignant pain unresponsive to non-opioid analgesics
- BY TRANSDERMAL APPLICATION USING PATCHES
  - Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS
- For Sevodyne®: It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

TRANSCTEC®
Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic: Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic
- BY TRANSDERMAL APPLICATION USING PATCHES
  - Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time

PHARMACOKINETICS
- For Transtec®: It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

UNLICENSED USE

IMPORTANT SAFETY INFORMATION
- With transdermal use in adults
  Do not confuse the formulations of transdermal patches which are available as 72-hourly, 96-hourly and 7-day patches, see Prescribing and dispensing information.

- CAUTIONS
  - GENERAL CAUTIONS: Impaired consciousness
  - SPECIFIC CAUTIONS
    - With transdermal use: Fever or external heat - other opioids should not be administered within 24 hours of patch removal (long duration of action)
    - When used for adjunct in the treatment of opioid dependence: Hepatitis B infection - hepatitis C infection - pre-existing liver enzyme abnormalities
  - CAUTIONS, FURTHER INFORMATION
    - Fever or external heat
    - With transdermal use: Manufacturer advises monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption).
  - BUVIDAL®: Susceptibility to QT-interval prolongation

- SIDE-EFFECTS
  - GENERAL SIDE-EFFECTS
    - Common or very common: Anxiety (in adults) - appetite decreased (in adults) - depression (in adults) - diarrrhoea (in adults) - dysphoria (in adults) - syncope (in adults) - tremor (in adults)
  - SPECIFIC SIDE-EFFECTS
    - Common or very common: With parenteral use: Arthralgia (in adults) - asthenia (in adults) - asthma (in adults) - behaviour abnormal (in adults) - chest pain (in adults) - chills (in adults) - cough (in adults) - dysmenorrhoea (in adults) - eye disorders (in adults) - fever (in adults) - gastrointestinal discomfort (in adults)
adults) - gastrointestinal disorders (in adults) - hypnoticsensitivity - increased risk of infection (in adults) - insomnia (in adults) - lymphadenopathy (in adults) - malaise (in adults) - migraine (in adults) - muscle complaints (in adults) - muscle tone increased (in adults) - pain (in adults) - parasthesia (in adults) - peripheral oedema (in adults) - speech disorder (in adults) - thinking abnormal (in adults) - vasodilation (in adults) - withdrawal syndrome neonatal - yawning (in adults)

- With sublingual use: Fatigue - sleep disorders
- With transdermal use: Astenia - gastrointestinal discomfort - muscle weakness - oedema - sleep disorders
- Uncommon
- With parenteral use: Procedural dizziness (in adults)
- Rare or very rare
- With sublingual use: Angioedema - bronchospasm
- With transdermal use: Angina pectoris - asthma exacerbated - dehydration - dysphagia - ear pain - eyelid oedema - increased risk of infection - influenza like illness - muscle contractions involuntary - psychotic disorder - vasodilation
- Frequency not known
- With parenteral use: Angioedema - bronchospasm - death (in adults) - hepatic disorders - hepatic encephalopathy (in adults) - psychotic disorder - vision blurred
- With sublingual use: Cerebrospinal fluid pressure increased - circulation impaired - haemorrhagic diathesis - hepatic disorders - oral disorders
- With transdermal use: Biliary colic - depersonalisation - seizure - withdrawal syndrome neonatal

Overdose
The effects of buprenorphine are only partially reversed by naloxone.

Breast feeding
Present in low levels in breast milk.

Monitoring
Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

Hepatic impairment
Manufacturer advises caution; avoid in severe impairment (limited information available).

For transdermal patch, manufacturer advises consider avoiding in severe impairment.

Dose adjustments
- In adults: For oral lyophilisate, manufacturer advises initial dose reduction in mild to moderate impairment.
- Renal impairment
Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

Pre-treatment screening
Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.

Monitoring requirements
Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.

Directions for administration
- In children: Sublingual tablets may be halved.
- In adults: Manufacturer advises oral lyophilisate should be placed on the tongue and allowed to dissolve. Patients should be advised not to swallow for 2 minutes and not to consume food or drink for at least 5 minutes after administration.

Butrans
Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and sitting replacement patch on a different area (avoid same area for at least 3 weeks).

Prenotrix
Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and sitting replacement patch on a different area (avoid same area for at least 7 days).

Hapocasin
Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and sitting replacement patch on a different area (avoid same area for at least 7 days).

Butech, Bupramyl, Panitaz, Reletrans
Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and sitting replacement patch on a different area (avoid same area for at least 7 days).

Transtec
Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and sitting replacement patch on a different area (avoid same area for at least 7 days).

Prescribing and dispensing information
Transdermal buprenorphine patches are not suitable for acute pain in or those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Transdermal patches are available as 72-hourly, 96-hourly and 7-day formulations; prescribers and dispensers must ensure that the correct preparation is prescribed and dispensed. Preparations that should be applied up to every 72 hours include Hapocasin and Prenotrix. Preparations that should be applied up to every 96 hours include Bupeaze, Buplast, Relevec, and Transtec. Preparations that should be applied up to every 7 days include Bupranyl, Butech, BuTrans, Panitaz, Reletrans and Sevodyne. Esprano oral lyophilisate has different bioavailability to other buprenorphine products and is not interchangeable with them—consult product literature before switching between products.

Patient and carer advice
Patients or carers should be given advice on how to administer buprenorphine products.

National funding/access decisions
NICE decisions
- Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TAI4
- In adults Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

Scottish Medicines Consortium (SMC) decisions
- In adults The Scottish Medicines Consortium has advised (June 2017) that buprenorphine oral lyophilisate (Esprano®) is accepted for restricted use within NHS Scotland as substitution treatment for opioid dependence for patients in whom methadone is not suitable. This
advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**BUTEC®**

**Scottish Medicines Consortium (SMC) decisions**
The Scottish Medicines Consortium has advised (January 2017) that buprenorphine transdermal patches (Buteed®) are accepted for restricted use within NHS Scotland for the treatment of chronic non-malignant pain of moderate intensity when an opioid is necessary for obtaining adequate analgesia in elderly patients (over 65 years).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Temosic** (Indivior UK Ltd)
  - Buprenorphine (as Buprenorphine hydrochloride)
    - 36 microgram per 1 ml Temgesic 30micrograms/1ml solution for injection ampoules | 5 ampoule [PMS] £2.46 [03]

**Sublingual tablet**

Co-codamol
The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 444.

- **INDICATIONS AND DOSE**
  - **Moderate pain (using co-codamol 8/500 preparations only)**
    - **BY MOUTH**
      - Adult: 8/500–16/1000 mg every 4–6 hours as required; maximum 64/4000 mg per day
  - **Moderate pain (using co-codamol 15/500 preparations only)**
    - **BY MOUTH**
      - Adult: 15/500–30/1000 mg every 4–6 hours as required; maximum 120/4000 mg per day
  - **Moderate to severe pain (using co-codamol 30/500 preparations only)**
    - **BY MOUTH**
      - Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

- **KAPAKE 15/500**
  - **Mild to moderate pain**
    - **BY MOUTH**
      - Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

- **SOLPADOL® CAPLETS**
  - **Severe pain**
    - **BY MOUTH**
      - Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

- **SOLPADOL® CAPSULES**
  - **Severe pain**
    - **BY MOUTH USING EFFERVESCENT TABLETS**
      - Adult: 2 tablets every 4–6 hours as required, tablets to be dispersed in water; maximum 8 tablets per day

- **CONTRA-INDICATIONS**
  - Acute ulcerative colitis - antibiotic-associated colitis - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers

- **CAUTIONS**
  - Acute abdomen - alcohol dependence - avoid abrupt withdrawal after long-term treatment - cardiac arrhythmias - chronic alcoholism - chronic dehydration - chronic malnutrition - convulsive disorders - gallstones - hepatocellular insufficiency

- **CAUTIONS, FURTHER INFORMATION**
  - Variation in metabolism - The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

- **INTERACTIONS**
  - Appendix 1: opioids - paracetamol

- **SIDE-EFFECTS**
  - Abdominal pain - addiction - agranulocytosis - blood disorder - irritability - pancreatitis - restlessness - severe cutaneous adverse reactions (SCARs) - thrombocytopenia

- **OVERDOSE**
  - Liver damage (and less frequently renal damage) following overdosage with paracetamol.

- **BREAST FEEDING**
  - Avoid — although amount of codeine usually too small to be harmful, mothers vary considerably...
in their capacity to metabolise codeine—risk of morphine overdose in infant.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **Dose adjustments** Manufacturer advises consider dose reduction in mild to moderate impairment.
- **RENA L IMPAIRMENT** Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensibility.

- **PRESCRIBING AND DISPENSING INFORMATION** Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x:y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively.

  When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

  The Drug Tariff allows tablets of co-codamol labelled 'dispersible' to be dispensed against an order for 'effervescent' and vice versa.

- **LESS SUITABLE FOR PRESCRIBING** Co-codamol is less suitable for prescribing.

- **EXCEPTIONS TO LEGAL CATEGORY** Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Codeine phosphate**

- **INDICATIONS AND DOSE**
  - **Acute diarrhoea**
    - **BY MOUTH**
      - Child 12-17 years: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day
      - Adult: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day
    - **BY INTRAMUSCULAR INJECTION**
      - Child 12-17 years: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day
  - **Mild to moderate pain**
    - **BY MOUTH**
      - Adult: 30–60 mg every 4 hours if required; maximum 240 mg per day
    - **BY INTRAMUSCULAR INJECTION**
      - Child 12-17 years: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day
Dry or painful cough

- BY MOUTH USING LINCTUS
- Adult: 15–30 mg 3–4 times a day

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (JULY 2013) CODEINE FOR ANALGESIA: RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY**

Codeine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy:

- in children aged 12–18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days
- codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
- codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures
- codeine is contra-indicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-rapid metabolisers)
- codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk
- parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced consciousness, lack of appetite, somnolence, constipation, respiratory depression, ‘pin-point’ pupils, nausea, vomiting)

**MHRA/CHM ADVICE (APRIL 2015) CODEINE FOR COUGH AND COLD: RESTRICTED USE IN CHILDREN**

Do not use codeine in children under 12 years as it is associated with a risk of respiratory side effects. Codeine is not recommended for adolescents (12–18 years) who have problems with breathing. When prescribing or dispensing codeine-containing medicines for cough and cold, consider that codeine is contra-indicated in:

- children younger than 12 years old
- patients of any age known to be CYP2D6 ultra-rapid metabolisers
- breastfeeding mothers

### CONTRA-INDICATIONS

- Acute ulcerative colitis
- antibiotic-associated colitis
- children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
- conditions where abdominal distension develops
- conditions where inhibition of peristalsis should be avoided
- known ultra-rapid codeine metabolisers

### CAUTIONS

- Acute abdomen
- cardiac arrhythmias
- gallstones
- not recommended for adolescents aged 12–18 years with breathing problems

### CAUTIONS, FURTHER INFORMATION

- Variation in metabolism: The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

### INTERACTIONS

- Appendix 1: opioids

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- Biliary spasm
- hypothermia
- mood altered
- sexual dysfunction
- urethral spasm

#### SPECIFIC SIDE-EFFECTS

- With oral use:
  - Abdominal cramps
  - addiction
  - appetite decrease
  - depression
  - drug reaction with eosinophilia and systemic symptoms (DRESS)
  - dyskinesia
  - dysphoria
  - face oedema
  - fatigue
  - fever
  - hypergastrinaemia
  - hypersensitivity
  - intracranial pressure increased
  - lymphadenopathy
  - malaise
  - muscle rigidity (with high doses)
  - nightmare
  - panic reaction
  - restless lessness
  - seizure
  - splenomegaly
  - urinary disorders
  - vision disorders
- With parenteral use
  - Dysuria

#### BREAST FEEDING

Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.

#### HEPATIC IMPAIRMENT

- With oral use
  - Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- With intravenous use
  - Manufacturer advises avoid.

#### DOSAGE ADJUSTMENTS

- With oral use
  - Manufacturer advises dose reduction in mild to moderate impairment.

#### RENAL IMPAIRMENT

Avoid
- Avoid or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

#### PRESCRIBING AND DISPENSING INFORMATION

- BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.

#### PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Codeine phosphate for pain
  - www.medicinesforchildren.org.uk/codeine-phosphate-pain

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

- **Galcodine** (Thornton & Ross Ltd)
  - Codeine phosphate 3 mg per 1 ml Galcodine 15 mg/5 ml linctus sugar-free | 2000 ml | £3.90 (D53)

Combinations available: **Aspirin with codeine**, p. 447
Diamorphine hydrochloride (Heroin hydrochloride)

**INDICATIONS AND DOSE**

**Acute pain**
- By intramuscular injection, or by subcutaneous injection
  - Adult: 5 mg every 4 hours if required
  - By slow intravenous injection
  - Adult: 1.25–2.5 mg every 4 hours if required

**Acute pain (heavier, well-muscled patients)**
- By intramuscular injection, or by subcutaneous injection
  - Adult: Up to 10 mg every 4 hours if required
  - By slow intravenous injection
  - Adult: 2.5–5 mg every 4 hours if required

**Chronic pain not currently treated with a strong opioid analgesic**
- By subcutaneous injection, or by intramuscular injection
  - Adult: Initially 2.5–5 mg every 4 hours, adjusted according to response
  - By subcutaneous infusion
  - Adult: Initially 5–10 mg, adjusted according to response, dose to be administered over 24 hours

**Acute pulmonary oedema**
- By slow intravenous injection
  - Adult: 2.5–5 mg, dose to be administered at a rate of 1 mg/minute

**Myocardial infarction**
- By slow intravenous injection
  - Adult: 5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute
  - Elderly: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

**Myocardial infarction (frail patients)**
- By slow intravenous injection
  - Adult: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

**Contra-indications**
- Delayed gastric emptying • phaeochromocytoma

**Cautions**
- CNS depression • severe cor pulmonary • severe diarrhoea • toxic psychosis

**Interactions**
- Appendix 1: opioids

**Side-effects**
- Biliary spasm • circulatory depression • intracranial pressure increased • mood altered

**Breast Feeding**
- Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.

**Hepatic Impairment**
- Manufacturer advises caution.

**Renal Impairment**
- Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

**Medicinal Forms**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Powder for solution for injection**
- Diamorphine hydrochloride (Non-proprietary)
  - Diamorphine hydrochloride 5 mg: Diamorphine 5 mg powder for solution for injection ampoules | 5 ampoule £11.36–£14.95 DT = £13.76 (C02)

  - Diamorphine hydrochloride 10 mg: Diamorphine 10 mg powder for solution for injection ampoules | 5 ampoule £16.36–£16.95 DT = £14.49 (C02)
Dihydrocodeine tartrate (Non-proprietary)  
Dihydrocodeine tartrate 30 mg | Dihydrocodeine 30mg tablets | 28 tablet (PS) £0.99 DT = £0.36 (CT) | 30 tablet (PS) £0.99–£1.56 (CT) | 100 tablet (PS) £3.89 DT = £3.36 (CT) | 500 tablet (PS) £16.80 (CT)  
DF 118 (Martindale Pharmaceuticals Ltd)  
Dihydrocodeine tartrate 40 mg | DF 118 Forte 40mg tablets | 100 tablet (PS) £11.51 DT = £11.51 (CT)  

Solution for injection  
Dihydrocodeine tartrate (Non-proprietary)  
Dihydrocodeine tartrate 50 mg per 1 ml | Dihydrocodeine 50mg/1ml solution for injection ampoules | 10 ampoule (PS) £115.80 DT = £115.80 (CT)  

Oral solution  
Dihydrocodeine tartrate (Non-proprietary)  
Dihydrocodeine tartrate 2 mg per 1 ml | Dihydrocodeine 10mg/5ml oral solution | 150 ml (PS) £9.83 DT = £9.83 (CT)  

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 444.

**INDICATIONS AND DOSE**

**Mild to moderate pain (using 10/500 preparations only)**  
**BY MOUTH**  
Adult: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day  

**Severe pain (using 20/500 preparations only)**  
**BY MOUTH**  
Adult: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day  

**Severe pain (using 30/500 preparations only)**  
**BY MOUTH**  
Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day  

**DOSE EQUIVALENCE AND CONVERSION**  
A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/ y, where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: DIHYDROCODEINE WITH PARACETAMOL (CO-DYDRAMOL): PRESCRIBE AND DISPENSE BY STRENGTH TO MINIMISE RISK OF MEDICATION ERROR (JANUARY 2018)

The MHRA has advised that dihydrocodeine with paracetamol preparations are prescribed and dispensed by strength to minimise dispensing errors and the risk of accidental opioid overdose—see Prescribing and dispensing information.

**CAUTIONS**  
Alcohol dependence - before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours - chronic alcoholism - chronic dehydration - chronic malnutrition - hepatocellular insufficiency - pancreatitis - severe cor pulmonale  

**INTERACTIONS**  
Appendix 1: opioids - paracetamol  

**SIDE-EFFECTS**  
Abdominal pain - blood disorder - leucopenia - malaise - neutropenia - pancreatitis - paraesthesia - paralytic ileus - severe cutaneous adverse reactions (SCARs) - thrombocytopenia  

**OVERDOSE**  
Lever damage (and less frequently renal damage) following overdosage with paracetamol.

**BREAST FEEDING**  
Amount of dihydrocodeine too small to be harmful but use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT**  
Manufacturer advises consider avoiding in mild to moderate impairment; avoid in severe impairment.

**Dose adjustments**  
Manufacturer advises dose reduction in mild to moderate impairment, if used.

**RENAL IMPAIRMENT**  
Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.

**PRESCRIBING AND DISPENSING INFORMATION**  
The MHRA advises when prescribing dihydrocodeine with paracetamol, the tablet strength and dose must be clearly indicated; when dispensing dihydrocodeine with paracetamol, ensure the prescribed strength is supplied—contact the prescriber if in doubt.

The BP defines Co-dyramol Tablets as containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg.

**LESS SUITABLE FOR PRESCRIBING**  
Dihydrocodeine with paracetamol is less suitable for prescribing.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**Dipipanone hydrochloride with cyclizine**

**INDICATIONS AND DOSE**

**Acute pain**  
**BY MOUTH**  
Adult: Initially 1 tablet every 6 hours, then increased if necessary up to 3 tablets every 6 hours, dose to be increased gradually

**CAUTIONS**  
Diabetes mellitus - palliative care (not recommended) - phaeochromocytoma

**INTERACTIONS**  
Appendix 1: antihistamines, sedating - opioids

**SIDE-EFFECTS**  

www.getintopharma.com
Fentanyl

**INDICATIONS AND DOSE**

**Chronic intractable pain not currently treated with a strong opioid analgesic**

- **BY TRANSDERMAL APPLICATION**
  - **Child 16-17 years:** Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)
  - **Adult:** Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

**Chronic intractable pain currently treated with a strong opioid analgesic**

- **BY TRANSDERMAL APPLICATION**
  - **Child 2-17 years:** Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under Chronic intractable pain not currently treated with a strong opioid analgesic, for conversion from long term oral morphine to transdermal fentanyl, see Pain management with opioids under Prescribing in palliative care p. 25.
  - **Adult:** Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under Chronic intractable pain not currently treated with a strong opioid analgesic, for conversion from long term oral morphine to transdermal fentanyl, see Pain management with opioids under Prescribing in palliative care p. 25.

**DOSE EQUIVALENCE AND CONVERSION**

- Fentanyl films are not bioequivalent to other fentanyl preparations.
- Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients...
are switched from another fentanyl-containing preparation, a new dose titration is required.

DOSES AT EXTREMES OF BODY-WEIGHT
- To avoid excessive dosage in obese patients, weight-based doses may need to be calculated on the basis of ideal bodyweight.

ABSTRAL®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
- BY MOUTH USING SUBLINGUAL TABLETS
  - Adult: Initially 100 micrograms, then 100 micrograms after 15–30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units 15–30 minutes apart, for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 2 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

EFFENTORA®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
- BY MOUTH USING BUCAL TABLET
  - Adult: Initially 100 micrograms, then 100 micrograms after 30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain during titration

INSTANYL®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
- BY INTRANASAL ADMINISTRATION
  - Adult: Initially 50 micrograms, dose to be administered into one nostril, then 50 micrograms after 10 minutes if required, dose to be adjusted according to response, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

PECEFENT®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
- BY INTRANASAL ADMINISTRATION
  - Adult: Initially 100 micrograms, adjusted according to response, dose to be administered into one nostril only, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE: TRANSDERMAL FENTANYL PATCHES: LIFE-THREATENING AND FATAL OPIOID TOXICITY FROM ACCIDENTAL EXPOSURE, PARTICULARLY IN CHILDREN (OCTOBER 2018)
Accidental exposure to transdermal fentanyl can occur if a patch is swallowed or transferred to another individual. Always fully inform patients and their carers about directions for safe use of fentanyl patches, including the importance of:
- not exceeding the prescribed dose;
- following the correct frequency of patch application, avoiding touching the adhesive side of patches, and washing hands after application;
- not cutting patches and avoiding exposure of patches to heat including via hot water;
- ensuring that old patches are removed before applying a new one;

- following instructions for safe storage and properly disposing of used patches or those which are not needed.

Patients and carers should be advised to seek immediate medical attention if overdose is suspected—see Side-effects and Patient and carer advice for further information.

- CAUTIONS
  - GENERAL CAUTIONS
    - Cerebral tumour - diabetes mellitus (with Actiq® and Cynril® lozenges) - impaired consciousness
  - SPECIFIC CAUTIONS
    - With buccal use mucusitis—absorption from oral preparations may be increased, caution during dose titration (in adults)

- CAUTIONS, FURTHER INFORMATION
  - With transdermal use Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.
  - With intravenous use Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

- INTERACTIONS
  - Appendix 1: opioids

- SIDE-EFFECTS
  - Common or very common
    - With parenteral use Apnoea - hypertension - movement disorders - muscle rigidity - post procedural complications - respiratory disorders - vascular pain
    - With sublingual use Asthenia - dyspnoea - oral disorders
    - With transdermal use Anxiety - appetite decreased - asthena - depression - diarrhoea - dyspnoea - gastrointestinal discomfort - hypertension - insomnia - malaise - muscle complaints - peripheral oedema - sensation abnormal - temperature sensation altered - tremor
  - Uncommon
    - With parenteral use Airway complication of anaesthesia - chills - hiccup - hypothermia
    - With transdermal use Consciousness impaired - cyanosis - fever - gastrointestinal disorders - influenza like illness - memory loss - respiratory disorders - seizures - sexual dysfunction - vision blurred
  - Rare or very rare
    - With transdermal use Apnoea
  - Frequency not known
with intranasal use. Diarrhoea, epistaxis, fatigue, fever, hot flush, insomnia, malaise, motion sickness, myoclonus, nasal complaints, peripheral oedema, seizure, sensation abnormal, stomatitis, taste altered, throat irritation.

- With sublingual use. Addiction, consciousness impaired, diarrhoea, fall, fever, hot flush, peripheral oedema, seizure, withdrawal syndrome neonatal

- With transdermal use. Myoclonus, withdrawal syndrome neonatal

**SIDE-EFFECTS, FURTHER INFORMATION**

**Muscle rigidity**

Intravenous administration of fentanyl can cause muscle rigidity, which may involve the thoracic muscles. Manufacturer advises administration by slow intravenous injection to avoid; higher doses may require premedication with benzodiazepines and muscle relaxants.

**Transdermal use**

Monitor patients using patches for increased side-effects if fever is present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).

**BREAST FEEDING**

- With buccal or intranasal use or sublingual use. Manufacturer advises avoid during treatment and for 5 days after last administration—present in milk.
- With intravenous use. Manufacturer advises avoid during treatment and for 24 hours after last administration—present in milk.
- With transdermal use. Manufacturer advises avoid during treatment and for 72 hours after removal of patch—present in milk.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution (risk of accumulation).

**Dose adjustments**

Manufacturer advises cautious dose titration.

**RENAL IMPAIRMENT**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**DIRECTIONS FOR ADMINISTRATION**

- With transdermal use. For patches, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days).
- With intravenous use in adults. For intravenous infusion (Sublimaze), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.
- With buccal use in adults. For buccal films, moisten mouth, place film on inner lining of cheek (pink side to cheek), hold for at least 5 seconds until it sticks, and leave to dissolve (15–30 minutes); if more than 1 film required do not overlap, but use another area of the mouth. Avoid liquids for 5 minutes after application; avoid food until the film has dissolved.
- With buccal use. Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.
- With buccal use. Patient should sit or stand during administration.

**EFFENTORA®**

Place tablet between cheek and gum and leave to dissolve; if more than 1 tablet required, place second tablet on the other side of the mouth; tablet may alternatively be placed under the tongue (sublingually).

**PRESCRIBING AND DISPENSING INFORMATION**

With transdermal use. Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write ‘(Fentanyl 25 micrograms per hour)’. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. ‘one patch to be applied every 72 hours’. The total quantity of patches to be supplied should be written in words and figures.

**PATIENT AND CARER ADVICE**

- With transdermal use. Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdose. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.
- In adults. Patients or carers should be given advice on how to administer fentanyl buccal films or fentanyl lozenges. Patients or carers should be given advice on how to administer fentanyl nasal spray.

**PNSCH**

Avoid concomitant use of other nasal preparations.

**INSTANYL®**

Avoid concomitant use of other nasal preparations.

**EFFENTORA®**

Patients or carers should be given advice on how to administer Effentora® buccal tablets.

Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate, effervescence does not occur, a switch of therapy may be advised.

**ABSTAL®**

Patients should be advised not to eat or drink until the tablet is completely dissolved. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

**NATIONAL FUNDING/ACCESS DECISIONS**

**PECFENT®**

The Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (September 2008) that PecFent® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**INSTANYL®**

The Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised that Instanyl® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**EFFENTORA®**

The Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised that Effentora® buccal tablets should be restricted for the management of breakthrough pain in adult patients using

---

Hydromorphone hydrochloride

**INDICATIONS AND DOSE**

Severe pain in cancer

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
  - Adult: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain
  - Adult: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

**CONTRA-INDICATIONS**

- Acute abdomen
- Pancreatitis - toxic psychosis

**SIDE-EFFECTS**

- Common or very common Abdominal pain - anxiety - appetite decreased - asthenia - sleep disorders
- Uncommon Depression - diarrhoea - dyspnoea - erectile dysfunction - malaise - movement disorders - paraesthesia - peripheral oedema - taste altered - tremor
- Frequency not known Hyperalgesia - paralytic ileus - seizure - withdrawal syndrome neonatal

**BREAST FEEDING**

Avoid — no information available

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid

**RENAL IMPAIRMENT**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs

**DIRECTIONS FOR ADMINISTRATION**

For immediate-release capsules, swallow whole capsule or sprinkle contents on soft food. For modified-release capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Modified-release capsule**

**CAUTIONARY AND ADVISORY LABELS**

**462 Pain**

**Meptazinol**

**INDICATIONS AND DOSE**

Moderate to severe pain, including post-operative pain and renal colic

- **BY MOUTH**
  - Adult: 200 mg every 3–6 hours as required
  - Adult: 75–100 mg every 2–4 hours if required
  - Adult: 50–100 mg every 2–4 hours if required

**Contra-indications**

- Myocardial infarction - phaeochromocytoma

**INTERACTIONS** → Appendix 1: opioids

**SIDE-EFFECTS**

- Common or very common Diarrhoea, gastrointestinal discomfort

**Overdose**

Effects only partially reversed by naloxone.

**Contraindications**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Meptid (Almirall Ltd)**
  - Meptazinol (as Meptazinol hydrochloride) 100 mg per 1 ml Meptid 100mg/1ml solution for injection ampoules | 10 ampoule<br> 15.21
  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 2
    - **Meptid (Almirall Ltd)**
      - Meptazinol (as Meptazinol hydrochloride) 200 mg Meptid 200mg tablets | 112 tablet 15.11 DT = 15.11

**Morphine**

**INDICATIONS AND DOSE**

**Pain**

- **BY SUBCUTANEOUS INJECTION**
  - Child 1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
  - Child 6 months-1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response

- **BY MOUTH**
  - Adult: 200 mg every 3–6 hours as required
  - Adult: 75–100 mg every 2–4 hours if required
  - Adult: 50–100 mg every 2–4 hours if required

- **CONTRA-INDICATIONS**
  - Myocardial infarction - phaeochromocytoma

- **INTERACTIONS** → Appendix 1: opioids

- **SIDE-EFFECTS**
  - Common or very common Diarrhoea, gastrointestinal discomfort

- **Overdose**
  - Effects only partially reversed by naloxone.

- **Contraindications**
  - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Meptid (Almirall Ltd)**
  - Meptazinol (as Meptazinol hydrochloride) 100 mg per 1 ml Meptid 100mg/1ml solution for injection ampoules | 10 ampoule<br> 15.21

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 2
  - **Meptid (Almirall Ltd)**
    - Meptazinol (as Meptazinol hydrochloride) 200 mg Meptid 200mg tablets | 112 tablet 15.11 DT = 15.11

**Pain**

- **Child 6 months-11 years:** 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
  - Child 12-17 years: 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response

  - **By mouth, or by rectum**
    - Child 1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
    - Child 3–5 years: 100–150 micrograms/kg every 4 hours, adjusted according to response
    - Child 6–11 years: 200 micrograms/kg every 4 hours, adjusted according to response
    - Child 12–17 years: Initially 5–10 mg every 4 hours, adjusted according to response

**Acute pain**

- **By mouth, or by subcutaneous injection, or by intramuscular injection**
  - Adult: Initially 10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration, use dose for elderly in frail patients
  - Elderly: Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration

- **By slow intravenous injection**
  - Adult: Initially 5 mg every 4 hours, adjusted according to response, dose can be adjusted more frequently during titration, reduced dose recommended in frail and elderly patients

**Chronic pain**

- **By mouth, or by subcutaneous injection, or by intramuscular injection**
  - Adult: Initially 5–10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients
  - Adult: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response

**Pain (with modified-release 12-hourly preparations)**

- **By mouth using modified-release medicines**
  - Adult: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

**Pain (with modified-release 24-hourly preparations)**

- **By mouth using modified-release medicines**
  - Adult: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

**Pain management in palliative care (starting dose for opioid-naive patients)**

- **By mouth**
  - Adult: 20–30 mg daily in divided doses, using immediate-release preparation 4-hourly or a 12-hourly modified-release preparation, for
management of breakthrough pain and other general advice, see Pain management with opioids under Prescribing in palliative care p. 25.

Pain management in palliative care (starting dose for patients being switched from a regular weak opioid)

- **BY MOUTH**
  - Adult: 40–60 mg daily in divided doses, using immediate-release preparation 4-hourly or 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see Pain management with opioids under Prescribing in palliative care p. 25.

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Usual dose 100 mg every 12 hours; up to 600 mg every 12 hours, higher dose may be required for some patients (occasionally more is needed); for management of breakthrough pain and other general advice, see Pain management with opioids under Prescribing in palliative care p. 25.

**Cough in palliative care**
- **BY MOUTH**
  - Adult: Initially 5 mg every 4 hours

**Premedication**
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: Up to 10 mg, dose to be administered 60–90 minutes before operation

**Patient controlled analgesia (PCA)**
- **BY INTRAVENOUS INFUSION**
  - Adult: (consult local protocol)

**Myocardial infarction**
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 5–10 mg, followed by 5–10 mg if required, dose to be administered at a rate of 1–2 mg/minute, use dose for elderly in frail patients
  - Elderly: 2.5–5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

**Acute pulmonary oedema**
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 5–10 mg, dose to be administered at a rate of 2 mg/minute, use dose for elderly in frail patients
  - Elderly: 2.5–5 mg, dose to be administered at a rate of 2 mg/minute

**Dyspnoea at rest in palliative care**
- **BY MOUTH**
  - Adult: Initially 5 mg every 4 hours, to be given in carefully titrated doses

**DOSE EQUIVALENCE AND CONVERSION**
- The doses stated refer equally to morphine hydrochloride and sulfate.

- With rectal use in children Suppositories are not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**
Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.

- **CONTRA-INDICATIONS** Acute abdomen · delayed gastric emptying · heart failure secondary to chronic lung disease · phaeochromocytoma

- **CAUTIONS** Cardiac arrhythmias · pancreatitis · severe cor pulmonale

- **INTERACTIONS** → Appendix 1: opioids

- **SIDE-EFFECTS**
  - Common or very common
  - With oral use Appetite decreased · asthenic conditions · gastrointestinal discomfort · insomnia · neuromuscular dysfunction
  - Uncommon
  - With oral use Agitation · bronchospasm · ileus · mood altered · myoclonus · peripheral oedema · pulmonary oedema · seizure · sensation abnormal · syncope · taste altered

- **Frequency not known**
  - With oral use Amenorrhoea · biliary pain · cough decreased · hyperalgesia · hypertension · pancreatitis exacerbated · sexual dysfunction · thinking abnormal · ureteral spasm
  - With parenteral use Alertness decreased · bile duct disorders · mood altered · myoclonus · sexual dysfunction · ureteral spasm · urinary disorders · vision disorders

- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
  - Avoid oral preparations in acute impairment; for injectable preparations—consult product literature.

- **DOSE ADJUSTMENTS** Manufacturer advises consider dose reduction—consult product literature.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

- **MONITORING REQUIREMENTS** Possible association between acute chest syndrome in patients with sickle cell disease treated with morphine during a vaso-occlusive crisis—manufacturer advises close monitoring for acute chest syndrome symptoms during treatment.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children For continuous intravenous infusion, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
  - With oral use For modified release capsules—swallow whole or open capsule and sprinkle contents on soft food.

**PRESCRIBING AND DISPENSING INFORMATION**
Modified-release preparations are available as 12-hourly or 24-hourly formulations; prescribers must ensure that the correct preparation is prescribed. Preparations that should be given 12-hourly include Filmarine® SR, MST Continus®, Morphgesic® SR and Zomorph®. Preparations that should be given 24-hourly include MXL®.

Prescriptions must specify the ‘form’.

- With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.

**Palliative care** For further information on the use of morphine in palliative care, see www.medicinescomplete.com/#/content/palliative/morphine.

**PATIENT AND CARER ADVICE**
- With oral use Patients or carers should be given advice on how to administer morphine modified-release capsules.
Medicines for Children leaflet: Morphine for pain
www.medicinesforchildren.org.uk/morphine-pain

EXCEPTIONS TO LEGAL CATEGORY
Morphine Oral Solutions Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL. Oral solutions of morphine can be prescribed by writing the formula:
Morphine hydrochloride 5 mg
Chloroform water to 5 mL.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from specialist-order manufacturers include: capsule, oral solution, solution for injection, infusion, solution for infusion, suppository

Modified-release tablet

Oramorph (Boehringer Ingelheim Ltd) Oramorph 2 mg per 1 ml Oramorph 20mg/ml oral solution | 100 ml [Pharm £1.80 (C02)] | 300 ml [Pharm £5.45 DT = £5.45 (C02)] | 500 ml [Pharm £8.50 (C02)]

Morphine sulfate 20 mg per 1 ml Oramorph 20mg/ml concentrated oral solution sugar-free | 120 ml [Pharm £19.50 DT = £19.50 (C02)]

Modified-release granules
CAUTIONARY AND ADVISORY LABELS 2, 13
- MST Continus (Napp Pharmaceuticals Ltd) Morphine sulfate 20 mg MST Continus suspension 20mg granules packets sugar-free | 30 sachet [Pharm £24.58 DT = £24.58 (C02)] Morphine sulfate 30 mg MST Continus suspension 30mg granules packets sugar-free | 30 sachet [Pharm £25.54 (C02)] Morphine sulfate 60 mg MST Continus suspension 60mg granules packets sugar-free | 30 sachet [Pharm £51.09 DT = £51.09 (C02)]

Morphine sulfate 100 mg MST Continus suspension 100mg granules packets sugar-free | 30 sachet [Pharm £85.15 DT = £85.15 (C02)]
- Morphine 200 mg MST Continus suspension 200mg granules packets sugar-free | 30 sachet [Pharm £170.30 DT = £170.30 (C02)]
Morphine with cyclizine

The properties listed below are those particular to the combination only. For the properties of the components please consider, morphine p. 463, cyclizine p. 430.

**INDICATIONS AND DOSE**

**CYCLIMORPH-10®**

- Moderate to severe pain (short-term use only)
  - By subcutaneous injection, or by intramuscular injection, or by intravenous injection
  - Adult: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

**CYCLIMORPH-15®**

- Moderate to severe pain (short-term use only)
  - By subcutaneous injection, or by intramuscular injection, or by intravenous injection
  - Adult: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

**CAUTIONS**

- Myocardial infarction (cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids) - not recommended in palliative care

**INTERACTIONS** → Appendix 1: antihistamines, sedating opioids

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Cyclimorph** (Advanz Pharma)
  - Morphine tartrate 15 mg per 1 mL, Cyclizine tartrate 50 mg per 1 mL Cyclimorph 15 solution for injection 1 mL ampoules | 5 ampoule | £9.12(10)
  - Morphine tartrate 10 mg per 1 mL, Cyclizine tartrate 50 mg per 1 mL Cyclimorph 10 solution for injection 1 mL ampoules | 5 ampoule | £8.77(10)

---

**Oxycodone hydrochloride**

**INDICATIONS AND DOSE**

**Postoperative pain | Severe pain**

- By mouth using immediate-release medicines
  - Adult: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

- By mouth using modified-release medicines
  - Adult: Initially 10 mg every 12 hours (max. per dose 200 mg every 12 hours), dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose, use 12-hourly modified-release preparations for this dose; see Prescribing and dispensing information

- By slow intravenous injection
  - Adult: 1–10 mg every 4 hours as required

- By intravenous infusion
  - Adult: Initially 2 mg/hour, adjusted according to response

- By subcutaneous injection
  - Adult: Initially 5 mg every 4 hours as required

- By intravenous infusion
  - Adult: Initially 7.5 mg/24 hours, adjusted according to response

**Patient controlled analgesia (PCA)**

- By intravenous infusion
  - Adult: (consult local protocol)

**Moderate to severe pain in palliative care**

- By mouth using immediate-release medicines
  - Adult: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain,
**PRESCRIBING AND DISPENSING INFORMATION**

Modified-release preparations are available as 12-hourly or 24-hourly formulations. Preparations that should be given 12-hourly include Abtard®, Carexil®, Ixyldone®, Leveraxo®, Longtec®, Oxeltra®, OxyCon®in, Oxynorm®, Oxylan®, Reltebon®, and Rencon®. Preparations that should be given 24-hourly include Onevita® XL.

**BREAST FEEDING**

With parenteral use:
- Max. initial dose:
- Dose adjustments:
- Avoid if eGFR less than 10 mL/minute/1.73 m².
- Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild to moderate impairment.

**PAIN**

Pain severity can be classified as mild, moderate, or severe. Pain severity is determined by the pain intensity, duration, and impact on daily activities.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special order manufacturers include: oral solution, solution for infusion.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (October 2004 and November 2010) that OxyNorm® injection is restricted for use within NHS Scotland for patients with cancer who have difficulty in tolerating morphine or diamorphine.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use
- With intravenous infusion (Oxynorm®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1 mg/mL.

**PRESCRIBING AND DISPENSING INFORMATION**

- Modified-release preparations are available as 12-hourly or 24-hourly formulations. Preparations that should be given 12-hourly include Abtard®, Carexil®, Ixyldone®, Leveraxo®, Longtec®, Oxeltra®, OxyCon®, Oxynorm®, Oxylan®, Reltebon®, and Rencon®. Preparations that should be given 24-hourly include Onevita® XL.
- Palliative care: For further information on the use of oxycodone in palliative care, see www.medicinescomplete.com/#/content/palliative/oxycodone.

- **Oxycodone hydrochloride 10 mg per 1 ml** Oxycodone 20mg/2ml solution for injection ampoules | 5 ampoule (Pb) £16.00 DT + £16.00 DT | 10 ampoule (Pb) £30.00 DT
  - **Oxycodone hydrochloride 15 mg per 1 ml** Oxycodone 30mg/3ml solution for injection ampoules | 5 ampoule (Pb) £18.00 DT + £18.00 DT | 10 ampoule (Pb) £36.00 DT
  - **Oxycodone hydrochloride 20 mg per 1 ml** Oxycodone 40mg/4ml solution for injection ampoules | 5 ampoule (Pb) £20.00 DT + £20.00 DT | 10 ampoule (Pb) £40.00 DT
  - **Oxycodone hydrochloride 30 mg per 1 ml** Oxycodone 60mg/6ml solution for injection ampoules | 5 ampoule (Pb) £32.00 DT + £32.00 DT | 10 ampoule (Pb) £64.00 DT
  - **Oxycodone hydrochloride 40 mg per 1 ml** Oxycodone 80mg/8ml solution for injection ampoules | 5 ampoule (Pb) £44.00 DT + £44.00 DT | 10 ampoule (Pb) £88.00 DT

### Oral solution

#### CAUTIONARY AND ADVISORY LABELS 2

- **Oxycodone hydrochloride (Non-proprietary)**
  - **Oxycodone hydrochloride 1 mg per 1 ml** Oxycodone 5mg/5ml oral solution sugar free sugar-free | 250 ml (Pb) £3.91 DT + £3.91 DT
  - **Oxycodone hydrochloride 10 mg per 1 ml** Oxycodone 10mg/ml oral solution sugar free sugar-free | 120 ml (Pb) £4.63 DT + £4.63 DT

- **Oxycodone hydrochloride 1 mg per 1 ml** Oxycodone 5mg/5ml oral solution sugar free sugar-free | 250 ml (Pb) £3.91 DT + £3.91 DT

- **Oxycodone hydrochloride 10 mg per 1 ml** Oxycodone 10mg/ml oral concentrate oral solution sugar-free | 120 ml (Pb) £4.63 DT + £4.63 DT

- **Oxycodone hydrochloride 1 mg per 1 ml** Shortec liquid 5mg/5ml oral solution sugar-free | 250 ml (Pb) £3.91 DT + £3.91 DT

### Capsule

#### CAUTIONARY AND ADVISORY LABELS 2

- **Lynlor (Actavis UK Ltd)**
  - **Oxycodone hydrochloride 5 mg** Lynlor 5mg capsules | 56 capsule (Pb) £6.86 DT + £11.43 DT
  - **Oxycodone hydrochloride 10 mg** Lynlor 10mg capsules | 56 capsule (Pb) £11.72 DT + £22.86 DT

- **Oxycodone hydrochloride 5 mg** Oxycodone 5mg capsules | 56 capsule (Pb) £6.86 DT + £11.43 DT
  - **Oxycodone hydrochloride 10 mg** Oxycodone 10mg capsules | 56 capsule (Pb) £11.72 DT + £22.86 DT

- **Oxycodone hydrochloride 5 mg** Shortec 5mg capsules | 56 capsule (Pb) £6.86 DT + £11.43 DT
  - **Oxycodone hydrochloride 10 mg** Shortec 10mg capsules | 56 capsule (Pb) £11.72 DT + £22.86 DT

- **Oxycodone hydrochloride 5 mg** Shortec 5mg capsules | 56 capsule (Pb) £6.86 DT + £11.43 DT
  - **Oxycodone hydrochloride 10 mg** Shortec 10mg capsules | 56 capsule (Pb) £11.72 DT + £22.86 DT
Oxycodone with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, oxycodone hydrochloride p. 466, naloxone hydrochloride p. 1369.

- **INDICATIONS AND DOSE**
  
  **Severe pain requiring opioid analgesia in patients not currently treated with opioid analgesics**
  
  - **BY MOUTH**
    - Adult: Initially 10/5 mg every 12 hours (max. per dose 40/20 mg every 12 hours), dose to be increased according to response; patients already receiving opioid analgesics can start with a higher dose.
  
  **Second-line treatment of symptomatic severe to very severe idiopathic restless legs syndrome after failure of dopamine therapy**
  
  - **BY MOUTH**
    - Adult: Initially 5/2.5 mg every 12 hours, adjusted weekly according to response, usual dose 10/5 mg every 12 hours; maximum 60/30 mg per day.

- **DOSE EQUIVALENCE AND CONVERSION**
  
  Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of oxycodone and naloxone respectively.

- **INTERACTIONS** → Appendix 1: opioids

- **MEDIcINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension.

**Modified-release tablet**

Papaveretum

- **INDICATIONS AND DOSE**

  **Postoperative analgesia | Severe chronic pain**
  
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Adult: 7.7–15.4 mg every 4 hours if required
    - Elderly: Initially 7.7 mg every 4 hours if required
  
  - **BY INTRAVENOUS INJECTION**
    - Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose.

- **PREMEDICATION**

  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Adult: 7.7–15.4 mg
    - Elderly: 7.7 mg

**Pain**

- **SIDE-EFFECTS** Biliary spasm · dysuria · hypothermia · mood altered · sexual dysfunction · urethral spasm

- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.

- **HEPATIC IMPAIRMENT** Manufacturer advises consider avoiding.

- **DOSE adjustments** Manufacturer advises dose reduction, if used.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **PRESCRIBING AND DISPENSING INFORMATION** The name Omnopon® was formerly used for papaveretum preparations.

  Papaveretum is a mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride.

- **LESS SUITABLE FOR PRESCRIBING** Papaveretum is less suitable for prescribing.

- **MEDIcINAL FORMS** Forms available from special-order manufacturers include: solution for injection

Pentazocine

- **INDICATIONS AND DOSE**

  **Moderate to severe pain**
  
  - **BY MOUTH**
    - Adult: 50 mg every 3–4 hours, dose to be taken preferably after food, usual dose 25–100 mg every 3–4 hours; maximum 600 mg per day

  **Moderate pain**
  
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Adult: 30 mg every 3–4 hours as required; maximum 360 mg per day

  **Severe pain**
  
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Adult: 45–60 mg every 3–4 hours as required; maximum 360 mg per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058 · heart failure secondary to chronic lung disease · patients dependent on opioids (can precipitate withdrawal)

- **CAUTIONS** Arterial hypertension · cardiac arrhythmias · myocardial infarction · pancreatitis · phaeochromocytoma · pulmonary hypertension

- **INTERACTIONS** → Appendix 1: opioids

- **SIDE-EFFECTS** Biliary spasm · blood disorder · chills · circulatory depression · face oedema · facial plethora · generalised tonic-clonic seizure · hypertension · hypothermia · intracranial pressure increased · mood altered · myalgia · paraesthesia · sexual dysfunction · sleep disorders · syncope · toxic epidermal necrolysis · tremor · urogenital spasm

- **OVERDOSE** Effects only partially reversed by naloxone.

- **BREAST FEEDING** Use with caution—limited information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (risk of increased bioavailability).

- **DOSE adjustments** Manufacturer advises consider dose reduction in severe impairment.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **LESS SUITABLE FOR PRESCRIBING** Pentazocine is less suitable for prescribing.

**IMPORTANT SAFETY INFORMATION**

Do not confuse with papaverine.

- **CONTRA-INDICATIONS** Heart failure secondary to chronic lung disease · phaeochromocytoma

- **CAUTIONS** Supraventricular tachycardia

- **INTERACTIONS** → Appendix 1: opioids

www.getintopharma.com
Pethidine hydrochloride
(Meperidine)

**INDICATIONS AND DOSE**

**Acute pain**
- **BY MOUTH**
  - Adult: 50–150 mg every 4 hours
  - By subcutaneous injection, or by intramuscular injection
    - Adult: 25–100 mg, then 25–100 mg after 4 hours, for debilitated patients use dose described for elderly patients
    - Elderly: Initially 25 mg, then 25–100 mg after 4 hours
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 25–50 mg, then 25–50 mg after 4 hours, for debilitated patients use dose described for elderly patients
  - Elderly: Initially 25 mg, then 25–50 mg after 4 hours

**Obstetric analgesia**
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 50–100 mg, then 50–100 mg after 1–3 hours if required; maximum 400 mg per day

**Premedication**
- **BY INTRAMUSCULAR INJECTION**
  - Adult: 25–100 mg, dose to be given 1 hour before operation, for debilitated patients use dose described for elderly patients
  - Elderly: 25 mg, dose to be given 1 hour before operation

**Postoperative pain**
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 25–100 mg every 2–3 hours if required, for debilitated patients use dose described for elderly patients
  - Elderly: Initially 25 mg every 2–3 hours if required

**CONTRA-INDICATIONS** Phaeochromocytoma

**CAUTIONS** Accumulation of metabolites may result in neurotoxicity · cardiac arrhythmias · not suitable for severe continuing pain · severe cor pulmonale

**INTERACTIONS** → Appendix 1: opioids

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Biliary spasm · dysuria · hypothermia

**SPECIFIC SIDE-EFFECTS**
- With oral use: Agitation · mood altered · muscle rigidity · sexual dysfunction · ureteral spasm
- With parenteral use: Anxiety · asthenia · coordination abnormal · delirium · seizure · syncope · tremor

**Overdose** Convulsions reported in overdosage.

**BREAST FEEDING** Present in milk but not known to be harmful.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**Dose adjustments** Manufacturer advises dose reduction in mild to moderate impairment.

**RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 2, 21
  - **Pentazocine (Non-proprietary)**
    - Pentazocine hydrochloride 25 mg · Pentazocine 25 mg tablets
    - 28 tablet (P) £25.36 DT + £24.99 (O)

**Capsule**
- CAUTIONARY AND ADVISORY LABELS 2, 21
  - **Pentazocine (Non-proprietary)**
    - Pentazocine hydrochloride 50 mg · Pentazocine 50 mg capsules
    - 28 capsule (P) £29.78 DT + £28.50 (O)

**Solution for injection**
- **Pentazocine hydrochloride (Non-proprietary)**
  - Pentazocine hydrochloride 50 mg/
  - 50 tablet (P) £49.92 DT + £69.92 (O)
  - Pentazocine 50 mg tablets
  - Pentazocine hydrochloride 50 mg per 1 ml
  - Solution for injection ampoules
    - 10 ampoule (P) £5.11 DT = £5.11 (O)

Sufentanil

**INDICATIONS AND DOSE**

**Acute moderate-to-severe post-operative pain**
- **BY SUBLINGUAL ADMINISTRATION**
  - Adult: (Specialist supervision in hospital): 15 micrograms every 20 minutes if required for a maximum of 72 hours

**CAUTIONS** Brain tumour · head injury · history of bradycardiac episodes (increased risk of bradycardia) · increased susceptibility to cerebral effects of CO₂ retention (including increased intracranial pressure and impaired consciousness)

**INTERACTIONS** → Appendix 1: opioids

**SIDE-EFFECTS**

- **Common or very common** Dyspepsia · fever · muscle Complaints
- **Uncommon** Apnoea · asthenia · chills · paraesthesia
- **Frequency not known** Apathy · biliary spasm · coma · movement disorders · nervousness · reflexes increased · respiratory arrest · seizure

**PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—risk of opioid effects or toxicity in the infant.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (limited information available).

**RENAL IMPAIRMENT** Manufacturer advises caution and close monitoring in severe impairment—limited information available.

**DIRECTIONS FOR ADMINISTRATION** Manufacturer advises doses should be administered using patient controlled analgesia administration device—consult product literature.

**PATIENT AND CARER ADVICE** Manufacture advises patients should avoid eating and drinking, and minimise talking, for 10 minutes after each dose. Patients should be instructed on appropriate use of the patient controlled analgesia administration device—consult product literature.

**Driving and skilled tasks** Manufacturer advises patients should be counselled on the effects on driving and skilled tasks—increased risk of dizziness and visual disturbances.
Tapentadol

**INDICATIONS AND DOSE**

**Moderate to severe acute pain which can be managed only with opioid analgesics**

- **By mouth using immediate-release medicines**
  - Adults: Initially 50 mg every 4–6 hours, adjusted according to response, on the first day of treatment, an additional dose of 50 mg may be taken 1 hour after the initial dose; maximum 700 mg in the first 24 hours; maximum 600 mg per day

**Severe chronic pain**

- **By mouth using modified-release medicines**
  - Adults: Initially 50 mg every 12 hours, adjusted according to response; maximum 500 mg per day

**INDICATIONS AND DOSE**

**Moderate to severe pain**

- **By mouth using immediate-release medicines**
  - Adults: 20 mg every 1–2 hours; maximum 160 mg/24 hours

**Severe chronic pain**

- **By mouth using modified-release medicines**
  - Adults: Initially 50 mg every 12 hours, adjusted according to response; maximum 600 mg per day

**INDICATIONS AND DOSE**

**Moderate to severe pain**

- **By mouth using immediate-release medicines**
  - Adults: Initially 20 mg every 4–6 hours; maximum 240 mg every 24 hours

**Severe chronic pain**

- **By mouth using modified-release medicines**
  - Adults: Initially 50 mg every 12 hours, adjusted according to response; maximum 600 mg per day

**INDICATIONS AND DOSE**

**Moderate to severe pain**

- **By mouth using immediate-release medicines**
  - Adults: Initially 20 mg up to every 8 hours; for oral solution, initiate at 25 mg up to every 8 hours; for modified-release tablets, initiate at 50 mg up to every 24 hours

**RENAI IMPAIRMENT**

- Manufacturer advises avoid in severe impairment (no information available).
**Moderate to severe pain (with modified-release 12-hourly preparations)**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours
  - Adult: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours

**Moderate to severe pain (with modified-release 24-hourly preparations)**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours
  - Adult: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours

**ZYDOL ® XL Moderate to severe pain**

- **BY MOUTH USING MODIFIED-RELEASE TABLETS**
  - Child 12-17 years: Initially 150 mg once daily, increased if necessary up to 400 mg once daily
  - Adult: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

---

**IMPORTANT SAFETY INFORMATION**

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.

- **CONTRA-INDICATIONS** Acute intoxication with alcohol - acute intoxication with analgesics - acute intoxication with hypnotics - acute intoxication with opioids - compromised respiratory function (in children) - not suitable for narcotic withdrawal treatment - uncontrolled epilepsy

- **CAUTIONS** Excessive bronchial secretions - history of epilepsy - use tramadol only if compelling reasons - impaired consciousness - not suitable as a substitute in opioid-dependent patients - not suitable in some types of general anaesthesia - postoperative use (in children) - susceptibility to seizures - use tramadol only if compelling reasons - variation in metabolism

- **CAUTIONS, FURTHER INFORMATION**
  - General anaesthesia Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).
  - Variation in metabolism The capacity to metabolise tramadol can vary considerably between individuals; there is a risk of developing side-effects of opioid toxicity in patients who are ultra-rapid tramadol metabolisers (CYP2D6 ultra-rapid metabolisers) and the therapeutic effect may be reduced in poor tramadol metabolisers.
  - Postoperative use Manufacturer advises extreme caution when used for postoperative pain relief in children - reports of rare, but life threatening adverse events after tonsillectomy and/or adenoidectomy for obstructive sleep apnoea; if used, monitor closely for symptoms of opioid toxicity.

- **INTERACTIONS** → Appendix 1: opioids

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common Fatigue
    - Rare or very rare Dyspnoea - epileptiform seizure - respiratory disorders - sleep disorders - vision blurred
    - Frequency not known Asthma exacerbated - hypoglycaemia

  - **SPECIFIC SIDE-EFFECTS**
    - Uncommon
      - With parenteral use Circulatory collapse - gastrointestinal discomfort
    - Rare or very rare
      - With parenteral use Angioedema - appetite change - behaviour abnormal - cognitive disorder - dysuria - hypersensitivity - mood altered - movement disorders - muscle weakness - perception disorders - psychiatric disorder - sensation abnormal
    - Frequency not known
      - With oral use Anxiety - blood disorder - gastrointestinal disorder - hyperkinesia - hypertension - paraesthesia - syncope - tremor - urinary disorder

- **PREGNANCY** Embryotoxic in animal studies—manufacturers advise avoid.

- **BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturers advise caution (risk of delayed elimination); some oral preparations should be avoided in severe impairment—consult product literature.

- **DOSE ADJUSTMENTS** Manufacturers advise consider increasing dosage interval.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for oral drops) in severe impairment.

- **TREATMENT CESSATION** Manufacturer advises consider tapering the dose gradually to prevent withdrawal symptoms.

- **DIRECTIONS FOR ADMINISTRATION** Tramadol hydrochloride orodispersible tablets should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed immediately without chewing—check individual preparations.

  For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations. Non-proprietary preparations of modified-release tramadol may be available as either 12-hourly or 24-hourly formulations; prescribers and dispensers must ensure that the correct formulation is prescribed and dispensed. Branded preparations that should be given 12-hourly include Invodol ® SR, Mabron ®, Manco ®, Maril ®, Moxitrax ® SR, Oldaram ®, Tilodol ® SR, Tramquiel ® SR, Zamadol ® SR, Zerodame ® SR and Zydol SR ®. Preparations that should be given 24-hourly include Tradorec XL ®, Zamadol ™ 24hr, and Zydol XR ®.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets.

  Medicines for Children leaflet: Tramadol for pain www.medicinesforchildren.org.uk/tramadol-pain

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension Modified-release tablet

  CAUTIONARY AND ADVISORY LABELS 2, 25

Combinations available: Tramadol with paracetamol, p. 474
Tramadol with dexketoprofen

The properties listed below are those particular to the combination only. For the properties of the components please consider, tramadol hydrochloride p. 471, dexketoprofen p. 1134.

- **INDICATIONS AND DOSE**
  - Moderate to severe acute pain
  - **BY MOUTH**
  - Adult: 75/25 mg every 8 hours as required for up to 5 days
  - Elderly: 75/25 mg every 8 hours as required for up to 5 days; Usual maximum 150/50 mg/24 hours

- **INTERACTIONS** → Appendix 1: NSAIDs - opioids

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **Skudexa** (A. Menarini Farmaceutica Internazionale SRL) ▶
      - Dexketoprofen 25 mg, Tramadol hydrochloride 75 mg Skudexa 75mg/25mg tablets: 10 tablet (Pack £3.68 [CO] | 20 tablet (Pack £5.52 [DT] + £5.52 [CO])

Tramadol with paracetamol

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 444, tramadol hydrochloride p. 471.

- **INDICATIONS AND DOSE**
  - Moderate to severe pain
  - **BY MOUTH**
  - Child 12-17 years: 75/650 mg every 6 hours as required
  - Adult: 75/650 mg every 6 hours as required

- **DOSE EQUIVALENCE AND CONVERSION**
  - The proportions are expressed in the form x/y, where x and y are the strengths in milligrams of tramadol and paracetamol respectively.

- **INTERACTIONS** → Appendix 1: opioids - paracetamol

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Effervescent tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 2, 13, 29, 30
    - **ELECTROLYTES:** May contain Sodium
    - **Tramadol** (Grunenthal Ltd)
      - Tramadol hydrochloride 37.5 mg, Paracetamol 325 mg Tramadol 37.5mg/325mg effervescent tablets sugar-free | 60 tablet (Pack £9.68 DT + £9.68 [CO])
  - **Tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 2, 25, 29, 30
    - **Tramadol with paracetamol (Non-proprietary)**
      - Tramadol hydrochloride 37.5 mg, Paracetamol 325 mg Tramadol 37.5mg / Paracetamol 325mg tablets | 60 tablet (Pack £2.75-£9.68 DT + £2.35 [CO])
      - Tramadol hydrochloride 75 mg, Paracetamol 650 mg Tramadol 75mg / Paracetamol 650mg tablets | 30 tablet (Pack £19.50 DT + £19.50 [CO])
    - **Tramacet** (Grunenthal Ltd)
      - Tramadol hydrochloride 37.5 mg, Paracetamol 325 mg Tramadol 37.5mg/325mg tablets | 60 tablet (Pack £9.68 DT + £2.35 [CO])
    - **Tramacet** (Grunenthal Ltd)
      - Tramadol hydrochloride 37.5 mg, Paracetamol 325 mg Tramadol 37.5mg/325mg tablets | 60 tablet (Pack £9.68 DT + £2.35 [CO])
    - **Tramacet** (Grunenthal Ltd)
      - Tramadol hydrochloride 37.5 mg, Paracetamol 325 mg Tramadol 37.5mg/325mg tablets | 60 tablet (Pack £9.68 DT + £2.35 [CO])

6.1a Migraine

Migraine

Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesic such as aspirin p. 121, paracetamol p. 444 (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant antiemetic treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a 5HT1-receptor agonist (‘tripitan’). Ergot alkaloids are rarely required now; oral preparations are associated with many side-effects and should be avoided in cerebrovascular or cardiovascular disease. Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT1-receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

Analgesics

Most migraine headaches respond to analgesics such as aspirin or paracetamol but because peristalsis is often limited by difflumes such as naproxen can be considered. Sumatriptan or naratriptan are also licensed for use in migraine.

Sufiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred. Compound preparations containing analgesics and antiemetics are available.

The NSAID tolfenamic acid p. 476 is licensed specifically for the treatment of an acute attack of migraine; diclofenac potassium p. 1135, flurbiprofen p. 1140, and ibuprofen p. 1141 are also licensed for use in migraine.

5HT1-receptor agonists

A 5HT1-receptor agonist is of considerable value in the treatment of an acute migraine attack. The 5HT1D-receptor agonists (‘tripitans’) act on the 5HT(D) receptors and they are therefore sometimes referred to as 5HT1B/D-receptor agonists. A 5HT1D-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics. 5HT1-receptor agonists are not indicated for the treatment of hemiplegic, basilar, or ophthalmoplegic migraine.

The 5HT1-receptor agonists available for treating migraine are almotriptan p. 478, eletriptan p. 479, frovatriptan p. 479, naratriptan p. 480, rizatriptan p. 480, sumatriptan p. 481, and zolmitriptan p. 482. If a patient does not respond to one 5HT1-receptor agonist, an alternative 5HT1-receptor agonist should be tried. For patients who have prolonged attacks that frequently recur despite treatment with a 5HT1-receptor agonist, combination therapy with a NSAID such as naproxen can be considered. Sumatriptan or zolmitriptan are also used to treat cluster headache.

Ergot Alkaloids

The value of ergotamine tartrate p. 478 for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and muscular cramps; it is best avoided. The recommended doses of ergotamine tartrate preparations should not be exceeded and treatment should not be repeated at intervals of less than 4 days.

To avoid habituation the frequency of administration of ergotamine tartrate should be limited to no more than twice a month. It should never be prescribed prophylactically but in the management of cluster headache a low dose is occasionally given for 1 to 2 weeks [unlicensed indication].

Antiemetics

Antiemetics, such as metoclopramide hydrochloride p. 432 or domperidone p. 431, or phenothiazine and antihistamine antiemetics, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Metoclopramide hydrochloride and domperidone have the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms. Oral analgesic preparations containing metoclopramide hydrochloride are a convenient alternative.

Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress, irregular lifestyle (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine.

Preventive treatment for migraine should be considered for patients who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migrainous infarction.

The beta-blockers propranolol hydrochloride p. 150, atenolol p. 152, metoprolol tartrate p. 154, nadolol p. 149, and timolol maleate p. 151 are all effective. Propranolol hydrochloride is the most commonly used.

Tricyclic antidepressants [unlicensed indication], gabapentin p. 315 [unlicensed indication], topiramate p. 331, sodium valproate p. 327 [unlicensed indication], and valproic acid p. 354 [unlicensed indication] are also effective for preventing migraine. See Conception and contraception, and Pregnancy in the topiramate drug monograph for information on use in females of childbearing potential and pregnancy.

Valproic acid and sodium valproate are highly teratogenic. They must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated, and must not be used during pregnancy for migraine prophylaxis. For further information see Important safety information, Conception and contraception, and Pregnancy in the valproic acid and sodium valproate drug monographs.

Pizotifen p. 474 is an antihistamine and a serotonin-receptor antagonist, structurally related to the tricyclic antidepressants. It is of limited value and may cause weight gain.

Botulinum toxin type A p. 407 is licensed for the prophylaxis of headaches in adults with chronic migraine.

Cluster headache and the trigeminal autonomic cephalalgias

Cluster headache rarely responds to standard analgesics. Sumatriptan given by subcutaneous injection is the drug of choice for the treatment of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil hydrochloride p. 164 or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone p. 678 can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil hydrochloride during verapamil titration.
Ergotamine tartrate, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods.

The other trigeminal autonomic cephalalgias, paroxysmal hemiarrhia (sensitive to indometacin p. 1143), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

Other drugs used for Migraine
Amitriptyline hydrochloride, p. 372 • Candesartan cilexetil, p. 175 • Clonidine hydrochloride, p. 145 • Cyclozine, p. 430 • Trifluoperazine, p. 390

Paracetamol with isometheptene
The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 444.

- **INDICATIONS AND DOSE**
  - **Treatment of acute attacks of migraine**
    - **BY MOUTH**
      - Adult: 2 capsules, to be taken at onset of attack, followed by 1 capsule every 1 hour if required, maximum of 5 capsules in 12 hours

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 1058

- **INTERACTIONS**
  - Appendix 1: paracetamol • sympathomimetics, vasoconstrictor

- **PATIENT AND CARER ADVICE**
  - Patient counselling is advised (dosage).

- **LESS SUITABLE FOR PRESCRIBING**
  - Isometheptene with paracetamol is less suitable for prescribing (more effective treatments available).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Capsule**
    - CAUTIONARY AND ADVISORY LABELS 30
      - *Midor (ChP Healthcare Ltd)*
      - Isometheptene mucate 65 mg, Paracetamol 325 mg
      - *Midor*
      - 325mg/65mg capsules | 30 capsule [P] £7.50

Paracetamol with metoclopramide
The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 444, metoclopramide hydrochloride p. 432.

- **INDICATIONS AND DOSE**
  - **Acute migraine**
    - **BY MOUTH**
      - Adult: 1 sachet, sachet to be mixed in water, and dose to be taken at the start of the attack, then 1 sachet after 2 hours if required; maximum 3 sachets per day

  - **INTERACTIONS**
    - Appendix 1: metoclopramide • paracetamol

  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.

  - **Capsule**
    - CAUTIONARY AND ADVISORY LABELS 30
      - *Paramax*
      - Metoclopramide hydrochloride 5 mg, Paracetamol 500 mg
      - *Paramax*
      - 500 mg Paramax tablets | 42 tablet [P] £9.64 DT + £9.64

**IMPORTANT SAFETY INFORMATION**
Metoclopramide can cause severe extrapyramidal effects, particularly in children and young adults.

- **CAUTIONS**
  - Treatment should not exceed 3 months due to risk of tardive dyskinesia

- **INTERACTIONS**
  - Appendix 1: metoclopramide • paracetamol

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 13, 30
      - *Paramax* (Sanofi)
      - Metoclopramide hydrochloride 5 mg, Paracetamol 500 mg
      - *Paramax* (Sanofi)
      - 500 mg Paramax tablets | 42 tablet [P] £12.52 DT + £12.52

Aspirin with metoclopramide
The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 121, metoclopramide hydrochloride p. 432.

- **INDICATIONS AND DOSE**
  - **Acute migraine**
    - **BY MOUTH**
      - Adult: 1 sachet, sachet to be mixed in water, and dose to be taken at the start of the attack, then 1 sachet after 2 hours if required; maximum 3 sachets per day

  - **INTERACTIONS**
    - Appendix 1: aspirin • metoclopramide

  - **PRESCRIBING AND DISPENSING INFORMATION**
    - Flavours of oral powder formulations may include lemon.

  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder**
    - CAUTIONARY AND ADVISORY LABELS 13, 17, 30
      - **EXCIPIENTS:** May contain Aspartame
      - *Migramax (Zentiva)*
      - Metoclopramide hydrochloride 10 mg, Aspirin DL-Lysine 900 mg
      - *Migramax*
      - Oral powder sachets sugar-free | 6 sachet [P] £6.61 DT + £6.61

Tolfenamic acid

- **INDICATIONS AND DOSE**
  - **Treatment of acute migraine**
    - **BY MOUTH**
      - Adult: 200 mg, dose to be taken at onset, then 200 mg after 1–2 hours if required

  - **CONTRA-INDICATIONS**
    - Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal haemorrhage (two or more distinct episodes) • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure

  - **CAUTIONS**
    - Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease.
coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Agranulocytosis · angioedema · aplastic anaemia · asthma · confusion · constipation · Crohn’s disease aggravated · depression · diarrhoea · dizziness · drowsiness · dyspnoea · dysuria (most common in men) · euphoretic mood · fatigue · fertility decreased female · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · increased risk of arterial thromboembolism · malaise · meningeitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral ulceration · pancreatitis · paraesthesia · photosensitivity reaction · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · tremor · vertigo · visual impairment · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Amount too small to be harmful. Use with caution during breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Dose adjustments The lowest effective dose should be used for the shortest possible duration. Monitoring In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Paracetamol with buclizine hydrochloride and codeine phosphate**

**INDICATIONS AND DOSE**

**MIGRALEV®**

**Acute migraine**

- **BY MOUTH**
  - Child 12-14 years: Initially 1 tablet, (pink tablet) to be taken at onset of attack, or if it is imminent, followed by 1 tablet every 4 hours if required, (yellow tablet) to be taken following initial dose; maximum 1 pink and 3 yellow tablets in 24 hours
  - Child 15–17 years: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours
  - Adult: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours

**INTERACTIONS** → Appendix 1: antihistamines, sedating opioids, paracetamol

**PRESCRIBING AND DISPENSING INFORMATION** See co-codamol p. 453 for Migraleve Yellow preparations.

**LESS SUITABLE FOR PRESCRIBING** Migraleve® is less suitable for prescribing.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2, 17, 30

- Migraleve Pink (McNeil Products Ltd)
  - Buclizine hydrochloride 6.25 mg, Codeine phosphate 8 mg,
  - Paracetamol 500 mg Migraleve Pink tablets | 12 tablet | £3.79 (C5) | 24 tablet | £6.08 (C5) | 48 tablet | £9.07 (C5)
- Migraleve Yellow (McNeil Products Ltd)
  - Codeine phosphate 8 mg, Paracetamol 500 mg Migraleve Yellow tablets | 16 tablet | £6.07 (C5)

**CALTITONIN GENE-RELATED PEPTIDE INHIBITORS**

**Erenumab**

14-May-2019

**DRUG ACTION** Erenumab is a human monoclonal antibody that binds to the calcitonin-gene related peptide (CGRP) receptor, inhibiting the function of CGRP, and thereby preventing migraine attacks.

**INDICATIONS AND DOSE**

Prophylaxis of migraine (in patients who have at least 4 migraine days per month) (initiated by a specialist)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 70 mg every 4 weeks; increased if necessary to 140 mg every 4 weeks, consider discontinuing if no response after 3 months of treatment

**SIDE-EFFECTS**

- Common or very common Constipation · muscle spasms · skin reactions
- Frequency not known Oedema · swelling

www.getintopharma.com
PREGNANCY  Manufacturer advises avoid—limited information available.

BREAST FEEDING  Manufacturer advises avoid during first few days after birth—possible risk from transfer of antibodies to infant. After this time, use during breast-feeding only if clinically needed.

DIRECTIONS FOR ADMINISTRATION  Manufacturer advises injection into the abdomen, thigh, or upper arm (if not self-administered). Patients may self-administer Aimovig® after appropriate training in subcutaneous injection technique.

HANDLING AND STORAGE  Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

PATIENT AND CARER ADVICE
Self-administration  Manufacturer advises that patients and their carers should be given training in subcutaneous injection technique if appropriate.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) decisions
SMC No. SMC2134
The Scottish Medicines Consortium has advised (April 2019) that erenumab (Aimovig®) is accepted for restricted use within NHS Scotland for the prophylaxis of migraine in adults who have at least four migraine days per month and in whom at least three prior prophylactic treatments have failed. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Aimovig (Novartis Pharmaceuticals UK Ltd) Erenumab 70 mg per 1 ml Aimovig 70mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection 188.50 (Hospital only)

ERGOT ALKALOIDS

Ergotamine tartrate

INDICATIONS AND DOSE
Management of cluster headache
BY MOUTH USING TABLETS
Adult: 1 mg once daily for 5 nights in 7; occasionally given for 1–2 weeks, dose to be taken at night

UNLICENSED USE  Not licensed for the management of cluster headache.

CONTRA-INDICATIONS  Acute porphyrias p. 1058 - coronary heart disease - hyperthyroidism - inadequately controlled hypertension - obliterative vascular disease - peripheral vascular disease - Raynaud’s syndrome - sepsis - severe hypertension - temporal arthritis

CAUTIONS  Anaemia - cardiac disease - dependence - elderly - risk of peripheral vasospasm

INTERACTIONS  Appendix 1: ergotamine

SIDE-EFFECTS

Common or very common  Abdominal pain - dizziness - nausea - vomiting

Uncommon  Cyanosis - diarrhoea - muscle weakness - pain in extremity - sensibility abnormal - vasoconstriction

Rare or very rare  Arrhythmias - cardiac valve fibrosis - dyspnoea - ergot poisoning (including absence of pulse and numbness in extremities) - gangrene - intestinal ischaemia - myalgia - myocardial infarction - myocarcial ischaemia - skin reactions

Frequency not known  Anxiety - arthralgia - blood disorder - cerebral ischaemia - confusion - constipation - depression -

Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride

INDICATIONS AND DOSE
Treatment of acute migraine

BY MOUTH
Adult: 1 tablet, to be taken at onset, followed by 0.5–1 tablet after 30 minutes, then 0.5–1 tablet every 30 minutes if required, max. 3 tablets in 24 hours, max. 4 tablets per attack, max. 6 tablets in one week

INTERACTIONS  Appendix 1: antihistamines, sedating - ergotamine

PATIENT AND CARER ADVICE  Patient counselling is advised for cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate tablets (dosage).

LESS SUITABLE FOR PRESCRIBING  Cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate (Migril®) is less suitable for prescribing.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS  2, 18

Migril (Wockhardt UK Ltd)
Ergotamine tartrate 2 mg, Cyclizine hydrochloride 50 mg, Caffeine hydrate 100 mg Migril tablets | 100 tablet 51.00

TRIPTANS

Almotriptan

INDICATIONS AND DOSE
Treatment of acute migraine

BY MOUTH
Adult: 12.5 mg, dose to be taken as soon as possible after onset, followed by 12.5 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 25 mg per day

UNLICENSED USE  Not licensed for use in elderly.

CONTRA-INDICATIONS  Coronary vasospasm - ischaemic heart disease - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack - Prinzmetal’s angina - severe hypertension - uncontrolled hypertension

www.getintopharma.com
Migraine 479

**CAUTIONS** Conditions which predispose to coronary artery disease - elderly

**INTERACTIONS** → Appendix 1: almotriptan

**SIDE-EFFECTS**

- **Common or very common** Asthenia - dizziness - drowsiness - nausea - vomiting
- **Uncommon** Bone pain - chest pain - diarrhoea - dry mouth - dyspepsia - headache - myalgia - palpitations - paraesthesia - throat tightness - tinnitus
- **Rare or very rare** Coronary vasospasm - myocardial infarction - tachycardia
- **Frequency not known** Intestinal ischaemia - seizure - vision disorders

**SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of heat, heaviness, pressure or tightness (including throat and chest) occur.

**ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.

**PREGNANCY** There is limited experience of using 5HT1-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

**BREAST FEEDING** Present in milk in animal studies— withhold breast-feeding for 24 hours.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**

Dose adjustments Max. 12.5 mg in 24 hours if eGFR less than 30 mL/minute/1.73 m².

Sumatriptan

- INDICATIONS AND DOSE Treatment of acute migraine

- BY MOUTH
  • Adult: Initially 50–100 mg for 1 dose, followed by 50–100 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 300 mg per day

- BY SUBCUTANEOUS INJECTION
  • Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

- BY INTRANASAL ADMINISTRATION
  • Adult 18–65 years: Initially 10–20 mg, to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

Treatment of acute cluster headache

- BY SUBCUTANEOUS INJECTION
  • Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

- BY INTRANASAL ADMINISTRATION
  • Adult 18–65 years: Initially 10–20 mg, dose to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

- UNLICENSED USE Not licensed for use in elderly.

- CONTRA-INDICATIONS Coronary vasospasm • ischaemic heart disease • mild uncontrolled hypertension • moderate and severe hypertension • peripheral vascular disease • previous cerebrovascular accident • previous myocardial infarction • previous transient ischaemic attack • Prinzmetal’s angina

- CAUTIONS Conditions which predispose to coronary artery disease • elderly • history of seizures • mild, controlled hypertension • pre-existing cardiac disease • risk factors for seizures

- INTERACTIONS → Appendix 1: sumatriptan

  • With intranasal use Epistaxis • nasal irritation • taste altered • throat irritation
Zolmitriptan

- **INDICATIONS AND DOSE**

  **Treatment of acute migraine**
  - **BY MOUTH**
    - Adult: 2.5 mg, followed by 2.5 mg after at least 2 hours if required, dose to be taken only if migraine recurs, then increased if necessary to 5 mg, dose to be taken only for subsequent attacks in patients not achieving satisfactory relief with 2.5 mg dose; maximum 10 mg per day
  - **BY INTRanasal administration**
    - Adult: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

  **Treatment of acute cluster headache**
  - **BY INTRanasal administration**
    - Adult: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

  **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises max. dose 5 mg in 24 hours with concurrent use of moderate and potent inhibitors of CYP2C19, cimetidine and moclobemide.

  **DOSE EQUIVALENT AND CONVERSION**
  - 1 spray of Zomig nasal spray = 5 mg zolmitriptan.

- **UNLICENSED USE** Not licensed for use in elderly. Not licensed for treatment of cluster headaches.

- **CONTRA-INDICATIONS** Arrhythmias associated with accessory cardiac conduction pathways - coronary vasospasm - ischaemic heart disease - moderate to severe hypertension - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - Prinzmetal’s angina - transient ischaemic attack - uncontrolled hypertension. Wolff-Parkinson-White syndrome.

- **CAUTIONS** Conditions which predispose to coronary artery disease - elderly. should not be taken within 24 hours of any other 5HT₁ receptor agonist.

- **INTERACTIONS** → Appendix 1: zolmitriptan

- **SIDE-EFFECTS**

  **GENERAL SIDE-EFFECTS**
  - Common or very common Abdominal pain - asthenia - chest discomfort - dizziness - drowsiness - dry mouth - dysphagia - feeling hot - headache - limb discomfort - muscle weakness - nausea - pain - palpitations - sensation abnormal - vomiting
  - Uncommon Tachycardia - urinary disorders
  - Rare or very rare Angina pectoris - angioedema - coronary vasospasm - gastrointestinal disorders - gastrointestinal infection - hypersensitivity - myocardial infarction - splenic infection - urticaria

  **SPECIFIC SIDE-EFFECTS**
  - Common or very common
    - With intranasal use Feeling abnormal - haemorrhage - myalgia - nasal discomfort - taste altered - throat pain
    - With oral use Muscle complaints - sensation of pressure - throat complaints
  - Rare or very rare
    - With oral use Diarrhoea

  **SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of heat, heaviness, pressure or tightness (including throat and chest) occur.

- **PREGNANCY** There is limited experience of using 5HT₁ receptor agonists during pregnancy; manufacturers advise
Neuropathic pain 483

Neuropathic pain

Overview and management

Neuropathic pain, which occurs as a result of damage to neural tissue, includes phantom limb pain, compression neuropathies, peripheral neuropathies (e.g. due to Diabetic complications p. 688, chronic excessive alcohol intake, HIV infection p. 640, chemotherapy, idiopathic neuropathy), trauma, central pain (e.g. pain following stroke, spinal cord injury, and syringomyelia), and postherpetic neuralgia (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain may occur in an area of sensory deficit and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a tricyclic antidepressant or with certain antiepileptic drugs. Amitriptyline hydrochloride p. 372 [unlicensed indication] and pregabalin p. 324 are effective treatments for neuropathic pain. Amitriptyline hydrochloride and pregabalin can be used in combination if the patient has an inadequate response to either drug at the maximum tolerated dose.

Nortriptyline p. 378 [unlicensed indication] may be better tolerated than amitriptyline hydrochloride. Gabapentin p. 315 is also effective for the treatment of neuropathic pain.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 471, morphine p. 463, and oxycodone hydrochloride p. 466; however, treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from topical local anaesthetic preparations, such as lidocaine hydrochloride medicated plasters p. 1352, while awaiting specialist review.

Capsaicin below is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia. A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients. It should be used under specialist supervision.

A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain. Neuroumodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

Trigeminal neuralgia

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine p. 311 taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin p. 323; the drug may be given by intravenous infusion (possibly as fosphenytoin sodium p. 314) in a crisis (specialist use only).

Chronic facial pain

Chronic oral and facial pain including persistent idiopathic facial pain (also termed ‘atypical facial pain’) and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs.

Tricyclic antidepressants may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners’ List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

Other drugs used for Neuropathic pain Amantadine hydrochloride, p. 418

CAPSAICIN

Capsaicin

- INDICATIONS AND DOSE

AIXSAIN ®

Post-herpetic neuralgia

- TO THE SKIN

Adult: Apply 3–4 times a day, dose to be applied sparingly; important; after lesions have healed, not more often than every 4 hours

7 Sleep disorders

7.1 Insomnia

Hypnotics and anxiolytics

Overview
Most anxiolytics (‘sedatives’) will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks. Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate p. 346 and barbiturates are not recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdose.

Benzodiazepine indications

- Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or causing the patient unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness. The use of benzodiazepines to treat short-term ‘mild’ anxiety is inappropriate.
- Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or causing the patient extreme distress.

Dependence and withdrawal
Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens. The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

Benzodiazepine withdrawal should be flexible and carried out at a reduction rate that is tolerable for the patient. The rate should depend on the initial dose of benzodiazepine, duration of use, and the patient’s clinical response. Short-term users of benzodiazepines (2–4 weeks only) can usually
taper off within 2–4 weeks. However, long-term users should be withdrawn over a much longer period of several months or more.

A suggested protocol for withdrawal for prescribed long-term benzodiazepine patients is as follows:

- Transfer patient stepwise, one dose at a time over about a week, to an equivalent daily dose of diazepam preferably taken at night.
- Reduce diazepam dose, usually by 1–2 mg every 2–4 weeks (in patients taking high doses of benzodiazepines, initially it may be appropriate to reduce the dose by up to one-tenth every 1–2 weeks). If uncomfortable withdrawal symptoms occur, maintain this dose until symptoms lessen.
- Reduce diazepam dose further, if necessary in smaller steps; steps of 500 micrograms may be appropriate towards the end of withdrawal. Then stop completely.
- For long-term patients, the period needed for complete withdrawal may vary from several months to a year or more.

Approximate equivalent doses, diazepam 5 mg

- Alprazolam 250 micrograms
- Clobazam 10 mg
- Clonazepam 250 micrograms
- Flurazepam 7.5–15 mg
- Chloridiazepoxide 12.5 mg
- Lorazepam 0.5–1 mg
- Lorazepam 500 micrograms
- Lorazepam 5 mg
- Oxazepam 10 mg
- Temazepam 10 mg

Withdrawal symptoms for long-term users usually resolve within 6–18 months of the last dose. Some patients will recover more quickly, others may take longer. The addition of beta-blockers, antidepressants and antipsychotics should be avoided where possible.

Counselling can be of considerable help both during and after the taper.

**Hypnotics**

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others understate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable, or when prescribing for elderly patients. Long-acting hypnotics are indicated in patients with poor sleep maintenance (e.g. early morning waking) that causes daytime effects, when an anxiolytic effect is needed during the day, or when sedation the following day is acceptable.

*Transient insomnia* may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is rapidly eliminated should be chosen, and only one or two doses should be given.

*Short-term insomnia* is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.

*Chronic insomnia* is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early wakening is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine hydrochloride p. 373 or mirtazapine p. 372 prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should not be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome.

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

**Elderly**

Benzodiazepines and the Z-drugs should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.

**Dental patients**

Some anxious patients may benefit from the use of hypnotics during dental procedures such as temazepam p. 488 or diazepam p. 343. Temazepam is preferred when it is important to minimise any residual effect the following day.

**Benzodiazepines**

Benzodiazepines used as hypnotics include nitrazepam p. 487 and flurazepam p. 486 which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative. Lorazepam p. 487, lormetazepam p. 487, and temazepam act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines. If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam given as a single dose at night may effectively treat both symptoms.

**Zolpidem, and zopiclone**

Zolpidem tartrate p. 490 and zopiclone p. 490 are non-benzodiazepine hypnotics (sometimes referred to as Z-drugs), but they act at the benzodiazepine receptor. They are not licensed for long-term use; dependence has been reported in a small number of patients. Both zolpidem tartrate and zopiclone have a short duration of action.

**Chloral and derivatives**

There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.

**Clomethiazole**

Clomethiazole p. 489 may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs.

**Antihistamines**

Some antihistamines such as promethazine hydrochloride p. 286 are on sale to the public for occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

**Alcohol**

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders.
Melatonin
Melatonin p. 489 is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years.

Anxiolytics
Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines.

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time. Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressant drugs are licensed for use in anxiety and related disorders. Some antipsychotic drugs, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects. The use of antihistamines (e.g. hydroxyzine hydrochloride p. 285) for their sedative effect in anxiety is not appropriate.

Beta-adrenoceptor blocking drugs do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

Benzodiazepines
Benzodiazepines are indicated for the short-term relief of severe anxiety; long-term use should be avoided. Diazepam, alprazolam p. 342, clorazepoxide hydrochloride p. 343, and clobazam p. 336 have a sustained action. Shorter-acting compounds such as lorazepam p. 339 and oxazepam p. 345 may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In panic disorders (with or without agoraphobia) resistant to antidepressant therapy, a benzodiazepine may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms.

Diazepam or lorazepam are very occasionally administered intravenously for the control of panic attacks. This route is the most rapid but the procedure is not without risk and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

Buspirone
Buspirone hydrochloride p. 342 is thought to act at specific serotonin (5HT1A) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone hydrochloride. The dependence and abuse potential of buspirone hydrochloride is low; it is, however, licensed for short-term use only (but specialists occasionally use it for several months).

Meprobamate
Meprobamate p. 346 is less effective than the benzodiazepines, more hazardous in overdosage, and can also induce dependence. It is not recommended.

Barbiturates
The intermediate-acting barbiturates have a place only in the treatment of severe intractable insomnia in patients already taking barbiturates; they should be avoided in the elderly. Intermediate-acting barbiturate preparations containing amobarbital sodium, butobarbital, and secobarbital sodium are available on a named patient basis.

The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy but its use as a sedative is unjustified.

The very short-acting barbiturate thiopental sodium p. 338 is used in anaesthesia.

Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

HYPNOTICS, SEDATIVES AND ANXIOLYRICS  BENZODIAZEPINES

Flurazepam

- INDICATIONS AND DOSE
  - Insomnia (short-term use)
    - BY MOUTH
      - Adult: 15–30 mg once daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
      - Elderly: 15 mg once daily, dose to be taken at bedtime

- CONTRA-INDICATIONS
  - Not for use alone to treat chronic psychosis, not for use alone to treat depression (or anxiety associated with depression), respiratory depression

- CAUTIONS
  - Acute porphyrias p. 1058 - hypoalbuminaemia - muscle weakness

  **CAUTIONS, FURTHER INFORMATION**

- Paradoxical effects
  - A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- INTERACTIONS
  - Appendix 1: flurazepam

- SIDE-EFFECTS
  - Common or very common
    - Taste altered
  - Rare or very rare
    - Abdominal discomfort - skin eruption
  - Frequency not known
    - Agranulocytosis - extrapyramidal symptoms - leucopenia - pancytopenia - suicide attempt - thrombocytopenia

- BREAST FEEDING
  - Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- HEPATIC IMPAIRMENT
  - Dose adjustments
  - Manufacturer advises dose of 15 mg in mild to moderate impairment.

- RENAL IMPAIRMENT
  - Dose adjustments
  - Start with small doses in severe impairment.

- NATIONAL FUNDING/ACCESS DECISIONS
  - NHS restrictions
  - Flurazepam capsules are not prescribable in NHS primary care.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - CAUTIONARY AND ADVISORY LABELS
  - Dalmane (Meda Pharmaceuticals Ltd)
    - Flurazepam (as Flurazepam hydrochloride) 15 mg Dalmane 15mg capsules | 30 capsule (PO) £6.73 (C07A)
    - Flurazepam (as Flurazepam hydrochloride) 30 mg Dalmane 30mg capsules | 30 capsule (PO) £8.63 (C07A)
**BNF 78**

**Loprazolam**

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**
- **BY MOUTH**
  - Adult: 1 mg once daily, then increased to 1.5–2 mg once daily if required, dose to be taken at bedtime, for debilitated patients, use elderly dose
  - Elderly: 0.5–1 mg once daily, dose to be taken at bedtime

**CONTRA-INDICATIONS** Not for use alone to treat chronic psychosis - not for use alone to treat depression (or anxiety associated with depression) - respiratory depression

**CAUTIONS** Acute porphyrias p. 1058 - hypoalbuminaemia - muscle weakness

**CAUTIONS, FURTHER INFORMATION**
- Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**INTERACTIONS** → Appendix 1: loprazolam

**SIDE-EFFECTS** Adjustment disorder - cognitive disorder - muscle tone decreased - speech disorder

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**RENAI IMPAIRMENT**
- **Dose adjustments** Start with small doses in severe impairment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 19
  - Lormetazepam (Non-proprietary)
  - Lormetazepam 500 microgram tablets | 30 tablet
  - Lormetazepam 1 mg tablets | 30 tablet
  - Lormetazepam 500 microgram | 30 tablet

**Nitrazepam**

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**
- **BY MOUTH**
  - Adult: 5–10 mg daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
  - Elderly: 2.5–5 mg daily, dose to be taken at bedtime

**CONTRA-INDICATIONS** Not for use alone to treat chronic psychosis - not for use alone to treat depression (or anxiety associated with depression) - respiratory depression

**CAUTIONS** Acute porphyrias p. 1058 - hypoalbuminaemia - muscle weakness

**CAUTIONS, FURTHER INFORMATION**
- Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**INTERACTIONS** → Appendix 1: nitrazepam

**SIDE-EFFECTS**
- Common or very common Movement disorders
- Uncommon Concentration impaired
- Rare or very rare Abdominal distress - muscle cramps - psychiatric disorder - skin reactions - Stevens-Johnson syndrome

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**RENAI IMPAIRMENT**
- **Dose adjustments** Start with small doses in severe impairment.

### Temazepam

#### INDICATIONS AND DOSE

**Insomnia (short-term use)**
- **BY MOUTH**
  - Adult: 10–20 mg once daily, alternatively 30–40 mg once daily, higher dose range only to be administered in exceptional circumstances, dose to be taken at bedtime, for debilitated patients, use elderly dose
  - Elderly: 10 mg once daily, alternatively 20 mg once daily, higher dose only to be administered in exceptional circumstances, dose to be taken at bedtime

**Conscious sedation for dental procedures**
- **BY MOUTH**
  - Adult: 15–30 mg, to be administered 30–60 minutes before procedure

**Premedication before surgery or investigatory procedures**
- **BY MOUTH**
  - Adult: 10–20 mg, to be taken 1–2 hours before procedure, alternatively 30 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances
  - Elderly: 10 mg, to be taken 1–2 hours before procedure, alternatively 20 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances

#### UNLICENSED USE

Temazepam doses in BNF may differ from those in product literature.
Not licensed for conscious sedation for dental procedures.

#### CONTRA-INDICATIONS

CNS depression - compromised airway - hyperkinesis - not for use alone to treat chronic psychosis - not for use alone to treat depression (or anxiety associated with depression) - obsessional state - phobic states - respiratory depression

#### CAUTIONS

Hypoaalbuminaemia - muscle weakness - organic brain changes

#### CAUTIONS, FURTHER INFORMATION

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

#### INTERACTIONS

Appendix 1: temazepam

#### SIDE-EFFECTS

Drug abuse - dry mouth - hypersalivation - speech slurred

#### BREAST FEEDING

Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

#### HEPATIC IMPAIRMENT

**Dose adjustments** When used for Insomnia Manufacturer advises initiate at 5 mg once daily, increase to 10 mg or 20 mg once daily in extreme cases. Dose to be taken at bedtime.

#### RENAL IMPAIRMENT

**Dose adjustments** Start with small doses in severe impairment.

#### PATIENT AND CARER ADVICE

**Driving and skilled tasks** Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

#### PROFESSION SPECIFIC INFORMATION

**Dental practitioners’ formulary**
Temazepam Tablets and Oral Solution may be prescribed.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS 19**

**Temazepam (Non-proprietary)**

- Temazepam 2 mg per 1 ml
  - Oral solution sugar free sugar-free | 300 ml [P8] £183.26 DT + £183.25 [C3]

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 19**

**Temazepam (Non-proprietary)**

- Temazepam 10 mg

- Temazepam 20 mg
  - Tablet | 20mg tablets | 25 tablet [P8] £13.93–£307.94 [C3]

### Chloral hydrate

#### INDICATIONS AND DOSE

**Insomnia (short-term use), using chloral hydrate 143.3 mg/5 mL oral solution**
- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 430–860 mg once daily (max. per dose 2 g), dose to be taken with water or milk at bedtime

**Insomnia (short-term use), using chloral betaine 707 mg (≈ 414 mg chloral hydrate) tablets**
- **BY MOUTH USING TABLETS**
  - Adult: 1–2 tablets, alternatively 414–828 mg once daily, dose to be taken with water or milk at bedtime; maximum 4 tablets per day; maximum 2 g per day

#### CONTRA-INDICATIONS

Acute porphyrias p. 1058 - gastritis - severe cardiac disease

#### CAUTIONS

Avoid contact with mucous membranes - avoid contact with skin - avoid prolonged use (and abrupt withdrawal thereafter) - reduce dose in debilitated - reduce dose in frail elderly

#### INTERACTIONS

Appendix 1: chloral hydrate

#### SIDE-EFFECTS

Agitation - allergic dermatitis - ataxia - confusion - delirium (more common on abrupt discontinuation) - drug use disorders - gastrointestinal discomfort - gastrointestinal disorders - headache - injury - ketonuria - kidney injury

#### PREGNANCY

Avoid.

#### BREAST FEEDING

Risk of sedation in infant—avoid.

#### HEPATIC IMPAIRMENT

Manufacturer advises avoid in marked impairment.

#### DIRECTIONS FOR ADMINISTRATION

For administration by mouth dilute liquid with plenty of water or juice to mask unpleasant taste.

#### PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include black currant.

#### PATIENT AND CARER ADVICE

**Driving and skilled tasks** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
LESS SUITABLE FOR PRESCRIBING Chloral hydrate is less suitable for prescribing in insomnia.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Chloral hydrate (Non-proprietary)
- Chloral betaine 707 mg tablet 30 (£138.59 DT + £138.59)

Oral solution

CAUTIONARY AND ADVISORY LABELS 19, 27
- Chloral hydrate (Non-proprietary)
- Chloral hydrate 28.66 mg per 1 ml oral solution BP 150 ml (£244.25 DT + £244.25)

Clomethiazole (Chlormethiazole)

INDICATIONS AND DOSE

Severe insomnia (short-term use)
- BY MOUTH USING CAPSULES
  - Elderly: 192 – 384 mg once daily, dose to be taken at bedtime
  - BY MOUTH USING ORAL SOLUTION
  - Elderly: 5 – 10 mg once daily, dose to be taken at bedtime

Restlessness and agitation
- BY MOUTH USING CAPSULES
  - Elderly: 192 mg 3 times a day
  - BY MOUTH USING ORAL SOLUTION
  - Elderly: 5 ml 3 times a day

Alcohol withdrawal
- BY MOUTH USING CAPSULES
  - Adult: Initially 2 – 4 capsules, to be repeated if necessary after some hours. 9 – 12 capsules daily in 3 – 4 divided doses on day 1 (first 24 hours), then 6 – 8 capsules daily in 3 – 4 divided doses on day 2, then 4 – 6 capsules daily in 3 – 4 divided doses on day 3, dose then to be gradually reduced over days 4 – 6, total duration of treatment for no more than 9 days
  - BY MOUTH USING ORAL SOLUTION
  - Adult: Initially 10 – 20 mL, to be repeated if necessary after some hours, then 45 – 60 mL daily in 3 – 4 divided doses on day 1 (first 24 hours), then 30 – 40 mL daily in 3 – 4 divided doses on day 2, then 20 – 30 mL daily in 3 – 4 divided doses on day 3, dose then to be gradually reduced over days 4 – 6, total duration of treatment for no more than 9 days

CONTRA-INDICATIONS Acute pulmonary insufficiency • alcohol-dependent patients who continue to drink

CAUTIONS Avoid prolonged use (and abrupt withdrawal thereafter) • cardiac disease (confusional state may indicate hypoxia) • chronic pulmonary insufficiency • elderly • excessive sedation may occur (particularly with higher doses) • history of drug abuse • marked personality disorder • respiratory disease (confusional state may indicate hypoxia) • sleep apnoea syndrome

INTERACTIONS → Appendix 1: clomethiazole

SIDE-EFFECTS Agitation • bronchial secretion increased • confusion • conjunctival irritation • drug dependence • excessive sedation • gastrointestinal disorder • hangover • nasal complaints • skin reactions • upper airway secretion increased

PREGNANCY Avoid if possible—especially during the first and third trimesters.

BREAST FEEDING Use only if benefit outweighs risk—present in breast milk but effects unknown.

HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).

Dose adjustments Manufacturer advises consider dose reduction in moderate hepatic disorders associated with alcoholism.

RENAL IMPAIRMENT Increased cerebral sensitivity.

Dose adjustments Start with small doses in severe impairment.

PATIENT AND CARER ADVICE

Driving and skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 19, 27
- Clomethiazole (Non-proprietary)
  - Clomethiazole (as Clomethiazole edisilate) 50 mg per 1 ml Clomethiazole 31.5mg/ml oral solution sugar free sugar-free 300 ml (£60.00)

Capsule

CAUTIONARY AND ADVISORY LABELS 19
- Clomethiazole (Non-proprietary)
  - Clomethiazole 192 mg Clomethiazole 192mg capsules 60 capsule (£32.80 DT + £32.80)

Melatonin

INDICATIONS AND DOSE

Insomnia (short-term use)
- BY MOUTH USING MODIFIED-RELEASE TABLETS
  - Adult 55 years and over: 2 mg once daily for up to 13 weeks, dose to be taken 1 – 2 hours before bedtime

CAUTIONS Autoimmune disease (manufacturer advises avoid—no information available)

INTERACTIONS → Appendix 1: melatonin

SIDE-EFFECTS

Common or very common Arthralgia • headaches • increased risk of infection • pain

Uncommon Anxiety • asthenia • chest pain • dizziness • drowsiness • dry mouth • gastrointestinal discomfort • hyperbilirubinemia • hypertension • leucopenia • meningitis • mood altered • movement disorders • nausea • night sweats • oral disorders • skin reactions • sleep disorders • urinary abnormalities • weight increased

Rare or very rare Aggression • angina pectoris • arthrosis • concentration impaired • crying • depression • disorientation • electrolyte imbalance • excessive tearing • gastrointestinal disorders • haematuria • hot flush • hypertiglyceridaemia • leucopenia • memory loss • muscle complaints • nail disorder • palpitations • paraesthesia • partial complex seizure • prostatitis • sexual dysfunction • syncope • thirst • thrombocytopenia • urinary disorders • vertigo • vision disorders • vomiting

Frequency not known Angioedema • galactorrhea

PREGNANCY No information available—avoid.

BREAST FEEDING Present in milk—avoid.

HEPATIC IMPAIRMENT Manufacturer advises avoid (risk of decreased clearance; limited information available).

RENAL IMPAIRMENT No information available—use with caution.
Zolpidem tartrate
02-Feb-2019

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**

**BY MOUTH**
- Adult: 10 mg daily for up to 4 weeks, dose to be taken at bedtime, increased if necessary to 5 mg daily for up to 4 weeks, dose to be taken at bedtime
- Elderly: 5 mg daily for up to 4 weeks, dose to be taken at bedtime

**CONTRA-INDICATIONS**
Acute respiratory depression • marked neuromuscular respiratory weakness • obstructive sleep apnoea • psychotic illness • severe respiratory depression • unstable myasthenia gravis

**CAUTIONS**
Avoid prolonged use (and abrupt withdrawal thereafter) • depression • elderly • history of alcohol abuse • history of drug abuse • muscle weakness • myasthenia gravis

**INTERACTIONS** → Appendix 1: zolpidem

**SIDE-EFFECTS**
- Common or very common Abdominal pain • anterograde amnesia • anxiety • back pain • diarrhoea • dizziness • fatigue • hallucination • headache • increased risk of infection • nausea • sleep disorders • vomiting
- Uncommon Confusion • diplopia • irritability
- Frequency not known Angioedema • behaviour abnormal • concentration impaired • delusions • depression • drug dependence • fall • gait abnormal • hepatic disorders • hyperhidrosis • level of consciousness decreased • libido disorder • muscle weakness • psychosis • respiratory depression • skin reactions • speech disorder • withdrawal syndrome

**PREGNANCY**
Avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

**BREAST FEEDING**
Small amounts present in milk—avoid.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in mild to moderate impairment (risk of decreased clearance); avoid in severe impairment.

**Dose adjustments**
Manufacturer advises initial dose reduction to 5 mg daily in mild to moderate impairment.

**RENAL IMPAIRMENT**
Use with caution.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**
Drowsiness may persist the next day—leave at least 8 hours between taking zolpidem and performing skilled tasks (e.g. driving, or operating machinery); effects of alcohol and other CNS depressants enhanced.

**INTERACTIONS** → Appendix 1: zolpidem

**SIDE-EFFECTS**
- Common or very common Dry mouth • taste bitter
- Uncommon Anxiety • dizziness • fatigue • headache • nausea • sleep disorders • vomiting
- Rare or very rare Behaviour abnormal • confusion • dysphoria • fall • hallucination • irritability • libido disorder • memory impairment • skin reactions
- Frequency not known Cognitive disorder • concentration impaired • delusions • depressed mood • diplopia • drug dependence • dyspepsia • movement disorders • muscle weakness • paraesthesia • respiratory depression • speech disorder • withdrawal syndrome

**PREGNANCY**
Not recommended (risk of neonatal withdrawal symptoms). Use during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

**BREAST FEEDING**
Present in milk—avoid.

---

Zopiclone
02-Feb-2019

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**

**BY MOUTH**
- Adult: 7.5 mg once daily for up to 4 weeks, dose to be taken at bedtime
- Elderly: Initially 3.75 mg once daily for up to 4 weeks, dose to be taken at bedtime, increased if necessary to 7.5 mg daily

**Insomnia (short-term use) in patients with chronic pulmonary insufficiency**

**BY MOUTH**
- Adult: Initially 3.75 mg once daily for up to 4 weeks, dose to be taken at bedtime, increased if necessary to 7.5 mg daily

**CONTRA-INDICATIONS**
Marked neuromuscular respiratory weakness • respiratory failure • severe sleep apnoea syndrome • unstable myasthenia gravis

**CAUTIONS**
Avoid prolonged use (risk of tolerance and withdrawal symptoms) • chronic pulmonary insufficiency (increased risk of respiratory depression) • elderly • history of drug abuse • muscle weakness • myasthenia gravis (avoid if unstable) • psychiatric illness

**INTERACTIONS** → Appendix 1: zopiclone

**SIDE-EFFECTS**
- Common or very common Dry mouth • taste bitter
- Uncommon Anxiety • dizziness • fatigue • headache • nausea • sleep disorders • vomiting
- Rare or very rare Behaviour abnormal • confusion • dysphoria • fall • hallucination • irritability • libido disorder • memory impairment • skin reactions
- Frequency not known Cognitive disorder • concentration impaired • delusions • depressed mood • diplopia • drug dependence • dyspepsia • movement disorders • muscle weakness • paraesthesia • respiratory depression • speech disorder • withdrawal syndrome

**PREGNANCY**
Not recommended (risk of neonatal withdrawal symptoms). Use during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

**BREAST FEEDING**
Present in milk—avoid.
7.2 Narcolepsy

Other drugs used for Narcolepsy Dexamfetamine sulfate, p. 350 · Methylphenidate hydrochloride, p. 348

CENTRAL NERVOUS SYSTEM DEPRESSANTS

Sodium oxybate

- **DRUG ACTION** A central nervous system depressant.

- **INDICATIONS AND DOSE**

  Narcolepsy with cataplexy (under expert supervision)

  - **BY MOUTH**
    - Adult: Initially 2.25 g daily, dose to be taken on retiring and 2.25 g after 2.5–4 hours, then increased in steps of 1.5 g daily in 2 divided doses; dose adjusted according to response at intervals of 1–2 weeks; dose titration should be repeated if restarting after interval of more than 14 days, maximum 9 g daily in 2 divided doses

  **DOSAGE ADJUSTMENTS DUE TO INTERACTIONS**

  - Manufacturer advises reduce dose by 20% with concurrent use of sodium valproate or valproic acid.

- **CONTRA-INDICATIONS**

  Major depression · sleep apnoea · sedation · lethargy · weight gain · nausea · vomiting · taste alteration · dizziness · respiratory depression · loss of consciousness · sleep disorders · sleep paralysis · mood disorders · insomnia · anxiety · delusions · hallucinations · depression · delirium · agitation · psychoses · suicidal tendencies

- **CAUTIONS**

  - Body mass index of 40 kg/m² or greater (higher risk of sleep apnoea) · elderly · epilepsy · heart failure (high sodium content) · history of depression · history of drug abuse · hypertension (high sodium content) · respiratory disorders · risk of discontinuation effects including rebound cataplexy and withdrawal symptoms

- **INTERACTIONS** → Appendix 1: sodium oxybate

- **SIDE-EFFECTS**

  - Common or very common Abdominal pain upper · anxiety · appetite abnormal · arthralgia · asthenia · back pain · concentration impaired · confusion · depression · diarrhoea · dizziness · dysphoria · fall · feeling drunk · headache · hyperhidrosis · hypertension · increased risk of infection · movement disorders · muscle spasms · nasal congestion · nausea · palpitations · peripheral oedema · sedation · sensation abnormal · skin reactions · sleep disorders · sleep paralysis · snoring · taste altered · tremor · urinary disorders · vertigo · vision blurred · vomiting · weight decreased

  - Uncommon Behaviour abnormal · faecal incontinence · hallucination · memory loss · psychosis · suicidal tendencies · thinking abnormal

  - Frequency not known Angioedema · dehydrogenase · delusions · dry mouth · homicidal ideation · loss of consciousness · mood altered · respiratory depression · seizure · sleep apnoea

  - **PREGNANCY** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).

  **DOSAGE ADJUSTMENTS** Manufacturer advises initial dose reduction of 50%.

- **RENA L IMPAIRMENT** Caution—contains 3.96 mmol Na⁺ per mL

- **DIRECTIONS FOR ADMINISTRATION** Dilute each dose with 50 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium oxybate oral solution.

  - **Driving and skilled tasks** Leave at least 6 hours between taking sodium oxybate and performing skilled tasks (e.g. driving or operating machinery); effects of alcohol and other CNS depressants enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Tablet**

  **CAUTIONARY AND ADVISORY LABELS** 19, 25

  - **Zopiclone (Non-proprietary)**
    - Zopiclone 3.75 mg Zopiclone 3.75 mg tablets | 28 tablet | £1.50 DT £0.87 (CD-1)
    - Zopiclone 7.5 mg Zopiclone 7.5 mg tablets | 28 tablet | £3.75 DT £0.87 (CD-3)
    - Zimovane (Sanofi)
      - Zopiclone 3.75 mg Zimovane LS 3.75mg tablets | 28 tablet | £2.24 DT £0.88 (CD-1)

### CNS STIMULANTS

Pitolisant

- **DRUG ACTION** Pitolisant is a histamine H₂-receptor antagonist which enhances the activity of brain histaminergic neurons.

- **INDICATIONS AND DOSE**

  Narcolepsy with or without cataplexy (initiated by a specialist)

  - **BY MOUTH**
    - Adult: Initially 9 mg once daily for 1 week, then increased if necessary to 18 mg once daily for 1 week, then increased if necessary to 36 mg once daily, dose to be taken in the morning with breakfast, dose can be decreased (down to 4.5 mg per day) or increased (up to 36 mg per day) according to response and tolerance

  **CAUTIONS**

  - Acid-related gastric disorders · epilepsy · history of psychiatric disorders · severe anorexia · severe obesity
ventricular hypertrophy • moderate uncontrolled hypertension • severe uncontrolled hypertension

**CAUTIONS**  
History of alcohol abuse • history of depression • history of drug abuse • history of mania • history of psychosis • possibility of dependence

**INTERACTIONS**  
Appendix 1: pitolisant

**SIDE-EFFECTS**

- Common or very common  
  Anxiety • asthenia • depression • dizziness • gastrointestinal discomfort • headaches • mood altered • nausea • sleep disorders • tremor • vertigo • vomiting

- Uncommon  
  Appetite abnormal • arrhythmias • arthralgia • blepharospasm • chest pain • concentration impaired • constipation • diarrhea • drowsiness • dry mouth • epilepsy • feeling abnormal • fluid retention • gastrointestinal disorders • hallucinations • hot flush • hypertension • hypotension • malaise • metrorrhagia • movement disorders • muscle complaints • muscle weakness • oedema • on and off phenomenon • oral intolernce • pain • paraesthesia • QT interval prolongation • sexual dysfunction • skin reactions • sweat changes • tinnitus • urinary frequency increased • visual acuity decreased • weight decreased • weight increased

- Rare or very rare  
  Blepharospasm • vomiting • dizziness • hallucinations • muscle complaints • muscle tone increased • muscle weakness • oedema • on and off phenomenon • oral intolernce • pain • paraesthesia • QT interval prolongation • sexual dysfunction • skin reactions • sweat changes • tinnitus • urinary frequency increased • visual acuity decreased • weight decreased • review treatment if significant • weight increased • review treatment if significant • yawning

**SIDE-EFFECTS, FURTHER INFORMATION**

- Common or very common  
  Anxiety • appetite abnormal • arrhythmias • asthenia • chest pain • confusion • constipation • depression • diarrhea • dizziness • drowsiness • dry mouth • gastrointestinal discomfort • headaches • mood altered • nausea • palpitations • sensation abnormal • sleep disorders • thinking abnormal • vasodilation • vision disorders

- Uncommon

**SIDE-EFFECTS**

- Common or very common  
  Anxiety • appetite abnormal • arrhythmias • arthralgia • chest pain • confusion • constipation • depression • diarrhea • dizziness • drowsiness • dry mouth • gastrointestinal discomfort • headaches • mood altered • nausea • palpitations • sensation abnormal • sleep disorders • thinking abnormal • vasodilation • vision disorders

**CONCEPATION AND CONTRACEPTION**  
Manufacturer advises effective contraception in women of childbearing potential for at least 21 days after treatment discontinuation—pitolisant may reduce the effectiveness of hormonal contraceptives.

**PREGNANCY**  
Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

**BREAST FEEDING**  
Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**  
Manufacturer advises caution in moderate impairment; avoid in severe impairment.

**Dose adjustments**  
Manufacturer advises consider dose increase after two weeks after initiation in moderate impairment; maximum daily dose of 18 mg.

**RENAL IMPAIRMENT**

**Dose adjustments**  
Manufacturer advises use with caution; maximum daily dose should not exceed 18 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**CNS STIMULANTS**  
**CENTRALLY ACTING SYMPATHOMIMETICS**

**Modafinil**

**INDICATIONS AND DOSE**

Excessive sleepiness associated with narcolepsy with or without cataplexy

- **BY MOUTH**
  Adult: Initially 200 mg daily in 2 divided doses, dose to be taken in the morning and at noon, alternatively initially 200 mg once daily, dose to be taken in the morning, adjusted according to response to 200–400 mg daily in 2 divided doses, alternatively adjusted according to response to 200–400 mg once daily
  Elderly: Initially 100 mg daily

**CONTRA-INDICATIONS**  
Arrhythmia • history of clinically significant signs of CNS stimulant-induced mitral valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias) • history of cor pulmonale • history of left
8 Substance dependence

Substance dependence

Guidance on treatment of drug misuse

Alcohol dependence

See Alcohol dependence p. 494.

Nicotine dependence

See Smoking cessation p. 497.

Opioid dependence

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber. Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at 36–72 hours; symptoms subside substantially after 5 days. Methadone hydrochloride or buprenorphine should be prescribed for patients when there is a risk of dose diversion for parenteral medications; there is also a lower risk of overdose.

Opioid substitution therapy

Methadone hydrochloride and buprenorphine are used as substitution therapy in opioid dependence. Substitute medication should be commenced with a short period of stabilisation, followed by either a withdrawal regimen or by maintenance treatment. Maintenance treatment enables patients to achieve stability, reduces drug use and crime, and improves health; it should be regularly reviewed to ensure the patient continues to derive benefit. The prescriber should monitor for signs of toxicity, and the patient should be told to be aware of warning signs of toxicity on initiation and during titration. A withdrawal regimen after stabilisation with methadone hydrochloride or buprenorphine should be attempted only after careful consideration. Enforced withdrawal is ineffective for sustained abstinence, and it increases the risk of patients relapsing and subsequently overdosing because of loss of tolerance. Complete withdrawal from opioids usually takes up to 4 weeks in an inpatient or residential setting, and up to 12 weeks in a community setting. If abstinence is not achieved, illicit drug use is resumed, or the patient cannot tolerate withdrawal, the withdrawal regimen should be stopped and maintenance therapy should be resumed at the optimal dose. Following successful withdrawal treatment, further support and monitoring to maintain abstinence should be provided for a period of at least 6 months.

Missed doses

Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients. If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine because of the risk of precipitated withdrawal.

Buprenorphine

Buprenorphine is preferred by some patients because it is less sedating than methadone hydrochloride; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving.

Buprenorphine is safer than methadone hydrochloride when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone hydrochloride because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose.

Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone hydrochloride before induction with naltrexone hydrochloride p. 497 for prevention of relapse.

Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal can occur in any patient if buprenorphine is administered when other opioid agonist drugs are in circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy, such as lofexidine hydrochloride p. 504, may be required if symptoms are severe.

To reduce the risk of precipitated withdrawal, the first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone hydrochloride. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone hydrochloride therapy—but care is still needed to avoid toxicity or precipitated withdrawal; dividing the dose on the first day may be useful.

A combination preparation containing buprenorphine with naloxone p. 503 (Suboxone®) can be prescribed for patients when there is a risk of dose diversion for parenteral administration; the naloxone hydrochloride p. 1369 component precipitates withdrawal if the preparation is injected, but it has little effect when the preparation is taken sublingually.

Methadone

Methadone hydrochloride, a long-acting opioid agonist, is usually administered in a single daily dose as methadone hydrochloride oral solution 1 mg/mL. Patients with a long history of opioid misuse, those who typically abuse a variety of sedative drugs and alcohol, and those who experience increased anxiety during withdrawal of opioids may prefer methadone hydrochloride to buprenorphine because it has a more pronounced sedative effect.

Methadone hydrochloride is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, plasma concentrations progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma concentrations to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus, titration to the optimal dose in methadone hydrochloride maintenance treatment may take several weeks.

Opioid substitution during pregnancy

Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone hydrochloride or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued (buprenorphine is not licensed for use in pregnancy). Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone hydrochloride or buprenorphine should be undertaken gradually during the second trimester, with dose

www.getintopharma.com
reductions made every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone hydrochloride or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone hydrochloride p. 502 or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute.

Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective suckling, and excessive wakefulness; severe, but rare symptoms include hypertonicity and convulsions.

Opioid substitution during breastfeeding
Dosage of methadone and buprenorphine should be kept as low as possible in breast-feeding mothers. Increased sleepiness, breathing difficulties, or limpopness in breast-fed babies of mothers taking opioid substitutes should be reported urgently to a healthcare professional.

Adjunctive therapy and symptomatic treatment
Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide hydrochloride p. 66 may be used for the control of diarrhoea; beverine hydrochloride p. 56 for controlling stomach cramps; paracetamol p. 444 and non-steroidal anti-inflammatory drugs for muscular pains and headaches; metoclopromide hydrochloride p. 432 or prochlorperazine p. 389 may be useful for nausea or vomiting. Topical rubefacients can be helpful for relieving muscle pain associated with methadone hydrochloride withdrawal. If a patient is suffering from insomnia, short-acting benzodiazepines or zopiclone p. 490 may be prescribed, but because of the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

Lofexidine
Lofexidine hydrochloride p. 504 may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lofexidine hydrochloride can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute or during withdrawal of the opioid substitute. Alternatively, lofexidine hydrochloride may be prescribed instead of an opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use.

Opioid-receptor antagonists
Patients dependant on opioids can be given a supply of naloxone hydrochloride p. 1369 to be used in case of accidental overdose. Naltrexone hydrochloride p. 497 precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor agonists are blocked by naltrexone hydrochloride, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

Opioid dependence in children
In younger patients (under 18 years), the harmful effects of drug misuse are more often related to acute intoxication than to dependence, so substitution therapy is usually inappropriate. Maintenance treatment with opioid substitution therapy is therefore controversial in young people; however, it may be useful for the older adolescent who has a history of opioid use to undergo a period of stabilisation with buprenorphine p. 447 or methadone hydrochloride before starting a withdrawal regimen.

8.1 Alcohol dependence

Alcohol dependence

Description of condition
Alcohol dependence is a cluster of behavioural, cognitive and physiological factors that typically include a strong desire to drink alcohol, tolerance to its effects, and difficulties controlling its use. Someone who is alcohol-dependent may persist in drinking, despite harmful consequences, such as physical or mental health problems.

In severely dependent patients who have been drinking excessively for a prolonged period of time, an abrupt reduction in alcohol intake may result in the development of an alcohol withdrawal syndrome, which, in the absence of medical management, can lead to seizures, delirium tremens, and death.

Assisted alcohol withdrawal

Patients with mild alcohol dependence usually do not need assisted alcohol withdrawal. Patients with moderate dependence can generally be treated in a community setting unless they are at high risk of developing alcohol withdrawal seizures or delirium tremens; individuals with severe dependence should undergo withdrawal in an inpatient setting. Patients with uncomplicated liver disease should be treated under specialist supervision.

A long-acting benzodiazepine, such as chloridiazepoxide hydrochloride p. 343 or diazepam p. 343, is recommended to attenuate alcohol withdrawal symptoms; local clinical protocols should be followed.

In primary care, fixed-dose reducing regimens are used. This involves using a standard, initial dose (determined by the severity of alcohol dependence or level of alcohol consumption), followed by dose reduction to zero, usually over 7–10 days. In inpatient or residential settings, a fixed-dose regimen or a symptom-triggered regimen can be used. A symptom-triggered approach involves involving the drug regimen according to the severity of withdrawal and any complications in an individual patient; adequate monitoring facilities should be available. The patient should be monitored on a regular basis and treatment only continued as long as there are withdrawal symptoms.

Carbamazepine p. 311 [unlicensed indication] can be used as an alternative treatment in acute alcohol withdrawal. Clomethiazole p. 489 may be considered as an alternative to a benzodiazepine or carbamazepine p. 311. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol. Note: Alcohol combined with clomethiazole p. 489, particularly in patients with cirrhosis, can lead to fatal respiratory depression even with short-term use.

When managing withdrawal from co-existing benzodiazepine and alcohol dependence, the dose of benzodiazepine used for withdrawal should be increased. The initial daily dose is calculated, based on the requirements for alcohol withdrawal plus the equivalent regularly used daily dose of benzodiazepine. A single benzodiazepine (chloridiazepoxide hydrochloride p. 343 or diazepam p. 343) should be used rather than multiple benzodiazepines. Inpatient withdrawal regimens should last for 2–3 weeks or longer, depending on the severity of benzodiazepine dependence. When withdrawal is managed...
in the community, or where there is a high level of benzodiazepine dependence, or both, the regimen should last for a minimum of 3 weeks (according to the patient’s symptoms).

If alcohol withdrawal seizures occur, a fast-acting benzodiazepine (such as lorazepam p. 339 [unlicensed indication]) should be prescribed to reduce the likelihood of further seizures. If alcohol withdrawal seizures develop in a person during treatment for acute alcohol withdrawal, review their withdrawal drug regimen. ▶ Delirium tremens

Delirium tremens is a medical emergency that requires specialist inpatient care. In patients with delirium tremens (characterised by agitation, confusion, paraesthesia, and visual and auditory hallucinations), oral lorazepam p. 339 should be used as first-line treatment. If symptoms persist or oral medication is declined, parenteral lorazepam p. 339 [unlicensed], or haloperidol p. 386 [unlicensed] can be given as adjunctive therapy. If delirium tremens develops during treatment for acute alcohol withdrawal, the withdrawal drug regimen should also be reviewed. ▶

**Alcohol dependence**

In harmful drinkers or patients with mild alcohol dependence, a psychological intervention (such as cognitive behavioural therapy) should be offered. In those who have not responded to psychological interventions alone or who have specifically requested a pharmacological treatment, acamprosate calcium p. 496 or oral naltrexone hydrochloride p. 497 can be used in combination with a psychological intervention.

Acamprosate calcium p. 496 or oral naltrexone hydrochloride p. 497 in combination with a psychological intervention are recommended for relapse prevention in patients with moderate and severe alcohol dependence, to start after successful assisted withdrawal. Disulfiram below is an alternative for patients in whom acamprosate calcium p. 496 and oral naltrexone hydrochloride p. 497 are not suitable, or if the patient prefers disulfiram below and understands the risks of taking the drug.

Nalmefene p. 496 is recommended for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level, without physical withdrawal symptoms, and who do not require immediate detoxification (see National funding/access decisions for nalmefene p. 496). Patients with severe alcohol-related hepatitis with a discriminant function of 32 or more can be given corticosteroids but only after any active infection or gastrointestinal bleeding is treated, any renal impairment is controlled, and following discussion of the potential benefits and risks of treatment. Corticosteroid treatment has been shown to improve survival in the short term (1 month) but not over a longer term (3 months to 1 year). It has also been shown to increase the risk of serious infections within the first 3 months of starting treatment.

Patients with chronic alcohol-related pancreatitis should be offered nutritional support; those who have symptoms of steatorrhoea or who have poor nutritional status due to Exocrine pancreatic insufficiency p. 95 should be prescribed pancreatic enzyme supplements; supplements are not indicated when pain is the only symptom.

**Wernicke’s encephalopathy**

Patients with alcohol dependence are at risk of developing Wernicke’s encephalopathy; patients at high risk are those who are malnourished, at risk of malnourishment, or have decompensated liver disease. Parenteral thiamine p. 1080, followed by oral thiamine p. 1080, should be given to patients with suspected Wernicke’s encephalopathy, those who are malnourished or at risk of malnourishment, those who have decompensated liver disease or who are attending hospital for acute treatment. Prophylactic oral thiamine p. 1080 should also be given to harmful or dependent drinkers if they are in acute withdrawal, or before and during assisted alcohol withdrawal. ▶ Parenteral thiamine is available as part of a vitamin B substances with ascorbic acid p. 1081 preparation.

**Useful Resources**

**ALDEHYDE DEHYDROGENASE INHIBITORS**

**Disulfiram**

- **INDICATIONS AND DOSE**

  Adjunct in the treatment of alcohol dependence (under expert supervision)

- **BY MOUTH**

  - Adult: 200 mg daily, increased if necessary up to 500 mg daily

- **UNLICENSED USE** Disulfiram doses in BNF may differ from those in product literature.

- **CONTRA-INDICATIONS** Cardiac failure - coronary artery disease - history of cerebrovascular accident - hypertension - psychosis - severe personality disorder - suicide risk

- **CAUTIONS** Alcohol challenge not recommended on routine basis (if considered essential—specialist units only with resuscitation facilities). Avoid in Acute porphyrias p. 1058. Diabetes mellitus - epilepsy - respiratory disease

- **INTERACTIONS** ▶ Appendix 1: disulfiram

- **SIDE-EFFECTS** Allergic dermatitis - breath odour - depression - drowsiness - encephalopathy - fatigue - hepatocellular injury - libido decreased - mania - nausea - nerve disorders - paraesthesia - psychosis - vomiting

- **PREGNANCY** High concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic; avoid in first trimester.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Use with caution.

- **PRE-TREATMENT SCREENING** Before initiating disulfiram, prescribers should evaluate the patient’s suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.

- **MONITORING REQUIREMENTS** During treatment with disulfiram, patients should be monitored at least every 2 weeks for the first 2 months, then each month for the following 4 months, and at least every 6 months thereafter.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be counselled on the disulfiram-alcohol reaction—reactions may occur following exposure to small amounts of alcohol found in perfume, aerosol sprays, or low alcohol and “non-alcohol” beers and wines; symptoms may be severe and life-threatening and can include nausea, flushing, palpitations, arrhythmias, hypotension, respiratory depression, and coma. ▶ Patients and their carers should be counselled on the signs of hepatotoxicity—patients should

**NICE decisions**

- **Nalmefene for reducing alcohol consumption in people with alcohol dependence (November 2014) NICE TA325**

  Nalmefene is recommended within its marketing authorisation, as an option for reducing alcohol consumption, for patients with alcohol dependence:
  - who have a high drinking risk level (defined as alcohol consumption of more than 60 g per day for men and more than 40 g per day for women, according to the World Health Organization’s drinking risk levels) without physical withdrawal symptoms, and
  - who do not require immediate detoxification.

  The marketing authorisation states that nalmefene should:
  - only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption, and
  - be initiated only in patients who continue to have a high drinking risk level 2 weeks after initial assessment.

  www.nice.org.uk/TA325

- **MEDICINAL FORMS**

- **Indications and dose**

- **Reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level without physical withdrawal symptoms, and who do not require immediate detoxification**

- **BY MOUTH**

- **Adult**
  - 18 mg daily if required, taken on each day there is a risk of drinking alcohol, preferably taken 1–2 hours before the anticipated time of drinking, if a dose has not been taken before drinking alcohol, 1 dose should be taken as soon as possible; maximum 18 mg per day

- **Contra-indications** Recent history of acute alcohol withdrawal syndrome · recent or current opioid use

- **Caution** Continued treatment for more than 1 year · history of seizure disorders (including alcohol withdrawal seizures) · psychiatric illness

  - Acamprosate calcium 333 mg | 168 tablet
  - £28.80 DT = £33.75

**OPIOID RECEPTOR ANTAGONISTS**

**Nalmefene**

- **Indications and dose**

  - **Reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level without physical withdrawal symptoms, and who do not require immediate detoxification**

- **By mouth**

- **Adult**
  - 18 mg daily if required, taken on each day there is a risk of drinking alcohol, preferably taken 1–2 hours before the anticipated time of drinking, if a dose has not been taken before drinking alcohol, 1 dose should be taken as soon as possible; maximum 18 mg per day
Naltrexone hydrochloride

**Drug Action**
Naltrexone is an opioid-receptor antagonist.

**Indications and Dose**

Adjunct to prevent relapse in formerly opioid-dependent patients (who have remained opioid-free for at least 7-10 days) (initiated under specialist supervision)

- **By mouth**
  - Adult: Initially 25 mg daily, then increased to 50 mg daily, total weekly dose may be divided and given on 3 days of the week for improved compliance (e.g. 100 mg on Monday and Wednesday, and 150 mg on Friday); maximum 350 mg per week

Adjunct to prevent relapse in formerly alcohol-dependent patients (initiated under specialist supervision)

- **By mouth**
  - Adult: 25 mg once daily on the first day, then increased if tolerated to 50 mg daily

**Unlicensed Use**
25 mg dose for adjunct to prevent relapse in formerly alcohol-dependent patients is an unlicensed dose.

**Contra-Indications**
Patients currently dependent on opioids

**Cautions**
Concomitant use of opioids

**Caution, Further Information**
Concomitant use of opioids

**Side-Effects**
Common or very common
- Abdominal pain
- Anxiety
- Appetite abnormality
- Arthralgia
- Asthenia
- Chest pain
- Chills
- Constipation
- Diarrhoea
- Dizziness
- Eye disorders
- Headache
- Hyperhidrosis
- Mood altered
- Myalgia
- Nausea
- Palpitations
- Sexual dysfunction
- Skin reactions
- Sleep disorders
- Tachycardia
- Thirst
- Vomiting

Uncommon
- Alopecia
- Confusion
- Cough
- Depression
- Drowsiness
- Dry mouth
- Dysphoria
- Dysphonia
- Ear discomfort
- Eye discomfort
- Eye swelling
- Feeling hot
- Fever
- Flatulence
- Flushing
- Hallucination
- Hepatic disorders
- Lymphadenopathy
- Nasal complaints
- Oropharyngeal pain
- Pain
- Paranoia
- Perioral coldness
- Seborrhoea
- Sinus disorder
- Sputum increased
- Tinnitus
- Tremor
- Ulcer
- Urinary disorders
- Vertigo
- Vision disorders
- Weight changes
- Yawning

Rare or very rare
- Immune thrombocytopenic purpura
- Rhabdomyolysis
- Suicidal tendencies

Frequency not known
Withdrawal syndrome

**Pregnancy**
Use only if benefit outweighs risk.

**Breast Feeding**
Avoid—potential toxicity.

**Hepatic Impairment**
Manufacturer advises caution in mild to moderate impairment; avoid in severe or acute impairment, acute hepatitis, or hepatic failure.

**Dose Adjustments**
Manufacturer advises consider dose adjustment in mild to moderate impairment.

**Renal Impairment**
Avoid in severe impairment.

**Pre-Treatment Screening**
Test for opioid dependence with naloxone before treatment.

**Monitoring Requirements**
Liver function tests needed before and during treatment.

**Patient and Carer Advice**
Patients should be warned that an attempt to overcome the blockade of opioid receptors by overdosing could result in acute opioid intoxication.

**National Funding/Access Decisions**
**NICE Decisions**
- Naltrexone for the management of opioid dependence (January 2007) NICE TA115

Naltrexone is recommended for the prevention of relapse in formerly opioid-dependent patients who are motivated to remain in a supportive care abstinence programme. Naltrexone should be administered under supervision and its effectiveness in preventing opioid misuse reviewed regularly. www.nice.org.uk/TA115

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**
- Naltrexone hydrochloride (Non-proprietary)
  - Naltrexone hydrochloride 50 mg
  - 28 tablet £23.00-£51.21 DT + £47.46
  - Adepend (AOP Orphan Pharmaceuticals AG)
  - Naltrexone hydrochloride 50 mg
  - 28 tablet £47.43 DT + £47.46

**8.2 Nicotine dependence**

**Smoking Cessation**

**Overview**
Smoking tobacco is the main cause of preventable illness and premature death in the UK. It is linked to a number of diseases such as cancer (primarily lung cancer), chronic obstructive pulmonary disease, and cardiovascular disease, and can lead to complications during pregnancy. Smoking cessation reduces the risk of developing or worsening of smoking-related illnesses, and the benefits begin as soon as a person stops smoking.

Smoking cessation may be associated with temporary withdrawal symptoms caused by nicotine dependence, making it difficult for people to stop. These symptoms include nicotine cravings, irritability, depression, restlessness, poor concentration, light-headedness, sleep disturbances, and increased appetite. Weight gain is a concern for many people who stop smoking, however it is less likely to occur when drug treatment is used to aid smoking cessation.

**Non-drug treatment**

All smokers, including those who smoke e-cigarettes, should be advised to stop smoking and be offered support to facilitate smoking cessation. They should also be advised that stopping in one step (‘abrupt quitting’) offers the best chance of lasting success, and that a combination of drug treatment and behavioural support is likely to be the most effective approach.

‘Abrupt quitting’ is when a smoker makes a commitment to stop smoking or before a particular date (the quit date), rather than by gradually reducing their smoking.

Smokers who wish to stop smoking should be referred to their local NHS Stop Smoking Services, where they will be provided with advice, drug treatment, and behavioural support options such as individual counselling or group meetings. Smokers who decline to attend their local NHS Stop Smoking Services should be referred to a suitable healthcare professional who can also offer drug treatment and practical advice.

**Drug treatment**
Nicotine replacement therapy (NRT), varenicline p. 501, and bupropion hydrochloride p. 498, are effective drug treatments to aid smoking cessation.
Nervous system

Stop smoking in the long-term. Smokers should be advised that NRT will make it easier to temporarily abstinence with or without the use of NRT. These approaches can reduce how much they smoke and improve their chance of quitting. Using NRT to prevent relapse, and smoking reduction or complete abstinence not achieved at 7 weeks, is much lower and less addictive than in smoking tobacco.

E-cigarettes

E-cigarettes deliver nicotine without the toxins found in tobacco smoke. Evidence suggests that e-cigarettes are substantially less harmful to health than tobacco smoking, but long-term effects are still largely unknown. Some smokers have found e-cigarettes useful for smoking cessation, however they cannot be prescribed or supplied by smoking cessation services. People who wish to use e-cigarettes should be advised that although these products are not licensed drugs, they are regulated by the Tobacco and Health Act 2009. 

Pregnancy

Pregnant females should be advised to stop smoking completely, and be informed about the risks to the unborn child of smoking during pregnancy, and the harmful effects of exposure to second-hand smoke for both mother and baby. All pregnant females who smoke or have stopped smoking in the last 2 weeks should be referred to their local NHS Stop Smoking Services, and ongoing support should be offered during and following pregnancy. Smoking cessation should also be encouraged for all members of the household. Pregnant females who smoke should be advised to contact the NHS Pregnancy Smoking Helpline for further information (Tel: 0800 169 9169). NRT should be used in pregnant females in non-drug treatment options have failed. Clinical judgement should be used when deciding whether to prescribe NRT following a discussion about its risks and benefits. Subsequent prescriptions should only be given to pregnant females who have demonstrated they are still not smoking.

Concomitant drugs

Polycyclic aromatic hydrocarbons found in tobacco smoke increase the metabolism of some drugs by inducing hepatic enzymes, often requiring an increase in dose. Information about drugs interacting with tobacco smoke can be found under Interactions of the relevant drug monograph.

Useful Resources

Antidepressants > Serotonin and Noradrenaline Re-uptake Inhibitors

Bupropion hydrochloride

(Amfebutamone hydrochloride)

- INDICATIONS AND DOSE

To aid smoking cessation in combination with motivational support in nicotine-dependent patients

- BY MOUTH

Adult: Initially 150 mg daily for 6 days, then 150 mg twice daily (max. per dose 150 mg), minimum 8 hours between doses; period of treatment 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks, consider maximum 150 mg daily in patients with risk factors for seizures; maximum 300 mg per day

Elderly: 150 mg daily for 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks, maximum 150 mg per day

- CONTRA-INDICATIONS

Acute alcohol withdrawal - acute benzodiazepine withdrawal - bipolar disorder - CNS tumour - eating disorders - history of seizures - severe hepatic cirrhosis

- CAUTIONS

Alcohol abuse - diabetes - elderly - history of head trauma - predisposition to seizures (prescribe only if benefit clearly outweighs risk)

- INTERACTIONS

Appendix 1: bupropion

- SIDE-EFFECTS

Common or very common Abdominal pain - anxiety - concentration impaired - constipation - dizziness - dry mouth - fever - gastrointestinal disorder - headache - hyponatraemia - hypersensitivity - insomnia (reduced by avoiding dose at bedtime) - nausea - skin reactions - taste altered - tremor - vomiting

Uncommon Appetite decreased - asthenia - chest pain - confusion - tachycardia - tinnitus - vasodilation - visual impairment

Rare or very rare Angioedema - arthralgia - behaviour abnormal - bronchoospasm - delusions - depersonalisation - dysphoria - hallucination - hepatic disorders - irritability - memory loss - movement disorders - muscle complaints - palpitations - paraesthesia - parkinsonism - postural hypotension - seizure - sleep disorders - Stevens-Johnson syndrome - syncope - urinary disorders

Frequency not known Anaemia - hyponatraemia - leukocytopenia - myelosuppression - suicidal tendencies - thrombocytopenia

PREGNANCY

Avoid—no information available.

BREAST FEEDING

Present in milk—avoid.

HEPATIC IMPAIRMENT

Manufacturer advises use with caution—monitor closely for adverse effects; avoid in severe cirrhosis.

www.getintopharma.com
NICOTINIC RECEPTOR AGONISTS

Dose adjustments  Manufacturer advises reduce dose to 150 mg daily in mild to moderate impairment

Renal impairment

Dose adjustments  Reduce dose to 150 mg daily.

Monitoring requirements  Manufacturer advises monitor blood pressure before and during treatment.

Patient and carer advice  Manufacturer advises patients and carers should be instructed to report any clinical worsening of depression, suicidal behaviour or thoughts and unusual changes in behaviour.

Driving and skilled tasks  Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and light-headedness.

Medicinal forms  There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet  Cautionary and advisory labels

- Zyban (GlaxoSmithKline UK Ltd)
- Bupropion hydrochloride 150 mg Zyban 150mg modified-release tablets 60 [PDR] £41.76 DT + £41.76

Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day

By mouth using chewing gum

Adult: 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

By sublingual administration using sublingual tablets

Adult: 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day

By mouth using chewing gum

Adult: 4 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, individuals should not exceed 15 pieces of 4-mg strength gum daily, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day

By sublingual administration using sublingual tablets

Adult: 2 tablets every 1 hour, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy by inhalation

Adult: As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, individuals should not exceed 12 cartridges of the 10-mg strength daily, or 6 cartridges of the 15-mg strength daily

By mouth using lozenges

Adult: 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the lower-strength lozenges should use the higher-strength lozenges; if attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day

By mouth using oromucosal spray

Adult: 1–2 sprays as required, individuals can spray in the mouth when the urge to smoke occurs or to prevent cravings, individuals should not exceed 2 sprays per episode (up to 4 sprays every hour); maximum 64 sprays per day

By intranasal administration using nasal spray

Adult: 1 spray as required, individuals can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day

By transdermal application using patches

Adult: Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks; a slower titration schedule can be used in individuals who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; individuals using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks

Nicotine dependence 499
SPECIFIC SIDE-EFFECTS

- Common or very common
  - When used by inhalation: Asthenia, cough, dry mouth, flatulence, gastrointestinal discomfort, hiccup, hypersensitivity, nasal complaints, oral disorders, taste altered, throat complaints
  - When used by intranasal use: Chest discomfort, cough, dypnoea, epistaxis, nasal complaints, paraesthesia, throat irritation
  - With oral use: Anxiety, appetite abnormal, burping, diarrhoea, dypesia (may be caused by swallowed nicotine), gastrointestinal disorders, hiccup, increased risk of infection, mood altered, oral disorders, sleep disorders
  - With sublingual use: Asthenia, cough, dry mouth, flatulence, gastrointestinal discomfort, hiccup, hypersensitivity, oral disorders, rhinitis, taste altered, throat complaints

- Uncommon
  - When used by inhalation: Abnormal dreams, arrhythmias, bronchospasm, burping, chest discomfort, dysphonia, dypnoea, hypertension, malaise
  - With intranasal use: Abnormal dreams, asthenia, hypertension, malaise
  - With oral use: Anger, asthma exacerbated, cough, dypesia aggravated, dysphagia, haemorrhage, laryngospasm, nasal complaints, nocturia, numbness, overdose, pain, palpatations exacerbated, peripheral oedema, tachycardia, taste altered, throat complaints, vascular disorders
  - With sublingual use: Abnormal dreams, arrhythmias, bronchospasm, burping, chest discomfort, dysphonia, dypnoea, hypertension, malaise, nasal complaints
  - With transdermal use: Arrhythmias, asthenia, chest discomfort, dypnoea, hypertension, malaise, myalgia, paraesthesia

- Rare or very rare
  - When used by inhalation: Dysphagia
  - With intranasal use: Arrhythmias
  - With oral use: Coagulation disorder, platelet disorder
  - With sublingual use: Dysphagia
  - With transdermal use: Abdominal discomfort, angioedema, pain in extremity

- Frequency not known
  - When used by inhalation: Angioedema, excessive tearing, vision blurred
  - With intranasal use: Abdominal discomfort, angioedema, excessive tearing, oropharyngeal complaints
  - With sublingual use: Excessive tearing, muscle tightness, vision blurred

SIDE-EFFECTS, FURTHER INFORMATION

Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms. Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.

- PREGNANCY
  - The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liqueurice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before delivery.

- BREAST FEEDING
  - Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.

- HEPATIC IMPAIRMENT
  - Manufacturer advises caution in moderate to severe impairment (risk of decreased clearance).

- RENAL IMPAIRMENT
  - Use with caution in severe renal impairment.

- DIRECTIONS FOR ADMINISTRATION
  - Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy.
  - Administration by transdermal patch: Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure adhesion; place next patch on a different area and avoid using the same site for several days.
  - Administration by nasal spray: Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.
  - Administration by oral spray: The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.
  - Administration by sublingual tablet: Each tablet should be placed under the tongue and allowed to dissolve. Administration by lozenge: Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.
  - Administration by inhalation: Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore if it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use.
  - Administration by medicated chewing gum: Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

- PRESCRIBING AND DISPENSING INFORMATION
  - Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.

- PATIENT AND CARER ADVICE
  - Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

- **Nicotine dependence**  

  **Varenicline**

  **DRUG ACTION** Varenicline is a selective nicotine-receptor partial agonist.

  **INDICATIONS AND DOSE** To aid smoking cessation

  **BY MOUTH**

  - Adult: Initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks; reduced if not tolerated to 500 micrograms twice daily, usually to be started 1–2 weeks before target stop date but can be started up to a maximum of 5 weeks before target stop date, 12-week course can be repeated in abstinent individuals to reduce risk of relapse

  **SIDE-EFFECTS**

  - Common or very common Appetite abnormal - asthenia - chest discomfort - constipation - diarrhoea - dizziness

  **IMPORTANT SAFETY INFORMATION**

  **MHRA/CHM ADVICE: SUICIDAL BEHAVIOUR AND VARENICLINE**

  Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation, depressed mood, or suicidal thoughts. Patients with a history of psychiatric illness should be monitored closely while taking varenicline.

  **CAUTIONS** Conditions that may lower seizure threshold - history of cardiovascular disease - history of psychiatric illness (may exacerbate underlying illness including depression) - predisposition to seizures

  www.getintopharma.com
502 Substance dependence

Nervous system

Opioid dependence

MEDICINAL FORMS

Tablet

Varenicline for smoking cessation (July 2011)

=form=""alignment=""top"">① NATIONALLY FUNDING/ACCESS DECISIONS

TREATMENT CESSATION

Driving and skilled tasks

FREQUENCY NOT KNOWN

Pregnancy

Breast feeding

RENAL IMPAIRMENT

Dose adjustments

Severe pain

BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

Adult: 5–10 mg every 6–8 hours, adjusted according to response, on prolonged use not to be given more frequently than every 12 hours

Adjuvant in treatment of opioid dependence

Adjunct in treatment of opioid dependence if tolerance low or not known

BY MOUTH USING ORAL SOLUTION

Adult: Initially 10–30 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Adjunct in treatment of opioid dependence if tolerance high (under expert supervision)

BY MOUTH USING ORAL SOLUTION

Adult: Initially up to 40 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Cough in palliative care

INITIALLY BY MOUTH USING LINCTUS

Adult: 1–2 mg every 4–6 hours, (by mouth) reduced to 1–2 mg twice daily, use twice daily frequency if prolonged use

DOSE EQUIVALENCES AND CONVERSION

See buprenorphine p. 447 for dose adjustments in opioid substitution therapy, for patients taking methadone who want to switch to buprenorphine.

UNLICENSED USE

Methadone hydrochloride doses for opioid dependence in the BNF may differ from those in the product literature.

IMPORTANT SAFETY INFORMATION

Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linctus (2 mg/5mL). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

CONTRA-INDICATIONS

Phaeochromocytoma

CAUTIONS

Family history of sudden death (ECG monitoring recommended) - history of cardiac conduction abnormalities

CAUTIONS, FURTHER INFORMATION

QT-interval prolongation Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.

INTERACTIONS

Other drugs used for Opioid dependence

Buprenorphine, p. 447 • Naltrexone hydrochloride, p. 497

www.getintopharma.com
SIDE-EFFECTS

GENERAL SIDE-EFFECTS
Asthma exacerbated, dry eye, dysuria, hyperprolactinaemia, hyperthermia, menstrual cycle irregularities, mood altered, nasal dryness, QT interval prolongation

SPECIFIC SIDE-EFFECTS
- With oral use: Galactorrhoea, intracranial pressure increased
- With parenteral use: Biliary spasm, muscle rigidity, oedema, restlessness, sexual dysfunction, sleep disorder, ureteral spasm, withdrawal syndrome neonatal

SIDE-EFFECTS, FURTHER INFORMATION
Methadone is a long-acting opioid therefore effects may be cumulative.

Methadone, even in low doses is a special hazard for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

Overdose
Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.

BREAST FEEDING
Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate).

HEPATIC IMPAIRMENT
Manufacturer advises caution; consider avoiding in severe impairment (risk of increased exposure).

Dose adjustments
Manufacturer advises consider dose reduction.

RENAL IMPAIRMENT
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

TREATMENT CESSATION
Avoid abrupt withdrawal.

DIRECTIONS FOR ADMINISTRATION
Syrup preserved with hydroxybenzoate (paraben) esters may be incompatible with methadone hydrochloride.

PRESCRIBING AND DISPENSING INFORMATION
- Flavours of oral liquid formulations may include tolu.
- Palliative care: For further information on the use of methadone in palliative care, see www.medicinescomplete.com/#/content/palliative/methadone

METHADOSE
- The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription.

Important:—care is required in prescribing and dispensing the correct strength since any confusion could lead to an overdose; this preparation should be dispensed only after dilution as appropriate with Methadose.

Diluent (life of diluted solution 3 months) and is for drug dependent persons.

NATIONAL FUNDING/ACCESS DECISIONS
NICE decisions
- Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA14

- Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

www.nice.org.uk/TA14

LESS SUITABLE FOR PRESCRIBING
Methadone linctus is less suitable for prescribing for cough in terminal disease (has a tendency to accumulate).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

OPIOID RECEPTOR ANTAGONISTS

Buprenorphine with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, buprenorphine p. 447, naloxone hydrochloride p. 1369.

INDICATIONS AND DOSE
- Adjunct in the treatment of opioid dependence (dose expressed as buprenorphine)
  - BY SUBLINGUAL ADMINISTRATION
    - Adult: Initially 2–4 mg once daily, an additional dose of 2–4 mg may be administered on day 1 depending on the individual patient’s requirement, increased in steps of 2–8 mg, adjusted according to response, total weekly dose may be divided and given on alternate days or 3 times weekly; maximum 24 mg per day

INTERACTIONS
- Appendix 1: opioids
Lofexidine hydrochloride

**INDICATIONS AND DOSE**

**Management of symptoms of opioid withdrawal**

- **BY MOUTH**
  - Adult: Initially 800 micrograms daily in divided doses, increased in steps of 400–800 micrograms daily (max. per dose 800 micrograms) as required recommended duration of treatment 7–10 days if no opioid use (but longer may be required); maximum 2.4 mg per day

**CAUTIONS**
- Bradycardia - cerebrovascular disease - depression - history of QT prolongation - hypotension (monitor pulse rate and blood pressure) - metabolic disturbances - recent myocardial infarction - severe coronary insufficiency

**INTERACTIONS**

- Appendix 1: Lofexidine

**SIDE-EFFECTS**
- Common or very common: Bradycardia - dizziness - drowsiness - hypotension - mucosal dryness

**FREQUENCY NOT KNOWN**
- QT interval prolongation

**PREGNANCY**
- Use only if benefit outweighs risk—no information available.

**BREAST FEEDING**
- Use only if benefit outweighs risk—no information available.

**RENAL IMPAIRMENT**
- Caution in chronic impairment.

**MONITORING REQUIREMENTS**
- Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation.

---

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 355/07

The Scottish Medicines Consortium has advised (March 2007) that buprenorphine/naloxone (Suboxone®) is accepted for restricted use within NHS Scotland for substitution treatment for opioid drug dependence, within a framework of medical, social and psychological treatment in whom methadone is not suitable.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Sublingual tablet**

- **Buprenorphine with naloxone (Non-proprietary)**
- Naloxone (as Naloxone hydrochloride dihydrate) 500 microgram,
- Buprenorphine (as Buprenorphine hydrochloride) 2 mg
- Buprenorphine 2mg / Naloxone 500 microgram sublingual tablets sugar-free (28 tablets)

- **Buprenorphine (as Buprenorphine hydrochloride)**
- Buprenorphine 8 mg / Naloxone 2 mg sublingual tablets sugar-free (28 tablets)

- **Suboxone (Indivior UK Ltd)**
- Naloxone (as Naloxone hydrochloride dihydrate) 500 microgram,
- Buprenorphine (as Buprenorphine hydrochloride) 2 mg
- Buprenorphine 2 mg / Naloxone 500 microgram sublingual tablets sugar-free (28 tablets)

- **Suboxone 2mg/500microgram sublingual tablets**
- Buprenorphine 8 mg / Naloxone 2 mg sublingual tablets sugar-free (28 tablets)

- **Suboxone 2mg/500microgram sublingual tablets**
- Buprenorphine 8 mg / Naloxone 2 mg sublingual tablets sugar-free (28 tablets)

**DISTRIBUTION**

Available from specialist importing companies.

---

**SYMPATHOMIMETICS**

- **ALPHA2-ADRENOCEPTOR AGONISTS**

- **Lofexidine hydrochloride**

- **DRUG ACTION** Lofexidine is an alpha2-adrenergic agonist.

1 Amoebic infection

Other drugs used for Amoebic infection Metronidazole, p. 542 - Tinidazole, p. 544

**ANTIPROTOZOALS**

**Mepacrine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Giardiasis**
    - **BY MOUTH**
    - Adult: 100 mg every 8 hours for 5–7 days

- **UNLICENSED USE** Not licensed for use in giardiasis.

- **CAUTIONS** Avoid in psoriasis - elderly - history of psychosis

- **INTERACTIONS** → Appendix 1: mepacrine

- **SIDE-EFFECTS** Aplastic anaemia (long term use) - central nervous system stimulation (with high doses) - corneal deposits - dermatosis (long term use) - dizziness - exfoliative dermatitis (severe; long term use) - gastrointestinal disorder - headache - hepatitis (long term use) - nail discouloration - nausea (with high doses) - oral discouloration - skin discouloration (long term use) - toxic psychosis (transient; with high doses) - urine discouloration (long term use) - visual impairment - vomiting (with high doses)

- **HEPATIC IMPAIRMENT** Use with caution.

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: tablet

2 Bacterial infection

**Antibacterials, principles of therapy**

07-Mar-2017

**Antibacterial drug choice**

Before selecting an antibacterial the clinician must first consider three factors—the patient, the known or likely causative organism, and the risk of bacterial resistance with repeated courses.

Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, risk of complications, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the factors above, will provide one or more antibacterial option.

In patients receiving antibacterial prophylaxis, an antibacterial from a different class should be used.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin p. 550 but sensitive to nitrofurantoin p. 590 (can cause nausea), gentamicin p. 519 (can be given only by injection and best avoided in pregnancy), tetracycline p. 567 (causes dental discoloration) and trimethoprim p. 574 (folic acid antagonist therefore theoretical teratogenic risk), and cefalexin p. 524. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin would be indicated for this patient.

Some patients may be at higher risk of treatment failure. They include those who have had repeated antibacterial courses, a previous or current culture with resistant bacteria, or those at higher risk of developing complications.
Antibacterial policies

Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

Antibacterials, considerations before starting therapy

The following precepts should be considered before starting:

- **Viral infections should not be treated with antibacterials.** However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
- **Samples should be taken for culture and sensitivity testing;** an antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- **Knowledge of prevalent organisms** and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- **The dose** of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The describing of the so-called ‘standard’ dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- **The route** of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- **Duration** of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

Advice to be given to patients

If an antibacterial is given, advise patients about:

- **Possible adverse effects** e.g. diarrhoea;
- **Seeking medical help** if symptoms worsen rapidly or significantly at any time, symptoms do not start to improve within an agreed time, or if the patient becomes systemically very unwell.

If an antibacterial is **not** given, advise patients about:

- **Seeking medical help** if symptoms worsen rapidly or significantly at any time, if symptoms do not start to improve within an agreed time, or if the patient becomes systemically very unwell.

Antibacterials, considerations during therapy

**Review choice of antibacterial if susceptibility results indicate bacterial resistance and symptoms are not improving**—consult local microbiologist as needed. If no bacterium is cultured, the antibacterial can be continued or stopped on clinical grounds.

**Review intravenous antibacterials within 48 hours and consider stepping down to oral antibacterials where possible.**

Superinfection

In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. **fungal infections or antibiotic-associated colitis** (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) or local health protection unit when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

<table>
<thead>

</tbody>
</table>

**Note** It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

Sepsis, early management

**Patients identified as being at high risk of severe illness or death due to suspected sepsis should be given a broad-spectrum antibacterial at the maximum recommended dose without delay (ideally within one hour).** Microbiological samples and blood cultures must be taken prior to administration of antibiotics; the prescription should be adjusted subsequently according to susceptibility results. A thorough clinical examination should be carried out to identify sources of infection. If the source of infection is identified, treatment in line with local antibacterial guidance or susceptibility results.

Patients who require empirical intravenous treatment for a suspected infection, but who have no confirmed diagnosis, should be treated with an intravenous antibiotic from the local formulary and in line with national guidelines.

The need for intravenous fluids, inotropes, vasopressors and oxygen should also be assessed without delay, taking into consideration the patient’s lactate concentration, systolic blood pressure, and their risk of severe illness or
death. Patients at high risk should be monitored continuously if possible, and no less than every 30 minutes. Patients with suspected sepsis who are not immediately deemed to be at high risk of severe illness or death, should be re-assessed regularly for the need for empirical treatment, taking into consideration all risk factors including lactate concentration and evidence of acute kidney injury.

### Antibacterials, use for prophylaxis

**Rheumatic fever: prevention of recurrence**
- Phenoxymethylpenicillin p. 548 or sulfadiazine p. 563.

**Invasive group A streptococcal infection: prevention of secondary cases**
- Phenoxymethylpenicillin.

**Meningococcal meningitis: prevention of secondary cases**
- Ciprofloxacin p. 558 or rifampicin p. 582 or i/m ceftriaxone p. 528 [unlicensed indication].

**Haemophilus influenzae type b disease: prevention of secondary cases**
- Rifampicin or (if rifampicin cannot be used) i/m or i/v ceftriaxone [unlicensed indication].

**Diphtheria in non-immune patients: prevention of secondary cases**
- Erythromycin (or another macrolide e.g. azithromycin or clarithromycin p. 538).

### Bacterial infection 507

**Pertussis, antibacterial prophylaxis**
- Clarithromycin (or azithromycin or erythromycin).

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

**Pneumococcal infection in asplenia or in patients with sickle-cell disease, antibacterial prophylaxis**
- Phenoxymethylpenicillin.

If penicillin-allergic, erythromycin.

Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

**Tuberculosis antibacterial prophylaxis in susceptible close contacts or those who have become tuberculin positive**
- See Close contacts and Chemoprophylaxis for latent tuberculosis under Tuberculosis p. 578.

**Animal and human bites, antibacterial prophylaxis**
- Co-amoxiclav p. 551 alone (or doxycycline p. 564 + metronidazole p. 542 if penicillin-allergic).

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1292 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

**Early-onset neonatal infection, antibacterial prophylaxis**
- i/v benzylpenicillin sodium p. 547 (or i/v clindamycin p. 535 if history of allergy to penicillins).

Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteriuria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.
Infection

Gastro-intestinal procedures, antibacterial prophylaxis

Operations on stomach or oesophagus
- Single dose of i/v gentamicin p. 519 or i/v cefuroxime p. 526 or i/v co-amoxiclav (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 532 (or vancomycin p. 534) if high risk of meticillin-resistant Staphylococcus aureus.

Open biliary surgery
- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant Staphylococcus aureus.

Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy
- Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant Staphylococcus aureus.

Endoscopic retrograde cholangiopancreatography
- Single dose of i/v gentamicin p. 519 or oral or i/v ciprofloxacin p. 558.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 546 or i/v teicoplanin p. 532 (or vancomycin p. 534).

Percutaneous endoscopic gastrostomy or jejunostomy
- Single dose of i/v co-amoxiclav p. 551 or i/v cefuroxime p. 526.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus.

Orthopaedic surgery, antibacterial prophylaxis

Joint replacement including hip and knee
- Single dose of i/v cefuroxime alone or i/v flucloxacillin p. 554 + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Closed fractures
- Single dose of i/v cefuroxime or i/v flucloxacillin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin (or vancomycin) (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Open fractures
- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole p. 542 (or i/v clindamycin p. 535 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant Staphylococcus aureus. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin + i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

High lower-limb amputation
- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus, use i/v teicoplanin (or vancomycin) + i/v gentamicin + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Urological procedures, antibacterial prophylaxis

Transrectal prostate biopsy
- Single dose of oral ciprofloxacin + oral metronidazole or i/v gentamicin + i/v metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole if high risk of meticillin-resistant Staphylococcus aureus (additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Transurethral resection of prostate
- Single dose of oral ciprofloxacin or i/v gentamicin or i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

- Use single dose of i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Obstetric and gynaecological surgery, antibacterial prophylaxis**

**Caesarean section**
- Single dose of i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

- Substitute i/v clindamycin if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Hysterectomy**
- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

- Use single dose of i/v gentamicin + i/v metronidazole or add i/v teicoplanin (or vancomycin) to other regimens if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss). Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Termination of pregnancy**
- Single dose of oral metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 564 postoperatively.

**Cardiology procedures, antibacterial prophylaxis**

**Cardiac pacemaker insertion**
- Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin or i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

- Use single dose of i/v teicoplanin (or vancomycin) + i/v cefuroxime or i/v teicoplanin (or vancomycin) + i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Vascular surgery, antibacterial prophylaxis**

**Reconstructive arterial surgery of abdomen, pelvis or legs**
- Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin p. 519 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v metronidazole p. 542 for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of i/v

**Bacterial infection**

509

www.getintopharma.com
The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

**Immunosuppression and indwelling intraperitoneal catheters**
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

**Blood infections, antibacterial therapy**

**Septicaemia (community-acquired)**
- A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 545, ticarcillin with clavulanic acid p. 546) or a broad-spectrum cephalosporin (e.g. cefuroxime p. 526).
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 534 (or teicoplanin p. 532).
- If anaerobic infection suspected, add metronidazole p. 542 to broad-spectrum cephalosporin.
- If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibacterial (e.g. meropenem p. 523).

**Septicaemia (hospital-acquired)**
- A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam, ticarcillin with clavulanic acid, ceftazidime p. 528, imipenem with cilastatin p. 522, or meropenem).
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin.

**Septicaemia related to vascular catheter**
- Vancomycin (or teicoplanin).
- If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
- Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, pseudomonas, or *Candida* species.

**Meningococcal septicaemia**
If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 547 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime p. 527 may be an alternative in penicillin allergy; chloramphenicol p. 568 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- Benzylpenicillin sodium or cefotaxime (or ceftriaxone p. 528)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol

To eliminate nasopharyngeal carriage, ciprofloxacin p. 558, or rifampicin p. 582, or ceftriaxone may be used.

---

**Cardiovascular system infections, antibacterial therapy**

**Endocarditis: initial ‘blind’ therapy**
- Native valve endocarditis, amoxicillin p. 548 (or ampicillin p. 550)
- Consider adding low-dose gentamicin p. 519
- If penicillin-allergic, or if meticillin-resistant *Staphylococcus aureus* suspected, or if severe sepsis, use vancomycin p. 534 + low-dose gentamicin
- If severe sepsis with risk factors for Gram-negative infection, use vancomycin + meropenem p. 523
- If prosthetic valve endocarditis, vancomycin + rifampicin p. 582 + low-dose gentamicin

**Endocarditis (native valve) caused by staphylococci**
- Flucloxacillin p. 554
- Suggested duration of treatment 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)
- If penicillin-allergic or if meticillin-resistant *Staphylococcus aureus*, vancomycin + rifampicin
- Suggested duration of treatment 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

**Endocarditis (prosthetic valve) caused by staphylococci**
- Flucloxacillin + rifampicin + low-dose gentamicin
- Suggested duration of treatment 4–6 weeks (at least 6 weeks if prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If penicillin-allergic or if meticillin-resistant *Staphylococcus aureus*, vancomycin + rifampicin + low-dose gentamicin
- Suggested duration of treatment at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

**Endocarditis caused by fully-sensitive streptococci**
- Benzylpenicillin sodium p. 547
- Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis)
- If penicillin-allergic, vancomycin (or teicoplanin p. 532) + low-dose gentamicin
- Suggested duration of treatment 4–6 weeks (stop gentamicin after 2 weeks)

**Endocarditis caused by less-sensitive streptococci**
- Benzylpenicillin sodium + low-dose gentamicin
- Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin
- If penicillin-allergic or highly penicillin-resistant, vancomycin (or teicoplanin) + low-dose gentamicin
- Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin

**Endocarditis caused by enterococci**
- Amoxicillin (or ampicillin) + low dose gentamicin or benzylpenicillin sodium + low-dose gentamicin
- Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue
### Bacterial infection

**Benzylpenicillin sodium**

- Meningitis caused by meningococci
  - Consider adding vancomycin if prolonged or multiple use
  - **Suggested duration of treatment** 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue benzylpenicillin at 2 weeks—seek specialist advice if benzylpenicillin considered necessary beyond 2 weeks
  - If penicillin-allergic or penicillin-resistant, vancomycin (or teicoplanin) + low-dose gentamicin
  - **Suggested duration of treatment** 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue benzylpenicillin at 2 weeks—seek specialist advice if benzylpenicillin considered necessary beyond 2 weeks
  - If penicillin resistant, amoxicillin (or ampicillin)
  - Add streptomycin p. 520 (if susceptible) for 2 weeks
  - **Suggested duration of treatment** at least 6 weeks

**Endocarditis caused by Haemophilus, Actinobacillus, Cardiobacterium, Eikenella, and Kingella species (‘HACEK’ micro-organisms)**

- Amoxicillin (or ampicillin) + low-dose gentamicin
- **Suggested duration of treatment** 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
- If amoxicillin-resistant, ceftriaxone p. 528 (or cefotaxime p. 527) + low-dose gentamicin
- **Suggested duration of treatment** 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

### Central nervous system infections, antibacterial therapy

**Meningitis: initial empirical therapy**

- Transfer patient to hospital urgently.
- If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 547 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 527 may be an alternative in penicillin allergy; chloramphenicol p. 568 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 675 (particularly if pneumococcal meningitis suspected in adults), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery. In hospital, if aetiology unknown:
  - **Adult and child 3 months**–50 years, cefotaxime (or ceftriaxone p. 528)
  - Consider adding vancomycin p. 534 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
  - **Suggested duration of treatment** at least 10 days
  - **Adult over 50 years** cefotaxime (or ceftriaxone) + amoxicillin p. 548 (or ampicillin p. 550)
  - Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
  - **Suggested duration of treatment** at least 10 days

**Meningitis caused by meningococci**

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
  - **Suggested duration of treatment** 7 days.
  - If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
  - **Suggested duration of treatment** 7 days.

**Meningitis caused by pneumococci**

- Cefotaxime (or ceftriaxone)
- Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
- **Suggested duration of treatment** 10 days.
- For H. influenzae type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
  - If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  - **Suggested duration of treatment** 10 days.
  - For H. influenzae type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

**Meningitis caused by Listeria**

- Amoxicillin (or ampicillin) + gentamicin p. 519
  - **Suggested duration of treatment** 21 days.
  - Consider stopping gentamicin after 7 days.
  - If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole p. 562
  - **Suggested duration of treatment** 21 days.

### Ear infections, antibacterial therapy

**Otitis externa**

- Otitis externa can be triggered by a bacterial infection caused by *Pseudomonas aeruginosa* or *Staphylococcus aureus*. Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.

**Choice of antibacterial therapy**

**No penicillin allergy**

- Flucoxacinil p. 554

**Penicillin allergy or intolerance**

- Clarithromycin p. 538 (or azithromycin p. 536 or erythromycin p. 539)

If *pseudomonas* suspected

- Ciprofloxacin p. 558 (or an aminoglycoside)
  - For topical treatments, see *Otitis externa*, under Ear p. 1194.
512  Bacterial infection

Otitis media
- Acute otitis media is an inflammation in the middle ear associated with effusion and accompanied by an ear infection. Acute otitis media is commonly seen in children and is generally caused by viruses (respiratory syncytial virus and rhinovirus) or bacteria (Haemophilus influenzae, Streptococcus pneumoniae, Streptococcus pyogenes, and Moraxella catarrhalis); both virus and bacteria often co-exist. For further information see Acute otitis media in Ear p. 1194.

Alternative if micro-organism sensitive
Cipro

Shigellosis
- Treat invasive or severe infection. Do not treat less severe infection, unless there is a risk of developing invasive infection (e.g. immunocompromised patients, those with haemoglobinopathy, or children under 6 months of age).
- Ciprofloxacin or cefotaxime p. 527

Genital system infections, antibacterial therapy

Bacterial vaginosis
- Oral metronidazole p. 542
- Suggested duration of treatment 5–7 days (or high-dose metronidazole as a single dose)
- Alternatively, topical metronidazole for 5 days or topical clindamycin p. 828 for 7 days

www.getintopharma.com
Uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection

- Contact tracing recommended.
- Azithromycin p. 536 or doxycycline p. 564
  - Suggested duration of treatment azithromycin as a single dose or doxycycline for 7 days
- Alternatively, erythromycin p. 539.
- Suggested duration of treatment 14 days

Gonorrhea: uncomplicated

- Contact tracing recommended. Consider chlamydia co-infection. Choice of alternative antibacterial regimen depends on locality where infection acquired.
- Azithromycin + i/m ceftriaxone p. 528
  - Suggested duration of treatment is a single-dose of each antibacterial
- Alternatively, when parenteral administration is not possible, cefixime p. 527 + azithromycin
  - Suggested duration of treatment is a single-dose of each antibacterial
- Alternatively, if micro-organism is sensitive to a quinolone, ciprofloxacin p. 558 + azithromycin
  - Suggested duration of treatment is a single-dose of each antibacterial
- Pharyngeal infection, azithromycin + i/m ceftriaxone
  - Suggested duration of treatment is a single-dose of each antibacterial

Pelvic inflammatory disease

- Contact tracing recommended.
- Doxycycline + metronidazole + single-dose of i/m ceftriaxone or ofloxacin p. 561 + metronidazole
  - Suggested duration of treatment 14 days (except i/m ceftriaxone).
  - In severely ill patients initial treatment with doxycycline + i/v ceftriaxone + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days’ treatment

Early syphilis (infection of less than 2 years)

- Contact tracing recommended.
- Benzathine benzylpenicillin [unlicensed]
  - Suggested duration of treatment single-dose (repeat dose after 7 days for women in the third trimester of pregnancy)
- Alternatively, doxycycline or erythromycin
  - Suggested duration of treatment 14 days

Late latent syphilis (asymptomatic infection of more than 2 years)

- Contact tracing recommended.
- Benzathine benzylpenicillin [unlicensed]
  - Suggested duration of treatment once weekly for 2 weeks
- Alternatively, doxycycline
  - Suggested duration of treatment 28 days

Asymptomatic contacts of patients with infectious syphilis

- Doxycycline
  - Suggested duration of treatment 14 days

Musculoskeletal system infections, antibacterial therapy

Osteomyelitis

- Seek specialist advice if chronic infection or prostheses present.
- Ceftriaxone p. 554
  - Consider adding fusidic acid p. 571 or rifampicin p. 582 for initial 2 weeks.
  - Suggested duration of treatment 6 weeks for acute infection
- If penicillin-allergic, clindamycin p. 535
  - Consider adding fusidic acid or rifampicin for initial 2 weeks.
  - Suggested duration of treatment 6 weeks for acute infection

Septic arthritis

- Seek specialist advice if prostheses present.
- Flucloxacillin
  - Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If penicillin-allergic, clindamycin
  - Suggested duration of treatment 4–6 weeks (longer if infection complicated).
- If meticillin-resistant Staphylococcus aureus suspected, vancomycin p. 534 (or teicoplanin p. 532)
  - Consider adding fusidic acid or rifampicin for initial 2 weeks.
  - Suggested duration of treatment 6 weeks for acute infection

Nose infections, antibacterial therapy

Sinusitis (acute)

Acute sinusitis is generally triggered by a viral infection, although occasionally it may become complicated by a bacterial infection caused by Streptococcus pneumoniae, Haemophilus influenzae, Moraxella catarrhalis, or Staphylococcus aureus. For further information see Sinusitis (acute) p. 1203.

Treatment

Antibacterial therapy should only be offered to patients with acute sinusitis who are systemically very unwell, have signs and symptoms of a more serious illness, those who are at high-risk of complications due to pre-existing comorbidities, or whenever bacterial sinusitis is suspected. Patients presenting with symptoms for around 10 days or more with no improvement may be prescribed a back-up antibiotic prescription, which can be used if symptoms do not improve within 7 days or if they worsen significantly at any time. ▶ For further information see, Sinusitis (acute) p. 1203.

Choice of antibacterial therapy

No penicillin allergy

- First line:
Oral bacterial infections

Antibacterial drugs
Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The ‘blind’ prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology. Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget’s disease. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 542 may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

Penicillins
- Phenoxyemepenicillin p. 548 is effective for dentoalveolar abscess.

Broad-spectrum penicillins
Amoxicillin p. 548 is as effective as phenoxyemepenicillin but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxyemepenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.

Amoxicillin may be useful for short course oral regimens.

Co-amoxiclav p. 551 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

Cephalosporins
The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin p. 524 and cefradine p. 525 have been used in the treatment of oral infections.

Tetracyclines
In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 564 has a longer duration of action than tetracycline p. 567 or oxytetracycline p. 567 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

Macrolides
The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

Clindamycin
Clindamycin p. 535 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria.

Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

Metronidazole and tinidazole
Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and pericoronitis; amoxicillin is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 544 is licensed for the treatment of acute ulcerative gingivitis.
Respiratory system infections, antibacterial therapy

Epiglottitis (Haemophilus influenzae)
- Cefotaxime p. 527 (or ceftixime p. 528)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 568

Bronchiectasis (non-cystic fibrosis), acute exacerbation
Bronchiectasis is a persistent or progressive condition, caused by chronic inflammatory damage to the airways and is characterised by thick-walled, dilated bronchi. Signs and symptoms may range from intermittent expectoration and infection, to chronic cough, persistent daily production of sputum, bacterial colonisation, and recurrent infections. An acute exacerbation is defined as sustained deterioration of the patient’s signs and symptoms from their baseline, and presents with worsening local symptoms, with or without increased wheeze, breathlessness or haemoptysis and may be accompanied by fever or pleurisy.

Treatment
- Obtain a sputum sample and send for culture and susceptibility testing. Antibacterial therapy should be given to all patients with an acute exacerbation.
  - For patients receiving prophylactic antibacterial therapy, switching from intravenous to oral antibacterials, and for advice to be given to patients, see Antibacterials, principles of therapy p. 505.
  - Refer patients to hospital if they have signs or symptoms suggestive of a more serious illness such as cardiorespiratory failure or sepsis.

Reassessment
- Reassess if symptoms worsen rapidly or significantly at any time and consider:
  - Other diagnoses such as pneumonia, or signs and symptoms of a more serious illness such as cardiorespiratory failure, or sepsis;
  - Previous antibacterial use that may have led to resistance.
  - Review choice of antibacterial if susceptibility results indicate bacterial resistance and symptoms are not improving—consult local microbiologist as needed.

Choice of antibacterial therapy
- The recommended total duration of treatment is 7–14 days.
  - Alternative therapy should be guided by the most recent sputum culture and susceptibility results when available.
  - Seek specialist advice for patients whose symptoms are not improving with repeated courses, or who are resistant to, or cannot take oral antibacterials.

  - Oral first line:
    - Amoxicillin p. 548, clarithromycin p. 538, or doxycycline p. 564.
    - Alternative if at high risk of treatment failure (repeated courses of antibacterials, previous culture with resistant or atypical bacteria, or high risk of complications): co-amoxiclav p. 551, or levofloxacin p. 559.
  - Intravenous first line (severely unwell or unable to take oral treatment):
    - Co-amoxiclav, piperacillin with tazobactam p. 545, or levofloxacin.
  - For patients with repeated acute exacerbations, a trial of antibacterial prophylaxis may be given on specialist advice only.

Chronic obstructive pulmonary disease, acute exacerbation
An acute exacerbation of chronic obstructive pulmonary disease (COPD) is a sustained worsening of symptoms from the patient’s usual stable state, that is beyond the usual day to day variations. Many exacerbations are not caused by bacterial infections, but instead can be triggered by other factors such as smoking or viral infections.

Treatment
- Consider antibacterial treatment taking into account:
  - The severity of symptoms, sputum colour changes and increases in volume and thickness;
  - The need for hospital admission;
  - Previous exacerbations and hospital admission history, and risk of developing complications.
  - For other considerations such as in patients receiving prophylactic antibacterial therapy, switching from intravenous to oral antibacterials, and for advice to be given to patients, see Antibacterials, principles of therapy p. 505. Refer patients to hospital if they have signs or symptoms suggestive of a more serious illness such as cardiorespiratory failure or sepsis.

Reassessment
- Reassess if symptoms worsen rapidly or significantly at any time and consider:
  - Other diagnoses such as pneumonia, or signs and symptoms of a more serious illness such as cardiorespiratory failure, or sepsis;
  - Previous antibacterial use that may have led to resistance;
  - Sending a sputum sample for testing if there is no improvement after antibacterial therapy and this has not already been done.

Choice of antibacterial therapy
- The recommended total duration of treatment is 5 days.
  - Treatment should be guided by the most recent sputum culture and susceptibility results when available.
  - Seek specialist advice for patients whose symptoms are not improving with repeated courses, or who are resistant to, or cannot take oral antibacterials.

  - Oral first line:
    - Amoxicillin, clarithromycin, or doxycycline.
    - Alternative if at high risk of treatment failure (repeated courses of antibacterials, previous culture with resistant or atypical bacteria, or high risk of complications): co-amoxiclav, or levofloxacin.

  - Intravenous second line (if no improvement after at least 2 to 3 days):
    - Use a first line antibacterial from a different class to the antibacterial used previously.
    - Alternative if at high risk of treatment failure: co-amoxiclav, levofloxacin, or co-trimoxazole p. 562 (only when sensitivities are available and there is good reason to use co-trimoxazole over single antibacterials).

  - Intravenous first line (severely unwell or unable to take oral treatment):
    - Amoxicillin, co-amoxiclav, clarithromycin, co-trimoxazole, or piperacillin with tazobactam.

  - Intravenous second line: Choice should be made in consultation with a local microbiologist.
  - For further information on COPD, see Chronic obstructive pulmonary disease p. 242.

Cough, acute
Acute cough is usually self-limiting and often resolves within 3–4 weeks without antibacterials. It is most commonly caused by a viral upper respiratory tract infection,
but can have other infective causes such as acute bronchitis or pneumonia, or non-infective causes such as interstitial lung disease or gastro-oesophageal reflux disease.

**Treatment**

Patients should be advised that an acute cough is usually self-limiting and to manage their symptoms using self-care treatments. These include honey and over-the-counter cough medicines containing expectorants or cough suppressants, however there is limited evidence to support the use of such products. For more information, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 296.

Patients with an acute cough who are systemically very unwell should be offered immediate antibiotic treatment. Do not routinely offer an antibacterial to treat an acute cough associated with an upper respiratory tract infection or acute bronchitis in patients who are not systemically very unwell or at higher risk of complications. 

Patients with a pre-existing co-morbidity, young children who were born prematurely, and patients aged over 70 years of age and the presence of certain criteria (hospitalisation in the previous year, type 1 or 2 diabetes, history of congestive heart failure, or currently taking oral corticosteroids) are considered to be at a higher risk of complications if they present with an acute cough. Immediate or back-up antibiotic treatment should be considered in these patients based on the face-to-face clinical examination. If back-up treatment is given, advise patients to start treatment if symptoms worsen rapidly or significantly at any time.

For general advice to give to patients, see Antibacterials, principles of therapy p. 505.

Seek specialist advice, or refer patients with an acute cough to hospital if they have signs or symptoms of a more serious illness or condition.

**Reassessmment**

Reassess if symptoms worsen rapidly or significantly taking into account alternative diagnoses, signs or symptoms suggestive of a more serious condition, and previous antibacterial use which may have led to resistant bacteria.

**Choice of antibacterial therapy**

The recommended duration of oral treatment is 5 days.

- **First line** Doxycycline p. 564.
- **Alternative first line choices**: amoxicillin p. 548, clarithromycin p. 538, or erythromycin p. 539.
- **Choice during pregnancy**:
  - Amoxicillin or erythromycin.

**Community-acquired pneumonia: low-severity**

- Amoxicillin (or ampicillin p. 550)
- Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
- If atypical pathogens suspected, add clarithromycin (or azithromycin p. 536 or erythromycin).
- If staphylococci suspected (e.g. in influenza or measles), add fluclaxacillin p. 554.
- Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)

**Community-acquired pneumonia: moderate-severity**

- Amoxicillin (or ampicillin) + clarithromycin (or azithromycin or erythromycin) or doxycycline alone
- Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 534 (or teicoplanin p. 532).
- Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)

**Community-acquired pneumonia: high-severity**

- Benzylpenicillin sodium p. 547 + clarithromycin (or azithromycin or erythromycin) or benzylpenicillin sodium + doxycycline
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci suspected)
- If life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, co-amoxiclav p. 551 + clarithromycin (or azithromycin or erythromycin)
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)

- Alternatives if life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, cefuroxime p. 526+ clarithromycin (or azithromycin or erythromycin) or cefotaxime p. 527 (or ceftriaxone p. 528) + clarithromycin (or azithromycin or erythromycin)
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)

**Pneumonia possibly caused by atypical pathogens**

- Clarithromycin (or azithromycin or erythromycin)
- If high-severity Legionella infection, add rifampicin p. 582 for the first few days.
- Suggested duration of treatment 14 days (usually 7–10 days for Legionella)
- Alternative if Legionella infection suspected, a quinolone
- If high-severity Legionella infection, add clarithromycin (or azithromycin or erythromycin) or rifampicin for the first few days.
- Suggested duration of treatment usually 7–10 days
- Alternative for chlamydial or mycoplasmal infections, doxycycline
- Suggested duration of treatment 14 days

**Hospital-acquired pneumonia**

- Early-onset infection less than 5 days after admission to hospital, co-amoxiclav or cefuroxime
- If life-threatening infection, or if history of antibacterial treatment in the last 3 months, or if resistant micro-organisms suspected, treat as for late-onset hospital-acquired pneumonia.
- Suggested duration of treatment 7 days
- Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 545) or a broad-spectrum cephalosporin (e.g. ceftazidine p. 528) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin p. 558)
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.
- For severe illness caused by *Pseudomonas aeruginosa*, consider adding an aminoglycoside.
Skin infections, antibacterial therapy

Impetigo: small areas of skin infected
- Seek local microbiology advice before using topical treatment in hospital.
- Topical fusidic acid p. 571
- Suggested duration of treatment 7 days is usually adequate (max. 10 days).
- Alternatively, if meticillin-resistant Staphylococcus aureus, topical mupirocin p. 1232
- Suggested duration of treatment 7 days is usually adequate (max. 10 days).

Impetigo: widespread infection
- Oral flucloxacillin p. 554
- If streptococci suspected in severe infection, add phenoxymethylpenicillin p. 548.
- Suggested duration of treatment 7 days.
- If penicillin-allergic, oral clarithromycin p. 538 (or azithromycin p. 536 or erythromycin p. 539)
- Suggested duration of treatment 7 days.

Erysipelas
- Phenoxymethylpenicillin or benzylpenicillin sodium p. 547
- If severe infection, replace phenoxymethylpenicillin or benzylpenicillin sodium with high-dose flucloxacillin
- Suggested duration of treatment at least 7 days.
- If penicillin-allergic, clindamycin p. 535 or clarithromycin (or azithromycin or erythromycin)
- Suggested duration of treatment at least 7 days.

Cellulitis
- Flucloxacillin (high-dose)
- If streptococcal infection confirmed, replace flucloxacillin with phenoxymethylpenicillin or benzylpenicillin sodium
- If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials.
- If penicillin-allergic, clindamycin or clarithromycin (or azithromycin or erythromycin) or vancomycin p. 534 (or teicoplanin p. 532)
- If Gram-negative bacteria suspected, use broad-spectrum antibacterials.

Animal and human bites
Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1292 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.
- Co-amoxiclav p. 551
- If penicillin-allergic, doxycycline p. 564 + metronidazole p. 542

Mastitis during breast-feeding
Treat if severe, if systemically unwell, if nipple fissure present, if symptoms do not improve after 12–24 hours of effective milk removal, or if culture indicates infection. Continue breast-feeding or expressing milk during treatment.
- Flucloxacillin

Suggested duration of treatment 7 days (longer if Pseudomonas aeruginosa confirmed)

ANTIBACTERIALS > AMINOGLYCOSIDES

Aminoglycosides

Overview
These include amikacin p. 518, gentamicin p. 519, neomycin sulfate p. 520, streptomycin p. 520, and tobramycin p. 520. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against Pseudomonas aeruginosa; streptomycin is active against Mycobacterium tuberculosis and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 542 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient’s weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against Ps. aeruginosa but shows less activity against certain other Gram-negative bacteria. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary Ps. aeruginosa infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulative may occur with resultant ototoxicity.

Once daily dosage
Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded multiple-daily dose regimens (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK.
endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

**Serum concentrations**

Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and must be determined in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

**Aminoglycosides (by injection)**

- **CONTRA-INDICATIONS** Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- **CAUTIONS** Care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related) - conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) - if possible, dehydration should be corrected before starting an aminoglycoside - whenever possible, parenteral aminoglycosides and must be determined in the elderly.

**SIDE-EFFECTS**

- Common or very common  Skin reactions  tinnitus
- Uncommon  Nausea  vomiting
- Rare or very rare  Anaemia  bronchospasm  eosinophilia  fever  headache  hearing loss  hypomagnesaemia  paraesthesia  renal impairment
- Frequency not known  Confusion  lethargy  nephrotoxicity

**SIDE-EFFECTS, FURTHER INFORMATION**

Ototoxicity and nephrotoxicity are important side-effects to consider with aminoglycoside therapy. Nephrotoxicity occurs most commonly in patients with renal impairment, who may require reduced doses; monitoring is particularly important in the elderly.

**PREGNANCY**

There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.

**RENAL IMPAIRMENT**

Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Ototoxicity and nephrotoxicity occur commonly in patients with renal failure.

- In adults A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.
- In children A once-daily, high-dose regimen of an aminoglycoside should be avoided in children over 1 month of age with a creatinine clearance less than 20 mL/minute.

**Dose adjustments**

If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well.

**Monitoring**

Serum-aminoglycoside concentrations must be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

**MONITORING REQUIREMENTS**

- Serum concentrations Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy.

**INTERACTIONS**

Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and must be determined in obesity, if high doses are being given and in cystic fibrosis.

- In adults Serum aminoglycoside concentrations must be determined in the elderly. In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change. For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration (’peak’ concentration) and also just before the next dose (’trough’ concentration). If the pre-dose (’trough’) concentration is high, the interval between doses must be increased. If the post-dose (’peak’) concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.

- In children In children with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen. Blood samples should be taken just before the next dose is administered (’trough’ concentration). If the pre-dose (’trough’) concentration is high, the interval between doses must be increased. For multiple daily dose regimens, blood samples should also be taken approximately 1 hour after intramuscular or intravenous administration (’peak’ concentration). If the post-dose (’peak’) concentration is high, the dose must be decreased.

- Renal function should be assessed before starting an aminoglycoside and during treatment.

- Auditory and vestibular function should also be monitored during treatment.

**Amikacin**

- **INDICATIONS AND DOSE**

  **Serious Gram-negative infections resistant to gentamicin (multiple daily dose regimen)**

  - By intramuscular injection, or by slow intravenous injection, or by intravenous infusion

  - Adult: 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses for up to 10 days, higher dose to be used in severe infections; maximum 1.5 g per day; maximum 15 g per course

  **Serious Gram-negative infections resistant to gentamicin (once daily dose regimen)**

  - By intravenous infusion

  - Adult: Initially 15 mg/kg (max. per dose 1.5 g once daily), dose to be adjusted according to serum-amikacin concentration; maximum 15 g per course

**DOSES AT EXTREMES OF BODY-WEIGHT**

- To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely

**SIDE-EFFECTS**

- Uncommon  Superinfection

- Rare or very rare  Albuminuria  arthralgia  azotaemia  balance impaired  hearing impairment  hypotension  muscle twitching  tremor

- Frequency not known  Apnoea  neuromuscular blockade  paralysis

**MONITORING REQUIREMENTS**

- With intravenous use Multiple daily dose regimen: one-hour (’peak’) serum concentration should not exceed 30 mg/litre; pre-dose (’trough’) concentration should be less than 10 mg/litre. Once daily dose regimen: pre-dose (’trough’) concentration should be less than 5 mg/litre.
DIRECTIONS FOR ADMINISTRATION
- With intravenous use: For intravenous infusion (Amikin®); intermittent in Glucose 5% or Sodium chloride 0.9%. To be given over 30 minutes.

PRESCRIBING AND DISPENSING INFORMATION
- Once daily dose regimen not to be used for endocarditis, febrile neutropenia, or meningitis. Consult local guidelines.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for intravenous injection, powder for reconstitution, and specific preparations for intrathecal or intravenous infusion.

Solution for Injection
- Amikacin (Non-proprietary)
  - Amikacin (as Amikacin sulfate) 250 mg per 1 ml: Amikacin 500mg/2ml solution for injection vials | 5 vial (P) £50.00 (Hospital only)
  - Amikin (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Amikin (as Amikacin sulfate) 50 mg per 1 ml: Amikin 100mg/2ml solution for injection vials | 5 vial (P) £10.33

Gentamicin
DIAGNOSTICS AND DOSE
- Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials)
- By intramuscular injection, or by slow intravenous injection, or by intravenous infusion
- Adult: 1 mg/kg every 12 hours, intravenous injection to be administered over at least 3 minutes, to be given in a multiple daily dose regimen

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in infectious meningitis | Prostatitis
- By intravenous infusion, or by slow intravenous injection, or by intramuscular injection
- Adult: 3–5 mg/kg daily in 3 divided doses, to be given in a multiple daily dose regimen, divided doses to be given every 8 hours, intravenous injection to be administered over at least 3 minutes
- By intravenous infusion
- Adult: Initially 5–7 mg/kg, subsequent doses adjusted according to serum-gentamicin concentration, to be given in a once daily dose regimen

CNS infections (administered on expert advice)
- By intrathecal injection
- Adult: 1 mg daily, increased if necessary to 5 mg daily, seek specialist advice

Surgical prophylaxis
- By intravenous infusion
- Adult: 1.5 mg/kg, intravenous injection to be administered over at least 3 minutes, administer dose up to 30 minutes before the procedure, dose may be repeated every 8 hours for high-risk procedures; up to 3 further doses may be given

Surgical prophylaxis in joint replacement surgery
- Adult: 5 mg/kg for 1 dose, administer dose up to 30 minutes before the procedure

DOSES AT EXTREMES OF BODY-WEIGHT
- With intramuscular use or intravenous use To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-gentamicin concentration closely.

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE: POTENTIAL FOR HISTAMINE-RELATED ADVERSE DRUG REACTIONS WITH SOME BATCHES (NOVEMBER 2017)
Following reports that some batches of gentamicin sulphate active pharmaceutical ingredient (API) used to manufacture gentamicin may contain higher than expected levels of histamine, which is a residual from the manufacturing process, the MHRA advise to monitor patients for signs of histamine-related adverse reactions; particular caution is required in patients taking concomitant drugs known to cause histamine release, in children, and in patients with severe renal impairment.

INTERACTIONS
- Appendix 1: aminoglycosides

SIDE-EFFECTS
- Antibiotic associated colitis | blood disorder | depression | encephalopathy | hallucination | hepatic reaction | neurotoxicity | peripheral neuropathy | seizure | stomatitis | vestibular damage

MONITORING REQUIREMENTS
- With intramuscular use or intravenous use: For multiple daily dose regimen, one-hour (‘peak’) serum concentration should be 5–10 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre. For multiple daily dose regimen in endocarditis, one-hour (‘peak’) serum concentration should be 3–5 mg/litre; pre-dose (‘trough’) concentration should be less than 1 mg/litre. Serum-gentamicin concentration should be measured after 3 or 4 doses, then at least every 3 days and after a dose change (more frequently in renal impairment).
- With intravenous use: For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration.

DIRECTIONS FOR ADMINISTRATION
- With intrathecal use: For intrathecal injection, use preservative-free intrathecal preparations only.
- With intravenous use: For intravenous infusion (Cidomycin®); Gentamicin paediatric injection, Beacon; Gentamicin injection Hospira, give intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%. Suggested volume for intermittent infusion 50–100 ml given over 20–30 minutes (given over 60 minutes for once daily dose regimen).

PRESCRIBING AND DISPENSING INFORMATION
- With intravenous use: Local guidelines may vary in the dosing advice provided for once daily administration.
- With intrathecal use: Only preservative-free intrathecal preparation should be used.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml: Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule (P) £36.28 DT + £36.28 (Hospital only)
- Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml Gentamicin 20mg/2ml solution for injection ampoules | 5 ampoule (P) £11.25 DT + £11.25
- Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial (P) £11.25 DT + £11.25
- Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials | 5 vial (P) £20.00 DT + £6.88 (Hospital only)
- Gentamicin 80mg/2ml solution for injection ampoules | 5 ampoule (P) £6.88 DT + £6.88 | 10 ampoule (P) £12.00
- Cidomycin (Sanofi)
- Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin Adult Injectable 80mg/2ml solution for injection vials | 5 vial (P) £6.88 DT + £6.88
Neomycin sulfate

**INDICATIONS AND DOSE**

**Bowel sterilisation before surgery**
- **BY MOUTH**
  - Adult: 1 g every 1 hour for 4 hours, then 1 g every 4 hours for 2–3 days

**Hepatic coma**
- **BY MOUTH**
  - Adult: Up to 4 g daily in divided doses usually for 5–7 days

**SIDE-EFFECTS** Blood disorder - confusion - diarrhoea - drug cross-reactivity - electrolyte imbalance - gastrointestinal disorders - haemolytic anaemia - nausea - nephrotoxicity - ototoxicity - parasthesia - superinfection - vomiting

SIDE-EFFECTS, FURTHER INFORMATION Although neomycin is associated with the same warnings as other aminoglycosides it is generally considered too toxic for systemic use.

**INTERACTIONS** → Appendix 1: neomycin

**CAUTIONS** Avoid prolonged use

**CONTRA-INDICATIONS** Intestinal obstruction - myasthenia gravis (aminoglycosides may impair neuromuscular transmission)

**MEDICINAL FORMS** Forms available from special-order manufacturers include: powder for solution for injection, oral solution, tablet, nebuliser solution, syrup, and liquid

**INDICATIONS AND DOSE**

**Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis or prostatitis | Pneumonia in hospital patients**

**BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INFUSION**
- Adult: 3 mg/kg daily in 3 divided doses; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, increased dose used in severe infection; dose to be reduced back to 3 mg/kg daily as soon as clinically indicated

**Urinary-tract infection**
- **BY INTRAMUSCULAR INJECTION**
  - Adult: 2–3 mg/kg for 1 dose

**Chronic Pseudomonas aeruginosa infection in patients with cystic fibrosis**
- **BY INHALATION OF NEBULISER SOLUTION**
  - Adult: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

**DOSES AT EXTREMES OF BODY-WEIGHT**
- With intramuscular use or intravenous use  To avoid excessive dosage in obese patients, use ideal weight for height to calculate parental dose and monitor serum-tobramycin concentration closely.

**VANTOBRA NEBULISER SOLUTION**
- Chronic pulmonary Pseudomonas aeruginosa infection in patients with cystic fibrosis
  - **BY INHALATION OF NEBULISER SOLUTION**
    - Adult: 170 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution
Bacterial infection 521

When used by inhalation Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by Pseudomonas aeruginosa in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contra-indications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA276

ANTIBACTERIALS > CARBAPENEMS

Carbapenems

Overview
The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; imipenem (imipenem with cilastatin p. 522) and meropenem p. 523 have good activity against Pseudomonas aeruginosa. The carbapenems are not active against meticillin-resistant Staphylococcus aureus and Enterococcus faecium.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections.

Ertaopenem p. 522 is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertaopenem is not active against Pseudomonas or against Acinetobacter spp.
Imipenem with cilastatin | 07-Feb-2019

● INDICATIONS AND DOSE

Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) | Hospital-acquired septicaemia

- **BY INTRAVENOUS INFUSION**
  - Adult: 500 mg every 6 hours, alternatively 1 g every 8 hours

Infection caused by *Pseudomonas* or other less sensitive organisms | Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection

- **BY INTRAVENOUS INFUSION**
  - Adult: 1 g every 6 hours

Dose equivalence and conversion

- Dose expressed in terms of imipenem.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

- *Ertapenem (Non-proprietary)*
  - Ertapenem (as Ertapenem sodium) 1 gram
  - Ertapenem 1 g powder for concentrate for solution for infusion vials | 10 vial (Hospital only)

- *Invanz* (Merck Sharp & Dohme Ltd)
  - Ertapenem (as Ertapenem sodium) 1 gram
  - Invanz 1 g powder for solution for infusion vials | 1 vial (Hospital)

£31.65 DT + £31.65

● CAUTIONS

CNS disorders—risk of seizures: elderly

● INTERACTIONS

Appendix 1: carbapenems

● SIDE-EFFECTS

- **Common or very common** Diarrhoea, headache, nausea, skin reactions, thrombophlebitis, vomiting
- **Uncommon** Appetite decreased, arthralgia, asthenia, confusion, constipation, dizziness, drowsiness, dry mouth, gastrointestinal discomfort, gastrointestinal disorders, hypotension, increased risk of infection, insomnia, oedema, pseudomembranous enterocolitis, seizure, swelling, taste altered, throat discomfort
- **Rare or very rare** Anxiety, cholecystitis, depression, dysphagia, eye disorder, haemorrhage, hepatic disorders, hypersensitivity, hypoglycaemia, malaise, muscle cramps, nasal congestion, neutropenia, renal impairment, shoulder pain, syncope, thrombocytopenia, tremor
- **Frequency not known** Aggression, delirium, drug reaction with eosinophilia and systemic symptoms (DRESS), gait abnormal, hallucination, level of consciousness decreased, movement disorders, muscle weakness, psychiatric disorder, tooth discoloration

● ALLERGY AND CROSS-SENSITIVITY

Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk.

● BREAST FEEDING

Present in milk—manufacturer advises avoid.

● RENAL IMPAIRMENT

Dose adjustments

Risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Invance™), give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

**Dilution**

Dilute to a concentration of 5 mg (as imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (as imipenem)
over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **ELECTROLYTES** May contain Sodium
  - Imipenem with cilastatin (Non-proprietary)
  - Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg
  - Imipenem 500mg / Cilastatin 500mg powder for solution for infusion vials | 10 vial
  - Primaxin IV (Merrick Sharp & Dohme Ltd)
  - Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg
  - Primaxin IV 500mg powder for solution for infusion vials | 1 vial

- **UNLICENSED USE** Not licensed for use in endocarditis.

- **INTERACTIONS** Appendix 1: carbapenems

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain, diarrhoea, headache, infection, leucopenia, neutropenia, nausea, pain, skin reactions, vomiting.
  - **Uncommon** Agranulocytosis, antibacterial associated colitis, eosinophilia, haemolytic anaemia, increased risk of infection, leucopenia, neutropenia, paraesthesia, severe cutaneous adverse reactions (SCARs), thrombocytopenia, thrombophlebitis.
  - **Rare or very rare** Seizure
  - **ALLERGY AND CROSS-SENSITIVITY** Avoid if history of immediate hypersensitivity reaction to beta-lactam antibiotics. Use with caution in patients with sensitivity to beta-lactam antibacterials.

- **PREGNANCY** Use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Unknown, manufacturer advises avoid.

- **RENAL IMPAIRMENT**
  - **Dose adjustments** Use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m².
  - Use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m².
  - Use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Manufacturer advises monitor liver function—risk of hepatotoxicity.

- **EFFECT ON LABORATORY TESTS** Positive Coombs’ test.

- **DIRECTIONS FOR ADMINISTRATION** Intravenous injection to be administered over 5 minutes. For intravenous infusion (Meronem ®), give intermittently in Glucose 5% or Sodium chloride 0.9%.

Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **ELECTROLYTES** May contain Sodium
  - Meropenem (Non-proprietary)
  - Meropenem (as Meropenem trihydrate) 500 mg
  - Meropenem 500mg powder for solution for injection vials | 10 vial
  - €83.00–€103.14 DT + €88.90 (Hospital only) | 10 vial
  - €88.90–€103.14 DT + €88.90
  - Meropenem (as Meropenem trihydrate) 1 gram
  - Meropenem 1g powder for solution for injection vials | 10 vial
  - €177.80–€206.28 DT + €177.80
  - Meropenem (Pfizer Ltd)
  - Meropenem (as Meropenem trihydrate) 500 mg
  - Meropenem 500mg powder for solution for injection vials | 10 vial
  - €88.90
  - Meropenem (as Meropenem trihydrate) 1 gram
  - Meropenem 1g powder for solution for injection vials | 10 vial
  - €206.28 DT + €177.80

**ANTIBACTERIALS > CEPHALOSPORINS**

**Cephalosporins**

**Overview**

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cefepime penetrates the cerebrospinal fluid poorly unless the meninges are inflamed; ceftriaxone p. 527 and ceftazidime p. 528 are suitable cephalosporins for infections of the CNS (e.g meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibacterial is not available, then cefixime p. 527, cefotaxime, ceftriaxone p. 528, ceftazidime, or cefuroxime p. 526 can be used with caution; cefaclor p. 525, cefadroxil p. 524, cefalexin p. 524, cefadine p. 525, and cefuroxime axetil p. 531 should be avoided.

The orally active 'first generation' cephalosporins, cefalexin, cefadine, and cefadroxil and the 'second generation' cephalosporin, cefuroxime, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. Cefuroxime axetil, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime is an orally active 'third generation' cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections. Cefotaxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, ceftazidime and ceftriaxone are ‘third generation’ cephalosporins with greater activity than the
"second generation" cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably Staphylococcus aureus. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Ceftaroline fosamil is a 'fifth generation' cephalosporin with bactericidal activity similar to cefotaxime; however, ceftaroline fosamil has an extended spectrum of activity against Gram-positive bacteria that includes meticillin-resistant Staphylococcus aureus and multi-drug resistant Streptococcus pneumoniae. Cefaroline fosamil is licensed for the treatment of community-acquired pneumonia and complicated skin and soft-tissue infections, but there is no experience of its use in pneumonia caused by meticillin-resistant S. aureus.

**DRUG ACTION**

Cephalosporins are antibacterials that attach to penicillin binding proteins to interrupt cell wall biosynthesis, leading to bacterial cell lysis and death.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · diarrhoea · dizziness · eosinophilia · headache · increased risk of infection · leucopenia · nausea · neutropenia · skin reactions · thrombocytopenia · vomiting
- **Uncommon** Anaphylactic reaction · antibiotic associated colitis
- **Rare or very rare** Agranulocytosis · angioedema · nephritis tubulointerstitial (reversible) · severe cutaneous adverse reactions (SCARs)
- **Frequency not known** Haemolytic anaemia
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with cephalosporin hypersensitivity.
- **Cross-sensitivity with other beta-lactam antibacterials** About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin and other beta-lactams should not receive a cephalosporin.
- **Cephalosporins should be used with caution in patients with sensitivity to penicillin and other beta-lactams.**
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive Coombs’ test.

**ANTIBACTERIALS** CEFALOSPORINS, FIRST-GENERATION
Bacterial infection

**PROFESSION SPECIFIC INFORMATION**

Adults: 250–500 mg 4 times a day; alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections.

**UNLICENSED USE**

In children. Not licensed for use in children for prevention of *Staphylococcus aureus* lung infection in cystic fibrosis.

**SIDE-EFFECTS**

- Akathisia, aplastic anaemia, arthralgia, blood disorder, chest tightness, confusion, gastrointestinal discomfort, glossitis, hepatitis (transient), hypersensitivity, jaundice cholestatic, muscle tone increased, nervousness, oedema, sleep disorder.

**PREGNANCY**

Not known to be harmful.

**BREAST FEEDING**

Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT**

Dose adjustments

- In adults: Max. 3 g daily if eGFR 40–50 mL/minute/1.73 m². Max. 1.5 g daily if eGFR 10–40 mL/minute/1.73 m². Max. 750 mg daily if eGFR less than 10 mL/minute/1.73 m².
- In children: Reduce dose in moderate impairment.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Cefalexin for bacterial infections www.medicinesforchildren.org.uk/cefalexin-bacterial-infections-0

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulation**

Cefalexin Capsules may be prescribed. Cefalexin Tablets may be prescribed.

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS**

526  Bacterial infection

- Adult: 500 mg 3 times a day; maximum 4 g per day

Pneumonia
- BY MOUTH USING MODIFIED-RELEASE TABLETS
- Child 12-17 years: 750 mg every 12 hours, dose to be taken with food
- Adult: 750 mg every 12 hours, dose to be taken with food

Lower urinary-tract infections
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
- Adult: 375 mg every 12 hours, dose to be taken with food

Asymptomatic carriage of *Haemophilus influenzae* or mild exacerbations in cystic fibrosis
- BY MOUTH

Distaclor
- Child 12
- Child 2
- Child 3 months
- BY MOUTH

Negative bacteria
- Susceptible infections due to Gram-positive and Gram-negative bacteria
- BY MOUTH

Cefuroxime
- **INDICATIONS AND DOSE**
  - Susceptible infections due to Gram-positive and Gram-negative bacteria
  - BY MOUTH

- Adult: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected
- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection and cystic fibrosis
- Adult: 750 mg every 6–8 hours; increased if necessary up to 1.5 g every 6–8 hours, increased dose used for severe infections

Lyme disease
- BY MOUTH
- Adult: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthriitis)

Lower urinary-tract infection
- BY MOUTH
- Child 12-17 years: 125 mg twice daily
- Adult: 125 mg twice daily

**SIDE-EFFECTS, FURTHER INFORMATION**
- Cefaclor is associated with protracted skin reactions, especially in children.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAI IMPAIRMENT** Manufacturer advises caution.
- **DOSE ADJUSTMENTS** No dose adjustment required.

**INTERACTIONS** → Appendix 1: cephalosporins

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**
- Cefaclor is associated with protracted skin reactions, especially in children.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAI IMPAIRMENT** Manufacturer advises caution.
- **DOSE ADJUSTMENTS** No dose adjustment required.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Oral suspension**
  - **CAUTIONARY AND ADVISORY LABELS** 9
  - **Distaclor** (Flynn Pharma Ltd)
  - Cefaclor (as Cefaclor monohydrate) 25 mg per 1 ml
  - Distaclor 125mg/5ml oral suspension | 100 ml  £4.13 DT = £4.13
  - **Distaclor** (as Cefaclor monohydrate) 30 mg per 1 ml
  - Distaclor 250mg/5ml oral suspension | 100 ml  £8.26 DT = £8.26

**Modified-release tablet**

**UNLICENSED USE** Duration of treatment in Lyme disease is unlicensed.

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
  - **Frequency not known**
  - **Common**
  - With oral use Drug fever - hepatic disorders - Jarisch-Herxheimer reaction - serum sickness
  - With parenteral use Cutaneous vasculitis - drug fever
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAI IMPAIRMENT**
  - **DOSE ADJUSTMENTS** With intravenous use in adults
    - Use parenteral dose of 750 mg twice daily if eGFR 10–20 mL/minute/1.73 m². Use parenteral dose of 750 mg once daily if eGFR less than 10 mL/minute/1.73 m².
    - In children Reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
  - With intramuscular use or intravenous use
    - Single doses over 750 mg should be administered by the intravenous route only.
    - With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.
    - With intravenous use in adults For *intravenous infusion* (*Zinacef*©), give intermittently or via drip tubing in glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (at least 2 mL for each 250 mg,15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes.

- **Surgical prophylaxis**
  - **INITIALLY BY INTRAVENOUS INJECTION**
    - Adult: 1.5 g, to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 750 mg every 8 hours if required for up to 3 doses (in high risk procedures)

- **Open fractures, prophylaxis**
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
    - Adult: 1.5 g every 8 hours until soft tissue closure (maximum duration 72 hours)

- **Frequency not known**
  - **Common**
  - With oral use Drug fever - hepatic disorders - Jarisch-Herxheimer reaction - serum sickness
  - With parenteral use Cutaneous vasculitis - drug fever
  - **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAI IMPAIRMENT**
  - **DOSE ADJUSTMENTS** With intravenous use in adults
    - Use parenteral dose of 750 mg twice daily if eGFR 10–20 mL/minute/1.73 m². Use parenteral dose of 750 mg once daily if eGFR less than 10 mL/minute/1.73 m².
    - In children Reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
  - With intramuscular use or intravenous use
    - Single doses over 750 mg should be administered by the intravenous route only.
    - With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.
    - With intravenous use in adults For *intravenous infusion* (*Zinacef*©), give intermittently or via drip tubing in glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (at least 2 mL for each 250 mg,15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes.
**PRESCRIBING AND DISPENSING INFORMATION**

- With oral use See Lyme disease p. 577 for information on treatment.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion

Tablet

- **CAUTIONARY AND ADVISORY LABELS** 9, 21, 25
  - **Cefuroxime (Non-proprietary)**
    - Cefuroxime (as Cefuroxime axetil) 250 mg 200 mg tablets | 14 tablet [POD] £11.72 DT = £11.72

  - **EXCipients:** May contain Aspartame, sucrose
    - **Zinacef** (GlasoSmithKline UK Ltd)
    - Cefuroxime (as Cefuroxime axetil) 25 mg per 1 ml Zinnat 125mg/5ml oral suspension | 70 ml [POD] £5.20 DT = £5.20

**ANTIBACTERIALS**  CEPHALOSPORINS, THIRD-GENERATION

**Cefixime**

- **INDICATIONS AND DOSE**

  **Acute infections due to sensitive Gram-positive and Gram-negative bacteria**
  - **BY MOUTH**
    - Child: 6–11 months: 75 mg daily
    - Child: 1–4 years: 100 mg daily
    - Child: 5–9 years: 200 mg daily
    - Child: 10–17 years: 200–400 mg daily, alternatively 100–200 mg twice daily
    - Adult: 200–400 mg daily in 1–2 divided doses

  **Uncomplicated gonorrhoea**
  - **BY MOUTH**
    - Adult: 400 mg for 1 dose

- **UNLICENSED USE** Use of cefixime for uncomplicated gonorrhoea is an unlicensed indication.
- **INTERACTIONS** → Appendix 1: cefuroxime
- **SIDE-EFFECTS** Acute kidney injury - arthralgia - drug fever - dyspepsia - dysphonia - face oedema - flattulence - genital pruritus - hypereosinophilia - jaundice - serum sickness - like reaction - thrombocytosis
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

**Bacterial infection 527**

**Cefotaxime**

- **INDICATIONS AND DOSE**

  **Uncomplicated gonorrhoea**
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: 500 mg for 1 dose

  **Infections due to sensitive Gram-positive and Gram-negative bacteria**
  - **SURGICAL PROPHYLAXIS**
    - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Adult: 1 g every 12 hours

  **Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**
  - **MENINGITIS**
    - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Adult: 8 g daily in 4 divided doses, increased if necessary to 12 g daily in 3–4 divided doses, intramuscular doses over 1 g should be divided between more than one site

  **Emergency treatment of suspected bacterial meningitis or meningooccal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin (e.g. because of an allergy)**
  - **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Child: 1 month–11 years: 50 mg/kg for 1 dose
    - Child: 12–17 years: 1 g for 1 dose
    - Adult: 1 g for 1 dose

- **INTERACTIONS** → Appendix 1: cefuroxime
- **SIDE-EFFECTS**
  - **Uncommon** Drug fever - Jarisch-Herxheimer reaction - renal impairment - seizure
  - **Frequency not known** Arrhythmia (following rapid injection) - bronchospasm - encephalopathy - hepatic disorders
  - **PREGNANCY** Not known to be harmful.
  - **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT**

- **Dose adjustments** → In adults Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 200 mg daily).
  - In children Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 9
  - **Suprax** (Sanofi)
  - Cefixime 200 mg Suprax 200mg tablets | 7 tablet [POD] £13.23 DT = £13.23

**Suprax** (Sanofi)

- Cefixime 200 mg Suprax 200mg tablets | 7 tablet [POD] £13.23 DT = £13.23

**Cefotaxime**

- **INDICATIONS AND DOSE**

  **Uncomplicated gonorrhoea**
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: 500 mg for 1 dose

  **Infections due to sensitive Gram-positive and Gram-negative bacteria**
  - **SURGICAL PROPHYLAXIS**
    - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Adult: 1 g every 12 hours

  **Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**
  - **MENINGITIS**
    - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Adult: 8 g daily in 4 divided doses, increased if necessary to 12 g daily in 3–4 divided doses, intramuscular doses over 1 g should be divided between more than one site

  **Emergency treatment of suspected bacterial meningitis or meningooccal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin (e.g. because of an allergy)**
  - **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Child: 1 month–11 years: 50 mg/kg for 1 dose
    - Child: 12–17 years: 1 g for 1 dose
    - Adult: 1 g for 1 dose

- **INTERACTIONS** → Appendix 1: cefuroxime
- **SIDE-EFFECTS**
  - **Uncommon** Drug fever - Jarisch-Herxheimer reaction - renal impairment - seizure
  - **Frequency not known** Arrhythmia (following rapid injection) - bronchospasm - encephalopathy - hepatic disorders
  - **PREGNANCY** Not known to be harmful.
  - **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT**

- **Dose adjustments** → In adults If eGFR less than 5 mL/minute/1.73 m², initial dose of 1 g then use half normal dose.
  - In children Usual initial dose, then use half normal dose if estimated glomerular filtration rate less than 5 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**

  **With intravenous use in children** Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute in glucose 5% or sodium chloride 0.9%; administer over 20–60 minutes; incompatible with alkaline solutions.

  **With intravenous use in adults** For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%; Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions.

www.getintopharma.com
Ceftazidime

**INDICATIONS AND DOSE**

**Prophylaxis for transurethral resection of prostate**
- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 1 g, single dose to be used up to 30 minutes before procedure and may be repeated if necessary when catheter removed

**Pseudomonal lung infection in cystic fibrosis**
- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 1–2 g every 8–12 hours

**Septicaemia: Hospital-acquired pneumonia**
- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 2 g every 8 hours

**Febrile neutropenia**
- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 2 g every 8 hours

**Meningitis**
- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 2 g every 8 hours

**Sepsis**
- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 2 g every 8 hours

**Complicated urinary-tract infection**
- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 1–2 g every 8–12 hours

**Gram-negative bacteria**
- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: 1–2 g every 8 hours

**INTERACTIONS**
- Appendix 1: cephalosporins

**SIDE-EFFECTS**
- Common or very common: Thrombocytopenia
- Very rare: Infection at the site of injection, Intra-abdominal infections
- Rare: Acute kidney injury
- Frequency not known: Coma, encephalopathy, jaundice, lymphopenia
- Neurological effects: Paralysis, seizures, taste alteration, tremor

**PREGNANCY**
- Not known to be harmful.

**BREAST FEEDING**
- Present in milk in low concentration, but appropriate to use.

**HEPATIC IMPAIRMENT**
- Manufacturer advises close monitoring in severe impairment—no information available.

**RENAL IMPAIRMENT**
- Dose adjustments: Manufacturer advises reduce dose if creatinine clearance 50 mL/minute or less—consult product literature.

**DIRECTIONS FOR ADMINISTRATION**
- Intravenous administration used when intravenous administration not possible; single doses over 1 g by intravenous route only.
- With intravenous use: For intravenous infusion give intermittently or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid. For Fortum® dilute further to a concentration of 40 mg/mL. For Kefadim® dilute further to a concentration of 20 mg/mL. Give over up to 30 minutes.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Cefotaxime (Non-proprietary)**
  - Cefotaxime (as Cefotaxime sodium) 500 mg: 10 vial (£0.30)
  - Cefotaxime (as Cefotaxime sodium) 1 gram: 10 vial (£0.35) (Hospital only)
  - Cefotaxime (as Cefotaxime sodium) 2 gram: 10 vial (£0.75) (Hospital only)

**Electrolytes**
- May contain Sodium

**Ceftazidime (as Ceftazidime pentahydrate)**
- 500 mg: 1 vial (£4.25)
- 1 gram: 1 vial (£3.96) (Hospital only)
- 2 gram: 1 vial (£7.90) (Hospital only)
- 3 gram: 1 vial (£13.50) (Hospital only)
- 5 vial (£19.15) (Hospital only)
Bacterial infection  529

SPECIFIC CAUTIONS
- With intravenous use concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) (in adults)
- INTERACTIONS  ➔ Appendix 1: cephalosporins
- SIDE-EFFECTS
  - Uncommon Anaemia - coagulation disorder
  - Rare or very rare Bronchospasm - glycosuria - haematuria - oedema
  - Frequency not known Cholelithiasis - hypersensitivity - nephrolithiasis - oral disorders - pancreatitis - seizure - vertigo

SIDE-EFFECTS, FURTHER INFORMATION
Precipitates of calcium ceftriaxone can occur in the gall bladder and urine (particularly in very young, dehydrated or those who are immobile)—consider discontinuation if symptomatic.

PREGNANCY
Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be harmful in animal studies. (EGG) Specialist sources indicate suitable for use in pregnancy.

- BREAST FEEDING (EGG) Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant. (EGG)

- RENAL IMPAIRMENT
  - Dose adjustments Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available.
  - In adults Manufacturer advises reduce dose if eGFR less than 10 mL/minute/1.73 m² (max. 2 g daily).
  - In children Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² max. 50 mg/kg daily or max. 2 g daily).

- MONITORING REQUIREMENTS
  - Manufacturer advises to monitor full blood count regularly during prolonged treatment.

- DIRECTIONS FOR ADMINISTRATION
  - With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.

  - With intravenous use in children For intravenous infusion (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%; give over at least 30 minutes (50 minutes in neonates—may displace bilirubin from serum albumin). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if infusion lines at different sites are used, or if the infusion lines are replaced or thoroughly flushed between infusions with Sodium Chloride 0.9% to avoid precipitation—consult product literature. Displacement value may be significant, consult local guidelines. For intravenous injection, give over 5 minutes.

  - With intramuscular use in children For intramuscular injection, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular injection should only be considered when the intravenous route is not possible or less appropriate. If administered by intramuscular injection, the lower end of the dose range should be used for the shortest time possible; volume depends on the age and size of the child, but doses over 1 g must be divided between more than one site. Displacement value may be significant, consult local guidelines. The maximum single intramuscular dose is 2 g, doses greater than 2 g must be given in divided doses or by intravenous administration (see above).

  - With intravenous use in adults For intravenous infusion (preferred route) (Rocephin®; Ceftriaxone Injection, Genus), give intermittently or via drip tubing in Glucose 5% or 10% or Sodium Chloride 0.9%. Reconstitute 2-g vial with 40 mL

  - In adults (EGG) Dose not licensed for treatment of pelvic inflammatory disease in adults over 18 years. Ceftriaxone is used for Lyme disease affecting the central nervous system, but the dose is not licensed for this indication.

- CAUTIONS
  - GENERAL CAUTIONS History of hypercalciuria - history of kidney stones
530 Bacterial infection

Infection

THIRD-GENERATION WITH BETA-

ANTIBACTERIALS

▶ PRESCRIBING AND DISPENSING INFORMATION

See Lyme disease p. 577 for place in therapy and further information on treatment.

▶ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturer include:

Powder for solution for injection

ELECTROLYTES: May contain Sodium

- Ceftriaxone (Non-proprietary)
  - Ceftriaxone (as Ceftriaxone sodium) 250 mg Ceftriaxone 250mg powder for solution for injection vials 1 vial (Pfizer) $2.30 GT + $2.40 (Hospital only)
  - Ceftriaxone (as Ceftriaxone sodium) 1 gram Ceftriaxone 1g powder for solution for injection vials 1 vial (Pfizer) GT $19.18 10 vial (Pfizer) $191.80
  - Ceftriaxone (as Ceftriaxone sodium) 2 gram Ceftriaxone 2g powder for solution for injection vials 1 vial (Roche) $19.18 GT + $19.18 10 vial (Roche) $191.80
- Rocephin (Roche Products Ltd)
  - Ceftriaxone (as Ceftriaxone sodium) 250 mg Rocephin 250mg powder for solution for injection vials 1 vial (Pfizer) $2.40 GT + $2.40
  - Ceftriaxone (as Ceftriaxone sodium) 1 gram Rocephin 1g powder for solution for injection vials 1 vial (Pfizer) GT $19.58 10 vial (Pfizer) $195.80
- Zavicefta (Pfizer Ltd)
  - Ceftriaxone (as Ceftriaxone sodium) 500 mg, Ceftazidime (as Ceftazidime pentahydrate) 2 gram Zavicefta 2g/0.5g powder for concentrate for solution for injection vials 1 vial (Pfizer) $857.00 (Hospital only)

DOSE EQUIVALENCE AND CONVERSION

- Dose expressed as x/y g ceftazidime/avibactam

INTERACTIONS → Appendix 1: cephalosporins

SIDE-EFFECTS

- Common or very common Thrombocytosis
- Uncommon Acute kidney injury - lymphocytosis - paraesthesia - taste altered
- Frequency not known Coma - encephalopathy - jaundice - myoclonus - neurological effects - seizures - tremor

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk — toxicity in animal studies.

BREAST FEEDING

Manufacturer advises avoid — presence of avibactam in milk unknown.

DIRECTIONS FOR ADMINISTRATION

Manufacturer advises for intravenous infusion (Zavicefta®) give in Glucose 5%, or Sodium Chloride 0.9%, or Sodium Chloride 0.45% with Glucose 2.5% combination or Lactated Ringer's solution. Reconstitute each 2 g/0.5 g vial with 10 mL water for injections; dilute requisite dose in an appropriate infusion bag and give over 120 minutes.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks — risk of dizziness.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- Zavicefta (Pfizer Ltd)
- Avibactam (as Avibactam sodium) 500 mg, Ceftazidime (as Ceftazidime pentahydrate) 2 gram

Ceftolozane with tazobactam

ANTIBACTERIALS > CEPHALOSPORINS, THIRD-GENERATION WITH BETA-LACTAMASE INHIBITOR

Ceftazidime with avibactam

The properties listed below are those particular to the combination only. For the properties of the components please consider, ceftazidime p. 528.

INDICATIONS AND DOSE

Complicated intra-abdominal infection (in combination with metronidazole when anaerobic pathogens suspected)

- BY INTRAVENOUS INFUSION
- Adult: 1/0.5 g every 8 hours for 4–14 days

Complicated urinary tract infection | Acute pyelonephritis

- BY INTRAVENOUS INFUSION
- Adult: 1/0.5 g every 8 hours for 7 days

DOSE EQUIVALENCE AND CONVERSION

- Dose expressed as x/y g where x and y are ceftolozane and tazobactam respectively.

INTERACTIONS → Appendix 1: cephalosporins

SIDE-EFFECTS

- Common or very common Anxiety - constipation - electrolyte imbalance - hypotension - insomnia - thrombocytosis

PREGNANCY

Manufacturer advises to use only if potential benefit outweighs risk — toxicity in animal studies with tazobactam.

BREAST FEEDING

Manufacturer advises avoid — no information available.

RENAL IMPAIRMENT

Manufacturer advises monitor for changes in renal function.

Dose adjustments Manufacturer advises reduce dose to 500/250 mg every 8 hours if eGFR

www.getintopharma.com
Bacterial infection 531

Ceftobiprole 12-Dec-2016

- **INDICATIONS AND DOSE**
  - **Hospital-acquired pneumonia (excluding ventilator-associated pneumonia) / Community-acquired pneumonia**
    - **BY INTRAVENOUS INFUSION**
  - **Adult:** 500 mg every 8 hours

- **CAUTIONS**
  - Pre-existing seizure disorder—increased risk of seizures · super-normal creatinine clearance

- **FURTHER INFORMATION**
  - Super-normal creatinine clearance Manufacturer advises to measure baseline renal function and increase duration of infusion if creatinine clearance greater than 150 mL/minute.

- **INTERACTIONS** → Appendix 1: cephalosporins

**Ceftaroline fosamil**

- **INDICATIONS AND DOSE**
  - **Community-acquired pneumonia**
    - **BY INTRAVENOUS INFUSION**
    - **Adult:** 600 mg every 12 hours for 5–7 days
  - **Complicated skin infections / Complicated soft-tissue infections**
    - **BY INTRAVENOUS INFUSION**
    - **Adult:** 600 mg every 12 hours for 5–14 days

- **CAUTIONS**
  - Seizure disorders
  - **INTERACTIONS** → Appendix 1: cephalosporins

- **SIDE-EFFECTS**
  - **Common or very common**
    - Drowsiness · dyspepsia · electrolyte imbalance · hypersensitivity · taste altered
  - **Uncommon**
    - Anaemia · anxiety · asthma · dyspnoea · laryngeal pain · muscle spasm · peripheral oedema · renal failure · sleep disorders · thrombocytosis
  - **Frequency not known**
    - Seizure
  - **PREGNANCY**
    - Manufacturer advises avoid unless essential—no information available.
  - **BREAST FEEDING**
    - Manufacturer advises avoid—present in milk in animal studies.
  - **RENAL IMPAIRMENT**
    - Manufacturer advises use with caution in severe impairment—limited information available.
  - **Dose adjustments** Reduce dose to 500 mg every 12 hours in moderate impairment and 250 mg every 12 hours in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - Manufacturer advises for *intravenous infusion* (Zeftera®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute each 500 mg with 10 mL. Water for injections or Glucose 5% dilute in 250 mL infusion fluid and give over 2 hours. Do not mix with calcium-containing solutions (except Lactated Ringer solution) in the same intravenous line—precipitation may occur.

- **HANDLING AND STORAGE**
  - Manufacturer advises store in a refrigerator (2–8°C) and consult product literature for storage after reconstitution and dilution.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks**
    - Manufacturer advises avoid unless reconstituted use within NHS Scotland when metillin-resistant *S. aureus* is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

**MEDIINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - **Zinforo (Pfizer Ltd)**
  - Ceftaroline fosamil (as Ceftaroline fosamil acetic acid solvate monohydrate) 600 mg. Zinforo 600mg powder for concentrate for solution for infusion vials | 10 vial [POM] £375.00 (Hospital only)

- **Ceftriaxone**
  - Ceftriaxone sodium (as Ceftriaxone sodium monohydrate) 1 gram. Ceftriaxone 1g for concentration for solution for infusion vials | 10 vial [POM] £670.30 (Hospital only)

**ANTIBACTERIALS > CEPHALOSPORINS, OTHER**

**Ceftaroline fosamil**

- **INDICATIONS AND DOSE**
  - **Community-acquired pneumonia**
  - **BY INTRAVENOUS INFUSION**
    - **Adult:** 600 mg every 12 hours for 5–7 days
  - **Complicated skin infections / Complicated soft-tissue infections**
    - **BY INTRAVENOUS INFUSION**
    - **Adult:** 600 mg every 12 hours for 5–14 days

- **CAUTIONS**
  - Seizure disorders
  - **INTERACTIONS** → Appendix 1: cephalosporins
  - **SIDE-EFFECTS**
    - **Common or very common**

- **Ceftriaxone**
  - Ceftriaxone sodium (as Ceftriaxone sodium monohydrate) 1 gram. Ceftriaxone 1g for concentration for solution for infusion vials | 10 vial [POM] £670.30 (Hospital only)

www.getintopharma.com
Antibacterials

Antibacterials > Glycopeptide Antibacterials

Dalbavancin

Drug Action
Dalbavancin is a glycopeptide antibiotic; it has bactericidal activity against Gram-positive bacteria including various staphylococci. However, there are reports of Staphylococcus aureus with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci.

Indications and Dose

- Acute bacterial skin and skin structure infections
  - By Intravenous Infusion
  - Adult: 1500 mg for 1 dose, alternatively 1000 mg, then 500 mg after 1 week

Side Effects
- Common or very common: Diarrhoea, headache, nausea
- Uncommon: Anaemia, antibiotic associated colitis, appetite decreased, constipation, cough, diziness, eosinophilia, flushing, gastrointestinal discomfort, increased risk of infection, infusion related reaction, insomnia, leucopenia, neutropenia, skin reactions, taste altered, thrombocytosis, vomiting, vulvovaginal pruritus
- Rare or very rare: Bronchospasms
- Frequency not known: Ototoxicity

Allergy and Cross-Sensitivity
Manufacturer advises use with caution in patients with other glycopeptide reports of sensitivity.

Pregnancy
Dose adjustments
Manufacturer advises avoid unless essential—toxicity in animal studies.

Breast Feeding
Dose adjustments
Manufacturer advises avoid—present in milk in animal studies.

Hepatic Impairment
Manufacturer advises caution in moderate to severe impairment (no information available).

Renal Impairment
Dose adjustments
Manufacturer advises reduce dose to 1000 mg as a single infusion or reduce dose to 750 mg followed one week later by 375 mg if creatinine clearance <30 mL/minute.

Directions for Administration
Manufacturer advises for intravenous infusion (Xydalba®), reconstitute each 500 mg vial to produce a 20 mg/mL solution with 25 mL water for injections. Dilute reconstituted solution to a concentration of 1–5 mg/mL with Glucose 5%; give intermittently over 30 minutes (avoid rapid infusion—risk of ‘red man’ syndrome).

National Funding/Access Decisions
Scottish Medicines Consortium (SMC) decisions
SMC No. 1105/15
The Scottish Medicines Consortium has advised (January 2017) that dalbavancin (Xydalba®) is accepted for restricted use within NHS Scotland for the treatment of acute bacterial skin and skin structure infections (ABSSSI), only if:
- used as second-line treatment, or
- meticillin-resistant Staphylococcus aureus infection is suspected, or
- under local microbiologist or infectious diseases specialist advice; and
- the patient is initially hospitalised due to ABSSSI requiring intravenous antibiotics but is eligible for early discharge as soon as their medical condition does not require further inpatient treatment.

All Wales Medicines Strategy Group (AWMSG) decisions
AWMSG No. 2001

Teicoplanin

Drug Action
The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of Staphylococcus aureus with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

Indications and Dose

Clostridium difficile infection
- By Mouth
- Adult: 100–200 mg twice daily for 7–14 days

Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft-tissue infections, pneumonia, complicated urinary tract infections)
- By Intravenous Injection, or By Intravenous Infusion, or By Intramuscular Injection
- Adult: Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Streptococcal or enterococcal endocarditis (in combination with another antibacterial) Bone and joint infections
- Initially by Intravenous injection, or by Intravenous infusion
- Adult: 12 mg/kg every 12 hours for 3–5 doses, then (by intravenous injection or by intravenous infusion or by intramuscular injection) 12 mg/kg once daily

Surgical prophylaxis
- By Intravenous Injection
- Adult: 400 mg, to be administered up to 30 minutes before the procedure

Surgical prophylaxis in open fractures
- By Intravenous Infusion
- Adult: 800 mg, to be administered up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure

Peritonitis associated with peritoneal dialysis (added to dialysis fluid)
- By Intrapерitoneal Infusion
- Adult: (consult local protocol)

Pharmacokinetics
- Teicoplanin should not be given by mouth for systemic infections because it is not absorbed significantly.

Unlicensed Use
Not licensed for surgical prophylaxis.
**Telavancin**

**DRUG ACTION** Telavancin is a glycopeptide antibiotic; it has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

**INDICATIONS AND DOSE**

- **Hospital-acquired pneumonia, known or suspected to be caused by meticillin-resistant *Staphylococcus aureus***
- **when other antibacterials cannot be used**
  - **BY INTRAVENOUS INFUSION**
  - Adult: 10 mg/kg once daily for 7–21 days

**CAUTIONS** Conditions that predispose to renal impairment: predisposition to QT interval prolongation (including electrolyte disturbances, congenital long QT syndrome, uncompensated heart failure, severe left ventricular hypertrophy)

**INTERACTIONS** → Appendix 1: telavancin

**SIDE-EFFECTS**

- **Common or very common** Asthenia - constipation - diarrhoea - dizziness - headaches - increased risk of infection - insomnia - nausea - renal impairment - skin reactions - taste altered - urine abnormalities - vomiting
- **Rare or very rare** Deafness

**ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with vancomycin or teicoplanin sensitivity.

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

**PREGNANCY** Avoid (teratogenic in animal studies).

**BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

**RENAL IMPAIRMENT** Avoid in acute renal failure—risk of mortality increased. In chronic renal failure, avoid if eGFR less than 30 mL/minute/1.73 m².

**SIDE-EFFECTS, FURTHER INFORMATION** Telavancin is associated with a lower incidence of nephrotoxicity than vancomycin.

**MEDICINAL FORMS**

- **Powder and solvent for solution for injection**
  - **Electrolytes**: May contain Sodium
  - **Teicoplanin (non-proprietary)** 
    - **Teicoplanin 200 mg**: Teicoplanin 200 mg powder and solvent for solution for injection vials | 1 vial | £3.93
    - **Teicoplanin 400 mg**: Teicoplanin 400 mg powder and solvent for solution for injection vials | 1 vial | £7.32
    - **Targocid (Sanofi)**
      - **Teicoplanin 200 mg**: Targocid 200 mg powder and solvent for solution for injection vials | 1 vial | £3.93
      - **Teicoplanin 400 mg**: Targocid 400 mg powder and solvent for solution for injection vials | 1 vial | £7.32
  - **Dose adjustments** In chronic renal failure, use 7.5 mg/kg once daily if eGFR 30–50 mL/minute/1.73 m².
  - **Monitoring requirements** Monitor renal function daily for at least the first 3–5 days, then every 2–3 days thereafter.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Vibutiv®). Avoid rapid infusion (can cause ‘red man’ syndrome). Give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 750 mg with 45 mL glucose 5%, sodium chloride 0.9%, or water for injections to produce a 15 mg/mL solution; for doses of 150–800 mg, dilute requisite dose in 100 to 250 mL infusion fluid; for doses outside this range, dilute to a final concentration of 0.5–8 mg/mL; give over at least 60 minutes.
Vancomycin

11-May-2018

**DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.

**Medical Forms** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **Vibativ** (Clinigen Healthcare Ltd)
  - Telavancin (as Telavancin hydrochloride) 750 mg
  - **Vibativ 750mg powder for solution for infusion vials** | 1 vial **£665.00** (Hospital only)

**INDICATIONS AND DOSE**

- **Clostridium difficile infection**
  - **[first episode]**
    - **By mouth**
      - Adult: 125 mg every 6 hours for 10 days; increased if necessary to 500 mg every 6 hours for 10 days, increased dose if severe or complicated infection
  - **[multiple recurrences]**
    - **By mouth**
      - Adult: 125 mg every 6 hours for 10 days, followed by, either tapering the dose (gradually reducing until 125 mg daily) or a pulse regimen (125–500 mg every 2–3 days for at least 3 weeks)

- **Complicated skin and soft tissue infections**
- **Bone infections**
- **Joint infections**
- **Community-acquired pneumonia**
- **Hospital-acquired pneumonia**
- **[including ventilator-associated pneumonia]**
- **[infective endocarditis]**
- **Acute bacterial meningitis**
- **Bacteraemia**

- **[occurring in association with or suspected to be associated with the licensed indications]**
  - **By intravenous infusion**
    - Adult: 15 mg/kg, to be given prior to induction of anaesthesia, a second dose may be required depending on duration of surgery
  - **Surgical prophylaxis**
    - **By intravenous infusion**
      - Adult: 1 g for 1 dose
  - **Peritonitis associated with peritoneal dialysis**
    - **By intraperitoneal administration**
      - Adult: (consult local protocol)

**Pharmacokinetics**

- Vancomycin should not be given by mouth for systemic infections because it is not absorbed significantly.

**UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route.

**CONTRA-INDICATIONS**

- With intravenous use Previous hearing loss

**CAUTIONS**

- With oral use systemic absorption may be enhanced in patients with inflammatory disorders of the intestinal mucosa or with *Clostridium difficile*-induced pseudomembranous colitis (increased risk of adverse reactions)

**INTERACTIONS** → Appendix 1: vancomycin

**SIDE-EFFECTS**

**General Side-effects**

- Agranulocytosis - dizziness - drug fever - eosinophilia - hypersensitivity - nausea - nephritis - tubulointerstitial - neutropenia (more common after 1 week or cumulative dose of 25g) - renal failure - severe cutaneous adverse reactions (SCARs) - skin reactions - thrombocytopenia - tinnitus (discontinue) - vasculitis - vertigo

**Specific Side-effects**

- With intravenous use Back pain - bradycardia - cardiac arrest (on rapid intravenous injection) - cardiogenic shock (on rapid intravenous injection) - chest pain - dyspnoea - hearing loss - hypotension - muscle complaints - pseudomembranous enterocolitis - red man syndrome - wheezing

**SIDE-EFFECTS, FURTHER INFORMATION** Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

**Allergy and Cross-Sensitivity**

- Caution if teicoplanin sensitivity.

**Pregnancy**

- Manufacturer advises use only if potential benefit outweighs risk.

**Monitoring**

- Plasma-vancomycin concentration monitoring with intravenous use
- Monitoring of renal function.

**Breast Feeding**

- Present in milk—significant absorption following oral administration unlikely.

**Renal Impairment**

- Manufacturer advises serial monitoring of renal function.

- With intravenous use Manufacturer advises use with caution—increased risk of toxic effects with prolonged high blood concentration.

**Dose Adjustments**

- With oral use Manufacturer advises dose adjustment is unlikely to be required unless substantial oral absorption occurs in inflammatory disorders of the intestinal mucosa or with *Clostridium difficile*-induced pseudomembranous colitis, see Monitoring.

- With intravenous use Manufacturer advises initial dose must not be reduced—consult product literature.

**Monitoring Requirements**

- With intravenous use Manufacturer advises initial doses should be based on body-weight; subsequent dose adjustments should be based on serum-vancomycin concentrations to achieve targeted therapeutic concentrations. All patients require serum-vancomycin measurement (on the second day of treatment, immediately before the next dose if renal function normal, earlier if renal impairment—consult product literature).

- Frequency of monitoring depends on the clinical situation and response to treatment; regular monitoring indicated in high-dose therapy and longer-term use, particularly in patients with impaired renal function, impaired hearing, or concurrent use of nephrotoxic or ototoxic drugs.

- Manufacturer advises pre-dose (‘trough’) concentration should normally be 10–20 mg/litre depending on the site of infection and the susceptibility of the pathogen; trough concentration of 15–20 mg/litre is usually recommended to cover susceptible pathogens with MIC greater than or equal to 1 mg/litre—consult product literature.

- Manufacturer advises periodic testing of auditory function.

www.getintopharma.com
**Antibacterials**

**Clindamycin**

- **Drug Action**: Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

**INDICATIONS AND DOSE**

**Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections | Erysipelas or cellulitis in penicillin-allergic patients (alternative to macrolides)**

- **By Mouth**
  - Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)
  - Adult: 150–300 mg every 6 hours; increased if necessary up to 450 mg every 6 hours if required, increased dose used in severe infection

- **By Deep Intramuscular Injection, or by Intravenous Infusion**
  - Adult: 0.6–2.7 g daily in 2–4 divided doses; increased if necessary up to 4.8 g daily, increased dose used in life-threatening infection, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

**Treatment of mild to moderate pneumonia**

- **By Mouth**
  - Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days
  - Adult: 450 mg every 8 hours for 7 days

**SIDE-EFFECTS**

**General Side-effects**

- **Common or very common** Skin reactions

**Specific Side-effects**

- **Common or very common**
  - With oral use: Abdominal pain | Antibiotic-associated colitis | Diarrhoea (discontinue)
  - Uncommon
  - With oral use: Nausea | Vomiting
  - Frequency not known

- **With oral use: Agranulocytosis | angioedema | eosinophilia | gastrointestinal disorders | Jaundice | Leucopenia | Neutropenia | Severe cutaneous adverse reactions (SCARs) | Taste altered | Thrombocytopenia | Vulvovaginal infection

- **With parenteral use: Abdominal pain | Agranulocytosis | Antibiotic-associated colitis | Cardiac arrest | Diarrhoea | Eosinophilia | Hypotension | Jaundice | Leucopenia | Nausea | Neutropenia | Severe cutaneous adverse reactions (SCARs) | Taste altered | Thrombocytopenia | Thrombophlebitis | Vomiting | Vulvovaginal infection

**Side-effects, Further Information**

**Antibiotic-associated colitis**

Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. If *Clostridium difficile* infection is suspected or confirmed, discontinue the antibiotic if appropriate. Seek specialist advice if the antibiotic cannot be stopped and the diarrhoea is severe.

**Medicinal Forms**

- **There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, infusion.

**Powder for solution for infusion**

- **Vancomycin** *(Non-proprietary)*

  - Vancomycin (as Vancomycin hydrochloride) 50 mg: Vancomycin 50 mg capsules | 28 capsule (PN) £132.47 DT + £112.47
  - Vancomycin (as Vancomycin hydrochloride) 125 mg: Vancomycin 125 mg capsules | 28 capsule (PN) £264.94 DT + £224.94

- **Vancomycin Matrigel** *(Flynn Pharma Ltd)*
  - Vancomycin (as Vancomycin hydrochloride) 125 mg: Vancomycin Matrigel 125 mg capsules | 28 capsule (PN) £88.31 DT + £132.47

**Medications**

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use: Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites.
  - For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible.
  - With oral use: Injection can be used to prepare solution for oral administration—consult product literature.

**Contraindications**

- Avoid use in Acute porphyrias p. 132
  - With parenteral use: Agranulocytosis | angioedema | eosinophilia | gastrointestinal disorders | Jaundice | Leucopenia | Neutropenia | Severe cutaneous adverse reactions (SCARs) | Taste altered | Thrombocytopenia | Vulvovaginal infection

- **UNLICENSED USE**
  - Not licensed for treatment of mild to moderate pneumococcal infection.

- **CONTRA-INDICATIONS**
  - Diarrhoeal states

- **CAUTIONS**
  - Avoid in Acute porphyrias p. 1058 | middle-aged and elderly women, especially after an operation (antibiotic-associated colitis more common)

- **INTERACTIONS**
  - Appendix 1: clindamycin

**UNLICENSED USE**

- Not licensed for treatment of mild to moderate pneumococcal infection. Not licensed for treatment of falciparum malaria.

- **SIDE-EFFECTS**
  - **Common or very common** Skin reactions
  - **Specific Side-effects**
  - **Common or very common**
  - With oral use: Abdominal pain | Antibiotic-associated colitis | Diarrhoea (discontinue)
  - **Uncommon**
  - With oral use: Nausea | Vomiting
  - **Frequency not known**
  - With oral use: Agranulocytosis | Angioedema | Eosinophilia | Gastrointestinal disorders | Jaundice | Leucopenia | Neutropenia | Severe cutaneous adverse reactions (SCARs) | Taste altered | Thrombocytopenia | Vulvovaginal infection
  - With parenteral use: Abdominal pain | Agranulocytosis | Antibiotic-associated colitis | Cardiac arrest | Diarrhoea (discontinue) | Eosinophilia | Hypotension | Jaundice | Leucopenia | Nausea | Neutropenia | Severe cutaneous adverse reactions (SCARs) | Taste altered | Thrombocytopenia | Thrombophlebitis | Vomiting | Vulvovaginal infection

**SIDE-EFFECTS, FURTHER INFORMATION**

**Antibiotic-associated colitis**

Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. If *Clostridium difficile* infection is suspected or confirmed, discontinue the antibiotic if appropriate. Seek specialist advice if the antibiotic cannot be stopped and the diarrhoea is severe.
**Macrolides**

### Overview

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many - penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 539 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin below is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, uncomplicated gonorrhea, typhoid [unlicensed indication], trachoma [unlicensed indication], and Lyme disease [unlicensed indication].

Clarithromycin p. 538 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication. Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

### Macrolides

#### CAUTIONS
- With intravenous use or oral use electrolyte disturbances (predisposition to QT interval prolongation) - may aggravate myasthenia gravis - predisposition to QT interval prolongation
- **SIDE EFFECTS**
  - **Common or very common** Appetite decreased - diarrhoea - dizziness - gastrointestinal discomfort - gastrointestinal disorders - headache - hearing impairment - insomnia - nausia - pancreatitis - paraesthesia - skin reactions - taste altered - vasodilation - vision disorders - vomiting
  - **Uncommon** Angioedema - anxiety - arrhythmias - candida infection - chest pain - constipation - drowsiness - eosinophilia - hepatic disorders - leucopenia - neutropenia - palpitations - QT interval prolongation - severe cutaneous adverse reactions (SCARs) - tinnitus - vertigo
  - **Rare or very rare** Antibiotic associated colitis - myasthenia gravis - nephritis tubulo-intertstitial
  - **Frequency not known** Hallucination - hypotension - seizure - smell altered - thrombocytopenia - tongue discolouration

#### Azithromycin

#### INDICATIONS AND DOSE

*Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin*
- **BY MOUTH**
  - Child 6 months-11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
  - Child 12-17 years: 500 mg once daily for 5 days
  - Adult: 500 mg once daily for 5 days

#### Macrolides

**BY MOUTH**
- Clindamycin (as Clindamycin hydrochloride) 75 mg Dalacin C 75mg capsules | 24 capsule (Pﬁzer Ltd) £7.45 DT £7.45 Clindamycin (as Clindamycin hydrochloride) 150 mg Dalacin C 150mg capsules | 24 capsule (Pﬁzer Ltd) £13.72 DT £13.08 | 100 capsule (Pﬁzer Ltd) £12.83-£55.08 Clindamycin (as Clindamycin hydrochloride) 300 mg Dalacin C 300mg capsules | 30 capsule (Pﬁzer Ltd) £42.00 DT £38.26

**INJECTION**
- Dalacin C (Pﬁzer Ltd) Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml Dalacin C Phosphate 300mg/2ml solution for injection ampoules | 5 amouple (Pﬁzer Ltd) £31.01 | 5 amouple (Hospital only) £33.01 (Hospital only)

#### Patanjali Ayurveda TLimited

- Clindamycin (as Clindamycin hydrochloride) 150 mg Dalacin C 150mg capsules | 24 capsule (Patanjali Ayurveda TLimited) £6.75 DT £6.13

#### Clarithromycin

- Clarithromycin (as Clarithromycin hydrochloride) 100 mg Zithromax 100mg capsules | 21 capsule (Pﬁzer Ltd) £27.20 DT £25.90

#### Spiramycin

- Spiramycin (as Spiramycin phosphate) 600 mg/4ml solution for injection ampoules | 5 ampoule (Pﬁzer Ltd) £14.61 (Hospital only)

### Spiramycin

- Spiramycin (as Spiramycin phosphate) 600 mg/4ml solution for injection ampoules | 5 ampoule (Pﬁzer Ltd) £14.61 (Hospital only)
**Respiratory-tract infections, otitis media, skin and soft-tissue infections**
- With oral use
  - Adult: 500 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 40–65 kg): 250 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 30–39 kg): 200 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 20–29 kg): 150 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 10–19 kg): 100 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 5–9 kg): 50 mg once daily for 3 days
  - Child 6 months-17 years (body-weight ≤ 5 kg): 25 mg once daily for 3 days
- With intravenous use
  - Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

**Uncomplicated genital chlamydial infections | Non-gonococcal urethritis**
- With oral use
  - Adult: 1 g for 1 dose
  - Child 12-17 years: 1 g for 1 dose
- With intravenous use
  - Adult: 1 g for 1 dose

**Lyme disease [erythema migrans and/or non-focal symptoms]**
- With oral use
  - Adult: 500 mg daily for 17 days
  - Child 6 months-17 years: 250 mg once daily for 7 days

**Mild to moderate typhoid due to multiple-antibacterial resistant organisms**
- With oral use
  - Adult: 500 mg once daily for 7 days
  - Child 6 months-17 years: 250 mg once daily for 7 days

**Community-acquired pneumonia, low to moderate severity**
- With oral use
  - Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

**Community-acquired pneumonia, high severity**
- Initially by intravenous infusion
  - Adult: Initially 500 mg once daily for at least 2 days, then (by mouth) 500 mg once daily for a total duration of 7–10 days

**Antibacterial prophylaxis for insertion of intra-uterine device**
- With oral use
  - Adult: 1 g for 1 dose

**Unlicensed use**
- In children Not licensed for prevention of group A streptococcal infection.
- With oral use in adults Azithromycin may be used as detailed below, although these situations are considered outside the scope of its licence:
  - Prevention of group A streptococcal infection;
  - Uncomplicated gonorrhoea;
  - Lyme disease;
  - Mild to moderate typhoid due to multiple-antibacterial resistant organisms;
  - Community-acquired pneumonia (high severity) when oral treatment continues for more than 3 days.

**Interactions**
- Appendix 1: macrolides

**Side-effects**
- Common or very common
  - With oral use Arthralgia
  - Uncommon
  - With oral use Numbness · oedema · photosensitivity reaction
  - With parenteral use Numbness · oedema · photosensitivity reaction

**Frequency not known**
- With oral use Acute kidney injury · aggression · akathisia · haemolytic anaemia · syncope
- With parenteral use Acute kidney injury · aggression · akathisia · haemolytic anaemia · syncope

**Pregnancy**
- Manufacturers advise use only if adequate alternatives not available.

**Breast feeding**
- Present in milk; use only if no suitable alternatives.

**Hepatic impairment**
- Manufacturer advises caution; consider avoiding in severe impairment (no information available).

**Renal impairment**
- In adults Use with caution if eGFR less than 10 mL/minute/1.73 m².
- With oral use in children Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use in adults For intravenous infusion (Zedbac®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 500 mg with 4.8 mL water for injections to produce a 100 mg/mL solution, then dilute 5 mL of solution with infusion fluid to a final concentration of 1 or 2 mg/mL; give the 1 mg/mL solution over 3 hours or give the 2 mg/mL solution over 1 hour.

**Prescribing and dispensing information**
- With oral use See Lyme disease p. 577 for place in therapy and further information on treatment. Flavours of oral liquid formulations may include cherry or banana.

**Patient and carer advice**
- Medicines for Children leaflet: Azithromycin for bacterial infections www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0

**Profession specific information**
- Dental practitioners’ formulary
  - With oral use Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed.
  - Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

**Exceptions to legal category**
- With oral use Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic Chlamydia trachomatis genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

INDICATIONS AND DOSE

Respiratory-tract infections | Mild to moderate skin and soft-tissue infections

- **By mouth using immediate-release medicines**
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
  - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily
  - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily
  - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily
  - Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days
  - Child 12–17 years: 250–500 mg twice daily for 5 days
  - Adult: 250–500 mg twice daily for 5 days

- **By intravenous infusion**
  - Adult: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

Acute exacerbation of chronic obstructive pulmonary disease

- **By mouth using immediate-release medicines**
  - Adult: 500 mg twice daily for 5 days
  - By intravenous infusion
  - Adult: 500 mg every 12 hours, to be administered into a large proximal vein

Acute exacerbation of bronchiectasis

- **By mouth using immediate-release medicines**
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7–14 days
  - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7–14 days
  - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7–14 days
  - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7–14 days
  - Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7–14 days
  - Child 12–17 years: 250–500 mg twice daily for 7–14 days
  - Adult: 500 mg twice daily for 7–14 days

Acute cough [if systemically very unwell or at higher risk of complications]

- **By mouth using immediate-release medicines**
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days

Acute otitis media

- **By mouth using immediate-release medicines**
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5–7 days
  - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5–7 days
  - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5–7 days
  - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5–7 days
  - Child 12–17 years: 250–500 mg twice daily for 5–7 days
  - Adult: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections

- **By intravenous infusion**
  - Adult: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

Prevention of pertussis

- **By mouth using immediate-release medicines**
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
  - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7 days
  - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7 days
  - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7 days
  - Child 1 month–11 years (body-weight 30–49 kg): 250 mg twice daily for 7 days
  - Child 12–17 years: 500 mg twice daily for 7 days
  - Adult: 500 mg twice daily for 7 days

Helicobacter pylori eradication in combination with a proton pump inhibitor and amoxicillin

- **By mouth**
  - Adult: 500 mg twice daily

Helicobacter pylori eradication in combination with a proton pump inhibitor and metronidazole

- **By mouth**
  - Adult: 250 mg twice daily

Acute sinusitis

- **By mouth using immediate-release medicines**
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days
  - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5 days
  - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5 days
  - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5 days
  - Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days
  - Child 12–17 years: 250 mg twice daily for 5 days, alternatively 500 mg twice daily for 5 days
  - Adult: 500 mg twice daily for 5 days

UNLICENSED USE

Duration of treatment for acute sinusitis differs from product literature and adheres to
Granules

Erythromycin

- INDICATIONS AND DOSE
  Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)
  - BY MOUTH
    - Child 1-23 months: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
    - Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
    - Child 8-17 years: 250-500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections
    - Adult: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections
  - BY INTRAVENOUS INFUSION
    - Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)
    - Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment not possible, increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

  Acute cough (if systemically very unwell or at higher risk of complications)
  - BY MOUTH
    - Child 1-23 months: 125 mg 4 times a day for 5 days, alternatively 250 mg twice daily for 5 days
    - Child 2-7 years: 250 mg 4 times a day for 5 days, alternatively 500 mg twice daily for 5 days

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 9, 21, 25

- Clarie XL (Teva UK Ltd)
  Clarithromycin 500 mg Clarie XL 500mg tablets | 7 tablet (Pos) £6.72 DT = £6.72 | 14 tablet (Pos) £11.23

- Klaricid XL (Mylan)
  Clarithromycin 500 mg Klaricid XL 500mg tablets | 7 tablet (Pos) £6.72 DT = £6.72 | 14 tablet (Pos) £11.23

- Xetinin XL (Morningside Healthcare Ltd)
  Clarithromycin 500 mg Xetinin XL 500mg tablets | 7 tablet (Pos) £6.72 DT = £6.72 | 14 tablet (Pos) £11.23
### Bacterial infection

#### 540

**Unlicensed use** Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. See Ear infections, antibacterial therapy p. 511 for further information.

- In adults Erythromycin may be used for gastrointestinal stasis, but it is not licensed for this indication.
- **Caution** Avoid in Acute porphyrias p. 1058
- **Interactions** Appendix 1: macrolides
- **Side-effects**
  - General side-effects
  - Rare or very rare
- **Special side-effects**
- **Pregnancy** Not known to be harmful.
- **Breast-feeding** Only small amounts in milk—not known to be harmful.
- **Hepatic impairment** May cause idiiosyncratic hepatotoxicity.
- **Renal impairment**
  - Dose adjustments In adults Max. 1.5 g daily in severe renal impairment (ototoxicity).
  - In children Reduce dose in severe renal impairment (ototoxicity).
- **Directions for administration**
  - With intravenous use in children Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.
  - With intravenous use in adults For intravenous infusion (as lactobionate), give intermittently in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%; dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1–5 mg/mL; give over 20–60 minutes.
- **Prescribing and dispensing information** Flavours of oral liquid formulations may include banana.
- **Patient and carer advice**
  - **Profession specific information**
  - **Dental practitioners’ formulary**
    - With oral use Erythromycin tablets e/c may be prescribed. Erythromycin ethyl succinate oral suspension may be prescribed. Erythromycin stearate tablets may be prescribed. Erythromycin ethyl succinate tablets may be prescribed.
  - **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.
  - **Gastro-resistant tablet**
  - See Ear infections, antibacterial therapy p. 511 for further information.

### Acne

**By mouth**

- Adult: 500 mg twice daily

### Gastro-intestinal stasis

**By mouth**

- Adult: 250–500 mg 3 times a day for up to 4 weeks, to be taken before food
- **By intravenous infusion**
- **Child**: 3 mg/kg 3 times a day

---

#### Prevention and treatment of pertussis

**By mouth**

- **Adult**: 4–8 mg/kg every 6 hours, to be increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

#### Prevention of secondary case of diphtheria in non-immune patient

**By mouth**

- **Adult**: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment

#### Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients

**By mouth**

- **Adult**: 250–500 mg every 6 hours for 10 days

#### Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)

**By mouth**

- **Adult**: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

#### Rosacea

**By mouth**

- **Adult**: 500 mg twice daily courses usually last 6–12 weeks and are repeated intermittently

---

### By mouth

- **Child 8–17 years**: 250–500 mg 4 times a day for 5 days, alternatively 500–1000 mg twice daily for 5 days
- **Adult**: 250–500 mg 4 times a day for 5 days, alternatively 500–1000 mg twice daily for 5 days

#### Acute otitis media

**By mouth**

- **Child 1–3 months**: 125 mg 4 times a day for 5–7 days, alternatively 250 mg 4 times daily for 5–7 days
- **Child 2–7 years**: 250 mg 4 times a day for 5–7 days, alternatively 500 mg twice daily for 5–7 days
- **Child 8–17 years**: 250–500 mg 4 times a day for 5–7 days, alternatively 500–1000 mg twice daily for 5–7 days

### Early syphilis

**By mouth**

- **Adult**: 500 mg 4 times a day for 14 days

#### Uncomplicated genital chlamydia | Non-gonococcal urethritis

**By mouth**

- **Adult**: 500 mg twice daily for 14 days

#### Chronic prostatitis

**By mouth**

- **Adult**: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 4 g daily in divided doses, dose increase may be used in severe infections
- **By intravenous infusion**
  - **Adult**: 6.25 mg/kg every 6 hours, for mild infections when oral treatment is not possible, increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

#### Prevention of secondary case of diphtheria in non-immune patient

**By mouth**

- **Adult**: (consult local protocol)

#### Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients

**By mouth**

- **Adult**: 250–500 mg every 6 hours for 10 days

#### Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)

**By mouth**

- **Adult**: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

#### Rosacea

**By mouth**

- **Adult**: 500 mg twice daily courses usually last 6–12 weeks and are repeated intermittently
Aztreonam

**Drug Action**

Aztreonam is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

**Indications and Dose**

Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*:

- **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
- Adult: 1 g every 8 hours, alternatively 2 g every 12 hours, single doses over 1 g intravenous route only

**Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis**

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Adult: 2 g every 6–8 hours

**Gonorrhoea | Cystitis**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 1 g for 1 single dose

**Urinary-tract infections**

- **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Adult: 0.5–1 g every 8–12 hours

**Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis**

- **BY INHALATION OF NEBULISED SOLUTION**
  - Adult: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

**Caution**

- When used by inhalation Haemoptysis— risk of further haemorrhage

**Side-effects**

**General side-effects**

- Common or very common Dyspnoea | respiratory disorders

**Specific side-effects**

- Common or very common Cough | haemoptysis | joint disorders | laryngeal pain | nasal complaints | rash

- Rare or very rare Abdominal pain | angioedema | chest pain | confusion | diplopia | dizziness | eosinophilia | haemorrhage | headache | hepatic disorders | hypotension | insomnia | leucocytosis | myalgia | nasal congestion | neutropenia | oral disorders | pancytopenia | paraesthesia | pseudomembranous enterocolitis | seizure | thrombocytopenia | thrombocytosis | tinnitus | vertigo | vulvovaginal candidiasis

**Frequency not known**

- With parental use Anaemia | asthenia | breast tenderness | chest pain | confusion | diplopia | dizziness | eosinophilia | haemorrhage | headache | hepatic disorders | hypotension | insomnia | leucocytosis | myalgia | nasal congestion | neutropenia | oral disorders | pancytopenia | paraesthesia | pseudomembranous enterocolitis | seizure | thrombocytopenia | thrombocytosis | tinnitus | vertigo | vulvovaginal candidiasis

**Allergy and cross-sensitivity**

Contra-indicated in aztreonam hypersensitivity. Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

**Pregnancy**

- With systemic use No information available; manufacturer of injection advises avoid.
  - When used by inhalation No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

**Breast feeding**

Amount in milk probably too small to be harmful.

**Hepatic impairment**

- With systemic use Manufacturer advises caution in chronic impairment with cirrhosis.

**Dose adjustments**

- With systemic use Manufacturer advises dose reduction of 20–25% for long term treatment of patients with chronic impairment with cirrhosis, especially in alcoholic cirrhosis and concomitant renal impairment.

**Renal impairment**

- With systemic use If eGFR 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If eGFR less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.
Bacterial infection

**DERIVATIVES**

**NATIONAL FUNDING/ACCESS DECISIONS**

When used by inhalation

**DIRECTIONS FOR ADMINISTRATION**

With intravenous use For *intravenous injection*, give over 3–5 minutes. For *intravenous infusion* (Azactam®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.

When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

**MONITORING REQUIREMENTS**

When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

**MEDICATIONS**

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 753/12

The Scottish Medicines Consortium has advised (January 2015) that aztreonam powder for nebuliser solution (Cayston®) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as >2% decline in forced expiratory volume in 1 second). This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

**DOSE EQUIVALENCE AND CONVERSION**

**AntibacteriaLs > Nitroimidazole derivatives**

**Metronidazole**

**DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

**INDICATIONS AND DOSE**

**Anaerobic infections**

By mouth

- Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- Child 2 months-11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- Child 12-17 years: 400 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- Adult: 400 mg every 8 hours, alternatively 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)

By rectum

- Child 1-11 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
- Child 1-4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days

- Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
- Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
- Adult: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days

By intravenous infusion

- Adult: 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection), to be given over 20 minutes

**Helicobacter pylori eradication; in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with amoxicillin and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole**

By mouth

- Adult: 400 mg twice daily

**Helicobacter pylori eradication; in combination with amoxicillin and omeprazole**

By mouth

- Adult: 400 mg 3 times a day

**Fistulating Crohn’s disease**

By mouth

- Adult: 10–20 mg/kg daily in divided doses, usual dose 400–500 mg 3 times a day usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy

**Leg ulcers and pressure sores**

By mouth

- Adult: 400 mg every 8 hours for 7 days

**Bacterial vaginosis (notably *Gardnerella vaginalis* infection)**

By mouth

- Adult: 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Bacterial vaginosis**

By vagina using vaginal gel

- Adult: 1 applicatorful daily for 5 days, dose to be administered at night

**DOSE EQUIVALENCE AND CONVERSION**

1 applicatorful of vaginal gel delivers a 5 g dose of metronidazole 0.75%

**Pelvic inflammatory disease**

By mouth

- Adult: 400 mg twice daily for 14 days

**Acute ulcerative gengivitis**

By mouth

- Adult: 1 applicatorful daily for 5 days, dose to be administered at night

**Dose equivalence and conversion**

1 applicatorful of vaginal gel delivers a 5 g dose of metronidazole 0.75%

**Surgical prophylaxis**

By mouth

- Adult: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)
**Invasive intestinal amoebiasis | Extra-intestinal amoebiasis (including liver abscess)**

- **BY MOUTH**
  - Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Adult: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

**Urogenital trichomoniasis**

- **BY MOUTH**
  - Child 1–2 years: 50 mg 3 times a day for 7 days
  - Child 3–6 years: 100 mg twice daily for 7 days
  - Child 7–9 years: 100 mg 3 times a day for 7 days
  - Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose
  - Adult: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Giardiasis**

- **BY MOUTH**
  - Child 1–2 years: 500 mg once daily for 3 days
  - Child 3–6 years: 600–800 mg once daily for 3 days
  - Child 7–9 years: 1 g once daily for 3 days
  - Child 10–17 years: 2 g once daily for 3 days, alternatively 400–500 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days
  - Adult: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

**Established case of tetanus**

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

---

**SIDE-EFFECTS**

- Rare or very rare
  - With systemic use: Agranulocytosis, angioedema, appetite decreased, ataxia, cerebellar syndrome, confusion, diarrhoea, dizziness, drowsiness, encephalopathy, epigastric pain, epileptiform seizure (with long term or intensive therapy), flushing, hallucination, hepatic disorders, meningitis aseptic, mucositis, nerve disorders, neutropenia, pancreatitis, pancytopenia, peripheral neuropathy (with long term or intensive therapy), psychotic disorder, seizure, severe cutaneous adverse reactions (SCARs), skin reactions, thrombocytopenia, urinae dark, vision disorders

- Frequency not known
  - With systemic use: Depressed mood, gastrointestinal disorder, hearing impairment, tinnitus

- PREGNANCY
  - With systemic use: Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.

- BREAST FEEDING
  - With systemic use: Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.

- HEPATIC IMPAIRMENT
  - With systemic use: Use with caution in hepatic encephalopathy.

---

**PRESCRIBING AND DISPENSING INFORMATION**

- With systemic use: In severe liver disease reduce total daily dose to one-third, and give once daily.

---

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use: For intravenous infusion, give over 20–30 minutes.

---

**MEDICATION FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository.
**Tinidazole**

- **DRUG ACTION** Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

- **INDICATIONS AND DOSE**

**Anaerobic infections**
- **BY MOUTH**
  - Adult: Initially 2 g, followed by 1 g daily usually for 5–6 days, alternatively 500 mg twice daily usually for 5–6 days

**Bacterial vaginosis / Acute ulcerative gingivitis**
- **BY MOUTH**
  - Adult: 2 g for 1 single dose

**Abdominal surgery prophylaxis**
- **BY MOUTH**
  - Adult: 2 g once daily for 2–3 days

**Intestinal amoebiasis**
- **BY MOUTH**
  - Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
  - Child 12–17 years: 2 g once daily for 2–3 days
  - Adult: 2 g once daily for 2–3 days

**Amoebic involvement of liver**
- **BY MOUTH**
  - Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
  - Child 12–17 years: 1.5–2 g once daily for 3–6 days
  - Adult: 1.5–2 g once daily for 3–6 days

**Urogenital trichomoniasis / Giardiasis**
- **BY MOUTH**
  - Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
  - Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary
  - Adult: 2 g for 1 single dose

**Helicobacter pylori eradication**
- **BY MOUTH**
  - Adult: (consult local protocol)

- **INTERACTIONS** Appendix 1: tinidazole

- **SIDE-EFFECTS**

**Common or very common** Abdominal pain - appetite decreased - diarrhoea - headache - nausea - skin reactions - vertigo - vomiting

**Frequency not known** Angioedema - ataxia - dizziness - fatigue - flushing - Leucopenia - oral disorders - peripheral neuropathy - seizure - sensation abnormal - taste altered - tongue discolouration - urine discolouration

- **Pregnancy** Manufacturer advises avoid in first trimester.

- **Breast Feeding** Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.

- **Monitoring Requirements** Clinical and laboratory monitoring advised if treatment exceeds 10 days.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - 4, 9, 21, 25

- **Fasigyn (Pfizer Ltd)**
  - Tinidazole 500 mg Fasigyn 500mg tablets £11.04
  - 16 tablet pack

**Antibacterials**

- **Penicillins**

**Benzylpenicillin and phenoxymethylpenicillin**

Benzylpenicillin sodium p. 547 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, and leptospirosis. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, tinidazole p. 542 is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gastro-intestinal tract is low; therefore it must be given by injection.

**Benazathine benzylpenicillin** is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin p. 548 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

**Penicillinase-resistant penicillins**

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin p. 554, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Temocillin p. 555 is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter* spp.

**Broad-spectrum penicillins**

Ampicillin p. 550 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by
common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the ‘blind’ treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections.

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin p. 548) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for ‘blind’ treatment of a sore throat. The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Amoxicillin is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin is also used for the treatment of Lyme disease.

Co-amoxiclav p. 551 consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* species that would otherwise be resistant. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampicil p. 550) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

**Antipseudomonal penicillins**

Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam.

Ticarcillin, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam below has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 546 and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary tract, skin and soft tissues, or intra-abdomen. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin p. 519) since they have a synergistic effect.

**Mecillinams**

Pivmecillinam hydrochloride p. 554 has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci.

Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

---

**Penicillins**

- **DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

- **CAUTIONS** History of allergy

- **SIDE-EFFECTS**
  - Common or very common Diarrhoea - hypersensitivity - nausea - skin reactions - thrombocytopenia - vomiting
  - Uncommon Antibiotic associated colitis - leucopenia
  - Rare or very rare Agranulocytosis - angioedema - haemolytic anaemia - hepatic disorders - nephritis - tubulointerstitial - neutropenia - seizure - severe cutaneous adverse reactions (SCARs)

- **ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

**ANTIBACTERIALS > PENICILLINS, ANTIPSEUDOMONAL WITH BETALACTAMASE INHIBITOR**

**Piperacillin with tazobactam**

- **INDICATIONS AND DOSE** Hospital-acquired pneumonia | Septicaemia | Complicated infections involving the urinary-tract | Complicated infections involving the skin | Complicated infections involving the soft-tissues | Acute exacerbation of chronic obstructive pulmonary disease | Acute exacerbation of bronchiectasis
  - By intravenous infusion
  - Adult: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections
Infections in neutropenic patients

- **BY INTRAVENOUS INFUSION**
- Adult: 4.5 g every 6 hours

**UNLICENSED USE** Piperacillin with tazobactam is used for the treatment of acute exacerbation of chronic obstructive pulmonary disease, but is not licensed for this indication. See Respiratory system infections, antibacterial therapy p. 515 for further information.

**CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)

**INTERACTIONS** → Appendix 1: penicillins

**SIDE-EFFECTS**
- **Common or very common** Anaemia - candida infection - constipation - gastrointestinal discomfort - headache - insomnia
- **Uncommon** Arthralgia - flushing - hypokalaemia - hypotension - myalgia - thrombophlebitis
- **Frequency not known** Eosinophilia - pancytopenia - pneumonia eosinophilic - renal failure - thrombocytosis

**PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.

**BREAST FEEDING** Trace amount in milk, but appropriate to use.

**RENA L IMPAIRMENT**
- **Dose adjustments** Max. 4.5 g every 8 hours if eGFR 20–40 mL/minute/1.73 m². Max. 4.5 g every 12 hours if eGFR less than 20 mL/minute/1.73 m².

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION** For **intravenous infusion**, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially (2.25 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (Tazocin® brand only), or sodium chloride 0.9%, then dilute to 50–150 mL with infusion fluid; give over 30 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Powder for solution for infusion**

- **ELECTROLYTES:** May contain Sodium
- **Piperacillin with tazobactam (Non-proprietary)**
  - **Tazocin (Pfizer Ltd)**
    - **Tazocin (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram** Tazocin 2g/0.25g powder for solution for infusion vials | 1 vial £7.65 DT = £7.65

**Tazocin with clavulanic acid**

**INDICATIONS AND DOSE**

Infections due to *Pseudomonas* and *Proteus spp.*

- **BY INTRAVENOUS INFUSION**
- Adult: 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

**CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)

**CAUTIONS, FURTHER INFORMATION**

- **Choledonic jaundice** Choledonic jaundice is possibly associated with clavulanic acid. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav (amoxicillin, clavulanic acid) than with amoxicillin. Choledonic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

**INTERACTIONS** → Appendix 1: clavulanic acid - penicillins

**SIDE-EFFECTS** Eosinophilia - haemorrhage - hypokalaemia - thrombophlebitis

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Trace amounts in milk, but appropriate to use.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

**RENA L IMPAIRMENT** Accumulation of electrolytes contained in preparation can occur in patients with renal failure.

- **Dose adjustments** Reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m²; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m²; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m².

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION** For **intravenous infusion** (Timentin®), give intermittently in Glucose 5%. Suggested volume (depending on dose) 100–150 mL; give over 30–40 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Powder for solution for infusion**

- **ELECTROLYTES:** May contain Potassium, sodium
- **Timentin (GSK/SmithKline UK Ltd)**
  - **Clavulanic acid (as Potassium clavulanate) 200 mg, Ticarcillin (as Ticarcillin sodium) 3 gram** Timentin 3.2g powder for solution for infusion vials | 4 vial £21.32
**ANTIBACTERIALS > PENICILLINS, BETA-LACTAMASE SENSITIVE**

**Benzylpenicillin sodium (Penicillin G)**

- **INDICATIONS AND DOSE**

  - **Mild to moderate susceptible infections**
    - **Throat infections**
    - **Otitis media**
    - **Cellulitis**
    - **Pneumonia**
    - **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - **Adult:** 0.6–1.2 g every 6 hours, dose may be increased if necessary in more serious infections (consult product literature), single doses over 1.2 g to be given by intravenous route only

  - **Endocarditis (in combination with other antibacterials if necessary)**
    - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** 1.2 g every 4 hours, increased if necessary to 2.4 g every 4 hours, dose may be increased in infections such as enterococcal endocarditis

  - **Anthrax (in combination with other antibacterials)**
    - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** 2.4 g every 4 hours

  - **Intrapartum prophylaxis against group B streptococcal infection**
    - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** Initially 3 g for 1 dose, then 1.5 g every 4 hours until delivery

  - **Meningitis / Meningococcal disease**
    - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** 2.4 g every 4 hours
    - **BY INTRAMUSCULAR INJECTION**
    - **Neonate up to 7 days:** 50 mg/kg every 12 hours.
    - **Neonate 7 days to 28 days:** 50 mg/kg every 8 hours.
    - **Child:** 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

  - **Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital**
    - **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - **Child 1–11 months:** 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
    - **Child 1–9 years:** 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
    - **Child 10–17 years:** 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
    - **Adult:** 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

  - **Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently**
    - **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - **Child 1–11 months:** 300 mg, administer as single dose prior to transfer to hospital
    - **Child 1–9 years:** 600 mg, administer as single dose prior to transfer to hospital

- **UNLICENSED USE**
  - In adults Benzylpenicillin doses in the BNF may differ from those in product literature.

- **IMPORTANT SAFETY INFORMATION**
  - Intrathecal injection of benzylpenicillin is not recommended.

- **CAUTIONS**
  - Accumulation of sodium from injection can occur with high doses
  - **INTERACTIONS > Appendix 1: penicillins**
  - **SIDE-EFFECTS**
    - **Fever**
    - **Jarisch-Herxheimer reaction**
    - **Coma**
  - **PREGNANCY**
  - **BREAST FEEDING**
  - **RENAI IMPAIRMENT**
  - **DIRECTIONS FOR ADMINISTRATION**
    - With intravenous use in children Intravenous route recommended in neonates and infants. **For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.**
    - With intravenous use in adults **For intravenous infusion (Crystapen), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Continuous infusion not usually recommended.**

- **MEDICINAL FORMS**
  - There may be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

- **Powder for solution for injection**
  - **ELECTROLYTES:** May contain Sodium
  - **Benzy|penicillin sodium (Non-proprietary)**
    - Benzylpenicillin sodium 600 mg Benzylpenicillin 600mg powder for solution for injection vials | 2 vial | £6.01–£6.08 DT = £6.08 | 25 vial | £75.12–£76.00
    - Benzylpenicillin sodium 1.2 gram Benzylpenicillin 1.2g powder for solution for injection vials | 25 vial | £109.49–£113.92 DT = £113.92

www.getintopharma.com
Phenoxymethylpenicillin
(Penicillin V)

**INDICATIONS AND DOSE**

**Oral infections | Tonsillitis | Otitis media | Erysipelas | Cellulitis**

- **BY MOUTH**
  - Child 1-11 months: 62.5 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
  - Child 1-5 years: 125 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
  - Child 6-11 years: 250 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
  - Child 12-17 years: 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day
  - Adult: 500 mg every 6 hours, increased if necessary up to 1 g every 6 hours

**Prevention of recurrence of rheumatic fever**

- **BY MOUTH**
  - Child 1-month–5 years: 125 mg twice daily
  - Child 6-17 years: 250 mg twice daily
  - Adult: 250 mg twice daily

**Prevention of secondary case of invasive group A streptococcal infection**

- **BY MOUTH**
  - Child 1-11 months: 62.5 mg every 6 hours for 10 days
  - Child 1-5 years: 125 mg every 6 hours for 10 days
  - Child 6-11 years: 250 mg every 6 hours for 10 days
  - Child 12-17 years: 250–500 mg every 6 hours for 10 days
  - Adult: 250–500 mg every 6 hours for 10 days

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease**

- **BY MOUTH**
  - Child 1-11 months: 62.5 mg twice daily
  - Child 1-4 years: 125 mg twice daily
  - Child 5-17 years: 250 mg twice daily
  - Adult: 250 mg twice daily

**Acute sinusitis**

- **BY MOUTH**
  - Child 1-11 months: 62.5 mg 4 times a day for 5 days
  - Child 1-5 years: 125 mg 4 times a day for 5 days
  - Child 6-11 years: 250 mg 4 times a day for 5 days
  - Child 12-17 years: 500 mg 4 times a day for 5 days
  - Adult: 500 mg 4 times a day for 5 days

**UNLICENSED USE**

Duration of treatment for acute sinusitis adheres to national guidelines. See Sinusitis (acute) p. 1203 for further information.

**INTERACTIONS**

- Appendix 1: penicillins

**SIDE-EFFECTS**

- Arthralgia, circulatory collapse, coagulation disorder, eosinophilia, faeces soft, fever, increased risk of infection, neurotoxicity, oral disorders, paraesthesia

**PREGNANCY**

Not known to be harmful.

**BREAST FEEDING**

Trace amounts in milk, but appropriate to use.

**EFFECT ON LABORATORY TESTS**

False-positive urinary glucose (if tested for reducing substances).

**PROFESSIONAL INFORMATION**

Dental practitioners’ formulary

Phenoxymethylpenicillin Tablets may be prescribed. Phenoxymethylpenicillin Oral Solution may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Phenoxymethylpenicillin (as Phenoxymethylpenicillin potassium)**
  - 25 mg per 1 ml
  - Phenoxymethylpenicillin 125mg/5ml oral solution | 100 ml (PSt) £34.00 DT + £4.28
  - Phenoxymethylpenicillin 125mg/5ml oral solution sugar free | 100 ml (PSt) £25.00 DT + £7.10

- **Phenoxymethylpenicillin (as Phenoxymethylpenicillin potassium)**
  - 50 mg per 1 ml
  - Phenoxymethylpenicillin 250mg/5ml oral solution | 100 ml (PSt) £35.00 DT + £5.23
  - Phenoxymethylpenicillin 250mg/5ml oral solution sugar free | 100 ml (PSt) £35.00 DT + £7.72

**Tablet**

- **Phenoxymethylpenicillin (Non-proprietary)**
  - Phenoxymethylpenicillin (as Phenoxymethylpenicillin potassium)
  - 250 mg
  - Phenoxymethylpenicillin 250mg tablets | 28 tablet (PSt) £5.00 DT + £10.93

**ANTIBACTERIALS | PENICILLINS, BROAD-SPECTRUM**

Amoxicillin
(Amoxyccillin)

**INDICATIONS AND DOSE**

Susceptible infections (including urinary-tract infections, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)

- **BY MOUTH**
  - Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
  - Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections
  - Adult: 500 mg every 8 hours, increased if necessary to 1 g every 8 hours, increased dose used in severe infections

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 500 mg every 8 hours

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 500 mg every 8 hours, increased to 1 g every 6 hours, use increased dose in severe infections

**Acute exacerbation of bronchiectasis**

- **BY MOUTH**
  - Child 1-11 months: 125 mg 3 times a day for 7–14 days
  - Child 1-4 years: 250 mg 3 times a day for 7–14 days
  - Child 5-17 years: 500 mg 3 times a day for 7–14 days
  - Adult: 500 mg every 3 times a day for 7–14 days

**Acute exacerbation of chronic obstructive pulmonary disease**

- **BY MOUTH**
  - Adult: 500 mg 3 times a day for 5 days, increased if necessary to 1 g 3 times a day, increased dose used in severe infections

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 500 mg every 8 hours, increased to 1 g every 6 hours, increased dose used in severe infections
Acute cough [if systemically very unwell or at higher risk of complications]
- **BY MOUTH**
  - Child 1-11 months: 125 mg 3 times a day for 5 days
  - Child 1-4 years: 250 mg 3 times a day for 5 days
  - Child 5-17 years: 500 mg 3 times a day for 5 days
  - Adults: 500 mg 3 times a day for 5 days

**Acute otitis media**
- **BY MOUTH**
  - Child 1-11 months: 125 mg 3 times a day for 5–7 days
  - Child 1-4 years: 250 mg 3 times a day for 5–7 days
  - Child 5-17 years: 500 mg 3 times a day for 5–7 days

**Lyme disease** (erythema migrans and/or non-focal symptoms) [Lyme disease (affecting cranial nerves or peripheral nervous system)]
- **BY MOUTH**
  - Adult: 1 g 3 times a day for 21 days

**Lyme arthritis** | **Acrodermatitis chronica atrophicans**
- **BY MOUTH**
  - Adult: 1 g 3 times a day for 28 days

**Anthrax (treatment and post-exposure prophylaxis)**
- **BY MOUTH**
  - Adult: 500 mg 3 times a day

**Dental abscess (short course)**
- **BY MOUTH**
  - Adult: 3 g, then 3 g after 8 hours

**Urinary-tract infections (short course)**
- **BY MOUTH**
  - Adult: 3 g, then 3 g after 10–12 hours

**Listerial meningitis** (in combination with another antibiotic)
- **BY INTRAVENOUS INFUSION**
  - Adult: 2 g every 4 hours

**Endocarditis** (in combination with another antibiotic if necessary)
- **BY INTRAVENOUS INFUSION**
  - Adult: 2 g every 4 hours

**Helicobacter pylori eradication** in combination with metronidazole and omeprazole
- **BY MOUTH**
  - Adult: 500 mg 3 times a day

**Helicobacter pylori eradication** in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with metronidazole and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole
- **BY MOUTH**
  - Adult: 1 g twice daily

---

**SPECIFIC CAUTIONS**
- With intravenous use accumulation of sodium can occur with high parenteral doses
- **INTERACTIONS** → Appendix 1: penicillins
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Rare or very rare: Colitis haemorrhagic - crystalluria - dizziness - hyperkinesia - hypersensitivity vasculitis - mucocutaneous candidiasis
    - Frequency not known: Jarisch-Herxheimer reaction
  - **SPECIFIC SIDE-EFFECTS**
    - Rare or very rare: With oral use Black hairy tongue
    - **PREGNANCY** Not known to be harmful.
    - **BREAST FEEDING** Trace amount in milk, but appropriate to use.

**RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy). With intravenous use accumulation of sodium from injection can occur in patients with renal failure. Dose adjustments Reduce dose in severe impairment; rashes more common.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use in adults For intravenous infusion (Amoxil®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes or give via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

**PRESCRIBING AND DISPENSING INFORMATION** See Lyme disease p. 577 for place in therapy and further information on treatment.
- Flavours of oral liquid formulations and sachets may include peach, strawberry, or lemon.

**PATIENT AND CARER ADVICE** Patient counselling is advised for Amoxicillin (Amoxil®) paediatric suspension (use of pipette).

**PROFESSION SPECIFIC INFORMATION**
- Dental practitioners’ formulary
- Amoxicillin capsules may be prescribed.
- Amoxicillin sachets may be prescribed as Amoxicillin Oral Powder.
- Amoxicillin Oral Suspension may be prescribed.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **ELECTROLYTES:** May contain Sodium
  - **Amoxicillin (as Amoxicillin sodium) 250 mg**
    - 10 vial £4.80
    - 10 vial [Pmax] £4.50
  - **Amoxicillin (as Amoxicillin sodium) 500 mg**
    - 10 vial £9.60 DT = £5.48
    - 10 vial [Pmax] £12.00 DT = £5.48 (Hospital only)
  - **Amoxicillin (as Amoxicillin sodium) 1 gram**
    - 1 vial £1.92
    - 10 vial [Pmax] £16.50 DT = £10.96 (Hospital only)
  - **Amoxil®** (GlaxoSmithKline UK Ltd)
    - **Amoxicillin (as Amoxicillin sodium) 500 mg**
      - 10 vial £5.48 DT = £5.48
    - **Amoxicillin (as Amoxicillin sodium) 1 gram**
      - 10 vial [Pmax] £10.96 DT = £10.96

---

**UNLICENSED USE** Amoxicillin doses in BNF Publications may differ from those in product literature. Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. See Ear infections, antibacterial therapy p. 511 for further information.

Amoxicillin is used for the treatment of acute exacerbation of bronchiectasis, but is not licensed for this indication. See Respiratory system infections, antibacterial therapy p. 515 for further information.

**CAUTIONS**
- **GENERAL CAUTIONS**
  - Acute lymphocytic leukaemia (increased risk of erythematous rashes).
  - Chronic lymphocytic leukaemia (increased risk of erythematous rashes). Cytomegalovirus infection (increased risk of erythematous rashes).
  - Glandular fever (erythematous rashes). Maintain adequate hydration with high doses (particularly during parenteral therapy).

Combinations available: Co-amoxiclav, p. 551

SPECIFIC CAUTIONS

▶ With intravenous use accumulation of electrolytes contained in parenteral preparations can occur with high doeses

SIDE-EFFECTS

Colitis haemorrhagic

PREGNANCY

Not known to be harmful.

BREAST FEEDING

Trace amounts in milk, but appropriate to use.

RENAL IMPAIRMENT

With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

Dose adjustments

In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common.

In children If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common.

DIRECTIONS FOR ADMINISTRATION

With oral use Administer at least 30 minutes before food.

With intravenous use in adults For intravenous infusion (Penbritin®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%. Continuous infusion not usually recommended.

INDICATIONS AND DOSE

Mixed infections involving beta-lactamase-producing staphylococci

BY MOUTH

Child 1 month–9 years: 125/250 mg every 6 hours
Child 10–17 years: 250/500 mg every 6 hours
Adult: 250/500 mg every 6 hours

BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Adult: 250/500 mg every 6 hours

SEVERE MIXED INFECTIONS INVOLVING Beta-lactamase-producing staphylococci

BY MOUTH

Child 1 month–9 years: 250/500 mg every 6 hours
Adult: 500/500 mg every 6 hours

www.getintopharma.com
Capsule  
**CAUTIONARY AND ADVISORY LABELS 9, 22**  
Co-fluampicil (Non-proprietary)  
Ampicillin (as Ampicillin trihydrate) 250 mg, Flucloxacillin (as Flucloxacillin sodium) 250 mg  
Co-fluampicil 250mg/250mg capsules  | 28 capsule (-Pack) £2.27 DT + £1.95  
100 capsule (Pack) £6.96

**ANTIBACTERIALS > PENICILLINS, BROAD-SPECTRUM WITH BETA-LACTAMASE INHIBITOR**

**Co-amoxiclav**

**INDICATIONS AND DOSE**  
Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites  
**BY MOUTH USING TABLETS**  
Child 12-17 years: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection  
Adult: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection  
**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**  
Child 1-2 months: 30 mg/kg every 12 hours, intravenous infusion recommended in children less than 3 months  
Child 3 months-17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)  
Adult: 1.2 g every 8 hours  
**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 125/31 suspension)**  
**BY MOUTH USING ORAL SUSPENSION**  
Child 1-11 months: 0.25 mg/kg 3 times a day, dose doubled in severe infection  
Child 1-5 years: 0.25 mg/kg 3 times a day, alternatively 5 ml 3 times a day, dose doubled in severe infection  
**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 250/62 suspension)**  
**BY MOUTH USING ORAL SUSPENSION**  
Child 6-11 years: 0.15 mg/kg 3 times a day, alternatively 5 ml 3 times a day, dose doubled in severe infection  
**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 400/57 suspension)**  
**BY MOUTH USING ORAL SUSPENSION**  
Child 2-23 months: 0.15 mg/kg twice daily, doubled in severe infection  
Child 2-6 years (body-weight 13-21 kg): 2.5 ml twice daily, doubled in severe infection  
Child 7-12 years (body-weight 22-40 kg): 5 ml twice daily, doubled in severe infection  
Child 12-17 years (body-weight 41 kg and above): 10 ml twice daily; increased if necessary to 10 ml 3 times a day, increased frequency to be used in severe infection  
Adult: 10 ml twice daily; increased if necessary to 10 ml 3 times a day, increased frequency to be used in severe infection  

---

**Bacterial infection 551**

**BNF 78**

---

**IMPORTANT SAFETY INFORMATION**

**HEPATIC DISORDERS**  
Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:  
- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;  
- flucloxacillin should be used with caution in patients with hepatic impairment;  
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibiotics.

**CAUTIONS**

**GENERAL CAUTIONS**  
Acute lymphocytic leukaemia (increased risk of erythematous rashes).  
Chronic lymphocytic leukaemia (increased risk of erythematous rashes).  
Cytomegalovirus infection (increased risk of erythematous rashes).  
Glandular fever (erythematous nodosum).  
Musculoskeletal disorder: Jarisch-Herxheimer reaction.  
Respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites.

**SPECIFIC CAUTIONS**

- With intravenous use accumulation of electrolytes contained in parenteral preparations can occur with high doses.
- **INTERACTIONS**  
  - Appendix 1: penicillins
- **SIDE-EFFECTS**  
- **PREGNANCY**  
  - Not known to be harmful.
- **BREAST FEEDING**  
  - Not appropriate to use.
- **HEPATIC IMPAIRMENT**  
  - Manufacturer advises use with caution in hepatic dysfunction.
- **RENAL IMPAIRMENT**  
  - With intravenous use accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.
  - **Dose adjustments**  
    - In adults: Reduce dose if eGFR less than 10 ml/minute/1.73 m²; rashes more common.
    - In children: Reduce dose or frequency if estimated glomerular filtration rate less than 10 ml/minute/1.73 m²; rashes more common.
- **EFFECT ON LABORATORY TESTS**  
  - False-positive urinary glucose (if tested for reducing substances).
- **PRESCRIBING AND DISPENSING INFORMATION**  
  - Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS 9, 22**  
Co-fluampicil (Non-proprietary)  
Ampicillin (as Ampicillin trihydrate) 25 mg per 1 ml Flucloxacillin (as Flucloxacillin magnesius) 25 mg per 1 ml (Co-fluampicil 125mg/125mg/5ml oral suspension)  
100 ml (Pack) £23.93 DT + £23.93

**Powder for solution for injection**

**ELECTROLYTES:** May contain Sodium

Co-fluampicil (Non-proprietary)  
Ampicillin (as Ampicillin sodium) 250 mg, Flucloxacillin (as Flucloxacillin sodium) 250 mg (Co-fluampicil 250mg/250mg powder for solution for injection vials)  
10 vial (Pack) £13.33

www.getintopharma.com
Severe dental infection with spreading cellulitis | Dental infection not responding to first-line antibacterial

- **BY MOUTH USING TABLETS**
  - Child 12-17 years: 250/125 mg every 8 hours for 5 days
  - Adult: 250/125 mg every 8 hours for 5 days

Surgical prophylaxis

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 1.2 g, to be administered up to 30 minutes before the procedure, then 1.2 g every 8 hours for up to 2–3 further doses in high risk procedures

Acute exacerbation of bronchiectasis (doses for 125/31 suspension)

- **BY MOUTH USING ORAL SUSPENSION**
  - Child 1-11 months: 0.25 mL/kg/3 times a day for 7–14 days
  - Child 1–5 years: 5 mL 3 times a day for 7–14 days, alternatively 0.25 mL/kg/3 times a day for 7–14 days

Acute exacerbation of bronchiectasis (doses for 250/62 suspension)

- **BY MOUTH USING ORAL SUSPENSION**
  - Child 6-11 years: 5 mL 3 times a day for 7–14 days, alternatively 0.15 mL/kg/3 times a day for 7–14 days
  - Adult: 500/125 mg 3 times a day for 7–14 days
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child 1–2 months: 30 mg/kg every 12 hours, intravenous infusion is recommended in children less than 3 months
  - Child 3 months-17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)
  - Adult: 1.2 g every 8 hours

Acute exacerbation of chronic obstructive pulmonary disease

- **BY MOUTH USING TABLETS**
  - Adult: 500/125 mg 3 times a day for 5 days
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 1.2 g every 8 hours

Acute sinusitis (doses for 125/31 suspension)

- **BY MOUTH USING ORAL SUSPENSION**
  - Child 1-11 months: 0.25 mL/kg/3 times a day for 5 days
  - Child 1–5 years: 5 mL 3 times a day for 5 days, alternatively 0.25 mL/kg/3 times a day for 5 days

Acute sinusitis (doses for 250/62 suspension)

- **BY MOUTH USING ORAL SUSPENSION**
  - Child 6–11 years: 5 mL 3 times a day for 5 days, alternatively 0.15 mL/kg/3 times a day for 5 days

Acute sinusitis

- **BY MOUTH USING TABLETS**
  - Child 12-17 years: 250/125 mg 3 times a day for 5 days, alternatively 500/125 mg 3 times a day for 5 days
  - Adult: 500/125 mg 3 times a day for 5 days

Acute otitis media (doses for 125/31 suspension)

- **BY MOUTH USING ORAL SUSPENSION**
  - Child 1-11 months: 0.25 mL/kg/3 times a day for 5–7 days
  - Child 1–5 years: 5 mL 3 times a day for 5–7 days, alternatively 0.25 mL/kg/3 times a day for 5–7 days

Acute otitis media (doses for 250/62 suspension)

- **BY MOUTH USING ORAL SUSPENSION**
  - Child 6–11 years: 5 mL 3 times a day for 5–7 days, alternatively 0.15 mL/kg/3 times a day for 5–7 days

Acute otitis media

- **BY MOUTH USING TABLETS**
  - Child 12-17 years: 250/125 mg 3 times a day for 5–7 days, alternatively 500/125 mg 3 times a day for 5–7 days

Dose equivalence and conversion

- Doses are expressed as co-amoxiclav.
- A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form \( x/y \) where \( x \) and \( y \) are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

**UNLICENSED USE** Duration of treatment for acute sinusitis differs from product literature and adheres to national guidelines. See Sinusitis (acute) p. 1203 for further information.

**CONTRA-INDICATIONS** History of co-amoxiclav-associated jaundice or hepatic dysfunction - history of penicillin-associated jaundice or hepatic dysfunction.

**CAUTIONS**

- **GENERAL CAUTIONS** Acute lymphocytic leukaemia (increased risk of erythematous rashes) - chronic lymphocytic leukaemia (increased risk of erythematous rashes) - cytomegalovirus infection (increased risk of erythematous rashes) - glandular fever (erythematous rashes common) - maintain adequate hydration with high doses (particularly during parental therapy)

**SPECIFIC CAUTIONS**

- With intravenous use accumulation of electrolytes contained in parenteral preparations can occur with high doses

**INTERACTIONS** → Appendix 1: clavulanic acid - penicillins

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - Common or very common: Increased risk of infection
  - Uncommon: Dizziness - dyspepsia - headache
  - **Frequency not known**
    - Colitis haemorrhagic - crystalluria - hypersensitivity vasculitis - meningitis aseptic

**SPECIFIC SIDE-EFFECTS**

- With oral use: Akathisia - black hairy tongue
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

www.getintopharma.com
**RENAIL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy).

**With intravenous use** Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

**Dose adjustments** With oral use in adults Co-amoxiclav 250/125 tablets or 500/125 tablets: if eGFR 10–30 mL/minute/1.73 m², one 250/125 strength tablet every 12 hours or one 500/125 strength tablet every 12 hours; if eGFR less than 10 mL/minute/1.73 m², one 250/125 strength tablet every 24 hours or one 500/125 strength tablet every 24 hours. Co-amoxiclav 400/57 suspension: avoid if eGFR less than 30 mL/minute/1.73 m².

With intravenous use in adults Co-amoxiclav injection (expressed as co-amoxiclav): If eGFR 10–30 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 12 hours; if eGFR less than 10 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 24 hours.

With oral use in children Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

Co-amoxiclav 400/57 suspension: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

With intravenous use in children Co-amoxiclav injection: use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

With intravenous use in children For intravenous infusion, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. For intravenous injection, administer over 3–4 minutes.

With intravenous use in adults For intravenous infusion (Augmentin®), give intermittently in Sodium Chloride 0.9%. Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid; reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid; give over 30–40 minutes. For intravenous injection, administer over 3–4 minutes. Via drip tubing in Sodium Chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION** Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

With oral use Flavours of oral liquid formulations may include raspberry and orange.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Co-amoxiclav for bacterial infections www.medicinesforchildren.org.uk/co-amoxiclav-bacterial-infections-0

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary Co-amoxiclav 250/125 Tablets may be prescribed. Co-amoxiclav 125/31 Suspension may be prescribed. Co-amoxiclav 250/62 Suspension may be prescribed.

**ANTIBACTERIALS > PENICILLINS, MECILLINAM-TYPE**

**Pivmecillinam hydrochloride**

- **INDICATIONS AND DOSE**
  - **Acute uncomplicated cystitis**
    - **BY MOUTH**
      - Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours to a total of 10 tablets.
      - Adult (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours to a total of 10 tablets.
  - **Chronic or recurrent bacteriuria**
    - **BY MOUTH**
      - Child (body-weight 40 kg and above): 400 mg every 6–8 hours.
      - Adult (body-weight 40 kg and above): 400 mg every 6–8 hours.
  - **Urinary-tract infections**
    - **BY MOUTH**
      - Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses.

- **UNLICENSED USE**
  - In children Not licensed for use in children under 3 months.
  - **CONTRA-INDICATIONS** Carnitine deficiency; gastrointestinal obstruction; infants under 3 months; oesophageal strictures.
  - **CAUTIONS** Avoid in Acute porphyrias p. 1058.
  - **INTERACTIONS** → Appendix 1: penicillins.
  - **SIDE-EFFECTS**
    - Common or very common Vulvovaginal fungal infection
    - Uncommon Dizziness; fatigue; gastrointestinal discomfort; gastrointestinal disorders; headache; oral ulceration; vertigo.
  - **PREGNANCY** Not known to be harmful, but manufacturer advises avoid.
  - **BREAST FEEDING** Trace amount in milk, but appropriate to use.
  - **MONITORING REQUIREMENTS** Liver and renal function tests required in long-term use.
  - **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).
  - **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.
  - **PATIENT AND CARER ADVICE** Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).

    - Pivmecillinam hydrochloride 200 mg Selexid 200mg tablets 10 tablet £5.40 DT = £5.40 18 tablet £9.72

**Flucloxacillin**

- **INDICATIONS AND DOSE**
  - **Infections due to beta-lactamase-producing staphylococci including otitis externa**
  - **Adjunct in pneumonia**
  - **Adjunct in impetigo**
  - **Adjunct in cellulitis**
    - **BY MOUTH**
      - Child 1 month–1 year: 6.25–125 mg 4 times a day.
      - Child 2–9 years: 125–250 mg 4 times a day.
      - Child 10–17 years: 250–500 mg 4 times a day.
      - Adult: 250–500 mg 4 times a day.
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: 250–500 mg every 6 hours.
    - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Adult: 0.25–2 g every 6 hours.
  - **Endocarditis (in combination with other antibacterial if necessary)**
    - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Adult: Up to 8 g daily in 3–4 divided doses.
  - **Surgical prophylaxis**
    - **INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Adult: 1–2 g, to be administered up to 30 minutes before the procedure, then (by mouth or by intramuscular injection or by slow intravenous injection or by intravenous infusion) 500 mg every 6 hours if required for up to 4 further doses in high risk procedures.
  - **Staphylococcal lung infection in cystic fibrosis**
    - **BY MOUTH**
      - Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day.
  - **Prevention of Staphylococcus aureus lung infection in cystic fibrosis—primary prevention**
    - **BY MOUTH**
      - Child 1 month–3 years: 125 mg twice daily.
  - **Prevention of Staphylococcus aureus lung infection in cystic fibrosis—secondary prevention**
    - **BY MOUTH**
      - Child: 50 mg/kg twice daily (max. per dose 1 g twice daily).

- **UNLICENSED USE**
  - In adults Flucloxacillin doses in the BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION**

**HEPATIC DISORDERS**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- Flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin.
Flucloxacillin should be used with caution in patients with hepatic impairment.
- Careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

**Cautions**
- With intravenous use, accumulation of electrolytes can occur with high doses.
- **Interactions** → Appendix 1: penicillins.

**Side-effects**
**General side-effects**
- Rare or very rare: Arthralgia; fever.
- Common or very common: With oral use, Gastrointestinal disorder.
- Rare or very rare: With oral use, Eosinophilia; myalgia.
- Frequency not known:
  - With parenteral use, bronchospasm; coma; dyspnoea; electrolyte imbalance; erythema nodosum; hallucination; Jarisch-Herxheimer reaction; nephropathy; neurotoxicity; oral candidiasis; platelet dysfunction; purpura; non-thrombocytopenic; vasculitis.
- **Pregnancy** Not known to be harmful.

**Breastfeeding**
Trace amounts in milk, but appropriate to use.

**Hepatic impairment**
Manufacturer advises caution; including in those with risk factors for hepatic reactions.

**Renal impairment**
- With intravenous use: Accumulation of electrolytes can occur in patients with renal failure.
  - **Dose adjustments**:
    - In adults: Reduce dose if eGFR less than 10 mL/minute/1.73 m².
    - In children: Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**Effect on laboratory tests**
False-positive urinary glucose (if tested for reducing substances).

**Directions for administration**
- With intravenous use in adults:
  - For intravenous infusion (Fluospen®), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

**Patient and carer advice**

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion.

**Oral solution**
CAUTIONARY AND ADVISORY LABELS 9, 23
- **Flucloxacillin (Non-proprietary)**
- **Flucloxacillin (as Flucloxacillin sodium) 25 mg per 1 ml Flucloxacillin 125mg/5ml oral solution:** 100 ml Flucloxacillin (Non-proprietary) £20.99 + £6.37
  - Flucloxacillin 125mg/5ml oral solution sugar-free sugar-free: 100 ml Flucloxacillin (Non-proprietary) £26.70 + £21.05
- **Flucloxacillin (as Flucloxacillin sodium) 50 mg per 1 ml Flucloxacillin 250mg/5ml oral solution sugar-free sugar-free:** 100 ml Flucloxacillin (Non-proprietary) £33.09 + £31.71

**Capsule**
CAUTIONARY AND ADVISORY LABELS 9, 23
- **Flucloxacillin (Non-proprietary)**
- **Flucloxacillin (as Flucloxacillin sodium) 250 mg Flucloxacillin 250mg capsules:** 28 capsule Flucloxacillin (Non-proprietary) £1.42 + £1.42
  - 100 capsule Flucloxacillin (Non-proprietary) £4.50 + £1.80

**Powder for solution for injection**
- **Flucloxacillin (Non-proprietary)**
- **Flucloxacillin (as Flucloxacillin sodium) 500 mg Flucloxacillin 500 mg capsules:** 28 capsule Flucloxacillin (Non-proprietary) £10.50 + £2.34
  - 100 capsule Flucloxacillin (Non-proprietary) £18.36 + £17.50

**Powder for solution for injection**
- **Flucloxacillin (Non-proprietary)**
- **Flucloxacillin (as Flucloxacillin sodium) 250 mg Flucloxacillin 250 mg powder for solution for injection.vials:** 10 vial Flucloxacillin (Non-proprietary) £8.60 + £8.60
  - Hospital only)
- **Flucloxacillin (as Flucloxacillin sodium) 500 mg Flucloxacillin 500 mg powder for solution for injection.vials:** 10 vial Flucloxacillin (Non-proprietary) £12.25 + £12.25
  - Hospital only)
- **Flucloxacillin (as Flucloxacillin sodium) 1 gram Flucloxacillin 1g powder for solution for injection.vials:** 10 vial Flucloxacillin (Non-proprietary) £34.50 + £34.50
  - Hospital only)
- **Flucloxacillin (as Flucloxacillin sodium) 2 gram Flucloxacillin 2g powder for solution for injection.vials:** 1 vial Flucloxacillin (Non-proprietary) £6.00 + £6.00
  - Hospital only)

**Combinations available:** Co-fluampicil, p. 550

**Temocillin**

- **Indications and dose**
  - Septicaemia brakes
  - **By intramuscular injection, or by slow intravenous injection**, or by intravenous infusion.
  - Adult: 2 g every 12 hours, alternatively 2 g every 8 hours, higher daily dose to be used in critically ill patients.
  - **By continuous intravenous infusion.**
  - Adult: (consult product literature).

**Cautions**
Accumulation of sodium from injection can occur with high doses.

**Interactions** → Appendix 1: penicillins.

**Side-effects**
Arthralgia; fever; myalgia; nervous system disorder; thrombophlebitis.

**Pregnancy**
Not known to be harmful.

**Breastfeeding**
Trace amounts in milk.

**Renal impairment**
Accumulation of sodium from injection can occur in patients with renal failure.

**Dose adjustments**
Manufacturer advises reduce usual dose to 1 g every 12 hours if creatinine clearance 30–60 mL/min; reduce usual dose to 1 g every 24 hours if creatinine clearance 30–50 mL/min.; reduce usual dose to 1 g every 48 hours or 500 mg every 24 hours if creatinine clearance less than 10 mL/min; no information available to recommend dose adjustments with higher daily dose for use in critically ill patients.

**Effect on laboratory tests**
False-positive urinary glucose (if tested for reducing substances).

**Directions for administration**
Manufacturer advises for intramuscular injection, reconstitute 1 g with 2 mL water for injections or Sodium chloride 0.9% (or 0.5 or 1% lidocaine solution, if pain is experienced at injection site). Manufacturer advises for slow intravenous injection, reconstitute 1 g with 10 mL water for injections or Sodium chloride 0.9%; give over 3–4 minutes. Manufacturer advises for intermittent intravenous infusion, give in Glucose 5% or 10% or Sodium chloride 0.9% or Ringer’s solution or Lactated Ringer’s solution. Reconstitute 1 g with 10 mL water for injections or infusion fluid, then dilute in up to 150 mL infusion fluid; give over 30–40 minutes. For continuous intravenous infusion, consult product literature.
**Bacterial infection**

**Colistimethate sodium**

**Drug action** The polymyxin antibiotic, colistimethate sodium (colistin sulfomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

**Indications and dose**

**Serious infections due to selected aerobic Gram-negative bacteria in patients with limited treatment options**

- **By intravenous infusion**
  - Adult: 9 million units daily in 2–3 divided doses, an initial loading dose of 9 million units should be used in those who are critically ill, loading and maintenance doses of up to 12 million units may be required in some cases, however clinical experience is limited and safety has not been established — consult product literature for details.

**Management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis**

- **By inhalation of nebulised solution**
  - Adult: 9 million units daily in 2–3 divided doses, an initial loading dose of 9 million units should be used in those who are critically ill, loading and maintenance doses of up to 12 million units may be required in some cases, however clinical experience is limited and safety has not been established — consult product literature for details.

**Contra-indications** Myasthenia gravis

**Cautions**

**General cautions** Children under 1 year of age (effects of immature renal and metabolic function on conversion to active colistin not known) (in children)

**Specific cautions**

- When used by inhalation Severe haemoptysis — risk of further haemorrhage

**Interactions**

- Appendix 1: colistimethate

**Side-effects**

**Common or very common**

- Arthralgia, asthenia, asthma, balance impaired, chest discomfort, cough, dysphonia, dysphagia, fever, haemorrhage, headache, lower respiratory tract infection, nausea, respiratory disorders, taste altered, throat complaints, tinnitus, vomiting

**Uncommon**

- Anxiety, appetite decreased, diarrhoea, drowsiness, ear congestion, flatulence, oral disorders, proteinuria, seizure, sputum purulent, thirst, weight change

**Rare or very rare**

- With parental use Confusion, nephrotoxicity, presyncope, psychosis, speech slurred, visual impairment

**Frequency not known**

- With parental use Apnoea, neurological effects, neurotoxicity, renal disorder, sensory disorder

**Side-effects, further information** Neurotoxicity and nephrotoxicity are dose-related.

**Pregnancy**

- When used by inhalation Clinical use suggests probably safe.

- When used by inhalation Manufacturer advises use only if potential benefit outweighs risk.

**Breast feeding** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

**Hepatic impairment**

- With intravenous use. Manufacturer advises caution (no information available).

**Renal impairment**

- When used by inhalation. Manufacturer advises caution.

**Dose adjustments**

- With intravenous use. Manufacturer advises reduce maintenance dose if creatinine clearance less than 50 mL/minute — consult product literature.

**Monitoring**

- With intravenous use. Monitor renal function.

- With intravenous use. Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

**Directions for administration**

- When used by inhalation. Manufacturer advises if other treatments are being administered, they should be taken in the order recommended by the physician. For nebulisation, consult product literature for information on reconstitution and dilution.

- With intravenous use. For intravenous infusion, manufacturer advises following reconstitution, dilute requisite dose, usually with 50 mL Sodium Chloride 0.9%; give over 30–60 minutes. Patients fitted with a totally implantable venous access device may tolerate an injection. For slow intravenous injection into a totally implantable venous access device, dilute to a concentration of 200 000 units/mL with Sodium Chloride 0.9%; give over at least 5 minutes.

**Prescribing and dispensing information**

Colistimethate sodium is included in some preparations for topical application.

**Patient and carer advice**

- When used by inhalation Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.

- Driving and skilled tasks. Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks — increased risk of dizziness, confusion and visual disturbances.

**National funding/access decisions**

**NICE decisions**

- Colistimethate sodium and tobramycin dry powders for inhalation for treating pseudomonas lung infection in cystic fibrosis (March 2013) NICE TA276

Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for
inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta276

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

- Powder for solution for injection
  - ELECTROLYTES: May contain Sodium
    - Colistimethate sodium (Non-proprietary)
      - Colistimethate sodium 1000000 unit powder for solution for injection vials | 10 vial | £30.00 DT + £18.00 DT = £18.00 (Hospital only)
    - Colomycin (Teva UK Ltd)
      - Colistimethate sodium 1000000 unit powder for solution for injection vials | 10 vial | £32.40 DT + £18.00 DT = £18.00
    - Colistimethate sodium 2000000 unit powder for solution for injection vials | 10 vial | £37.50 DT + £18.00 (Hospital only)
  - Inhalation powder
    - Colobreathe (Teva UK Ltd)
      - Colistimethate sodium 1662500 unit inhalation powder capsules | 36 capsule | £66.80 DT + £968.80
  - Powder for nebuliser solution
    - Promixin (Profile Pharma Ltd)
      - Colistimethate sodium 1000000 unit powder for nebuliser solution unit dose vials | 30 unit dose | £240.00

ANTIBACTERIALS > QUINOLONES

Quinolones

31-Oct-2017

- MHRA/CHM advice: Systemic and inhaled fluoroquinolones (November 2018, and March 2019)

  The MHRA and CHM have released important safety information regarding the use of systemic and inhaled fluoroquinolones. For restrictions and precautions, see Important safety information for all quinolones. Ciprofloxacin p. 558, levofloxacin p. 559, moxifloxacin p. 560, and ofloxacin p. 561.

  Overview

  In the UK, only fluoroquinolones are available; the recommendations below therefore refer to the use of fluoroquinolones.

  Ciprofloxacin is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including Salmonella, Shigella, Campylobacter, Neisseria, and Pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as Streptococcus pneumoniae and Enterococcus faecalis; it should not be used for pneumococcal pneumonia. It is active against Chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), infections of the gastrointestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicaemia caused by sensitive organisms.

  Ofloxacin is licensed for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

  Levofloxacin is active against Gram–positive and Gram-negative organisms. It has greater activity against Pseudomonas than ciprofloxacin.

  Many Staphylococci are resistant to quinolones and their use should be avoided in MRSA infections.

  Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including Pseudomonas, than ciprofloxacin. Moxifloxacin is not active against Pseudomonas aeruginosa or meticillin-resistant Staphylococcus aureus (MRSA).

Quinolones

IMPORTANT SAFETY INFORMATION

The CSM has warned that quinolones may induce convulsions in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

Tendon damage

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

MHRA/CHM ADVICE: SYSTEMIC AND INHALED FLUOROQUINOLONES: SMALL INCREASED RISK OF AORTIC ANEURYSM AND DISSECTION; ADVICE FOR PRESCRIBING IN HIGH-RISK PATIENTS (NOVEMBER 2018)

The MHRA advises that benefit-risk should be assessed and other therapeutic options considered before using fluoroquinolones in patients at risk of aortic aneurysm and dissection. Patients (particularly the elderly and those at risk) and their carers should be informed about rare events of aortic aneurysm and dissection, and advised to seek immediate medical attention if sudden-onset severe abdominal, chest, or back pain develops.

MHRA/CHM ADVICE: FLUOROQUINOLONE ANTIBIOTICS: NEW RESTRICTIONS AND PRECAUTIONS FOR USE DUE TO VERY RARE REPORTS OF DISABLING AND POTENTIALLY LONG-LASTING OR IRREVERSIBLE SIDE EFFECTS (MARCH 2019)

Disabling, long-lasting or potentially irreversible adverse reactions affecting musculoskeletal and nervous systems have been reported very rarely with fluoroquinolone antibiotics. Healthcare professionals are advised to inform patients to stop treatment at the first signs of a serious adverse reaction, such as tendinitis or tendon rupture, muscle pain, muscle weakness, joint pain, joint swelling, peripheral neuropathy, and CNS effects, and to contact their doctor immediately. Fluoroquinolones should not be prescribed for non-severe or self-limiting infections, or non-bacterial conditions. Unless other commonly recommended antibiotics are inappropriate, fluoroquinolones should not be prescribed for some mild to moderate infections, such as acute exacerbation of chronic bronchitis and chronic obstructive pulmonary disease, and ciprofloxacin or levofloxacin should not be prescribed for uncomplicated cystitis. Fluoroquinolones should be avoided in patients who have previously had serious adverse reactions. Use of fluoroquinolones with corticosteroids should also be avoided as it may exacerbate fluoroquinolone-induced tendinitis and tendon rupture. Fluoroquinolones should be prescribed with caution in patients older than 60 years and in...
patients with renal impairment or solid-organ transplants as they are at a higher risk of tendon injury.

**CONTRA-INDICATIONS** History of tendon disorders related to quinolone use

**CAUTIONS** Can prolong the QT interval; children or adolescents (arthropathy has developed in weight-bearing joints in young animals) in children; conditions that predispose to seizures - diabetes (may affect blood glucose); exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs); G6PD deficiency - history of epilepsy - myasthenia gravis (risk of exacerbation)

**CAUTIONS, FURTHER INFORMATION**

- Use in children: Quinolones cause arthropathy in the weight-bearing joints of immature animals and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of ciprofloxacin may be justified in children.

**SIDE-EFFECTS**

- **Common or very common** Appetite decreased - arthralgia - asthenia - constipation (in adults) - diarrhoea - dizziness - dyspnoea - eye discomfort - eye disorders - fever - gastrointestinal discomfort - headache - muscle complaints - nausea - QT interval prolongation - skin reactions - sleep disorders - taste altered - tinnitus - vision disorders - vomiting

- **Rare or very rare** Agranulocytosis - angioedema - arthritis - cardiac arrest (in adults) - gait abnormal - haemolytic anaemia - hyperglycaemia - hypoglycaemia - idiopathic intracranial hypertension - muscle weakness - myasthenia gravis aggravated - nephritis tubulointerstitial - pancreatitis - pancytopenia - peripheral neuropathy (sometimes irreversible) - photosensitivity reaction - polyneuropathy - psychotic disorder - severe cutaneous adverse reactions (SCARs) - stomatitis (in adults) - suicidal tendencies - syncope - vasculitis

- **Frequency not known** Corneal deposits (reversible after completion of treatment) - hypoglycaemic coma - increased risk of aortic aneurysm (more common in elderly) - increased risk of aortic dissection (more common in elderly) - ligament rupture - rhabdomyolysis (in adults) - self-endangering behaviour

**SIDE-EFFECTS, FURTHER INFORMATION** The drug should be discontinued if neurological, psychiatric, tendon disorders or hypersensitivity reactions (including severe rash) occur. For more information regarding the safety of fluoroquinolones, please see Important Safety Information.

**ALLERGY AND CROSS-SENSITIVITY** Use of quinolones contra-indicated in quinolone hypersensitivities.

**PREGNANCY** Avoid in pregnancy—shown to cause arthropathy in animal studies; safer alternatives are available.

**PATIENT AND CARER ADVICE** The MHRA has produced an advice sheet on serious adverse reactions affecting musculoskeletal and nervous systems associated with fluoroquinolone use, which should be provided to patients and their carers.

## Ciprofloxacin

**INDICATIONS AND DOSE**

**Fistulating Crohn’s disease**
- **BY MOUTH**
  - Adult: 500 mg twice daily

**Respiratory-tract infections**
- **BY MOUTH**
  - Adult: 500–750 mg twice daily
- **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Pseudomonal lower respiratory-tract infection in cystic fibrosis**
- **BY MOUTH**
  - Adult: 750 mg twice daily

**Urinary-tract infections**
- **BY MOUTH**
  - Adult: 250–750 mg twice daily
- **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Acute uncomplicated cystitis in women**
- **BY MOUTH**
  - Adult: 250 mg twice daily for 3 days

**Acute or chronic prostatitis**
- **BY MOUTH**
  - Adult: 500 mg twice daily for 28 days
- **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Gonorrhoea**
- **BY MOUTH**
  - Adult: 500 mg for 1 dose

**Most other infections**
- **BY MOUTH**
  - Adult: Initially 500 mg twice daily; increased to 750 mg twice daily, in severe or deep-seated infection
- **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Surgical prophylaxis**
- **BY MOUTH**
  - Adult: 750 mg, to be taken 60 minutes before procedure

**Anthrax (treatment and post-exposure prophylaxis)**
- **BY MOUTH**
  - Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
  - Child 5–11 years: 250 mg for 1 dose
  - Child 12–17 years: 500 mg for 1 dose
  - Adult: 500 mg for 1 dose

**Prevention of secondary case of meningococcal meningitis**
- **BY MOUTH**
  - Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
  - Child 5–11 years: 250 mg for 1 dose
  - Child 12–17 years: 500 mg for 1 dose
  - Adult: 500 mg for 1 dose

**UNLICENSED USE** Not licensed for use in children for prophylaxis of meningococcal meningitis.

**CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) - avoid excessive alkalinity of urine (risk of crystalluria) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) -...
ensure adequate fluid intake (risk of crystalluria) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)

- INTERACTIONS → Appendix 1: quinolones

- SIDE-EFFECTS
  - Common or very common  Arthropathy (in children)
  - Rare or very rare  Bone marrow depression · crystalluria · erythema nodosum · haematuria · intracranial pressure increased · leucocytosis · migraine · muscle tone increased · status epilepticus
  - Frequency not known  Mood altered

- PREGNANCY  A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.

- BREAST FEEDING  Amount too small to be harmful but manufacturer advises avoid.

- RENAL IMPAIRMENT
  - Dose adjustments
    - With oral use in adults  Give 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
    - With intravenous use in adults  Give (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
    - In children  Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—consult product literature.

- PRESCRIBING AND DISPENSING INFORMATION
  - With oral use  Flavours of oral liquid formulations may include strawberry.

- PATIENT AND CARER ADVICE
  - Medicines for Children leaflet: Ciprofloxacin for bacterial infections (Bayer Plc)
  - Driving and skilled tasks  May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

- MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Tablet**
  - CAUTIONARY AND ADVISORY LABELS  T, 9, 25
  - Ciprofloxacin (Non-proprietary)

  - Ciprofloxacin (as Ciprofloxacin lactate) 2 mg per 1 ml Ciprofloxacin 200mg/100ml infusion bags 5 bag [PO] £60.00 (Hospital only)
  - Ciprofloxacin 400mg/200ml infusion bags 5 bag [PO] £85.00 (Hospital only) 10 bag [PO] £200.00–£228.46 (Hospital only)

Levofloxacin

- INDICATIONS AND DOSE
  - Acute sinusitis
    - BY MOUTH
      - Adult: 500 mg once daily for 10–14 days

  - Acute exacerbation of chronic obstructive pulmonary disease
    - BY MOUTH
      - Adult: 500 mg once daily for 5 days

  - Acute exacerbation of bronchiectasis
    - BY MOUTH
      - Adult: 500 mg 1–2 times a day for 7–14 days
      - BY INTRAVENOUS INFUSION
      - Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

  - Community-acquired pneumonia
    - BY MOUTH
      - Adult: 500 mg 1–2 times a day for 7–14 days
      - BY INTRAVENOUS INFUSION
      - Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

  - Urinary-tract infections
    - BY MOUTH
      - Adult: 500 mg once daily for 7–14 days

  - Urinary-tract infections (uncomplicated infection)
    - BY MOUTH
      - Adult: 250 mg once daily for 3 days

  - Complicated urinary-tract infections
    - BY INTRAVENOUS INFUSION
      - Adult: 500 mg once daily, to be given over at least 60 minutes

  - Chronic prostatitis
    - BY MOUTH
      - Adult: 500 mg once daily for 28 days
      - BY INTRAVENOUS INFUSION
      - Adult: 500 mg once daily, to be given over at least 60 minutes

  - Complicated skin infections / Complicated soft-tissue infections
    - BY MOUTH
      - Adult: 500 mg 1–2 times a day for 7–14 days
      - BY INTRAVENOUS INFUSION
      - Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

  - Inhalation of anthrax (treatment and post-exposure prophylaxis)
    - BY MOUTH
      - Adult: 500 mg once daily for 8 weeks

www.getintopharma.com
unlicensed use \(^{212}\) Duration of treatment for acute exacerbation of chronic obstructive pulmonary disease differs from product literature and adheres to national guidelines. \(^{212}\) See Respiratory system infections, antibacterial therapy p. 515 for further information.

interactions \(^{212}\) \(^{212}\) Levofoxacin is used for the treatment of acute exacerbation of bronchiectasis, \(^{212}\) but is not licensed for this indication. See Respiratory system infections, antibacterial therapy p. 515 for further information.

cautions History of psychiatric illness \(^{212}\) risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)

interactions \(^{212}\) Side-effects

common or very common

- When used by inhalation: Bronchial secretion changes 
- Dysphonia 
- Haemoptysis 
- Weight decreased

uncommon

- When used by inhalation: Costochondritis 
- Hyperbilirubinaemia 
- Joint stiffness

rare or very rare

- With oral and intravenous use: Paranoia

frequency not known

- With oral and intravenous use: Diarrhoea haemorrhagic

side-effects, further information Systemic side-effects may occur with nebulised levofloxacin.

bronchospasm Manufacturer advises if acute symptomatic bronchospasm occurs after receiving nebulised levofloxacin, patients may benefit from the use of a short-acting inhaled bronchodilator at least 15 minutes to 4 hours prior to subsequent doses.

breast feeding Manufacturer advises avoid.

renal impairment

Dose adjustments

- With intravenous use or oral use: usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m\(^2\); consult product literature if eGFR less than 20 mL/minute/1.73 m\(^2\).

- When used by inhalation: Manufacturer advises avoid if creatinine clearance less than 20 mL/minute.

patient and carer advice

- When used by inhalation: Manufacturer advises patients and carers should be given advice on how to administer levofloxacin.

- Missed doses: When used by inhalation: Manufacturer advises if a dose is more than 4 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- Driving and skilled tasks: May impair performance of skilled tasks (e.g. driving).

national funding/access decisions

Scottish medicines consortium (SMC) decisions

The Scottish medicines consortium has advised (August 2016) that levofloxacin (Quinsair®) is accepted for restricted use within NHS Scotland for the management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis, as a third-line treatment option after colistimethate sodium (first line) and tobramycin (second line). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales medicines strategy Group (AWMSG) decisions

The All Wales medicines strategy Group has advised (November 2016) that levofloxacin (Quinsair®) is recommended as an option for restricted use within NHS Wales as third-line therapy for the management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis, who do not respond to, or are intolerant of, second-line treatment with tobramycin, only if the approved Wales patient access scheme (WPAS) is used or where the list price is equivalent or lower.

medicinal forms There can be variation in the licensing of different medicines containing the same drug.

tablet

Cautionary and advisory labels 6, 9, 25

- Levofloxacin (Non-proprietary)

- Levofloxacin (as Levofloxacin hemihydrate) 250 mg

- 250 mg tablets | 5 tablet | £1.19-1.74 | 10 tablet | £4.84

- DT = £3.80

- Levofloxacin (as Levofloxacin hemihydrate) 500 mg

- 500 mg tablets | 5 tablet | £7.90-£12.93 | 10 tablet | £25.85

- DT = £23.10

solution for infusion

Electrolytes: May contain Sodium

- Levofloxacin (Non-proprietary)

- Levofloxacin (as Levofloxacin hemihydrate) 5 mg per

- 1 ml Levofloxacin 500 mg/100 ml solution for infusion vials | 1 vial | £11.80 (Hospital only)

- Levofloxacin 500 mg/100 ml solution for infusion bottles | 1 bottle | £12.00 | 10 bottle | £26.00

Nebuliser liquid

- Quinsair (Chiesi Ltd)

- Levofloxacin (as Levofloxacin hemihydrate) 100 mg per

- 1 ml Quinsair 240 mg nebuliser solution ampoules | 16 ampoule | £2.18

Infusion

- Levofloxacin (Non-proprietary)

- Levofloxacin (as Levofloxacin hemihydrate) 5 mg per

- 1 ml Levofloxacin 500 mg/100 ml infusion bags | 10 bag | £250.00 (Hospital only)

- 20 bag | £502.00 (Hospital only)

Moxifloxacin

- Indications and dose

  Sinusitis

  - By mouth

  - adult: 400 mg once daily for 7 days

Community-acquired pneumonia

- By mouth

- adult: 400 mg once daily for 7–14 days

- By intravenous infusion

- adult: 400 mg once daily for 7–14 days, to be given over 60 minutes

Exacerbations of chronic bronchitis

- By mouth

- adult: 400 mg once daily for 5–10 days

Mild to moderate pelvic inflammatory disease

- By mouth

- adult: 400 mg once daily for 14 days

Complicated skin and soft-tissue infections which have failed to respond to other antibiotics or for patients who cannot be treated with other antibiotics

- By mouth

- adult: 400 mg once daily for 7–21 days

- By intravenous infusion

- adult: 400 mg once daily for 7–21 days, to be given over 60 minutes

- Contra-indications Acute myocardial infarction (risk factor for QT interval prolongation), bradycardia (risk factor for QT interval prolongation), sick sinus syndrome, long QT syndrome, QT interval prolongation.
factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

INTERACTIONS  ➔ Appendix 1: quinolones

SIDE-EFFECTS

With oral and intravenous use  Angina pectoris - dehydration - gastritis - hyperlipidaemia - malaise - pelvic pain

Rare or very rare

With oral and intravenous use  Concentration impaired - depersonalisation - dysphagia - emotional lability - generalised tonic-clonic seizure - hypertension - hyperuricaemia - memory loss - self-injurious behaviour - speech disorder

BREAST FEEDING  Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT  Manufacturer advises avoid in severe impairment or increased transaminases (5 times upper limit of normal).

PATIENT AND CARER ADVICE

Driving and skilled tasks  May impair performance of skilled tasks (e.g. driving).

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS  6, 9

Moxifloxacin (Non-proprietary)

Moxifloxacin (as Moxifloxacin hydrochloride) 400 mg Moxifloxacin 400mg tablets  5 tablet  £11.81 DT = £9.54

Avelox (Bayer Plc)

Moxifloxacin (as Moxifloxacin hydrochloride) 400 mg Avelox 400mg tablets  5 tablet  £12.43 DT = £9.54

Solution for infusion

ELECTROLYTES: May contain Sodium

Moxifloxacin (Non-proprietary)

Moxifloxacin (as Moxifloxacin hydrochloride) 1.6 mg per 1 ml Moxifloxacin 400mg/250ml solution for infusion bottles  10 bottle  £399.50-£509.90 (Hospital only)

Avelox (Bayer Plc)

Moxifloxacin (as Moxifloxacin hydrochloride) 1.6 mg per 1 ml Avelox 400mg/250ml solution for infusion bottles  1 bottle  £39.95 (Hospital only)  5 bottle  £199.75 (Hospital only)

Ofloxacin

INDICATIONS AND DOSE

Urinary-tract infections

BY MOUTH

Adult: 200–400 mg daily, preferably taken in the morning; increased if necessary to 400 mg twice daily, in upper urinary tract infections

Complicated urinary-tract infection

BY INTRAVENOUS INFUSION

Adult: 200 mg daily, increased if necessary to 400 mg twice daily, dose increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

Acute or chronic prostatitis

BY MOUTH

Adult: 200 mg twice daily for 28 days

Lower respiratory-tract infections

BY MOUTH

Adult: 400 mg daily, dose preferably taken in the morning, then increased if necessary to 400 mg twice daily

BY INTRAVENOUS INFUSION

Adult: 200 mg twice daily, increased to 400 mg twice daily, dose to be increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

Skin and soft-tissue infections

BY MOUTH

Adult: 400 mg twice daily

BY INTRAVENOUS INFUSION

Adult: 400 mg twice daily, to be given over at least 30 minutes for each 200 mg

Uncomplicated gonorrhoea

BY MOUTH

Adult: 400 mg as a single dose

Uncomplicated genital chlamydial infection  Non-gonococcal urethritis

BY MOUTH

Adult: 400 mg daily for 7 days, dose may be taken as a single daily dose or in divided doses

Pelvic inflammatory disease

BY MOUTH

Adult: 400 mg twice daily for 14 days

CAUTIONS  Acute myocardial infarction (risk factor for QT interval prolongation) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of psychiatric illness - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

INTERACTIONS  ➔ Appendix 1: quinolones

SIDE-EFFECTS

Rare or very rare

With oral and intravenous use  Enterocolitis - enterocolitis haemorrhagic

Frequency not known

With oral and intravenous use  Bone marrow failure - myopathy - nephritis acute interstitial

BREAST FEEDING  Amount probably too small to be harmful but manufacturer advises avoid.

HEPATIC IMPAIRMENT  Manufacturer advises caution.

Dose adjustments  Manufacturer advises maximum 400 mg daily in hepatic failure (risk of decreased elimination).

RENAL IMPAIRMENT  usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m²

PATIENT AND CARER ADVICE

Driving and skilled tasks  May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Infection

ANTIBACTERIALS

Co-trimoxazole

- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

- **INDICATIONS AND DOSE**
  - **Treatment of susceptible infections**
    - **BY MOUTH**
      - Child: 120 mg twice daily, alternatively 24 mg/kg twice daily
      - Child: 240 mg twice daily, alternatively 24 mg/kg twice daily
      - Child 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
      - Child 12–17 years: 960 mg twice daily
      - Adult: 960 mg twice daily
    - **BY INTRAVENOUS INFUSION**
      - Adult: 960 mg every 12 hours, increased to 1.44 g every 12 hours, increased dose used in severe infection

  - **Acute exacerbation of chronic obstructive pulmonary disease**
    - **BY MOUTH**
      - Adult: 960 mg twice daily for 5 days
    - **BY INTRAVENOUS INFUSION**
      - Adult: 960 mg every 12 hours, increased if necessary to 1.44 g every 12 hours, increased dose used in severe infection

  - **Treatment of Pneumocystis jiroveci (Pneumocystis carinii) infections** (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)
    - **BY MOUTH**
      - Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children
      - Adult: 120 mg/kg daily in 2–4 divided doses for 14–21 days

  - **Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) infections**
    - **BY MOUTH**
      - Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines
      - Adult: 960 mg once daily, reduced if not tolerated to 480 mg once daily, alternatively 960 mg once daily on alternate days, alternate day dose to be given 3 times weekly, alternatively 960 mg twice a day on alternate days, alternate day dose to be given 3 times weekly

  - **DOSE EQUIVALENCE AND CONVERSION**
    - 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

- **SIDE-EFFECTS**
  - Common or very common: Diarrhoea, electrolyte imbalance, fungal overgrowth, headache, nausea, skin reactions
  - Uncommon: Vomiting
  - Rare or very rare: Agranulocytosis, angioedema, aplastic anaemia, appetite decreased, arthralgia, ataxia, cough, depression, dizziness, dyspnoea, eosinophilia, fever, haemolysis, haemolytic anaemia, hallucination, hepatic disorders, hypoglycaemia, leucopenia, lung infiltration, megaloblastic anaemia, meningitis, aseptic meningitis, metabolic acidosis, methaemoglobinemia, myalgia, myocarditis, allergic, nephritis, tubulointerstitial, neutropenia, oral disorders, pancreatitis, peripheral neuritis, photosensitivity reaction, pseudomembranous enterocolitis, renal impairment, renal tubular acidosis, seizure, serum sickness, severe cutaneous adverse reactions (SCARs), systemic lupus erythematosus (SLE), thrombocytopenia, tinnitus, urticaria, vasculitis, vertigo

- **INTERACTIONS**
  - Appendix 1: sulfonamides, trimethoprim

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome or toxic epidermal necrolysis) develop.

- **PREGNANCY**
  - Teratogenic risk in first trimester (trimethoprim is a folate antagonist). Neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

- **BREAST FEEDING**
  - Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid in severe liver disease.

- **RENAL IMPAIRMENT**
  - In adults Avoid if eGFR less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.
  - In children Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.

- **IN CHILDREN**
  - Not licensed for use in children under 6 weeks.

- **IMPORTANT SAFETY INFORMATION**
  - **RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE**
    - Co-trimoxazole is the drug of choice in the prophylaxis and treatment of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia; it is also indicated for nocardiosis, Stenotrophomonas maltophilia infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract where there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by Burkholderia cepacia in cystic fibrosis [unlicensed indication].

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 1058
  - **CAUTIONS**
    - Asthma - avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus - elderly (increased risk of serious side-effects) - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency - predisposition to hyperkalaemia

- **UNLICENSED USE**
  - Not licensed for Burkholderia cepacia infections in cystic fibrosis. Not licensed for Stenotrophomonas maltophilia infections.
**Dose adjustments**

- In adults: Use half normal dose if eGFR 15–30 mL/minute/1.73 m².
- In children: Use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor blood counts on prolonged treatment.
- In children: Plasma concentration monitoring may be required with high doses; seek expert advice.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in adults: For intermittent intravenous infusion, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.
- With intravenous use in children: For intermittent intravenous infusion (Septrin® for infusion), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

- Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts. Flavours of oral liquid formulations may include banana, or vanilla.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Excipients:** May contain Alcohol, propylene glycol, sulfites
- **Electrolytes:** May contain Sodium
- **Co-trimoxazole (Non-proprietary)**
  - Trimethoprim 16 mg per 1 ml, Sulfamethoxazole 80 mg per 1 ml Co-trimoxazole 80mg/400mg/5ml solution for infusion ampoules | 10 ampoule | £35.00 DT + £35.00

**Oral suspension**

- CAUTIONARY AND ADVISORY LABELS
- **Co-trimoxazole (Non-proprietary)**
  - Trimethoprim 8 mg per 1 ml, Sulfamethoxazole 40 mg per 1 ml Co-trimoxazole 40mg/200mg/5ml oral suspension sugar free | 100 ml [Pip] £3.95–£3.96 DT + £3.96
  - Trimethoprim 16 mg per 1 ml, Sulfamethoxazole 80 mg per 1 ml Co-trimoxazole 80mg/400mg/5ml oral suspension | 100 ml | £10.95–£10.96 DT + £10.96

**Tablet**

- CAUTIONARY AND ADVISORY LABELS
- **Co-trimoxazole (Non-proprietary)**
  - Trimethoprim 80 mg, Sulfamethoxazole 400 mg Co-trimoxazole 80mg/400mg tablets | 28 tablet | £15.50 DT + £2.01 | 100 tablet [Pip] £7.18–£10.91
  - Trimethoprim 160 mg, Sulfamethoxazole 800 mg Co-trimoxazole 160mg/800mg tablets | 100 tablet [Pip] £23.40–£23.46 DT + £23.46

**Sulfadiazine**

(Sulfaphidazine)

- **DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

- **INDICATIONS AND DOSE**
  - Prevention of rheumatic fever recurrence
  - **By mouth**
  - Adult (body-weight up to 30 kg): 500 mg daily
  - Adult (body-weight 30 kg and above): 1 g daily

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

Sulfadiazine has been confused with sulfasalazine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058
- **CAUTIONS** Asthma - avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus - elderly - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency - predisposition to hyperkaemia
- **INTERACTIONS**
  - Appendix 1: sulfonamides
- **SIDE-EFFECTS**
  - Rare or very rare: Haemolytic anaemia

- **SIDE-EFFECTS, FURTHER INFORMATION** Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis) develop.

- **PREGNANCY** Risk of neonatal haemolyis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment or jaundice.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.
**Tetracyclines**

**Overview**

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline below with either streptomycin or rifampicin p. 582), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 539).

Tetracyclines have a role in the management of meticillin-resistant *Staphylococcus aureus* (MRSA) infection. Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline (including Q-fever), brucella (doxycycline below with either streptomycin or rifampicin p. 582), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 539).

Tetracyclines sometimes cause irreversible pigmentation.

**Tetracyclines**

- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) · systemic lupus erythematosus (may be exacerbated)
- **SIDE-EFFECTS**
  - Common or very common Angioedema, diarrhoea, headache, Hoench-Schönlein purpura, hypersensitivity, nausea, pericarditis, photosensitivity reaction, skin reactions · systemic lupus erythematosus exacerbated · vomiting
  - Rare or very rare Appetite decreased, discoloration of thyroid gland, dysphagia, eosinophilia, fontanelle bulging (in infants), gastrointestinal disorders, haemolytic anaemia, hepatic disorders, idiopathic intracranial hypertension · increased risk of infection · neutropenia · oral disorders · pancreatitis · pseudodemembranous enterocolitis · Stevens-Johnson syndrome · thrombocytopenia
  - Frequency not known Dizziness · tooth discolouration
- **SIDE-EFFECTS, FURTHER INFORMATION** Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment if raised intracranial pressure develops).
- **PREGNANCY** Should not be given to pregnant women; effects on skeletal development have been documented in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **HEPATIC IMPAIRMENT** Should be avoided or used with caution in patients with hepatic impairment.

**INDICATIONS AND DOSE**

**Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)**

- **BY MOUTH**
  - Adult: 150 mg 4 times a day, alternatively 300 mg twice daily

**Treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable**

- **BY MOUTH**
  - Adult: Initially 0.9–1.2 g daily in divided doses, maintenance 600–900 mg daily

**CAUTIONS** Photosensitivity more common than with other tetracyclines

**INTERACTIONS** → Appendix 1: tetracyclines

**SIDE-EFFECTS**

- Rare or very rare: Agranulocytosis · aplastic anaemia · hearing impairment · nephritis · severe cutaneous adverse reactions (SCARs)
- Frequency not known: Intracranial pressure increased · muscle weakness · nephrogenic diabetes insipidus · vision disorders
- **HEPATIC IMPAIRMENT** Dose adjustments: Max. 1 g daily in divided doses.

**RENAI IMPAIRMENT** May exacerbate renal failure and should not be given to patients with renal impairment.

**PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight or sun lamps.

Child 12-17 years: 100 mg twice daily for 28 days
Adult: 100 mg twice daily for 28 days

Neurosyphilis
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: 200 mg twice daily for 28 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Child 12-17 years: 100 mg twice daily for 7 days
Adult: 100 mg twice daily for 7 days

Pelvic inflammatory disease
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Child 12-17 years: 100 mg twice daily for 14 days
Adult: 100 mg twice daily for 14 days

Lyme disease [erythema migrans and/or non-focal symptoms] | Lyme disease [affecting cranial nerves or peripheral nervous system] | Lyme carditis
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: 200 mg daily in 1–2 divided doses for 21 days

Lyme disease [affecting central nervous system]
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: 400 mg daily in 1–2 divided doses for 21 days

Lyme arthritis | Acrodermatitis chronica atrophicans
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: 200 mg daily in 1–2 divided doses for 28 days

Anthrax (treatment or post-exposure prophylaxis)
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Child 12-17 years: 100 mg twice daily
Adult: 100 mg twice daily

Prophylaxis of malaria
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Child 12-17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years
Adult: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

Adjuct to quinine in treatment of Plasmodium falciparum malaria
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Child 12-17 years: 200 mg daily for 7 days
Adult: 200 mg daily for 7 days

Periodontitis (as an adjunct to gingival scaling and root planing)
▶ BY MOUTH USING DISPERSIBLE TABLETS
Adult: 100 mg twice daily, continue treatment for at least 3 days after fever subsides, minimum treatment duration is 5–7 days

Unlicensed use
Doxycycline may be used as detailed below, although these situations are considered outside the scope of its licence:

† IV/IM Duration of treatment for acute sinusitis (d), see Sinusitis (acute) p. 1203 for further information;
† IV/IM Lyme disease (d);
† treatment or post-exposure prophylaxis of anthrax;
† malaria prophylaxis during pregnancy;
† recurrent aphthous ulceration.
In adults Immediate-release doxycycline may be used for the treatment of rosacea, but it is not licensed for this indication.

Caution
Alcohol dependence

Interactions
Appendix 1: tetracyclines

Side-effects
Common or very common
Dyspnoea • hypotension • peripheral oedema • tachycardia
Uncommon
Gastrointestinal discomfort
Rare or very rare
Antibiotic associated colitis • anxiety • arthralgia • flushing • intracranial pressure increased with papilloedema • Jarisch–Herxheimer reaction • myalgia • photosensitisation • severe cutaneous adverse reactions (SCARs) • skin hyperpigmentation (long term use) • tinnitus • vision disorders

Pregnancy
When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation.

Renal impairment
Use with caution (avoid excessive doses).

Monitoring requirements
When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.

Directions for administration
Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.

Prescribing and dispensing information
See Lyme disease p. 577 for place in therapy and further information on treatment.

Patient and carer advice
Counselling on administration advised.
**Minocycline**

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily
  - Adult: 100 mg twice daily

Acne

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily
  - Adult: 100 mg once daily, alternatively 50 mg twice daily

Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 100 mg twice daily for 5 days, minocycline treatment is usually followed by administration of rifampicin

**CAUTIONS** Systemic lupus erythematosus

**INTERACTIONS** → Appendix 1: tetracyclines

**SIDE-EFFECTS**

- Rare or very rare Acute kidney injury - hearing impairment - respiratory disorders - tinnitus

- Frequency not known Alopecia - antibiotic associated colitis - arthralgia - ataxia - breast secretion - conjunctival discoloration - drug reaction with eosinophilia and systemic symptoms (DRESS) - dyspepsia - hyperbilirubinaemia - hyperhidrosis - polyarteritis nodosa - sensation abnormal - tear discolouration - tongue discolouration - vertigo

**RENAL IMPAIRMENT** Use with caution (avoid excessive doses).

**MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

**DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.

**PATIENT AND CARER ADVICE** Counselling on administration advised (posture).

**LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

| Capsule |

| Minocycline (as Minocycline hydrochloride) 100 mg | Minocycline 100 mg modified-release capsules | 56 capsule (PO) £20.08 DT = £20.08 |
Oxytetracycline

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
- **BY MOUTH**
  - Child 12-17 years: 250–500 mg 4 times a day
  - Adult: 250–500 mg 4 times a day

Rosacea
- **BY MOUTH**
  - Adult: 500 mg twice daily usually for 6–12 weeks (course may be repeated intermittently)

Acne
- **BY MOUTH**
  - Adult: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

- **BY MOUTH**
  - Adult: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

- **BY MOUTH**
  - Adult: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

- **BY MOUTH**
  - Adult: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

- **BY MOUTH**
  - Adult: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

**INTERACTIONS**
- Appendix 1: tetracyclines

**SIDE-EFFECTS**
- Gastrointestinal discomfort - renal impairment
- Renal impairment. May exacerbate renal failure and should not be given to patients with renal impairment.

**PROFESSIONAL INFORMATION**
- Dental practitioners' formulary
- Oxytetracycline Tablets may be prescribed.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tetracycline**

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia, mycoplasma)
- **BY MOUTH**
  - Child 12-17 years: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections
Tigecycline

**DRUG ACTION** Tigecycline is a glycylcycline antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline.

**INDICATIONS AND DOSE**

Complicated skin and soft tissue infections (when other antibiotics are not suitable).

Complicated intra-abdominal infections (when other antibiotics are not suitable).

**Caution:** Abscess, appetite decreased, diarrhoea, dizziness, gastrointestinal discomfort, headache, healing impaired, hyperbilirubinaemia, hypoglycaemia, hypoproteinaemia, increased risk of infection, nausea, sepsis, skin reactions, vomiting.

**Uncommon** Hepatic disorders, pancreatitis, thrombocytopenia, thrombophlebitis.

**Frequency not known** Acidosis, azotaemia, hyperphosphataemia, hypofibrinogenaemia, idiopathic intracranial hypertension, photosensitivity reaction, pseudomembranous enterocolitis, severe cutaneous adverse reactions (SCARs), tooth discoloration.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Side-effects similar to those of the tetracyclines can potentially occur.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to tetracyclines.
- **PREGNANCY** Tetracyclines should not be given to pregnant women; effects on skeletal development have been documented in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxity has been reported with large parenteral doses.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **Dose adjustments** Manufacturer advises dose reduction to 25 mg every 12 hours following the loading dose in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tygacil®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks: Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Tigecycline (Non-proprietary)**
    - Tigecycline 50 mg Tigecycline 50mg powder for solution for infusion vials | 10 vial | £290.79 (Hospital only)

**ANTIBACTERIALS**

**Chloramphenicol**

**DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

**INDICATIONS AND DOSE**

Life threatening infections particularly those caused by *Haemophilus influenzae* Typhoid fever.

- **By mouth, or by intravenous injection, or by intravenous infusion**
  - Adult: 12.5 mg/kg every 6 hours, in exceptional cases dose can be doubled for severe infections such as sepsicaemia and meningitis, providing high doses reduced as soon as clinically indicated.

**CONTRA-INDICATIONS**

- Acute porphyrias p. 1058
- Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

**PREGNANCY** Manufacturer advises avoid; neonatal ‘grey baby syndrome’ if used in third trimester.

**BREAST FEEDING** Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause ‘grey syndrome’.

**HEPATIC IMPAIRMENT** Avoid if possible—increased risk of bone–marrow depression.

**Dose adjustments** Reduce dose.

**MONITORING REQUIREMENTS**

- Plasma concentration monitoring preferred in the elderly.
- Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose (‘trough’*) concentration should not exceed 15 mg/litre.
- Blood counts required before and periodically during treatment.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion, give intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%.

---

www.getintopharma.com
**Daptomycin**

**DRUG ACTION** Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

**INDICATIONS AND DOSE**

**Complicated skin and soft-tissue infections caused by Gram-positive bacteria**

- **BY INTRAVENOUS INFUSION**
  - **Child 12-23 months:** 10 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteremia—duration of treatment in accordance with risk of complications in individual patients
  - **Child 2-6 years:** 9 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteremia—duration of treatment in accordance with risk of complications in individual patients
  - **Child 7-11 years:** 7 mg/kg once daily for up to 14 days, alternatively 9 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteremia—duration of treatment in accordance with risk of complications in individual patients
  - **Child 12-17 years:** 5 mg/kg once daily for up to 14 days, alternatively 7 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteremia—duration of treatment in accordance with risk of complications in individual patients

**Complicated skin and soft-tissue infections caused by Gram-positive bacteria**

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - **Adult:** 4 mg/kg once daily for 7–14 days or longer if necessary, alternatively 6 mg/kg once daily, higher dose only if associated with *Staphylococcus aureus* bacteremia—duration of treatment may need to be longer than 14 days in accordance with risk of complications in individual patients

**Right-sided infective endocarditis caused by *Staphylococcus aureus* (administered on expert advice)**

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - **Adult:** 6 mg/kg once daily, duration of treatment in accordance with official recommendations

**CAUTIONS** Obesity (limited information on safety and efficacy)

**INTERACTIONS** → Appendix 1: daptomycin

**SIDE-EFFECTS**

- **Common or very common** Anaemia · anxiety · asthenia · constipation · diarrhoea · dizziness · fever · flatulence · gastrointestinal discomfort · headache · hypertension · hypotension · increased risk of infection · insomnia · nausea · pain · skin reactions · vomiting
- **Uncommon** Appetite decreased · arrhythmias · arthralgia · electrolyte imbalance · eosinophilia · flushing · glossitis · hyperglycaemia · muscle weakness · myalgia · myopathy · paraesthesia · renal impairment · taste altered · thrombocytosis · tremor · vertigo
- **Rare or very rare** Jaundice
- **Frequency not known** Acute generalised exanthematous pustulosis (AGEP) · antibiotic associated colitis · chills · cough · infusion related reaction · peripheral neuropathy · respiratory disorders · syncope

**SIDE-EFFECTS, FURTHER INFORMATION** If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING** Present in milk in small amounts, but absorption from gastrointestinal tract negligible.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

**RENAL IMPAIRMENT**

- **In children** Manufacturer advises the dosage regimen has not been established—use with caution and monitor renal function regularly.
- **In adults** Manufacturer advises use only when potential benefit outweighs risk—higher risk of developing myopathy; monitor renal function regularly.

**Dose adjustments**

- **In adults** Use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- **Manufacturer advises monitor plasma creatine phosphokinase (CPK) before treatment and then at least weekly during treatment; monitor CPK more frequently in patients at higher risk of developing myopathy, including those with renal impairment, taking other drugs associated with myopathy, or if CPK elevated more than 5 times upper limit of normal before treatment.**

**DIRECTIONS FOR ADMINISTRATION**

- **In children** For intravenous infusion, manufacturer advises give intermittently in Sodium Chloride 0.9%; reconstitute with Sodium Chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 60 minutes for children aged 1–6 years and over 30 minutes for children aged 7–17 years.
- **In adults** For intravenous infusion, manufacturer advises give intermittently in Sodium Chloride 0.9%; reconstitute with Sodium Chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes. For intravenous injection, give over 2 minutes.

**HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage after reconstitution and dilution.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

- **SMC No. 248/06**
  - In adults The *Scottish Medicines Consortium* has advised (April 2006) that daptomycin (Cubicin®) is accepted for restricted use within NHS Scotland for treatment of...
complicated skin and soft tissue infections in patients with known or suspected methicillin resistant *Staphylococcus aureus* infection and on the advice of local microbiologists or specialists in infectious disease.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

- **Daptomycin (Non-proprietary)**
  - Daptomycin 350 mg: Daptomycin 350mg powder for solution for infusion vials | 1 vial (£00) £60.00-£62.00 (Hospital only)
  - Daptomycin 500 mg: Daptomycin 500mg powder for solution for infusion vials | 1 vial (£00) £88.00-£88.57 (Hospital only)
- **Cubicin** (Merck Sharp & Dohme Ltd)
  - Cubicin 350 mg: Cubicin 350mg powder for concentrate for solution for infusion vials | 1 vial (£00) £62.00
  - Cubicin 500 mg: Cubicin 500mg powder for concentrate for solution for infusion vials | 1 vial (£00) £88.57 (Hospital only)

**Fidaxomicin**  **08-Feb-2019**

- **DRUG ACTION**  Fidaxomicin is a macrocyclic antibacterial that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections.

- **INDICATIONS AND DOSE**
  - **Clostridium difficile infection**
    - **BY MOUTH**
    - Adult: 200 mg every 12 hours for 10 days, limited clinical data is available on the use of fidaxomicin in severe or life-threatening *C. difficile* infection

- **CAUTIONS**  Inflammatory bowel disease - severe or life-threatening *C. difficile* infection

- **INTERACTIONS**  → Appendix 1: fidaxomicin

- **SIDE-EFFECTS**
  - **Common or very common**  Constipation - nausea - vomiting
  - **Uncommon**  Abdominal distension - appetite decreased - dizziness - dry mouth - flatulence - headache - skin reactions - taste altered
  - **Frequency not known**  Angioedema - dyspnoea - hypersensitivity

- **ALLERGY AND CROSS-SENSITIVITY**  Use with caution in macrolide hypersensitivity.

- **PREGNANCY**  Manufacturer advises avoid—no information available.

- **BREAST FEEDING**  Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**  Manufacturer advises caution in moderate to severe impairment—limited information available.

- **RENAI IMPAIRMENT**  Manufacturer advises caution in severe impairment—no information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) decisions**
    - SMC No. 791/12
      - The Scottish Medicines Consortium has advised (July 2012) that fidaxomicin (Dificlir®) is accepted for restricted use within NHS Scotland to treat the first recurrence of *C. difficile* infection, on the advice of a microbiologist or specialist in infectious diseases.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS**
    - **Dificlir** (Astellas Pharma Ltd)
      - Fidaxomicin 200 mg  Dificlir 200mg tablets | 20 tablet (£00) £1,350.00

**Fosfomycin**  **25-Apr-2019**

- **DRUG ACTION**  Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and *Enterobacteriaceae.*

- **INDICATIONS AND DOSE**
  - **Acute uncomplicated lower urinary-tract infections**
    - **BY MOUTH USING GRANULES**
      - Adult: 3 g for 1 dose
  - **Prophylaxis of urinary-tract infections in transurethral surgical procedures**
    - **BY MOUTH USING GRANULES**
      - Adult: 3 g, to be given 3 hours before surgery. Dose may be repeated once, 24 hours after surgery
  - **Osteomyelitis when first-line treatments are inappropriate or ineffective**
    - **Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective**
      - **BY INTRAVENOUS INFUSION**
        - Adult: 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms
  - **Complicated urinary-tract infections when first-line treatment ineffective or inappropriate**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 12–16 g daily in 2–3 divided doses (max. per dose 8 g)
  - **Bacterial meningitis when first-line treatment ineffective or inappropriate**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

- **CAUTIONS**  With intravenous use: Cardiac insufficiency - elderly (high doses) - hyperaldosteronism - hypernatraemia - hypertension - pulmonary oedema

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Common or very common**  Abdominal pain - diarrhoea - headache - nausea - vomiting
  - **Uncommon**  Skin reactions
  - **Frequency not known**  Antibiotic associated colitis

- **SPECIFIC SIDE-EFFECTS**
  - **Common or very common**  With oral use: Dizziness - vulvovaginal infection
  - **Uncommon**  With parenteral use: Appetite decreased - dyspnoea - electrolyte imbalance - fatigue - oedema - taste altered - vertigo
  - **Rare or very rare**  With parenteral use: Asthmatic attack - anaphylaxis - anaphylactoid reaction - angioedema - angioneurotic oedema - anaphylactic shock - urticaria - vasculitis
  - **Frequency not known**  With parenteral use: Bone marrow disorders - eosinophilia - hepatic disorders - visual impairment

www.getintopharma.com
**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.

**RENAL IMPAIRMENT**
- With oral use Avoid oral treatment if eGFR less than 10 mL/minute/1.73 m².
- With intravenous use Use intravenous treatment with caution if eGFR 40–80 mL/minute/1.73 m² and consult product literature for dose if eGFR less than 40 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- With intravenous use Monitor electrolytes and fluid balance.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion (Fomicyt®), give intermittently in Glucose 5% or 10% or Water for Injections; reconstitute each 2-g vial with 50 mL infusion fluid; give 2 g over 15 minutes.
- With oral use Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.

**PRESCRIBING AND DISPENSING INFORMATION**
- Doses expressed as Fusidic acid base.

**NATIONAL FUNDING/ACCESS DECISIONS**
- Scottish Medicines Consortium (SMC) decisions
  - SMC No. 1033/15
    - The Scottish Medicines Consortium has advised (March 2015) that Fosfomycin (Fomicyt®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.
  - SMC No. 1163/16
    - The Scottish Medicines Consortium has advised (September 2016) that Fosfomycin trometamol (Monuril®) is accepted for use within NHS Scotland for the treatment of acute lower uncomplicated urinary tract infections, caused by pathogens sensitive to Fosfomycin in adult and adolescent females and for prophylaxis in diagnostic and surgical transurethral procedures.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

**ELECTROLYTES:** May contain Sodium

- Fomicyt (Nordic Pharma Ltd)
  - Fosfomycin (as Fosfomycin sodium) 2 gram Fomicyt 2g powder for solution for infusion vials | 10 vial (BOL) £150.00
  - Fosfomycin (as Fosfomycin sodium) 4 gram Fomicyt 4g powder for solution for infusion vials | 10 vial (BOL) £300.00

**Granules**

**CAUTIONARY AND ADVISORY LABELS**: May contain Sucrose

- Fosfomycin (Non-proprietary)
  - Fosfomycin (as Fosfomycin trometamol) 3 gram Fosfomycin 3g granules sachets | 1 sachet (BOL) £75.45 DT + £4.86
- Monuril (Profile Pharma Ltd)
  - Fosfomycin (as Fosfomycin trometamol) 3 gram Monuril 3g granules sachets | 1 sachet (BOL) £4.86 DT + £4.86

---

**Fusidic acid**

**DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

**INDICATIONS AND DOSE**

**Staphylococcal skin infection**
- **BY MOUTH USING TABLETS**
  - Child 12–17 years: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate
  - Adult: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - **Uncommon** Skin reactions
  - **Common or very common**
    - With intravenous use Dizziness, drowsiness, hepatic disorders, hyperbilirubinaemia, thrombophlebitis, vascular pain (reduced if given via central vein)
    - With oral use Diarrhoea, dizziness, drowsiness, gastrointestinal discomfort, nausea, vomiting
  - **Rare**
    - With topical use Angioedema, conjunctivitis
  - **Frequency not known**
    - With intravenous use Agranulocytosis, anaemia, leucopenia, neutropenia, pancytopenia, renal failure, rhabdomyolysis, thrombocytopenia
    - With oral use Agranulocytosis, anaemia, hepatic disorders, hyperbilirubinaemia, leucopenia, neutropenia

---

**DOSAGE AND ADMINISTRATION**

- **BY MOUTH USING TABLETS**
  - Child: Apply 3–4 times a day usually for 7 days
  - Adult: Apply 3–4 times a day

**Penicillin-resistant staphylococcal infection including osteomyelitis**

- **Staphylococcal endocarditis in combination with other antibacterials**
  - **BY MOUTH USING ORAL SUSPENSION**
    - Child 1–11 months: 15 mg/kg 3 times a day
    - Child 1–4 years: 250 mg 3 times a day
    - Child 5–11 years: 500 mg 3 times a day
    - Child 12–17 years: 750 mg 3 times a day
  - Adult: 750 mg 3 times a day

**Staphylococcal infections due to susceptible organisms**

- **BY INTRAVENOUS INFUSION**
  - Child (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate
  - Child (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate
  - Adult (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate
  - Adult (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

**DOSE EQUIVALENCE AND CONVERSION**

- With oral use
  - Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.
Linezolid

**Drug Action** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including metillin-resistant Staphylococcus aureus (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is not active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

**Indications and Dose**

Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) / Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

- **By Mouth**
  - Adult: 600 mg every 12 hours usually for 10–14 days (maximum duration of treatment 28 days)

- **By Intravenous Infusion**
  - Adult: 600 mg every 12 hours

**Important Safety Information**

CHM Advice (Optic Neuropathy)

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**Blood Disorders**

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

**Caution**

Acute confusional states - bipolar depression - carcinoid tumour - elderly (increased risk of blood disorders) - history of seizures - phaeochromocytoma - schizophrenia - thyrotoxicosis - uncontrolled hypertension

**Caution, Further Information**

Close observation. Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

**Interactions** Appendix 1: linezolid

**Side-Effects**

- Common or very common Anaemia - constipation - diarrhoea - dizziness - gastrointestinal discomfort -
Tedizolid

07-Feb-2019

**DRUG ACTION** Tedizolid is an oxazolidinone antibacterial, which inhibits bacterial protein synthesis.

**INDICATIONS AND DOSE**

Treatment of acute bacterial skin and skin structure infections

- **By intravenous infusion, or by mouth**
- **Adult:** 200 mg once daily for 6 days, patients should be switched from the intravenous to the oral route when clinically appropriate

**CAUTIONS** Neutropenia—limited clinical experience; patients aged 75 years and over—limited clinical experience

**INTERACTIONS** → Appendix 1: tedizolid

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Diarrhoea, dizziness, fatigue, headache, nausea, skin reactions, vomiting
- **Uncommon** Abcess, alopecia, antibiotic associated colitis, anxiety, arthralgia, bradycardia, chills, constipation, cough, dehydration, diabetic control impaired, drowsiness, dry mouth, fever, gastrointestinal discomfort, gastrointestinal disorders, haematochezia, hyperhidrosis, hyperkalaemia, increased risk of infection, irritability, limb discomfort, lymphadenopathy, muscle spasms, nasal dryness, pain, peripheral oedema, pulmonary congestion, sensation abnormal, sleep disorders, taste altered, tremor, urine odour abnormal, vasodilation, vision blurred, vitreous floater, vulvovaginal pruritus

**SPECIFIC SIDE-EFFECTS**

- **Uncommon**
  - With intravenous use: Infusion related reaction
  - **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential; an additional method of contraception is advised in women taking hormonal contraceptives—effectiveness may be reduced
  - **PREGNANCY** Manufacturer advises avoid—fetal developmental toxicity in animal studies
  - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies
  - **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Sivextro®) give intermittently in Sodium Chloride 0.9%; reconstitute each 200 mg vial with 4 mL Water for Injections, then dilute reconstituted solution in 250 mL sodium chloride 0.9%; give over approx. 1 hour
  - **POTENTIAL AND CARER ADVICE** Optic neuropathy. Although neuropathy (peripheral and optic) has not been reported in patients treated with tedizolid, manufacturer advises patients and carers are warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately; patients should be evaluated promptly, and referred to an ophthalmologist if necessary
  - **Missed doses** Manufacturer advises that if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time
  - **DRIVING AND SKILLED TASKS** Patients and carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness and fatigue
  - **NATIONAL FUNDING/ACCESS DECISIONS** Scottish Medicines Consortium (SMC) decisions SMC No. 1080/15
  - The Scottish Medicines Consortium has advised (August 2015) that tedizolid (Sivextro®) is accepted for restricted use within NHS Scotland as an alternative oxazolidinone antibacterial for the treatment of acute bacterial skin and skin structure infections caused by Gram-positive *Staphylococcus aureus* (specifically methicillin-resistant *Staphylococcus aureus* [MRSA]) isolates, on the specific advice of local microbiologists or specialists in infectious disease

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

**EXCIPIENTS:** May contain Glucose ELECTROLYTES: May contain Sodium

- **Linezolid (Non-proprietary)**
  - Linezolid 2 mg per 1 ml Linezolid 600mg/300ml infusion bags 10 bag £445.00–£515.20 | (Hospital only)

- **Zyvox (Pfizer Ltd)**
  - Linezolid 2 mg per 1 ml Zyvox 600mg/300ml infusion bags 10 bag £445.00

**Oral suspension**

CAUTIONARY AND ADVISORY LABELS 9, 10

**EXCIPIENTS:** May contain Aspartame

- **Zyvox (Pfizer Ltd)**
  - Linezolid 20 mg per 1 ml Zyvox 100mg/5ml granules for oral suspension 150 ml £222.50 DT £222.50

**Tablet**

CAUTIONARY AND ADVISORY LABELS 9, 10

- **Linezolid (Non-proprietary)**
  - Linezolid 600 mg Linezolid 600mg tablets 10 tablet £82.12–£445.00 DT £327.22

- **Zyvox (Pfizer Ltd)**
  - Linezolid 600 mg Zyvox 600mg tablets 10 tablet £445.00 DT £327.22
**Tablet**
- **Sivextro (Merck Sharp & Dohme Ltd)**

**Tedizolid phosphate 200 mg**
- Sivextro 200mg tablets | 6 tablet **PO** £8.62.00

---

**Trimethoprim**

- **INDICATIONS AND DOSE**
  - **Urinary-tract infections** | **Respiratory-tract infections**
    - **BY MOUTH**
      - Child 4-5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
      - Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
      - Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
      - Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
      - Child 12–17 years: 200 mg twice daily
      - Adult: 200 mg twice daily

  - **Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)**
    - **BY MOUTH**
      - Child 4–5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night
      - Child 6 weeks–5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night
      - Child 6 months–5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night
      - Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
      - Child 12–17 years: 100 mg once daily, dose to be taken at night
      - Adult: 100 mg once daily, dose to be taken at night

  - **Treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)**
    - **BY MOUTH**
      - Child: 5 mg/kg every 6–8 hours
      - Adult: 5 mg/kg every 6–8 hours

- **Acne resistant to other antibacterials**
  - **BY MOUTH**
  - Adult: 300 mg twice daily

- **Prostatitis**
  - Adult: (consult product literature)

- **Shigellosis | Invasive salmonella infection**
  - **BY MOUTH**
  - Adult: (consult product literature)

- **UNLICENSED USE**
  - Not licensed for treatment of pneumocystis pneumonia.
  - In children Not licensed for use in children under 6 weeks.
  - In adults Not licensed for treatment of acne resistant to other antibacterials.

- **CONTRA-INDICATIONS**
  - Blood dyscrasias

- **CAUTIONS**
  - Elderly: Acute porphyrias p. 1058 • predisposition to folate deficiency

- **INTERACTIONS**
  - Appendix 1: trimethoprim

- **SIDE-EFFECTS**
  - Common or very common: Diarrhoea • electrolyte imbalance • fungal overgrowth • headache • nausea • skin reactions • vomiting
  - Rare or very rare: Agranulocytosis • angioedema • anxiety • appetite decreased • arthralgia • behaviour abnormal • bone marrow disorders • confusion • constipation • cough • depression • dizziness • dyspnoea • eosinophilia • erythema nodosum • fever • haemolysins • haemolytic anaemia • haemorrhage • hallucination • hepatic disorders • hypoglycaemia • lethargy • leucopenia • meningitis aseptic • movement disorders • myalgia • neutropenia • oral disorders • pancreatitis • paraesthesia • peripheral neuritis • photosensitivity reaction • pseudomembranous enterocolitis • renal impairment • seizure • severe cutaneous adverse reactions (SCARs) • sleep disorders • syncope • systemic lupus erythematosus (SLE) • thrombocytopenia • tinnitus • tremor • uveitis • vasculitis • vertigo • wheezing

- **Frequency not known**
  - Gastrointestinal disorder • megaloblastic anaemia • methaemoglobinemia

- **PREGNANCY**
  - Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.

- **BREAST FEEDING**
  - Present in milk—short-term use not known to be harmful.

- **RENAL IMPAIRMENT**
  - **Dose adjustments**
    - In adults
      - Use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m². Use half normal dose if eGFR less than 15 mL/minute/1.73 m².
    - In children
      - Use normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m².

  - **Monitoring**
    - Monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).

- **PATIENT AND CARER ADVICE**
  - Blood disorders
    - On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

- **Medicines for Children leaflet: Trimethoprim for bacterial infections**
  - www.medicinesforchildren.org.uk/trimethoprim-bacterial-infections

- **MEDIcINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Oral suspension**
  - **CAUTIONARY AND ADVISORY LABELS**
    - **Trimethoprim (Non-proprietary)**
      - **Trimethoprim 10 mg per 1 ml**
        - Trimethoprim 50mg/5ml oral suspension sugar free
        - 100 ml **PO** £5.70 DT = £5.70
      - **Monotrim (Chemidex Pharma Ltd)**
        - **Trimethoprim 10 mg per 1 ml**
          - Monotrim 50mg/5ml oral suspension sugar-free
          - 100 ml **PO** £1.77 DT = £5.70

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS**
    - **Trimethoprim (Non-proprietary)**
      - **Trimethoprim 100 mg**
        - Trimethoprim 100mg tablets | 28 tablet **PO** £3.99 DT = £3.83
      - **Trimethoprim 200 mg**
        - Trimethoprim 200mg tablets | 6 tablet **PO** £2.15 DT = £0.38 | 14 tablet **PO** £9.99 DT = £0.89

  - Combinations available: **Co-trimoxazole**, p. 562

www.getintopharma.com
ANTIMYCOBACTERIALS > RIFAMYCINS

Rifabutin

● INDICATIONS AND DOSE
Prophylaxis of Mycobacterium avium complex infections in immunosuppressed patients with low CD4 count
- BY MOUTH
  - Adult: 300 mg once daily, also consult product literature

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs
- BY MOUTH
  - Adult: 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs
- BY MOUTH
  - Adult: 150–450 mg once daily for at least 6 months

● CAUTIONS
Acute porphyrias p. 1058 - discoulours soft contact lenses

● INTERACTIONS
  - Appendix 1: rifabutin

● SIDE-EFFECTS
Agranulocytosis - anaemia - arthralgia - bronchospasm - chest pain - coarcal deposits - decreased leucocytes - dyspnoea - eosinophilia - fever - haemolysis - hepatic disorders - influenza like illness - myalgia - nausea - neutropenia - pancreatitis - skin reactions - thrombocytopenia - urine discolouration - uveitis (more common following high doses or concomitant use with drugs that increase plasma concentration) - vomiting

● ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with rifamycin hypersensitivity.

● CONCEPTION AND CONTRACEPTION
Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.

● PREGNANCY
Manufacturer advises avoid — no information available.

● BREAST FEEDING
Manufacturer advises avoid — no information available.

● HEPATIC IMPAIRMENT
Dose adjustments Reduce dose in severe impairment.

Monitoring In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

● RENAL IMPAIRMENT
Dose adjustments Use half normal dose if eGFR less than 30 ml/minute/1.73 m².

● MONITORING REQUIREMENTS
  - Renal function should be checked before treatment.
  - Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However hepatic function should be monitored on prolonged therapy.
  - Blood counts should be monitored on prolonged therapy.
  - Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

● PRESCRIBING AND DISPENSING INFORMATION
If treatment interruption occurs, re-introduce with low dosage and increase gradually.

PATIENT AND CARER ADVICE
Soft contact lenses Patients or their carers should be advised that rifabutin discoulours soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise, jaundice develop.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule
CAUTIONARY AND ADVISORY LABELS 8, 14
- Mycobutin (Pfizer Ltd)
  - Rifabutin 150 mg Mycobutin 150mg capsules | 30 capsule £9.38

Rifaximin

● DRUG ACTION
Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections.

● INDICATIONS AND DOSE
Travellers’ diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours
- BY MOUTH
  - Adult: 200 mg every 8 hours for 3 days

Reduction in recurrence of hepatic encephalopathy
- BY MOUTH
  - Adult: 550 mg twice daily

● CONTRA-INDICATIONS
Intestinal obstruction

● INTERACTIONS
  - Appendix 1: rifaximin

● SIDE-EFFECTS
  - Common or very common Arthralgia - ascites - constipation - depression - dizziness - dyspnoea - gastrointestinal discomfort - gastrointestinal disorders - headaches - muscle complaints - nausea - oedema - skin reactions - vomiting
  - Rare or very rare Hypertension - hypotension
  - Frequency not known Angioedema - syncope - thrombocytopenia - urine discolouration

● ALLERGY AND CROSS-SENSITIVITY
Contra-indicated if history of rifamycin hypersensitivity.

● PREGNANCY
Manufacturer advises avoid — toxicity in animal studies.

● BREAST FEEDING
Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.

● HEPATIC IMPAIRMENT
  - When used for Hepatic encephalopathy Manufacturer advises caution in severe impairment (risk of increased exposure).

● PRESCRIBING AND DISPENSING INFORMATION
Not recommended for diarrhoea associated with invasive organisms such as Campylobacter and Shigella.

www.getintopharma.com
Prophylaxis should continue for [unlicensed indication] for exposure prophylaxis extensive oedema, or lesions of the head or neck. Amoxicillin p.

Diseases, London (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone p. 577 resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone, rifampicin p. 582, and clofazimine below. Other drugs with significant activity against Mycobacterium leprae include ofloxacin p. 561, minocycline p. 566 and clarithromycin p. 538, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for multibacillary leprosy (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for paucibacillary leprosy (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum lepromatous) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 578 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 962 [unlicensed] is also useful in patients who have become corticosteroid dependent, but it should be used only under specialist supervision. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must not be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

**ANTI-MYCOBACTERIALS**

**Clofazimine**

- **INDICATIONS AND DOSE**
  - Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen) (administered on expert advice)
    - **BY MOUTH**
      - Adult: 300 mg once a month, to be administered under supervision and 50 mg daily, to be self-administered, alternatively 300 mg once a month, to be administered under supervision and 100 mg once daily on alternate days, to be self-administered
  - Lepromatous lepra reactions (administered on expert advice)
    - **BY MOUTH**
      - Adult: 300 mg daily for max. 3 months
  - Severe type II (erythema nodosum lepromatous) reactions (administered on expert advice)
    - **BY MOUTH**
      - Adult: 100 mg 3 times a day for one month, subsequent dose reductions are required, may take 4–6 weeks to attain full effect

- **CAUTIONS** Avoid if persistent abdominal pain and diarrhoea; may discolour soft contact lenses
- **INTERACTIONS** Appendix 1: clofazimine
- **SIDE-EFFECTS** Abdominal pain; appetite decreased; dry eye; eye discolouration; fatigue; gastrointestinal disorders; hair colour changes (reversible); headache; lymphadenopathy; nausea; photosensitivity reaction; red discoloration of body fluids; skin discoloration (including areas exposed to light); skin reactions; splenic infarction; urinary red; visual impairment; vomiting (hospitalise if persistent); weight decreased
- **PREGNANCY** Use with caution.

**2.1 Anthrax**

**Anthrax**

Treatment and post-exposure prophylaxis

Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin p. 558 or, in patients over 12 years, doxycycline p. 564 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 548, benzylpenicillin sodium p. 547, chloramphenicol p. 568, clarithromycin p. 538, clindamycin p. 535, imipenem with cilastatin p. 522, rifampicin p. 582 [unlicensed indication], and vancomycin p. 534). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for post-exposure prophylaxis. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

**2.2 Leprosy**

**Leprosy**

Management

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen’s disease). Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone p. 577 resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are rifampicin p. 582, and clofazimine below. Other drugs with significant activity against Mycobacterium leprae include ofloxacin p. 561, minocycline p. 566 and clarithromycin p. 538, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for multibacillary leprosy (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for paucibacillary leprosy (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum lepromatous) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 578 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 962 [unlicensed] is also useful in patients who have become corticosteroid dependent, but it should be used only under specialist supervision. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must not be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

**ANTI-MYCOBACTERIALS**

**Clofazimine**

- **INDICATIONS AND DOSE**
  - Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen) (administered on expert advice)
    - **BY MOUTH**
      - Adult: 300 mg once a month, to be administered under supervision and 50 mg daily, to be self-administered, alternatively 300 mg once a month, to be administered under supervision and 100 mg once daily on alternate days, to be self-administered
  - Lepromatous lepra reactions (administered on expert advice)
    - **BY MOUTH**
      - Adult: 300 mg daily for max. 3 months
  - Severe type II (erythema nodosum lepromatous) reactions (administered on expert advice)
    - **BY MOUTH**
      - Adult: 100 mg 3 times a day for one month, subsequent dose reductions are required, may take 4–6 weeks to attain full effect

- **CAUTIONS** Avoid if persistent abdominal pain and diarrhoea; may discolour soft contact lenses
- **INTERACTIONS** Appendix 1: clofazimine
- **SIDE-EFFECTS** Abdominal pain; appetite decreased; dry eye; eye discolouration; fatigue; gastrointestinal disorders; hair colour changes (reversible); headache; lymphadenopathy; nausea; photosensitivity reaction; red discoloration of body fluids; skin discoloration (including areas exposed to light); skin reactions; splenic infarction; urinary red; visual impairment; vomiting (hospitalise if persistent); weight decreased
- **PREGNANCY** Use with caution.
**BREAST FEEDING** May alter colour of milk; skin discoloration of infant.
**HEPATIC IMPAIRMENT** Use with caution.
**RENAL IMPAIRMENT** Use with caution.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

### 2.3 Lyme disease

#### Description of condition

Lyme disease, also known as Lyme borreliosis, is an infection caused by bacteria called *Borrelia burgdorferi*. It is transmitted to humans by the bite of an infected tick. Ticks are mainly found in grassy and wooded areas including urban gardens and parks. Most tick bites do not cause Lyme disease, and the prompt and correct removal of the tick reduces the risk of infection.

Lyme disease usually presents with a characteristic erythema migrans rash. This usually becomes visible 1–4 weeks after a tick bite, but can appear from 3 days to 3 months, and last for several weeks. It may be accompanied by non-focal (non-organ-related) symptoms, such as fever, swollen glands, malaise, fatigue, neck pain or stiffness, joint or muscle pain, headache, cognitive impairment, or paraesthesia.

Other signs and symptoms of Lyme disease may also appear months or years after the initial infection and are typically characterised by focal symptoms (relating to at least 1 organ system). These include neurological (affecting cranial nerves, peripheral and central nervous systems), joint (Lyme arthritis, cardiac (Lyme carditis), or skin (acrodermatitis chronica atrophicans) manifestations.

#### Drug treatment

**ECG** Patients diagnosed with Lyme disease should be given treatment with an antibacterial drug; the choice of drug should be based on presenting symptoms. In patients who present with focal symptoms, a discussion with, or referral to, a specialist should be considered but should not delay treatment.

In patients presenting with *erythema migrans* rash with or without non-focal symptoms, oral doxycycline p. 564 [unlicensed indication] is recommended as first-line treatment. If doxycycline cannot be given, oral amoxicillin p. 548 should be used as an alternative. Oral azithromycin p. 536 [unlicensed indication] should be given if both doxycycline and amoxicillin p. 548 are unsuitable.

In patients presenting with focal symptoms of *cranial nerve or peripheral nervous system* involvement, oral doxycycline p. 564 [unlicensed indication] is recommended as first-line treatment. If doxycycline cannot be given, oral amoxicillin p. 548 should be used as an alternative.

In patients presenting with symptoms of *central nervous system* involvement, intravenous ceftriaxone p. 528 is recommended as first-line treatment. Oral doxycycline [unlicensed indication] should be used as an alternative if ceftriaxone p. 528 cannot be given, or when switching to oral antibacterial treatment.

In patients with symptoms of *Lyme arthritis* or *acrodermatitis chronica atrophicans*, oral doxycycline [unlicensed indication] is recommended as first-line treatment. If doxycycline cannot be given, oral amoxicillin p. 548 should be used as an alternative. Intravenous
In patients with symptoms of *Lyme carditis who are haemodynamically stable*, oral doxycycline [unlicensed indication] is recommended as first-line treatment. If doxycycline cannot be given, intravenous ceftriaxone p. 528 should be used as an alternative.

In patients with symptoms of *Lyme carditis who are haemodynamically unstable*, intravenous ceftriaxone p. 528 is recommended. Oral doxycycline [unlicensed indication] should be given when switching to oral antibacterial treatment. A

### Ongoing symptom management

If symptoms continue to persist or worsen after antibacterial treatment, patients should be assessed for possible alternative causes, re-infection with *Lyme disease*, treatment failure or non-adherence to previous antibacterial treatment, or progression to organ damage caused by *Lyme disease* (such as nerve palsy).

A second course of antibacterial treatment should be given to patients presenting with signs and symptoms of re-infection. In patients presenting with ongoing symptoms due to possible treatment failure, treatment with an alternative antibacterial drug should be considered. A third course of antibacterial treatment is not recommended, and further management should be discussed with a national reference laboratory or suitable specialist depending on symptoms (for example, a rheumatologist or neurologist).

### Useful Resources

## 2.4 Methicillin-resistant staphylococcus aureus

### MRSA

#### Management

Infection from *Staphylococcus aureus* strains resistant to meticillin [now discontinued] (meticillin-resistant *Staph. aureus*; MRSA) and to fluoroquinolone p. 554 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 582 or fusidic acid p. 571 should not be used alone because resistance may develop rapidly. A *tetracycline* alone or a combination of rifampicin and fusidic acid can be used for *skin and soft-tissue infections* caused by MRSA; clindamycin p. 535 alone is an alternative. A *glycopeptide* (e.g. vancomycin p. 534) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, linezolid p. 572 can be used on expert advice. As linezolid is not active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

Tigecycline p. 568 and daptomycin p. 569 are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A *tetracycline* or clindamycin can be used for *bronchectasis* caused by MRSA. A *glycopeptide* can be used for *pneumonia* associated with MRSA; if a glycopeptide is unsuitable, linezolid can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms.

A *tetracycline* can be used for *urinary-tract infections* caused by MRSA; trimethoprim p. 574 or nitrofurantoin p. 590 are alternatives. A *glycopeptide* can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A *glycopeptide* can be used for *septicaemia* associated with MRSA.

See the management of *endocarditis, osteomyelitis, or septic arthritis* associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 532 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

See eradication of nasal carriage of MRSA in Nose p. 1201.

## 2.5 Tuberculosis

### Treatment phases, overview

Active tuberculosis is treated in two phases—an *initial phase* using four drugs and a *continuation phase* using two drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should not be used concurrently. Compliance with therapy is a major determinant of its success.

#### Initial phase

The concurrent use of four drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as fixed-dose, combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of rifampicin p. 582, ethambutol hydrochloride p. 586, pyrazinamide p. 588 and isoniazid p. 587 (with pyridoxine hydrochloride p. 1080 for prophylaxis of isoniazid-induced neuropathy); modified according to drug susceptibility testing. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for two months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after two months, treatment with rifampicin, ethambutol hydrochloride, isoniazid and pyrazinamide (with pyridoxine hydrochloride) should be continued until full susceptibility is confirmed, even if this is for longer than two months.
Streptomycin p. 520 is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced, or when patients cannot tolerate standard treatment.

**Continuation phase**

After the initial phase, daily treatment is continued for a further four months with rifampicin and isoniazid (preferably given as a combination preparation) with pyridoxine hydrochloride. Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

**Unsupervised treatment**

The unsupervised treatment regimen should be used for patients who are likely to take antituberculosis drugs reliably **without supervision**. Patients who are unable or unlikely to comply with daily administration of therapy should be treated with the regimen described under **Supervised Treatment**.

**Pregnancy and breast-feeding**

The standard unsupervised six month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised six month treatment regimen may be used during breast-feeding.

**Supervised treatment**

Drug administration should be **fully supervised** (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. If daily directly observed therapy is not possible, a supervised dosing schedule of three times a week should be considered. Regimens with a dosing schedule of fewer than three times a week should not be used.

Directly observed therapy should be offered to patients who:
- have a history of non-adherence;
- have previously been treated for tuberculosis;
- are in denial of the tuberculosis diagnosis;
- have multidrug-resistant tuberculosis;
- have a major psychiatric or cognitive disorder;
- have a history of homelessness, drug or alcohol misuse;
- are in prison, or have been in the past 5 years;
- are too ill to self-administer treatment;
- request directly observed therapy.

**Immunocompromised patients**

Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity.

Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard six month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis for patients who are HIV-positive (see also **Latent tuberculosis** below); care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first two months of antituberculosis treatment increases the risk of immune reconstitution syndrome. Treatment for tuberculosis should not routinely exceed six months in patients who are HIV-positive, unless the tuberculosis has central nervous system involvement (in which case treatment should not routinely extend beyond twelve months).

Infection may also be caused by other mycobacteria e.g. *M. avium* complex, in which case specialist advice on management is needed.

**Extrapulmonary tuberculosis**

**Central nervous system tuberculosis**

Patients with active central nervous system tuberculosis should be offered treatment with rifampicin, ethambutol hydrochloride, isoniazid and pyrazinamide (with pyridoxine hydrochloride for prophylaxis of isoniazid-induced neuropathy) for two months. After completion of the initial treatment phase, rifampicin and isoniazid (with pyridoxine hydrochloride) should be continued for a further ten months. Treatment for tuberculosis meningitis should be offered if clinical signs and laboratory findings are consistent with the diagnosis, even if a rapid diagnostic test is negative.

An initial high dose of dexamethasone p. 675 or prednisolone p. 678 should be started at the same time as antituberculosis therapy, and then slowly withdrawn over 4–8 weeks.

Referral for surgery should be considered only in patients who have raised intracranial pressure.

**Pericardial tuberculosis**

An initial high dose of oral prednisolone should be offered to patients with active pericardial tuberculosis at the same time as initiation of antituberculosis therapy; it should then be slowly withdrawn over 2–3 weeks.

**Latent tuberculosis**

Clinicians should be aware that some patients with latent tuberculosis are at increased risk of developing active tuberculosis (such as patients who are HIV-positive, diabetic or receiving treatment with a tumour necrosis factor alpha inhibitor). These patients should be advised of the risks and symptoms of active tuberculosis.

**Note:** the risk of adverse events to chemoprophylaxis in patients aged over 35 years with a risk of hepatotoxicity is likely to be greater than the potential benefit of treating latent disease. **When indicated,** drug treatment should only be offered to patients aged 35–65 years if hepatotoxicity is not a concern. Treatment for latent tuberculosis is not usually indicated in patients over 65 years.

**Close contacts**

Anyone aged under 65 years who is a close contact (prolonged, frequent or intense contact, e.g. household contacts or partners) of a person with pulmonary or laryngeal drug-sensitive tuberculosis should be assessed for active disease, and if negative, offered chemoprophylaxis.

**Immunocompromised**

Patients who are immunocompromised, such as those with HIV or who have had a solid organ or allogeneic stem cell transplant, should be tested for latent tuberculosis using an appropriate method. Patients who test positive should then be assessed for active disease, and if negative, offered treatment for latent tuberculosis.

**Healthcare workers**

New NHS employees who are new entrants from a high incidence country should be offered appropriate testing for latent tuberculosis; those who are not new entrants from a high incidence country, but who will be in contact with patients or clinical materials should be offered appropriate testing for latent tuberculosis if prior BCG vaccination cannot be verified (see also BCG vaccine p. 1297).

Those who test positive should then be assessed for active disease, and if negative, offered treatment for latent tuberculosis.
### Recommended dosage for standard unsupervised 6-month treatment

</tbody>
</table>
For healthcare workers who are immunocompromised, follow standard advice for testing and treatment (see *Immunocompromised above*).

**Chemoprophylaxis for latent tuberculosis**
Chemoprophylaxis involves use of either isoniazid p. 587 (with pyridoxine hydrochloride p. 1080) alone for six months (recommended if interactions with rifampicins are a concern) or rifampicin p. 582 and isoniazid (with pyridoxine hydrochloride) for three months (recommended when hepatotoxicity is a concern).

Choice of regimen is dependent on clinical factors, including age, risk of hepatotoxicity and possible drug interactions. Testing for HIV, hepatitis B and hepatitis C should be offered before starting antituberculosis treatment as this may affect choice of therapy.

Patients with severe liver disease should be treated under the care of a specialist team; careful monitoring of liver function is necessary in patients with non-severe liver disease, abnormal liver function, or who misuse alcohol or drugs.

See advice on immunisation against tuberculosis in BCG vaccine p. 1297.

**Treatment failure**
Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

**Treatment interruptions**
A break in antituberculosis treatment of at least two weeks (during the initial phase) or missing more than 20% of prescribed doses is classified as treatment interruption. Re-establishing treatment appropriately following interruptions is key to ensuring treatment success without relapse, drug resistance or further adverse events. If an adverse reaction recurs upon re-introducing a particular drug, do not give that drug in future regimens and consider extending the total regimen accordingly.

**Treatment interruptions due to drug-induced hepatotoxicity**
Following treatment interruption due to drug-induced hepatotoxicity, all potential causes of hepatotoxicity should be investigated. Once hepatic function has recovered, antituberculosis therapy should be sequentially re-introduced at previous full doses over a period of no more than ten days, initially with ethambutol hydrochloride p. 586 and either isoniazid (with pyridoxine hydrochloride) or rifampicin.

In patients with severe or highly infectious tuberculosis who need to interrupt the standard regimen, consider continuing treatment with at least two drugs with low risk of hepatotoxicity, such as ethambutol hydrochloride and streptomycin p. 520 (with or without a quinoline, such as levofloxacin p. 559 or moxifloxacin p. 560), with ongoing monitoring by a liver specialist.

**Treatment interruptions due to cutaneous reactions**
If a patient with severe or highly infectious tuberculosis has a cutaneous reaction, consider continuing treatment with a combination of at least two drugs with low risk for causing cutaneous reactions, such as ethambutol hydrochloride and streptomycin, with monitoring by a dermatologist.

**Antituberculosis drugs**
Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculosis regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculosis regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months (‘initial phase’) of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20–30% of patients.

Rifabutin p. 575, another rifamycin, is indicated for *prophylaxis* against *M. avium* complex infections in patients with a low CD4 count; it is also licensed for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis.

Pyrazinamide p. 588 is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*.

Ethambutol hydrochloride is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms.

**Drug-resistant tuberculosis**
Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Multidrug-resistant tuberculosis (*resistance to isoniazid and rifampicin*, with or without any other resistance) requires treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive. Testing for resistance to second-line drugs is recommended and treatment should be modified according to susceptibility. The risk of resistance is minimised by ensuring therapy is administered in the correct dose and combination for the prescribed duration.

Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include aminosalicylic acid p. 584, amikacin p. 518, capreomycin p. 585, cycloserine p. 585, newer macrolides (e.g. azithromycin p. 536 and clarithromycin p. 538), moxifloxacin and protonamide (prothionamide; no longer on UK market). Bedaquiline p. 585 and delamanid p. 586 are licensed for the treatment of multiple-drug resistant pulmonary tuberculosis. Bedaquiline has a long half-life.

**Single drug-resistant tuberculosis**
For single drug-resistance the following treatment regimens are recommended:

**Resistance to isoniazid:**
- First two months (initial phase): rifampicin, pyrazinamide and ethambutol hydrochloride
- Continue with (continuation phase): rifampicin and ethambutol hydrochloride for seven months (up to ten months for extensive disease)

**Resistance to pyrazinamide:**
- First two months (initial phase): rifampicin, ethambutol hydrochloride and isoniazid (with pyridoxine hydrochloride)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for seven months
** Resistance to ethambutol hydrochloride: **
- First two months (initial phase): rifampicin, pyrazinamide and isoniazid (with pyridoxine hydrochloride)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for four months

** Resistance to rifampicin below: **
- Offer treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive.

** Management of tuberculosis in children **
Children are given isoniazid p.o. for 3–6 months followed by isoniazid and rifampicin during the next four months. However, care is needed in young children receiving ethambutol hydrochloride because of the difficulty in testing eyesight and in obtaining reports of visual symptoms.

** Antimycobacterials > Rifamycins **

** Rifampicin **

- Indications and dose
  - Brucellosis in combination with other antibiotics
  - Legionnaires disease in combination with other antibiotics
  - Serious staphylococcal infections in combination with other antibiotics
  - **By mouth, or by intravenous infusion**
  - Child 1–11 months: 5–10 mg/kg twice daily
  - Child 1–17 years: 10 mg/kg twice daily (max. per dose 600 mg)
  - Adult: 0.6–1.2 g daily in 2–4 divided doses

- Endocarditis in combination with other drugs
  - **By mouth, or by intravenous infusion**
  - Adult: 0.6–1.2 g daily in 2–4 divided doses

- Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment)(under expert supervision)
  - **By mouth**
  - Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
  - Adult: 600–900 mg 3 times a week for 6 months (initial and continuation phases)

- Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)
  - **By mouth**
  - Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
  - Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day
  - Adult (body-weight up to 50 kg): 450 mg once daily for 6 months (initial and continuation phases)
  - Adult (body-weight 50 kg and above): 600 mg once daily for 6 months (initial and continuation phases)

** Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid **
- **By mouth**
  - Child 1–11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
  - Child 1–11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
  - Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 3 months
  - Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 3 months
  - Adult (body-weight up to 50 kg): 450 mg daily for 3 months
  - Adult (body-weight 50 kg and above): 600 mg daily for 3 months

** Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant **
- **By mouth**
  - Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
  - Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
  - Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 6 months
  - Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 6 months

** Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant and under 35 years **
- **By mouth**
  - Adult 18–34 years (body-weight up to 50 kg): 450 mg daily for 6 months
  - Adult 18–34 years (body-weight 50 kg and above): 600 mg daily for 6 months

** Prevention of secondary case of Haemophilus influenzae type b disease **
- **By mouth**
  - Child 1–2 months: 10 mg/kg once daily for 4 days
  - Child 3 months–11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
  - Child 12–17 years: 600 mg once daily for 4 days
  - Adult: 600 mg once daily for 4 days

** Prevention of secondary case of meningococcal meningitis **
- **By mouth**
  - Child 1–11 months: 5 mg/kg every 12 hours for 2 days
  - Child 1–11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
  - Child 12–17 years: 600 mg every 12 hours for 2 days
  - Adult: 600 mg every 12 hours for 2 days

** Multibacillary leprosy in combination with dapsone and clofazimine (3-drug regimen) > Paucibacillary leprosy in combination with dapsone (2-drug regimen) **
- **By mouth**
  - Adult (body-weight up to 35 kg): 450 mg once a month, supervised administration
  - Adult (body-weight 35 kg and above): 600 mg once a month, supervised administration

** Contra-indications **
- Acute porphyrias p. 1058: jaundice

** Precautions **
- Discourages soft contact lenses

** Interactions **
- Appendix 1: rifampicin

** Side-effects **
- Common or very common: Nausea, thrombocytopenia, vomiting
- Uncommon: Diarrhoea, leucopenia
- Frequency not known: Abdominal discomfort, acute kidney injury, adrenal insufficiency, agranulocytosis, appetite decreased, disseminated intravascular coagulation, dysphoria, eosinophilia, flushing, haemolytic anaemia, hepatitis, hypersensitivity, influenza, intracranial haemorrhage, menstrual disorder, muscle weakness, myopathy, oedema, pseudomembranous enterocolitis, severe cutaneous adverse reactions (SCARs), shock, skin reactions, sputum discolouration, sweat discolouration, teardiscolouration, urine discolouration, vasculitis, wheezing

** Specific Side-effects **
- With intravenous use: Bone pain, gastrointestinal disorder, hyperbilirubinaemia, psychotic disorder
- With oral use: Psychosis

www.getintopharma.com
Tuberculosis 583

SIDENOTES, FURTHER INFORMATION

Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, and acute renal failure. Discontinue if serious side-effects develop.

- ALLERGY AND CROSS-SENSITIVITY
  Contra-indicated in patients with rifamycin hypersensitivity.

- CONCEPTION AND CONTRACEPTION
  Important - effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

- PREGNANCY
  Manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of increase gradually.

- BREAST FEEDING
  Guideline advice - breast feeding is not contraindicated; manufacturers advise caution.

- HEPATIC IMPAIRMENT
  Monitor liver function weekly for two weeks, then every two weeks for the next six weeks.

- MONITORING REQUIREMENTS
  - Renal function should be checked before treatment.
  - Hepatic function should be checked before treatment. If there is no evidence of liver disease (pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
  - Blood counts should be monitored in patients on prolonged therapy.
  - In adults with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 weeks. Blood counts should also be monitored in these patients.

- DIRECTIONS FOR ADMINISTRATION
  - With intravenous use in adults. For intravenous infusion (Rifadin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours.
  - With intravenous use in children. Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

- PRESCRIBING AND DISPENSING INFORMATION
  If treatment interruption occurs, re-introduce with low dosage and increase gradually.
  - Flavours of syrup may include raspberry.
  - With oral use in children. In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

- PATIENT AND CARER ADVICE
  - Soft contact lenses. Patients or their carers should be advised that rifampicin discolours soft contact lenses.
  - Hepatic disorders. Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

- Oral suspension
  - CAUTIONARY AND ADVISORY LABELS 8, 14, 23
  - Excipients: May contain Sucrose.
  - Rifadin® (Sanofi)
  - Rifampicin 20 mg per 1 mL. Rifadin 100mg/5mL syrup | 120 mL [PO] £4.27 DT + £4.27
  - Capsule
  - CAUTIONARY AND ADVISORY LABELS 8, 14, 23
  - Rifampicin (Non-proprietary)
  - Rifampicin 150 mg Rifampicin 150mg capsules | 100 capsule [PO] £50.49 DT + £50.49
  - Rifampicin 300 mg Rifampicin 300mg capsules | 100 capsule [PO] £123.89 DT + £123.89
  - Rifadin® (Sanofi)
  - Rifampicin 150 mg Rifadin 150mg capsules | 100 capsule [PO] £18.32 DT + £50.49
  - Rifampicin 300 mg Rifadin 300mg capsules | 100 capsule [PO] £36.63 DT + £123.89
  - Rimactane (Sandoz Ltd)
  - Rifampicin 300 mg Rimactane 300mg capsules | 60 capsule [PO] £21.98

- Powder and solvent for solution for infusion
  - Electrolytes: May contain Sodium.
  - Rifadin® (Sanofi)
  - Rifampicin 600 mg Rifadin 600mg powder and solvent for solution for infusion vials | 1 vial [PO] £3.20

Rifampicin with ethambutol, isoniazid and pyrazinamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 582, ethambutol hydrochloride p. 586, isoniazid p. 587, pyrazinamide p. 588.

- INDICATIONS AND DOSE
  - Initial treatment of tuberculosis
  - By mouth
  - Adult (body-weight 30–39 kg): 2 tablets daily for 2 months (initial phase).
  - Adult (body-weight 40–54 kg): 3 tablets daily for 2 months (initial phase).
  - Adult (body-weight 55–69 kg): 4 tablets daily for 2 months (initial phase).
  - Adult (body-weight 70 kg and above): 5 tablets daily for 2 months (initial phase).

- DOSE EQUIVALENCE AND CONVERSION
  - Tablet quantities refer to the number of Voractiv® Tablets which should be taken. Each Voractiv® Tablet contains ethambutol hydrochloride 275 mg, isoniazid 75 mg, pyrazinamide 400 mg and rifampicin 150 mg.

- CAUTIONS
  - Peripheral neuropathy. The risk of peripheral neuropathy may be increased by high doses of isoniazid; pyridoxine should, therefore, be considered for those receiving Voractiv® 5 tablets daily.

- INTERACTIONS
  + Appendix 1: ethambutol - isoniazid - pyrazinamide - rifampicin
**Rifampicin with isoniazid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 582, isoniazid p. 587.

**INDICATIONS AND DOSE**

**Treatment of tuberculosis (continuation phase)**

- **BY MOUTH**
  - Adult (body-weight up to 50 kg): 450/300 mg daily for 4 months (continuation phase after 2-month initial phase), use Rifinah® 150/100 Tablets, preferably taken before breakfast.
  - Adult (body-weight 50 kg and above): 600/300 mg daily for 4 months (continuation phase after 2-month initial phase), use Rifinah® 300/150 Tablets, preferably taken before breakfast.

**DOSE EQUIVALENCE AND CONVERSION**

- Rifinah® Tablets contain rifampicin and isoniazid; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of rifampicin and isoniazid respectively.
  - Each Rifinah® 150/100 Tablet contains rifampicin 150 mg and isoniazid 100 mg.
  - Each Rifinah® 300/150 Tablet contains rifampicin 300 mg and isoniazid 150 mg.

**INTERACTIONS** → Appendix 1: isoniazid · rifampicin

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

---

**Rifampicin with isoniazid and pyrazinamide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 582, isoniazid p. 587, pyrazinamide p. 588.

**INDICATIONS AND DOSE**

**Initial unsupervised treatment of tuberculosis (in combination with ethambutol)**

- **BY MOUTH**
  - Adult (body-weight up to 40 kg): 3 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.
  - Adult (body-weight 40–49 kg): 4 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.
  - Adult (body-weight 50–64 kg): 5 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.

**ADULT (body-weight 65 kg and above):** 6 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.

**DOSE EQUIVALENCE AND CONVERSION**

- Tablet quantities refer to the number of Rifater® Tablets which should be taken. Each Rifater® Tablet contains isoniazid 50 mg, pyrazinamide 300 mg and rifampicin 120 mg.

**INTERACTIONS** → Appendix 1: isoniazid · pyrazinamide · rifampicin

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

---

**Aminosalicylic acid**

**INDICATIONS AND DOSE**

**Multiple-drug resistant tuberculosis, in combination with other drugs**

- **BY MOUTH**
  - Adult: 4 g every 8 hours for a usual treatment duration of 24 months; maximum 12 g per day

**Desensitisation regimen**

- **BY MOUTH**
  - Adult: (consult product literature)

**CAUTIONS** Peptic ulcer

**INTERACTIONS** → Appendix 1: aminosalicylic acid

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea · gastrointestinal discomfort · nausea · skin reactions · vestibular syndrome · vomiting
- **Uncommon** Appetite decreased
- **Rare or very rare** Agranulocytosis · anaemia · crystalluria · dizziness · gastrointestinal disorders · gastrointestinal haemorrhage · headache · hepatic disorders · hypoglycaemia · hypothyroidism · leucopenia · methaemoglobinemia · peripheral neuropathy · taste metallic · tendon pain · thrombocytopenia · visual impairment · weight decreased
- **Frequency not known** Hypersensitivity

**PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies (highest risk during first trimester).

**BREAST FEEDING** Present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Manufacturer advises use with caution.

**RENAI IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment due to accumulation of inactive metabolites.

**MONITORING REQUIREMENTS**

- Monitor for hypersensitivity reaction during the first 3 months of treatment—for desensitisation dosing regimen consult product literature.
- Monitor liver function—discontinue immediately if signs or symptoms of hepatic toxicity (including rash, fever and gastrointestinal disturbance).

**DIRECTIONS FOR ADMINISTRATION** Disperse granules in orange or tomato juice and take immediately (granules will not dissolve, ensure all granules are swallowed). Granules can be sprinkled on apple sauce or yoghurt for administration.
**Bedaquiline**

**INDICATIONS AND DOSE**

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

- **BY MOUTH**
  - Adult: Initially 400 mg once daily for 2 weeks, then 200 mg 3 times a week for 22 weeks, intervals of at least 48 hours between each dose, continue appropriate combination therapy after bedaquiline

**MONITORING REQUIREMENTS**

- **GASTRO-INTESTINAL**
  - Nausea, vomiting, diarrhea, abdominal pain

- **HEPATIC IMPAIRMENT**
  - If severe abnormalities in liver function tests.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

**CONTRA-INDICATIONS**

- QTc interval more than 500 milliseconds (derived using Fridericia’s formula) - ventricular arrhythmia
- Hypothyroidism - QTc interval more than 500 milliseconds - risk factors for QT interval prolongation (e.g. electrolyte disturbances, heart failure with reduced left ventricular ejection fraction, history of symptomatic arrhythmias (avoid if ventricular arrhythmia present), bradycardia, congenital long QT syndrome).

**INTERACTIONS**

- Common or very common: Arthralgia - diarrhoea - dizziness - headache - hepatic function abnormal - myalgia - nausea - QT interval prolongation - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

If syncope occurs, obtain ECG.

**PREGNANCY**

Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

**RENAK IMPAIRMENT**

Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Determine serum potassium, calcium, and magnesium before starting treatment (correct if necessary) - remeasure if QT prolongation occurs during treatment.
- Obtain ECG before starting treatment, and then at least monthly during treatment or more frequently if concomitant use with other drugs known to prolong the QT interval.
- Monitor liver function before starting treatment and then at least monthly during treatment - discontinue treatment if severe abnormalities in liver function tests.

**PATIENT AND CARER ADVICE**

- **Missed doses**
  - If a dose is missed during the first two weeks of treatment, the missed dose should not be taken and the next dose should be taken at the usual time; if a dose is missed during weeks 3–24 of treatment, the missed dose should be taken as soon as possible and then the usual regimen resumed.

- **Driving and skilled tasks**
  - Dizziness may affect performance of skilled tasks (e.g. driving)

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - 4, 8, 21
  - Sirturo (Janssen-Cilag Ltd)

- **Bedaquiline (as Bedaquiline fumarate) 100 mg**
  - Sirturo 100mg tablets | 188 tablet | £18,700.00

**Capreomycin**

**INDICATIONS AND DOSE**

Tuberculosis resistant to first-line drugs, in combination with other drugs

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 1 g daily (max. per dose 20 mg/kg) for 2–4 months, then reduced to 1 g 2–3 times a week

**CAUTIONS**

Auditory impairment

**INTERACTIONS**

- Appendix 1: capreomycin

**SIDE-EFFECTS**

Auditory, vestibular, and peripheral nervous system disorders (e.g. vertigo), visual disorders (e.g. blurred vision), and skin disorders (e.g. urticaria, rash)

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk - teratogenic in animal studies.

**RENAK IMPAIRMENT**

Nephrotic, ototoxic. Dose adjustments: Reduce dose - consult product literature.

**MONITORING REQUIREMENTS**

Monitor renal, hepatic, auditory, and vestibular function and electrolytes.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Capreomycin (Non-proprietary)**
  - Capreomycin (as Capreomycin sulphate) 1 gram
  - Capreomycin 1g powder for solution for injection | 1 vial | £11.47

**Cycloserine**

**INDICATIONS AND DOSE**

Tuberculosis resistant to first-line drugs, in combination with other drugs

- **BY MOUTH**
  - Adult: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

**PHARMACOKINETICS**

- Cycloserine penetrates the CNS.

**CONTRA-INDICATIONS**

- Alcohol dependence - depression - epilepsy - psychotic states - severe anxiety

**INTERACTIONS**

- Appendix 1: cycloserine

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

- CNS toxicity
  - Discontinue or reduce dose if symptoms of CNS toxicity occur.

- Rash or allergic dermatitis
  - Discontinue or reduce dose if rashes or allergic dermatitis develop.

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk - crosses the placenta.
**Delamanid**

**INDICATIONS AND DOSE**

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

**BY MOUTH**

Adult: 100 mg twice daily for 2 weeks, continue appropriate combination therapy after delamanid

**CONTRA-INDICATIONS**

QTc interval more than 500 milliseconds (derived using Fridericia’s formula).

**CAUTIONS**

Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, severe hypertension, left ventricular hypertrophy, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)

**INTERACTIONS**

Appendix 1: delamanid

**SIDE-EFFECTS**

Common or very common: Anxiety, appetite decreased, asthenia, chest pain, cough, depression, dyslipidaemia, dyspnoea, ear pain, electrolyte imbalance, gastrointestinal discomfort, haemoptysis, headache, hyperhidrosis, hypertension, hypotension, malaise, muscle weakness, nausea, oropharyngeal pain, osteoarthritis, pain, palpitations, peripheral neuropathy, photophobia, psychotic disorder, QT interval prolongation, reticulocytosis, sensation abnormal, skin reactions, sleep disorders, throat irritation, tinnitus, tremor, vomiting

Uncommon: Aggression, atrioventricular block, balance impaired, dehydration, delusional disorder, persecutory type, dysphagia, extrasystole, hepatic function abnormal, increased risk of infection, lethargy, leucopenia, oral paraesthesia, psychiatric disorders, thrombocytopenia, urinary disorders

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment.

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid in moderate to severe impairment.

**RENAL IMPAIRMENT**

Manufacturer advises avoid in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Monitor serum albumin and electrolytes before starting treatment and then during treatment—discontinue treatment if serum albumin less than 28 g/litre.
- Obtain ECG before starting treatment and then monthly during treatment (more frequently if serum albumin 28–34 g/litre, or if concomitant use of potent CYP3A4 inhibitors, or if risk factors for QT interval prolongation, or if QTc interval 450–500 milliseconds in men or 470–500 milliseconds in women)—discontinue treatment if QTc interval more than 500 milliseconds (derived using Fridericia’s formula).

**HANDLING AND STORAGE**

Dispense in original container (contains desiccant).

**Ethambutol hydrochloride**

**INDICATIONS AND DOSE**

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

**BY MOUTH**

- Child: 20 mg/kg once daily for 2 months (initial phase)
- Adult: 15 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

**BY MOUTH**

- Child: 30 mg/kg 3 times a week for 2 months (initial phase)
- Adult: 30 mg/kg 3 times a week for 2 months (initial phase)

**CONTRA-INDICATIONS**

Optic neuritis - poor vision

**CAUTIONS**

Elderly, young children

**CAUTIONS, FURTHER INFORMATION**

Understanding warnings: Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

**INTERACTIONS**

Appendix 1: ethambutol

**SIDE-EFFECTS**

Common or very common: Hyperuricaemia, nerve disorders, visual impairment

Rare or very rare: Nephritis tubulointerstitial

Frequency not known: Alveolitis allergic, appetite decreased, asthenia, confusion, dizziness, eosinophilia, fever, flatulence, gastrointestinal discomfort, gout, hallucination, headache, jaundice, leucopenia, nausea, nephrotoxicity, neutropenia, photosensitive lichenoid eruption, sensation abnormal, severe cutaneous adverse reactions (SCARs), skin reactions, taste metallic, thrombocytopenia, tremor, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Ocular toxicity is more common where excessive dosage is used or if the patient’s renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

**PREGNANCY**

Not known to be harmful.

**BREAST FEEDING**

Amount too small to be harmful.

**RENAL IMPAIRMENT**

Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment.
Dose adjustments ▶ In adults If creatinine clearance less than 30 mL/minute, use 15–25 mg/kg (max. 2.5 g) 3 times a week.
▶ In children If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week.
Monitoring If creatinine clearance less than 30 mL/minute, monitor plasma-ethambutol concentration.

MONITORING REQUIREMENTS
▶ 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
▶ Renal function should be checked before treatment.
▶ Visual acuity should be tested by Snellen chart before treatment with ethambutol.

PATIENT AND CARER ADVICE
▶ Renal function should be checked before treatment.

PRESCRIBING AND DISPENSING INFORMATION The RCPCH and NPPG recommend that, when a liquid special is required, the following strength is used: 400 mg/5 mL.

PATIENT AND CARER ADVICE
ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice. Medicines for Children leaflet: Ethambutol for the treatment of tuberculosis www.medicinesforchildren.org.uk/ethambutol-treatment-tuberculosis

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
Tablet
CAUTIONARY AND ADVISORY LABELS 8
Ethambutol hydrochloride (Non-proprietary)
Ethambutol hydrochloride 100 mg Ethambutol 100mg tablets | 56 tablet ▶ £17.00 DT + £11.51
Ethambutol hydrochloride 400 mg Ethambutol 400mg tablets | 56 tablet ▶ £42.74 DT + £42.74
Combinations available: Rifampicin with ethambutol, isoniazid and pyrazinamide, p. 583

Isoniazid

INDICATIONS AND DOSE
Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)
▶ By mouth, or by intramuscular injection, or by intravenous injection
Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
Adult: 300 mg daily for 6 months (initial and continuation phases)
Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)
▶ By mouth, or by intramuscular injection, or by intravenous injection
Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

PREVENTION OF TUBERCULOSIS IN SUSCEPTIBLE CLOSE CONTACTS OR THOSE WHO HAVE BECOME TUBERCULIN POSITIVE
▶ Initially by mouth, or by intramuscular injection, or by intravenous injection
Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively (by mouth) 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
Child 12–17 years: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin
Adult: 300 mg daily for 6 months, alternatively (by mouth) 300 mg daily for 3 months, to be taken in combination with rifampicin

CONTRA-INDICATIONS Drug-induced liver disease

CAUTIONS Acute porphyrias p. 1058 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)

SAFETY IN PREGNANCY Peripheral neuropathy In pregnant women peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 1080 should be given prophylactically from the start of treatment.

INTERACTIONS → Appendix 1: isoniazid

SIDE-EFFECTS
▶ Uncommon Hepatic disorders
▶ Rare or very rare Severe cutaneous adverse reactions (SCARs)
▶ Frequency not known Agranulocytosis · alopecia · anaemia · aplastic anaemia · eosinophilia · fever · gynaecomastia · haemolytic anaemia · hyperglycaemia · lupus-like syndrome · nerve disorders · optic atrophy · pancreatitis · pellagra · psychosis · seizure · skin reactions · thrombocytopenia · vasculitis

SIDE-EFFECTS, FURTHER INFORMATION Hepatitis more common in those aged over 35 years and those with a daily alcohol intake.

PREGNANCY Not known to be harmful; prophylactic pyridoxine recommended.

BREAST FEEDING Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother.

MONITORING In breast-feeding, monitor infant for possible toxicity.

HEPATIC IMPAIRMENT Use with caution.

MONITORING In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

RENAL IMPAIRMENT Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 1080 recommended.

MONITORING REQUIREMENTS
▶ Renal function should be checked before treatment.
▶ Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
▶ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.

PRESCRIBING AND DISPENSING INFORMATION
▶ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The RCPCH and NPPG

www.getintopharma.com
recommend that, when a liquid special of isoniazid is required, the following strength is used: 50 mg/5 mL.

- In children Doses may need to be recalculated to allow for weight gain in younger children.

**PATIENT AND CARER ADVICE**

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to continue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

**Pyrazinamide**

**INDICATIONS AND DOSE**

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

- **BY MOUTH**
  - Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
  - Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
  - Adult (body-weight up to 50 kg): 1.5 g once daily for 2 months (initial phase)
  - Adult (body-weight 50 kg and above): 2 g once daily for 2 months (initial phase)

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

- **BY MOUTH**
  - Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
  - Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
  - Adult (body-weight up to 50 kg): 2 g 3 times a week for 2 months (initial phase)
  - Adult (body-weight 50 kg and above): 2.5 g 3 times a week for 2 months (initial phase)

**CONTRA-INDICATIONS**

Acute attack of gout (in adults)

**CAUTIONS**

Diabetes - gout (in adults)

**INTERACTIONS**

→ Appendix 1: pyrazinamide

**SIDE-EFFECTS**

Appetite decreased, arthralgia, dysuria, flushing, gout aggravated, hepatic disorders, malaise, nausea, peptic ulcer aggravated, photosensitivity reaction, sideroblastic anaemia, skin reactions, splenomegaly, vomiting

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid in severe impairment, acute hepatic disease and for up to 6 months after occurrence of hepatitis (risk of increased exposure).

**RENAL IMPAIRMENT**

Dose adjustments

- In adults 25–30 mg/kg 3 times a week if eGFR less than 30 mL/minute/1.73 m².
- In children If estimated glomerular filtration rate less than 30 mL/minute/1.73 m², use 25–30 mg/kg 3 times a week.

**Monitoring**

Monitor for gout in renal impairment.

**MONITORING REQUIREMENTS**

- **Renal function** should be checked before treatment.
- **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.

**PRESCRIBING AND DISPENSING INFORMATION**

- In children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children. The RCPCH and NPPG recommend that, when a liquid special of pyrazinamide is required, the following strength is used: 500 mg/5 mL.

**PATIENT AND CARER ADVICE**

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to continue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

2.6 Urinary tract infections

Urinary-tract infections

Overview

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage. *Escherichia coli* is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include *Proteus* and *Klebsiella* spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection;
- complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Antibacterial therapy for lower urinary-tract infections

Uncomplicated lower urinary-tract infections often respond to trimethoprim p. 574 or nitrofurantoin p. 590, or alternatively, amoxicillin p. 548, ampicillin p. 550 or oral cephalosporin.

Suggested duration of treatment is 7 days, but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women.

Infections caused by fully sensitive bacteria respond to amoxicillin.

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav p. 551 (amoxicillin with clavulanic acid), an oral cephalosporin, nitrofurantoin, pivmecillinam hydrochloride p. 554, or a quinolone.

Fosfomycin p. 570 can be used, on the advice of a microbiologist, for the treatment of acute uncomplicated lower urinary-tract infections caused by organisms sensitive to fosfomycin.

Long-term low dose therapy may be required in selected patients to prevent recurrence of infection; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin p. 524 have been recommended for long-term therapy.

Methenamine hippurate below (hexamine hippurate) should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

Antibacterial therapy for upper urinary-tract infections

Acute pyelonephritis can lead to sepsicaemia and is treated initially by injection of a broad-spectrum antibacterial such as a cephalosporin (e.g. cefuroxime p. 526) or a quinolone if the patient is severely ill; gentamicin p. 519 can also be used. Suggested duration of treatment is 10–14 days (longer treatment may be necessary in complicated pyelonephritis). Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as one of the quinolones (ciprofloxacin p. 558 or ofloxacin p. 561), or alternatively, trimethoprim.

Suggested duration of treatment is 28 days.

Where infection is localised and associated with an indwelling catheter, a bladder instillation is often effective.

Pregnancy

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides and quinolones should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment

In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

ANTIBACTERIALS

Methenamine hippurate

(Hexamine hippurate)

<table>

**Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections in patients with catheters**

*BY MOUTH*  
Adult: 1 g every 8–12 hours

**CONTRA-INDICATIONS**  
Gout - metabolic acidosis - severe dehydration

**INTERACTIONS**  
Appendix 1: methenamine

**SIDE-EFFECTS**

- Uncommon  
  Epigastric discomfort - skin reactions

**PREGNANCY**  
There is inadequate evidence of safety, but it has been in wide use for many years without apparent ill consequence, however, manufacturer advises it is preferable to avoid.

**BREAST FEEDING**  
Amount too small to be harmful.

**HEPATIC IMPAIRMENT**  
Manufacturer advises avoid.

**RENAL IMPAIRMENT**  
Avoid if eGFR less than 10 mL/minute/1.73 m²—risk of hippurate crystalluria.

**EFFECT ON LABORATORY TESTS**  
False results for urinary steroids, catecholamines and 5-hydroxyindole acetic acid can occur.

**LESS SUITABLE FOR PRESCRIBING**  
Methenamine (hexamine) hippurate should not generally be used.
Nitrofurantoin

**INDICATIONS AND DOSE**

**Acute uncomplicated urinary-tract infections**
- By mouth using immediate-release medicines
  - Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
  - Child 12–17 years: 50 mg 4 times a day for 3–7 days
  - Adult: 50 mg 4 times a day for 3–7 days, dose to be taken with food
- By mouth using modified-release medicines
  - Child 12–17 years: 100 mg twice daily, dose to be taken with food
  - Adult: 100 mg twice daily, dose to be taken with food

**Severe chronic recurrent urinary-tract infections**
- By mouth using immediate-release medicines
  - Child 12–17 years: 100 mg 4 times a day for 3–7 days
  - Adult: 100 mg 4 times a day for 7 days, dose to be taken with food, reduce dose or discontinue treatment if severe nausea occurs

**Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)**
- By mouth using immediate-release medicines
  - Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
  - Child 12–17 years: 50–100 mg once daily, dose to be taken at night
  - Adult: 50–100 mg once daily, dose to be taken at night

**Genito-urinary surgical prophylaxis**
- By mouth using modified-release medicines
  - Adult: 100 mg twice daily on day of procedure and for 3 days after

**CONTRA-INDICATIONS**
- Acute porphyrias p. 1058
- G6PD deficiency
- Infants less than 3 months old

**CAUTIONS**
- Anaemia
- Diabetes mellitus
- Electrolyte imbalance
- Folate deficiency
- Pulmonary disease
- Susceptibility to peripheral neuropathy
- Urine may be coloured yellow or brown
- Vitamin B deficiency

**INTERACTIONS**
- Appendix 1: nitrofurantoin

**SIDE-EFFECTS**
- Agranulocytosis
- Alopexia
- Anaemia
- Angioedema
- Aplastic anaemia
- Appetite decreased
- Arthralgia
- Asthenia
- Chest pain
- Chills
- Circulatory collapse
- Confusion
- Cynosis
- Depression
- Diarrhoea
- Dizziness
- Drowsiness
- Dyspnoea
- Eosinophilia
- Euphoric mood
- Fever
- Granulocytopenia
- Haemolytic anaemia
- Headache
- Hepatic disorders
- Idiopathic intracranial hypertension
- Increased risk of infection
- Leucopenia
- Lupus-like syndrome
- Nausea
- Nerve disorders
- Nystagmus
- Pancreatitis
- Psychotic disorder
- Pulmonary hypersensitivity
- Pulmonary reaction (possible association with lupus erythematosus-like syndrome)
- Respiratory disorders
- Skin reactions
- Stevens-Johnson syndrome
- Thrombocytopenia
- Urine discolouration
- Vertigo
- Vomiting

**PREGNANCY**
- Avoid at term—may produce neonatal haemolysis

**BREAST FEEDING**
- Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution

**RENAL IMPAIRMENT**
- Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract
- In adults: Avoid if eGFR less than 45 mL/minute/1.73 m²; may be used with caution if eGFR 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk
- In children: Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk

**MONITORING REQUIREMENTS**
- On long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function)

**EFFECT ON LABORATORY TESTS**
- False positive urinary glucose (if tested for reducing substances)

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Nitrofurantoin for urinary tract infections
  - www.medicinesforchildren.org.uk/nitrofurantoin-urinary-tract-infections

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 9, 14, 21
  - Nitrofurantoin (Non-proprietary)
    - Nitrofurantoin 50 mg Nitrofurantoin 50mg tablets | 28 tablet £35.00 DT = £8.34 | 100 tablet £52.79–£111.89
    - Nitrofurantoin 100 mg Nitrofurantoin 100mg tablets | 28 tablet £12.99 DT = £70.4 | 100 tablet £21.07–£30.00
    - Genfura (Genesis Pharmaceuticals Ltd)
      - Nitrofurantoin 50 mg Genfura 50mg tablets | 28 tablet £8.00 DT = £8.34 | 100 tablet £28.57
      - Nitrofurantoin 100 mg Genfura 100mg tablets | 100 tablet £30.36

**Oral suspension**
- CAUTIONARY AND ADVISORY LABELS 9, 14, 21
  - Nitrofurantoin (Non-proprietary)
    - Nitrofurantoin 5 mg per 1 ml Nitrofurantoin 25mg/5ml oral suspension sugar free sugar-free | 300 ml £46.95 DT = £0.95

**Modified-release capsule**
- CAUTIONARY AND ADVISORY LABELS 9, 14, 21
  - Macrolid (Advanz Pharma)
    - Nitrofurantoin 100 mg Macrolid 100mg modified-release capsules | 14 capsule £9.90 DT = £0.95
Fungal infection

3 Fungal infection

Antifungals, systemic use

Fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 599 is the treatment of choice for aspergillosis; liposomal amphotericin p. 593 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 592, or itraconazole p. 597, can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication]. Posaconazole p. 598 is licensed for use in patients with invasive aspergillosis who are refractory to, or intolerant of itraconazole or amphotericin.

Candidiasis

Many superficial candidal infections including infections of the skin are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis may be treated with locally acting antifungals or with fluconazole p. 595 given by mouth; for resistant organisms in adults, itraconazole can be given by mouth.

Oral thrush is effectively treated with topical therapy; fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For invasive or disseminated candidiasis, an echinocandin can be used. Fluconazole is an alternative for Candida albicans infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant Candida spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, fluocytosine p. 601 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and fluocytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons.

Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 1234 are used more frequently than griseofulvin p. 601 because they have a broader spectrum of activity and require a shorter duration of treatment. Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by Trichophyton tonsurans and Microsporum spp. Terbinafine is used for tinea capitis caused by T. tonsurans [unlicensed indication]. The role of terbinafine in the management of Microsporum infections is uncertain.

Pityriasis versicolor may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent “pulse” therapy. Topical antifungals also have a role in the treatment of onychomycosis.

Immunocompromised patients

Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against Aspergillus spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Posaconazole can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia or myelodysplastic syndrome. Micafungin p. 593 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections. Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption.
Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment. Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

**Imidazole antifungals**
The imidazole antifungals include clotrimazole p. 829, econazole nitrate p. 830, ketoconazole p. 830, and tioconazole p. 1233. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 1219 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

**Polyene antifungals**
The polyene antifungals include amphoterin p. 593 and nystatin p. 1219; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (Abelcet® and AmBisome®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

**Echinocandin antifungals**
The echinocandin antifungals include anidulafungin below, caspofungin below and micafungin p. 593. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS.

**Other antifungals**
Flucytosine p. 601 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy.

Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis. Griseofulvin p. 601 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophytosis infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 1234 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

**ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS**

### Anidulafungin

**INDICATIONS AND DOSE**

**Invasive candidiasis**
- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 200 mg once daily for 1 day, then 100 mg once daily

**SIDE-EFFECTS**
- **Common or very common** Bronchospasm · cholestasis · diarrhoea · dyspnoea · headache · hyperglycaemia · hypertension · hypokalaemia · hypotension · nausea · seizure · skin reactions · vomiting
- **Uncommon** Abdominal pain upper · coagulation disorder · vasodilation

**PREGNANCY**
Manufacturer advises avoid unless potential benefit outweighs risk—*toxicity in animal studies.*

**BREAST FEEDING**
Manufacturer advises avoid unless potential benefit outweighs risk—*present in milk in animal studies.*

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion (*Ecalta®*), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL, give at a rate not exceeding 1.1 mg/minute. Follow product information if using stock supplied with ethanol solvent.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

** Powder for solution for infusion**
- **Anidulafungin (Non-proprietary)**
  - Anidulafungin 100 mg Anidulafungin 100mg powder for concentrate for solution for infusion vials | 1 vial (£84.99) (£84.99 (Hospital only))
- **Ecalta (Pfizer Ltd)**
  - Anidulafungin 100 mg Ecalta 100mg powder for concentrate for solution for infusion vials | 1 vial (£99.99 (Hospital only))

**Caspofungin**

**INDICATIONS AND DOSE**

**Invasive aspergillosis**| **Invasive candidiasis**| **Empirical treatment of systemic fungal infections in patients with neutropenia**
- **BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 81 kg): 70 mg once daily for 1 day, then 50 mg once daily
  - Adult (body-weight 81 kg and above): 70 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Manufacturer advises increase dose to 70 mg daily with concurrent use of some enzyme inducers (such as carbamazepine, dexamethasone, phenytoin, and rifampicin); no dose adjustment required for patients already on 70 mg daily.

**INTERACTIONS**
Appendix 1: caspofungin

**SIDE-EFFECTS**
- **Common or very common** Arthralgia · diarrhoea · dyspnoea · electrolyte imbalance · fever · headache · hyperhidrosis · nausea · skin reactions · vomiting
- **Uncommon** Anaemia · anxiety · appetite decreased · arthralgias · ascites · chest discomfort · coagulation disorder · congestive heart failure · constipation · cough · disorientation · dizziness · drowsiness · dry mouth · dysphagia · excessive tearing · eyelid oedema · fatigue · flatulence · fluid overload · flushing · gastrointestinal discomfort · haematuria · hepatic disorders ·

www.getintopharma.com
hyperbilirubinaemia · hyperglycaemia · hypertension · hypoten-sion · hypoxia · induration · insomnia · laryngeal pain · leucopenia · malaise · metabolic acidosis · muscle weakness · myalgia · nasal congestion · oedema · pain · palpitations · renal impairment · respiratory disorders · sensation abnormal · taste altered · thrombocyto-penia · thrombophlebitis · tremor · vision blurred

- **Frequency not known** Severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.
- **BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** No information available for severe impairment.
- **DIRECTIONS FOR ADMINISTRATION**
  - **HEPATIC IMPAIRMENT**
  - **BREAST FEEDING**
  - **PREGNANCY**

- **Adult (body-weight 40 kg and above):**
  - **BY INTRAVENOUS INFUSION**
  - **Adult (body-weight up to 40 kg):**
  - **BY INTRAVENOUS INFUSION**

- **Severe systemic fungal infections in patients not responding to conventional amphotericin B or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin B, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptoco-ccosis in HIV patients**
  - **BY INTRAVENOUS INFUSION**
  - **Adult:** Test dose 1 mg, to be given over 15 minutes, then 5 mg/kg once daily for at least 14 days

- **AmBisome**
  - **Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin B**
  - **Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials**
  - **BY INTRAVENOUS INFUSION**
  - **Adult:** Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day
Fungal infection

Aspergillosis
- **BY INTRAVENOUS INFUSION**
- **Adult:** Test dose 1 mg, to be given over 10–20 minutes, then 3 mg/kg daily; maximum 5 mg/kg per day

Viral encephalitis (unresponsive to the antimonial alone)
- **BY INTRAVENOUS INFUSION**
- **Adult:** 1–2 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

**FUNGIZONE®**

Systemic fungal infections
- **BY INTRAVENOUS INFUSION**
- **Adult:** Test dose 1 mg, to be given over 20–30 minutes, then 250 micrograms/kg daily, gradually increased over 2–4 days, increased if tolerated to 1 mg/kg daily, max. (severe infection) 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

**UNLICENSED USE**

**AMBISOME®** Use at the maximum dose of 5 mg/kg once daily is an unlicensed dose.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: PARENTERAL AMPHOTERICIN B: REMINDER OF RISK OF POTENTIALLY FATAL ADVERSE REACTION IF FORMULATIONS CONFUSED (JULY 2018)**

The MHRA is aware of three fatal overdoses which were caused by medication error in which Fungizone® was administered (a non-lipid-based formulation of amphotericin B) instead of a lipid-based formulation. Healthcare professionals are advised:
- when prescribing and dispensing amphotericin products, both the complete generic name and the proprietary name should be used;
- the product name and dose should be verified before administration, especially if the dose prescribed exceeds the maximum recommended dose for Fungizone®.

**CAUTIONS** Avoid rapid infusion (risk of arrhythmias) - when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

**CAUTIONS, FURTHER INFORMATION**
- Anaphylaxis Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

**INTERACTIONS** Appendix 1: amphotericin

**SIDE-EFFECTS**
- Common or very common Anaemia · appetite decreased · azotaemia · chills · diarrhoea · dyspnoea · electrolyte imbalance · fever · headache · hepatic function abnormal (discontinue) · hypotension · hypotension · nausea · nephrocalcinosis · renal impairment · renal tubular acidosis · skin reactions · vomiting
- Uncommon Agranulocytosis · arthralgias · flushing · gastrointestinal discomfort · hepatic disorders · leucopenia · myalgia · peripheral neuropathy · respiratory disorders · thrombocytopenia
- Rare or very rare Arthralgia · cardiac arrest · coagulation disorder · deafness · encephalopathy · eosinophilia · haemorrhage · heart failure · hypersensitivity · hypertension · malaise · nephrogenic diabetes insipidus · pain · pulmonary oedema non-cardiogenic · seizure · severe cutaneous adverse reactions (SCARs) · shock · tinnitus · vertigo · vision disorders · weight decreased

**PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

**BREAST FEEDING** No information available.

**RENAI IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

**MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

**DIRECTIONS FOR ADMINISTRATION**

**ABELCET® Amphotericin (lipid complex)**

For intravenous infusion, give intermittently in Glucose 5%. Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20–25 mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line.

**AMBISOME® Amphotericin (liposomal)**

For intravenous infusion (Ambisome®), give intermittently in Glucose 5% or 10%. Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose of 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

**FUNGIZONE® Amphotericin (as sodium deoxycholate complex)**

For intravenous infusion (Fungizone®), give intermittently in Glucose 5%. Reconstitute each vial with 10 mL water of injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of the buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose of 1 mg over 20–30 minutes); begin infusion immediately after dilution; protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

**PRESCRIBING AND DISPENSING INFORMATION** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.
Fungal infection

**Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)**

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
  - Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)
  - Adult: 400 mg, dose to be given on first day, then 200–400 mg daily (max. per dose 800 mg once daily), treatment continued according to response (at least 8 weeks for cryptococcal meningitis), maximum dose for use in severe infections

**Prevention of fungal infections in immunocompromised patients**

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
  - Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia
  - Adult: 50–400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose adjusted according to risk

**Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)**

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
  - Adult: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

**Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy**

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
  - Adult: 200 mg daily

---

**Indications and dose**

**Candidal balanitis**

**BY MOUTH**

- Child 16-17 years: 150 mg for 1 dose
- Adult: 150 mg for 1 dose

**Vaginal candidiasis**

**BY MOUTH**

- Adult: 150 mg for 1 dose

**Vulvovaginal candidiasis (recurrent)**

**BY MOUTH**

- Adult: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months

**Mucosal candidiasis (except genital)**

**BY MOUTH, OR BY INTRAVENOUS INFUSION**

- Child 1 month-11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)
- Child 12-17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections
- **BY MOUTH**
  - Adult: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

**Tinea pedis, corporis, cruris, pityriasis versicolor**

**DERMAL CANDIDIASIS**

**BY MOUTH**

- Adult: 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

---

**Contra-indications**

Acute porphyrias p. 1058

**Caution**

Susceptibility to QT interval prolongation

**Interactions**

Appendix 1: antifungals, azoles

**Side-effects**

**General side-effects**

- **Common or very common** Diarrhoea; gastrointestinal discomfort; headache; nausea; skin reactions; vomiting
- **Uncommon** Dizziness; flatulence; hepatic disorders; oesophagitis; oedema; neutropenia; QT interval prolongation; severe cutaneous adverse reactions (SCARs); thrombocytopenia; taste altered
- **Rare or very rare** Agranulocytosis; alopecia; dyslipidaemia; hypokalaemia; leucopenia; neutropenia; QT interval prolongation; severe cutaneous adverse reactions (SCARs); thrombocytopenia; torsade de pointes

**Specific side-effects**

**Uncommon**

- With parenteral use Anaemia; appetite decreased; asthenia; constipation; drowsiness; dry mouth; fever; hyperhidrosis; insomnia; malaise; myalgia; paraesthesia; vertigo
- **Rare or very rare**
  - With parenteral use Angioedema; face oedema; tremor
  - Frequency not known
  - With oral use Cardio-respiratory distress; oedema

**Side-effects, further information**

If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

**Pregnancy**

Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.

**Breast feeding**

Present in milk but amount probably too small to be harmful.

**Hepatic impairment**

Manufacturer advises caution—limited information available.
Fluconazole Capsules

- **CAUTIONARY AND ADVISORY LABELS**
  - Flavours of Fluconazole may contain sodium.
  - Electrolytes: May contain sodium.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Infusion**
    - Fluconazole (Non-proprietary) 2 mg per 1 ml: Fluconazole 200mg/100ml infusion solution for infusion bags | 5 bag [POT] £19.45 (Hospital only)
    - Fluconazole 400mg/200ml infusion solution | 5 bag [POT] £72.50 (Hospital only)

  - **Solution for infusion**
    - Fluconazole (Non-proprietary) 2 mg per 1 ml: Fluconazole 200mg/100ml infusion solution for infusion vials | 1 vial [POT] £15.00–£29.28
    - Fluconazole 400mg/250ml infusion solution for infusion vials | 1 vial [POT] £12.00 (Hospital only)
    - Fluconazole 200mg/100ml solution for infusion vials | 10 vial [POT] £373.60 | 20 bottle [POT] £603.17

  - **Diflucan** (Pfizer Ltd)
    - Fluconazole 2 mg per 1 ml: Diflucan 200mg/100ml solution for infusion vials | 1 vial [POT] £29.28 (Hospital only)

  - **Oral suspension**
    - Fluconazole (Non-proprietary)
      - Fluconazole 10 mg per 1 ml: Fluconazole 200mg/5ml oral suspension solution | 35 ml [POT] £26.52 DT = £20.51
      - Fluconazole 50 mg capsules | 7 capsule [POT] £6.00 DT = £0.72
      - Fluconazole 150 mg capsules | 1 capsule [POT] £16.00 DT = £0.72

  - **Capsule**
    - Fluconazole (Non-proprietary)
      - Fluconazole 50 mg: Fluconazole 50mg capsules | 7 capsule [POT] £6.00 DT = £0.60
      - Fluconazole 150 mg: Fluconazole 150mg capsules | 1 capsule [POT] £16.00 DT = £0.60
      - Fluconazole 200 mg: Fluconazole 200mg capsules | 7 capsule [POT] £6.02 DT = £0.60

  - **Canesten (Fluconazole)** (Bayer Plc)
    - Fluconazole 150 mg: Canesten Thrush Oral 150mg capsules | 1 capsule [POT] £6.33 DT = £0.69

  - **Diflucan (Pfizer Ltd)**
    - Fluconazole 50 mg: Diflucan 50mg capsules | 7 capsule [POT] £16.61 DT = £0.72
    - Fluconazole 150 mg: Diflucan 150mg capsules | 1 capsule [POT] £7.12 DT = £0.69
    - Fluconazole 200 mg: Diflucan 200mg capsules | 7 capsule [POT] £6.42 DT = £3.94

---

**Isavuconazole**

- **DRUG ACTION** Isavuconazole is a triazole antifungal that blocks the synthesis of ergosterol, a key component of the fungal cell membrane.

- **INDICATIONS AND DOSE**

  - Invasive aspergillosis: | *Mucormycosis in patients for whom amphotericin B is inappropriate* |
    - By mouth, or by intravenous infusion
    - Adult: Loading dose 200 mg every 8 hours for 48 hours (6 administrations in total), then maintenance 200 mg once daily, maintenance dose to be started at least 12 hours after the last loading dose; long-term treatment should be reviewed after 6–months

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 1058 - short QT syndrome

- **CAUTIONS**
  - Elderly—limited information

- **INTERACTIONS**
  - Appendix 1: antifungals, azoles

- **SIDE-EFFECTS**

  - **GENERAL SIDE-EFFECTS**
    - Common or very common:
      - Appetite decreased - asthenia - chest pain - delirium - diarrhoea - drowsiness - electrolyte imbalance - gastrointestinal discomfort - headache - hepatic disorders - nausea - skin reactions - thrombophlebitis
    - Uncommon:

  - **SPECIFIC SIDE-EFFECTS**
    - Common or very common:
      - With intravenous use: Hyperbilirubinaemia
    - Uncommon:
      - With intravenous use: Peripheral oedema

  - **SIDE-EFFECTS, FURTHER INFORMATION**

  - Infusion-related reactions have been reported, including hypotension, dysphagia, dizziness, paraesthesia, nausea, and headache—manufacturer advises discontinue treatment if these reactions occur.

- **PREGNANCY**
  - Manufacturer advises avoid unless severe or life-threatening infection—toxicity in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in severe impairment (no information available)—monitor for drug toxicity.

- **DIRECTIONS FOR ADMINISTRATION**

  - With intravenous use: For intravenous infusion, reconstitute each 200 mg with 5 mL water for injection; dilute dose to concentration of 0.8 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give via a 0.2–1.2 micron filter over at least 1 hour.

---

**BNF 78**

- **RENAI IMPAIRMENT**
  - **Dose adjustments**
    - In adults: Usual initial dose then halve subsequent doses if eGFR less than 50 mL/minute/1.73 m².
    - In children: Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic necrosis.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children: For intravenous infusion, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of oral liquid formulations may include orange.

- **PRACTICE SPECIFIC INFORMATION**
  - Dental practitioners’ formula.
  - Fluconazole Capsules 50 mg may be prescribed.
  - Fluconazole Oral Suspension 50 mg; 5 mL may be prescribed.

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Uncommon:
**HANDLING AND STORAGE**
- With intravenous use Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage after reconstitution or dilution.

**PATIENT AND CARER ADVICE**
- **Driving and skilled tasks** Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—an increased risk of confusion, syncope and dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**

**All Wales Medicines Strategy Group (AWMSG) decisions**

**AWMSG No. 2433**

The All Wales Medicines Strategy Group has advised (January 2017) that isavuconazole (Cresemba<sup>®</sup>) is recommended as an option for use in adults within NHS Wales for the treatment of invasive aspergillosis, and the treatment of mucormycosis in patients for whom amphotericin B is inappropriate, only if the approved Wales Patient Access Scheme (WPAS) is used or where the list/contract price is equivalent or lower.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- Cresemba (Pfizer Ltd)  
  - Isavuconazole (as isavuconazolium sulfate) 200 mg Cresemba 200mg powder for concentrate for solution for infusion vials | £297.84 (Hospital only)

**Capsule**
- Cresemba (Pfizer Ltd)  
  - Isavuconazole (as isavuconazolium sulfate) 100 mg Cresemba 100mg capsules | 14 capsule pack £599.28 (Hospital only)

---

**Itraconazole**

**INDICATIONS AND DOSE**

**Vulvovaginal candidiasis**
- **BY MOUTH**
  - Adult: 200 mg twice daily for 1 day

**Vulvovaginal candidiasis (recurrent)**
- **BY MOUTH**
  - Adult: 50–100 mg daily for 6 months

**Oral or oesophageal candidiasis that has not responded to fluconazole**
- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 100–200 mg twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

**Oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients**
- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 200 mg daily in 1–2 divided doses for 1 week (continue for another week if no response)

**Systemic candidiasis where other antifungal drugs inappropriate or ineffective**
- **BY MOUTH**
  - Adult: 100–200 mg once daily

**Systemic candidiasis (invasive or disseminated) where other antifungal drugs inappropriate or ineffective**
- **BY MOUTH**
  - Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Tinea pedis | Tinea manuum**
- **BY MOUTH**
  - Adult: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

**Tinea corporis | Tinea cruris**
- **BY MOUTH**
  - Adult: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

**Onychomycosis**
- **BY MOUTH**
  - Adult: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

**Aspergillosis**
- **BY MOUTH**
  - Adult: 200 mg twice daily

**Systemic aspergillosis where other antifungal drugs inappropriate or ineffective**
- **BY INTRAVENOUS INFUSION**
  - Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Histoplasmosis**
- **BY MOUTH**
  - Adult: 200 mg 3 times a day for 3 days, then 200 mg 1–2 times a day

**BY INTRAVENOUS INFUSION**
  - Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective**
- **BY MOUTH**
  - Adult: 200 mg once daily, dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 200 mg twice daily

**Prophylaxis of deep fungal infections (when standard therapy inappropriate)**
- **BY INTRAVENOUS INFUSION**
  - Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate**
- **BY MOUTH**
  - Adult: 200 mg once daily, then increased to 200 mg twice daily, dose increased only if low plasma-itraconazole concentration

**Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic**
- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 5 mg/kg daily in 2 divided doses, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established in elderly patients

**Dose adjustments due to interactions**
- Manufacturer advises max. dose 200 mg daily with concurrent use of cobicistat.

**UNLICENSED USE** Itraconazole doses in BNF may differ from those in product literature.

---

**IMPORTANT SAFETY INFORMATION**

**Heart failure**

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;

www.getintopharma.com
Infection

- older adults and those with cardiac disease;
- patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

CONTRA-INDICATIONS Acute porphyrias p. 1058

CAUTIONS Active liver disease • history of hepatotoxicity with other drugs • susceptibility to congestive heart failure

INTERACTIONS ➔ Appendix 1: antifungals, azoles

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Alopecia • constipation • diarrhoea • dyspnoea • gastrointestinal discomfort • headache • heart failure • hepatic disorders • hyperbilirubinaemia • nausea • oedema • pulmonary oedema • skin reactions • vision disorders • vomiting
- Uncommon Hearing loss • taste altered
- Rare or very rare Angioedema • hypersensitivity vasculitis • hypertiglyceridaemia • pancreatitis • photosensitivity reaction • severe cutaneous adverse reactions (SCARs)
- Frequency not known Peripheral neuropathy (discontinue)

SPECIFIC SIDE-EFFECTS

- Common or very common
  - With intravenous use Chest pain • confusion • cough • dizziness • drowsiness • electrolyte imbalance • fatigue • gastrointestinal disorder • granulocytopenia • hyperglycaemia • hyperhidrosis • hypersensitivity • hypotension • hypotension • myalgia • pain • renal impairment • tachycardia • tremor • urinary incontinence
- Rare or very rare
  - With oral use Dysphoria • numbness • thrombocytopenia
  - With oral use Flatulence • increased risk of infection • menstrual disorder
- Rare or very rare
  - With oral use Erectile dysfunction • leucopenia • sensation abnormal • serum sickness • tinnitus • urinary frequency increased

SIDE-EFFECTS, FURTHER INFORMATION Potentially life-threatening hepatotoxicity reported very rarely — discontinue if signs of hepatitis develop.

CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

PREGNANCY Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies).

BREAST FEEDING Small amounts present in milk — may accumulate; manufacturer advises avoid.

HEPATIC IMPAIRMENT Use only if potential benefit outweighs risk of hepatotoxicity.

Dose adjustments Dose reduction may be necessary.

RENAL IMPAIRMENT Risk of congestive heart failure.

- With oral use Bioavailability of oral formulations possibly reduced.
- With intravenous use Use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m²; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS

- Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
- Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion (Sporanox®), give intermittently in Sodium Chloride 0.9%; dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.
- With oral use For oral liquid, do not take with food; swish around mouth and swallow, do not rinse afterwards.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include cherry.

PATIENT AND CARER ADVICE Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.

- With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for infusion

EXCIPIENTS: May contain Propylene glycol

- Sporanox (Janssen-Cilag Ltd)
  Itraconazole 10 mg per 1 ml Sporanox IV. 250mg/25ml solution for infusion amoroso and diluent • 1 ampoule (£58.34-£59.25) £59.25

Oral solution

CAUTIONARY AND ADVISORY LABELS 9, 23

- Itraconazole (Non-proprietary)
  - Itraconazole 10 mg per 1 ml Itraconazole 50mg/5ml oral solution sugar free sugar-free • 150 ml (£50) £58.34–£59.25 DT = £59.25
  - Sporanox (Janssen-Cilag Ltd)
  Itraconazole 10 mg per 1 ml Itraconazole 50mg/5ml oral solution sugar-free • 150 ml (£58.34–£59.25 DT = £59.25

Capsule

CAUTIONARY AND ADVISORY LABELS 5, 9, 21, 25

- Itraconazole (Non-proprietary)
  - Itraconazole 100 mg Itraconazole 100mg capsules • 15 capsule (£69.77 DT = £3.24) • 60 capsule (£69.77 DT = £12.96–£15.10
  - Sporanox (Janssen-Cilag Ltd)
  Itraconazole 100 mg Sporanox-Pulse 100mg capsules • 28 capsule (£25.72) £25.72
  Sporanox 100mg capsules • 4 capsule (£3.67) • 15 capsule (£69.77 DT = £3.24) • 60 capsule (£69.77 DT = £55.10

Posaconazole

INDICATIONS AND DOSE

Invasive aspergillosis either refractory to, or in patients intolerant of, itraconazole or amphotericin | Fusariosis either refractory to, or in patients intolerant of, amphotericin | Chromoblastomycosis and mycetoma either refractory to, or in patients intolerant of, itraconazole | Coccidioidomycosis either refractory to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole

- BY MOUTH USING ORAL SUSPENSION
  - Adult: 400 mg twice daily, to be taken with food, alternatively 200 mg 4 times a day, if unable to tolerate food
  - BY MOUTH USING TABLETS, OR BY INTRAVENOUS INFUSION
  - Adult: Loading dose 300 mg twice daily on first day, then 300 mg once daily, switch from intravenous to oral route when appropriate

Oral pain (severe infection or in immunocompromised patients only)

- BY MOUTH USING ORAL SUSPENSION
  - Adult: Loading dose 200 mg on first day, then 100 mg once daily for 13 days, dose to be taken with food

598 | Fungal infection

BNF 78

www.getintopharma.com
Prophylaxis of invasive fungal infections in patients at high risk and undergoing high-dose immunosuppressive therapy for haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia or myelodysplastic syndrome and expected to develop prolonged neutropenia

▶ BY MOUTH USING ORAL SUSPENSION
> Adults: 200 mg 3 times a day, dose to be taken with food, for chemotherapy patients, start several days before the expected onset of neutropenia and continue for 7 days after neutrophil count rises above 500 cells/mm³
> Adults: Loading dose 300 mg twice daily on first day, then 300 mg once daily, for chemotherapy patients, start several days before the expected onset of neutropenia and continue for 7 days after neutrophil count rises above 500 cells/mm³, switch from intravenous to oral route when appropriate

Dose equivalence and conversion
> Posaconazole oral suspension is not interchangeable with tablets on a milligram-for-milligram basis.

Pharmacokinetics
> Posaconazole oral suspension should be taken with food (preferably a high fat meal) or nutritional supplement to ensure adequate exposure for systemic effects. Where possible, tablets should be used in preference to suspension because tablets have a higher bioavailability.

Contraindications
> Acute porphyrias p. 1058

Cautions
> Administration by intravenous infusion, particularly by peripheral catheter—increased risk of QTc interval prolongation - body-weight over 120 kg—risk of treatment failure possibly increased - body-weight under 60 kg—risk of side effects increased • bradycardia - cardiomyopathy - history of QTc interval prolongation - symptomatic arrhythmias

Interactions
> Appendix 1: antifungals, azoles

Side-effects
> Common or very common • Appetite decreased - asthenia - constipation - diarrhoea - dizziness - drowsiness - dry mouth - electrolyte imbalance - gastrointestinal discomfort - gastrointestinal disorders - headache - hypertension - nausea - neutropenia - sensation abnormal - skin reactions - taste altered - vomiting

Rare or very rare • Adrenal insufficiency - breast pain - cardiac arrest - coagulation disorder - depression - encephalopathy - haemolytic uraemic syndrome - hearing impairment - heart failure - myocardial infarction - nephritis tubulointerstitial - neuropathy - perineural disorder - pulmonary hypertension - renal tubular acidosis - Stevens-Johnson syndrome - stroke - sudden cardiac death - syncope

Conception and contraception
> Manufacturer recommends effective contraception during treatment.

Pregnancy
> Manufacturer advises avoid unless potential benefit outweighs risk; toxicity in animal studies.

Breast feeding
> Manufacturer advises avoid—present in milk in animal studies.

Hepatic impairment
> Manufacturer advises caution (risk of increased exposure, limited information available).

Renal impairment
> Manufacturer advises monitor efficacy in severe impairment—variable exposure expected.
> With intravenous use • Manufacturer advises caution if eGFR less than 50 mL/minute/1.73 m²—intravenous vehicle may accumulate.

Monitoring requirements
> Monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy.
> Monitor liver function before and during therapy.

Directions for administration
> With intravenous use • Manufacturer advises for intravenous infusion (Noxafil®), give continuously in Glucose 5% or Sodium Chloride 0.9%; dilute requisite dose in infusion fluid to produce a final concentration of 1–2 mg/mL; give via a central venous catheter or peripherally inserted central catheter over approx. 90 minutes (can give a single dose via peripheral venous catheter if central access not established—dilute to a final concentration of 2 mg/mL and give over approx. 30 minutes).

Prescribing and dispensing information
> Flavours of oral liquid formulations may include cherry.

Handling and storage
> With intravenous use • Manufacturer advises store in a refrigerator (2–8 °C).

Patient and carer advice
Driving and skilled tasks • Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

Medicinal forms
> There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Electrolytes: May contain Sodium
> Noxafil® (Merck Sharp & Dohme Ltd)
> Posaconazole 18 mg per 1 ml Noxafil® 300mg/16.7ml concentrate for solution for infusion vials 1 vial £211.00 (Hospital only)

Oral suspension
> Cautionary and Advisory Labels 3, 9, 21
> Noxafil® (Merck Sharp & Dohme Ltd)
> Posaconazole 40 mg per 1 ml Noxafil® 40mg/ml oral suspension 105 ml (Hospital only) £491.20 (Hospital only)

Gastro-resistant tablet
> Cautionary and Advisory Labels 3, 9, 25
> Noxafil® (Merck Sharp & Dohme Ltd)
> Posaconazole 100 mg Noxafil® 100mg gastro-resistant tablets 24 tablet £596.96 DT + £596.96 96 tablet £2,387.85

Voriconazole

Indications and dose
Invasive aspergillosis • Serious infections caused by Scedosporium spp., Fusarium spp., or invasive fluconazole-resistant Candida spp. (including C. krusei)
> By mouth
> Adult (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
> Adult (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours
> By intravenous infusion
> Adult: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months
600 Fungal infection

**Dose Adjustments due to Interactions**

- With intravenous use: Manufacturer advises increase maintenance dose to 5 mg/kg every 12 hours with concurrent use of fosphenytoin, phenytoin or rifabutin.
- With oral use: Manufacturer advises increase maintenance dose with concurrent use of fosphenytoin or phenytoin: 400 mg every 12 hours for patients of body-weight 40 kg and above; 200 mg every 12 hours for patients of body-weight less than 40 kg. Manufacturer advises if concurrent use of rifabutin is unavoidable, increase maintenance dose to 350 mg every 12 hours for patients of body-weight 40 kg and above; 200 mg every 12 hours for patients of body-weight less than 40 kg.

**Contra-Indications**
- Acute porphyrias p. 1058

**Caution**
- Avoid exposure to sunlight - bradycardia - cardiomyopathy - electrolyte disturbances - history of QT interval prolongation - patients at risk of pancreatitis - symptomatic arrhythmias

**Interactions**
- Appendix 1: antifungals, azoles

**Side-Effects**

**General Side-Effects**

- **Common**
  - Acute kidney injury
  - Agranulocytosis
  - Alopoeia
  - Anaemia
  - Anxiety
  - Arrhythmias
  - Asthenia
  - Bone marrow disorders
  - Chest pain
  - Chills
  - Confusion
  - Constipation
  - Depression
  - Diarrhoea
  - Dizziness
  - Drowsiness
  - Dyspnoea
  - Electrolyte imbalance
  - Eye disorders
  - Eye inflammation
  - Fever
  - Gastrointestinal discomfort
  - Haemorrhage
  - Hallucination
  - Headache
  - Hepatic disorders
  - Hypoglycaemia
  - Hypotension
  - Increased risk of infection
  - Insomnia
  - Leucopenia
  - Muscle tone increased
  - Nausea
  - Neutropenia
  - Oedema
  - Oral disorders
  - Pain
  - Pulmonary oedema
  - Respiratory disorders
  - Seizure
  - Sensation abnormal
  - Skin reactions
  - Syncope
  - Tetany
  - Thrombocytopenia
  - Tremor
  - Vision disorders
  - Vomiting

- **Uncommon**
  - Adrenal insufficiency
  - Arthritis
  - Brain oedema
  - Duodenitis
  - Encephalopathy
  - Eosinophilia
  - Gallbladder disorders
  - Hearing impairment
  - Hypothyroidism
  - Influenza like illness
  - Lymphadenopathy
  - Lymphangitis
  - Movement disorders
  - Nephritis
  - Nerve disorders
  - Pancreatitis
  - Parkinsonism
  - Phototoxicity
  - Proteinuria
  - Pseudomembranous enterocolitis
  - QT interval prolongation
  - Renal tubular necrosis
  - Severe cutaneous adverse reactions (SCARs)
  - Taste altered
  - Thrombophlebitis
  - Tinnitus
  - Vertigo

- **Rare or very rare**
  - Angiœdœma
  - Cardiac conduction disorders
  - Disseminated intravascular coagulation
  - Hyperthyroidism

- **Frequency not known**
  - Cutaneous lupus erythematosus
  - Periostitis (more common in transplant patients)
  - Squamous cell carcinoma (more common in presence of phototoxicity)

**Specific Side-Effects**

- With intravenous use: Infusion related reaction

**Side-Effects, Further Information**

**Hepatotoxicity**

Hepatitis, cholestasis, and acute hepatic failure have been reported; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.

**Phototoxicity**

Phototoxicity occurs uncommonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

**Conception and Contraception**

Effective contraception required during treatment.

**Pregnancy**

Toxicity in animal studies - manufacturer advises avoid unless potential benefit outweighs risk.

**Breast Feeding**

Manufacturer advises avoid - no information available.

**Hepatic Impairment**

Manufacturer advises caution, particularly in severe impairment (no information available).

**Dose Adjustments**

Manufacturer advises use initial loading dose then halve maintenance dose in mild to moderate cirrhosis.

**Renal Impairment**

Intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m² — use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

**Monitoring Requirements**

- Monitor renal function.
- Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

**Directions for Administration**

- With intravenous use: For intravenous infusion, reconstitute each 200 mg with 19 mL. Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5 – 5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

**Prescribing and Dispensing Information**

- Flavours of oral liquid formulations may include orange.

**Patient and Carer Advice**

- Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

Patients and their carers should be advised to keep the alert card with them at all times.

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for Solution for Infusion**

**Excipients:** May contain Sodium Bicarbonate, Sodium Chloride, Lactose, Sorbitol, Gelatin, Sodium Hypophosphite.

**Voriconazole (Non-proprietary)**

Voriconazole 200 mg

Voriconazole 50 mg, 100 mg tablets for solution for infusion vials: 1 vial (Pfizer Ltd) £51.43 – £77.14 (Hospital only)

VFEND (Pfizer Ltd)

Voriconazole 200 mg

VFEND 200 mg powder for solution for infusion vials: 1 vial (Pfizer Ltd) £77.14 (Hospital only)

**Oral Suspension**

**Cautionary and Advisory Labels** 9, 11, 23

VFEND (Pfizer Ltd)

Voriconazole 40 mg per 1 ml

VFEND 40 mg/ml oral suspension: 75 ml (Pfizer Ltd) £55.37

**Tablet**

**Cautionary and Advisory Labels** 9, 11, 23

Voriconazole 50 mg

Voriconazole 50 mg tablets: 10 tablets (Pfizer Ltd) £275.68

Voriconazole 100 mg

Voriconazole 100 mg tablets: 10 tablets (Pfizer Ltd) £1,102.74 £680.92

www.getintopharma.com
Pneumocystis pneumonia

Overview

Pneumonia caused by *Pneumocystis jirovecii* (Pneumocystis carinii) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

**Treatment**

Mild to moderate disease

Co-trimoxazole p. 562 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone p. 602 is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone p. 577 with trimethoprim p. 574 is given by mouth for the
treatment of mild to moderate disease [unlicensed indication]. A combination of clindamycin p. 535 and primaquine p. 618 by mouth is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate below given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion. Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy

In moderate to severe infections associated with HIV infection, prednisolone p. 678 is given by mouth for 5 days (alternatively, hydrocortisone p. 676 may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy. Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given daily or on alternate days (3 times a week); the dose may be reduced to improve tolerance. Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone can be used. Atovaquone has also been used for prophylaxis [unlicensed indication].

ANTIPROTOZOAALs

Atovaquone

- **INDICATIONS AND DOSE**
  - **Treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia in patients intolerant of co-trimoxazole**
    - **BY MOUTH**
      - Adult: 750 mg twice daily for 21 days, dose to be taken with food, particularly high fat food
  - **Prophylaxis against pneumocystis pneumonia**
    - **BY MOUTH**
      - Adult: 750 mg twice daily
  - **UNLICENSED USE** Not licensed for prophylaxis against pneumocystis pneumonia.
  - **CAUTIONS** Other causes of pulmonary disease should be sought and treated - elderly - initial diarrhoea and difficulty in taking food may reduce absorption (and require alternative therapy)

- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
  - Common or very common Anaemia - angioedema - bronchospasm - diarrhoea - headache - hypersensitivity - hypoglycaemia - insomnia - nausea - neutropenia - skin reactions - throat tightness - vomiting
  - Frequency not known Stevens-Johnson syndrome
  - PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
  - BREAST FEEDING Manufacturer advises avoid.
  - HEPATIC IMPAIRMENT Manufacturer advises use with caution in significant impairment and monitor closely—no information available.
  - RENAL IMPAIRMENT Manufacturer advises caution. Monitoring Monitor more closely in renal impairment.
  - PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include tutti-frutti.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
- **Oral suspension** CAUTIONARY AND ADVISORY LABELS
  - 21 Wellvone (GlaxoSmithKline UK Ltd) Atovaquone 150 mg per 1 ml Wellvone 750mg/5ml oral suspension sugar-free | 226 ml [P] £486.37 DT + £486.37

### Pentamidine isetionate

- **INDICATIONS AND DOSE**
  - **Treatment of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 4 mg/kg once daily for at least 14 days
  - **Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia (specialist use only)**
    - **BY INHALATION OF NEBULISED SOLUTION**
      - Adult: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature
  - **Visceral leishmaniasis (specialist use only)**
    - **BY DEEP INTRAMUSCULAR INJECTION**
      - Adult: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary
  - **Cutaneous leishmaniasis (specialist use only)**
    - **BY DEEP INTRAMUSCULAR INJECTION**
      - Adult: 3–4 mg/kg 1–2 times a week until condition resolves
  - **Trypanosomiasis (specialist use only)**
    - **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
      - Adult: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for primary prevention of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia by inhalation of nebulised solution.
- **CAUTIONS** Anaemia - bradycardia - coronary heart disease - history of ventricular arrhythmias - hyperglycaemia - hypertension - hypoglycaemia - hypokalaemia - hypomagnesaemia - hypotension - leucopenia - risk of severe hypotension following administration - thrombocytopenia
- **INTERACTIONS** → Appendix 1: pentamidine
- **SIDE-EFFECTS**
  - Common or very common Dizziness - hypoglycaemia (can be severe and sometimes fatal) - hypotension (can be
severe and sometimes fatal) - local reaction - nausea - rash - taste altered
  ▶ Rare or very rare QT interval prolongation
  ▶ Frequency not known Pancreatitis acute (can be severe and sometimes fatal)

**SPECIFIC SIDE-EFFECTS**
  ▶ Common or very common
    - When used by inhalation Cough - dyspnoea - respiratory disorders
  ▶ Rare or very rare
    - With parenteral use Arrhythmias - perioral hypoaesthesia - sensation abnormal - Stevens-Johnson syndrome
  ▶ PREGNANCY Manufacturer advises avoid unless essential.
  ▶ BREAST FEEDING Manufacturer advises avoid unless essential—no information available.
  ▶ HEPATIC IMPAIRMENT Manufacturer advises caution.
  ▶ RENAL IMPAIRMENT
    - Dose adjustments: Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in life-threatening infection, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in less severe infection, use 4 mg/kg on alternate days for at least 14 doses.
  ▶ MONITORING REQUIREMENTS
    - Monitor blood pressure before starting treatment, during treatment and personnel should be adequately protected during handling and administration.
    - Carry out laboratory monitoring according to product literature.
    - Directions for administration: Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and never given rapidly; intramuscular injections should be deep and preferably given into the buttck. For intravenous infusion, reconstitute 300 mg with 3–5 mL. Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL. Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.
    - Powder for injection (dissolved in water for injection) may be used for nebulisation.
  ▶ HANDLING AND STORAGE: Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.
  ▶ MEDICINAL FORMS: There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
  ▶ Pentacamrinat (Sanofi)
    - Pentamidine isetionate 300 mg
    - Pentacamrinat 300mg powder for solution for injection vials | 5 vial (PO) £158.86

**Threadworms**

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 605 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

**Ascaricides (common roundworm infections)**

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice. Levamisole p. 605 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the alternative when mebendazole cannot be used. It is very well tolerated.

**Tapeworm infections**

**Taenicides**

Niclosamide [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antimitic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 605 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

**Hydatid disease**

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albenzaule p. 604 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albenzaule cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albenzaule (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

**Hookworms**

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection
requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative. Levamisole is also is also effective in children.

Schistosomiasis (bilharziasis)
Adult Schistosoma haematobium worms live in the genito-urinary veins and adult S. mansoni in those of the colon and mesentery. S. japonicum is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Filaricides
Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is effective against microfilariae and adults of Loa loa, Wuchereria bancrofti, and Brugia malayi. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy Loa loa infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin below [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is very effective in onchocerciasis and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for onchocerciasis because of their toxicity.

Cutaneous larva migrans (creeping eruption)
Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or thiabendazole (thiabendazole) by mouth [all unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

Strongyloidiasis
Adult Strongyloides stercoralis live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for chronic Strongyloides infection in adults and children over 5 years. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

**ANTHELMINTICS**

### Albendazole

- **INDICATIONS AND DOSE**
  - Chronic Strongyloides infection
    - By mouth
    - Adult: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary
  - Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases
    - By mouth
    - Adult: (consult product literature)

- **UNLICENSED USE** Albendazole is an unlicensed drug.
- **INTERACTIONS** → Appendix 1: albendazole

### Diethylcarbamazine

- **INDICATIONS AND DOSE**
  - Wuchereria bancrofti infections | Brugia malayi infections
    - By mouth
    - Adult: Initially 1 mg/kg daily on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

- **UNLICENSED USE** Diethylcarbamazine is an unlicensed drug.

### Ivermectin

- **INDICATIONS AND DOSE**
  - Chronic Strongyloides infection
    - By mouth
    - Adult: 200 micrograms/kg daily for 2 days
  - Onchocerciasis
    - By mouth
    - Adult: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months, depending on symptoms, must be given until the adult worms die out
Helminth infection 605

Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone

- **BY MOUTH**
  - Adult: 200 micrograms/kg for 1 dose, further doses of 200 micrograms/kg may be required

- **UNLICENSED USE** Ivermectin is unlicensed.
- **INTERACTIONS** → Appendix 1: ivermectin
- **SIDE-EFFECTS**
  - Common or very common Skin reactions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet
  - Tablet
    - **Stromectol (Imported (France))**
      - Ivermectin 3 mg Stromectol 3mg tablets | 4 tablet [PDF]

Levamisole

- **INDICATIONS AND DOSE**
  - **Roundworm infections**
    - **BY MOUTH**
    - Adult: 120–150 mg for 1 dose

- **UNLICENSED USE** Not licensed.
- **CONTRA-INDICATIONS** Blood disorders
- **CAUTIONS** Epilepsy - Sjögren’s syndrome
- **INTERACTIONS** → Appendix 1: levamisole
- **SIDE-EFFECTS** Arthralgia (long term use) - blood disorder (long term use) - diarroha - dizziness - headache - influenza like illness (long term use) - insomnia (long term use) - myalgia (long term use) - nausea - rash (long term use) - seizure (long term use) - taste altered (long term use) - vasculitis (long term use) - vomiting
- **PREGNANCY** Embryotoxic in animal studies, avoid if possible.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Dose adjustments Use with caution—dose adjustment may be necessary.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet
  - Tablet
    - CAUTIONARY AND ADVISORY LABELS 4
      - Ergamisol (Imported (Belgium))
        - Levamisole (as Levamisole hydrochloride) 50 mg Ergamisol 50mg tablets | 20 tablet [PDF]

Mebendazole

- **INDICATIONS AND DOSE**
  - **Threadworm infections**
    - **BY MOUTH**
      - Child 6 months–17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
      - Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
  - **Whipworm infections | Hookworm infections**
    - **BY MOUTH**
      - Child 1–17 years: 100 mg twice daily for 3 days
      - Adult: 100 mg twice daily for 3 days
  - **Roundworm infections**
    - **BY MOUTH**
      - Child 1 year: 100 mg twice daily for 3 days

- **Child 2–17 years**: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose
- **Adult**: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

- **UNLICENSED USE** Not licensed for use as a single dose of 500 mg in roundworm infections.
- **In children** Not licensed for use in children under 2 years.
- **INTERACTIONS** → Appendix 1: mebendazole
- **SIDE-EFFECTS**
  - Common or very common Gastrointestinal discomfort
  - Uncommon Diarroha - flatulence
  - Rare or very rare Alopecia - dizziness - hepatitis - neutropenia - seizure - severe cutaneous adverse reactions (SCARs) - skin reactions
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Amount present in milk too small to be harmful but manufacturer advises avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Mebendazole for worm infections www.medicinesforchildren.org.uk/mebendazole-worm-infections

- **EXCEPTIONS TO LEGAL CATEGORY** Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - **Vermox (Janssen-Cilag Ltd)**
      - Mebendazole 20 mg per 1 ml Vermox 100mg/5ml oral suspension | 30 ml [PDF] £1.55 DT + £1.55
  - **Chewable tablet**
    - **Vermox (Janssen-Cilag Ltd)**
      - Mebendazole 100 mg Vermox 100mg chewable tablets sugar-free | 6 tablet [PDF] £1.34 DT + £1.34

Praziquantel

- **INDICATIONS AND DOSE**
  - **Tapeworm infections (Taenia solium)**
    - **BY MOUTH**
      - Adult: 5–10 mg/kg for 1 dose, to be taken after a light breakfast
  - **Tapeworm infections (Hymenolepis nana)**
    - **BY MOUTH**
      - Adult: 25 mg/kg for 1 dose, to be taken after a light breakfast
  - **Schistosoma haematobium worm infections | Schistosoma mansoni worm infections**
    - **BY MOUTH**
      - Adult: 20 mg/kg, followed by 20 mg/kg after 4–6 hours
  - **Schistosoma japonicum worm infections**
    - **BY MOUTH**
      - Adult: 20 mg/kg 3 times a day for 1 day

- **UNLICENSED USE** Praziquantel is an unlicensed drug.
- **INTERACTIONS** → Appendix 1: praziquantel

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet
  - **Tablet**
    - **Praziquantel (Imported (Germany))**
      - Praziquantel 600 mg Biltricide 600mg tablets | 6 tablet [PDF]
Protozoal infection

5 Amoebicides

Metronidazole p. 542 is the drug of choice for acute invasive amoebic dysentery since it is very effective against vegetative forms of Entamoeba histolytica in ulcers. Tindazole p. 544 is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with E. histolytica cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for Trichomonas vaginalis infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for Giardia lamblia infections. Alternative treatments are tinidazole or mepacrine hydrochloride p. 505.

Leishmaniacides

Cautious leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

Amphotericin, p. 593 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (Ambisome®). Abelcet®, a lipid formulation of amphotericin, is also likely to be effective but less information is available.

Pentamidine isethionate p. 602 has been used in antimoney-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Toxoplasmosis

Most infections caused by Toxoplasma gondii are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 620 and sulfadiazine p. 563, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 535 or clari-thromycin p. 538 or azithromycin p. 536. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

5.1 Leishmaniasis

Other drugs used for Leishmaniasis Amphotericin, p. 593 • Pentamidine isethionate, p. 602

ANTIPROTOZOALS

Sodium stibogluconate

- INDICATIONS AND DOSE

Visceral leishmaniasis (specialist use only)
- By intravenous injection, or by intramuscular injection
- Adult: 20 mg/kg daily for 28 days

Cutaneous leishmaniasis (specialist use only)
- By intravenous injection, or by intramuscular injection
- Adult: 20 mg/kg daily for 20 days

- CAUTIONS
Heart disease (withdraw if conduction disturbances occur) • mucocutaneous disease • predisposition to QT interval prolongation • treat intercurrent infection (e.g. pneumonia)

- INTERACTIONS → Appendix 1: sodium stibogluconate

- SIDE-EFFECTS
• Common or very common Abdominal pain • appetite decreased • arthralgia • diarrhoea • headache • lethargy • malaise • myalgia • nausea • vomiting
• Rare or very rare Chest pain • chills • fever • flushing • haemorrhage • hyperhidrosis • jaundice • skin reactions • vertigo
Malaria, prophylaxis against malaria

The recommendations on prophylaxis against malaria reflect guidelines agreed by UK malaria specialists, published in the Public Health England Guidelines for malaria prevention in travellers from the United Kingdom (2018) published by Public Health England state that patients already taking hydroxychloroquine or doxycycline should remain on hydroxychloroquine or doxycycline, but can be used in the treatment of falciparum malaria with (or following) quinine.

Quinine
Quinine should not be used alone, but is used with sulfadoxine.

Pyrimethamine
Pyrimethamine is not recommended for the prophylaxis of falciparum malaria with (or following) quinine.

Useful resources
All recommendations on prophylaxis against malaria reflect guidelines agreed by UK malaria specialists, published in the Public Health England Guidelines for malaria prevention in travellers from the United Kingdom, 2018. The advice is aimed at residents of the UK who travel to endemic areas.

Malaria, prophylaxis against malaria

The recommendations on prophylaxis against malaria reflect guidelines agreed by UK malaria specialists, published in the Public
Infection

malaria

If all recommended precautions against contracting the disease are not taken, even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should see a doctor immediately and specifically mention their exposure to malaria.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In these patients, doxycycline or atovaquone with proguanil hydrochloride may be used. However doxycycline may interact with some antiepileptics and its dose may need to be adjusted, see interactions information for doxycycline.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined. In the case of proguanil hydrochloride, folic acid p. 1025 (dosed as a pregnancy at ‘high-risk’ of neural tube defects) should be given for at least the first trimester. If travelling to high risk areas or there is resistance to other drugs, mefloquine may be considered during the second or third trimester of pregnancy. Mefloquine can be used in the first trimester with caution if the benefits outweigh the risks. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed]. Atovaquone with proguanil hydrochloride should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative. Folic acid (dosed as a pregnancy at ‘high-risk’ of neural tube defects) should be given if atovaquone with proguanil hydrochloride is used during pregnancy.

Breast-feeding

Some antimalarials should be avoided when breast feeding, see individual drugs for details.

Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin sodium p. 140 should begin chemoprophylaxis 2–3 weeks before departure and the INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Other medical conditions

For additional information on malaria prophylaxis in patients with other medical conditions, see Public Health England Guidelines for malaria prevention in travellers from the UK.

Standby treatment

Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible. In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

Specialist centres offering advice on specific malaria-related problems, see Malaria, treatment p. 613. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

For more information on choice of drug, see also Antimalarials p. 607.

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important and is recommended even in malaria-free areas as a preventive measure against other insect vector-borne diseases. Mosquito nets impregnated with permethrin p. 1237 provide the most effective barrier protection against insects; mats and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% (available as sprays, and modified-release polymer formulations) is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. However, ingestion should be avoided, therefore breast-feeding mothers should wash their hands and breast tissue before handling infants. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. If DEET is not tolerated or is unavailable, see Public Health England Guidelines for malaria prevention in travellers from the United Kingdom for alternative options. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis

In order to determine tolerance and to establish habit, prophylaxis should generally be started before travel into an endemic area; 1 week before travel for chloroquine p. 616 and proguanil hydrochloride p. 618; 2–3 weeks before travel for mefloquine p. 617; and 1–2 days before travel for atovaquone with proguanil hydrochloride p. 615 or doxycycline p. 564. Prophylaxis should be continued for 4 weeks after leaving the area (except for atovaquone with proguanil hydrochloride prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine and proguanil hydrochloride may be used. However there is considerable concern over the protective efficacy of the combination of chloroquine and proguanil hydrochloride in certain areas where it was previously useful. Mefloquine is licensed for use up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years, and atovaquone with proguanil hydrochloride for up to 1 year. Prophylaxis with mefloquine, doxycycline, or atovaquone with proguanil hydrochloride may be considered for longer durations if it is justified by the risk of exposure to malaria.

Specialist advice should be sought for long-term prophylaxis.

Return from malarial region

It is important to consider that any illness that occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should see a doctor immediately and specifically mention their exposure to malaria.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Malaria prophylaxis, specific recommendations

Travellers planning journeys across continents can travel into areas that have different malaria prophylaxis recommendations. The choice of prophylaxis medication must reflect overall risk to ensure protection in all areas; it may be possible to change from one regimen to another. Those travelling to remote or little-visited areas may require expert advice. For further information see Recommended regimens for prophylaxis against malaria, and Public Health England Guidelines for malaria prevention in travellers from the United Kingdom.

Important

Settled immigrants (or long-term visitors) to the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

Malaria, treatment

Advice for healthcare professionals

A number of specialist centres are able to provide advice on specific problems.

Treatment of malaria

Recommendations on the treatment of malaria reflect guidelines agreed by UK malaria specialists.

If the infective species is not known, or if the infection is mixed, initial treatment should be as for falciparum malaria with quinine p. 619, Malarone® (atovaquone with proguanil hydrochloride p. 615), or Riamet® (artemether with lumefantrine p. 614). Falciparum malaria can progress rapidly in unprotected individuals and antimarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by Plasmodium falciparum. In most parts of the world P. falciparum is now resistant to chloroquine p. 616 which should not therefore be given for treatment.
Quinine, Malarone® (atovaquone with proguanil hydrochloro), or Riamet® (artemether with lumezantrine) can be given by mouth if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the patient is seriously ill or unable to take tablets. Mefloquine p. 617 is now rarely used for treatment because of concerns about resistance.

Oral quinine is given by mouth for 5–7 days, together with or followed by either doxycycline p. 564 for 7 days or clindamycin p. 535 for 7 days [unlicensed].

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine. Alternatively, Malarone®, or Riamet® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment. If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by intravenous infusion [unlicensed] (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intra venous artesunate may be available for ‘named-patient’ use.

Pregnancy
Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses or oral and intravenous quinine (including the loading dose) can safely be given to pregnant women. Clindamycin should be given after quinine [unlicensed indication]. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, Malarone®, and Riamet® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quine, infection acquired in quinine-resistant areas of south east Asia) because intra venous artesunate may be available for ‘named-patient’ use.

Non-falciparum malaria (treatment)
Non-falciparum malaria is usually caused by Plasmodium vivax and less commonly by P. ovale and P. malariae. P. knowlesi is also present in the Asia-Paciﬁc region. Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant P. vivax has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, Malarone® [unlicensed indication], quinine, or Riamet® [unlicensed indication] can be used; as with chloroquine, primaquine p. 618 should be given for radical cure. Chloroquine alone is adequate for P. malariae and P. knowlesi infections but in the case of P. vivax and P. ovale, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine, with the dose dependent on the infecting organism. For a radical cure, primaquine [unlicensed] is then given for 14 days, with the dose also dependent on the infecting organism.

Parenteral
Parenteral If the patient is unable to take oral therapy, quinine can be given by intravenous infusion [unlicensed], changed to oral chloroquine as soon as the patient’s condition permits.

Pregnancy
The adult treatment doses of chloroquine can be given for non-falciparum malaria. In the case of P. vivax or P. ovale, however, the radical cure with primaquine should be postponed until the pregnancy is over; instead chloroquine should be continued, given weekly during the pregnancy.

**ANTIPROTOZOALS > ANTIMALARIALS**

### Artemether with Lumezantrine

#### INDICATIONS AND DOSE

**Treatment of acute uncomplicated falciparum malaria**

- **By mouth**
  - Adult (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48 and 60 hours (total 24 tablets over 60 hours)

- **Unlicensed use**
  - Use in treatment of non-falciparum malaria is an unlicensed indication.

- **Contra-Indications**
  - Family history of congenital QT interval prolongation • family history of sudden death • history of arrhythmias • history of clinically relevant bradycardia • history of congestive heart failure accompanied by reduced left ventricular ejection fraction

- **Caution**
  - Avoid in Acute porphyrias p. 1058 • electrolyte disturbances

- **Interactions**
  - Appendix 1: antimalarials

- **Side-effects**
  - Common or very common Abdominal pain • appetite decreased • arthralgia • asthenia • cough • diarrhoea • dizziness • gait abnormal • headache • movement disorders • myalgia • nausea • palpitations • QT interval prolongation • sensation abnormal • skin reactions • sleep disorders • vomiting

- **Uncommon**
  - Drowsiness

- **Frequency not known**
  - Angioedema

- **Pregnancy**
  - Toxicity in animal studies with artemether.
  - Manufacturer advises use only if potential benefit outweighs risk.

- **Breastfeeding**
  - Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in animal studies.

- **Hepatic Impairment**
  - Manufacturer advises caution in severe impairment (no information available) – monitor ECG and plasma potassium concentration.

- **Renal Impairment**
  - Manufacturer advises caution in severe impairment.

- **Monitoring**
  - In severe renal impairment monitor ECG and plasma potassium concentration.

- **Monitoring Requirements**
  - Tablets may be crushed just before administration.

- **Patient and Carer Advice**
  - Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Cautionary and Advisory Labels 21**
  - Riamet (Novartis Pharmaceuticals UK Ltd)
  - Artemether 20 mg, Lumezantrine 120 mg Riamet tablets 24 tablet £22.50
Artemisom with piperaquine phosphate

(Piperaquine tetraphosphate with dihydroartemisinin)

**INDICATIONS AND DOSE**

**Treatment of uncomplicated falciparum malaria**

- **BY MOUTH**
  - Child 6 months-17 years (body-weight 7-12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months-17 years (body-weight 13-23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months-17 years (body-weight 24-35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months-17 years (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months-17 years (body-weight 75-99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Adult (body-weight 75-99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Adult (body-weight 100 kg and above): 5 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

**SIDE-EFFECTS**

- **Common or very common** Anemia, arthralgia, asthenia, conjunctivitis (in children), cough, diarrhea, dizziness (in adults), epistaxis (in children), fever, headache, hepatitis, hypernatremia, jaundice, leucopenia (in children), malaise, myalgia (in adults), myalgia, myositis (in children), nausea, oral disorders, rash, rhinorrhoea (in children), skin disorder, skin rash, stomatitis (in children), stomatitis (in adults), vomiting (in children)

**PREGNANCY** Teratogenic in animal studies—manufacturer advises use only if other antimalarials cannot be used.

**BREAST FEEDING** Manufacturer advises use only if no suitable alternative available.

**MONITORING** Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.

**RENAI IMPAIRMENT** No information available in moderate to severe impairment.

**INTERACTIONS**

- **Antimalarials**
- **Dihydroartemisinin**
- **Piperfquine**
- **Proguanil**
- **Artemisinin**

**DOSE EQUIVALENCE AND CONVERSION**

- Atovaquone with proguanil hydrochloride

**INDICATIONS AND DOSE**

**MALARONE® 250MG/100MG**

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

- **BY MOUTH**
  - Adult (body-weight 40 kg and above): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

**TREATMENT OF ACUTE UNCOMPLICATED FALCIPARUM MALARIA**

**TREATMENT OF NON-FALCIPARUM MALARIA**

- **BY MOUTH**
  - Adult: 4 tablets once daily for 3 days

**DOSE EQUIVALENCE AND CONVERSION**

- Each tablet of Malarone® contains 250 mg of atovaquone and 100 mg of proguanil hydrochloride.

**DIRECTIONS FOR ADMINISTRATION**

Tablet

- Eurartesim (Logixx Pharma Solutions Ltd)
- Artesinol 40 mg, Piperaquine phosphate 320 mg Eurartesim 320mg/40mg tablets 12 tablet £4.00

Atovaquone with proguanil hydrochloride

28-May-2019

**MALARONE® 250MG/100MG**

**INDICATIONS AND DOSE**

**PROPHYLAXIS OF FALCIPARUM MALARIA, PARTICULARLY WHERE RESISTANCE TO OTHER ANTIMALARIAL DRUGS SUSPECTED**

- **BY MOUTH**
  - Adult (body-weight 40 kg and above): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

**TREATMENT OF ACUTE UNCOMPLICATED FALCIPARUM MALARIA**

**TREATMENT OF NON-FALCIPARUM MALARIA**

- **BY MOUTH**
  - Adult: 4 tablets once daily for 3 days

**DOSE EQUIVALENCE AND CONVERSION**

- Each tablet of Malarone® contains 250 mg of atovaquone and 100 mg of proguanil hydrochloride.

**DIRECTIONS FOR ADMINISTRATION**

Tablet

- Eurartesim (Logixx Pharma Solutions Ltd)
- Artesinol 40 mg, Piperaquine phosphate 320 mg Eurartesim 320mg/40mg tablets 12 tablet £4.00

**UNLICENSED USE** Not licensed for treatment of non-falciparum malaria.

**CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) - efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)

**INTERACTIONS**

- Appendix 1: antimalarials

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, appetite decreased, cough, depression, diarrhea, dizziness, fever, headache, palpitations, photosensitivity reaction, rash, Stevens-Johnson syndrome, tachycardia, vasculitis

**PREGNANCY**

- Manufacturer advises use only if no suitable alternative available.

**MONITORING**

- Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.

**RENAI IMPAIRMENT**

- No information available in moderate to severe impairment.

**INTERACTIONS**

- **Antimalarials**
- **Dihydroartemisinin**
- **Piperfquine**
- **Proguanil**
- **Artemisinin**
**RENAL IMPAIRMENT**  Avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73m².

**PATIENT AND CARER ADVICE**  Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

**NATIONAL FUNDING/ACCESS DECISIONS**  NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- Malarine (GlaxoSmithKline UK Ltd)
  - Proguanil hydrochloride 100 mg, Atovaquone 250 mg
  - Malarone 250mg/100mg tablets  12 tablet

**DOSAGE**

</tr>
</tbody>
</table>

**IMPORTANCE OF SAFETY INFORMATION**

- In adults Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily).

**CAUTIONS**  Acute porphyrias p. 1058 - diabetes (may lower blood glucose) - elderly - G6PD deficiency - long-term therapy (regular ophthalmic examination recommended by manufacturers) - may aggravate myasthenia gravis - may exacerbate psoriasis - neurological disorders, especially epilepsy (may lower seizure threshold) - avoid for prophylaxis of malaria if history of epilepsy - severe gastrointestinal disorders

**CAUTIONS, FURTHER INFORMATION**

- Screening for retinopathy
  - In adults A review group convened by the Royal College of Ophthalmologists has updated guidelines on screening for chloroquine and hydroxychloroquine retinopathy (Hydroxychloroquine and Chloroquine Retinopathy: Recommendations on Screening 2018). Chloroquine appears to be more retinotoxic than hydroxychloroquine.
  - Screening recommendations for chloroquine:
    - All patients planning to be on long-term treatment should receive a baseline examination (including fundus photography and spectral domain optical coherence tomography) within 6–12 months of treatment initiation;
    - Annual screening is recommended in all patients who have taken chloroquine for greater than 1 year.

**INTERACTIONS**  → Appendix 1: antimalarials

**SIDE-EFFECTS**

- Rare or very rare Cardiomyopathy - hallucination - hepatitis

SIDE-EFFECTS, FURTHER INFORMATION  Side-effects which occur at doses used in the prophylaxis or treatment of malaria are generally not serious.

Overdose Chloroquine is very toxic in overdose; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- PREGNANCY Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.

- BREAST FEEDING Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.

- HEPATIC IMPAIRMENT Manufacturer advises caution, particularly in cirrhosis.

- RENAL IMPAIRMENT Manufacturers advise caution. Dose adjustments Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose.

MONITORING REQUIREMENTS
- In adults Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory.
- In children Ophthalmic examination with long-term therapy.

PATIENT AND CARER ADVICE Warn travellers going to malarious areas about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

- NATIONAL FUNDING/ACCESS DECISIONS NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimalarials are prescribed.

- EXCEPTIONS TO LEGAL CATEGORY Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Paludrine/Avloclor (Alliance Pharmaceuticals Ltd)
  Paludrine/Avloclor tablets anti-malarial travel pack | 112 tablet | £13.50

Mefloquine

- INDICATIONS AND DOSE
  Treatment of malaria
  - BY MOUTH
  - Adult: (consult product literature)

  Prophylaxis of malaria
  - BY MOUTH
  - Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
  - Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks after entering endemic area and continued for 4 weeks after leaving
  - Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before establishing endemic area and continued for 4 weeks after leaving
  - Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
  - Adult (body-weight 45 kg and above): 250 mg once weekly; dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

- UNLICENSED USE Mefloquine doses in BNF Publications may differ from those in product literature.
- In children Not licensed for use in children under 5 kg body-weight and under 3 months.

- CONTRA-INDICATIONS Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions.
- Avoid for standby treatment if history of convulsions.

- CAUTIONS Cardiac conduction disorders - epilepsy (avoid for prophylaxis).

CONTRA-INDICATIONS
- Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as insomnia, nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life.

For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the Guide for Healthcare Professionals provided by the manufacturer.

INTERACTIONS  Appendix 1: antimalarials

- SIDE-EFFECTS
  - Common or very common Anxiety, depression, diarrhoea, dizziness, gastrointestinal discomfort, headache, nausea, skin reactions, sleep disorders, vision disorders, vomiting
  - Frequency not known Acute kidney injury, agranulocytosis, alopecia, aplastic anaemia, appetite decreased, arthralgia, asthma, behaviour abnormal -

Chloroquine with proguanil

The properties listed below are those particular to the combination only. For the properties of the components please consider, chloroquine p. 616, proguanil hydrochloride p. 618.

- INDICATIONS AND DOSE
  Prophylaxis of malaria
  - BY MOUTH
  - Adult: (consult product literature)

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with hypersensitivity to quinine.

CONCESSION AND CONTRACEPTION Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in animal studies).

PREGNANCY Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

BREAST FEEDING Present in milk but risk to infant minimal.

HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—elimination may be prolonged.

RENAL IMPAIRMENT Manufacturer advises caution.

DIRECTIONS FOR ADMINISTRATION Tablet may be crushed and mixed with food such as jam or honey just before administration.

PATIENT AND CARER ADVICE Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that management of the condition is initiated in a timely manner.

Driving and skilled tasks Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis are not prescribable in NHS primary care; health authorities may investigate circumstances under which antimarials are prescribed.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 10, 21, 27

Lariam (Cheplapharm Arzneimittel GmbH)

Mefloquine (as Mefloquine hydrochloride) 250 mg Lariam 250mg tablets | 8 tablet [30] £14.53 DT + £14.53

Primaquine

INDICATIONS AND DOSE

Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection

BY MOUTH

Adult: 15 mg daily for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection in patients with mild G6PD deficiency (administered on expert advice)

BY MOUTH

Adult: 45 mg once weekly for 8 weeks

Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)

BY MOUTH

Adult: 30 mg daily, this combination is associated with considerable toxicity

UNLICENSED USE Not licensed.

CAUTIONS G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, leukaemia, aplastic anaemia) - lupus erythematosus

INTERACTIONS → Appendix 1: antimalarials

SIDE-EFFECTS

Common or very common Abdominal pain - appetite decreased - nausea - vomiting

Uncommon Haemolytic anaemia (more common in G6PD deficiency) - leucopenia - methaemoglobinemia

PREGNANCY Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

BREAST FEEDING No information available; theoretical risk of haemolysis in G6PD-deficient infants.

PRE-TREATMENT SCREENING Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

INDICATIONS AND DOSE

Prophylaxis of malaria

BY MOUTH

Child 4-11 weeks (body-weight up to 6 kg): 25 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

Child 3-11 months (body-weight 6-9 kg): 50 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

Child 1-3 years (body-weight 10-15 kg): 75 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

Child 4-7 years (body-weight 16-24 kg): 100 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

Child 8-12 years (body-weight 25-44 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

www.getintopharma.com
Quinine

**INDICATIONS AND DOSE**

**Nocturnal leg cramps**
- **BY MOUTH**
- Adult: 200–300 mg once daily, to be taken at bedtime

**Non-falciparum malaria**
- **BY INTRAVENOUS INFUSION**
- Adult: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Change to oral chloroquine as soon as the patient’s condition permits, reduce dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

**Falciparum malaria**
- **BY MOUTH**
- Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, to be given together with or followed by either doxycycline (in children over 12 years), or clindamycin
- Adult: 600 mg every 8 hours for 5–7 days, to be given together with or followed by either doxycycline or clindamycin
- **BY INTRAVENOUS INFUSION**
- Adult: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

**Falciparum malaria (in intensive care unit)**
- **BY INTRAVENOUS INFUSION**
- Adult: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, to be given together with or followed by either doxycycline or clindamycin, reduce maintenance dose to 5–7 mg/kg if parenteral treatment is required for more than 48 hours

**DOSE EQUIVALENCE AND CONVERSION**
- When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.
- Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

620  Viral infection

6.1  Hepatitis

Overview

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alfa p. 956 [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Chronic hepatitis B

Peginterferon alfa p. 623 is an option for the initial treatment of chronic hepatitis B and may be preferable to interferon alfa. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alfa-2a may be justified in some cases.

Entecavir p. 621 or tenofovir disoproxil p. 654 are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include adefovir dipivoxil p. 623, lamivudine p. 653, or telbivudine p. 622.

Entecavir alone, tenofovir disoproxil alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

5.3  Toxoplasmosis

ANTIPROTOZOAIS

Pyrimethamine

- **INDICATIONS AND DOSE**
  - **Toxoplasmosis in pregnancy (in combination with sulfadiazine and folinic acid)**
    - **BY MOUTH**
      - Adult: 50 mg once daily until delivery
If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir dipivoxil or tenofovir disoproxil can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adefovir dipivoxil, entecavir, lamivudine, telbivudine, or tenofovir disoproxil is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 651 or lamivudine may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa or adefovir dipivoxil. Treatment may be continued long-term, even if adequate seroconversion has occurred. Management of these patients should be coordinated between HIV and hepatology specialists.

### Chronic hepatitis C

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of ribavirin p. 626 and peginterferon alfa is used for the treatment of chronic hepatitis C. The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

Daclatasvir is licensed for use in combination with sofosbuvir p. 628 for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis; the addition of ribavirin should be considered for patients with advanced liver disease or with other negative prognostic factors, such as prior treatment experience. It is also licensed in combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis, and in combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4. Daclatasvir must not be given as monotherapy.

Ombitasvir with paritaprevir and ritonavir p. 625 (Viekirax®), is licensed for use in combination with dasabuvir p. 631, with or without ribavirin, for the treatment of chronic hepatitis C infection of genotype 1 in patients with or without compensated cirrhosis; it is also licensed for use in combination with ribavirin for the treatment of chronic hepatitis C infection of genotype 4 with or without compensated cirrhosis.

Ribavirin inhibits a wide range of DNA and RNA viruses. It is given by mouth for the treatment of chronic hepatitis C infection, in double therapy with peginterferon alfa, interferon alfa, or sofosbuvir, or in triple therapy with peginterferon alfa and one protease inhibitor or sofosbuvir. Ribavirin is also effective in Lassa fever [unlicensed indication].

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alfa, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

Ledipasvir is licensed for use in combination with sofosbuvir (ledipasvir with sofosbuvir p. 628), with or without ribavirin, for the treatment of chronic hepatitis C infections of genotypes 1, 3, 4, 5 or 6. Sofosbuvir with velpatasvir and voxilaprevir p. 630 is licensed for the treatment of chronic hepatitis C of all genotypes.

### 6.2 Hepatitis infections

#### 6.2a Chronic hepatitis B

**Other drugs used for Chronic hepatitis B**

- Interferon alfa, p. 956
- Lamivudine, p. 653
- Tenofovir disoproxil, p. 654

#### Entecavir

**NUCLEOSIDE ANALOGUES**

**INDICATIONS AND DOSE**

- Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues
  - **BY MOUTH**
  - Adult: 500 micrograms once daily

- Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) and lamivudine-resistance
  - **BY MOUTH**
  - Adult: 1 mg once daily, consider other treatment if inadequate response after 6 months

**SIDE-EFFECTS**

- Diarrhoea
- Fatigue
- Headache
- Insomnia
- Nausea
- Vomiting

**CAUTIONS**

- HIV infection—risk of HIV resistance in patients not receiving 'highly active antiretroviral therapy'—lamivudine-resistant chronic hepatitis B—risk of entecavir resistance

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment.

**PREGNANCY**

Caution: May cause birth defects. Use only if potential benefit outweighs risk.

**BREAST FEEDING**

Avoid—present in milk in animal studies.

**RENAL IMPAIRMENT**

Consult product literature.

- **Dose adjustments**
  - Reduce dose if eGFR less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

**CAUTIONS, FURTHER INFORMATION**

Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

**COMMON OR VERY COMMON**

- Diarrhoea
- Dizziness
- Dyspepsia
- Fatigue
- Headache
- Insomnia
- Nausea
- Vomiting

**COMMON**

- Alopecia
- Rash

**SIDE-EFFECTS**

- Diarrhoea
- Fatigue
- Insomnia
- Nausea
- Vomiting

**FREQUENCY NOT KNOWN**

- Lactic acidosis

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment.

**PREGNANCY**

Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**RENAAL IMPAIRMENT**

Consult product literature.

- **Dose adjustments**
  - Reduce dose if eGFR less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
Telbivudine

- **INDICATIONS AND DOSE**
  Chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate
  - **BY MOUTH**
  - Adult: 25 mg once daily (for duration of treatment consult product literature)

- **CAUTIONS**
  Laminudine-resistant chronic hepatitis B—risk of telbivudine resistance

- **INTERACTIONS**
  → Appendix 1: telbivudine

- **SIDE-EFFECTS**
  - **Common or very common**
    - Abdominal pain
    - Cough
    - Diarrhoea
    - Dizziness
    - Fatigue
    - Headache
    - Nausea
    - Rash
  - **Uncommon**
    - Arthralgia
    - Malaise
    - Muscle complaints
    - Nerve disorders
    - Pain
    - Sensation abnormal
    - Taste altered
  - **Rare or very rare**
    - Lactic acidosis
  - **PREGNANCY**
    - Manufacturer advises use only if potential benefit outweighs risk.
  - **BREAST FEEDING**
    - Manufacturer advises avoid—present in milk in animal studies.
  - **RENAL IMPAIRMENT**
    - Dose adjustments
    - 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m².
  - **MONITORING REQUIREMENTS**
    - Monitor liver function tests every 3 months and viral markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation.

- **PATIENT AND CARER ADVICE**
  Muscle effects and peripheral neuropathy

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE decisions**
  Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop.

- **MEDICINAL FORMS**
  Tablets
  - Sebivo (Novartis Pharmaceuticals UK Ltd)
  - Telbivudine 600 mg Sebivo 600mg tablets | 28 tablet £25.30

**Antivirals > Nucleoside Reverse Transcriptase Inhibitors**

**Tenofovir alafenamide**

- **INDICATIONS AND DOSE**
  Chronic hepatitis B (initiated by a specialist)
  - **BY MOUTH**
  - Adult: 25 mg once daily (for duration of treatment consult product literature)

- **CAUTIONS**
  Decompensated liver disease - HIV co-infection

- **INTERACTIONS**
  → Appendix 1: tenofovir alafenamide

- **SIDE-EFFECTS**
  - Common or very common
  - Abdominal distension
  - Frequency not known
  - Hepatitis aggravated (during or following treatment)

- **BREAST FEEDING**
  Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  Manufacturer advises caution in decompensated hepatic disease (no information available).

- **PRE-TREATMENT SCREENING**
  Manufacturer advises HIV antibody testing should be offered to those with unknown HIV-1 status before initiation of treatment.

- **MONITORING REQUIREMENTS**
  Manufacturer advises monitor liver function tests at repeated intervals during treatment and for at least 6 months after last dose—recurrent hepatitis may occur on discontinuation.

- **PATIENT AND CARER ADVICE**
  Missed doses
  - Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**INDICATIONS AND DOSE**
Chronic hepatitis B (initiated by a specialist)
- **BY MOUTH**
- Adult: 25 mg once daily (for duration of treatment consult product literature)

- **CAUTIONS**
  Decompensated liver disease - HIV co-infection

- **INTERACTIONS**
  → Appendix 1: tenofovir alafenamide

- **SIDE-EFFECTS**
  - Common or very common
  - Abdominal distension
  - Frequency not known
  - Hepatitis aggravated (during or following treatment)

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
**ANTIVIRALS**

**Nucleotide Analougues**

**Adefovir dipivoxil**

- **INDICATIONS AND DOSE**
  Chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir
  - **BY MOUTH**
    - Adults: 10 mg once daily

- **CAUTIONS**
  Elderly

- **INTERACTIONS**
  - Appendix 1: adefovir

- **SIDE-EFFECTS**
  - Common or very common: Asthenia, diarrhoea, flatulence, gastrointestinal discomfort, headache, nausea, renal impairment, skin reactions, vomiting
  - Frequency not known: Bone fracture, bone pain, hypophosphataemia, myopathy, nephrotoxicity, osteomalacia, pancreatitis, proximal renal tubulopathy

- **CONCEPTION AND CONTRACEPTION**
  Effective contraception required during treatment.

- **PREGNANCY**
  Toxicity in animal studies — manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  Manufacturer advises avoid — no information available.

- **RENAI IMPAIRMENT**
  No information available if eGFR less than 10 mL/minute/1.73 m².
  **Dose adjustments**
  - 10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m²;
  - 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m².

- **Monitoring**
  Monitor renal function more frequently in patients with renal impairment.

- **MONITORING REQUIREMENTS**
  - Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation — recurrent hepatitis may occur on discontinuation).
  - Monitor renal function before treatment then every 3 months, more frequently in patients receiving nephrotoxic drugs.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Tablet**
  - Hepsera (Gilead Sciences International Ltd)
    - Adefovir dipivoxil 10 mg: Hepsera 10 mg tablets | 30 tablet | £252.22

**IMMUNOSTIMULANTS**

**Interferons**

**Peginterferon alfa**

- **DRUG ACTION**
  Polyethylene glycol-conjugated (‘pegylated’) derivatives of interferon alfa (peginterferon alfa-2a and peginterferon alfa-2b) are available; pegylation increases the persistence of the interferon in the blood.

- **INDICATIONS AND DOSE**
  **PEGASYS®**
  Combined with ribavirin for chronic hepatitis C | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated | Monotherapy for chronic hepatitis B
  - **BY SUBCUTANEOUS INJECTION**
    - Adult: (consult product literature)

- **CONTRA-INDICATIONS**
  **CONTRA-INDICATIONS, FURTHER INFORMATION**
  For contra-indications consult product literature.

- **CAUTIONS**
  **CAUTIONS, FURTHER INFORMATION**
  For cautions consult product literature.

- **INTERACTIONS**
  - Appendix 1: interferons

- **SIDE-EFFECTS**
  - Common or very common: Alopecia, anaemia, anxiety, appetite abnormal, arthralgias, arthralgia, arthritis, asthenia, ataxia, behaviour abnormal, breathlessness, chest discomfort, chills, concentration impaired, confusion, constipation, cough, crying, dehydration, depression, diarrhoea, dizziness, dryness, dry eye, dry mouth, dysphagia, dysphonia, dysphoria, ear pain, eye discomfort, eye disorders, eye inflammation, feeling abnormal, fever, gastrointestinal discomfort, gastrointestinal disorders, haemolytic anaemia, haemorrhage, hair texture abnormal, headaches, hearing impairment, hyperbiliarinaemia, hypertension, hyperthyroidism, hyperuricaemia, hypertension, hypothyroidism, increased risk of infection, influenza like illness, leucopenia, lymphadenopathy, malaise, memory loss, menorrhea, menstrual cycle irregularities, mood altered, muscle complaints, muscle tone increased, muscle weakness, nail disorder, nasal complaints, nausea, neutropenia, oedema, oral disorders, ovarian disorder, pain, palpitations, photosensitivity reaction, prostatitis, respiratory disorders, sensation abnormal, sepsis, sexual dysfunction, skin reactions, sleep disorders, sweat changes, syncope, taste altered, thirst, throat complaints, thrombocytopenia, tinnitus, tremor, urinary disorders, urine abnormal, vaginal disorder, vasodilatation, vertigo, vision disorders, vomiting, weight decreased
  - Uncommon: Diabetes mellitus, hallucination, hypersensitivity, hypertriglyceridaemia, myocardial infarction, nerve disorders, pancreatitis, psychosis, sarcoidosis, suicidal tendencies, thyroiditis
  - Rare or very rare: Angioedema, bone marrow disorder, cardiac inflammation, cardiomyopathy, cerebral ischaemia, CNS haemorrhage, coma, congestive heart failure, diabetic ketoacidosis, embolism and thrombosis, encephalopathy, facial paralysis, injection site necrosis, ischaemic heart disease, myopathy, renal failure, retinopathy, seizure (more common with high doses in the elderly), severe cutaneous adverse reactions (SCARs), systemic lupus erythematosus (SLE), ulcerative colitis, vasculitis
  - Frequency not known: Homicidal ideation, pericardial effusion, peripheral ischaemia, pulmonary arterial hypertension, pure red cell aplasia, solid organ transplant rejection, tongue discoloration

6.2b Chronic hepatitis C

Other drugs used for Chronic hepatitis C

Interferon alfa, p. 956 · Peginterferon alfa, p. 623

**ANTIVIRALS > HCV INHIBITORS**

**Elbasvir with grazoprevir**

**DATE** 24-Apr-2017

**DRUG ACTION** Elbasvir is an HCV NSSA inhibitor and grazoprevir is an HCV NS3/4A protease inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

**INDICATIONS AND DOSE**

Chronic Hepatitis C infection of genotypes 1 or 4 (with or without ribavirin) (initiated by a specialist)

- **BY MOUTH**
  - Adult: 50/100 mg once daily for 12 weeks (may extend to 16 weeks in some circumstances—consult product literature)

**DOSE EQUIVALENCE AND CONVERSION**

- Dose expressed as x/y mg elbasvir/grazoprevir.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVISE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVISE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVISE: DIRECT-ACTING ANTIVIRALS TO TREAT HEPATITIS B REACTIVATION (DECEMBER 2018)

MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

**CAUTIONS**

- Hepatitis B co-infection re-treatment following previous exposure to elbasvir with grazoprevir, or to drugs of the same classes (NS5A inhibitors or NS3/4A inhibitors other than telaprevir, simeprevir, boceprevir)—efficacy not demonstrated

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Benzyl alcohol

- **Pegasys** (Roche Products Ltd)
  - Peginterferon alfa-2a 180 microgram per 1 ml Pegasys 90micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PS) £76.51
  - Peginterferon alfa-2a 270 microgram per 1 ml Pegasys 135micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PS) £107.76 DT + £107.76
  - Peginterferon alfa-2a 360 microgram per 1 ml Pegasys 180micrograms/0.5ml solution for injection pre-filled syringes | 4 pre-filled disposable injection (PS) £497.60

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment—consult product literature.

**PREGNANCY**

Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING**

Manufacturers advise avoid—no information available.

**HEPATIC IMPAIRMENT**

Avoid in severe impairment.

**RENAIL IMPAIRMENT**

For further information on peginterferon alfa use in renal impairment consult product literature.

Dose adjustments: Reduce dose in moderate to severe hepatic impairment.

- **MONITORING REQUIREMENTS**
  - Monitoring Close monitoring required in mild to moderate hepatic impairment.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010) NICE TA200
  - The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage (‘watchful waiting’). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.

- Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200
  - The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years;
  - not previously treated with interferon alfa or peginterferon alfa;
  - treated previously with interferon alfa alone or in combination with ribavirin;
  - whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
  - co-infected with HIV.
  - Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk.
  - Patients receiving interferon alfa may be switched to peginterferon alfa. www.nice.org.uk/TA200

**BNF**

**624 Viral infection**

  Uncommon

- **INTERACTIONS**  
  Manufacturer advises if a dose is more than 800 000 IU/mL.

**MORBIDITY**  
Adult: 2 tablets once daily for duration of treatment consult product literature, to be taken with food.

**ANTIVIRALS**  
NON-STRUCTURAL PROTEIN 5A INHIBITORS

**Ombitasvir with paritaprevir and ritonavir**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ritonavir p. 659.

- **INDICATIONS AND DOSE**  
  Chronic hepatitis C of genotype 1 (in combination with dasabuvir, with or without ribavirin) · Chronic hepatitis C of genotype 4 (in combination with ribavirin)

- **BY MOUTH**
  - Adult: 2 tablets once daily for duration of treatment consult product literature, to be taken with food.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF HYPOGLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:

- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

**CONTRA-INDICATIONS**  
HIV co-infection without suppressive antiretroviral therapy

**CAUTIONS**  
Retreatment—efficacy not established

**INTERACTIONS**  
 Appendix 1: HIV- protease inhibitors · ombitasvir · paritaprevir

**SIDE-EFFECTS**

- **Common or very common**  
  Anaemia · asthenia · insomnia · nausea · pruritus

- **Rare or very rare**  
  Angioedema

- **Frequency not known**  
  Depression · suicidal behaviour

**SIDE-EFFECTS, FURTHER INFORMATION**  
Side-effects listed are reported when ombitasvir with paritaprevir and grazoprevir are used.

**626  Viral infection**

ritonavir is used in combination with dasabuvir, with or without ribavirin.

**CONCEPTION AND CONCEPTION** For women of childbearing potential, exclude pregnancy before initiation of treatment; effective contraception should be used during treatment.

**PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid—risk of growth retardation in children, the risk of rejection.

**PATIENT AND CARER ADVICE**

**HEPATIC IMPAIRMENT**

**BREAST FEEDING**

**CONCEPTION AND CONTRACEPTION**

**UNLICENSED USE**

When used by inhalation in children Inhalation licensed for use in children (age range not specified by manufacturer).

With intravenous use in children Intravenous preparation not licensed.

**CONTRA-INDICATIONS**

With systemic use Active severe psychiatric condition (in children) · autoimmune disease (in children) · autoimmune hepatitis (in children) · consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products · haemoglobinopathies · history of severe psychiatric condition (in children) · severe cardiac disease (in adults) · severe debilitating medical conditions · severe, uncontrolled cardiac disease in children with chronic hepatitis C (in children) · unstable or uncontrolled cardiac disease in previous 6 months (in adults).

**CAUTIONS**

When used by inhalation Maintain standard supportive respiratory and fluid management therapy.

With systemic use Anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) · consult product literature for specific cautions when ribavirin used in combination with other medicinal products · gout (in adults) · haemolysis (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) · patients with a transplant—risk of rejection · risk of growth retardation in children, the

**NICE decisions**

**Ribavirin**

(Tribavirin)

**INDICATIONS AND DOSE**

**Bronchiolitis**

**By Inhalation of Aerosol, or by Inhalation of Nebulised Solution**

Child 1-23 months: Inhalate a solution containing 20 mg/mL for 12–18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator.

Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (administered on expert advice)

**By Intravenous Infusion**

Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days.

**COPEGUS® Tablets**

Chronic hepatitis C (in combination with direct acting antivirals, or interferon alfa 2a, or peginterferon alfa 2a with or without direct acting antivirals)

**By Mouth**

Adult (body-weight up to 75 kg): 400 mg, to be taken in the morning and 600 mg, dose to be taken in the evening.

Adult (body-weight 75 kg and above): 600 mg twice daily.
reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt (in children).
- severe dental disorders (in adults).
- severe ocular disorders (in adults).
- severe periodontal disorders (in adults).
- severe psychiatric effects (in adults).
- **INTERACTIONS** → Appendix 1: ribavirin

- **SIDE-EFFECTS**
  - **Uncommon**. Dehydration - diabetes mellitus - hallucination - hearing loss - hepatic disorders - hypertension - nerve disorders - sarcoidosis - suicidal tendencies - thyroiditis
  - **Rare or very rare**. Angina pectoris - angioedema - bone marrow disorders - cardiac inflammation - cerebral ischaemia - cholangitis - coma - congestive heart failure - facial paralysis - hepatic failure (discontinue) - hypersensitivity - intracranial haemorrhage - myocardial infarction - myopathy - pancreatitis - psychotic disorder - pulmonary embolism - retinopathy - seizure - severe cutaneous adverse reactions (SCARs) - systemic lupus erythematosus (SLE) - vasculitis
  - **Frequency not known**. Haemolytic anaemia - homicidal ideaion - nephrotic syndrome - pure red cell aplasia - renal failure - solid organ transplant rejection - tongue discolouration - ulcerative colitis

**SIDE-EFFECTS, FURTHER INFORMATION**. Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

- **CONCEPTION AND CONTRACEPTION**
  - With systemic use: Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
  - When used by inhalation: Women planning pregnancy should avoid exposure to aerosol.

- **PREGNANCY**. Avoid; teratogenicity in animal studies.
  - When used by inhalation: Pregnant women should avoid exposure to aerosol.

- **BREAST FEEDING**. Avoid—no information available.

- **HEPATIC IMPAIRMENT**. Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.
- **Dose adjustments**. No dosage adjustment required.

- **RENAL IMPAIRMENT**. Plasma-ribavirin concentration increased.
  - In adults: Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.
  - In children: Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely. Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - When used by inhalation: Monitor electrolytes closely. Monitor equipment for precipitation.
  - With systemic use in children: Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).
  - With systemic use in adults: Determine full blood count, platelets, electrolytes, glucose, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).
  - With systemic use in children: Test thyroid function before treatment and then every 3 months.
  - With oral use in children: Eye examination recommended before treatment. Eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.

- **PRESCRIBING AND DISPENSING INFORMATION**. Flavours of oral liquid formulations may include bubble-gum.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010) NICE TA200
      - In adults: The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage (‘watchful waiting’).
      - www.nice.org.uk/TA200
    - Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200
      - In adults: The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:—not previously treated with interferon alfa or peginterferon alfa;—treated previously with interferon alfa alone or in combination with ribavirin;—whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;—co-infected with HIV.
      - Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.
      - www.nice.org.uk/TA200
    - Peginterferon alfa and ribavirin for chronic hepatitis C (November 2013) NICE TA300
      - In children: Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children.
      - www.nice.org.uk/TA300

**Ledipasvir with sofosbuvir**  11-Jul-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir below.

**DRUG ACTION**  Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

**INDICATIONS AND DOSE**

- **Chronic hepatitis C infection (initiated by a specialist)**
  - **BY MOUTH**
    - **Adult:** 90/400 mg once daily, for duration of treatment consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- **Manufacturer advises reduce dose of concurrent H2-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.**
- **Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take at the same time as sofosbuvir with ledipasvir.**

**DOSE EQUIVALENCE AND CONVERSION**
- **Dose expressed as x/y mg ledipasvir/sofosbuvir.**

**CAUTIONS**  Retreatment following treatment failure—efficacy not established

**INTERACTIONS**  → Appendix 1: ledipasvir - sofosbuvir

**SIDE-EFFECTS**
- **Common or very common**  Fatigue · headache · rash
- **Frequency not known**  Angioedema · arthralgia

**PRESCRIBING AND DISPENSING INFORMATION**  Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**

**Vomiting**  If vomiting occurs within 5 hours of administration, an additional dose should be taken.

**Missed doses**  If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- **Ledipasvir - sofosbuvir for treating chronic hepatitis C (November 2015) NICE TA363**
  - Ledipasvir with sofosbuvir is recommended as an option for treating adults with chronic hepatitis C infection:
    - of genotype 1 without cirrhosis (treatment naive patients)—8 weeks' treatment
    - of genotype 1 or 4 with cirrhosis (treatment naive patients)—12 weeks' treatment
    - of genotype 1 or 4 without cirrhosis (or with cirrhosis but only if the person has a low risk of the disease getting worse) that has not responded adequately to previous treatment—12 weeks' treatment
  - In addition, ledipasvir with sofosbuvir is only recommended in patients with cirrhosis for the durations mentioned above if the following criteria are met:
    - Child-Pugh class A
    - platelet count of 75,000/mm³ or more
    - no features of portal hypertension
    - no history of an HCV-associated decompensation episode
    - not previously treated with an NSA inhibitor
  - Patients whose treatment with ledipasvir with sofosbuvir is not recommended in this NICE guidance, but was started within the NHS before this guidance was published, should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.
  - www.nice.org.uk/guidance/ta363

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1030/15
The Scottish Medicines Consortium has advised (March 2015) that ledipasvir with sofosbuvir (Harvoni®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 and 4 only.

SMC No. 1084/15
The Scottish Medicines Consortium has advised (September 2015) that ledipasvir with sofosbuvir (Harvoni®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotype 3 in patients who are ineligible for, or unable to tolerate interferon.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

    - **Adult:** 400 mg once daily, for duration of treatment consult product literature

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)**

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)**

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C
viruses must be monitored and managed according to current clinical guidelines.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS FOR CHRONIC HEPATITIS C: RISK OF HYPOGLYCAEMIA IN PATIENTS WITH DIABETES (DECEMBER 2018)

Rapid reduction in hepatitis C viral load during direct-acting antiviral therapy for hepatitis C may improve glucose metabolism in patients with diabetes and result in symptomatic hypoglycaemia if diabetic treatment is continued at the same dose.

The MHRA advises healthcare professionals:
- to monitor glucose levels closely in patients with diabetes during direct-acting antiviral therapy for hepatitis C, especially within the first 3 months of treatment and modify diabetic medication or doses when necessary;
- to be vigilant for changes in glucose tolerance and advise patients of the risk of hypoglycaemia;
- to inform the healthcare professional in charge of the diabetic care of the patient when direct-acting antiviral therapy is initiated.

- CAUTIONS, FURTHER INFORMATION Manufacturer advises in chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin dual therapy in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment.

- INTERACTIONS Appendix 1: sofosbuvir

- SIDE-EFFECTS

- Common or very common Alopecia, anaemia, anxiety, appetite decreased, arthralgia, asthma, chest pain, chills, concentration impaired, constipation, cough, depression, diarrhoea, dizziness, dry mouth, dysphonia, fever, gastrointestinal discomfort, gastrooesophageal reflux disease, headaches, influenza like illness, insomnia, irritability, memory loss, muscle complaints, nasopharyngitis, nausea, neutropenia, pain, skin reactions, vision blurred, vomiting, weight decreased

- Frequency not known Arrhythmia

SIDE-EFFECTS, FURTHER INFORMATION Side-effects listed are reported when sofosbuvir is used in combination with ribavirin or with ribavirin and peginterferon alfa.

- PREGNANCY Manufacturer advises avoid—limited information available.

- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

- RENAL IMPAIRMENT Safety and efficacy not established if eGFR less than 30 mL/minute/1.73 m² — accumulation may occur.

- PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (contains desiccant).

- PATIENT AND CARER ADVICE

- Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- NATIONAL FUNDING/ACCESS DECISIONS

- NICE decisions

- Sofosbuvir for treating chronic hepatitis C (February 2015) NICE TA330 Sofosbuvir (Sovaldi®) in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:
  - of genotype 1
  - of genotype 3 with cirrhosis (treatment naive patients)
  - of genotype 3 that has not adequately responded to interferon-based treatment
  - of genotype 4, 5, or 6 with cirrhosis.

- Sofosbuvir (Sovaldi®) in combination with ribavirin is an option for treating adults with chronic hepatitis C infection:
  - of genotype 2 who are intolerant to or ineligible for interferon (treatment naive patients)
  - of genotype 2 that has not adequately responded to interferon-based treatment
  - of genotype 3 with cirrhosis who are intolerant to or ineligible for interferon (treatment naive patients)
  - of genotype 3 with cirrhosis that has not adequately responded to interferon-based treatment

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta330

- Sofosbuvir for treating chronic hepatitis C (February 2015) NICE TA330

- Sofosbuvir (Sovaldi®) in combination with ribavirin is not recommended for the treatment of adults with chronic hepatitis C infection of genotypes 1, 4, 5, or 6.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta330

Scottish Medicines Consortium (SMC) decisions

SMC No. 964/14

The Scottish Medicines Consortium has advised (June 2014) that sofosbuvir (Sovaldi®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 to 6; its use in combination with ribavirin as dual therapy for chronic hepatitis C infection of either genotype 2 (in treatment naive patients) or genotype 3 is restricted to those who cannot use peginterferon alfa because of intolerance or contra-indications.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Sofosbuvir with velpatasvir

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 628.

- DRUG ACTION Sofosbuvir is a nucleotide analogue inhibitor and velpatasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

- INDICATIONS AND DOSE

Chronic hepatitis C infection, with or without ribavirin (initiated by a specialist)

- BY MOUTH

- Adult: 400/100 mg once daily for 12 weeks (may extend to 24 weeks in some circumstances—consult product literature)

- DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose of concurrent H2-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.

- Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to
Sofosbuvir with velpatasvir and voxilaprevir

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 628.

**INDICATIONS AND DOSE**

Chronic hepatitis C infection (specialist use only)

- **BY MOUTH**
  - Adult: 1 tablet once daily, for duration of treatment, consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises reduce dose of concurrent H₂-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily.
- Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg.

**CAUTIONS**

- Hepatitis B co-infection
- INTERACTIONS → Appendix 1: sofosbuvir - velpatasvir
- SIDE-EFFECTS Atrioventricular block - bradycardia - fatigue - headache - nausea

**PATIENT AND CARER ADVICE**

Vomiting Manufacturer advises if vomiting occurs within 3 hours of administration, an additional dose should be taken.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Sofosbuvir-velpatasvir for treating chronic hepatitis C (January 2017) NICE TA430

Sofosbuvir with velpatasvir is recommended as an option for treating chronic hepatitis C infection in adults, if the following criteria are met:

- of genotype 1, 3, 4, 5 or 6 with or without cirrhosis (previously treated or treatment naive patients);
- of genotype 2 with cirrhosis (previously treated or treatment naive patients);
- of genotype 2 without cirrhosis (treatment naive patients), only if interferon not suitable or not tolerated, or without cirrhosis (previously treated patients). This is contingent on the manufacturer providing the drug with the discount agreed in the simple discount agreement.

Patients whose treatment was started within the NHS before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta430

**Scottish Medicines Consortium (SMC) decisions**

**SMC No. 1195/16**

The Scottish Medicines Consortium has advised (November 2016) that sofosbuvir with velpatasvir (Epclusa®) is accepted for restricted use within NHS Scotland for the treatment of adults with chronic hepatitis C infection of genotype 3 only.

**SMC No. 1271/17**

The Scottish Medicines Consortium has advised (October 2017) that sofosbuvir with velpatasvir (Epclusa®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in adults with genotype 2, 5 or 6 or decompensated cirrhosis, irrespective of chronic HCV genotype. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**NMC No. 1271/17**

The Scottish Medicines Consortium has advised (April 2018) that sofosbuvir with velpatasvir (Epclusa®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus (HCV) infection in adults with genotype 1 or 4. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
632 Viral infection

6.3 Herpesvirus infections

Herpes simplex and varicella–zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.

Herpes simplex infections

Herpes infections of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents.

Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella–zoster immunoglobulin (see under Disease Specific Immunoglobulins). In herpes zoster (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days.

Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice

Aciclovir p. 633 is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of...
Herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famiclovir p. 635, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes.

Valaciclovir p. 636 is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famiclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet sodium p. 637 is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex below has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

Cytomegalovirus infection

Ganciclovir p. 637 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 655; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir p. 638 is an ester of ganciclovir which is licensed for the initial treatment and maintenance treatment of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet sodium is also active against cytomegalovirus; it is toxic and can cause renal impairment.

See local treatment of CMV retinitis.

Antiviral Proceedings

Inosine pranobex (Inosine acedoben dimepranol)

Indications and dose

Mucocutaneous herpes simplex

- **By mouth**
  - Adult: 1 g 4 times a day for 7–14 days

Adjunctive treatment of genital warts

- **By mouth**
  - Adult: 1 g 3 times a day for 14–28 days

Subacute sclerosing panencephalitis

- **By mouth**
  - Adult: 50–100 mg/kg daily in 6 divided doses

Caution

History of gout, history of hyperuricaemia

Side-effects

Arthralgia, constipation, diarrhoea, drowsiness, epigastric discomfort, fatigue, headache, insomnia, malaise, nausea, nervousness, polyuria, skin reactions, vertigo, vomiting

Pregnancy

Manufacturer advises avoid.

Renal impairment

Manufacturer advises caution; metabolised to uric acid.

Less suitable for prescribing

Inosine pranobex is less suitable for prescribing.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Table

General dosage

- **Imunovir** (KoRa Healthcare)
  - Inosine acedoben dimepranol 500 mg Imunovir 500 mg tablets | 100 tablet 950 £39.50

Antiviral Proceedings

Aciclovir

(Acyclovir)

Indications and dose

Herpes simplex, suppression

- **By mouth**
  - Child 12–17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
  - Adult: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, prophylaxis in the immunocompromised

- **By mouth**
  - Child 1–5 years: 200 mg 4 times a day
  - Child 6–12 years: 400 mg 4 times a day
  - Adult: 400 mg 4 times a day

- **By intravenous infusion**
  - Adult: 5 mg/kg every 8 hours

Herpes simplex, treatment (non-genital)

- **By mouth**
  - Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment (non-genital) in immunocompromised or if absorption impaired

- **By mouth**
  - Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment

- **By mouth**
  - Child 1–5 years: 100–200 mg 4 times a day
  - Child 6–12 years: 200–400 mg 4 times a day
  - Adult: 200–400 mg 4 times a day

- **By intravenous infusion**
  - Adult: 5 mg/kg every 8 hours

Herpes simplex, treatment in immunocompromised or if absorption impaired

- **By mouth**
  - Child 1–5 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
  - Child 6–12 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
Varicella zoster (chickenpox), attenuation of infection if varicella–zoster immunoglobulin not indicated

- **BY MOUTH**
  - Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure
  - Adult: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

**DOSES AT EXTREMES OF BODY-WEIGHT**
- With intravenous use: To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

- **UNLICENSED USE**
  - With oral use in children: Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer).
  - With oral use: Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.

- **CAUTIONS**
  - Elderly (risk of neurological reactions) - maintain adequate hydration (especially with infusion or high doses)

- **INTERACTIONS** → Appendix 1: aciclovir

- **SIDE-EFFECTS**
  - **Common or very common**
    - With intravenous use: Abdominal pain, diarrhea, dizziness, fatigue, fever, headache, nausea, photosensitivity reaction, skin reactions, vomiting
  - With oral use: Abdominal pain, diarrhea, dizziness, drowsiness, dysarthria, dysphagia, encephalopathy, fatigue, fever, hallucination, headache, hepatic disorders, inflammation localised, psychosis, renal impairment, renal pain, seizure, tremor
  - Uncommon: Abdominal pain, ataxia, coma, confusion, diarrhea, dizziness, dysarthria, dysphagia, encephalopathy, hallucination, hepatic disorders, leucopenia, psychosis, renal impairment, renal pain, seizure, thrombocytopenia, tremor
  - **Rare or very rare**
    - With intravenous use: Abdominal pain, agitation, angioedema, ataxia, coma, confusion, diarrhea, dizziness, drowsiness, dysarthria, dysphagia, encephalopathy, fever, hallucination, headache, hepatic disorders, inflammation localised, psychosis, renal impairment, renal pain, seizure, tremor
  - With oral use: Abdominal pain, ataxia, coma, confusion, diarrhea, dizziness, drowsiness, dysarthria, dysphagia, encephalopathy, hallucination, hepatic disorders, leucopenia, psychosis, renal impairment, renal pain, seizure, tremor
  - Frequency not known: Abdominal pain, ataxia, coma, confusion, diarrhea, dizziness, drowsiness, dysarthria, dysphagia, encephalopathy, hallucination, hepatic disorders, leucopenia, psychosis, renal impairment, renal pain, seizure, tremor
  - With intravenous use: Crystalluria
  - With oral use: Alopecia, crystalluria
  - **PREGNANCY** Not known to be harmful — manufacturers advise use only when potential benefit outweighs risk.
  - **BREAST FEEDING** Significant amount in milk after systemic administration — not known to be harmful but manufacturer advises caution.

- **RENAL IMPAIRMENT** Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

**Dose adjustments**
- With intravenous use in adults: Use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²). Consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m².
- With oral use in adults: For herpes zoster, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²).
- For herpes simplex, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m².
- With oral use in children: For herpes zoster, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²).
For herpes simplex, use normal dose every 12 hours if estimated glomerular filtration rate less than 10.0/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use in adults For intravenous Zovirax IV®, Aciclovir IV (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/mL in water for injection or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for Aciclovir IV (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.

**PRESCRIBING AND DISPENSING INFORMATION**
- With oral use Flavours of oral liquid preparations may include banana, or orange.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Aciclovir (oral) for viral infections
  - With oral use www.medicinesforchildren.org.uk/aciclovir-oral-viral-infections-

**PROFESSION SPECIFIC INFORMATION**
- Dental practitioners’ formulary
  - With oral use Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| Aciclovir (Non-proprietary) | Aciclovir 200 mg Aciclovir 200mg tablets | 25 tablet [POD] £1.25 OT  
|                           | Aciclovir 400 mg Aciclovir 400mg tablets | 56 tablet [POD] £3.30 OT

| ELECTROLYTES: | May contain Sodium  
| Aciclovir (as Aciclovir sodium) 250 mg Aciclovir 250mg powder for solution for infusion vials | 5 vial [POD] £16.50 (Hospital only)  
| Aciclovir 250mg powder for solution for infusion vials | 10 vial [POD] £39.30 (Hospital only)  
| Aciclovir (as Aciclovir sodium) 500 mg Aciclovir 500mg powder for solution for infusion vials | 5 vial [POD] £82.00 (Hospital only)  
| Zovirax IV. (GlaxoSmithKline Ltd) | Aciclovir (as Aciclovir sodium) 250 mg Zovirax IV. 250mg powder for solution for infusion vials | 5 vial [POD] £16.70  
| Aciclovir (as Aciclovir sodium) 500 mg Zovirax IV. 500mg powder for solution for infusion vials | 5 vial [POD] £17.00  

**Famciclovir**

| INDICATIONS AND DOSE |  
| Herpes zoster infection, treatment |  
| BY MOUTH | Adult: 500 mg 3 times a day for 7 days, alternatively 750 mg 1–2 times a day for 7 days  
| Herpes zoster infection, treatment in Immunocompromised patients |  
| BY MOUTH | Adult: 500 mg 3 times a day for 10 days, continue for 2 days after crusting of lesions  
| Genital herpes, suppression |  
| BY MOUTH | Adult: 250 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences  
| Genital herpes, suppression in immunocompromised or HIV-positive patients |  
| BY MOUTH | Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences  
| Genital herpes infection, treatment of first episode |  
| BY MOUTH | Adult: 250 mg 3 times a day for 5 days or longer if new lesions appear during treatment or if healing incomplete  
| Genital herpes infection, treatment of first episode in immunocompromised or HIV-positive patients |  
| BY MOUTH | Adult: 500 mg twice daily for 10 days  
| Genital herpes infection, treatment of recurrent infection |  
| BY MOUTH | Adult: 125 mg twice daily for 5 days, alternatively 1 g twice daily for 1 day  
| Genital herpes infection, treatment of recurrent infections in immunocompromised or HIV-positive patients |  
| BY MOUTH | Adult: 500 mg twice daily for 5–10 days  
| Herpes simplex infection (non-genital), treatment in Immunocompromised patients |  
| BY MOUTH | Adult: 500 mg twice daily for 7 days  

| UNLICENSED USE |  
| Famciclovir doses in BNF may differ from those in product literature.  
| SIDE-EFFECTS |  
| Common or very common | Abdominal pain - diarrhoea - dizziness - headache - nausea - skin reactions - vomiting  
| Uncommon | Angioedema - confusion - drowsiness  
| Rare or very rare | Hallucination - jaundice cholestatic - palpitations - thrombocytopenia  
| PREGNANCY | Manufacturers advise avoid unless potential benefit outweighs risk.  

www.getintopharma.com
HERPES SIMPLEX

Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients
► BY MOUTH
► Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Genital herpes, reduction of transmission (administered on expert advice)
► BY MOUTH
► Adult: 500 mg once daily, to be taken by the infected partner

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used
► BY MOUTH
► Adult: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

CAUTIONS
Elderly (risk of neurological reactions) - maintain adequate hydration (especially with high doses)

INTERACTIONS
► Appendix 1: valaciclovir

SIDE-EFFECTS
Common or very common
Diarrhoea, dizziness, headache, nausea, photosensitivity reaction - skin reactions - vomiting

Uncommon
Abdominal discomfort, agitation, confusion, dyspnoea, haematuria, hallucination, leucopenia, level of consciousness decreased, renal pain, thrombocytopenia, tremor

Rare or very rare
Angioedema, ataxia, coma, delirium, dysarthria, encephalopathy, nephrolithiasis, psychosis, renal impairment, seizure

Frequency not known
Microangiopathic haemolytic anaemia

SIDE-EFFECTS, FURTHER INFORMATION
Neurological reactions more frequent with higher doses.

PREGNANCY
Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

BREAST FEEDING
Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

HEPATIC IMPAIRMENT
Manufacturer advises caution with doses of 4 g or more per day (no information available).

RENAL IMPAIRMENT
Maintain adequate hydration.
Dose adjustments
In adults For herpes zoster, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m²; (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m²). For treatment of herpes simplex, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For treatment of herpes labialis, if eGFR 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate 7.5–10 mL/minute/1.73 m², initially 250 mg, then 250 mg 12 hours after initial dose; if estimated glomerular filtration rate < 7.5 mL/minute/1.73 m², initially 125 mg, then 125 mg 12 hours after initial dose).

Valaciclovir

INDICATIONS AND DOSE
Herpes zoster infection, treatment
► BY MOUTH
► Adult: 1 g 3 times a day for 7 days
Herpes zoster infection, treatment in immunocompromised patients
► BY MOUTH
► Adult: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions
Herpes simplex, treatment of first infective episode
► BY MOUTH
► Adult: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)
Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients
► BY MOUTH
► Adult: 1 g twice daily for 10 days
Herpes simplex, treatment of recurrent infections
► BY MOUTH
► Adult: 500 mg twice daily for 3–5 days
Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients
► BY MOUTH
► Adult: 1 g twice daily for 5–10 days
Herpes labialis treatment
► BY MOUTH
► Child 12-17 years: Initially 2 g, then 2 g after 12 hours
► Adult: Initially 2 g, then 2 g after 12 hours
Herpes simplex, suppression of infections
► BY MOUTH
► Adult: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
Cytomegalovirus infections

6.3a Cytomegalovirus infections

ANTIVIRALS  NUCLEOSIDE ANALOGUES

Cidofovir

DRUG ACTION Cidofovir is a selective inhibitor of human cytomegalovirus (HCMV) DNA polymerase which inhibits viral DNA synthesis and thereby suppresses HCMV replication.

INDICATIONS AND DOSE Cytomegalovirus retinitis in patients with AIDS (in combination with probenecid) (specialist use only)

BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg once weekly for 2 weeks, then maintenance 5 mg/kg every 2 weeks, maintenance treatment to be started 2 weeks after completion of induction treatment

CONTRA-INDICATIONS Concomitant administration with potentially nephrotoxic drugs—discontinue potentially nephrotoxic drugs at least 7 days before starting cidofovir. Patients unable to receive probenecid

CAUTIONS Diabetes mellitus (increased risk of ocular hypotony), ensure concomitant use of probenecid and Sodium Chloride 0.9%

CAUTIONS, FURTHER INFORMATION

Probenecid and Sodium Chloride 0.9%. Manufacturer advises oral probenecid and intravenous Sodium Chloride 0.9% must be administered with each cidofovir dose to prevent nephrotoxicity (consult cidofovir product literature for information on probenecid dosing and recommendations on intravenous hydration); see Prescribing and dispensing information for details on obtaining probenecid.

INTERACTIONS Appendix 1: cidofovir

SIDE-EFFECTS

Common or very common Alopecia · asthenia · chills · diarrhoea · dyspnoea · eye inflammation · fever · headache · nausea · neutropenia · ocular hypotony · proteinuria · rash · renal failure · vomiting

Uncommon Fanconi syndrome acquired

Frequency not known Hearing impairment · nephrotoxicity · pancreatitis

SIDE-EFFECTS, FURTHER INFORMATION

Manufacturer advises intravenous sodium chloride 0.9% prehydration and concomitant oral probenecid for prevention of nephrotoxicity; consider treatment interruption, or discontinuation if changes in renal function occur—consult product literature.

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and after treatment in women; men should be advised to use barrier contraception during and for 3 months after treatment. Cidofovir may cause impaired fertility in males—reduced testes weight and hypospermatia observed in animal studies.

PREGNANCY Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING Manufacturer advises avoid (no information available).

HEPATIC IMPAIRMENT Manufacturer advises caution (no information available).

RENAL IMPAIRMENT Manufacturer advises avoid if creatinine clearance is less than or equal to 55 mL/minute or if proteinuria is greater than or equal to 100 mg/dL.

MONITORING REQUIREMENTS

Manufacturer advises monitor serum creatinine, urine electrolytes, creatinine clearance and creatinine half-life; review drug interactions regularly; consider monitoring proteinuria; monitor liver function tests; review information on interactions.

HANDLING AND STORAGE

Caution in handling. Manufacturer advises cidofovir should be considered a potential carcinogen and must be handled with caution (consult product literature); if contact with skin or mucous membranes occurs, wash thoroughly with water.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

Cidofovir (non-proprietary)

Cidofovir 75 mg per 1 ml Cidofovir 375mg/5ml concentrate for solution for infusion vials 1 vial

Ganciclovir

INDICATIONS AND DOSE Prevention of cytomegalovirus disease [pre-emptive therapy in patients with drug-induced immunosuppression]

BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg every 12 hours for 7–14 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance 5 mg/kg once daily

Prevention of cytomegalovirus disease [universal prophylaxis in patients with drug-induced immunosuppression]

BY INTRAVENOUS INFUSION

Adult: 6 mg/kg once daily, on 5 days of the week, alternatively 5 mg/kg once daily

Treatment of cytomegalovirus disease [in immunocompromised patients]

BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg every 12 hours for 14–21 days, then maintenance 6 mg/kg once daily, on 5 days of the week, alternatively maintenance continued →
5 mg/kg once daily, maintenance only for patients at risk of relapse; if disease progresses initial induction treatment may be repeated

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) - abnormally low neutrophil count (consult product literature) - abnormally low platelet count (consult product literature)

- **CAUTIONS** History of cytopenia - potential carcinogen (including long-term carcinogenicity) - potential teratogen (including long-term teratogenicity) - radiotherapy

- **INTERACTIONS** → Appendix 1: ganciclovir

- **SIDE-EFFECTS**
  - Uncommon Alopecia - arrhythmia - deafness - haematura - hypotension - infertility male - oral ulceration - pancreatitis - psychotic disorder - tremor - visual impairment
  - Rare or very rare Agranulocytosis - hallucination

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 90 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. Ganciclovir may cause temporary or permanent inhibition of spermatogenesis — impaired fertility observed in animal studies.

- **PREGNANCY** Women of childbearing potential should use effective contraception during and for at least 90 days after treatment.

- **BREAST FEEDING** Manufacturer advises avoid — present in milk in animal studies.

- **RENAI IMPAIRMENT**
  - **DOSE ADJUSTMENTS** Manufacturer advises reduce dose for patients receiving mg/kg dosing if creatinine clearance less than 70 mL/minute — consult product literature.
  - **MONITORING REQUIREMENTS** Monitor full blood count closely (sd - bone deterioration may require correction and possibly treatment interruption).

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises, for intravenous infusion, give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute with Water for Injections (500 mg/10 mL) then dilute requisite dose to a concentration of not more than 10 mg/mL with infusion fluid; give over 1 hour into a vein with adequate flow, preferably using a plastic cannula.

- **HANDLING AND STORAGE** Caution in handling Ganciclovir is a potential teratogen and carcinogen. Manufacturer advises avoid inhalation of the powder or direct contact of the powder or reconstituted solution with the skin or mucous membranes; if contact occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.

**Valganciclovir**

**INDICATIONS AND DOSE**

Cytopathic virus retinitis [induction and maintenance treatment in patients with AIDS]

- **BY MOUTH**
  - Adult: Initially 900 mg twice daily for 21 days, then maintenance 900 mg daily, induction regimen may be repeated if retinitis progresses

Prevention of cytopathic virus disease [following solid organ transplantation from a cytopathic virus positive donor]

- **BY MOUTH**
  - Adult: 900 mg daily for 100 days (for 100 – 200 days following kidney transplantation), to be started within 10 days of transplantation

**DOSE EQUIVALENCE AND CONVERSION**

- Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

**CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) - abnormally low neutrophil count (consult product literature) - abnormally low platelet count (consult product literature)

**CAUTIONS** History of cytopenia - potential carcinogen (including long-term carcinogenicity) - potential teratogen (including long-term teratogenicity) - radiotherapy

**INTERACTIONS** → Appendix 1: valganciclovir

**SIDE-EFFECTS**

- Uncommon Alopecia - arrhythmia - deafness - haematura - hypotension - infertility male - oral ulceration - pancreatitis - psychotic disorder - tremor - visual impairment

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least 90 days after treatment; men with partners of childbearing potential should be advised to use barrier contraception during and for at least 90 days after treatment. Ganciclovir may cause temporary or permanent inhibition of spermatogenesis — impaired fertility observed in animal studies.
Cytomegalovirus infections | 639

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenicity observed with ganciclovir in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—ganciclovir present in milk in animal studies.
- **RENAL IMPAIRMENT**
  - Dose adjustments Manufacturer advises reduce dose if creatinine clearance less than 60 mL/minute—consult product literature.
- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Valganciclovir is a pro-drug of ganciclovir. Flavours of oral liquid formulations may include tutti-frutti.
  - Caution in handling the powder, reconstituted solution, or broken tablets and avoid inhalation of powder; if contact with skin or mucous membranes occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.
  - If exposure to foscarnet sodium occurs, wash hands with soap and water.
- **HANDLING AND STORAGE**
  - Manufacturer advises reconstituted powder for oral solution should be stored in a refrigerator (2–8°C) for up to 49 days.
  - Caution in handling Valganciclovir is a potential teratogen and carcinogen. Manufacturer advises caution when handling the powder, reconstituted solution, or broken tablets and avoid inhalation of powder; if contact with skin or mucous membranes occurs, wash thoroughly with soap and water; rinse eyes thoroughly with plain water.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution
  - **Oral solution**
    - CAUTIONARY AND ADVISORY LABELS 21
    - Valcyte (Roche Products Ltd)
      - Valganciclovir (as Valganciclovir hydrochloride) 50 mg per 1 ml Valcyte 50mg/ml oral solution sugar-free | 100 ml (POS) £230.32
    - Valcyte (Roche Products Ltd)
      - Valganciclovir (as Valganciclovir hydrochloride) 450 mg Valganciclovir 450mg tablets | 60 tablet (POS) £865.17–£1,081.46 DT = £1,027.39
    - Valcyte (Roche Products Ltd)
      - Valganciclovir (as Valganciclovir hydrochloride) 450 mg Valcyte 450mg tablets | 60 tablet (POS) £1,081.46 DT = £1,027.39

### Antibacterials

#### Foscarnet sodium

- **INDICATIONS AND DOSE**
  - **Cytomegalovirus disease**
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially 60 mg/kg every 8 hours for 2–3 weeks, alternatively initially 90 mg/kg every 12 hours for 2–3 weeks, then maintenance 60 mg/kg daily, then increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen
      - **Muco-cutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients**
        - **BY INTRAVENOUS INFUSION**
          - Adult: 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal
  - **UNLICENSED USE** Licensed for CMV retinitis in AIDS patients only. Foscarnet doses in BNF may differ from those in product literature.
  - **CAUTIONS** Ensure adequate hydration
  - **INTERACTIONS** → Appendix 1: foscarnet

- **SIDE-EFFECTS**
  - Common or very common Aggression, anaemia, anxiety, appetite decreased, arrhythmias, chest pain, chills, confusion, constipation, coordination abnormal, dehydration, depression, diarrhoea, dizziness, electrolyte imbalance, fever, gastrointestinal discomfort, genital discomfort (due to high concentrations excreted in urine), genital ulceration (due to high concentrations excreted in urine), haemorrhage, headache, hepatic function abnormal, hypertension, hypotension, leucopenia, malaise, muscle contractions involuntary, myalgia, nausea (reduce infusion rate), neutropenia, numbness, oedema, palpitations, pancreatitis, paraesthesia (reduce infusion rate), peripheral neuropathy, proteinuria, renal impairment, seizure, sepsis, skin reactions, thrombocytopenia, thrombophlebitis, tremor, urinary disorders, vomiting
  - Uncommon Acidosis, angioedema, glomerulonephritis, nephropathy, pancytopenia
  - Frequency not known Anaphylactoid reaction, diabetes insipidus, muscle weakness, myopathy, oesophageal ulcer, QT interval prolongation, renal pain, renal tubular acidosis, severe cutaneous adverse reactions (SCARs)
  - **CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Reduce dose; consult product literature.
- **RENAL IMPAIRMENT**
  - Dose adjustments Reduce dose; consult product literature.
- **MONITORING REQUIREMENTS**
  - Monitor electrolytes, particularly calcium and magnesium.
  - Monitor serum creatinine every second day during induction and every week during maintenance.
  - **DIRECTIONS FOR ADMINISTRATION** Avoid rapid infusion. For intravenous infusion (Foscavir®), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution via central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for infusion**
    - ELECTROLYTES: May contain Sodium
      - Foscavir (Clinigen Healthcare Ltd)
        - Foscarnet sodium 24 mg per 1 ml Foscavir 6g/250ml solution for infusion bottles | 1 bottle (POS) £119.85 (Hospital only)

#### Letermovir

- **DRUG ACTION** Letermovir is a cytomegalovirus DNA terminase complex inhibitor that interferes with cytomegalovirus genome formation and virion maturation.

- **INDICATIONS AND DOSE**
  - Prevention of cytomegalovirus reactivation and disease (in recipients of an allogeneic haematopoietic stem cell transplant who are seropositive for the human cytomegalovirus) (initiated by a specialist)
    - **BY MOUTH**
      - Adult: 480 mg once daily for 100 days post-transplant, start within 28 days post-transplant, treatment beyond 100 days may be considered in some patients—consult product literature
      - **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
        - Manufacturer advises reduce dose to 240 mg once daily with concurrent use of ciclosporin.
      - **INTERACTIONS** → Appendix 1: letermovir

www.getintopharma.com
Infection in their use. remain slightly higher than in uninfected individuals. associated with premature ageing, mortality and morbidity (antiretrovirals) may be associated with serious side-effects. is not responding. to the Antiretroviral Pregnancy Registry at www.apregistry.com. HIV infection in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

HIV infection, switching therapy
Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

HIV infection in pregnancy
Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. All treatment options require careful assessment by a specialist. Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

HIV infection and breast-feeding
Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

HIV infection, pre-exposure prophylaxis
The risk of acquiring HIV is increased in:
- men or transgender individuals who have unprotected anal intercourse with men;
- sexual partners of people who are HIV-positive with a detectable viral load; and
- HIV-negative heterosexual individuals who have unprotected intercourse with a HIV-positive person, and are likely to repeat this with the same person or another person with a similar status.

Emtricitabine with tenofovir disoproxil p. 652 may be appropriate for pre-exposure prophylaxis to reduce the risk of sexually acquired HIV-1 infection in combination with safer sex practices in adults at high risk; recommendations developed by the British Association for Sexual Health and HIV are available at: www.bashh.org.
HIV infection, post-exposure prophylaxis

Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-infected material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer’s Expert Advisory Group on AIDS), www.gov.uk/dh and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org.

Drug treatment

Zidovudine p. 655, a nucleoside reverse transcriptase inhibitor (or ‘nucleoside analogue’), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 648, emtricitabine, lamivudine, stavudine p. 654, and tenofovir disoproxil.

The protease inhibitors include atazanavir, darunavir, fosamprenavir (a pro-drug of amprenavir), lopinavir (available as lopinavir with ritonavir), ritonavir, saquinavir p. 660, and tipranavir p. 660. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, lopinavir (available as lopinavir with ritonavir), saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 645, nevirapine, and rilpivirine are used in the treatment of HIV-1 infection, but not against the subtype HIV-2, a subtype that is rare in the UK. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz; CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2-4 weeks of treatment). Efavirenz has also been associated with an increased plasma-cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide below, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc p. 660 is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV.

Dolutegravir p. 642, elvitegravir p. 643 and raltegravir p. 643 are inhibitors of HIV integrase. They are licensed for the treatment of HIV infection in combination with other antiretroviral drugs.

Cobicistat p. 661 is a pharmacokinetic enhancer that boosts the concentrations of other antiretrovirals, but it has no antiretroviral activity itself.

Immune reconstitution syndrome

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves’ disease) have also been reported many months after initiation of treatment.

Osteonecrosis

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

HIV infection in children

HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

Antivirals > HIV-fusion inhibitors

**Enfuvirtide**

**DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypersensitivity**

Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

**Osteonecrosis**

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution— no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).

**DIRECTIONS FOR ADMINISTRATION** For subcutaneous injection, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.

**PATIENT AND CARER ADVICE**

Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.
Dolutegravir

**DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

**INDICATIONS AND DOSE**

HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

- **BY MOUTH**
  - Adult: 50 mg once daily

HIV infection in patients where resistance to other inhibitors of HIV integrase suspected, in combination with other antiretroviral drugs

- **BY MOUTH**
  - Adult: 50 mg twice daily, dose to be taken with food

HIV infection in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)

- **BY MOUTH**
  - Adult: 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: DOLUTEGRAVIR (TIVICAY®), TRIUMEQ®, JULUCA®: SIGNAL OF INCREASED RISK OF NEURAL TUBE DEFECTS; DO NOT PRESCRIBE TO WOMEN SEEKING TO BECOME PREGNANT; EXCLUDE PREGNANCY BEFORE INITIATION AND ADVISE USE OF EFFECTIVE CONTRACEPTION (JUNE 2018)

New safety recommendations have been issued while an EU review evaluates cases of neural tube defects in babies born to mothers who became pregnant while taking dolutegravir. The MHRA advises:

- dolutegravir should not be prescribed to women who are trying to become pregnant;
- pregnancy should be excluded in women of childbearing potential with pregnancy testing before starting dolutegravir;
- women of childbearing potential should be advised to use effective contraception throughout treatment with dolutegravir;
- if pregnancy is confirmed in the first trimester while a woman is taking dolutegravir, switch to an alternative treatment unless there is no suitable alternative;
- women taking dolutegravir for HIV should be advised not to stop taking their medicine without first consulting their doctor.

**INTERACTIONS**

Appendix 1: dolutegravir

**SIDE-EFFECTS**

- Common or very common Depresssion · diarrhoea · dizziness · fatigue · flatulence · gastrointestinal discomfort · headache · nausea · skin reactions · sleep disorders · vomiting
- Uncommon Arthralgia · hepatitis · hypersensitivity · immune reconstitution inflammatory syndrome · myalgia · suicidal tendencies

**SIDE-EFFECTS, FURTHER INFORMATION**

Hypersensitivity

Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

**Osteonecrosis** Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

**PREGNANCY** Manufacturer advises avoid, see Important Safety Information.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dolutegravir tablets.

**Missed doses** If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (May 2014) that dolutegravir (Tivicay®) is accepted for use within NHS Scotland when used in combination with other anti-retroviral medicines for the treatment of HIV infected adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

The All Wales Medicines Strategy Group has advised (October 2017) that dolutegravir (Tivicay®) is recommended as an option for use within NHS Wales in combination with other anti-retroviral medicinal products for the treatment of HIV infected adults. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Tivicay (ViiV Healthcare UK Ltd)
  - Dolutegravir (as Dolutegravir sodium) 10 mg
    - 30 tablet pack £39.75 OT + £39.75
  - Dolutegravir (as Dolutegravir sodium) 25 mg
    - 30 tablet pack £249.38 OT + £249.38
  - Dolutegravir (as Dolutegravir sodium) 50 mg
    - 30 tablet pack £498.75 OT + £498.75

**Combinations available**: Abacavir with dolutegravir and lamivudine, p. 647

**Dolutegravir with rilpivirine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dolutegravir above, rilpivirine p. 646.

**INDICATIONS AND DOSE**

HIV-1 infection (initiated by a specialist)

- **BY MOUTH**
  - Adult: 50/25 mg once daily

**DOSE EQUIVALENCES AND CONVERSION**

- Dose expressed as x/y mg dolutegravir/rilpivirine.

**INTERACTIONS**

Appendix 1: dolutegravir - rilpivirine

**PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and
HIV infection 643

HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and atazanavir or lopinavir

BY MOUTH

Adult: 85 mg once daily, take at the same time as a once daily ritonavir-boosted regimen or with the first dose of a twice daily ritonavir-boosted regimen

HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and darunavir or fosamprenavir

BY MOUTH

Adult: 150 mg once daily, take with the first dose of a twice daily ritonavir-boosted regimen

CAUTIONS Elderly—limited information available

INTERACTIONS → Appendix 1: elvitegravir

SIDE-EFFECTS

Common or very common Diarrhoea, fatigue, headache, nausea, rash, vomiting

Uncommon Depression, dizziness, drowsiness, flatulence, gastrointestinal discomfort, insomnia, paraesthesia

suicidal ideation (in patients with history of depression or psychiatric illness) - taste altered

Frequency not known Hyperglycaemia, osteonecrosis - weight increased

SIDE-EFFECTS, FURTHER INFORMATION For further information regarding osteonecrosis see HIV infection p. 640

CONCEPTION AND CONTRACEPTION Manufacturer advises women of child-bearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).

PREGNANCY Manufacturer advises avoid unless essential—limited data available.

PATIENT AND CARER ADVICE Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

MEDICINAL FORMS No licensed medicines listed.

Combinations available: Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide, p. 649 - Elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil, p. 650

Elvitegravir 14-Jul-2018

DRUG ACTION Elvitegravir is an inhibitor of HIV integrase.

INDICATIONS AND DOSE

HIV-1 infection (initiated by a specialist)

BY MOUTH USING TABLETS

Adult: 400 mg twice daily, alternatively 1200 mg once daily, once daily dosing for use in patients who are treatment naive or virologically suppressed on an initial regimen of 400 mg twice daily—use 600 mg tablets only

CONTRA-INDICATIONS Pre-term neonates—no information available

CAUTIONS Psychiatric illness (may exacerbate underlying illness including depression) - risk factors for myopathy - risk factors for rhabdomyolysis

INTERACTIONS → Appendix 1: elvitegravir

SIDE-EFFECTS

Common or very common Akathisia, appetite abnormal, asthenia, behaviour abnormal, depression, diarrhoea, dizziness, fever, gastrointestinal discomfort, gastrointestinal disorders, headaches, nausea, skin reactions, sleep disorders, vertigo, vomiting

Uncommon Alopecia, anaemia, anxiety, arrhythmias, arthralgia, arthritis, body fat disorder, burning, cachexia, chest discomfort, chills, cognitive disorder, concentration impaired, confusion, constipation, diabetes mellitus, drowsiness, dry mouth, dyslipidaemia, dysphonia, erectile dysfunction, feeling jittery, glosisits, gynaecomastia, haemorrhage, hepatic disorders, hot flush, hyperglycaemia, hypersensitivity, hypertension, immune reconstitution inflammatory syndrome, increased risk of infection, lipodystrophy, lymph node abscess, lymphatic abnormalities, malaise, memory loss, menopausal symptoms, mood altered, myalgia, myopathy, nasal congestion, nephritis, nephrolithiasis, nerve disorders, neutropenia, nocturia, odynophagia, oedema, osteopenia, pain, palpitations, pancreatitis acute, polydipsia, psychiatric disorder, renal cyst, renal impairment, sensation abnormal, severe cutaneous adverse reactions (SCARs), skin papilloma, submandibular mass, suicidal tendencies, sweat changes, taste altered...
tendinitis • thrombocytopenia • tinnitus • tremor • visual impairment • weight increased

▶ Frequency not known Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blisters, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

For further information regarding lipodystrophy and osteonecrosis see HIV infection p. 640

▶ PREGNANCY Manufacturer advises avoid—toxicity in animal studies.

▶ HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).

▶ PRESCRIBING AND DISPENSING INFORMATION Dispense raltegravir chewable tablets in original container (contains desiccant).

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 613/10

The Scottish Medicines Consortium has advised (May 2010) that raltegravir (Isentress®) is accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

SMC No. 1280/17

The Scottish Medicines Consortium has advised (November 2017) that raltegravir 600 mg film-coated tablets (Isentress®) are accepted for restricted use within NHS Scotland for the treatment of HIV-1 infection in adults and paediatric patients weighing at least 40 kg when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Doravirine

28-May-2019

INDICATIONS AND DOSE

HIV-1 infection in combination with other antiretroviral drugs (initiated by a specialist)

▶ BY MOUTH

Adult: 100 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises if concurrent use of moderate inducers of CYP3A4, dabrafenib, modafinil, or telotristat ethyl is unavoidable, increase dose to 100 mg twice daily. Manufacturer advises 100 mg twice daily with rifabutin.

INTERACTIONS → Appendix 1: doravirine

SIDE-EFFECTS

Common or very common Asthenia • diarrhoea • dizziness • drowsiness • gastrointestinal discomfort • gastrointestinal disorders • headache • hepatic cellular injury • nausea • skin reactions • sleep disorders • vomiting

Uncommon Anxiety • arthralgia • concentration impaired • confusion • constipation • depression • electrolyte imbalance • hypertension • malaise • memory loss • mood altered • muscle tone increased • myalgia • paraesthesia • suicidal ideation

Rare or very rare Acute kidney injury • adjustment disorder • aggression • chest pain • chills • dyspnoea • hallucination • pain • rash pustular • renal disorder • thirst • tonsillar hypertrophy • urolithiasis

PREGNANCY Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (no information available).

PATIENT AND CARER ADVICE

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, dizziness, and somnolence.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Uncommon Behaviour abnormal • confusion • flushing • gynaecomastia • hallucination • hepatic disorders • memory loss • mood altered • pancreatitis • psychosis • seizure • Stevens-Johnson syndrome • suicidal tendencies • thinking abnormal • tinnitus • tremor • vertigo • vision blurred

Rash Rare or very rare Delusions • photosensitivity reaction

SIDE-EFFECTS, FURTHER INFORMATION For further information regarding osteonecrosis, immune reconstitution syndrome and lipodystrophy, see HIV infection p. 640

Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

CNS effects Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

www.getintopharma.com
● PREGNANCY Reports of neural tube defects when used in first trimester.
● HEPATIC IMPAIRMENT Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in moderate to severe impairment.

Monitoring In mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function.
● RENAL IMPAIRMENT Manufacturer advises caution in severe renal failure—no information available.
● MONITORING REQUIREMENTS Monitor liver function if receiving other hepatotoxic drugs.

● DIRECTIONS FOR ADMINISTRATION For patients who cannot swallow capsules, the capsule may be opened and contents added to a small amount of food—consult product literature. No additional food should be consumed for up to 2 hours after administration of efavirenz.

● PATIENT AND CARER ADVICE Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Etravirine
12-Jul-2018

● INDICATIONS AND DOSE HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)
  ▶ BY MOUTH
  Adult: 200 mg twice daily, to be taken after food

● CONTRA-INDICATIONS Acute porphyrias p. 1058

● INTERACTIONS
  → Appendix 1: etravirine

● SIDE-EFFECTS
  Common or very common Diabetes mellitus, diarrhoea, headache, hyperglycaemia, myocardial infarction, nausea, skin reactions, vomiting
  Uncommon Angioedema, bronchospasm, dry mouth, dyslipidaemia, gynaecomastia, haematemesis, hepatic disorders, hyperhidrosis, hypersensitivity, hyposomnia, numbness, pancreatitis, slughness, vision blurred
  Rare or very rare Severe cutaneous adverse reactions (SCARs)
  Frequency not known Haemorrhagic stroke, osteonecrosis, weight increased

SIDE-EFFECTS, FURTHER INFORMATION For further information regarding osteonecrosis, immune reconstitution syndrome and lipodystrophy, see HIV infection p. 640

Hypersensitivity reactions Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

● HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment and in patients with hepatitis B or C (increased risk of hepatic side effects); avoid in severe impairment (no information available).

● DIRECTIONS FOR ADMINISTRATION Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.

● PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (contains desiccant).

● PATIENT AND CARER ADVICE

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 21
Intenice (Janssen-Cilag Ltd)
Etravirine 25 mg Etravirine 25mg tablets | 120 tablet PEA £75.32
Etravirine 100 mg Etravirine 100mg tablets | 120 tablet PEA £301.27
Etravirine 200 mg Etravirine 200mg tablets | 60 tablet PEA £301.27

Nevirapine
12-Jul-2018

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (initial dose)
  ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  Adult: Initially 200 mg once daily for first 14 days, initial dose titration using ‘immediate-release’ preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the ‘immediate-release’ preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)
  ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  Adult: 200 mg twice daily
  ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
  Adult: 400 mg once daily

● CONTRA-INDICATIONS Acute porphyrias p. 1058 * post-exposure prophylaxis

● CAUTIONS Females (at greater risk of hepatic side effects) * high CD4 cell count (at greater risk of hepatic side effects)

CAUTIONS, FURTHER INFORMATION
  Hepatic effects Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic
side effects— if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk.

- INTERACTIONS → Appendix 1: nevirapine
- SIDE-EFFECTS
  - Common or very common Abdominal pain - angioedema - diarrhoea - fatigue - fever - headache - hepatic disorders - hypersensitivity - hypotension - nausea - pain - pruritus - vomiting
  - Uncommon Anaemia - arthralgia - myalgia - severe cutaneous adverse reactions (SCARs)
  - Frequency not known Eosinophilia - osteonecrosis - weight increased

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic effects
Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

Rash
Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

Osteonecrosis
Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- HEPATIC IMPAIRMENT
  For modified-release preparations, manufacturer advises avoid (no information available). For immediate-release preparations, manufacturer advises caution in moderate impairment and chronic hepatitis (increased risk of hepatic side effects; consider interrupting or discontinuing treatment if hepatic function worsens); avoid in severe impairment (no information available).

- RENAL IMPAIRMENT
  Manufacturer advises avoid modified-release preparation—no information available.

- MONITORING REQUIREMENTS
  Hepatic disease
  Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
  Rash
  Monitor closely for skin reactions during first 18 weeks.

- PATIENT AND CARER ADVICE
  Hypersensitivity reactions
  Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.
  Missed doses
  If a dose is more than 8 hours late with the ‘immediate-release’ preparation (or more than 12 hours late with the modified-release preparation), the missed dose should not be taken and the next dose should be taken at the usual time.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Oral suspension
  → Viramune (Boehringer Ingelheim Ltd)
  Nevirapine (as Nevirapine hemihydrate) 10 mg per 1 ml Viramune 50mg/5ml oral suspension | 240 ml £50.40

  Nevirapine 400 mg Nevirapine 400mg modified-release tablets | 30 tablet | £21.45–£170.00
  → Viramune (Boehringer Ingelheim Ltd)
  Nevirapine 100 mg Viramune 100mg modified-release tablets | 90 tablet | £12.75 (Hospital only)

Tablet

- Nevirapine (Non-proprietary)
  Nevirapine 200 mg Nevirapine 200mg tablets | 60 tablet £21.45–£170.00

Rilpivirine

- INDICATIONS AND DOSE
  HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than or equal to 100 000 copies/ml.
  → BY MOUTH
  → Adult: 25 mg once daily

- CAUTIONS
  Acute porphyrias p. 1058

- INTERACTIONS → Appendix 1: rilpivirine

- SIDE-EFFECTS
  - Common or very common Appetite decreased - depression - dizziness - drowsiness - dry mouth - fatigue - gastrointestinal discomfort - headache - nausea - rash - sleep disorders - vomiting
  - Uncommon Immune reconstitution inflammatory syndrome

SIDE-EFFECTS, FURTHER INFORMATION
For further information regarding lipodystrophy, see HIV infection p. 640

- PREGNANCY
  Manufacturer advises avoid unless essential—no information available.

- HEPATIC IMPAIRMENT
  Manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).

- RENAL IMPAIRMENT
  Manufacturer advises caution in severe impairment.

- PATIENT AND CARER ADVICE
  Patients or carers should be given advice on how to administer rilpivirine tablets.
  Missed doses
  If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Nucleoside reverse transcriptase inhibitors

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain - anaemia (may require transfusion) - appetite decreased - asthenia - diarrhoea - dizziness - headache - myalgia - nausea - skin reactions - vomiting
  - Uncommon: Hepatic steatosis - lactic acidosis - pancreatitis - thrombocytopenia
  - Frequency not known: Immune reconstitution inflammatory syndrome - osteonecrosis - weight increased

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

- **PRECAUTIONS**
  - Monitoring: Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

- **HEPATIC IMPAIRMENT**
  - In general, manufacturers advise caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

### Abacavir

#### INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH**
  - Adult: 600 mg daily in 1–2 divided doses

- **CAUTIONS**
  - HIV load greater than 100,000 copies/mL - patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%)

- **INTERACTIONS**
  - Appendix 1: abacavir

- **SIDE-EFFECTS**
  - Common or very common: Fever - lethargy
  - Rare or very rare: Severe cutaneous adverse reactions (SCARs)
  - Frequency not known: Hypersensitivity

#### Abacavir with dolutegravir and lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir above, lamivudine p. 653, dolutegravir p. 642.

- **INDICATIONS AND DOSE**
  - HIV infection
  - **BY MOUTH**
    - Adult (body-weight 40 kg and above): 1 tablet once daily

- **INTERACTIONS**
  - Appendix 1: abacavir - dolutegravir - lamivudine

- **RENAL IMPAIRMENT**
  - Avoid Triumeq® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

- **PATIENT AND CARER ADVICE**
  - Misseled doses: If a dose is more than 2 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

#### Abacavir with dolutegravir and lamivudine

- **Tablet**
  - Triumeq (ViiV Healthcare UK Ltd)
    - Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg
    - 50 mg/600 mg/300 mg tablets | £798.16
Abacavir with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 647, lamivudine p. 653.

- **INDICATIONS AND DOSE**
  - HIV infection in combination with other antiretrovirals
    - **BY MOUTH**
      - Adult: body-weight 40 kg and above: 1 tablet once daily

- **INTERACTIONS**
  - **RENAL IMPAIRMENT** Avoid Kivexa® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).
  - **INTERACTIONS** → Appendix 1: abacavir · lamivudine

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Abacavir with lamivudine (Non-proprietary)
      - Lamivudine 300 mg, Abacavir 600 mg Abacavir 600mg / Lamivudine 300mg tablets | 30 tablet [P] £190.00–£299.41 | 30 tablet [P] £224.56 (Hospital only)
    - Kivexa® (ViiV Healthcare UK Ltd)
      - Lamivudine 300 mg, Abacavir 600 mg Kivexa 600mg/300mg tablets | 30 tablet [P] £352.25

Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 647, lamivudine p. 653, zidovudine p. 655.

- **INDICATIONS AND DOSE**
  - HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)
    - **BY MOUTH**
      - Adult: 1 tablet twice daily

- **INTERACTIONS** → Appendix 1: abacavir · lamivudine · zidovudine
  - **RENAL IMPAIRMENT** Avoid Trizivir® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Trizivir® (ViiV Healthcare UK Ltd)
      - Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg Trizivir tablets | 60 tablet [P] £509.06

Bictegravir with emtricitabine and tenofovir alafenamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 651, tenofovir alafenamide p. 622.

- **INDICATIONS AND DOSE**
  - HIV-1 infection (initiated by a specialist)
    - **BY MOUTH**
      - Adult: 1 tablet once daily

- **INTERACTIONS** → Appendix 1: bictegravir · tenofovir alafenamide

- **SIDE-EFFECTS**
  - Common or very common Depression · diarrhoea · dizziness · fatigue · headache · nausea · sleep disorders
  - Uncommon Anaemia · angioedema · anxiety · arthralgia · flatulence · gastrointestinal discomfort · hyperbilirubinaemia · skin reactions · suicidal behaviour · vomiting

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance is less than 30 mL/minute—limited information available.

- **PATIENT AND CARER ADVICE**
  - **Missed doses** Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) decisions**
    - SMC No. SMC2093
    - The Scottish Medicines Consortium has advised (September 2018) that bictegravir with emtricitabine and tenofovir alafenamide (Biktarvy®) is accepted for use within NHS Scotland for the treatment of adults infected with human immunodeficiency virus type 1 without present or past evidence of viral resistance to the integrase inhibitor class, emtricitabine or tenofovir. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

  - **All Wales Medicines Strategy Group (AWMSG) decisions**
    - AWMSG No. 3414
    - The All Wales Medicines Strategy Group has advised (December 2018) that bictegravir with emtricitabine and tenofovir alafenamide (Biktarvy®) is recommended as an option for restricted use within NHS Wales for the treatment of adults infected with human immunodeficiency virus-1 (HIV-1) without present or past evidence of viral resistance to the integrase inhibitor class, emtricitabine or tenofovir, and who are either unsuitable for or unable to tolerate abacavir with dolutegravir and lamivudine (Triumeq®).
    - Bictegravir with emtricitabine and tenofovir alafenamide (Biktarvy®) is not recommended for use within NHS Wales outside of this subpopulation. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Bictegravir with emtricitabine and tenofovir alafenamide (Biktarvy®) is accepted for use within NHS Wales.

Didanosine

(HDV; DDI)

- **INDICATIONS AND DOSE**
  - HIV infection in combination with other antiretroviral drugs
    - **BY MOUTH**
      - Adult (body-weight up to 60 kg): 250 mg daily in 1–2 divided doses
      - Adult (body-weight 60 kg and above): 400 mg daily in 1–2 divided doses
Efavirenz with emtricitabine and tenofovir disoproxil

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 654, efavirenz p. 644, tenofovir p. 651.

**INDICATIONS AND DOSE**

**HIV infection stabilised on antiretroviral therapy for more than 3 months**
- **BY MOUTH**
  - Adult: 1 tablet once daily

**INTERACTIONS**
- Appendix 1: efavirenz, tenofovir disoproxil

**HEPATIC IMPAIRMENT**
Manufacturer of Atripla® advises caution in mild impairment; avoid Atripla® in moderate to severe impairment.

**RENAI IMPAIRMENT**
Avoid Atripla® if eGFR less than 50 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**
Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 23, 25
- Efavirenz with emtricitabine and tenofovir disoproxil (Non-proprietary)
  - Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg, Efavirenz 600 mg
    - Elvitegravir 245mg tablets | 30 tablet (PO) 847.58-532.87
  - Atripla® (Gilead Sciences International Ltd)
    - Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg, Efavirenz 600 mg
      - Atripla 600mg/200mg/245mg tablets | 30 tablet (PO) £532.87

Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 651, elvitegravir p. 643, cobicistat p. 661, tenofovir alafenamide p. 622.

**INDICATIONS AND DOSE**

**HIV-1 infection (specialist use only)**
- **BY MOUTH**
  - Adult: 1 tablet once daily

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

**CAUTIONARY AND ADVISORY LABELS** 25
- Videx EC (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Didanosine 125 mg Videx EC 125mg capsules | 30 capsule (PO)
  - Didanosine 250 mg Videx EC 250mg capsules | 30 capsule (PO) £36.37 (Hospital only)
  - Didanosine 400 mg Videx EC 400mg capsules | 30 capsule (PO) £154.19 (Hospital only)

**INTERACTIONS**
- Appendix 1: cobicistat, elvitegravir, tenofovir alafenamide

**IMPORRNT SAFETY INFORMATION**
MHRA/CHM ADVICE: ELVITEGRAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERINAL-TO-CHILD TRANSMISSION OF HIV-1 (APRIL 2019)
Pharmacokinetic data show mean exposure of elvitegravir boosted with cobicistat (available in combination in Genvoya® and Stribild®) to be lower during the second and third trimesters of pregnancy than postpartum. Low elvitegravir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see Pregnancy.
Elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil

22-May-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 654, emtricitabine p. 651, cobicistat p. 661, elvitegravir p. 643.

**INDICATIONS AND DOSE**

**HIV infection**

- **BY MOUTH**
- Adult: 1 tablet once daily

**SIDE-EFFECTS**

- Common or very common Abnormal dreams, diarrhoea, dizziness, fatigue, flatulence, gastrointestinal discomfort, headache, nausea, skin reactions, vomiting
- Uncommon Anaemia, angioedema, depression
- Frequency not known Nephrototoxicity, osteonecrosis, weight increased

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must contain drospirenone or norgestimate as the progestogen and at least 30 micrograms ethinylestradiol.

**PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low elvitegravir exposure; women who become pregnant during therapy should be switched to an alternative regimen.

**HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatic side-effects); avoid in severe impairment (no information available).

**RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available.

**PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container—contains desiccant.

**PATIENT AND CARER ADVICE**

- Missed doses Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

SNC No. 1142/16
The Scottish Medicines Consortium has advised (May 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (Genvoya®) is accepted for use within NHS Scotland for the treatment of adults and adolescents (aged 12 years and older with body weight at least 35 kg) infected with human immunodeficiency virus-1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**All Wales Medicines Strategy Group (AWMSG) decisions**

AWMSG No. 2248
The All Wales Medicines Strategy Group has advised (July 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (Genvoya®) is recommended as an option for use within NHS Wales for the treatment of adults and adolescents (aged 12 years and older with body weight at least 35 kg) infected with human immunodeficiency virus-1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 21

- **Genvoya** (Gilead Sciences International Ltd) ▼
  - Tenofovir alafenamide 10 mg, Cobicistat 150 mg, Elvitegravir 150 mg, Emtricitabine 200 mg (Genvoya 150mg/150mg/200mg/10mg tablets | 30 tablet [PO] 5879.51)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: ELVITEGRAVIR BOOSTED WITH COBICISTAT: AVOID USE IN PREGNANCY DUE TO RISK OF TREATMENT FAILURE AND MATERNL-TO-CHILD TRANSMISSION OF HIV-1 (APRIL 2019)
Pharmacokinetic data show mean exposure of elvitegravir boosted with cobicistat (available in combination in Genvoya® and Stribild®) to be lower during the second and third trimesters of pregnancy than postpartum. Low elvitegravir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see Pregnancy.

**INTERACTIONS** → Appendix 1: cobicistat - elvitegravir - tenofovir disoproxil

**SIDE-EFFECTS**

- Common or very common Appetite decreased, asthenia, constipation, diarrhoea, dizziness, electrolyte imbalance, flatulence, gastrointestinal discomfort, headache, hyperbilirubinaemia, hyperglycaemia, hypersensitivity, hypertriglyceridaemia, nausea, neutropenia, pain, rash pustular, skin reactions, sleep disorders, vomiting
- Uncommon Anaemia, angioedema, depression (in patients with history of depression or psychiatric illness), muscle weakness, myopathy, pancreatitis, proteinuria, renal failure, renal tubular disorders, suicidal ideation (in patients with history of depression or psychiatric illness)
- Rare or very rare Acute tubular necrosis, hepatic disorders, lactic acidosis, nephritis, nephrogenic diabetes insipidus, osteomalacia
- Frequency not known Autoimmune disorder, Grave’s disease, inflammation, osteonecrosis, weight increased

**CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).

**PREGNANCY** Manufacturer advises not to be initiated during pregnancy due to low elvitegravir exposure; women who become pregnant during therapy should be switched to an alternative regimen.

**HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of hepatic side-effects); avoid in severe impairment (no information available).

**RENAL IMPAIRMENT** If eGFR less than 90 mL/minute/1.73 m², only initiate Stribild® if other treatments cannot be used (avoid initiating Stribild® if eGFR less than 70 mL/minute/1.73 m²); if eGFR less than 70 mL/minute/1.73 m², only continue Stribild® if potential benefit outweighs risk (discontinue Stribild® if eGFR less than 50 mL/minute/1.73 m²).

**MONITORING REQUIREMENTS** Test urine glucose before treatment, then every 4 weeks for 1 year and then every 3 months.

**PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

**www.getintopharma.com**
**Emtricitabine (FTC)**

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**
- **BY MOUTH USING CAPSULES**
  - Adult: 200 mg once daily
- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 240 mg once daily

**DOSE EQUIVALENCE AND CONVERSION**
- 240 mg oral solution = 200 mg capsule; where appropriate the capsule may be used instead of the oral solution.

**SIDE-EFFECTS**
- **Common or very common** Dyspepsia, hyperbilirubinaemia, hyperglycaemia, hypersensitivity, hypertriglyceridaemia, neutropenia, pain, rash pustular, sleep disorders, systemic symptoms
- **Uncommon** Angioedema

**HEPATIC IMPAIRMENT**

**RENAL IMPAIRMENT**
- **Dose adjustments** Reduce dose if eGFR less than 50 ml/minute/1.73 m²; consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include candy.

**PATIENT AND CARER ADVICE**
- **Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**
- **ELECTROLYTES:** May contain Sodium
  - Emtricitabine 10 mg per 1 ml (Emtriva 10mg/ml oral solution sugar-free)
  - 170 ml (PO) £39.53

**Capsule**
- Emtriva (Gilead Sciences International Ltd)
  - Emtricitabine 200 mg (Emtriva 200mg capsules)
  - 30 capsule (PO) £138.98

**Combinations available:** Darunavir with cobicistat, emtricitabine and tenofovir alafenamide, p. 658

---

**Emtricitabine with rilpivirine and tenofovir alafenamide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine above, rilpivirine p. 646, tenofovir alafenamide p. 622.

**INDICATIONS AND DOSE**

**HIV infection in patients with plasma HIV-1 RNA concentration of 100 000 copies/mL or less (specialist use only)**
- **BY MOUTH**
  - Adult: 1 tablet once daily

**SIDE-EFFECTS**
- **Common or very common** Appetite decreased, depression, diarrhoea, dizziness, drowsiness, dry mouth, fatigue, flatulence, gastrointestinal discomfort, headache, nausea, skin reactions, sleep disorders, vomiting
- **Uncommon** Anaemia, angioedema, arthralgia, immune reconstitution inflammatory syndrome
- **Frequency not known** Conjunctivitis, drug reaction with eosinophilia and systemic symptoms (DRESS), eosinophilia, fever, osteonecrosis, QT interval prolongation, weight increased

**SIDE-EFFECTS, FURTHER INFORMATION**
- Systemic symptoms reported with severe skin reactions include fever, blisters, conjunctivitis, angioedema, elevated liver function tests, and eosinophilia.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in moderate impairment (increased risk of hepatic side-effects); avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**
- Manufacturer advises avoid if creatinine clearance less than 30 ml/minute—no information available.

**PATIENT AND CARER ADVICE**
- Vomiting: Manufacturer advises if vomiting occurs within 4 hours of taking a dose, a replacement dose should be taken.
- Driving and skilled tasks: Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**
- The Scottish Medicines Consortium has advised (October 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (Odefsey®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

**All Wales Medicines Strategy Group (AWMSG) decisions**
- The All Wales Medicines Strategy Group has advised (November 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (Odefsey®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1, without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.
Emtricitabine with rilpivirine and tenofovir disoproxil

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 651, rilpivirine p. 646.

- **INDICATIONS AND DOSE**
- **HIV infection in patients with plasma HIV-1 RNA concentration less than 100,000 copies/mL**
  - **BY MOUTH**
  - Adult: 1 tablet once daily

- **INTERACTIONS** → Appendix 1: rilpivirine - tenofovir disoproxil

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (increased risk of hepatic side-effects); avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Avoid Eviplera® if eGFR less than 50 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer Eviplera®.

  - Missed doses: If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**
    - Eviplera (Gilead Sciences International Ltd) |
    - Rilpivirine (as Rilpivirine hydrochloride) 25 mg, Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 25 mg, Emtricitabine 200 mg/Odyssey 200 mg/25 mg/25 mg tablets |
    - 30 tablet pack £52.35

Emtricitabine with tenofovir alafenamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 651, tenofovir alafenamide p. 622.

- **INDICATIONS AND DOSE**
- **HIV infection in combination with other antiretroviral drugs (specialist use only)**
  - **BY MOUTH**
  - Adult: 200/10–200/25 mg once daily, dose is dependent on drug regimen—consult product literature

  - **DOSE EQUIVALENCE AND CONVERSION**
  - Dose expressed as x/y mg emtricitabine/tenofovir alafenamide.

- **INTERACTIONS** → Appendix 1: tenofovir alafenamide

- **SIDE-EFFECTS**
  - Common or very common Abnormal dreams, diarrhoea, dizziness, fatigue, flatulence, gastrointestinal discomfort, headache, nausea, skin reactions, vomiting

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

   - **Tablet**
     - Descovy (Gilead Sciences International Ltd) |
     - Tenofovir alafenamide (as Tenofovir alafenamide fumarate) 25 mg, Emtricitabine 200 mg, Descovy 200 mg/25 mg tablets |
     - 30 tablet pack £355.73

Emtricitabine with tenofovir disoproxil

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 654, emtricitabine p. 651.

- **INDICATIONS AND DOSE**
- **HIV-1 infection (initiated by a specialist)**
  - **BY MOUTH**
  - Adult: 200/245 mg once daily

- **Pre-exposure prophylaxis of HIV-1 infection (initiated by a specialist)**
  - **BY MOUTH**
  - Adult: 200/245 mg once daily

  - **DOSE EQUIVALENCE AND CONVERSION**
  - Dose expressed as x/y mg emtricitabine/tenofovir disoproxil.

- **INTERACTIONS** → Appendix 1: tenofovir disoproxil

- **RENAL IMPAIRMENT**
  - When used for HIV-1 infection: Manufacturer advises avoid in severe impairment.
  - When used for Pre-exposure prophylaxis of HIV-1 infection: Manufacturer advises avoid if creatinine clearance less than 60 mL/minute.

  - **Dose adjustments**
  - When used for HIV-1 infection: Manufacturer advises use normal dose every 2 days in moderate impairment.

- **DIRECTIONS FOR ADMINISTRATION** Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste).

www.getintopharma.com
**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer emtricitabine with tenofovir tablets.

**Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (April 2017) that emtricitabine/tenofovir disoproxil (Truvada®) is accepted for use within NHS Scotland in combination with safer sex practices for pre-exposure prophylaxis of sexually acquired HIV-1 infection in adults at high risk.

**All Wales Medicines Strategy Group (AWMSG) decisions**

The All Wales Medicines Strategy Group has advised (September 2017) that emtricitabine/tenofovir disoproxil (Truvada®) is not recommended for use within NHS Wales in combination with safer sex practices for pre-exposure prophylaxis to reduce the risk of sexually acquired HIV 1 infection in adults at high risk. The case for cost-effectiveness has not been proven.

Subsequent to this AWMSG recommendation, Truvada® has been made available in Wales and is being provided through NHS Wales from 17 July 2017 for up to three years for use as pre-exposure prophylaxis. During this time, eligible patients will receive Truvada® and data will be collected to assess its effectiveness at preventing HIV and address some of the concerns of AWMSG in relation to cost-effectiveness.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 21

- **Emtricitabine with tenofovir disoproxil (Non-proprietary)**
  - Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg: Truvada® 245mg tablets | 30 tablet (PO) £355.73 DT = £355.73 (Hospital only)
  - Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg: Truvada® 30 tablet (PO) £106.72-£355.73 DT = £355.73
- **Ictastan (Actavis UK Ltd)**
  - Emtricitabine 300 mg: Ictastan 300mg tablets | 30 tablet (PO) £74.43 DT = £74.43
- **Truvada (Gilead Sciences International Ltd)**
  - Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg: Truvada® 200mg/245mg tablets | 30 tablet (PO) £355.73 DT = £355.73

**Lamivudine**

**Tablet**

**INDICATIONS AND DOSE**

**EPIVIR® ORAL SOLUTION**

**HIV infection in combination with other antiretroviral drugs**

- **By mouth**
  - Adult: 150 mg every 12 hours, alternatively 300 mg once daily

**EPIVIR® TABLETS**

**HIV infection in combination with other antiretroviral drugs**

- **By mouth**
  - Adult: 150 mg every 12 hours, alternatively 300 mg once daily

**ZEFFIX®**

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

- **By mouth**
  - Adult: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

**CAUTIONS**

- Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

**INTERACTIONS** → Appendix 1: lamivudine

**SIDE-EFFECTS**

- Common or very common: Hepatitis aggravated - muscle cramps - myopathy
- Rare or very rare: Angioedema
- Frequency not known: Abdominal discomfort - malaise - respiratory tract infection - throat complaints

**BREATFEEDING**

Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

**RENAL IMPAIRMENT**

Dose adjustments: Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.

**MONITORING REQUIREMENTS**

When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation — recurrent hepatitis may occur on discontinuation).

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral liquid formulations may include banana and strawberry.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

**EXCIPIENTS:** May contain Sucrose

- **EPIVIR® (ViiV Healthcare UK Ltd)**
  - Lamivudine 10 mg per 1 ml Epivir 50mg/5ml oral solution | 240 ml (PO) £39.01

**Tablet**

- **EPIVIR® (ViiV Healthcare UK Ltd)**
  - Lamivudine 150 mg Epivir 150mg tablets | 60 tablet (PO) £143.32 DT = £143.32
  - Lamivudine 300 mg Epivir 300mg tablets | 30 tablet (PO) £157.51 DT = £157.51
- **Zeffix (GliaSmidKihline UK Ltd)**
  - Lamivudine 100 mg Zeffix 100mg tablets | 28 tablet (PO) £78.09 DT = £74.11

**Lamivudine with tenofovir disoproxil and doravirine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, lamivudine above, tenofovir disoproxil p. 654, doravirine p. 644.

**INDICATIONS AND DOSE**

**HIV-1 infection (initiated by a specialist)**

- **By mouth**
  - Adult: 1 tablet once daily
DOSE ADJUSTMENTS DUE TO INTERACTIONS
- Manufacturer advises if concurrent use of moderate inducers of CYP3A4, dabrafenib, modafinil or telotristat ethyl is unavoidable, increase doravirine dose to 100 mg twice daily. Manufacturer advises increasing doravirine dose to 100 mg twice daily with rifabutin. The extra doravirine 100 mg dose should be taken approximately 12 hours after the dose of Delstrigo™.

INTERACTIONS → Appendix 1: doravirine • lamivudine • tenofovir disoproxil

PREGNANCY
- Manufacturer advises avoid.

HEPATIC IMPAIRMENT
- Manufacturer advises caution in severe impairment—no information available.

RENAI IMPAIRMENT
- Manufacturer advises caution in creatinine clearance less than 50 mL/minute.

PATIENT AND CARER ADVICE
- Missed doses: If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- Driving and skilled tasks: Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, dizziness, and somnolence.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Tablet
- CAUTIONARY AND ADVISORY LABELS 25, 3
  - De Facto (McKesson Sharp & Dohme Ltd) ▼
  - Doravirine 100 mg, Tenofovir disoproxil fumarate (as Tenofovir disoproxil fumarate) 245 mg, Lamivudine 300 mg Delstrigo 100mg/300mg/245mg tablets | 30 tablet (PO) £57.55

Stavudine (d4T)

INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible
- BY MOUTH
  - Adult (body-weight up to 60 kg): 30 mg every 12 hours, to be taken preferably at least 1 hour before food
  - Adult (body-weight 60 kg and above): 40 mg every 12 hours, to be taken preferably at least 1 hour before food

CAUTIONS
- Excessive alcohol intake • history of pancreatitis • history of peripheral neuropathy • lactic acidosis (especially when used in combination with didanosine)—use only if alternative regimens are not suitable

CAUTIONS, FURTHER INFORMATION
- Lactic acidosis: Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with stavudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

INTERACTIONS → Appendix 1: stavudine

SIDE-EFFECTS
- Common or very common: Depression • drowsiness • dyspepsia • hyperlactataemia • lipopatrophy • nerve disorders • paraesthesia • peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) • sleep disorders • thinking abnormal

SIDE-EFFECTS, FURTHER INFORMATION
- Metabolic effects may occur with stavudine; plasma lipids and blood glucose concentrations should be measured routinely.

PREGNANCY
- Manufacturer advises use only if potential benefit outweighs risk.

RENAI IMPAIRMENT
- Risk of peripheral neuropathy.
- Dose adjustments: Use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m².
- Use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m².

PRESCRIBING AND DISPENSING INFORMATION
- Flavours of oral liquid formulations may include cherry.
- LESS SUITABLE FOR PRESCRIBING
  - Stavudine (especially in combination with didanosine) is associated with a higher risk of lipoatrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Capsule
- Zerit (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Zerit 20 mg Zerit 20mg capsules | 56 capsule (PO) £13.96
  - Zerit 30 mg Zerit 30mg capsules | 56 capsule (PO) £14.25
  - Zerit 40 mg Zerit 40mg capsules | 56 capsule (PO) £15.66

Tenofiev disoproxil

INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs
- Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis).
- Chronic hepatitis B infection with decompensated liver disease
  - BY MOUTH
  - Adult: 245 mg once daily

DOSE EQUIVALENCE AND CONVERSION
- 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

INTERACTIONS → Appendix 1: tenofovir disoproxil

SIDE-EFFECTS
- Common or very common
  - Abdominal distension • flatulence
  - Uncommon: Proximal renal tubulopathy
  - Rare or very rare
    - Acute tubular necrosis • angioedema • hepatitis • nephritis • nephrogenic diabetes insipidus • renal impairment

HEPATIC IMPAIRMENT
- Manufacturer advises caution in uncompensated hepatic disease (limited information available).

RENAI IMPAIRMENT
- Dose adjustments
  - Granules: 132 mg once daily if eGFR 30–50 mL/minute/1.73 m²; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m²; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m².
  - Tablets: 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m²; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m².

MONITORING: Monitor renal function—interrupt treatment if further deterioration.

MONITORING REQUIREMENTS
- Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at

www.getintopharma.com
increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.

- When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–5 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **DIRECTIONS FOR ADMINISTRATION** *Granules*: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tenofovir granules. Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**

---

**Zidovudine**

(Azidothymidine; AZT)

- **INDICATIONS AND DOSE**
  - **HIV infection in combination with other antiretroviral drugs**
    - **BY MOUTH**
      - Adult: 250–300 mg twice daily
  - **Prevention of maternal-fetal HIV transmission**
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)
  - **HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

- **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) - abnormally low neutrophil counts (consult product literature)

- **CAUTIONS**
  - Elderly - lactic acidosis - risk of haematological toxicity particularly with high dose and advanced disease - vitamin B12 deficiency (increased risk of neutropenia)

- **CAUTIONS, FURTHER INFORMATION**
  - Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** → Appendix 1: zidovudine

- **SIDE-EFFECTS**
  - **Common or very common** Leucopenia - malaise - neutropenia
  - **Uncommon** Bone marrow disorders - dyspnoea - fever - flatulence - generalised pain - myopathy
  - **Rare or very rare** Alertness decreased - anxiety - cardiomyopathy - chest pain - chills - cough - depression - drowsiness - dyspepsia - gynaecomastia - hepatic disorders - hyperhidrosis - influenza like illness - insomnia - nail discoulouration - oral discoulouration - paraesthesia - pure red cell aplasia - seizure - taste altered - urinary frequency increased.

- **Frequency not known** Lipatrophies

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Anaemia and myelosuppression**
  - If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

- **Lipodystrophy syndrome**
  - Metabolic effects may occur with zidovudine; plasma lipids and blood glucose concentrations should be measured routinely.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in moderate to severe impairment (increased risk of accumulation).
  - **Dose adjustments**
    - Manufacturer advises consider dose reduction in moderate to severe impairment—consult product literature.

- **RENAL IMPAIRMENT**
  - **Dose adjustments**
    - Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor full blood count after 4 weeks of treatment, then every 3 months.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For *intermittent intravenous infusion*, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- [Retrovir](ViiV Healthcare UK Ltd)
  - [Zidovudine 10 mg per 1 ml](Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial) | £52.48

**Oral solution**

- [Retrovir](ViiV Healthcare UK Ltd)
  - Zidovudine 10 mg per 1 ml
    - [Retrovir 50mg/5ml oral solution sugar-free](Retrovir 50mg/5ml oral solution sugar-free | 200 ml) | £20.91
Infection

HEPATIC IMPAIRMENT

▶ Uncommon
▶ Common or very common

SIDE-EFFECTS

PROTEASE INHIBITORS, HIV

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—Zidovudine with lamivudine

BY MOUTH
Adult: 1 tablet twice daily

INTERACTIONS
Appendix 1: lamivudine - zidovudine

RENAL IMPAIRMENT
Avoid if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

DIRECTIONS FOR ADMINISTRATION

COMBIVIR ® TABLETS Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
Zidovudine with lamivudine (Non-proprietary)
Lamivudine 150 mg, Zidovudine 300 mg
Zidovudine 300mg / Lamivudine 150mg tablets | 60 tablet £240.10-£255.10
Combivir (ViiV Healthcare UK Ltd)
Lamivudine 150 mg, Zidovudine 300 mg
Combivir 150mg/300mg tablets | 60 tablet £300.12

ANTIVIRALS > PROTEASE INHIBITORS, HIV

Protease inhibitors

CONTRA-INDICATIONS
Acute porphyrias p. 1058

CAUTIONS
Haemophilia (increased risk of bleeding)

SIDE-EFFECTS

Common or very common

Uncommon
Drowsiness - immune reconstitution inflammatory syndrome - osteonecrosis - Stevens-Johnson syndrome - weight increased

HEPATIC IMPAIRMENT
In general, manufacturers advise use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

Atazanavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—Atazanavir with cobicistat

BY MOUTH
Adult: 300 mg daily

CAUTIONS
Cardiac conduction disorders - electrolyte disturbances - predisposition to QT interval prolongation

INTERACTIONS
Appendix 1: HIV- protease inhibitors

SIDE-EFFECTS

Uncommon
Chest pain - depression - disorientation - drug reaction with eosinophilia and systemic symptoms (DRESS) - gallbladder disorders - gynaecomastia - haematuria - memory loss - myopathy - nephritis - tubulointerstitial nephritis - nephrolithiasis - proteinuria - syncope - torsade de pointes - urinary frequency increased

Rare or very rare
Gait abnormal - oedema - palpitations - QT interval prolongation - renal pain - vasodilation

SIDE-EFFECTS, FURTHER INFORMATION
Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.

PREGNANCY
Theoretical risk of hyperbilirubinaemia in neonate if used at term.

Monitoring
In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.

HEPATIC IMPAIRMENT
Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment (no information available).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Atazanavir with cobicistat

The properties listed below are those particular to the combination only. For the properties of the components please consider, atazanavir above, cobicistat p. 661.

INDICATIONS AND DOSE

HIV infection, in combination with other antiretroviral drugs (initiated by a specialist)

BY MOUTH
Adult: 300/150 mg once daily

DOSE EQUIVALENCE AND CONVERSION

Dose expressed as x/y mg of atazanavir/cobicistat.

CONTRA-INDICATIONS
Haemodialysis

INTERACTIONS
Appendix 1: cobicistat - HIV- protease inhibitors

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 5, 21
Evotaz (Bristol-Myers Squibb Pharmaceuticals Ltd) Capsule
Atazanavir (as Atazanavir sulfate) 150 mg
Evotaz 300mg/150mg tablets | 30 tablet £223.38
Darunavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir

BY MOUTH
Adult: 600 mg twice daily, alternatively 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells x 10^9/litre

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with cobicistat

BY MOUTH
Adult: 800 mg once daily

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

BY MOUTH
Adult: 800 mg once daily

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with cobicistat

BY MOUTH
Adult: 800 mg once daily

INTERACTIONS

Appendix 1: HIV–protease inhibitors

SIDE-EFFECTS

Uncommon Angina pectoris • arrhythmias • burping • chest pain • concentration impaired • confusion • constipation • cough • depression • dry eye • eye erythema • feeling hot • flushing • gout • gynaecomastia • haemorrhage • herpes simplex • hyperglycaemia • hypothyroidism • leucopenia • memory loss • mood altered • muscle weakness • myocardial infarction • nail discolouration • nephrolithiasis • oral disorders • osteoporosis • pain • peripheral oedema • polydipsia • QT interval prolongation • renal impairment • sensation abnormal • sexual dysfunction • sweat changes • throat irritation • thrombocytopenia • urinary disorders • urine abnormalities • vertigo

Rare or very rare Arthritis • chills • feeling abnormal • joint stiffness • musculoskeletal stiffness • palpitations • rhinorrhoea • severe cutaneous adverse reactions (SCARs) • syncope • visual impairment

SIDE-EFFECTS, FURTHER INFORMATION

Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if this develops.

ALLERGY AND CROSS-SENSITIVITY

Use with caution in patients with sulfonamide sensitivity.

PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen. For use with cobicistat, see darunavir with cobicistat below or darunavir with cobicistat, emtricitabine and tenofovir alafenamide p. 658.

HEPATIC IMPAIRMENT

Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

MONITORING REQUIREMENTS

Monitor liver function before and during treatment.
Fosamprenavir

- **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

- **INDICATIONS AND DOSE** HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir
  - **BY MOUTH**
  - Adult: 700 mg twice daily

- **SIDE-EFFECTS**
  - **Common or very common** Oral paraesthesia

- **DOSAGE AND ADMINISTRATION**
  - In adults, oral suspension should be taken on an empty stomach.
  - **Prescribing and dispensing information** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  
  **Tablet**

- **IMPORTANT SAFETY INFORMATION**
  - **Mhra/chm advice: Darunavir boosted with cobicistat—Avoid use in pregnancy due to risk of treatment failure and maternal-to-child transmission of HIV-1 (July 2018)**
  
  Pharmacokinetic data show mean exposure of darunavir boosted with cobicistat (available in combination in Rezolsta® and Symtuza®) to be lower during the second and third trimesters of pregnancy than during 6–12 weeks postpartum. Low darunavir exposure may be associated with an increased risk of treatment failure and an increased risk of HIV-1 transmission to the unborn child. For further information, see Pregnancy.

- **INTERACTIONS**
  - Appendix 1: HIV-protease inhibitors · tenofovir alafenamide
  
  **PREGNANCY**
  - Manufacturer advises not to be initiated during pregnancy due to low darunavir exposure; women who become pregnant during therapy should be switched to an alternative regimen.

  **RENAL IMPAIRMENT**
  - Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.

  **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions
  
  SMC No. 1290/18
  
  The Scottish Medicines Consortium advises (January 2018) that darunavir with cobicistat, emtricitabine and tenofovir alafenamide (Symtuza®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg).

- **All Wales Medicines Strategy Group (AWMSG) decisions**
  
  AWMSG No. 2418
  
  The All Wales Medicines Strategy Group has advised (March 2018) that darunavir with cobicistat, emtricitabine and tenofovir alafenamide (Symtuza®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adults and adolescents (aged 12 years and older with body weight at least 40 kg).

Darunavir with cobicistat, emtricitabine and tenofovir alafenamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, darunavir p. 657, cobicistat p. 661, emtricitabine p. 651, tenofovir alafenamide p. 622.

- **INDICATIONS AND DOSE**
  - HIV infection (initiated by a specialist)
    - **BY MOUTH**
    - Adult: 1 tablet once daily

- **INTERACTIONS**
  - Appendix 1: cobicistat · HIV-protease inhibitors · tenofovir alafenamide

- **PREGNANCY**
  - Manufacturer advises not to be initiated during pregnancy due to low darunavir exposure; women who become pregnant during therapy should be switched to an alternative regimen.

- **RENAL IMPAIRMENT**
  - Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions
  
  SMC No. 1081/15
  
  The Scottish Medicines Consortium has advised (August 2015) that darunavir with cobicistat (Rezolsta®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus-1 (HIV-1) infection in adults, in combination with other antiretrovirals. Genotypic testing should guide its use.
**Lopinavir with ritonavir**

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- **By mouth using tablets**
  - Adult: 400/100 mg twice daily, alternatively 800/200 mg once daily, once daily dose to be used only in adults with a HIV strain that has less than 3 mutations to protease inhibitors
  - **By mouth using oral solution**
  - Adult: 5 mL twice daily

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Side-effects**
  - **Common or very common**
    - Increased risk of infection - leucopenia - lymphadenopathy - menstrual cycle irregularities - migraine - muscle weakness - myopathy - night sweats - pain - sexual dysfunction
  - **Uncommon**
    - Atherosclerosis - atroventricular block - cholangitis - constipation - deep vein thrombosis - haemorrhage - hyperbilirubinemia - hypogonadism - myocardial infarction - nephritis - stomatitis - stroke - tinnitus - tremor - tricuspid valve incompetence - vasculitis - vertigo - visual impairment

**CAUTIONS**

- Cardiac conduction disorders, pancreatitis - patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) - structural heart disease

**INTERACTIONS**

- Appendix 1: HIV-protease inhibitors

**DOSE EQUIVALENCE AND CONVERSION**

- Oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL (or 80 mg lopinavir, 20 mg ritonavir/mL).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Cautionary and advisory labels**
  - **21**
  - **Excipients:** May contain Alcohol, propylene glycol
  - **Kaletra (AbbVie Ltd)**
    - Ritonavir 20 mg per 1 ml, Lopinavir 80 mg per 1 ml
    - | Kaletra 80 mg/200 mg/1 ml oral solution | 120 ml PTFE | £122.96
    - | 300 ml PTFE | £307.39

**Tablet**

- **Cautionary and advisory labels**
  - **25**
  - **Kaletra (AbbVie Ltd)**

  - **21, 25**
  - **Kaletra (Non-proprietary)**
    - Ritonavir 100 mg
    - | Ritonavir 100 mg tablets | 30 tablet PTFE | £16.52–£19.40
    - | Norvir (AbbVie Ltd) Ritonavir 100 mg | 30 tablet PTFE | £19.44

www.getintopharma.com
**Viral infection**

### Saquinavir

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretrovirals in patients previously treated with antiretroviral therapy—

- **BY MOUTH**
  - Adult: 1 g every 12 hours

HIV infection in combination with other antiretrovirals in patients not previously treated with antiretroviral therapy—

- **BY MOUTH**
  - Adult: 500 mg every 12 hours for 7 days, then increased to 1 g every 12 hours

**CONTRA-INDICATIONS**

Bradydysrythmias · congenital QT prolongation · electrolyte disturbances · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · predisposition to cardiac arrhythmias

**INTERACTIONS**

▶ Appendix 1: HIV-protease inhibitors

**SIDE-EFFECTS**

- Common or very common · Burping · constipation · dry lips · libido decreased · lipatrophy · paraesthesia
- Uncommon · Mucosal ulceration · renal impairment · visual impairment
- Frequency not known · QT interval prolongation

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate impairment (limited information available); avoid in decompensated liver disease.

**RENAL IMPAIRMENT**

Use with caution if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

Monitor ECG before starting treatment (do not initiate treatment if QT interval over 450 milliseconds; if baseline QT interval less than 450 milliseconds, monitor ECG during treatment (particularly 10 days after starting treatment in patients not previously treated with antiretroviral therapy)—discontinue if QT interval increases over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, if prolongation of PR interval, or if arrhythmias occur.

**PATIENT AND CARER ADVICE**

Arrhythmias · Patients should be told how to recognize signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncpe develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 21
  - **Invirase** (Roche Products Ltd)
    - Saquinavir (as Saquinavir mesilate) 500 mg · Invirase 500 mg tablets · 120 tablet [PDR] £251.26

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS** 5, 21
  - **Aptivus** (Boehringer Ingelheim Ltd)
    - Tipranavir 250 mg · Aptivus 250 mg capsules · 120 capsule [PDS]
      - £441.00

### Tipranavir

**INDICATIONS AND DOSE**

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—

- **BY MOUTH**
  - Adult: 500 mg twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

**CAUTIONS**

Abnormal liver function tests and/or signs or symptoms of liver injury (consider delaying treatment if serum transaminase levels are greater than 5 times the upper limit of normal—consult product literature) · patients at risk of increased bleeding from trauma, surgery or other pathological conditions

**INTERACTIONS**

▶ Appendix 1: HIV-protease inhibitors

**SIDE-EFFECTS**

- Uncommon · Hyperamylasaemia · hyperglycaemia · influenza like illness · renal failure · thrombocytopenia
- Rare or very rare · Dehydration · hyperbilirubinaemia · intracranial haemorrhage
- Frequency not known · Bleeding tendency

**SIDE-EFFECTS, FURTHER INFORMATION**

Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver function abnormality develops (consult product literature).

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in mild impairment (risk of increased exposure)—monitor liver function before treatment, then every two weeks for 3 months, then monthly until 48 weeks, then every 8 to 12 weeks thereafter, and discontinue if liver function worsens; avoid in moderate to severe impairment.

**MONITORING REQUIREMENTS**

Monitor liver function before treatment, then every 2 weeks for 1 month, then every 4 weeks until 24 weeks, then every 8 to 12 weeks thereafter.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of oral liquid formulations may include toffee and mint.

**PATIENT AND CARER ADVICE**

Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS** 5, 21
  - **INCIPIENTS**: May contain Ethanol
  - **Aptivus** (Boehringer Ingelheim Ltd)
    - Tipranavir 250 mg · Aptivus 250 mg capsules · 120 capsule [PDS]
      - £441.00

### Maraviroc

**DRUG ACTION**

Maraviroc is an antagonist of the CCR5 chemokine receptor.

**INDICATIONS AND DOSE**

CCR5-tropic HIV infection in combination with other antiretrovirals in patients previously treated with antiretrovirals—

- **BY MOUTH**
  - Adult: 300 mg twice daily

**CAUTIONS**

Cardiovascular disease

**INTERACTIONS**

▶ Appendix 1: maraviroc

**SIDE-EFFECTS**

- Common or very common · Abdominal pain · anaemia · appetite decreased · asthenia · depression · diarrhoea · flatulence · headache · insomnia · nausea · rash
- Uncommon · Hyperbilirubinaemia · increased risk of infection · myopathy · postural hypotension · proteinuria · renal failure · seizure
- Rare or very rare · Angina pectoris · granulocytopenia · hepatic disorders · metastases · neoplasms · pancytopenia · severe cutaneous adverse reactions (SCARs)
**Influenza 661**

### Influenza

**Management**

Oseltamivir p. 662 and zanamivir p. 663 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in patients with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised patients.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed]. Amantadine hydrochloride p. 418 is licensed for prophylaxis and treatment of influenza A but it is no longer recommended.

Information on pandemic influenza, avian influenza, and swine influenza may be found at [www.gov.uk/phe](http://www.gov.uk/phe).

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

**Oseltamivir in children under 1 year of age**

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

---

**5 Infection**

**CBICOSTAT**

30-Jun-2018

**INDICATIONS AND DOSE**

Pharmacokinetic enhancer used to increase the effect of atazanavir or darunavir

*BY MOUTH*

- Adults: 150 mg once daily

**INTERACTIONS**

- Appendix 1: cobicistat

**PREGNANCY**

Manufacturer advises avoid unless essential. For use with darunavir, see darunavir with cobicistat p. 657 or darunavir with cobicistat, emtricitabine and tenofovir alafenamide p. 658. For use with elvitegravir, see elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil p. 650 or elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide p. 649.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**

No dose adjustment required; inhibits tubular secretion of creatinine; when any co-administered drug requires dose adjustment based on renal function, avoid initiating cobicistat if eGFR less than 70 mL/minute/1.73 m².

**PRESCRIBING AND DISPENSING INFORMATION**

Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**

Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

*Tybost* (Gilead Sciences International Ltd)

- Cobicistat 150 mg Tybost 150 mg tablets | 30 tablet [UPL] £21.38

Infection

Breast feeding

In adults Avoid for treatment and prevention if eGFR less than 10 mL/minute/1.73 m².

In children Avoid for treatment and prevention if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

Dose adjustments - in adults For treatment, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m² (30 mg once daily if eGFR 10–30 mL/minute/1.73 m²). For prevention, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m² (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m²).

In children For treatment, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For prevention, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).

Directions for administration If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

Prescribing and dispensing information Flavours of oral liquid formulations may include tutti-frutti.

Patient and carer advice Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-influenza-flu

National funding/access decisions

NICE decisions

Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158

Oseltamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

Oseltamivir is not recommended for seasonal prophylaxis against influenza.

When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged 65 years or older or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

www.getintopharma.com
This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/ta158

▶ Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168

Oseltamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

▲ When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

▲ During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes. At risk patients include those aged over 65 years or those who have one or more of the following conditions:
- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/ta168

NHS restrictions Tamiflu® is not prescribable in NHS primary care except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SLS’.

▲ MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

EXCIPIENTS: May contain sorbitol

▶ Tamiflu® (Roche Products Ltd) Oseltamivir (as Oseltamivir phosphate) 6 mg per 1 ml Tamiflu 6mg/ml oral suspension sugar-free | 65 ml £10.27 DT = £10.27

Capsule

CAUTIONARY AND ADVISORY LABELS 9

▶ Tamiflu® (Roche Products Ltd) Oseltamivir (as Oseltamivir phosphate) 30 mg Tamiflu 30mg capsules | 10 capsule £7.17

Oseltamivir (as Oseltamivir phosphate) 45 mg Tamiflu 45mg capsules | 10 capsule £15.41

Oseltamivir (as Oseltamivir phosphate) 75 mg Tamiflu 75mg capsules | 10 capsule £15.41

Zanamivir

▲ DRUG ACTION Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

▲ INDICATIONS AND DOSE

Post-exposure prophylaxis of influenza

▲ BY INHALATION OF POWDER

Child 5-17 years: 10 mg once daily for 10 days

Adult: 10 mg once daily for 10 days

Prevention of influenza during an epidemic

▲ BY INHALATION OF POWDER

Child 5-17 years: 10 mg once daily for up to 28 days

Adult: 10 mg once daily for up to 28 days

Treatment of influenza

▲ BY INHALATION OF POWDER

Child 5-17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

Adult: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

▲ UNLICENSED USE Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

▲ CAUTIONS Asthma • chronic pulmonary disease • uncontrolled chronic illness

CAUTIONS, FURTHER INFORMATION

Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available.

Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

▲ SIDE-EFFECTS

▶ Common or very common Skin reactions

▶ Uncommon Bronchospasm • dehydration • dyspnoea • oropharyngeal oedema • presyncope • severe cutaneous adverse reactions (SCARs) • throat tightness

▶ Rare or very rare Face oedema

▶ Frequency not known Behaviour abnormal • delirium • hallucination • level of consciousness decreased • psychiatric disorder • seizure

SIDE-EFFECTS, FURTHER INFORMATION Neurological and psychiatric disorders occur more commonly in children and adolescents.

▲ PREGNANCY Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

▲ BREAST FEEDING Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

▲ DIRECTIONS FOR ADMINISTRATION Other inhaled drugs should be administered before zanamivir.

▲ PRESCRIBING AND DISPENSING INFORMATION Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SLS’.

▲ NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

▶ Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158

Zanamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

▲ Zanamivir is not recommended for seasonal prophylaxis against influenza.

www.getintopharma.com
When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Zanamivir should be given within 36 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community).

During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:
- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/TA168

Drugs for Respiratory Diseases

Respiratory syncytial virus

Management in children

Ribavirin p. 626 is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis.

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:
- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:
- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see Immunisation against Infectious Disease (2006), available at www.gov.uk/dh.

Palivizumab

Indications and dose

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)
- By intramuscular injection
  - Child 1–23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/guidance/TA168
Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites.

---

**UNLICENSED USE** Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

**CAUTIONS** Moderate to severe acute infection · moderate to severe febrile illness · serum-palivizumab concentration may be reduced after cardiac surgery · thrombocytopenia

**SIDE-EFFECTS**
- Common or very common Apnoea
- Uncommon Seizure · thrombocytopenia · urticaria
- Frequency not known Hypersensitivity

**ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to humanised monoclonal antibodies.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Synagis** (AbbVie Ltd)
  - Palivizumab 100 mg per 1 ml Synagis 100mg/1ml solution for injection vials | 1 vial £563.64
  - Synagis 50mg/0.5ml solution for injection vials | 1 vial £306.34

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus

Vasopressin p. 669 (antidiuretic hormone, ADH) is used in the treatment of pituitary (‘cranial’) diabetes insipidus as is its analogue desmopressin p. 667. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 311 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand’s disease; it is also used to test fibrinolytic response. Desmopressin may also have a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 823, another posterior pituitary hormone, is indicated in obstetrics.

Antidiuretic hormone antagonists

Demeclocycline hydrochloride p. 564 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 669 is a vasopressin V2-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment. Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

1.1 Diabetes insipidus

Other drugs used for Diabetes insipidus Chlortalidone, p. 230
**Desmopressin**

- **DRUG ACTION** Desmopressin is an analogue of vasopressin.

- **INDICATIONS AND DOSE**

  **Diabetes insipidus, treatment**
  - **BY MOUTH**
  - Adult: 20 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 2–11 years: 5 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 1 year or less: 2 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - **BY SUBLINGUAL ADMINISTRATION**
  - Adult: 20 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 2–11 years: 5 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 1 year or less: 2 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - **BY INTRAMUSCULAR INJECTION**
  - Adult: 200 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 5–17 years: 20 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 2–11 years: 5 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 1 year or less: 2 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 20 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 2–11 years: 5 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 1 year or less: 2 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - **BY INTRANASAL ADMINISTRATION**
  - Adult: 20 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 2–11 years: 5 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 1 year or less: 2 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - **BY ORAL SUSPENSION**
  - Adult: 20 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 2–11 years: 5 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Child 1 year or less: 2 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted

- **Primary nocturnal enuresis**

  - **BY MOUTH**
  - Child 5–17 years: 200 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Adult 18–65 years: 200 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - **BY SUBLINGUAL ADMINISTRATION**
  - Child 5–17 years: 120 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted
  - Adult 18–65 years: 120 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted

- **Postoperative polyuria or polydipsia**

  - **BY MOUTH**
  - Adult: 20 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted

- **Polyuria or polydipsia after hypophysectomy**

  - **BY SUBLINGUAL ADMINISTRATION**
  - Adult: 20 micrograms once daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted

- **Idiopathic nocturnal polyuria in females**

  - **BY SUBLINGUAL ADMINISTRATION**
  - Adult: 25 micrograms daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted

- **Idiopathic nocturnal polyuria in males**

  - **BY SUBLINGUAL ADMINISTRATION**
  - Adult: 50 micrograms daily, dose to be decreased according to urine osmolality; oral fluid intake to be restricted

- **Diabetes insipidus, diagnosis (water deprivation test)**

  - **BY INTRANASAL ADMINISTRATION**
  - Adult: 20 micrograms, dose to be increased according to response; usual dose 200 micrograms daily
  - Child 2–11 years: 5 micrograms, dose to be increased according to response; usual dose 100–200 micrograms daily
  - Child 1 year or less: 2 micrograms, dose to be increased according to response; usual dose 2–10 micrograms daily

- **Nocturia associated with multiple sclerosis (when other treatments have failed)**

  - **BY INTRANASAL ADMINISTRATION**
  - Adult 18–65 years: 10–20 micrograms daily, dose to be increased according to response; usual dose 200 micrograms daily

- **Renal function testing**

  - **BY INTRANASAL ADMINISTRATION**
  - Adult: 40 micrograms, dose to be increased according to response; usual dose 200 micrograms daily

- **Mild to moderate haemophilia and von Willebrand’s disease**

  - **BY INTRANASAL ADMINISTRATION**
  - Adult: 300 micrograms every 12 hours if required, dose to be increased according to response; usual dose 300 micrograms/kg for 1 dose
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 300 micrograms/kg for 1 dose, dose to be increased according to response; usual dose 200 micrograms/kg for 1 dose

- **Fibrinolytic response testing**

  - **BY INTRANASAL ADMINISTRATION**
  - Adult: 300 micrograms/kg for 1 dose, dose to be increased according to response; usual dose 200 micrograms/kg for 1 dose
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 300 micrograms/kg for 1 dose, dose to be increased according to response; usual dose 200 micrograms/kg for 1 dose

- **Lumbar-puncture-associated headache**

  - **BY INTRANASAL ADMINISTRATION**
  - Adult: 200 micrograms/kg for 1 dose, dose to be increased according to response; usual dose 200 micrograms/kg for 1 dose

UNLICENSED USE Consult product literature for individual preparations. Oral use of DDAVP intravenous injection is not licensed.

CONTRA-INDICATIONS Cardiac insufficiency - conditions treated with diuretics - history of hyponatraemia - polydipsia in alcohol dependence - psychogenic polydipsia - syndrome of inappropriate ADH secretion (in adults)

CAUTIONS

GENERAL CAUTIONS Asthma - avoid fluid overload - cardiovascular disease (not indicated for nocturnal enuresis or nocturia) - conditions which might be aggravated by water retention - cystic fibrosis - elderly (avoid for primary nocturnal enuresis and nocturia associated with multiple sclerosis in those over 65 years) - epilepsy - heart failure - hypertension (not indicated for nocturnal enuresis or nocturia) - migraine - nocturia — limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards - nocturnal enuresis — limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

SPECIFIC CAUTIONS

With intranasal use should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

CAUTIONS, FURTHER INFORMATION Elderly patients are at increased risk of hyponatraemia and renal impairment — manufacturer advises measure baseline serum sodium concentration, then monitor regularly during treatment; discontinue treatment if levels fall below the normal range. Review treatment if no therapeutic benefit after 3 months.

INTERACTIONS ➔ Appendix 1: desmopressin

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

• Common or very common Hyponatraemia (on administration without restricting fluid intake) - nausea

• Frequency not known Abdominal pain - aggression (in children) - allergic dermatitis - emotional disorder - fluid retention - headache - hyponatraemic seizure - vomiting - weight increased

SPECIFIC SIDE-EFFECTS

• With intranasal use Epistaxis - nasal congestion - rhinitis

• With intravenous or subcutaneous use Vasodilation

• With sublingual use Epistaxis - nasal congestion

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants) — increases risk of hyponatraemia.

PREGNANCY Small oxytocic effect in third trimester; increased risk of pre-eclampsia.

BREAST FEEDING Amount too small to be harmful.

RENAL IMPAIRMENT Use with caution; antidiuretic effect may be reduced.

MONITORING REQUIREMENTS In nocturia, periodic blood pressure and weight checks are needed to monitor for fluid overload.

DIRECTIONS FOR ADMINISTRATION DDAVP® and Desmota® tablets may be crushed. DDAVP® intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL. DDAVP® injection may be administered orally. Desmopressin oral lyophilisates are for sublingual administration.

With intravenous use in adults For intravenous infusion (DDAVP®, Octim®), give intermittently in Sodium chloride 0.9%; dilute with 50 mL and give over 20 minutes.

PRESCRIBING AND DISPENSING INFORMATION Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.

Children requiring an intranasal dose of less than 10 micrograms should be given DDAVP® intranasal solution.

PATIENT AND CARER ADVICE

Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

Medicines for Children leaflet: Desmopressin for bedwetting www.medicinesforchildren.org.uk/desmopressin-bedwetting-0

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions SMC No. 1218/17 The Scottish Medicines Consortium has advised (August 2017) that desmopressin oral lyophilisate (Noqdina®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of nocturia due to idiopathic nocturnal polyuria in patients aged 65 years and over.

All Wales Medicines Strategy Group (AWMSG) decisions AWMSG No. 2382 The All Wales Medicines Strategy Group has advised (October 2017) that desmopressin acetate (Noqdina®) is recommended for restricted use within NHS Wales for idiopathic nocturnal polyuria in adults aged over 65 years, for whom treatment options are currently limited.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, spray, nasal drops

1.2 Syndrome of inappropriate antidiuretic hormone secretion

Other drugs used for Syndrome of inappropriate antidiuretic hormone secretion: Demeclocycline hydrochloride, p. 564

www.getintopharma.com
6 Tolvaptan for treating autosomal dominant polycystic kidney disease

NATIONAL FUNDING/ACCESS DECISIONS

PATIENT AND CARER ADVICE

▶ When used for Hyponatraemia secondary to syndrome of nephrogenic diabetes insipidus, Manufacturer advises monitor serum-sodium concentration no later than 6 hours or 8 mmol/litre in the first 6–12 hours, frequency of monitoring should be increased; interrupt or discontinue treatment if serum-sodium increases by 12 mmol/litre or greater in 24 hours or 18 mmol/litre or greater in 48 hours.

▶ When potentially less harmful measures are ineffective corticosteroids are used topicaly for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in pregnancy. Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease. They are also included in locally applied creams for haemorrhoids. Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 676 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 676 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 675 and betamethasone p. 674 have little if any mineralocorticoid activity and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic–pituitary–adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing’s syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

2 Corticosteroid responsive conditions

Corticosteroids, general use

Overview

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topicaly for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in pregnancy. Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease. They are also included in locally applied creams for haemorrhoids. Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 676 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 676 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 675 and betamethasone p. 674 have little if any mineralocorticoid activity and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic–pituitary–adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing’s syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.
Corticosteroids, replacement therapy

Overview
The adrenal cortex normally secretes hydrocortisone p. 676 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 676; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In Addison’s disease or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In acute adrenocortical insufficiency, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9% p. 1040.

In hypopituitarism, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 773 and sex hormones should be given as indicated by the pattern of hormone deficiency.
The relatively high mineralocorticoid activity of hydrocortisone p. 676, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked. Prednisolone p. 678 and prednisone have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 674 and dexamethasone p. 675 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage. Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia).

Some esters of betamethasone and of beclometasone dipropionate p. 45 (beclometasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations). Deflazacort p. 674 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

• CONTRA-INDICATIONS Avoid injections containing benzyl alcohol in neonates • avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) • systemic infection (unless specific therapy given)

• CONTRA-INDICATIONS, FURTHER INFORMATION For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

• CAUTIONS Congestive heart failure • diabetes mellitus (including a family history of) • diverticulitis • erythromelalgia • glaucoma (including a family history of or susceptibility to) • history of steroid myopathy • history of tuberculosis or X-ray changes (frequent monitoring required) • hypertension • hypothyroidism • infection (particularly untreated) • myasthenia gravis • ocular herpes simplex (risk of corneal perforation) • osteoporosis (in children) • osteoporosis (post-menopausal women and the elderly at special risk) (in adults) • peptic ulcer • psychiatric reactions • recent intestinal anastomoses • recent myocardial infarction (rupture reported) • severe affective disorders (particularly if history of steroid-induced psychosis) • should not be used long-term • thromboembolic disorders • ulcerative colitis

CAUTIONS, FURTHER INFORMATION For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

• SIDE-EFFECTS
  • Common or very common Anxiety • behaviour abnormal • cataract • subcapsular • cognitive impairment • Cushing’s syndrome • electrolyte imbalance • fluid retention • gastrointestinal discomfort • headache • healing impaired • hirsutism • hypertension • increased risk of infection • menstrual cycle irregularities • mood altered • nausea • osteoporosis • peptic ulcer • psychotic disorder • skin reactions • sleep disorders • weight increased
  • Uncommon Adrenal suppression • alkalosis • hypokalaemia • appetite increased • bone fractures • diabetic control impaired • eye disorders • fatigue • glaucoma • haemorrhage • heart failure • hyperhidrosis • hypotension • leucocytosis • myopathy • osteonecrosis • pancreatitis • papilloedema • seizure • thromboembolism • tuberculosis reactivation • vertigo • vision blurred
  • Rare or very rare Malaise • tendon rupture
  • Frequency not known Chorioretinopathy • growth retardation (very common in children) • intracranial pressure increased with papilloedema (usually after withdrawal) • telangiectasia

SIDE-EFFECTS, FURTHER INFORMATION Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to
Acute adrenal insufficiency, hypotension, or death. To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

**Infections** Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoeobiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

**Chickenpox** Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox. Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella–zoster immunoglobulin is needed for exposed non–immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

**Measles** Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

**Psychiatric reactions** Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment. Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid–induced psychosis, or who have a personal or family history of psychiatric disorders.

**Pregnancy** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.

**Monitoring** Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

- **Breastfeeding** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
- **Hepatic Impairment** In general, manufacturers advise caution (risk of increased exposure).
- **Renal Impairment** Use by oral and injectable routes should be undertaken with caution.
- **Monitoring Requirements**
  - in children The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
- **Effect on Laboratory Tests** May suppress skin test reactions.
- **Treatment Cessation**
  - in adults Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss. The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case–by–case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
    - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
    - been given repeat doses in the evening;
    - received more than 3 weeks’ treatment;
    - received more than 3 weeks’ treatment;
    - taken a short course within 1 year of stopping long-term therapy;
    - other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

- in children The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case–by–case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
  - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week or 2 mg/kg daily for 1 week or 1 mg/kg daily for 1 month;
  - been given repeat doses in the evening;
  - received more than 3 weeks’ treatment;
  - received more than 3 weeks’ treatment;
  - received more than 3 weeks’ treatment;
  - taken a short course within 1 year of stopping long-term therapy;
  - other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above. During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to
Betamethasone

**INDICATIONS AND DOSE** Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia

- **BY MOUTH**
  - Adult: Usual dose 0.5–5 mg daily
  - Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
  - Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 4–20 mg, repeated up to 4 times in 24 hours

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS** Hiccups, myocardial rupture (following recent myocardial infarction), oedema, Stevens-Johnson syndrome

**PREGNANCY** Readily crosses the placenta. Transient effect on fetal movements and heart rate.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (as sodium phosphate) (Betresol®), give continuously or intermittently or via drip tubing In Glucose 5% or Sodium chloride 0.9%.

**PATIENT AND CARER ADVICE**

- With oral use Patient counselling is advised for betamethasone soluble tablets (steroid card).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Soluble tablet**

| CAUTIONARY AND ADVISORY LABELS | 5, 13, 21 (not for use as mouthwash for oral ulceration) |
| Betamethasone (Non-proprietary) |  |
| Betamethasone (as Betamethasone sodium phosphate) |  |
| 500 microgram | Betamethasone 500 microgram soluble tablets sugar-free sugar-free | 100 tablet | £65.18 DT = £58.15

**Solution for injection**

| CAUTIONARY AND ADVISORY LABELS | 10 |
| Betamethasone (Non-proprietary) |  |
| Betamethasone (as Betamethasone sodium phosphate) |  |
| 4 mg per 1 ml | Betamethasone 4 mg/1 ml 5 ampoules | £33.93 DT = £32.61

**Deflazacort**

**DRUG ACTION** Deflazacort is derived from prednisolone; it has predominantly glucocorticoid activity.

**INDICATIONS AND DOSE**

**Suppression of inflammatory and allergic disorders**

- **BY MOUTH**
  - Adult: Maintenance 3–18 mg daily
  - Adult: Initially up to 120 mg daily

**Suppression of inflammatory and allergic disorders (acute disorders)**

- **BY MOUTH**
  - Adult: 60 mg per dose
  - Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
  - Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS**

- Uncommon: Oedema

**HEPATIC IMPAIRMENT**

- Dose adjustments Manufacturer advises adjust to the minimum effective dose.

**PATIENT AND CARER ADVICE** Patient counselling is advised for deflazacort tablets (steroid card).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**

| CAUTIONARY AND ADVISORY LABELS | 5, 10 |
| Deflazacort |  |
| 6 mg | Calcort 6mg tablets | 60 tablet | £15.82 DT = £15.82

www.getintopharma.com
Dexamethasone

**DRUG ACTION** Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

**INDICATIONS AND DOSE**

- **Suppression of inflammatory and allergic disorders**
  - **By mouth**
  - **Adults:** 0.5–10 mg daily
  - **Children:** Initially 150 micrograms/kg for 1 dose

- **Mild croup**
  - **By mouth**
  - **Child:** 150 micrograms/kg for 1 dose

- **Severe croup (or mild croup that might cause complications)**
  - **Initial** by mouth
  - **Child:** Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

- **Congenital adrenal hyperplasia (under expert supervision)**
  - **By mouth**
  - **Adults:** Consult specialist for advice on dosing
  - **Intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
  - **Adults:** Consult specialist for advice on dosing

- **Overnight dexamethasone suppression test**
  - **By mouth**
  - **Adults:** 1 mg for 1 dose, to be given at night

- **Adjunctive treatment of bacterial meningitis (starting before or with first dose of antibiotic)**
  - **By intravenous injection**
  - **Adults:** 8.3 mg every 6 hours for 4 days

- **Symptom control of anorexia in palliative care**
  - **Adults:** 2–4 mg daily

- **Dysphagia due to obstruction by tumour in palliative care**
  - **Adults:** 8 mg daily

- **Dyspnoea due to bronchospasm or partial obstruction in palliative care**
  - **Adults:** 4–8 mg daily

- **Adjunct in the treatment of nausea and vomiting in palliative care**
  - **By mouth**
  - **Adults:** 8–16 mg daily

- **Headaches due to raised intracranial pressure in palliative care**
  - **Adults:** 16 mg daily for 4–5 days, then reduced to 4–6 mg daily, reduce dose if possible. To be given before 6pm to reduce the risk of insomnia

- **Pain due to nerve compression in palliative care**
  - **Adults:** 8 mg daily

- **Cerebral oedema associated with malignancy**
  - **By mouth**
  - **Adults:** 0.5–10 mg daily

- **Cerebral oedema**
  - **Initially by intravenous injection**
  - **Adults:** Initially 8–16 mg for 1 dose, then (by intramuscular injection or by intravenous injection) 5 mg every 6 hours until adequate response achieved then taper-off gradually, use the 3.8 mg/mL injection preparation for this dose

- **Cerebral oedema associated with malignancy**
  - **Initially by intravenous injection**
  - **Adults:** Initially 8.3 mg for 1 dose, then (by intramuscular injection) 3.3 mg every 6 hours as required for 2–4 days, subsequently, reduce dose

**INTERACTIONS**

- **With oral use** Hiccups, hyperglycaemia, myocardial rupture (following recent myocardial infarction), protein catabolism

- **With parental use** Perineal irritation (may occur following the intravenous injection of large doses of the phosphate ester)

**PREGNANCY** Dexamethasone readily crosses the placenta.

**DIRECTIONS FOR ADMINISTRATION**

- **With systemic use in children** For further information on the dose of dexamethasone in palliative care, see www.medicinescomplete.com/#/content/palliative/systemic-corticosteroids.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Dexamethasone for croup www.medicinesforchildren.org.uk/dexamethasone-croup-0

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Soluble tablet**

- **Dexamethasone (Non-proprietary)**
  - **Dexamethasone**
  - **Dexamethasone (as Dexamethasone sodium phosphate)**
    - 2 mg Dexamethasone 2mg soluble tablets sugar-free sugar-free | 50 tablet (POM) £30.00–£30.01 DT + £30.01
    - 4 mg Dexamethasone 4mg soluble tablets sugar-free sugar-free | 50 tablet (POM) £60.00–£60.01 DT + £60.01
  - **Dexamethasone (as Dexamethasone sodium phosphate)**
    - 8 mg Dexamethasone 8mg soluble tablets sugar-free sugar-free | 50 tablet (POM) £120.00–£120.01 DT + £120.01
  - **Glensoludex** (Glenmark Pharmaceuticals Europe Ltd)
    - **Dexamethasone (as Dexamethasone sodium phosphate)**
      - 2 mg Glensoludex 2mg soluble tablets sugar-free | 50 tablet (POM) £10.00 DT + £30.01
      - 4 mg Glensoludex 4mg soluble tablets sugar-free | 50 tablet (POM) £20.00 DT + £60.01
    - **Dexamethasone (as Dexamethasone sodium phosphate)**
      - 8 mg Glensoludex 8mg soluble tablets sugar-free | 50 tablet (POM) £40.00 DT + £120.01

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Dexamethasone (Non-proprietary)**
  - **Dexamethasone 500 microgram** Dexamethasone 500microgram tablets | 28 tablet (POM) £9.51–£54.24 DT + £10.27 | 30 tablet (POM) £11.00–£64.92
  - **Dexamethasone 2 mg** Dexamethasone 2mg tablets | 50 tablet (POM) £49.00 DT + £9.79 | 100 tablet (POM) £17.32–£38.00

Gradually and stop over 5–7 days, use the 3.3 mg/mL injection preparation for this dose
### Endocrine system

#### SIDE-EFFECTS

- **Conjunctivitis**
- **Idiopathic intracranial hypertension**
- **Muscle weakness**
- **Thrombophlebitis**

#### INTERACTIONS

- Not licensed for use in neuropathic postural hypotension.
- **Appendix 1**: corticosteroids

#### DRUG ACTION

**Hydrocortisone**

- **Drug action**: Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

- **Indications and dose**
  - **Thyrotoxic crisis (thyroid storm)**
    - **By intravenous injection**
    - Adult: 100 mg every 6 hours, to be administered as sodium succinate
  - **Adrenocortical insufficiency resulting from septic shock**
    - **By intravenous injection**
    - Adult: 50 mg every 6 hours, given in combination with fludrocortisone
  - **Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline)**
    - **By intravenous injection**
    - Adult: 100–300 mg, to be administered as sodium succinate
  - **Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of minor surgery under general anaesthesia**
    - **By intravenous injection, or by intravenous infusion**
    - Adult: Initially 25–50 mg, to be administered at induction of surgery, the patient’s usual oral corticosteroid dose is recommenced after surgery
  - **Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of moderate or major surgery**
    - **Initially by intravenous injection, or by intravenous infusion**
    - Adult: Initially 25–50 mg, to be administered at induction of surgery (following usual oral corticosteroid dose on the morning of surgery), followed by (by intravenous injection) 25–50 mg 3 times a day for 24 hours after moderate surgery and for 48–72 hours after major surgery
  - **Adrenocortical insufficiency in Addison’s disease or following adrenalectomy**
    - **By mouth using immediate-release medicines**
    - Adult: 20–30 mg daily in 2 divided doses, the larger dose to be given in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion, the optimum daily dose is determined on the basis of clinical response
  - **Adrenocortical insufficiency**
    - **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
    - Adult: 100–500 mg 3–4 times a day or when required

#### Unlicensed use

- Not licensed for use in neuropathic postural hypotension.

#### Hepatic impairment

- **Monitoring**: Monitor patient closely in hepatic impairment.

#### Medicinal forms

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

#### Table

#### Medica...
Replacement in adrenocortical insufficiency

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 20–30 mg once daily, adjusted according to response, dose to be taken in the morning
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 20–30 mg daily in divided doses, adjusted according to response

**Ulcerative colitis / Proctitis / Proctosigmoiditis**

- **BY RECTUM USING RECTAL FOAM**
  - Adult: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

**Acute hypersensitivity reactions / Angioedema**

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child 1-5 months: Initially 25 mg 3 times a day, adjusted according to response
  - Child 6 months-5 years: Initially 50 mg 3 times a day, adjusted according to response
  - Child 6-11 years: Initially 100 mg 3 times a day, adjusted according to response
  - Child 12-17 years: Initially 200 mg 3 times a day, adjusted according to response

**Severe acute asthma / Life-threatening acute asthma**

- **BY INTRAVENOUS INJECTION**
  - Child 1 month-1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
  - Child 2-4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
  - Child 5-11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
  - Child 12-17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
  - Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

**DOSE EQUIVALENCE AND CONVERSION**

- With oral use
- When switching from immediate-release hydrocortisone tablets to modified release Plenadren® use same total daily dose. Bioavailability of Plenadren® lower than immediate release tablets—monitor clinical response.

- **CONTRA-INDICATIONS**
  - With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

- **CAUTIONS**
  - With rectal use Systemic absorption may occur

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS**
  - With oral use Dyslipidaemia · myocardial rupture (following recent myocardial infarction) · oedema.
  - With parenteral use Hiccups · Kaposi’s sarcoma · lipomatosis · myocardial rupture (following recent myocardial infarction)

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.

- With intravenous use in adults For intravenous infusion (SoluCortef®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

- **PATIENT AND CARER ADVICE**
  - Patient counselling is advised for hydrocortisone tablets and injections (steroid card).

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions

  - **CONTRA-INDICATIONS**
    - With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

  - **EXCEPTIONS TO LEGAL CATEGORY**
    - With intramuscular use or intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Methylprednisolone

- **DRUG ACTION** Methylprednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

- **INDICATIONS AND DOSE** Suppression of inflammatory and allergic disorders
  - By mouth
    - Adult: Initially 2–40 mg daily
    - By intramuscular injection, or by slow intravenous injection, or by intravenous infusion
    - Adult: Initially 10–500 mg
  - Treatment of graft rejection reactions
    - By intravenous infusion
    - Adult: Up to 1 g daily for up to 3 days
  - Treatment of relapse in multiple sclerosis
    - By mouth
    - Adult: 500 mg once daily for 5 days
  - Treatment of relapse in multiple sclerosis (when oral steroids have failed or have not been tolerated, or in those who require hospital admission)
    - By intravenous infusion
    - Adult: 1 g once daily for 3–5 days

**DEPO-MEDRONE ®**

- **Suppression of inflammatory and allergic disorders**
  - By deep intramuscular injection
  - Adult: 40–120 mg, then 40–120 mg after 2–3 weeks if required, to be injected into the gluteal muscle

- **UNLICENSED USE**
  - With intravenous use or oral use. Not licensed for use by mouth for the treatment of multiple sclerosis relapse. Not licensed for use by intravenous infusion for the treatment of multiple sclerosis relapse for durations longer than 3 days. Methylprednisolone doses in the BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE:** Methylprednisolone injectable medicine containing lactose (Solu-Medrone ® 40 mg): Do not use in patients with cows’ milk allergy (October 2017)

- With intramuscular use or intravenous use
  - An EU-wide review has concluded that Solu-Medrone ® 40 mg may contain trace amounts of milk proteins and should not be used in patients with a known or suspected allergy to cows’ milk. Serious allergic reactions, including bronchospasm and anaphylaxis, have been reported in patients allergic to cows’ milk proteins. If a patient’s symptoms worsen or new allergic symptoms occur, administration should be stopped and the patient treated accordingly.

**CAUTIONS**

- With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse

**INTERACTIONS** Appendix 1: corticosteroids

**SIDE-EFFECTS**

- Common or very common
  - With oral use Depressed mood
  - Frequency not known
  - With oral use Confusion, delusions, diarrhea, dizziness, dyslipidaemia, hallucination, hiccups, Kaposi’s sarcoma, lipomatosis, myocardial rupture (following recent myocardial infarction), oedema, schizophrenia, suicidal ideation, withdrawal syndrome
  - With parenteral use Confusion, delusions, depressed mood, diarrhea, dizziness, dyslipidaemia, hallucination, hiccups, Kaposi’s sarcoma, lipomatosis, oedema, schizophrenia, suicidal thoughts, vomiting, withdrawal syndrome

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (as sodium succinate) (Solu-Medrone ®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes.

**PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Formulations available from special-order manufacturers include: oral suspension

**Prednisolone**

- **DRUG ACTION** Prednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

- **INDICATIONS AND DOSE**
  - Acute exacerbation of chronic obstructive pulmonary disease (if increased breathlessness interferes with daily activities)
    - By mouth
    - Adult: 30 mg daily for 7–14 days
Severe myasthenia gravis (before transfer to hospital) / Mild myasthenia that might cause complications (before transfer to hospital)
- BY MOUTH
  - Adult: 1–2 mg/kg
  - Child: 1–2 mg/kg

Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) / Severe or life-threatening acute asthma (oral corticosteroid taken for more than a few days)
- BY MOUTH
  - Adult: Initial dose 40–50 mg daily for at least 5 days
  - Child 10–18 years: 10–20 mg/kg daily for up to 3 days, longer if necessary

Mild to moderate acute asthma / Severe or life-threatening acute asthma
- BY MOUTH
  - Adult: 25–100 mg 1–2 times a day, as prednisolone acetate

Suppression of inflammatory and allergic disorders (initial dose in severe disease)
- BY MOUTH
  - Adult: Initially 60 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months

Idiopathic thrombocytopenic purpura
- BY MOUTH
  - Adult: 1 mg/kg daily, gradually reduce dose over several weeks

Ulcerative colitis / Crohn’s disease
- BY MOUTH
  - Adult: Initially 20–40 mg daily until remission occurs, followed by reducing doses, up to 60 mg daily, may be used in some cases, doses preferably taken in the morning after breakfast

Neuritic pain or weakness heralding rapid onset of permanent nerve damage (during reversal reactions of multibacillary leprosy)
- BY MOUTH
  - Adult: Initially 40–60 mg daily, dose to be instituted at once

Generalised myasthenia gravis (when given on alternate days)
- BY MOUTH
  - Adult: Initially 10 mg once daily on alternate days, then increased in steps of 10 mg once daily on alternate days; increased to 1–1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis in ventilated patients (when given on alternate days)
- BY MOUTH
  - Adult: Initially 1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis (when giving daily)
- BY MOUTH
  - Adult: Initially 5 mg daily, increased in steps of 5 mg daily, maintenance 60–80 mg daily, alternatively maintenance 0.75–1 mg/kg daily, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days

Ocular myasthenia
- BY MOUTH
  - Adult: Usual dose 10–40 mg once daily on alternate days, reduce to minimum effective dose

Reduction in rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years’ duration
- BY MOUTH
  - Adult: 7.5 mg daily

Polymyalgia rheumatica
- BY MOUTH
  - Adult: 10–15 mg daily until remission of disease activity; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

Giant cell (temporal) arteritis
- BY MOUTH
  - Adult: 60–80 mg daily until remission of disease activity, the higher dose being used if visual symptoms occur; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

Polyarteritis nodosa / Polymyositis / Systemic lupus erythematosus
- BY MOUTH
  - Child: 5–10 mg/kg once daily on alternate days, increased to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection
- BY MOUTH
  - Adult: 50–80 mg daily for 5 days, the dose is then reduced to complete 21 days of treatment, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete

Short-term prophylaxis of episodic cluster headache as monotherapy or in combination with verapamil during verapamil titration
- BY MOUTH
  - Adult: 60–100 mg once daily for 2–5 days, then reduced in steps of 10 mg every 2–3 days until prednisolone is discontinued

Proctitis
- BY RECTUM USING RECTAL FOAM
  - Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Distal ulcerative colitis
- BY RECTUM USING RECTAL FOAM
  - Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone
Rectal complications of Crohn's disease
- **BY RECTUM USING SUPPOSITORIES**
- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement.

Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn's disease
- **BY RECTUM USING ENEMA**
- Adult: 20 mg daily for 2–4 weeks, continued if response good, to be used at bedtime.

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**
- With systemic use Prednisolone has been confused with propranolol; care must be taken to ensure the correct drug is prescribed and dispensed.

**CONTRA-INDICATIONS**
- With rectal use Bowel perforation • extensive fistulas • intestinal obstruction • recent intestinal anastomoses

**CAUTIONS**
- With rectal use systemic absorption may occur with rectal preparations
- With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity) • systemic sclerosis (increased incidence of scleroderma renal crisis with a daily dose of 15 mg or more)

**INTERACTIONS**
- Appendix 1: corticosteroids

**SIDE-EFFECTS**
- With intramuscular use Diarrhoea • dizziness • hiccups • Kaposis's sarcoma • myocardial infarction (following recent myocardial infarction) • scleroderma renal crisis • vomiting
- With oral use Diarrhoea • dizziness • dyslipidaemia • lipomatosis • protein catabolism • scleroderma renal crisis

**PREGNANCY**
- As it crosses the placenta 88% of prednisolone is inactivated.

**Monitoring**
- With systemic use Pregnant women with fluid retention should be monitored closely.

**BREAST FEEDING**
- Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

**Monitoring**
- With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

**MONITORING REQUIREMENTS**
- With systemic use Manufacturer advises monitor blood pressure and renal function (S-creatinine) routinely in patients with systemic sclerosis—increased incidence of scleroderma renal crisis.

**PRESCRIBING AND DISPENSING INFORMATION**
- Palliative care
  - With oral use in adults For further information on the use of prednisolone in palliative care, see www.medicinescomplete.com/#/content/palliative/systemic-corticosteroids.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Prednisolone for asthma
  - With oral use www.medicinesforchildren.org.uk/prednisolone-asthma

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, enema

**Foam**
- Prednisolone (Non-proprietary) Prednisolone (as Prednisolone sodium metasulfobenzoate) 20 mg per 1 application Prednisolone 20mg/application foam enema | 14 dose (PSTM) £187.00 DT = £187.00

**Gastro-resistant tablet**
- **CAUTIONARY AND ADVISORY LABELS 5, 10, 25**
- Prednisolone (Non-proprietary) Prednisolone 1 mg Prednisolone 1mg gastro-resistant tablets | 30 tablet (PSTM) £1.60–£1.92 DT = £1.92
- Prednisolone 2.5 mg Prednisolone 2.5mg gastro-resistant tablets | 28 tablet (PSTM) £0.93 DT = £0.93 | 30 tablet (PSTM) £0.98–£1.15
- Prednisolone 5 mg Prednisolone 5mg gastro-resistant tablets | 28 tablet (PSTM) £2.34 DT = £0.94 | 30 tablet (PSTM) £0.96–£6.29

- DeltaCortril Enteric (Alliance Pharmaceuticals Ltd) Prednisolone 2.5 mg DeltaCortril 2.5mg gastro-resistant tablets | 30 tablet (PSTM) £1.16
- Dilacort (Crescent Pharma Ltd, Teva UK Ltd) Prednisolone 2.5 mg Dilacort 2.5mg gastro-resistant tablets | 28 tablet (PSTM) £1.14–£1.85 DT = £0.93
- Prednisolone 5 mg Dilacort 5mg gastro-resistant tablets | 28 tablet (PSTM) £1.45–£1.85 DT = £0.94

**Soluble tablet**
- **CAUTIONARY AND ADVISORY LABELS 10, 13, 21**
- Prednisolone (Non-proprietary) Prednisolone (as Prednisolone sodium phosphate) 5 mg Prednisolone 5mg soluble tablets | 30 tablet (PSTM) £53.48 DT = £17.27

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS 10, 21**
- Prednisolone (Non-proprietary) Prednisolone 1 mg Prednisolone 1mg tablets | 28 tablet (PSTM) £4.00 DT = £0.63
- Prednisolone 2.5 mg Prednisolone 2.5mg tablets | 28 tablet (PSTM) £1.35
- Prednisolone 5 mg Prednisolone 5mg tablets | 28 tablet (PSTM) £3.86 DT = £0.74
- Prednisolone 10 mg Prednisolone 10mg tablets | 28 tablet (PSTM) £1.77
- Prednisolone 20 mg Prednisolone 20mg tablets | 28 tablet (PSTM) £3.55
- Prednisolone 25 mg Prednisolone 25mg tablets | 56 tablet (PSTM) £78.38 DT = £77.23
- Prednisolone 30 mg Prednisolone 30mg tablets | 28 tablet (PSTM) £6.15 DT = £8.15
- Pevanti (Advanz Pharma) Prednisolone 2.5 mg Pevanti 2.5mg tablets | 30 tablet (PSTM) £1.42 DT = £1.42
- Prednisolone 5 mg Pevanti 5mg tablets | 30 tablet (PSTM) £0.95
- Prednisolone 10 mg Pevanti 10mg tablets | 30 tablet (PSTM) £1.90 DT = £1.90
- Prednisolone 20 mg Pevanti 20mg tablets | 30 tablet (PSTM) £3.80 DT = £3.80
- Prednisolone 25 mg Pevanti 25mg tablets | 56 tablet (PSTM) £40.00 DT = £77.23

**Suppository**
- Prednisolone (Non-proprietary) Prednisolone (as Prednisolone sodium phosphate) 5 mg Prednisolone sodium phosphate 5mg suppositories | 10 suppository (PSTM) £70.73 DT = £69.79

**Suspension for injection**
- DeltaTast (Advanz Pharma) Prednisolone acetate 25 mg per 1 ml DeltaTast 25mg/1ml suspension for injection ampoules | 10 ampoule (PSTM) £68.72

**Oral solution**
- **CAUTIONARY AND ADVISORY LABELS 10**
- Prednisolone (Non-proprietary) Prednisolone 1 mg per 1 ml Prednisolone 5mg/5ml oral solution unit dose | 10 unit dose (PSTM) £11.41 DT = £11.41
- Prednisolone 10 mg per 1 ml Prednisolone 10mg/1ml oral solution sugar free sugar-free | 30 ml (PSTM) £55.50 DT = £55.50

**Enema**
- Prednisolone (Non-proprietary) Prednisolone sodium phosphate 200 microgram per 1 ml Prednisolone 20mg/100ml rectal solution | 7 enema (PSTM) £14.95 DT = £15.00
Triamcinolone acetonide

**DRUG ACTION** Triamcinolone exerts predominantly glucocorticoid effects with minimal mineralcorticoid effect.

**INDICATIONS AND DOSE**

**Suppression of inflammatory and allergic disorders**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adults: 40 mg (max. per dose 100 mg), repeated if necessary, dose given for depot effect, to be administered into gluteal muscle; repeated at intervals according to patient’s response.

**CAUTIONS** High dosage (may cause proximal myopathy), avoid in chronic therapy.

**INTERACTIONS**

- **Uncommon** Dizziness, flushing, hyperglycaemia.

**PATIENT AND CARER ADVICE** Patient counselling is advised for triamcinolone acetonide injection (steroid card).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Injection for suspension**

**CAUTIONARY AND ADVISORY LABELS** 10

**EXCIPIENTS** May contain Benzyl alcohol.

- **Adcortyl Intra-articular / Intradermal** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - **Triamcinolone acetonide 10 mg per 1 ml** Adcortyl Intra-articular / Intradermal 50mg/5ml suspension for injection vials | 1 vial (POM) £3.63
  - **Adcortyl Intra-articular / Intradermal 10mg/1ml suspension for injection ampoules** | 5 ampoule (POM) £4.47 DT = £4.47
  - **Kenalog** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - **Triamcinolone acetonide 40 mg per 1 ml** Kenalog Intra-articular / Intramuscular 40mg/1ml suspension for injection vials | 5 vial (POM) £7.45 DT = £7.45

---

2.1 Cushing’s syndrome and disease

**Cushing’s Syndrome**

**Management**

Most types of Cushing’s syndrome are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone p. 682 has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing’s syndrome to prepare the patient for surgery.

The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotropic tumour cells in patients with Cushing’s disease. It is used under specialist supervision for treatment of endogenous Cushing’s syndrome.

**Other drugs used for Cushing’s syndrome and disease**

Pasireotide, p. 951

---

**ENZYME INHIBITORS**

**Ketoconazole**

**DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17α-hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotropic tumour cells in patients with Cushing’s disease.

**INDICATIONS AND DOSE**

**Endogenous Cushing’s syndrome (specialist use only)**

- **BY MOUTH**
  - Adult: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises max. dose 200 mg daily with concurrent use of cobicistat.

**IMPORTANT SAFETY INFORMATION**

**CHMP ADVICE: KETOCONAZOLE (JULY 2013)**

The CHMP has recommended that the marketing authorisation for oral ketoconazole to treat fungal infections should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Oral ketoconazole for Cushing’s syndrome and topical products containing ketoconazole are not affected by this advice.

**CONTRA-INDICATIONS** Acquired QTc prolongation - Acute porphyrias p. 1058 - Avoid concomitant use of hepatotoxic drugs - Congenital QTc prolongation

**CAUTIONS** Pre-treatment liver enzymes should not exceed 2 times the normal upper limit - Risk of adrenal insufficiency

**INTERACTIONS**

- **Appendix 1: antifungals, azoles**

**SIDE-EFFECTS**

- **Common or very common** Adrenal insufficiency - diarrhoea - gastrointestinal discomfort - nausea - skin reactions - vomiting

- **Uncommon** Allergic conditions - alopecia - angioedema - asthenia - dizziness - drowsiness - headache - thrombocytopenia

- **Rare or very rare** Fever - hepatic disorders - taste altered

- **Frequency not known** Alcohol intolerance - appetite abnormal - arthralgia - azospermia - dry mouth - epistaxis - flatulence - fontanelle bulging - gynaecomastia - hot flush - insomnia - intracranial pressure increased - malaise - menstrual disorder - myalgia - nervousness - papilloedema - paraesthesia - peripheral oedema - photophobia - photosensitivity reaction - tongue discoloration

**SIDE-EFFECTS, FURTHER INFORMATION** Potentially life-threatening hepatotoxicity reported rarely with oral use.

www.getintopharma.com
Diabetes mellitus and hypoglycaemia

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.

**PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—present in breast milk.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid.

**MONITORING REQUIREMENTS**
- **Adrenal insufficiency** Monitor adrenal function within one week of initiation, then monthly for 6 months. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose if necessary.
- **Hepatotoxicity** Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal lower limit detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit. If liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.

**PATIENT AND CARER ADVICE** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

**Driving and skilled tasks** Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

**CONTRA-INDICATIONS** Adrenocortical insufficiency

**CAUTIONS** Avoid in Acute porphyrias p. 1058 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)

**INTERACTIONS** → Appendix 1: metyrapone

**SIDE-EFFECTS**
- **Common or very common** Dizziness · headache · hypotension · nausea · sedation · vomiting
- **Rare or very rare** Abdominal pain · adrenal insufficiency · allergic dermatitis · hirsutism
- **Frequency not known** Alopecia · bone marrow failure · hypertension

**PREGNANCY** Avoid (may impair biosynthesis of fetal-placental steroids).

**HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of delayed response).

**PATIENT AND CARER ADVICE**
- **Driving and skilled tasks** Drowsiness may affect the performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Drug Action** Metyrapone is a competitive inhibitor of 11β-hydroxylase in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

**Indications and Dose**

**Differential diagnosis of ACTH-dependent Cushing’s syndrome (specialist supervision in hospital)**
- **By Mouth**
  - Adult: 750 mg every 4 hours for 6 doses

**Management of Cushing’s syndrome (specialist supervision in hospital)**
- **By Mouth**
  - Adult: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

**Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy)** (specialist supervision in hospital)
- **By Mouth**
  - Adult: 3 g daily in divided doses

**Contra-Indications** Adrenocortical insufficiency

**Cautions** Avoid in Acute porphyrias p. 1058 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)

**Interactions** → Appendix 1: metyrapone

**Side-Effects**

## 3 Diabetes mellitus and hypoglycaemia

### 3.1 Diabetes mellitus

**Diabetes**

**Description of condition**

Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads to the abnormalities of carbohydrate, fat, and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes mellitus p. 684 and Type 2 diabetes mellitus p. 686 are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrine disease). Treatment with endocrine, antiviral, or antipsychotic drugs may also cause secondary diabetes.

**Driving**

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence they hold, and whether they have diabetic complications (including episodes of hypoglycaemia). All drivers who are treated with insulin must inform the DVLA, with some exceptions for
temporary treatment. Detailed guidance on notification requirements, eligibility to drive, and precautions required, is available from the DVLA at www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive.

Advice from the DVLA
The DVLA recommends (2018) that drivers with diabetes need to be particularly careful to avoid hypoglycaemia and should be informed of the warning signs and actions to take. Drivers treated with insulin should always carry a glucose meter and blood-glucose strips when driving, and check their blood-glucose concentration no more than 2 hours before driving and every 2 hours while driving. More frequent self-monitoring may be required if, for any reason, there is a greater risk of hypoglycaemia, such as after physical activity or altered meal routine.

Blood-glucose should always be above 5 mmol/litre while driving. If blood-glucose falls to 5 mmol/litre or below, a snack should be taken. Drivers treated with insulin should ensure that a supply of fast-acting carbohydrate is always available in the vehicle. If blood-glucose is less than 4 mmol/litre, or warning signs of hypoglycaemia develop, the driver should not drive. If already driving, the driver should:

- stop the vehicle in a safe place;
- switch off the engine, remove keys from the ignition, and move from the driver’s seat;
- eat or drink a suitable source of sugar;
- wait until blood-glucose has returned to normal, before continuing journey.

Drivers must not drive if hypoglycaemia awareness has been lost and the DVLA must be notified; driving may resume if a medical report confirms that awareness has been regained.

Depending on the type of licence, notification and monitoring may also be necessary for drivers taking oral antidiabetic drugs, particularly those which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide p. 701, repaglinide p. 702).

Note: additional criteria apply for drivers of large goods or passenger carrying vehicles—consult DVLA guidance.

Alcohol
Alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; specialist sources recommend that patients with diabetes should drink alcohol only in moderation, and when accompanied by food.

Oral glucose tolerance tests
The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and a blood-glucose concentration that does not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It is also used to establish the presence of gestational diabetes.

An oral glucose tolerance test involves measuring the blood-glucose concentration after fasting, and then 2 hours after drinking a standard anhydrous glucose drink. Anhydrous glucose may alternatively be given as the appropriate amount of Polycal® or as Rapilose® OGTT oral solution.

HbA1c measurement
Glycated haemoglobin (HbA1c) forms when red blood cells are exposed to glucose in the plasma. The HbA1c test reflects average plasma glucose over the previous 2 to 3 months and provides a good indicator of glycaemic control. Unlike the oral glucose tolerance test, an HbA1c test can be performed at any time of the day and does not require any special preparation such as fasting.

HbA1c values are expressed in mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol), a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

| Equivalent values |
|-------------------|------------------|
| IFCC-HbA1c (mmol/mol) | DCCT-HbA1c (%) |
| 42 | 6.0 |
| 48 | 6.5 |
| 53 | 7.0 |
| 59 | 7.5 |
| 64 | 8.0 |
| 69 | 8.5 |
| 75 | 9.0 |

Diagnosis
The HbA1c test is used for monitoring glycaemic control in both Type 1 diabetes p. 684 and Type 2 diabetes p. 685 and is now also used for diagnosis of type 2 diabetes. HbA1c should not be used for diagnosis in those with suspected type 1 diabetes, in children, during pregnancy, or in women who are up to two months postpartum. It should also not be used for patients who have:

- had symptoms of diabetes for less than 2 months;
- a high diabetes risk and are acutely ill;
- treatment with medication that may cause hypoglycaemia;
- Acute pancreatic damage;
- end-stage chronic kidney disease;
- HIV infection.

HbA1c used for diagnosis of diabetes should be interpreted with caution in patients with abnormal haemoglobin, anaemia, altered red cell lifespan, or who have had a recent blood transfusion.

Monitoring
HbA1c is also a reliable predictor of microvascular and macrovascular complications and mortality. Lower HbA1c is associated with a lower risk of long term vascular complications and patients should be supported to aim for an individualised HbA1c target (see Type 1 diabetes p. 684 and Type 2 diabetes p. 686).

HbA1c should usually be measured in patients with type 1 diabetes every 3 to 6 months, and more frequently if blood-glucose control is thought to be changing rapidly. Patients with type 2 diabetes should be monitored every 3 to 6 months until HbA1c and medication are stable when monitoring can be reduced to every 6 months.

HbA1c monitoring is invalid for patients with disturbed erythrocyte turnover or for patients with a lack of, or abnormal haemoglobin. In these cases, quality-controlled plasma glucose profiles, total glycated haemoglobin estimation (if there is abnormal haemoglobin), or fructosamine estimation can be used. Laboratory measurement of fructosamine concentration measures the glycated fraction of all plasma proteins over the previous 14 to 21 days but is a less accurate measure of glycaemic control than HbA1c.

Advanced Pharmacy Services
Patients with diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.
Type 1 diabetes

Description of condition
Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood. Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, neuropathy, premature cardiovascular disease, and peripheral arterial disease.

Typical features in adult patients presenting with type 1 diabetes are hyperglycaemia (random plasma-glucose concentration above 11 mmol/litre), ketosis, rapid weight loss, a body mass index below 25 kg/m², age younger than 50 years, and a personal/family history of autoimmune disease (though not all features may be present).

Aims of treatment
Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications.

Disability from complications can often be prevented by early detection and active management of the disease (see Diabetic complications p. 688). The target for glycaemic control should be individualised for each patient, considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, occupation and history of hyperglycaemia.

A target HbA1c concentration of 48 mmol/mol (6.5%) or lower is recommended in patients with type 1 diabetes. Blood-glucose concentration should be monitored at least four times a day, including before each meal and before bed. Patients should aim for:

- a fasting blood-glucose concentration of 5–7 mmol/litre on waking;
- a blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- a blood-glucose concentration of 5–9 mmol/litre at least 90 minutes after eating;
- a blood-glucose concentration of at least 5 mmol/litre when driving.

Overview
Type 1 diabetes requires insulin replacement, supported by active management of other cardiovascular risk factors, such as hypertension and high circulating lipids (see Diabetic complications p. 688). Insulin replacement therapy aims to recreate normal fluctuations in circulating insulin concentrations while supporting a flexible lifestyle with minimal restrictions. Flexible insulin therapy usually involves self-injecting multiple daily doses of insulin, with doses adjusted according to planned exercise, intended food intake and other factors, including current blood-glucose, which the patient needs to test on a regular basis.

Patients who have a BMI of 25 kg/m² or above (23 kg/m² or above for patients of South Asian or related ethnicity) who wish to improve their blood-glucose control while minimising their effective insulin dose, may benefit from metformin hydrochloride p. 692 [unlicensed indication] as an addition to insulin therapy.

Dietary control is important in both type 1 and type 2 diabetes and patients should receive advice from a diettian. Dietary advice should include information on weight control, cardiovascular risk, hyperglycaemic effects of different foods and appropriate changes in insulin doses according to food intake. Healthy eating can reduce cardiovascular risk and dietary modifications may be recommended to account for various associated features of diabetes such as excess weight and obesity, low body-weight, eating disorders, hypertension and renal failure. Patients with type 1 diabetes should be offered carbohydrate-counting training as part of a structured education programme.

Insulin therapy in type 1 diabetes
All patients with type 1 diabetes require insulin therapy (see also Insulin p. 685). Treatment should be initiated and managed by clinicians with relevant expertise; there are several different types of regimens.

Multiple daily injection basal–bolus insulin regimens
One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside multiple bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

Mixed (biphasic) regimen
One, two, or three insulin injections per day of short-acting insulin with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

Continuous subcutaneous insulin infusion (insulin pump)
A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

Recommended insulin regimens
Patients with type 1 diabetes should be offered multiple daily injection basal–bolus insulin regimens as the first-line choice. Twice-daily insulin detemir p. 717 should be offered as the long-acting basal insulin therapy. Once-daily insulin glargine p. 718 may be prescribed if insulin detemir is not tolerated, or if a twice–daily regimen is not acceptable to the patient. Insulin detemir may also be offered as an alternative once-daily regimen.

Patients who are using alternative basal regimens may continue if agreed targets are being achieved; other basal insulin regimens should be considered only if the recommended regimens do not deliver agreed targets. Non-basal–bolus insulin regimens (e.g. twice-daily mixed [biphasic], basal-only, or bolus-only regimens) are not recommended for adults with newly diagnosed type 1 diabetes.

A rapid-acting insulin analogue is recommended as the bolus or mealtime insulin replacement, rather than soluble human insulin or animal insulin (rarely used). The rapid-acting insulin analogue should be injected before meals—routine use after meals should be discouraged. Patients who have a strong preference for an alternative mealtime insulin should be offered their preferred insulin.

Alternatively, if a multiple daily injection basal–bolus regimen is not possible, a twice-daily mixed insulin regimen should be considered if it is preferred.

In patients who are using a twice-daily human insulin mixed regimen and have hypoglycaemia that affects their quality of life, a trial of a twice–daily analogue mixed insulin regimen should be considered.

Continuous subcutaneous insulin infusion (insulin pump) therapy, should only be offered to adults who suffer disabling hypoglycaemia, or, who have high HbA1c concentrations (69 mmol/mol [8.5%] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Insulin pump therapy should be initiated by a specialist team.
Insulin requirements

The dosage of insulin must be determined individually for each patient and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations. Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet, exercise and alcohol intake), psychological issues, and organic causes such as renal disease, thyroid disorders, coeliac disease, Addison’s disease or gastroparesis.

Injection, stress, accidental or surgical trauma can all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, impaired renal function, and in certain endocrine disorders.

Risks of hypoglycaemia with insulin

Hypoglycaemia is an inevitable adverse effect of insulin treatment, and patients should be advised of the warning signs and actions to take (for guidance on management, see Hypoglycaemia p. 724).

Impaired awareness of hypoglycaemia can occur when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present. Patients’ awareness of hypoglycaemia should be assessed annually using the Gold score or the Clarke score.

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor.

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see Driving under Diabetes p. 682).

To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous blood-glucose monitoring should be considered. Patients should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. Relaxation of individualised blood-glucose targets should be avoided as a strategy to improve impaired awareness of symptoms. If recurrent severe episodes of hypoglycaemia continue despite appropriate interventions, the patient should be referred to a specialist centre.

There is conflicting evidence regarding reports that some patients may experience loss of awareness of hypoglycaemia after transfer from animal to human insulin; clinical studies do not confirm that human insulin decreases hypoglycaemia awareness.

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

Hypodermic equipment

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers. Arrangements should be made for the suitable disposal of these containers.

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be access online at:

- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff

Advanced Pharmacy Services

Patients with type 1 diabetes may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Useful Resources

Insulin

Overview

For recommended insulin regimens see Type 1 diabetes p. 684 and Type 2 diabetes p. 686.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins. Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs).
Absorption from a limb site can vary considerably (by as much as 20–40%) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood flow around the injection site due to exercise can also increase insulin absorption.

Lipohypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered.

Lipohypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipohypertrophy before administration.

**Insulin preparations**

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

**Short-acting insulins**

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble Insulin p. 685 (human and, bovine or porcine—both rarely used), and the rapid-acting insulin analogues (insulin aspart p. 713, insulin glulisine p. 714 and insulin lispro p. 714).

**Soluble insulin**

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimens, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

When injected intravenously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours. When injected intramuscularly, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. Diabetic ketoacidosis p. 689 and peri-operatively.

**Rapid-acting insulin**

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection.

For maintenance regimens, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA1c, and reduction in the incidence of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of post-meal injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial glucose concentration, and subsequent hypoglycaemia.

**Intermediate-acting insulin**

Intermediate-acting insulins (isophane insulin p. 716) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of approximately 1–2 hours, a maximal effect at 3–12 hours, and a duration of action of 11–24 hours.

Isophane insulin is a suspension of insulin with protamine; it may be given as one or more daily injections alongside separate meal-time short-acting insulin injections, or mixed with a short-acting (soluble or rapid-acting) insulin in the same syringe—for recommended insulin regimens see Type 1 diabetes p. 684 and Type 2 diabetes below. Isophane insulin may be mixed with a short-acting insulin by the patient, or a pre-mixed biphasic insulin can be supplied (biphasic isophane insulin p. 715, biphasic insulin aspart p. 716 and biphasic insulin lispro p. 716).

Biphasic insulins (biphasic isophane insulin, biphasic insulin aspart, biphasic insulin lispro) are pre-mixed insulin preparations containing various combinations of short-acting insulin (soluble insulin or rapid-acting analogue insulin) and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 15% to 50%. These preparations should be administered by subcutaneous injection immediately before a meal.

**Long-acting insulin**

Like intermediate-acting insulins, the long-acting insulins (protamine zinc insulin p. 719, insulin zinc suspension p. 718, insulin detemir p. 717, insulin glargine p. 718, insulin degludec p. 717) mimic endogenous basal insulin secretion, but their duration of action may last up to 36 hours. They achieve a steady-state level after 2–4 days to produce a constant level of insulin.

Insulin glargine and insulin degludec are given once daily and insulin detemir is given once or twice daily according to individual requirements. The older long-acting insulins, (insulin zinc suspension and protamine zinc insulin) are now rarely prescribed.

**Type 2 diabetes**

**Description of condition**

Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic insulin production also occurs progressively over time, resulting in hyperglycaemia. It is commonly associated with obesity, physical inactivity, raised blood pressure, dyslipidaemia and a tendency to develop thrombosis; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

**Aims of treatment**

Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effective blood-glucose control and maintenance of HbA1c at or below the target value set for each individual patient.

**Overview**

Weight loss, smoking cessation and regular exercise can help to reduce hyperglycaemia and reduce cardiovascular risk, and should be encouraged (with input from a dietician where appropriate). For guidance on reducing cardiovascular risk, see Cardiovascular disease risk assessment and prevention p. 189. Antidiabetic drugs should be prescribed to augment lifestyle interventions, when these changes are not adequate to control blood-glucose alone.
Antidiabetic drugs

There are several classes of non-insulin antidiabetic drugs available for the treatment of type 2 diabetes. The choice of drug should be based on effectiveness, safety, tolerability and should also take into consideration the patient’s comorbidities and concomitant medication. For recommended treatment regimens and the place in therapy of each drug, see Drug treatment, antidiabetic drugs (below).

Metformin hydrochloride p. 692 has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. It does not stimulate insulin secretion and therefore, when given alone, does not cause hypoglycaemia. The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastro-intestinal side effects. Modified-release metformin hydrochloride should be offered if standard treatment is not tolerated.

The sulfonylureas (glibenclamide p. 709, glyburide p. 709, glimepiride p. 710, tolbutamide p. 710) may cause hypoglycaemia; it is more likely with long-acting sulfonylureas such as glibenclamide, which have been associated with severe, prolonged and sometimes fatal cases of hypoglycaemia. Sulfonylureas are also associated with modest weight gain, probably due to increased plasma-insulin concentrations.

Acarbose p. 692 has a poorer anti-hyperglycaemic effect than many other antidiabetic drugs, including the sulfonylureas, metformin hydrochloride, and pioglitazone p. 710.

The meglitinides, nateglinide p. 701 and repaglinide p. 702, have a rapid onset of action and short duration of activity. These drugs can be used flexibly around mealtimes and adjusted to fit around individual eating habits which may be beneficial for some patients, but generally are a less preferred option than the sulfonylureas.

The thiazolidinedione, pioglitazone, is associated with several long-term risks and its ongoing benefit to the patient should be reviewed regularly and treatment stopped if response is insufficient (see Important safety information under pioglitazone).

The dipeptidylpeptidase-4 inhibitors (gliptins), alogliptin p. 694, linagliptin p. 694, sitagliptin p. 694, saxagliptin p. 695, and vildagliptin p. 697, do not appear to be associated with weight gain and have less incidence of hypoglycaemia than the sulfonylureas.

The sodium glucose co-transporter 2 inhibitors, canagliflozin p. 702, dapagliflozin p. 704, and empagliflozin p. 706, may be suitable for some patients when first-line options are not appropriate. Canagliflozin and empagliflozin can be beneficial in patients with type 2 diabetes and established cardiovascular disease.

Sodium glucose co-transporter 2 inhibitors are associated with a risk of diabetic ketoacidosis.

The glucagon-like peptide-1 receptor agonists, dulaglutide p. 698, exenatide p. 698, liraglutide p. 695 and lixisenatide p. 700, should be reserved for combination therapy when other treatment options have failed.

Polycystic ovary syndrome

Metformin hydrochloride (initiated by a specialist) is prescribed as an insulin sensitising drug in women with polycystic ovary syndrome who are not planning pregnancy (unlicensed indication). Long-term benefit or superiority over other treatment options has not been confirmed by good quality evidence. Metformin hydrochloride may improve short-term insulin sensitivity and reduce androgen concentrations, but there is insufficient supporting evidence that metformin improves weight gain, hirsutism, acne or regulation of the menstrual cycle. Treatment should only be initiated by a specialist. Metformin hydrochloride does not exert a hypoglycaemic action in non-diabetic patients except in overdose.

Drug treatment, antidiabetic drugs

Type 2 diabetes should initially be treated with a single oral antidiabetic drug. A target HbA1c concentration of 48 mmol/mol (6.5%) is generally recommended when type 2 diabetes is managed by diet and lifestyle alone or when combined with a single antidiabetic drug not associated with hypoglycaemia (such as metformin hydrochloride). Adults prescribed a single drug associated with hypoglycaemia (such as a sulphonylurea), or two or more antidiabetic drugs in combination, should usually aim for an HbA1c concentration of 53 mmol/mol (7.0%). Targets may differ and should be individualised and agreed with each patient.

Note: Consider relaxing the target HbA1c level on a case-by-case basis, with particular consideration for people who are older, frail, or where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

If HbA1c concentrations are poorly controlled despite treatment with a single drug (usually considered to be a rise of HbA1c to 58 mmol/mol (7.5%) or higher), the drug treatment should be intensified, alongside reinforcement of advice regarding diet, lifestyle, and adherence to drug treatment.

When two or more antidiabetic drugs are prescribed, an HbA1c concentration target of 53 mmol/mol (7.0%) is recommended for patients in which it is appropriate, but a relaxation of the target may be more appropriate in some individual cases (for example, those at high risk of the consequences of hypoglycaemia, poor life expectancy, or significant comorbidities).

Initial treatment

Metformin hydrochloride is recommended as the first choice for initial treatment for all patients, due to its positive effect on weight loss, reduced risk of hypoglycaemic events and the additional long-term cardiovascular benefits associated with its use.

If metformin is contra-indicated or not tolerated, see Alternative non-metformin regimens below.

First intensification of treatment

If metformin hydrochloride (alongside modification to diet) does not control HbA1c to below the agreed threshold, treatment should be intensified, and metformin hydrochloride combined with one of the following:

- a sulfonylurea (glibenclamide, glimepiride, glipizide, tolbutamide);
- Pioglitazone;
- a dipeptidylpeptidase-4 inhibitor (lixisenatide, sitagliptin, vildagliptin);
- a sodium glucose co-transporter 2 inhibitor (canagliflozin, dapagliflozin or empagliflozin) only when sulfonylureas are contra-indicated or not tolerated, or if the patient is at significant risk of hypoglycaemia or its consequences.

Elderly patients or those with renal impairment are at particular risk of hypoglycaemia; if a sulfonylurea is indicated, a shorter-acting sulfonylurea, such as glimepiride p. 709 or tolbutamide p. 710 should be prescribed. The place in therapy of alogliptin p. 694 (a dipeptidylpeptidase-4 inhibitor) is not yet known.

Second intensification of treatment

If dual therapy is unsuccessful, treatment should be intensified again, and one of the following triple therapy regimens prescribed:

- Metformin hydrochloride p. 692 and a dipeptidylpeptidase-4 inhibitor and a sulfonylurea;
- Metformin hydrochloride and pioglitazone p. 710 and a sulfonylurea;
Diabetes mellitus and hypoglycaemia

- Metformin hydrochloride and a sulfonylurea and one of the sodium glucose co-transporter 2 inhibitors;
- Metformin hydrochloride and pioglitazone and a sodium glucose co-transporter 2 inhibitor (canagliflozin p. 702 or empagliflozin p. 706; note that dapagliflozin is not recommended in a triple therapy regimen with pioglitazone).

Alternatively, it may be appropriate to start insulin-based treatment at this stage—see Drug treatment, insulin.

**Glucagon-like peptide-1 receptor agonists**

If triple therapy with metformin hydrochloride and two other oral drugs is tried and is not effective, not tolerated or contra-indicated, a glucagon-like peptide-1 receptor agonist may be prescribed as part of a triple combination regimen with metformin hydrochloride and a sulfonylurea.

These should only be prescribed for patients who have a BMI of 35 kg/m² or above (adjusted for ethnicity) and who also have specific psychological or medical problems associated with obesity; or for those who have a BMI lower than 35 kg/m² but for whom insulin therapy would have significant occupational implications or if the weight loss associated with glucagon-like peptide-1 receptor agonists would benefit other significant obesity-related comorbidities.

After 6 months, the drug should be reviewed and only continued if there has been a beneficial metabolic response (a reduction of at least 11 mmol/mol [1.0%] in HbA1c and a weight loss of at least 3% of initial body-weight).

Insulin should only be prescribed in combination with a glucagon-like peptide-1 receptor agonist under specialist care advice and with ongoing support from a consultant-led multidisciplinary team.

**Alternative non-metformin regimens**

If metformin is contra-indicated or not tolerated, initial treatment should be single therapy with:

- a sulfonylurea (glibenclamide p. 709, gliclazide, glimepiride p. 709, glipizide p. 710, or tolbutamide) (first choice) or
- a dipeptidyl peptidase-4 inhibitor (linagliptin p. 694, saxagliptin p. 695, sitagliptin p. 696, or vildagliptin p. 697), or
- Pioglitazone.

The sodium glucose co-transporter 2 inhibitors canagliflozin, dapagliflozin p. 704, or empagliflozin are also options for monotherapy when metformin is contra-indicated or not tolerated, only if a dipeptidylpeptidase-4 inhibitor would otherwise be prescribed and neither a sulfonylurea nor pioglitazone is appropriate.

Repaglinide p. 702 is also an effective alternative option for single therapy, but it has a limited role in treatment because, should an intensification of treatment be required, it is not licensed to be used in any combination other than with metformin hydrochloride; it would therefore require a complete change of treatment in those patients who have started it due to intolerance or contra-indication to metformin.

**Intensification**

If the initial single drug does not control HbA1c to below the agreed threshold, treatment should be intensified and one of the following dual combinations prescribed:

- a dipeptidylpeptidase-4 inhibitor and pioglitazone;
- a dipeptidylpeptidase-4 inhibitor and a sulfonylurea; or
- Pioglitazone and a sulfonylurea.

If dual therapy does not provide adequate glucose control, insulin-based treatment should be considered—see Drug treatment, insulin.

**Drug treatment, insulin**

When indicated for intensification, insulin (see also, Insulin p. 685) should be started with a structured support programme covering insulin dose titration, injection technique, self-monitoring, and knowledge of dietary effects and glucose control. Metformin hydrochloride should be continued unless it is contra-indicated or not tolerated. Other antidiabetic drugs should be reviewed and stopped if necessary.

Recommended insulin regimens include:

- human isophane insulin p. 716 injected once or twice daily, according to requirements;
- a human isophane insulin in combination with a short-acting insulin, administered either separately or as a pre-mixed (biphasic) human insulin preparation (this may be particularly appropriate if HbA1c is 75 mmol/mol (9.0%) or higher);
- Insulin detemir p. 717 or insulin glargine p. 718 as an alternative to human isophane insulin. This can be preferable if a once daily injection would be beneficial (for example if assistance is required to inject insulin), or if recurrent symptomatic hypoglycaemic episodes are problematic, or if the patient would otherwise need twice-daily human isophane insulin injections in combination with oral glucose-lowering drugs. Also consider switching to insulin detemir or insulin glargine from human isophane insulin if significant hypoglycaemia is problematic, or in patients who cannot use the device needed to inject human isophane insulin;
- biphasic preparations (pre-mixed) that include a short-acting human analogue insulin (rather than short-acting human soluble insulin) can be preferable for patients who prefer injecting insulin immediately before a meal, or if hypoglycaemia is a problem, or if blood-glucose concentrations rise markedly after meals.

When starting insulin therapy, bedtime basal insulin should be initiated and the dose titrated against morning (fasting) glucose. Patients who are prescribed a basal insulin regimen (human isophane insulin, insulin detemir or insulin glargine) should be monitored for the need for short-acting insulin before meals (or a biphasic insulin preparation).

Patients who are prescribed a biphasic insulin should be monitored for the need for a further injection of short-acting insulin before meals or for a change to a basal-bolus regimen with human isophane insulin or insulin detemir or insulin glargine if blood-glucose control remains inadequate.

**Advanced Pharmacy Services**

Patients with type 2 diabetes may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

**Useful Resources**

**Diabetic complications**

10-May-2018

**See also**

Diabetes p. 682
Type 1 diabetes p. 684
Type 2 diabetes p. 686

**Diabetes and cardiovascular disease**

Diabetes is a strong risk factor for cardiovascular disease.

Other risk factors for cardiovascular disease that should
also be addressed are: smoking, hypertension, obesity, and dyslipidaemia. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor (or an angiotensin-II receptor antagonist) and lipid‐regulating drugs. For full guidance on the assessment and prevention of cardiovascular disease, see Cardiovascular disease risk assessment and prevention p. 189.

Diabetic nephropathy

In diabetic patients with nephropathy, blood pressure should be reduced to the lowest achievable level to slow the rate of decline of glomerular filtration rate and reduce proteinuria. Provided there are no contra-indications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist, even if the blood pressure is normal. ACE inhibitors or angiotensin-II receptor antagonists should also be given as monotherapy, or combined therapy, in patients with chronic kidney disease and proteinuria, to reduce the rate of progression of chronic kidney disease. ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

See also treatment of hypertension in diabetes in Hypertension p. 140.

Diabetic neuropathy

Optimal diabetic control is beneficial for the management of painful neuropathy. Monotherapy with antidepressant drugs, including tricyclics (such as amitriptyline hydrochloride p. 372 and imipramine hydrochloride p. 376 [unlicensed use]), duloxetine p. 367, and venlafaxine p. 368 [unlicensed use] should be considered in patients for the treatment of painful diabetic peripheral neuropathy. Antiepileptic drugs, such as pregabalin p. 324 and gabapentin p. 315, can also be considered. Opioid analgesics in combination with gabapentin can be considered if pain is not controlled with monotherapy.

In autonomic neuropathy, diabetic diarrhoea can often be managed by antidiarrhoeal preparations such as loperamide p. 299 [unlicensed use], or codeine phosphate p. 454 as the best alternative; other antidiarrhoeal preparations can also be tried. Erythromycin (especially when given intravenously) may be useful in postural hypotension.

In diabetic autonomic neuropathy, diabetic diarrhoea can often be managed by antidiarrhoeal preparations [both unlicensed use], or codeine phosphate p. 454 as the best alternative; other antidiarrhoeal preparations can also be tried. Erythromycin p. 539 (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use]. In neuropathic postural hypotension, increased salt intake and the use of the mineralocorticoid fludrocortisone acetate p. 576 [unlicensed use] may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen p. 1140 and ephedrine hydrochloride p. 272 [both unlicensed]. Midodrine [unlicensed], an alpha agonist, may also be useful in postural hypotension.

Gustatory sweating can be treated with an antimuscarinic such as propantheline bromide p. 86; side-effects are common. See also, the management of hyperhidrosis (Hyperhidrosis p. 1264).

In some patients with neuropathic oedema, ephedrine hydrochloride [unlicensed use] offers effective relief. See also the management of Erectile dysfunction p. 812.

Visual impairment

Optimal diabetic control (HbA1c ideally around 7% or 53 mmol/mol) and blood pressure control (<130/80 mmHg) should be maintained to prevent onset and progression of diabetic eye disease.

Diabetic ketoacidosis

Management

To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL sodium chloride 0.9% by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.

When blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline or suggested regimen.

Include potassium chloride in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).

Start an intravenous insulin infusion: soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.9% intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.

Established subcutaneous therapy with long-acting insulin analogues (insulin detemir p. 717 or insulin glargine p. 718) should be continued during treatment of diabetic ketoacidosis.

Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.

Once blood-glucose concentration falls below 14 mmol/litre, glucose 10% should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion.

Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

Diabetes, surgery and medical illness

Management of diabetes during surgery

Peri-operative management of blood-glucose concentrations depends on factors including the required duration of fasting, timing of surgery (morning or afternoon), usual treatment regimen (insulin, antidiabetic drugs or diet), prior glycaemic control, other co-morbidities, and the likelihood that the patient will be capable of self-managing their diabetes in the immediate post-operative period. All patients should have emergency treatment for hypoglycaemia written on their drug chart on admission.
Note: The following recommendations provide general guidance for the management of diabetes during surgery. Local protocols and guidelines should be followed where they exist.

Use of insulin during surgery

Elective surgery—minor procedures in patients with good glycaemic control

Patients usually treated with insulin who have good glycaemic control (HbA1c less than 69 mmol/mol or 8.5%) and are undergoing minor procedures, can be managed during the operative period by adjustment of their usual insulin regimen, which should be adjusted depending on the type of insulin usually prescribed, following detailed local protocols (which should also include intravenous fluid management, monitoring and control of electrolytes and avoidance of hyperchloremic metabolic acidosis). On the day before the surgery, the patient’s usual insulin should be given as normal, other than once daily long-acting insulin analogues, which should be given at a dose reduced by 20%.

Elective surgery—major procedures or poor glycaemic control

Patients usually treated with insulin, who are either undergoing major procedures (surgery requiring a long fasting period of more than one missed meal) or whose diabetes is poorly controlled, will usually require a variable rate intravenous insulin infusion (continued until the patient is eating/drinking and stabilised on their previous glucose-lowering medication).

The aim is to achieve and maintain glucose concentration within the usual target range (6–10 mmol/litre; but up to 12 mmol/litre is acceptable) by infusing a constant rate of glucose-containing fluid as a substrate, while also infusing insulin at a variable rate. Detailed local protocols should be consulted. In general, the following steps should be followed:

- on the day before surgery, once daily long-acting insulin analogues should be given at 80% of the usual dose; otherwise the patient’s usual insulin should be given as normal;
- on the day of surgery and throughout the intra-operative period, once daily long-acting insulin analogues should be continued at 80% of the usual dose; all other insulin should be stopped until the patient is eating and drinking again after surgery;
- on the day of surgery, start an intravenous substrate infusion of potassium chloride with glucose and sodium chloride. p. 1039 (based on serum electrolytes which must be measured frequently), and infuse at a rate appropriate to the patient’s fluid requirements. To prevent hypoglycaemia, this infusion must not be stopped while the insulin infusion is running;
- a variable rate intravenous insulin infusion of soluble human insulin p. 712 in sodium chloride 0.9% p. 1040 (made either according to locally agreed protocols or using prefilled syringes) should be given via a syringe pump at an initial infusion rate determined by bedside capillary blood-glucose measurement. Hourly blood-glucose measurement should be undertaken to ensure that the intravenous insulin infusion rate is correct for at least the first 12 hours; the insulin infusion rate should be adjusted according to local protocol to maintain blood-glucose concentrations within the usual target range (6–10 mmol/litre; up to 12 mmol/litre is acceptable);
- intravenous glucose 20% p. 1041 should be given if blood-glucose drops below 6 mmol/litre, and blood-glucose checked every hour, to prevent a drop below 4 mmol/litre. If blood-glucose drops below 4 mmol/litre, intravenous glucose 20% should be adjusted and blood-glucose checked every 15 minutes, until blood-glucose is above 6 mmol/litre (testing can then revert to hourly). If blood-glucose rises above 12 mmol/litre, check ketones and consider other signs of diabetic ketoacidosis (see Diabetic ketoacidosis p. 689).

Conversion back to a subcutaneous insulin should not begin until the patient can eat and drink without nausea or vomiting. Once the patient’s previous insulin regimen is restarted, the usual insulin dose may require adjustment, as insulin requirements can change due to post-operative stress, infection or altered food intake.

Previous subcutaneous basal-bolus regimens, should be restarted when the first postoperative meal-time insulin dose is due (e.g. with breakfast or lunch); doses may need adjustment due to postoperative stress, infection or altered food intake. The variable rate intravenous insulin infusion and intravenous fluids should be continued until 30–60 minutes after the first meal-time short-acting insulin dose. If the patient was previously on a long-acting insulin analogue, this should have been continued throughout the operative period at 80% of the normal dose, and should now just continue at that same dose until the patient leaves hospital; only the short-acting insulin needs to be restarted as above.

Previous subcutaneous twice-daily mixed insulin regimens, should be restarted before breakfast or an evening meal (not at any other time). The variable rate intravenous insulin infusion should be maintained for 30–60 minutes after the first subcutaneous insulin dose has been given.

Patients who were previously managed with a continuous subcutaneous insulin infusion should be referred to a specialist team. The subcutaneous infusion should be restarted at the normal basal rate, not at bedtime, and the insulin infusion continued until the next meal bolus has been given.

Patients not previously prescribed insulin, who are to start a subcutaneous insulin regimen post-surgery, should have an insulin dose calculated with advice from a specialist diabetes team, considering the patient’s sensitivity to insulin, degree of glycaemic control, weight, age, and the average hourly insulin dose used in the peri-operative period.

Emergency surgery

Patients with diabetes (type 1 and 2) requiring emergency surgery, should always have their blood-glucose, blood or urinary ketone concentration, serum electrolytes and serum bicarbonate checked before surgery. If ketones are high or bicarbonate is low, blood gases should also be checked. If ketoadiposis is present, recommendations for Diabetic ketoacidosis p. 689 should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for major elective surgery (above).

Use of antidiabetic drugs during surgery

Manipulation of antidiabetic drug may not be appropriate for all surgery or for all patients; particularly when fasting time is more than one missed meal, in patients with poor glycaemic control, and when there is risk of renal injury. In these cases, a variable rate intravenous insulin p. 712 infusion should be used as for major elective surgery (above), and usual antidiabetic medication adjusted in the peri-operative period. Insulin is almost always required in medical and surgical emergencies.

When insulin is required and given during surgery, acarbose p. 692, meglitinides, sulfonylureas, pioglitazone p. 710, dipeptidyl peptidase-4 inhibitors (gliptins) and sodium glucose co-transporter 2 inhibitors should be stopped once the insulin infusion is commenced and not restarted until the patient is eating and drinking normally. Glucagon-like peptide-1 receptor agonists can be continued as normal during the insulin infusion.

If elective minor surgical procedures only require a short-fasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue.
In suitable cases, acarbose, nateglinide p. 701 and repaglinide p. 702 can be continued with just the dose omitted on the morning of surgery if fasting (the morning dose may be given if the patient is not fasting and surgery is in the afternoon).

Pioglitazone, dipeptidylpeptidase-4 inhibitors (gliptins) and glucagon-like peptide-1 receptor agonists can be taken as normal during the whole peri-operative period.

Sodium glucose co-transporter 2 inhibitors should be omitted on the day of surgery and not restarted until the patient is stable; their use during periods of dehydration and acute illness is associated with an increased risk of developing diabetic ketoacidosis.

Sulfonylureas are associated with hypoglycaemia in the fasted state and therefore should always be omitted on the day of surgery until the patient is eating and drinking again. Capillary blood-glucose should be checked hourly. If hyperglycaemia occurs, an appropriate dose of subcutaneous rapid-acting insulin may be given. A second dose may be given 2 hours later, and a variable rate intravenous insulin infusion considered if hyperglycaemia persists.

Metformin hydrochloride p. 692 is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. If only one meal will be missed during surgery, and the patient has an eGFR greater than 60 mL/minute/1.73m² and a low risk of acute kidney injury (and the procedure does not involve administration of contrast media), it may be possible to continue metformin hydrochloride throughout the peri-operative period—just the lunchtime dose should be omitted if the usual dose is prescribed three times a day.

If the patient will miss more than one meal or there is significant risk of the patient developing acute kidney injury, metformin hydrochloride should be stopped when the pre-operative fast begins. A variable rate intravenous insulin infusion should be started if the metformin hydrochloride dose is more than once daily. Otherwise insulin should only be started if blood-glucose concentration is greater than 12 mmol/litre on two consecutive occasions. Metformin should not be recommenced until the patient is eating and drinking again, and renal function has been assessed. There is no need to stop metformin hydrochloride after contrast medium in patients missing only one meal or who have an eGFR greater than 60 mL/minute/1.73m². If contrast medium is to be used, and eGFR is less than 60 mL/minute/1.73m², metformin should be omitted on the day of the procedure and for the following 48 hours.

Use of antidiabetic drugs during medical illness
Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during intercurrent illness when the drug is unlikely to control hyperglycaemia (such as myocardial infarction, coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Sodium glucose co-transport 2 inhibitors are associated with increased risk of developing diabetic ketoacidosis during periods of dehydration, stress, surgery, trauma, acute medical illness or any other catabolic state, and should be used with caution during these times. The MHRA has advised (2016) that these drugs should be temporarily stopped in patients who are hospitalised for acute serious illness until the patient is medically stable.

Diabetes mellitus

Management of pre-existing diabetes

Women with pre-existing diabetes who are planning on becoming pregnant should aim to keep their HbA1c concentration below 48 mmol/mol (6.5%) if possible without causing problematic hypoglycaemia. Any reduction towards this target is likely to reduce the risk of congenital malformations in the newborn.

Women with pre-existing diabetes who are planning to become pregnant should be advised to take folic acid at the dose for women who are at high-risk of conceiving a child with a neural tube defect, see folic acid p. 1025.

Overview

Oral antidiabetic drugs

All oral antidiabetic drugs, except metformin hydrochloride p. 692, should be discontinued before pregnancy (or as soon as an unplanned pregnancy is identified) and substituted with insulin therapy. Women with diabetes may be treated with metformin hydrochloride p. 692 [unlicensed in type 1 diabetes] as an adjunct or alternative to insulin in the preconception period and during pregnancy, when the likely benefits from improved blood-glucose control outweigh the potential for harm. Metformin hydrochloride p. 692 can be continued, or glibenclamide p. 709 resumed, immediately after birth and during breastfeeding for those with pre-existing Type 2 diabetes p. 686. All other antidiabetic drugs should be avoided while breastfeeding.

Insulin

Limited evidence suggests that the rapid-acting insulin analogues (insulin aspart p. 713 and insulin lispro p. 714) can be associated with fewer episodes of hypoglycaemia, a reduction in postprandial glucose excursions and an improvement in overall glycaemic control compared with regular human insulin.

Glargine p. 716 is the first-choice for long-acting insulin during pregnancy, however in women who have good blood-glucose control before pregnancy with the long-acting insulin analogues (insulin detemir p. 717 or insulin glargine p. 718), it may be appropriate to continue using them throughout pregnancy.

Continuous subcutaneous insulin infusion p. 712 (insulin pump therapy) may be appropriate for pregnant women who have difficulty achieving glycaemic control with multiple daily injections of insulin p. 712 without significant disabling hypoglycaemia.

All women treated with insulin p. 712 during pregnancy should be aware of the risks of hypoglycaemia, particularly in the first trimester, and should be advised to always carry a fast-acting form of glucose, such as dextrose tablets or a glucose-containing drink. Pregnant women with Type 1 diabetes p. 684 should also be prescribed glucagon p. 724 for use if needed.

Women with pre-existing diabetes treated with insulin p. 712 during pregnancy are at increased risk of hypoglycaemia in the postnatal period and should reduce their insulin immediately after birth. Blood-glucose levels should be monitored carefully to establish the appropriate dose.

Medication for diabetic complications

Angiotensin-converting enzyme inhibitors and angiotensin II receptor antagonists should be discontinued and replaced with an alternative antihypertensive suitable for use in pregnancy before conception or as soon as pregnancy is confirmed (see Hypertension in pregnancy under Endocrine system).
Hypertension p. 140). Statins should not be prescribed during pregnancy and should be discontinued before a planned pregnancy.

**Gestational diabetes**

Women with gestational diabetes who have a fasting plasma glucose below 7 mmol/litre at diagnosis, should first attempt a change in diet and exercise alone in order to reduce blood-glucose. If blood-glucose targets are not met within 1 to 2 weeks, metformin hydrochloride below may be prescribed [unlicensed use]. Insulin p. 712 may be prescribed if metformin is contra-indicated or not acceptable, and may also be added to treatment if metformin is not effective alone.

Women who have a fasting plasma glucose above 7 mmol/litre at diagnosis should be treated with insulin in 712 immediately, with or without metformin hydrochloride below, in addition to a change in diet and exercise.

Women who have a fasting plasma glucose between 6 and 6.9 mmol/litre alongside complications such as macrosomia or hydramnios should be considered for immediate insulin p. 712 treatment, with or without metformin hydrochloride below.

Glibenclamide p. 709 [unlicensed use] may be considered for women from 11 weeks gestation (after organogenesis) who cannot tolerate metformin, or for those in whom metformin is not effective and do not wish to have insulin therapy.

Women with gestational diabetes should discontinue hypoglycaemic treatment immediately after giving birth.

**Useful Resources**

www.nice.org.uk/guidance/ng3

**BLOOD GLUCOSE LOWERING DRUGS > ALPHA GLUCOSIDASE INHIBITORS**

**Acarbose**

**Drug action** Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

**Indications and dose**

Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

- **By mouth**
  - Adult: Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day)

**Contra-Indications** Hernia - inflammatory bowel disease - predisposition to partial intestinal obstruction - previous abdominal surgery

**Caution** May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose)

**Interactions** → Appendix 1: acarbose

**Side-effects**

- Common or very common Diarrhoea (may need to reduce dose) - gastrointestinal discomfort - gastrointestinal disorders

- Uncommon Nausea - vomiting

- Rare or very rare Hepatic disorders - oedema

- Frequency not known Acute generalised exanthematous pustulosis (AGEP) - thrombocytopenia

**Side-effects, further information**

Antacids containing magnesium and aluminium salts unlikely to be beneficial for treating side effects.

- **Pregnancy** Avoid.

- **Breast feeding** Avoid.

- **Hepatic impairment** Manufacturer advises avoid in severe impairment.

- **Renal impairment** Avoid if eGFR less than 25 mL/minute/1.73 m².

- **Monitoring requirements** Monitor liver function.

- **Directions for administration** Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food.

- **Patient and carer advice** Antacids unlikely to be beneficial for treating side-effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Acarbose (Non-proprietary)
  - Acarbose 50 mg Acarbose 50mg tablets | 90 tablet POM £15.00 DT + £11.51
  - Acarbose 100 mg Acarbose 100mg tablets | 90 tablet POM £27.00 DT + £13.03

**Blood glucose lowering drugs > Biguanides**

**Metformin hydrochloride**

**Drug action** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

**Indications and dose**

Type 2 diabetes mellitus [monotherapy or in combination with other antidiabetic drugs (including insulin)]

- **By mouth using immediate-release medicines**
  - Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
  - Adult: Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day

- **By mouth using modified-release medicines**
  - Adult: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets
Type 2 diabetes mellitus [reduction in risk or delay of onset]

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult 18-74 years: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, for further information on risk factors—consult product literature

### Polycystic ovary syndrome

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5–1.7 g daily in 2–3 divided doses

### Hepatic impairment

- Rare or very rare

### Interactions

- **CAUTIONS** Risk factors for lactic acidosis
  - **CAUTIONS, FURTHER INFORMATION**
    - Risk factors for lactic acidosis: Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.

### Side-effects

- Common or very common: Abdominal pain - appetite decreased, diarrhoea (usually transient), gastrointestinal disorder - nausea - taste altered - vomiting
- Rare or very rare: Hepatitis - lactic acidosis (discontinue), skin reactions - vitamin B12 absorption decreased

### Side-effects, further information

- Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

### Pregnancy

- Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

### Breastfeeding

- May be used during breast-feeding in women with pre-existing diabetes.

### Renal impairment

- In adults: Manufacturer advises avoid if eGFR is less than 30 mL/minute/1.73 m².
- In children: Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

#### Dose adjustments

- In children: Manufacturer advises consider dose reduction in moderate impairment.
- In adults: Manufacturer advises reduce dose in moderate impairment—consult product literature.

### Monitoring requirements

- Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

### Prescribing and dispensing information

- In adults: Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.

### Patient and carer advice

- Manufacturer advises that patients and their carers should be informed of the risk of lactic acidosis and told to seek immediate medical attention if symptoms such as dyspnoea, muscle cramps, abdominal pain, hypothermia, or asthenia occur.

### Medicines for Children

- Metformin is accepted for restricted use in patients for whom a once daily preparation is not licensed.

### National funding/access decisions

- Glucophage® SR

- Scottish Medicines Consortium (SMC) decisions

- The Scottish Medicines Consortium has advised (September 2009) that Glucophage® SR is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

### Medicinal forms

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution.

#### Modified-release tablet

- **CAUTIONARY AND ADVISORY LABELS 21, 25**

- **Metformin hydrochloride (Non-proprietary)**

  28 tablet (P413) £186.75 DT + £17.81

Linagliptin

DRUG ACTION
Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

INDICATIONS AND DOSE
Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

INTERACTIONS → Appendix 1: linagliptin

MEDICINAL FORMS
Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with other pioglitazone or insulin if existing treatment fails to achieve adequate glycaemic control

SIDE-EFFECTS
- Cough
- Rare or very rare  Angioedema, skin reactions
- Frequency not known  Pancreatitis

Alogliptin

DRUG ACTION
Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

INDICATIONS AND DOSE
Type 2 diabetes mellitus in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

INTERACTIONS → Appendix 1: alogliptin

Saxagliptin

**DRUG ACTION**
Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control.

- **BY MOUTH**
  - Adult: 5 mg once daily, for further information on use with other antidiabetic drugs—consult product literature.

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Dose of concomitant sulfonylurea or insulin may need to be reduced.

**CAUTIONS**
Elderly—history of pancreatitis.

**INTERACTIONS**
Appendix 1: saxagliptin.

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - dizziness - fatigue - headache - increased risk of infection - skin reactions - vomiting
- **Uncommon** Pancreatitis
- **Rare or very rare** Angioedema
- **Frequency not known** Constipation - nausea

**SIDE-EFFECTS, FURTHER INFORMATION**
Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.

**ALLERGY AND CROSS-SENSITIVITY**
Contra-indicated if patient has a history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.

**PREGNANCY**
Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING**
Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in moderate impairment; avoid in severe impairment (risk of increased exposure).

**RENAL IMPAIRMENT**
Use with caution in severe impairment.

**Dose adjustments**
Reduce dose to 2.5 mg once daily in moderate to severe impairment.

**MONITORING REQUIREMENTS**
Determine renal function before treatment and periodically thereafter.

**NATIONAL FUNDING/ACCESS DECISIONS**
The Scottish Medicines Consortium has advised that saxagliptin (Onglyza®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
| Onglyza (AstraZeneca UK Ltd) | Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg | £31.60 DT = £31.60 |
| Saxagliptin (as Saxagliptin hydrochloride) 5 mg | £31.60 DT = £31.60 |

Linagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, linagliptin p. 694, metformin hydrochloride p. 692.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin.

- **BY MOUTH**
  - Adult: 1 tablet twice daily, based on patient’s current metformin dose

**INTERACTIONS**
Appendix 1: linagliptin - metformin.

**NATIONAL FUNDING/ACCESS DECISIONS**
The Scottish Medicines Consortium has advised (May 2015) that linagliptin plus metformin combination tablets (Jentadueto®) are accepted for restricted use within NHS Scotland for the treatment of patients with type 2 diabetes mellitus in combination with insulin, as an adjunct to diet and exercise to improve glycaemic control when a combination of insulin and metformin alone is inadequate. It is restricted to use in the treatment of patients for whom a combination of linagliptin and metformin is an appropriate choice of therapy and the fixed doses are considered appropriate.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
| Jentadueto (Boehringer Ingelheim Ltd) |
| Linagliptin 2.5 mg, Metformin hydrochloride 850 mg | £33.26 DT + £33.26 |
| Linagliptin 2.5 mg, Metformin hydrochloride 1000 mg | £33.26 DT + £33.26 |

**INTERACTIONS**
Appendix 1: linagliptin - metformin.

**NATIONAL FUNDING/ACCESS DECISIONS**
The Scottish Medicines Consortium has advised that linagliptin (Trajenta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when both metformin and a sulfonylurea are inappropriate (January 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
| Trajenta (Boehringer Ingelheim) |
| Linagliptin 5 mg Trajenta 5mg tablets | 28 tablet £33.26 DT + £33.26 |

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Dose of concomitant sulfonylurea or insulin may need to be reduced.

**CAUTIONS**
Elderly—history of pancreatitis.

**INTERACTIONS**
Appendix 1: linagliptin - metformin.

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - dizziness - fatigue - headache - increased risk of infection - skin reactions - vomiting
- **Uncommon** Pancreatitis
- **Rare or very rare** Angioedema
- **Frequency not known** Constipation - nausea

**SIDE-EFFECTS, FURTHER INFORMATION**
Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.

**ALLERGY AND CROSS-SENSITIVITY**
Contra-indicated if patient has a history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.

**PREGNANCY**
Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING**
Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in moderate impairment; avoid in severe impairment (risk of increased exposure).

**RENAL IMPAIRMENT**
Use with caution in severe impairment.

**Dose adjustments**
Reduce dose to 2.5 mg once daily in moderate to severe impairment.

**MONITORING REQUIREMENTS**
Determine renal function before treatment and periodically thereafter.

**NATIONAL FUNDING/ACCESS DECISIONS**
The Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised that linagliptin (Trajenta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when both metformin and a sulfonylurea are inappropriate (January 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
| Trajenta (Boehringer Ingelheim) |
| Linagliptin 5 mg Trajenta 5mg tablets | 28 tablet £33.26 DT + £33.26 |
Saxagliptin with dapagliflozin

The properties listed below are those particular to the combination only. For the properties of the components please consider, saxagliptin p. 695, dapagliflozin p. 704.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus not controlled by metformin and/or a sulfonylurea with either saxagliptin or dapagliflozin

- **BY MOUTH**
  - Adult 18-74 years: 5/10 mg once daily
  - Adult 75 years and over: Initiation not recommended

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Dose of concomitant sulfonylurea may need to be reduced.

**DOSE EQUIVALENCE AND CONVERSION**
- Dose expressed as x/y mg saxagliptin/dapagliflozin.

**INTERACTIONS** → Appendix 1: dapagliflozin - saxagliptin

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT**
Dose adjustments Manufacturer advises avoid if eGFR less than 60 mL/minute/1.73 m² (ineffective).

**PATIENT AND CARER ADVICE**
Missed doses Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (July 2017) that saxagliptin with dapagliflozin 5 mg/10 mg (Qtern®) is accepted for restricted use within NHS Scotland for the treatment of patients with type 2 diabetes mellitus in combination with metformin when the use of a sulfonylurea is inappropriate, only if:
- metformin and/or a sulfonylurea, in combination with dapagliflozin or saxagliptin, do not provide adequate glycaemic control; or
- the patient is already being treated with the free combination of dapagliflozin and saxagliptin.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Qtern (AstraZeneca UK Ltd)
  - Saxagliptin (as Saxagliptin hydrochloride) 5 mg, Dapagliflozin (as Dapagliflozin propanediol monohydrate) 10 mg
  - Tablets: 28 tablet (PFR) £40.56 DT + £40.56

Saxagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, saxagliptin p. 695, metformin hydrochloride p. 692.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

- **BY MOUTH**
  - Adult: 1 tablet twice daily, based on patient’s current metformin dose

**INTERACTIONS** → Appendix 1: metformin - saxagliptin

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (May 2013) that Komboglyze® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone and when the addition of a sulfonylurea is inappropriate.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Komboglyze (AstraZeneca UK Ltd)
  - Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg, Metformin hydrochloride 850 mg
  - Tablets: 56 tablet (PFR) £31.60 DT + £31.60
  - Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg, Metformin hydrochloride 1 gram
  - Tablets: 56 tablet (PFR) £31.60 DT + £31.60

**Sitagliptin**

**DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

- **BY MOUTH**
  - Adult: 100 mg once daily, for further information on use with other antidiabetic drugs—consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Dose of concomitant sulfonylurea or insulin may need to be reduced.

**CONTRA-INDICATIONS** Ketoadicosis

**INTERACTIONS** → Appendix 1: sitagliptin

**SIDE-EFFECTS**
- Common or very common
  - Headache
- Uncommon
  - Constipation
  - Dizziness
  - Skin reactions
- Frequency not known
  - Angioedema
  - Back pain
  - Cutaneous vasculitis
  - Interstitial lung disease
  - Joint disorders
  - Myalgia
  - Pancreatitis acute
  - Renal impairment
  - Stevens-Johnson syndrome
  - Vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur such as persistent, severe abdominal pain.

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**RENAI IMPAIRMENT**
Dose adjustments Manufacturer advises reduce dose to 50 mg once daily if eGFR 30–45 mL/minute/1.73 m². Manufacturer advises reduce dose to 25 mg once daily if eGFR less than 30 mL/minute/1.73 m².

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
SMC No. 607/10
The Scottish Medicines Consortium has advised (July 2010) that sitagliptin (Januvia®) is accepted for restricted use within NHS Scotland as monotherapy, to improve glycaemic control in patients with type 2 diabetes mellitus, for whom both metformin and sulfonylureas are not appropriate.

SMC No. 1083/15
The Scottish Medicines Consortium has advised (September 2015) that sitagliptin (Januvia®) is accepted for use within NHS Scotland as an add-on to insulin (with or without metformin) to improve glycaemic control in adults with type 2 diabetes mellitus.
**Sitatgliptin with metformin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, sitagliptin p. 696, metformin hydrochloride p. 692.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or pioglitazone or insulin

- **BY MOUTH**
  - Adults: 1 tablet twice daily

**INTERACTIONS** → Appendix 1: metformin · sitagliptin

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (July 2008) that Janumet® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus when the addition of a sulfonylurea to metformin is not appropriate; it is also accepted for use in NHS Scotland in combination with a sulfonylurea in patients inadequately controlled on maximum tolerated doses of metformin and a sulfonylurea.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Vildagliptin**

27-Mar-2019

**DRUG ACTION**

Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs (including insulin) if existing treatment fails to achieve adequate glycaemic control

- **BY MOUTH**
  - Adults: 50 mg twice daily. Reduce dose to 50 mg once daily in the morning when used in dual combination with a sulfonylurea. For further information on use with other antidiabetic drugs—consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Dose of concomitant sulfonylurea or insulin may need to be reduced.

**CONTRA-INDICATIONS**

Ketoacidosis

**CAUTIONS**

Manufacturer advises avoid in severe heart failure—no information available

**INTERACTIONS** → Appendix 1: vildagliptin

**SIDE-EFFECTS**

Common or very common: Dizziness

Common: Neuropathy

Uncommon: Arthralgia · constipation · headache · hypoglycaemia · peripheral oedema

Rare or very rare: Increased risk of infection

Frequency not known: Hepatitis · myalgia · pancreatitis · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION

**Pancreatitis**

- **Discontinue if symptoms of acute pancreatitis occur, such as persistent severe abdominal pain.**
- **Liver toxicity**
  - Rare reports of liver dysfunction; discontinue if jaundice or other signs of liver dysfunction occur.
- **PREGNANCY**
  - Avoid—toxicity in animal studies.
- **BREAST FEEDING**
  - Avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 435/07

The Scottish Medicines Consortium has advised (April 2008) that vildagliptin (Galvus®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in combination with metformin when addition of a sulfonylurea is inappropriate.

SMC No. 57/09

The Scottish Medicines Consortium has advised (October 2009) that vildagliptin (Galvus®) is accepted for use within NHS Scotland for the treatment of type 2 diabetes mellitus in combination with a sulfonylurea for those patients where the maximal dose of a sulfonylurea as monotherapy is insufficient, or if metformin is inappropriate.

SMC No. 826/12

The Scottish Medicines Consortium has advised (January 2013) that vildagliptin (Galvus®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of type 2 diabetes mellitus in adults when treatment with metformin or a sulfonylurea is inappropriate.

SMC No. 875/13

The Scottish Medicines Consortium has advised (December 2013) that vildagliptin (Galvus®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adults as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate.

**BLOOD GLUCOSE LOWERING DRUGS**

GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS

**Dulaglutide**

- **DRUG ACTION** Dulaglutide is a long-acting glucagon-like peptide 1 (GLP-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

- **INDICATIONS AND DOSE**

  - **Type 2 diabetes mellitus as monotherapy if metformin inappropriate**
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: 0.75 mg once weekly

  - **Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: 1.5 mg once weekly

  - **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
    - Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

- **CONTRA-INDICATIONS** Severe gastro-intestinal disease—no information available

- **CAUTIONS** Congestive heart failure—no information available

- **INTERACTIONS** → Appendix 1: dulaglutide

- **SIDE-EFFECTS**

  - Common or very common
    - Appetite decreased.
    - Atrioventricular block.
    - Constipation.
    - Diarrhoea.
    - Fatigue.
    - Gastrointestinal discomfort.
    - Gastrointestinal disorders.
    - Hypoglycaemia.
    - Nausea.
    - Sinus tachycardia.
    - Vomiting.

  - Rare or very rare
    - Anaphylactic reaction.
    - Angioedema.
    - Pancreatitis acute (discontinue)

  - **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

  - **BREAST FEEDING** Manufacturer advises avoid—no information available.

  - **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment and end stage renal disease—no information available.

  - **HANDLING AND STORAGE** Refrigerated storage is usually necessary (2 °C – 8 °C). In use, may be stored unrefrigerated for up to 14 days at a temperature not above 30 °C.

  - **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dulaglutide injection. Acute pancreatitis. Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

  - **Missed doses** If a dose is missed, it should be administered as soon as possible only if there are at least 3 days until the next scheduled dose; if less than 3 days remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

**Exenatide**

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

- **INDICATIONS AND DOSE**

  - **Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination**
    - **BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES**
      - Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)
    - **BY SUBCUTANEOUS INJECTION USING MODIFIED-RELEASE MEDICINES**
      - Adult: 2 mg once weekly
**Type 2 diabetes mellitus in combination with basal insulin alone or with metformin or pioglitazone (or both)**

- **BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES**
- **Adult:** Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Dose of concomitant sulfonylurea may need to be reduced.

**SIDE-EFFECTS**

- **Common or very common**
  - Appetite decreased - asthenia - constipation - diarrhoea - dizziness - gastrointestinal discomfort - gastrointestinal disorders - headache - nausea - skin reactions - vomiting

- **Uncommon**
  - Alopecia - burping - drowsiness - hyperhidrosis - renal impairment - taste altered

- **Frequency not known**
  - Angioedema - pancreatitis acute

**CAUTIONS**

- Elderly: may cause weight loss greater than 1.5 kg weekly - pancreatitis

**INTERACTIONS**

- **Appendix 1: exenatide**

**CONTRA-INDICATIONS**

- Ketoacidosis - severe gastrointestinal disease

**MEDICATION FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**CAUTIONARY AND ADVISORY LABELS**

- **Byetta (AstraZeneca UK Ltd)**
  - Exenatide 250 microgram per 1 ml Byetta 10 micrograms/0.04 ml solution for injection 2.4 ml pre-filled pen
  - 1 pre-filled disposable injection
  - £81.89 DT £81.89

- **Bydureon (AstraZeneca UK Ltd)**
  - Exenatide 2 mg Bydureon 2 mg powder and solvent for prolonged-release suspension for injection pre-filled pen
  - 4 pre-filled disposable injection
  - £73.36 DT £73.36

**Liraglutide**

- **14-Feb-2019**

**DRUG ACTION**

- Liraglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

**INDICATIONS AND DOSE**

**SAXENDA®**

- **Adjunct in weight management [in conjunction with dietary measures and increased physical activity in individuals with a body mass index (BMI) of 30 kg/m² or more, or in individuals with a BMI of 27 kg/m² or more in the presence of at least one weight-related co-morbidity]**

  - **BY SUBCUTANEOUS INJECTION**
  - **Adult:** Initially 0.6 mg once daily, then increased in steps of 0.6 mg; dose to be increased at intervals of at least 1 week; consider discontinuation if escalation to the next dose is not tolerated for 2 consecutive weeks. Discontinue if at least 5% of initial body-weight has not been lost after 12 weeks at maximum dose; maximum 3 mg per day

**VICTOZA®**

- **Type 2 diabetes mellitus [monotherapy (if metformin inappropriate), or in combination with other antidiabetic drugs]**

  - **BY SUBCUTANEOUS INJECTION**
  - **Adult:** Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary to 1.8 mg once daily, for information on use with other antidiabetic drugs—consult product literature
DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant insulin or sulfonylurea may need to be reduced.

CONTRA-INDICATIONS
Diabetic gastroparesis - inflammatory bowel disease - severe congestive heart failure - no information available

SAXENDA®
Concomitant use with other products for weight management - elderly 75 years or over (limited information) - obesity secondary to endocrinological or eating disorders

VICTOZA®
Diabetic ketoacidosis

INTERACTIONS
Appendix 1: Liraglutide

SIDE-EFFECTS

Common or very common
- Appetite decreased - asthma - burping - constipation - diarrhea - dizziness - dry mouth - gallbladder disorders - gastrointestinal discomfort - gastrointestinal disorders - headache - increased risk of infection - insomnia - nausea - skin reactions - taste altered - toothache - vomiting

Uncommon
- Dehydration - malaise - pancreatitis - renal impairment - tachycardia

Frequency not known
- Angioedema - dyspnoea - hypotension - oedema - palpitations - pancreatitis acute (discontinue permanently) - thyroid disorder

SIDE-EFFECTS, FURTHER INFORMATION
Discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.

PREGNANCY
Manufacturer advises avoid — toxicity in animal studies (recommendation also supported by tertiary sources).

BREAST FEEDING
Manufacturer advises avoid — no information available; animal studies suggest that transfer into milk is low, but excretion into human milk not known (a tertiary source confirms lack of information in human lactation, but also states that risk to infants appears to be negligible. [Eft] Blood glucose monitoring of the infant should be considered). [Eft]

HEPATIC IMPAIRMENT

SAXENDA®
Manufacturer advises use with caution in mild to moderate impairment; avoid in severe impairment (risk of decreased exposure).

VICTOZA®
Manufacturer advises avoid in severe impairment (risk of decreased exposure).

RENAL IMPAIRMENT

SAXENDA®
Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.

VICTOZA®
Manufacturer advises avoid in end-stage renal disease.

HANDLING AND STORAGE
Manufacturer advises store in a refrigerator (2–8°C) — after first use can also be stored below 30°C and used within 1 month; keep cap on pen to protect from light.

PATIENT AND CARER ADVICE
Manufacturer advises patients and their carers should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms develop. Manufacturer advises patients and their carers should be informed of the potential risk of dehydration in relation to gastrointestinal side-effects and advised to take precautions to avoid fluid depletion; they should also be informed of the symptoms of cholelithiasis and cholecystitis, and of increased heart rate.

SAXENDA®
Missed doses
Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Saxenda (Novo Nordisk Ltd)
Liraglutide 6 mg per 1 ml Saxenda 6 mg/mL solution for injection 3 ml pre-filled disposable injection £196.20

Victoza (Novo Nordisk Ltd)
Liraglutide 6 mg per 1 ml Victoza 6 mg/mL solution for injection 3 ml pre-filled disposable injection £78.48 DT — £78.48 | 3 pre-filled disposable injection £117.72

Combinations available: Insulin degludec with liraglutide, p. 717

Lixisenatide
26-Mar-2019

DRUG ACTION
Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

INDICATIONS AND DOSE
Type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs

BY SUBCUTANEOUS INJECTION

Adult: Initially 10 micrograms once daily for 14 days, then increased to 20 micrograms once daily, dose to be taken within 1 hour before the first meal of the day or the evening meal

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Dose of concomitant sulfonylurea or insulin may need to be reduced.

CONTRA-INDICATIONS
Ketoacidosis - severe gastrointestinal disease

CAUTIONS
History of pancreatitis

INTERACTIONS
Appendix 1: Lixisenatide

SIDE-EFFECTS

Common or very common
- Back pain - cystitis - diarrhea - dizziness - drowsiness - dyspepsia - headache - increased risk of infection - nausea - vomiting

Uncommon
- Urticaria

Frequency not known
- Pancreatitis acute

SIDE-EFFECTS, FURTHER INFORMATION
Manufacturer advises discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.

CONCEPTION AND CONTRACEPTION
Women of childbearing age should use effective contraception.

PREGNANCY
Avoid — toxicity in animal studies.

BREAST FEEDING
Avoid — no information available.

RENAL IMPAIRMENT
Use with caution if eGFR less than 30 mL/minute; 1.73 m² — no information available.

PATIENT AND CARER ADVICE
Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection — consult product literature for details.

Missed doses
If a dose is missed, inject within 1 hour before the next meal — do not administer after a meal.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (August 2013) that lixisenatide (Lyxumia®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is
appropriate, as an alternative to an existing GLP-1 agonist (exenatide or lixisenatide).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - **CAUTIONARY AND ADVISORY LABELS**
      - **10**
        - **Lyxumia** (Sanofi)
        - Lixisenatide 50 microgram per 1 ml Lyxumia 10micrograms/0.2ml solution for injection 3ml pre-filled pen 1 pre-filled disposable injection £31.67 DT + £31.67
        - Lixisenatide 100 microgram per 1 ml Lyxumia 20micrograms/0.2ml solution for injection 3ml pre-filled pen 2 pre-filled disposable injection £57.93 DT + £57.93
        - **Combinations available:** Insulin glargine with lixisenatide, p. 718

**Semaglutide**

- **DRUG ACTION** Semaglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppress glucagon secretion, and slow gastric emptying.

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus [monotherapy (if metformin inappropriate) or in combination with other antidiabetic drugs]**
    - **BY SUBCUTANEOUS INJECTION**
    - **Adult:** Initially 0.25 mg once weekly for 4 weeks, then increased to 0.5 mg once weekly for at least 4 weeks, then increased if necessary to 1 mg once weekly, for information on use with other antidiabetic drugs—consult product literature.
    - **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
      - **Manufacturer advises dose of concomitant insulin or sulfonylurea may need to be reduced.**

- **CONTRA-INDICATIONS** Diabetic ketoacidosis • severe congestive heart failure (no information available)

- **CAUTIONS** Diabetic retinopathy (in patients treated with insulin) • history of pancreatitis

- **INTERACTIONS** → Appendix 1: semaglutide

- **SIDE-EFFECTS**
  - **Common or very common** Appetite decreased • burping • cholelithiasis • constipation • diarrhea • diziness • fatigue • gastrointestinal discomfort • gastrointestinal disorders • hypoglycaemia (in combination with insulin or sulfonylurea) • nausea • vomiting • weight decreased
  - **Uncommon** Taste altered

- **SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if symptoms of acute pancreatitis occur, such as persistent, severe abdominal pain.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use effective contraception during and for at least two months after stopping treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (limited information in severe impairment).

- **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) — after first use can also be stored below 30°C, keep cap on pen to protect from light.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms develop.

- **MISSED DOSES** Manufacturer advises if a dose is more than 5 days late, the missed dose should not be taken and the next dose should be administered at the normal time.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) decisions**
    - **SME No. SMC2092**
      - The Scottish Medicines Consortium has advised (January 2019) that semaglutide (Ozempic®) is accepted for restricted use within NHS Scotland for the treatment of adults with insufficiently controlled type 2 diabetes mellitus in addition to other oral antidiabetic medicines, or as an add-on to basal insulin, as an alternative glucagon-like peptide-1 receptor agonist option.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - **Ozempic** (Novo Nordisk Ltd)
      - Semaglutide 1.34 mg per 1 ml Ozempic 1mg/0.74ml solution for injection 3ml pre-filled pen 1 pre-filled disposable injection £73.25
      - Ozempic 0.5mg/0.37ml solution for injection 1.5ml pre-filled pen 1 pre-filled disposable injection £73.25
      - Ozempic 0.25mg/0.19ml solution for injection 1.5ml pre-filled pen 1 pre-filled disposable injection £73.25

**BLOOD GLUCOSE LOWERING DRUGS**

- **MEGLITINIDES**

### Nateglinide

- **DRUG ACTION** Nateglinide stimulates insulin secretion.

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus in combination with metformin when metformin alone inadequate**
    - **BY MOUTH**
      - **Adult:** Initially 60 mg 3 times a day (max. per dose 180 mg), adjusted according to response, to be taken within 30 minutes before main meals

- **CONTRA-INDICATIONS** Ketoacidosis

- **CAUTIONS** Debilitated patients • elderly • malnourished patients

- **CAUTIONS, FURTHER INFORMATION** Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally).

- **INTERACTIONS** → Appendix 1: nateglinide

- **SIDE-EFFECTS**
  - **Common or very common** Diarrhoea • gastrointestinal discomfort • hypoglycaemia • nausea
  - **Uncommon** Vomiting
  - **Rare or very rare** Skin reactions
  - **Frequency not known** Appetite increased • diziness • fatigue • muscle weakness • palpitations • sweating • abnormal • tremor

- **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (no information available).

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.
Repaglinide

- **DRUG ACTION** Repaglinide stimulates insulin secretion.

**INDICATIONS AND DOSE**

- **Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)**
  - **BY MOUTH**
    - Adult 18-74 years: Initially 500 micrograms (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day.
    - Adult 75 years and over: Not recommended.

- **Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral antidiabetic drug**
  - **BY MOUTH**
    - Adult 18-74 years: Initially 1 mg (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day.
    - Adult 75 years and over: Not recommended.

- **CONTRA-INDICATIONS** Ketoacidosis.

- **CAUTIONS** Debilitated patients • malnourished patients • severe liver disease • cardiovascular disease • severe renal impairment • history of hypoglycaemia • alcoholism • elderly patients.

**SIDE-EFFECTS**

- Common or very common Abdominal pain • diarrhoea • dyspepsia • hypoglycaemia
- Rare or very rare Cardiovascular disease • constipation • hepatic function abnormal • vasculitis • vision disorders • vomiting
- Frequency not known Acute coronary syndrome • hypoglycaemic coma • nausea • skin reactions

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (risk of increased exposure).

- **RENAL IMPAIRMENT** Use with caution.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

**MEDICINAL FORMS**

-星形
- **Tablet**
  - **Repaglinide (Non-proprietary)**
    - Repaglinide 2 mg tablets | 90 tablet | £5.88
    - Repaglinide 1 mg tablets | 30 tablet | £3.33
    - Repaglinide 500 microgram tablets | 30 tablet | £2.86

**IMPORTANT SAFETY INFORMATION**

- **MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)**

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- Inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these.
- Test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal.
- Use canagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients.
- Discontinue treatment if DKA is suspected or diagnosed.
● do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
● interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient’s condition has stabilised

MHRA/CHM ADVICE (UPDATED MARCH 2017): INCREASED RISK OF LOWER-LIMB AMPUTATION (MAINLY TOES)

Canagliflozin may increase the risk of lower-limb amputation (mainly toes) in patients with type 2 diabetes. Preventive foot care is important for all patients with diabetes. The MHRA has issued the following advice while clinical trials are ongoing:
● consider stopping canagliflozin if a patient develops a significant lower limb complication (e.g. skin ulcer, osteomyelitis, or gangrene)
● carefully monitor patients who have risk factors for amputation (e.g. previous amputations, existing peripheral vascular disease, or neuropathy)
● monitor all patients for signs and symptoms of water or salt loss; ensure patients stay sufficiently hydrated to prevent volume depletion in line with the manufacturer’s recommendations
● advise patients to stay well hydrated, carry out routine preventive foot care, and seek medical advice promptly if they develop skin ulceration, discoulouration, or new pain or tenderness
● start treatment for foot problems (e.g. ulceration, infection, or new pain or tenderness) as early as possible
● continue to follow standard treatment guidelines for routine preventive foot care for people with diabetes.

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER’S GANGRENE (NECROTISING FASCIITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier’s gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier’s gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement). Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urgenital infection or perineal abscess may precede necrotising fasciitis.

● CONTRA-INDICATIONS  Ketaocidosis
● CAUTIONS  Cardiovascular disease (risk of hypertension) • elderly (risk of hypotension) • elevated haematocrit • history of hypotension

CAUTIONS, FURTHER INFORMATION
● Volume depletion  Correct hypovolaemia before starting treatment.

● INTERACTIONS  → Appendix 1: canagliflozin

● SIDE-EFFECTS
● Common or very common  Balanoposthitis • constipation • dyslipidaemia • hypoglycaemia (in combination with insulin or sulfonylurea) • increased risk of infection • nausea • thirst • urinary disorders • urosepsis
● Uncommon  Dehydration • dizziness postural • hypotension • lower limb amputations • renal failure • skin reactions • syncope
● Rare or very rare  Anaphylactic reaction • angioedema • diabetic ketoacidosis (discontinue immediately)
● Frequency not known  Fournier’s gangrene (discontinue and initiate treatment promptly)

SIDE-EFFECTS, FURTHER INFORMATION  Consider interrupting treatment if volume depletion occurs.

● PREGNANCY  Avoid—toxicity in animal studies.

● BREAST FEEDING  Avoid—present in milk in animal studies.

● HEPATIC IMPAIRMENT  Manufacturer advises avoid in severe impairment—no information available.

● RENAL IMPAIRMENT  Avoid initiation if eGFR less than 60 mL/minute/1.73 m². Avoid if eGFR less than 45 mL/minute/1.73 m².

Dose adjustments  Reduce dose to 100 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m² and existing canagliflozin treatment tolerated.

Monitoring  Monitor renal function at least twice a year in moderate impairment.

● MONITORING REQUIREMENTS  Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter.

● PATIENT AND CARER ADVICE  Patients should be advised to report symptoms of volume depletion including postural hypotension and dizziness. Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions

➤ Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390

Canagliflozin (Invokana®) as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated and when diet and exercise alone do not provide adequate glycaemic control, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed, and a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving canagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta390

➤ Canagliflozin in combination therapy for treating type 2 diabetes (June 2014) NICE TA315

Canagliflozin (Invokana®) in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if a sulfonylurea is contra-indicated or not tolerated, or the patient has a significant risk of hypoglycaemia.

Canagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with metformin and a sulfonylurea, or metformin and a thiazolidinedione.

Canagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Patients currently receiving canagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta315

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Canagliflozin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, canagliflozin p. 702, metformin hydrochloride p. 692.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with insulin or other antidiabetic drugs

- **BY MOUTH**
  - Adult: 1 tablet twice daily, dose based on patient's current metformin dose, daily dose of metformin should not exceed 2 g

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**INTERACTIONS**  

- Appendix 1: canagliflozin - metformin

**RENAL IMPAIRMENT**

Avoid if eGFR less than 60 mL/minute/1.73 m².

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1019/14

The Scottish Medicines Consortium has advised (January 2015) that canagliflozin with metformin (Vokanamet®) is accepted for restricted use within NHS Scotland in patients with type 2 diabetes mellitus for whom a combination of canagliflozin and metformin is an appropriate choice of therapy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Dapagliflozin

**DRUG ACTION**

Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus [as monotherapy if metformin inappropriate]  
Type 2 diabetes mellitus [in combination with insulin or other antidiabetic drugs]

- **BY MOUTH**
  - Adult 18-74 years: 10 mg once daily
  - Adult 75 years and over: Initiation not recommended

**Type 1 diabetes mellitus [as an adjunct to insulin in patients with a BMI greater than or equal to 27 kg/m², when insulin alone fails to achieve adequate glycaemic control] **

- **BY MOUTH**
  - Adult 18-74 years: 5 mg once daily
  - Adult 75 years and over: Initiation not recommended

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use dapagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient’s condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER’S GANGRENE (NECROTISING FASCIITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier’s gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier’s gangrene is suspected, stop the SGLT2 inhibitor urgently and start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

**CONTRA-INDICATIONS**

- When used for type 1 diabetes mellitus high risk of diabetic ketoacidosis (consult product literature)

**CAUTIONS**

- Cardiovascular disease (risk of hypotension)  
- elderly (risk of hypotension)  
- electrolyte disturbances  
- hypotension  
- raised haematocrit

**CAUTIONS, FURTHER INFORMATION**

Volume depletion Correct hypovolaemia before starting treatment.

**INTERACTIONS**

**DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**INDICATIONS AND DOSE**

* Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) * Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

- **BY MOUTH**
  - Adult 18-84 years: 10 mg once daily, increased to 25 mg once daily if necessary and if tolerated
  - Adult 85 years and over: Initiation not recommended

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)**

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with an SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- Inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- Test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- Use empagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- Discontinue treatment if DKA is suspected or diagnosed
- Do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- Interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient’s condition has stabilised

**MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER’S GANGRENE (NECTROTISING FASCITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)**

Fournier’s gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier’s gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement). Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

**CONTRA-INDICATIONS** Diabetic ketoacidosis

**CAUTIONS** Cardiovascular disease (increased risk of volume depletion) - complicated urinary tract infections—consider temporarily interrupting treatment - concomitant antihypertensive therapy (increased risk of volume depletion) - elderly patients aged over 75 years (increased risk of volume depletion) - heart failure - history of hypotension (increased risk of volume depletion) - patients at increased risk of volume depletion - predisposition to fluid disturbances e.g. gastro-intestinal illness, concomitant use of diuretics (increased risk of volume depletion)

**CAUTIONS, FURTHER INFORMATION**

- Volume depletion Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.
- **INTERACTIONS** → Appendix 1: empagliflozin
- **SIDE-EFFECTS**
  - Common or very common: Balanoposthitis, hypoglycaemia (in combination with insulin or sulfonylurea) - increased risk of infection - pruritus generalised - thirst - urinary disorders
  - Uncommon: Hypovolaemia
  - Rare or very rare: Diabetic ketoacidosis (discontinue immediately)
  - Frequency not known: Fournier’s gangrene (discontinue and initiate treatment promptly)
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Avoid initiation if eGFR below 60 mL/minute/1.73 m². Avoid if eGFR is persistently below 45 mL/minute/1.73 m².

**Dose adjustments** Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.

**PATIENT AND CARER ADVICE** Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016)
- NICE TA390

Empagliflozin (Jardiance®) as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated and when diet and exercise alone do not provide adequate glycaemic control, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed, and a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving empagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta390
Empagliflozin in combination therapy for treating type 2 diabetes (March 2015) NICE TA336
Empagliflozin (Jardiance®) in a dual therapy regimen in combination with metformin is an option for the treatment of type 2 diabetes, only if:
• a sulfonylurea is contra-indicated or not tolerated, or
• the patient is at significant risk of hypoglycaemia or its consequences.

Empagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with:
• metformin and a sulfonylurea, or
• metformin and a thiazolidinedione.

Empagliflozin in combination with insulin with or without other antidiabetic drugs is an option for the treatment of type 2 diabetes.

Patients currently receiving empagliflozin whose disease does not meet the above criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta336

Empagliflozin with metformin 01-Mar-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, empagliflozin p. 766, metformin hydrochloride p. 692.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Tablet
> Jardiance (Boehringer Ingelheim Ltd)  
Empagliflozin 10 mg Jardiance 10mg tablets  |  28 tablet  
£36.59 DT + £36.59

Empagliflozin 25 mg Jardiance 25mg tablets  |  28 tablet  
£36.59 DT + £36.59

DOSAGE

INDICATIONS AND DOSE

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with other antidiabetic drugs or insulin

BY MOUTH

Adult 18-84 years: 5/850–5/1000 mg twice daily, based on patient’s current metformin dose, increased if necessary to 12.5/850–12.5/1000 mg twice daily

BY MOUTH

Adult 85 years and over: Initiation not recommended

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

DOSE EQUIVALENCE AND CONVERSION

The proportions are expressed in the form ‘x’/‘y’ where ‘x’ and ‘y’ are the strengths in milligrams of empagliflozin and metformin respectively.

INTERACTIONS  Appendix 1: empagliflozin - metformin

MEDICATIONS

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions
SMC No. 1092/15
The Scottish Medicines Consortium has advised (October 2015) that empagliflozin with metformin (Synjardy®) is accepted for restricted use within NHS Scotland in patients for whom a fixed dose combination of empagliflozin and metformin is an appropriate choice of therapy, or when use of a sulfonylurea is considered inappropriate.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

• inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
• test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
• use empagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
• discontinue treatment if DKA is suspected or diagnosed
• do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
Diabetes mellitus and hypoglycaemia

- interrupt SGLT2 inhibitor treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient’s condition has stabilised

MHRA/CHM ADVICE: SGLT2 INHIBITORS: REPORTS OF FOURNIER’S GANGRENE (NECROTISING FASCIITIS OF THE GENITALIA OR PERINEUM) (FEBRUARY 2019)

Fournier’s gangrene, a rare but serious and potentially life-threatening infection, has been associated with the use of sodium-glucose co-transporter 2 (SGLT2) inhibitors. If Fournier’s gangrene is suspected, stop the SGLT2 inhibitor and urgently start treatment (including antibiotics and surgical debridement).

Patients should be advised to seek urgent medical attention if they experience severe pain, tenderness, erythema, or swelling in the genital or perineal area, accompanied by fever or malaise—urogenital infection or perineal abscess may precede necrotising fasciitis.

- CONTRA-INDICATIONS Diabetic ketoacidosis
- CAUTIONS Dehydration - elderly (risk of volume depletion)
- HEPATIC IMPAIRMENT
- RARE or very RARE Diabetic ketoacidosis (discontinue immediately)
- FREQUENCY not known Fournier’s gangrene (discontinue and initiate treatment promptly) - lower limb amputations - phimosis

SIDE-EFFECTS, FURTHER INFORMATION

MANUFACTURER ADVICE: ERTUGLIFLOZIN

- For treatment of type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, or the person is at significant risk of hypoglycaemia or its consequences.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta572

Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2102

The Scottish Medicines Consortium has advised (January 2019) that ertugliflozin (Steglatro®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as monotherapy, in patients who would otherwise receive a dipeptidyl peptidase-4 inhibitor and in whom a sulphonylurea or pioglitazone is not appropriate, and as add-on therapy.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Steglatro (Merck Sharp & Dohme Ltd) £

Ertugliflozin (as Ertugliflozin L-pyroglutamic acid) 5 mg 
5mg tablets | 28 tablet | £29.40

Ertugliflozin (as Ertugliflozin L-pyroglutamic acid) 15 mg 
15mg tablets | 28 tablet | £29.40

BLOOD GLUCOSE LOWERING DRUGS > SULFONYLUREAS

Sulfonylureas

- DRUG ACTION The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

- CONTRA-INDICATIONS Presence of ketoacidosis

- CAUTIONS Can encourage weight gain (should be taken at the lowest dose that adequately controls blood glucose) - elderly - G6PD deficiency

- SIDE-EFFECTS

- COMMON or very common Abdominal pain - diarrhoea - hypoglycaemia - nausea

- UNCOMMON Hepatic disorders - vomiting

- RARE or very rare Agranulocytosis - erythropenia - granulocytopenia - haemolytic anaemia - leucopenia - pancytopenia - thrombocytopenia

- FREQUENCY not known Allergic dermatitis (usually in the first 6–8 weeks of therapy) - constipation - visual impairment

- HEPATIC IMPAIRMENT Jaundice may occur.

Dose adjustments Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia.

- RENAL IMPAIRMENT Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.

- PATIENT AND CARER ADVICE The risk of hypoglycaemia associated with sulfonylureas should be discussed with the
Glibenclamide

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus**
    - **Adult:** Initially 5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 1058

- **INTERACTIONS** → Appendix 1: sulfonylureas

- **SIDE-EFFECTS** Appetite decreased · gastrointestinal discomfort · SIADH · taste metallic

- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.

- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension Modified-release tablet

Gliclazide

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Adult: Initially 40–80 mg daily, adjusted according to response, increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      - Adult: Initially 30 mg daily, dose to be taken with breakfast, adjust dose according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); maximum 120 mg per day

  **DOSE EQUIVALENT AND CONVERSION**

  - Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg.

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 1058

- **INTERACTIONS** → Appendix 1: sulfonylureas

- **SIDE-EFFECTS** Anaemia · angioedema · dyspepsia · gastrointestinal disorder · hypersensitivity vasculitis · hyponatraemia · severe cutaneous adverse reactions (SCARs) · skin reactions

- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

- **BREAST FEEDING** Avoid—theroretical possibility of hypoglycaemia in the infant.

- **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Modified-release tablet**

  **CAUTIONARY AND ADVISORY LABELS** 25

Glimepiride

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus**
    - **BY MOUTH**
      - Adult: Initially 1 mg daily, adjusted according to response, then increased in steps of 1 mg every 1–2 weeks, increased to 4 mg daily, dose to be taken shortly before or with first main meal, the daily dose may be increased further, in exceptional circumstances; maximum 6 mg per day
Diabetes mellitus and hypoglycaemia

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

- Porphyria Sulfonylureas should be avoided where possible in Acute porphyrias p. 1058 but glimepiride is thought to be safe.

**INTERACTIONS** → Appendix 1: sulfonylureas

**SIDE-EFFECTS**

- Rare or very rare Gastrointestinal discomfort • Hypersensitivity vasculitis

**FREQUENCY not known** Drug cross-reactivity

**PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

**BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.

**MONITORING REQUIREMENTS** Manufacturer recommends regular hepatic and haematological monitoring but limited evidence of clinical value.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

| Tablet | Glimperide (Non-proprietary) | Glimepiride 1 mg Glimperide 1mg tablets | 30 tablet | £5.00 DT = £1.63

**Glipizide**

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

- BY MOUTH

  - Adult: Initially 2.5–5 mg daily, adjusted according to response, dose to be taken shortly before breakfast or lunch; doses up to 15 mg may be given as a single dose, higher doses to be given in divided doses; maximum 20 mg per day

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

- Porphyria Sulfonylureas should be avoided where possible in Acute porphyrias p. 1058 but glimepiride is thought to be safe.

**INTERACTIONS** → Appendix 1: sulfonylureas

**SIDE-EFFECTS**

- Common or very common Abdominal pain upper

- Uncommon Dizziness • drowsiness • skin reactions • tremor • vision disorders

- Frequency not known Confusion • headache • hyponatraemia • malaise • photosensitivity reaction

**PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

**BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.

**HEPATIC IMPAIRMENT** Avoid if the patient has both renal and hepatic impairment.

**RENAI IMPAIRMENT** Avoid if the patient has both renal and hepatic impairment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

| Tablet | Glimperide (Non-proprietary) | Glimepiride 5 mg Glimepiride 5mg tablets | 28 tablet | £3.00 DT = £2.60
| Minodiol (Pfizer Ltd) | Glimepiride 5 mg Minodiol 5mg tablets | 28 tablet | £1.26 DT = £2.60

**Tolbutamide**

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

- BY MOUTH

  - Adult: 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

**CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 1058

**INTERACTIONS** → Appendix 1: sulfonylureas

**SIDE-EFFECTS**

- Rare or very rare Aplastic anaemia • blood disorder

- Frequency not known Alcohol intolerance • appetite abnormal • erythema multiforme (usually in the first 6–8 weeks of therapy) • exfoliative dermatitis (usually in the first 6–8 weeks of therapy) • fever (usually in the first 6–8 weeks of therapy) • headache • hyponatraemia (usually in the first 6–8 weeks of therapy) • paraesthesia • photosensitivity reaction • tinnitus • weight increased

**PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

**BREAST FEEDING** The use of sulfonylureas in breastfeeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

**RENAI IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

| Tablet | Tolbutamide (Non-proprietary) | Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet | £34.88 DT = £13.74
| 112 tablet | £14.96

**BLOOD GLUCOSE LOWERING DRUGS**

**THIAZOLIDINEDIONES**

**Pioglitazone**

**DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

- BY MOUTH

  - Adult: Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

---

www.getintopharma.com
MONITORING REQUIREMENTS

- HEPATIC IMPAIRMENT
- BREAST FEEDING
- PREGNANCY

Frequency not known
- Uncommon
- Common or very common

CAUTIONS

- CONTRA-INDICATIONS History of heart failure - previous or active bladder cancer - uninvestigated macroscopic haematuria
- CAUTIONS Cardiovascular disease or in combination with insulin (risk of heart failure) - elderly (increased risk of heart failure, fractures, and bladder cancer) - increased risk of bone fractures, particularly in women - risk factors for bladder cancer

CAUTIONS, FURTHER INFORMATION Substitute insulin during peri-operative period.

INTERACTIONS Appendix 1: pioglitazone

SIDE-EFFECTS
- Common or very common Bone fracture - increased risk of infection - numbness - visual impairment - weight increased
- Uncommon Bladder cancer - insomnia
- Frequency not known Macular oedema

SIDE-EFFECTS, FURTHER INFORMATION Rare reports of liver dysfunction; discontinue if jaundice occurs.

PREGNANCY Avoid—toxicity in animal studies.

BREAST FEEDING Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Manufacturer advises avoid.

MONITORING REQUIREMENTS Monitor liver function before treatment and periodically thereafter.

DOSE ADJUSTMENTS DUE TO INTERACTIONS
- Dose of concomitant sulfonylurea or insulin may need to be reduced.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)
The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

PATIENT AND CARER ADVICE

Liver toxicity Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions The Scottish Medicines Consortium accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet
- Pioglitazone (Non-proprietary)
  - Pioglitazone (as Pioglitazone hydrochloride) 15 mg Pioglitazone 15mg tablets | 28 tablet (£89.30 DT = £1.55)
  - Pioglitazone (as Pioglitazone hydrochloride) 30 mg Pioglitazone 30mg tablets | 28 tablet (£15.89 DT = £2.20)
  - Pioglitazone (as Pioglitazone hydrochloride) 45 mg Pioglitazone 45mg tablets | 28 tablet (£39.55 DT = £2.15)
  - Actos (Takeda UK Ltd) Pioglitazone (as Pioglitazone hydrochloride) 15 mg Actos 15mg tablets | 28 tablet (£25.83 DT = £1.45)
  - Pioglitazone (as Pioglitazone hydrochloride) 30 mg Actos 30mg tablets | 28 tablet (£35.89 DT = £2.02)
  - Pioglitazone (as Pioglitazone hydrochloride) 45 mg Actos 45mg tablets | 28 tablet (£39.55 DT = £2.15)
  - Glidipion (Actavis UK Ltd) Pioglitazone (as Pioglitazone hydrochloride) 15 mg Glidipion 15mg tablets | 28 tablet (£25.83 DT = £1.45)
  - Pioglitazone (as Pioglitazone hydrochloride) 30 mg Glidipion 30mg tablets | 28 tablet (£35.89 DT = £2.02)
  - Pioglitazone (as Pioglitazone hydrochloride) 45 mg Glidipion 45mg tablets | 28 tablet (£39.55 DT = £2.15)

Pioglitazone with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, pioglitazone p. 710, metformin hydrochloride p. 692.

INDICATIONS AND DOSE

Type 2 diabetes not controlled by metformin alone
- BY MOUTH
  - Adult: 1 tablet twice daily, titration with the individual components (pioglitazone and metformin) desirable before initiation

INTERACTIONS Appendix 1: metformin - pioglitazone

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 21
- Pioglitazone with metformin (Non-proprietary)

Insulin

**INSULINS**

**INSULINS**

**Insulins**

**IMPORTANT SAFETY INFORMATION**

**NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)**

Insulin should not be extracted from insulin pen devices. The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

**SIDE-EFFECTS**

- Common or very common Odema
- Uncommon Lipodystrophy

**SIDE-EFFECTS, FURTHER INFORMATION**

Overdose Overdose causes hypoglycaemia.

**PREGNANCY**

Dose adjustments During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

**BREAST FEEDING**

Dose adjustments During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

**HEPATIC IMPAIRMENT**

Dose adjustments Insulin requirements may be decreased in patients with hepatic impairment.

**RENAL IMPAIRMENT**

The compensatory response to hypoglycaemia is impaired in renal impairment. Dose adjustments Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary.

**MONITORING REQUIREMENTS**

- Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- Since blood-glucose concentration varies substantially throughout the day, ‘normoglycaemia’ cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- In adults it is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).
- In children it is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).

While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values, strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

**DIRECTIONS FOR ADMINISTRATION**

Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy. Injection devices (‘pens’), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

**PRESCRIBING AND DISPENSING INFORMATION**

Show container to patient or carer and confirm the expected version is dispensed. Units The word ‘unit’ should not be abbreviated.

**PATIENT AND CARER ADVICE**

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 QFH

Insuman Comb (Eli Lilly and Company Ltd)  Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Insuman Comb 30 100 units/ml suspension for injection 3ml cartridges | 5 cartridge | £15.70 DT = £15.70

Insuman Comb 30 (Sanofi)  Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Insuman Comb 30 100 units/ml suspension for injection 3ml cartridges | 5 cartridge | £22.40 DT = £25.46

Insuman Comb 30 (Sanofi)  Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Insuman Comb 30 100 units/ml suspension for injection 3ml cartridges | 5 cartridge | £32.61 DT = £37.61

Insuman Comb 30 (Sanofi)  Insulin human (as Insulin isophane human) 25 unit per 1 ml, Insulin human (as Insulin soluble human) 75 unit per 1 ml Insuman Comb 30 100 units/ml suspension for injection 3ml cartridges | 5 cartridge | £61.31 DT = £68.31

Insuman Comb 30 (Sanofi)  Insulin human (as Insulin isophane human) 25 unit per 1 ml, Insulin human (as Insulin soluble human) 75 unit per 1 ml Insuman Comb 30 100 units/ml suspension for injection 3ml cartridges | 5 cartridge | £119.50 DT = £121.61

Insuman Comb 30 (Sanofi)  Insulin human (as Insulin isophane human) 25 unit per 1 ml, Insulin human (as Insulin soluble human) 75 unit per 1 ml Insuman Comb 30 100 units/ml suspension for injection 3ml cartridges | 5 cartridge | £210.70 DT = £221.10

Insuman Comb 30 (Sanofi)  Insulin human (as Insulin isophane human) 25 unit per 1 ml, Insulin human (as Insulin soluble human) 75 unit per 1 ml Insuman Comb 30 100 units/ml suspension for injection 3ml cartridges | 5 cartridge | £466.95 DT = £492.95

Insuman Comb 30 (Sanofi)  Insulin human (as Insulin isophane human) 25 unit per 1 ml, Insulin human (as Insulin soluble human) 75 unit per 1 ml Insuman Comb 30 100 units/ml suspension for injection 3ml cartridges | 5 cartridge | £759.20 DT = £829.20

Insuman Comb 30 (Sanofi)  Insulin human (as Insulin isophane human) 25 unit per 1 ml, Insulin human (as Insulin soluble human) 75 unit per 1 ml Insuman Comb 30 100 units/ml suspension for injection 3ml cartridges | 5 cartridge | £1469.95 DT = £1579.95

Insuman Comb 30 (Sanofi)  Insulin human (as Insulin isophane human) 25 unit per 1 ml, Insulin human (as Insulin soluble human) 75 unit per 1 ml Insuman Comb 30 100 units/ml suspension for injection 3ml cartridges | 5 cartridge | £2959.95 DT = £3179.95
Isophane insulin

(Isophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane insulin (NPH)—intermediate acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**
- **BY SUBCUTANEOUS INJECTION**
- Child: According to requirements
- Adult: According to requirements

**INTERACTIONS** → Appendix 1: insulins

**PREGNANCY** Recommended where longer-acting insulins are needed.

**PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
- **Humulin I** (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin isophane human) 100 unit per 1 ml
  - Humulin I 100 units/ml suspension for injection 10ml vials | 1 vial (PMS) £15.68 DT = £15.68
  - Humulin I 100 units/ml suspension for injection 3ml cartridges | 5 cartridge (PMS) £19.08 DT = £19.08
- **Humulin I KwikPen** (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin isophane human) 100 unit per 1 ml
  - Humulin I KwikPen 100 units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (PMS) £21.70 DT = £21.70
- **Humalog Mix**
  - Insulin aspart (as Insulin aspart protamine) 70 unit/ml suspension for injection 10ml vials | 1 vial (PMS) £32.80 DT = £32.80
  - Humalog Mix 30 FlexPen (Novo Nordisk Ltd)
  - Insulin aspart 30 unit/ml suspension for injection 3ml cartridges | 5 cartridge (PMS) £28.79 DT = £28.79
- **Insulin lispro** (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin isophane human) 100 unit per 1 ml
  - Insulin lispro 25 unit/ml suspension for injection 3ml cartridges | 5 cartridge (PMS) £22.90 DT = £22.90
  - Insuman Basal (Sanofi)
  - Insulin lispro 25 unit/ml suspension for injection 3ml cartridges | 5 cartridge (PMS) £17.50 DT = £17.50
  - Insuman Basal SoloStar (Sanofi)
  - Insulin lispro 25 unit/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection (PMS) £21.70
  - Insuman Basal (Sanofi)
  - Insulin human (as Insulin isophane human) 100 unit per 1 ml
  - Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulin Basal 100 units/ml suspension for injection 5ml vials | 1 vial (PMS) £5.61
  - Insulin Basal 100 units/ml suspension for injection 3ml cartridges | 5 cartridge (PMS) £19.08 DT = £19.08
  - Insuman Basal SoloStar (Sanofi)
  - Insulin lispro 25 unit/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection (PMS) £21.70

**Interactions** → Appendix 1: insulins

**Side-effects**
- Uncommon Skin reactions

**Prescribing and dispensing information** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
- **NovoMix 30 FlexPen** (Novo Nordisk Ltd)
  - Insulin aspart 30 unit/ml suspension for injection 3ml cartridges | 5 cartridge (PMS) £28.79 DT = £28.79
- **NovoMix 30 Penfill** (Novo Nordisk Ltd)
  - Insulin aspart 30 unit/ml suspension for injection 3ml cartridges | 5 cartridge (PMS) £28.79 DT = £28.79

**Biphasic insulin aspart**

(Intermediate-acting insulin)

**INDICATIONS AND DOSE**

**Diabetes mellitus**
- **BY SUBCUTANEOUS INJECTION**
- Child: Administer up to 15 minutes before or soon after a meal, according to requirements
- Adult: Administer up to 15 minutes before or soon after a meal, according to requirements

**INTERACTIONS** → Appendix 1: insulins

**SIDE-EFFECTS**
- Rare Hypoglycaemia

**Prescribing and dispensing information** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
- **Humalog Mix25** (Eli Lilly and Company Ltd)
  - Insulin lispro 25 unit/ml suspension for injection 10ml vials | 1 vial (PMS) £16.61 DT = £16.61
  - Humalog Mix25 100 units/ml suspension for injection 3ml cartridges | 5 cartridge (PMS) £29.46 DT = £29.46
  - Humalog Mix25 KwikPen (Eli Lilly and Company Ltd)
  - Insulin lispro 25 unit/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (PMS) £39.98 DT = £39.98

**Biphasic insulin lispro**

(Intermediate-acting insulin)

**INDICATIONS AND DOSE**

**Diabetes mellitus**
- **BY SUBCUTANEOUS INJECTION**
- Child: Administer up to 15 minutes before or soon after a meal, according to requirements
- Adult: Administer up to 15 minutes before or soon after a meal, according to requirements

**INTERACTIONS** → Appendix 1: insulins

**Prescribing and dispensing information** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
- **Humalog Mix25** (Eli Lilly and Company Ltd)
  - Insulin lispro 25 unit/ml suspension for injection 10ml vials | 1 vial (PMS) £16.61 DT = £16.61
  - Humalog Mix25 100 units/ml suspension for injection 3ml cartridges | 5 cartridge (PMS) £29.46 DT = £29.46
  - Humalog Mix25 KwikPen (Eli Lilly and Company Ltd)
  - Insulin lispro 25 unit/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (PMS) £39.98 DT = £39.98
In children 
All Wales Medicines Strategy Group (AWMSG) decisions 
AWMSG No. 3158 
In children The All Wales Medicines Strategy Group has advised (October 2016) that insulin degludec (Tresiba®) is not recommended for use within NHS Wales for the treatment of diabetes mellitus in adolescents and children from the age of 1 year.

Insulin detemir 
(Recombinant human insulin analogue–long acting) 

● INDICATIONS AND DOSE 
Diabetes mellitus 
BY SUBCUTANEOUS INJECTION 
Child: 2-17 years: According to requirements 
Adult: According to requirements 

● INTERACTIONS → Appendix 1: insulins 

● SIDE-EFFECTS 
Uncommon Refraction disorder 
PREGNANCY 
Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
Solution for injection 
Levemir FlexPen (Novo Nordisk Ltd) 
Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £42.00 DT + £14.00
Insulin glargine

(Recombinant human insulin analogue—long acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**

- **BY SUBCUTANEOUS INJECTION**
- **Child: 2 - 17 years:** According to requirements
- **Adult:** According to requirements

Toujeo®

**Diabetes mellitus**

- **BY SUBCUTANEOUS INJECTION**
- **Adult:** According to requirements

**INTERACTIONS** → Appendix 1: insulins

**SIDE-EFFECTS**

- Rare or very rare: Myalgia - sodium retention - taste altered

**PREGNANCY**

Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

**PRESCRIBING AND DISPENSING INFORMATION**

Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised that Lantus® preparations (April 2013) and Toujeo® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin

It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Abasaglar (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
  - Abasaglar 100units/ml solution for injection 3ml cartridges | 5 pre-filled disposable injection | £42.00 DT = £42.00
- Toujeo (Sanofi)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
  - Toujeo 100units/ml solution for injection 3ml cartridges | 5 pre-filled disposable injection | £51.30 DT = £37.77

**Insulin glargine with lixisenatide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin glargine above, lixisenatide p. 700.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus [in combination with metformin]

- **BY SUBCUTANEOUS INJECTION**
- **Adult:** (consult product literature)

**INTERACTIONS** → Appendix 1: insulins - lixisenatide

**PRESCRIBING AND DISPENSING INFORMATION**

Suliqua® is available in two pen strengths, providing different dosing options. To avoid medication errors, the prescriber must ensure that the correct strength and number of dose steps is prescribed. The manufacturer of Suliqua® has provided a healthcare professional guide and letter which includes important information on dosing.

**PATIENT AND CARER ADVICE**

Manufacturer advises check pen label before each administration to avoid medication error.

A patient guide should be provided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Abasaglar (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
  - Abasaglar 100units/ml solution for injection 3ml cartridges | 5 pre-filled disposable injection | £35.28 DT = £37.77
- Abasaglar KwikPen (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
  - Abasaglar KwikPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection | £35.28 DT = £37.77
- Lantus (Sanofi)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
  - Lantus 100units/ml solution for injection 3ml cartridges | 5 pre-filled disposable injection | £37.77 DT = £37.77
- Semglee (Mylan)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
  - Semglee 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection | £29.99 DT = £37.77
- Toujeo (Sanofi)
  - Insulin human (as Insulin glargine) 300 unit per 1 ml
  - Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pen | 3 pre-filled disposable injection | £33.13 DT = £33.13
- Toujeo DoubleStar (Sanofi)
  - Insulin human (as Insulin glargine) 300 unit per 1 ml
  - Toujeo 300units/ml solution for injection 3ml pre-filled DoubleStar pen | 3 pre-filled disposable injection | £66.26

**Insulin zinc suspension**

(Insulin zinc suspension (mixed)—long acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**

- **BY SUBCUTANEOUS INJECTION**
- **Child:** According to requirements
- **Adult:** According to requirements

**INTERACTIONS** → Appendix 1: insulins

**SIDE-EFFECTS**

Hypokalaemia - weight increased

**PREGNANCY**

Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 716 is recommended where longer-acting insulins are needed; insulin detemir p. 717 may also be considered.

**PRESCRIBING AND DISPENSING INFORMATION**

A sterile neutral suspension of bovine and/or porcine insulin or human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).
3.1a Diabetes, diagnosis and monitoring

Diabetes mellitus, diagnostic and monitoring devices

Urinalysis: urinary glucose

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with Micro-Al Test Kit® but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood glucose monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood ketones should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Other drugs used for Diabetes, diagnosis and monitoring

Glucose, p. 1041

Blood glucose testing strips

### Hypodermic insulin injection pens

#### HYPODERMIC INSULIN INJECTION PENS

**A U T O P E N ® 24**

- **Autopen® 24** (for use with Sanofi- Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).
- **Autopen 24** hypodermic insulin injection pen reusable for 3ml cartridge 1 unit dial up / range 1-21 units (Owen Mumford Ltd)
  - 1 device - NHS indicative price = £16.71 - Drug Tariff (Part IX)
- **Autopen 24** hypodermic insulin injection pen reusable for 3ml cartridge 2 unit dial up / range 2-42 units (Owen Mumford Ltd)
  - 1 device - NHS indicative price = £16.71 - Drug Tariff (Part IX)

**C L I K S T A R ®**

- For use with Lantus®, Apidra®, and Insulan® 3-mL insulin cartridges, allowing 1-unit dose adjustment, max. 80 units.

**H U M A P E N ® L U X U R A H D**

- For use with Humulin® and Humalog® 3-mL cartridges; allowing 0.5-unit dosage adjustment, max. 30 units.
- HumaPen Luxura HD hypodermic insulin injection pen reusable for 3ml cartridge 0.5 unit dial up / range 0-30 units (Eli Lilly and Company Ltd)
  - 1 device - NHS indicative price = £27.01 - Drug Tariff (Part IX)

**N O V O P E N ® 4**

- For use with Penfil® 3-mL insulin cartridges; allowing 1-unit dosage adjustment, max. 60 units.
- NovoPen 4 hypodermic insulin injection pen reusable for 3ml cartridge 1 unit dial up / range 1-60 units (Novo Nordisk Ltd)
  - 1 device - NHS indicative price = £26.86 - Drug Tariff (Part IX)

**S I N S U E T ®**

- For use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max 40 units.
- Available as starter set (Insulet® device, nozzle cap, nozzle and piston, 1 × 10-mL adaptor, 1 × 3-mL adaptor, 1 cartridge cap removal key), nozzle pack (15 nozzles), cartridge adaptor pack (15 adaptors), or vial adaptor pack (15 adaptors).
- Insulet starter set (Spirit Healthcare Ltd)
  - 1 pack - NHS indicative price = £90.00 - Drug Tariff (Part IX)

### Needle free insulin delivery systems

#### NEEDLE FREE INSULIN DELIVERY SYSTEMS

**I N S U J E T ®**

- For use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max 40 units.
- Diastix testing strips (Ascensia Diabetes Care UK Ltd)
  - 50 strip - NHS indicative price = £2.89 - Drug Tariff (Part IX)
- MediTest Glucose testing strips (BHR Pharmaceuticals Ltd)
  - 50 strip - NHS indicative price = £2.53 - Drug Tariff (Part IX)
Endocrine system

3.2 Hypoglycaemia

Hypoglycaemia

Treatment of hypoglycaemia

Initially glucose p. 1041.10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. If necessary this may be repeated after 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal (if it is due) can prevent blood-glucose concentration from falling again.

Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrogel®, GSF-Syrup®, Rapilose®) are available on prescription for patients to keep on hand in case of hypoglycaemia.

Alternatively, approximately 10 g of glucose is available from 2 teaspoons of sugar, or from 3 sugar lumps, and also from non-diet versions of the following soft drinks: 110 mL of Lucozade® Energy Original (also, see note below), 100 mL of Coca-Cola®, 19 mL of Ribena® Blackcurrant (to be diluted).

Note: The carbohydrate content of some commercially available glucose-containing drinks is currently subject to change—individual product labels should be checked.

Patients should be aware that for a time, both old and new bottles and cans may be available—individual product labels should be checked.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon, below, a polypeptide hormone secreted by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an ‘if necessary’ basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 20% may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

See also, emergency management of hypoglycaemia in dental practice for further advice.

Chronic hypoglycaemia

Diazoxide p. 725, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

GLYCOGENOLYTIC HORMONES

Glucagon

- INDICATIONS AND DOSE

Insulin-induced hypoglycaemia

BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

Child: 1 month–1 year: 500 micrograms

Child: 2–17 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given

Child: 2–17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given

Adult: 1 mg, if no response within 10 minutes intravenous glucose must be given

Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

BY INTRAVENOUS INJECTION

Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

Adult: 2–10 mg, to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

Dose and indication for cardiogenic shock unresponsive to atropine

Adult: (consult product literature)

DOSE EQUVALENT AND CONVERSION

1 unit of glucagon = 1 mg of glucagon.

- UNLICENSED USE

Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

- CONTRA-INDICATIONS

Phaeochromocytoma

- CAUTIONS

Glucoagonoma - ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency - insulinoma

- INTERACTIONS

Appendix 1: glucagon

- SIDE-EFFECTS

Common or very common Nausea

Uncommon Vomiting

Rare or very rare Abdominal pain - hypotension - hypotension - tachycardia

- DIRECTIONS FOR ADMINISTRATION

With intravenous use in children When administered by continuous intravenous infusion, do not add to infusion fluids containing calcium—precipitation may occur.

- PATIENT AND CARER ADVICE

Medicines for Children leaflet: Glucagon for hypoglycaemia

www.medicinesforchildren.org.uk/glucagon-hypoglycaemia
3.2a Chronic hypoglycaemia

GLYCOGENOLYTIC HORMONES

Diazoxide

- **INDICATIONS AND DOSE**
  - Chronic intractable hypoglycaemia
    - **BY MOUTH**
    - Adult: Initially 5 mg/kg daily in 2–3 divided doses, adjusted according to response; maintenance 3–8 mg/kg daily in 2–3 divided doses

- **CAUTIONS**
  - Aortic coarctation • aortic stenosis • arteriovenous shunt • heart failure • hyperuricaemia • impaired cardiac circulation • impaired cerebral circulation

- **INTERACTIONS**
  - → Appendix 1: diazoxide

- **SIDE-EFFECTS**
  - Abdominal pain • albuminuria • appetite decreased (long term use) • arrhythmia • azotaemia • cardiomegaly • cataract • constipation • diabetic hyperosmolar coma • diarrhoea • dizziness • dyspnoea • eosinophilia • extrapyramidal symptoms • fever • fluid retention • galactorrhoea • haemorrhage • headache • heart failure • hirsutism • hyperglycaemia • hyperuricaemia (long term use) • hypogammaglobulinaemia • hypotension • ileus • ketoacidosis • leucopenia • libido decreased • musculoskeletal pain • nausea • nephritic syndrome • oculargrycic crisis • pancreatitis • parkinsonism • pulmonary hypertension • skin reactions • sodium retention • taste altered • thrombocytopenia • tinnitus • vision disorders • voice alteration (long term use) • vomiting

- **PREGNANCY**
  - Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT**
  - Dose adjustments
    - Dose reduction may be required.

- **MONITORING REQUIREMENTS**
  - Monitor blood pressure.
  - Monitor white cell and platelet count during prolonged use.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

  **Tablet**
  - Eudemine (RPH Pharmaceuticals AB)
  - Diazoxide 50 mg • Eudemine 50mg tablets | 100 tablet | £46.45

  **Capsule**
  - Proglycem (Imported (Germany))
  - Diazoxide 25 mg • Proglycem 25 capsules | 100 capsule | £52

Osteoporosis

**Description of condition**

Osteoporosis is a progressive bone disease characterised by low bone mass measured by bone mineral density (BMD), and microarchitectural deterioration of bone tissue. This leads to an increased risk of fragility fractures as a result. Osteoporosis is considered severe if there have been one or more fragility fractures.

Osteoporosis occurs most commonly in postmenopausal women, men over 50 years, and in patients taking long-term oral corticosteroids (glucocorticoids). Risk factors for osteoporosis include age, low body mass index (BMI), cigarette smoking, excess alcohol intake, lack of physical activity, vitamin D deficiency and low calcium intake, family history of hip fractures, a previous fracture at a site characteristic of osteoporotic fractures and early menopause. Some diseases are also known to be associated with osteoporosis such as rheumatoid arthritis and diabetes.

**Aims of treatment**

A combination of lifestyle changes and drug treatment aims to prevent bone fractures in patients with osteoporosis.

**Lifestyle changes**

- Patients should be encouraged to increase their level of physical activity, stop smoking, maintain a normal BMI level (between 20–25 kg/m²), and reduce their alcohol intake to improve their bone health and reduce the risk of fragility fractures. A For guidance on stopping smoking, see Smoking cessation p. 497.

- Patients at risk of osteoporosis should also ensure an adequate intake of calcium and vitamin D, preferably through increasing dietary intake.

- Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and can benefit from supplements. A Elderly patients also have an increased risk of falls (see Prescribing in the elderly p. 30).

**Drug treatment**

**Postmenopausal osteoporosis**

The therapeutic options for the prevention and treatment of osteoporosis in postmenopausal women are the same. Oral bisphosphonates, alendronic acid p. 727 and risedronate sodium p. 730 are considered as first-line choices for most patients with postmenopausal osteoporosis due to their broad spectrum of anti-fracture efficacy. Alendronic acid and risedronate sodium have been shown to reduce occurrence of vertebral, non-vertebral and hip fractures. Intravenous bisphosphonates (ibandronic acid p. 728 or zoledronic acid p. 732), denosumab p. 734, or raloxifene hydrochloride p. 754 are alternative options in women who are intolerant of oral bisphosphonates or in whom they are contra–indicated.

Hormone replacement therapy (HRT) is an additional option. The use of HRT for osteoporosis is generally restricted to younger postmenopausal women with menopausal symptoms who are at high risk of fractures. This is due to the risk of adverse effects such as cardiovascular disease and cancer in older postmenopausal women and women on long-term HRT therapy.

Teriparatide p. 734 is reserved for postmenopausal women with severe osteoporosis at very high risk for vertebral fractures. Its duration of treatment is limited to 24 months.

**A**
Glucocorticoid-induced osteoporosis
Glucocorticoid therapy is associated with bone loss and increased risk of fractures. The greatest rate of bone loss occurs early after initiation of glucocorticoids and increases with dose and duration of therapy. **Bone-protection treatment** should be started at the onset of therapy in patients who are at a high risk of fracture. If glucocorticoid therapy is stopped, the need to continue bone-protection treatment should be reviewed. However, bone-protection treatment should be continued with long-term glucocorticoid therapy. Complex cases of glucocorticoid-induced osteoporosis should be referred to a specialist.

Women aged 70 years or over, or with a previous fragility fracture, or taking large doses of glucocorticoids (prednisolone ≥ 7.5 mg daily or equivalent) are at high risk of fractures and should be assessed for prophylactic bone-protection. Some younger patients, particularly those with a previous history of fracture or receiving high doses of glucocorticoids can also be considered for bone-protection treatment.

The therapeutic options for prophylaxis and treatment of glucocorticoid-induced osteoporosis are the same; oral bisphosphonates, alendronic acid, or risedronate sodium are first-line options. Intravenous zoledronic acid or teriparatide are alternatives in patients intolerant of oral bisphosphonates or in whom they are contra-indicated.

Osteoporosis in men
Oral bisphosphonates, alendronic acid or risedronate sodium are recommended as first-line treatments for osteoporosis in men. Intravenous zoledronic acid or denosumab are alternatives in men who are intolerant of oral bisphosphonates or in whom they are contra-indicated; teriparatide is an additional option.

Men having long-term androgen deprivation therapy for prostate cancer have an increased fracture risk. Fracture risk should be assessed when starting this therapy. A bisphosphonate can be offered to men with confirmed osteoporosis; denosumab is an alternative if bisphosphonates are contra-indicated or not tolerated.

**Bisphosphonates: treatment duration**
There is some evidence to suggest that patients can benefit from a bisphosphonate-free period as their therapeutic effects last for some time after cessation of treatment.

Bisphosphonate treatment should be reviewed after 5 years of treatment with alendronic acid, risedronate sodium or ibandronic acid, and after 3 years of treatment with zoledronic acid. Patients over 75 years of age, or with a history of previous hip or vertebral fracture, or patients who have had one or more fragility fractures during treatment, or who are taking long-term glucocorticoid therapy can continue bisphosphonates beyond this period.

**Useful Resources**

**Other drugs used for Disorders of bone metabolism**
Calcitriol, p. 1083

---

**ANABOLIC STEROIDS**

**Nandrolone**

- **INDICATIONS AND DOSE**
  - **Osteoporosis in postmenopausal women (but not recommended)**
    - BY DEEP INTRAMUSCULAR INJECTION
      - Adult (female): 50 mg every 3 weeks.
  - **CONTRA-INDICATIONS**
    - Acute porphyrias p. 1058
  - **CAUTIONS**
    - Cardiac impairment - diabetes mellitus - epilepsy - hypertension - migraine - skeletal metastases (risk of hypercalcaemia)
  - **INTERACTIONS**
    - Appendix 1: nandrolone
  - **SIDE-EFFECTS**
    - Clitoris enlarged - dysphonia - hepatic disorders - hepatic neoplasm - hirsutism - hypertension - libido increased - nausea - oedema - skin reactions - sodium retention - urine flow decreased - virilism (with high doses including voice changes - sometimes irreversible)
  - **HEPATIC IMPAIRMENT**
    - Manufacturer advises caution in severe impairment (discontinue treatment if hepatic function worsens or if oedema, with or without congestive heart failure, develops).
  - **RENAL IMPAIRMENT**
    - Use with caution—may cause sodium and water retention.
  - **LESS SUITABLE FOR PRESCRIBING**
    - Nandrolone injection is less suitable for prescribing.
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - EXCIPIENTS: May contain Arachis (peanut) oil, benzyl alcohol
    - Nandrolone decanoate 50 mg per 1 ml Deca-Durabolin 50mg/1ml solution for injection ampoules | 1 ampoule (dose recommended) [£3.17 (excl)]

**BISPHOSPHONATES**

**Bisphosphonates**

- **DRUG ACTION**
  - Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVISORY BOARD: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis. The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease.
Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

### Side-effects

- **Common or very common** Alopeica · anaemia · arthralgia · asthenia · constipation · diarrhoea · dizziness · dysphagia · electrolyte imbalance · eye inflammation · fever · gastritis · gastrointestinal discomfort · headache · influenza like illness · malaise · myalgia · nausea · oesophageal ulcer (discontinue) · oesophagitis (discontinue) · pain · peripheral oedema · renal impairment · skin reactions · taste altered · vomiting

- **Uncommon** Anaphylactic reaction · angioedema · bronchospasm · oesophageal stenosis (discontinue) · osteonecrosis

- **Rare or very rare** Atypical femur fracture · Stevens–Johnson syndrome

### Patient and Carer Advice

**Atypical femoral fractures** Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

**Osteonecrosis of the jaw** During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.

**Osteonecrosis of the external auditory canal** Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

### Indications and dose

**Treatment of postmenopausal osteoporosis**

| BY MOUTH | Adult (female): 10 mg daily, alternatively 70 mg once weekly. |

**Treatment of osteoporosis in men**

| BY MOUTH | Adult (male): 10 mg daily. |

**Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy**

| BY MOUTH | Adult (female): 10 mg daily. |

### Contra-indications

- Abnormalities of oesophagus - hypocalcaemia - other factors which delay emptying (e.g. stricture or achalasia)

### Caution

- Active gastrointestinal bleeding - atypical femoral fractures - duodenitis - dysphagia - exclude other causes of osteoporosis - gastritis - history (within 1 year) of ulcers - surgery of the upper gastrointestinal tract - symptomatic oesophageal disease - ulcers - upper gastrointestinal disorders

### Interactions

- **Common or very common** Gastrointestinal disorders - joint swelling - vertigo

- **Uncommon** Haemorrhage

- **Rare or very rare** Femoral stress fracture - oropharyngeal ulceration - photosensitivity reaction - severe cutaneous adverse reactions (SCARs)

### Side-effects, Further Information

Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

### Pregnancy

Avoid.

### Breast Feeding

Manufacturer advises avoid—no information available.

### Renal Impairment

Avoid if eGFR less than 35 mL/minute/1.73 m².

### Monitoring Requirements

Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.

### Directions for Administration

Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

### Patient and Carer Advice

Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution. Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.
**Alendronic acid with colecalciferol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, alendronic acid p. 727, colecalciferol p. 1084.

**INDICATIONS AND DOSE**

**Treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency**

- **BY MOUTH**
  - Adult (female): 1 tablet once weekly.

**INTERACTIONS** → Appendix 1: bisphosphonates - vitamin D substances

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- **Bisphosphonates for treating osteoporosis (updated February 2018)** NICE TA464

This technology appraisal guidance should be applied clinically in conjunction with:

- **NICE guideline on assessing the risk of fragility fractures (CG146)**, which defines who is eligible for osteoporotic fracture risk assessment.

- **NICE quality standard on osteoporosis (QS149)**, which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

Alendronic acid is recommended as an option for treating osteoporosis in patients, only if:

- the person is eligible for risk assessment as defined in the full NICE guideline on osteoporosis, and

- the 10-year probability of osteoporotic fracture fragility is at least 1%.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangement, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta464](www.nice.org.uk/guidance/ta464)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1137/16

The Scottish Medicines Consortium has advised (April 2016) that alendronic acid (Binosto®) is accepted for restricted use within NHS Scotland for the treatment of postmenopausal osteoporosis where alendronic acid is the appropriate treatment choice, but the patient is unable to swallow tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of medicines containing the same drug.

**Tablet**

- **Alendronic acid with colecalciferol (Non-proprietary)**

  Colecalciferol 70 microgram, Alendronic acid (as Alendronate sodium) 70 mg | 4 tablet (PDB) £22.80-£24.94 DT = £24.94

  Colecalciferol 140 microgram, Alendronic acid (as Alendronate sodium) 70 mg | 4 tablet (PDB) £45.25

- **Fosavance** (Merck Sharp & Dohme Ltd)

  Colecalciferol 70 microgram, Alendronic acid (as Alendronate sodium) 70 mg | 4 tablet (PDB) £22.80 DT = £24.94

- **Bentexo** (Conscient Health Ltd)

  Colecalciferol 70 microgram, Alendronic acid (as Alendronate sodium) 70 mg | 4 tablet (PDB) £22.80 DT = £24.94

**lindsay acid**

**INDICATIONS AND DOSE**

**Reduction of bone damage in bone metastases in breast cancer**

- **INITIALLY BY MOUTH**
  - Adult: 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3–4 weeks

**Hypercalcaemia of malignancy**

- **BY INTRAVENOUS INFUSION**
  - Adult: 2–4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

**TREATMENT OF POSTMENOPAUSAL OSTEOPOROSIS**

- **INITIALLY BY MOUTH**
  - Adult (female): 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

Hypocalcaemia

**SPECIFIC CONTRA-INDICATIONS**

- With oral use Abnormalities of the oesophagus - other factors which delay emptying (e.g. stricture or achalasia)

**CAUTIONS**

- Atypical femoral fractures - cardiac disease (avoid fluid overload)

**INTERACTIONS** → Appendix 1: bisphosphonates

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Face oedema

- Uncommon Asthma exacerbated

**SPECIFIC SIDE-EFFECTS**

- Common or very common
  - With intravenous use Bundle branch block - cataract - increased risk of infection - joint disorder - oral disorders - osteoarthritis - parathyroid disorder - thirst
  - With oral use Acute phase reaction - gastrointestinal disorders - muscle cramps - musculoskeletal stiffness

- Uncommon
- pulmonary oedema - radiculopathy - renal cyst - sleep disorder - stridor - urinary retention - weight decreased

- Rare or very rare
- With intravenous use
- Hypersensitivity
- Frequency not known
- With oral use
- Oesophagitis erosive (discontinue)
- PREGNANCY
- Avoid.
- BREAST FEEDING
- Avoid—present in milk in animal studies.

- RENAL IMPAIRMENT
- When used for postmenopausal osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m².

**Dose adjustments**
- With intravenous use
  - When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 4 mg and infuse over 1 hour; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 2 mg and infuse over 1 hour.
  - With oral use
    - When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 50 mg on alternative days; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 50 mg once weekly.

- MONITORING REQUIREMENTS
- Monitor renal function and serum calcium, phosphate and magnesium.

- DIRECTIONS FOR ADMINISTRATION
- Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes after food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet.

  For intravenous infusion (Bondronat®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours.

- PATIENT AND CARER ADVICE
- Patients or carers should be given advice on how to administer ibandronic acid tablets. Oesophageal reactions Patients and carers should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

  Patient reminder card A patient reminder card should be provided to patients receiving intravenous ibandronic acid (risk of osteonecrosis of the jaw).

- NATIONAL FUNDING/ACCESS DECISIONS

  - NICE decisions
    - Bisphosphonates for treating osteoporosis (updated February 2018) NICE TA464
      - This technology appraisal guidance should be applied clinically in conjunction with:
        - NICE guideline on assessing the risk of fragility fractures (CG146), which defines who is eligible for osteoporotic fracture risk assessment.
        - NICE quality standard on osteoporosis (QS149), which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

      **With oral use**
      - ibandronic acid is recommended as an option for treating osteoporosis in patients, only if:
        - the person is eligible for risk assessment as defined in the full NICE guideline on osteoporosis, and
        - the 10-year probability of osteoporotic fragility fracture is at least 1%.

      **With intravenous use**
      - ibandronic acid is recommended as an option for treating osteoporosis in patients, only if:
        - the person is eligible for risk assessment as defined in the full NICE guideline on osteoporosis, and
        - the 10-year probability of osteoporotic fragility fracture is at least 10%, or
        - the 10-year probability of osteoporotic fragility fracture is at least 1% and the person has difficulty taking oral bisphosphonates (alendronic acid, ibandronic acid or risedronate sodium) or these drugs are contra-indicated or not tolerated.

  - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

    - www.nice.org.uk/guidance/ta464

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - ibandronic acid (Non-proprietary)
    - ibandronic acid (as ibandronic sodium monohydrate) 1 mg per 1 mL ibandronic acid 3 mg/3 mL solution for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £65.20–£66.00 DT = £65.40
    - Bonviva (Atnahs Pharma UK Ltd)
      - ibandronic acid (as ibandronic sodium monohydrate) 1 mg per 1 mL Bonviva 3 mg/3 mL solution for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £68.64 DT = £65.40

  **Solution for infusion**
  - ibandronic acid (Non-proprietary)
    - ibandronic acid (as ibandronic sodium monohydrate) 1 mg per 1 mL ibandronic acid 6 mg/6 mL concentrate for solution for infusion vials | 1 vial (PFS) £130.42 (Hospital only)
      - ibandronic acid 2 mg/2 mL concentrate for solution for infusion vials | 1 vial (PFS) £43.47 (Hospital only)
    - Bondronat (Atnahs Pharma UK Ltd)
      - ibandronic acid (as ibandronic sodium monohydrate) 1 mg per 1 mL Bondronat 2 mg/2 mL concentrate for solution for infusion vials | 1 vial (PFS) £89.36 (Hospital only)
      - Bondronat 6 mg/6 mL concentrate for solution for infusion vials | 1 vial (PFS) £183.69

  **Tablet**
  - ibandronic acid (Non-proprietary)
    - ibandronic acid (as ibandronic sodium monohydrate) 50 mg | 28 tablet (PFS) £186.69 DT = £26.30
    - ibandronic acid (as ibandronic sodium monohydrate) 150 mg | 150 mg tablets | 1 tablet (PFS) £19.95 DT = £1.10
    - Bondronat (Atnahs Pharma UK Ltd)
      - ibandronic acid (as ibandronic sodium monohydrate) 50 mg | 50 mg tablets | 28 tablet (PFS) £183.69 DT = £26.30
      - ibandronic acid (as ibandronic sodium monohydrate) 150 mg | 150 mg tablets | 1 tablet (PFS) £18.40 DT = £1.10
  - Iasibon (Aspire Pharma Ltd)
    - ibandronic acid (as ibandronic sodium monohydrate) 50 mg | 50 mg tablets | 28 tablet (PFS) £174.50 DT = £26.30
    - Quodixor (Aspire Pharma Ltd)
      - ibandronic acid (as ibandronic sodium monohydrate) 150 mg | 150 mg tablets | 1 tablet (PFS) £18.40 DT = £1.10

**Pamidronate disodium**

(Formerly called aminohydroxypropyldenediphosphonate disodium (APD))

- INDICATIONS AND DOSE

  **Hypercalcaemia of malignancy**
  - Adult: 15–50 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course

  **Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma**
  - By intravenous infusion
    - Adult: 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may continued →

**Disorders of bone metabolism**

### Paget’s disease of bone

- **BY INTRAVENOUS INFUSION**
  - Adult: 30 mg every week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course

### Contraindications

- Atypical femoral fractures - cardiac disease (especially in elderly) - ensure adequate hydration - previous thyroid surgery (risk of hypocalcaemia)

### Interactions

- Appendix 1: bisphosphonates

### Side-effects

- **Common or very common** Appetite decreased - chills - decreased leucocytes - drowsiness - flushing - hypertension - insomnia - paraesthesia - tetany - thrombocytopenia
- **Uncommon** Agitation - dyspnoea - hypotension - muscle cramps - seizure
- **Rare or very rare** Confusion - glomerulonephritis - haematuria - heart failure - nephritis tubulointerstitial - nephrotic syndrome - oedema - pulmonary oedema - reactivation of infections - renal disorder exacerbated - renal tubular disorder - respiratory disorders - visual hallucinations - xanthopsia

### Frequency not known

- Atrial fibrillation

### Side-effects, Further information

**Oral supplements** are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget’s disease.

### Pregnancy

- Avoid - toxicity in animal studies.

### Breast Feeding

- Avoid.

### Hepatic impairment

- Manufacturer advises caution in severe hepatic impairment (no information available).

### Renal impairment

- **Dose adjustments** Max. infusion rate 20 mg/hour. Avoid if eGFR less than 30 mL/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk.
- If renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

### Monitoring requirements

- Monitor serum electrolytes, calcium and phosphate - possibility of convulsions due to electrolyte changes.
- Assess renal function before each dose.

### Directions for administration

- For **slow intravenous infusion** (Pamidronate disodium, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For **Pamidronate disodium** (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL

### Patient and carer advice

- A patient reminder card should be provided (risk of osteonecrosis of the jaw).
- **Driving and skilled tasks** Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

### Medicinal forms

- There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

- **Pamidronate disodium (Non-proprietary)**
  - **Pamidronate disodium 3 mg per 1 ml** Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial (Hospital only) | 5 vial (Hospital only) €14.15 (Hospital only)
  - **Pamidronate disodium 30mg/10ml solution for infusion vials** | 1 vial (Hospital only) €55.00–€98.66 (Hospital only)
  - **Pamidronate disodium 60mg/20ml solution for infusion vials** | 1 vial (Hospital only) €110.00 (Hospital only)
  - **Pamidronate disodium 90mg/30ml solution for infusion vials** | 1 vial (Hospital only) €165.00 (Hospital only)

- **Pamidronate disodium 9 mg per 1 ml** Pamidronate disodium 90mg/10ml solution for infusion vials | 1 vial (Hospital only) €170.45 (Hospital only)

- **Pamidronate disodium 15 mg per 1 ml** Pamidronate disodium 60mg/4ml solution for infusion ampoules | 1 ampoule (Hospital only) €119.32
  - Pamidronate disodium 15mg/1ml solution for infusion ampoules | 4 ampoules (Hospital only) €119.32
  - **Pamidronate disodium 90mg/6ml solution for infusion ampoules** | 1 ampoule (Hospital only) €170.46
  - Pamidronate disodium 30mg/2ml solution for infusion ampoules | 2 ampoules (Hospital only) €119.32

### Risedronate sodium

#### Indications and dose

**Paget’s disease of bone**

- **BY MOUTH**
  - Adult: 30 mg daily for 2 weeks, course may be repeated if necessary after at least 2 months

#### Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

- **BY MOUTH**
  - Adult (female): 5 mg daily, alternatively 35 mg once weekly.

#### Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women

- **BY MOUTH**
  - Adult (female): 5 mg daily.

#### Treatment of osteoporosis in men at high risk of fractures

- **BY MOUTH**
  - Adult (male): 35 mg once weekly.

### Contraindications

- Hypocalcaemia

### Caution

- Atypical femoral fractures - oesophageal abnormalities - other factors which delay transit or emptying (e.g. stricture or achalasia)

### Interactions

- Appendix 1: bisphosphonates

### Side-effects

- **Uncommon** Gastrointestinal disorders
- **Rare or very rare** Glosisitis
- **Frequency not known** Amblyopia - apnoea - chest pain - corneal lesion - dry eye - hypersensitivity - hypersensitivity vasculitis - increased risk of infection - leg cramps - liver disorder - muscle weakness - neoplasms - nocturia - tinnitus - toxic epidermal necrolysis - weight decreased

### Pregnancy

- Avoid.

### Breast feeding

- Avoid.

### Renal impairment

- Avoid if eGFR less than 30 mL/minute/1.73 m².

### Monitoring requirements

- Correct hypocalcaemia before starting.
- Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.

### Directions for administration

Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after...
**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer risedronate sodium tablets.

Oesophageal reactions. Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Bisphosphonates for treating osteoporosis (updated February 2018) NICE TA464

This technology appraisal guidance should be applied clinically in conjunction with:

- NICE guideline on assessing the risk of fragility fractures (CG146), which defines who is eligible for osteoporotic fracture risk assessment.
- NICE quality standard on osteoporosis (QS149), which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

Risedronate sodium is recommended as an option for treating osteoporosis in patients, only if:

- the person is eligible for risk assessment as defined in the full NICE guideline on osteoporosis, and
- the 10-year probability of osteoporotic fragility fracture is at least 1%.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta464

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, tablets, effervescent tablets, capsules, granules, injectable solutions, sublingual tablets, and topical products.

**Tablet**

- **Risedronate sodium (Non-proprietary)**
  - Risedronate sodium 5 mg
  - Risedronate sodium 30 mg

**Injectable**

- **Risedronate sodium**
  - Injection 3 mg/0.5 mL
  - Injection 30 mg/0.5 mL

**Transdermal film**

- **Risedronate sodium**
  - Film 3 mg (NICE-approved indication: cancer)

**Solution**

- **Risedronate sodium**
  - Solution 3 mg/0.5 mL

**Suspension**

- **Risedronate sodium**
  - Suspension 3 mg/0.5 mL

**CONTRA-INDICATIONS**

Acute gastro-intestinal inflammatory conditions

**CAUTIONS**

Atypical femoral fractures - maintain adequate fluid intake during treatment

**INTERACTIONS**

- Appendix 1: bisphosphonates
- Side-effects: Proteinuria - respiratory disorder
- Pregnancy: Avoid.
- Breastfeeding: Manufacturer advises avoid—no information available.
- Renal impairment: Avoid if eGFR less than 10 mL/minute/1.73 m².

---

**Risedronate with calcium carbonate and colecalciferol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, risedronate sodium p. 730, calcium carbonate p. 1045, colecalciferol p. 1084.

**INDICATIONS AND DOSE**

**Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures**

- **BY MOUTH**
  - Adult: 1 tablet once weekly on day 1 of the weekly cycle, followed by 1 sachet daily on days 2–6 of the weekly cycle

**INTERACTIONS**

- Appendix 1: bisphosphonates - calcium salts - vitamin D substances

**DIRECTIONS FOR ADMINISTRATION**

Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred in a glass of water and after dissolution complete taken immediately.

**PRESCRIBING AND DISPENSING INFORMATION**

**Actonel Combi**

- effervescent granules contain calcium carbonate 2.5 g (calcium 1 g or Ca²⁺ 25 mmol) and colecalciferol 22 micrograms (880 units)/sachet.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer risedronate with calcium carbonate and colecalciferol tablets and granules.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablets/Granules**

- **Actonel Combi** (Theramex HQ UK Ltd)

  - Actonel Combi 35 mg tablets and 1000 mg/880 unit effervescent granules

  - 4 week supply (POM) £19.12

---

**Sodium clodronate**

**INDICATIONS AND DOSE**

**Osteolytic lesions, hypercaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma**

- **BY MOUTH**
  - Adult: 1.6 g daily in 1–2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

**LORON 520**

**Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma**

- **BY MOUTH**
  - Adult: Initially 2 tablets daily in 1–2 divided doses, increased if necessary up to 4 tablets daily
Dose adjustments Max. initial dose 1200 mg daily if eGFR 30–50 mL/minute/1.73 m². Use half normal dose if eGFR 10–30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor renal function, serum calcium and serum phosphate before and during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

**CAUTIONARY AND ADVISORY LABELS**

- Bonefos (Bayer Plc)
- Loron (Intrapharm Laboratories Ltd)

**Sodium clodronate 800 mg** Bonefos 800mg tablets

| 60 tablet | £146.43 DT + £146.43
|-----------|---------------------|

**Sodium clodronate 520 mg** Loron 520mg tablets

| 60 tablet | £114.44 DT + £114.44

| 120 capsule | £139.83 DT + £139.83
|-------------|---------------------|

**Sodium clodronate 400 mg** Clasteon 400mg capsules

| 30 capsule | £34.96 | 120 capsule | £139.83 DT + £139.83
|------------|--------|------------|---------------------|

### Zoledronic acid

**INDICATIONS AND DOSE**

**Prevention of skeletal related events in advanced malignancies involving bone (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Adult: 4 mg every 3–4 weeks, calcium 500 mg daily and vitamin D 400 units daily should also be taken

**Tumour-induced hypercalcaemia (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Adult: 4 mg for 1 dose

**Paget's disease of bone (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Adult: 5 mg for 1 dose, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

**Osteoporosis (including corticosteroid-induced osteoporosis) in men and postmenopausal women**

- **BY INTRAVENOUS INFUSION**
  - Adult: 5 mg once yearly as a single dose, in patients with a recent low-trauma hip fracture, the dose should be given at least 2 weeks after hip fracture repair, before first infusion given 50,000–125,000 units of vitamin D

- **CAUTIONS** Atypical femoral fractures - cardiac disease (avoid fluid overload) - comitant medicines that affect renal function

- **INTERACTIONS** Appendix 1: bisphosphonates

- **SIDE-EFFECTS**
  - Common or very common Appetite decreased - chills - flushing

- **Rare or very rare** Confusion - Fanconi syndrome acquired - pancytopenia

- **Frequency not known** Acute phase reaction

**SIDE-EFFECTS, FURTHER INFORMATION** Renal impairment and renal failure have been reported; ensure patient is hydrated before each dose and assess renal function.

**CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment (limited information available).

**RENEAL IMPAIRMENT** Avoid in tumour-induced hypercalcaemia if serum creatinine above 400 micromol/litre. Avoid in advanced malignancies involving bone if eGFR less than 30 mL/minute/1.73 m² (or if serum creatinine greater than 265 micromol/litre). Avoid in Paget’s disease, treatment of postmenopausal osteoporosis and osteoporosis in men if eGFR less than 35 mL/minute/1.73 m².

**Dose adjustments** In advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks; if eGFR 40–50 mL/minute/1.73 m² reduce dose to 3.3 mg every 3–4 weeks; if eGFR 30–40 mL/minute/1.73 m² reduce dose to 3 mg every 3–4 weeks; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

- **MONITORING REQUIREMENTS**
  - Correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypercalcaemia) before starting. Monitor serum electrolytes, calcium, phosphate and magnesium.

- **Monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated.

**DIRECTIONS FOR ADMINISTRATION**

- **When used for Prevention of skeletal related events in advanced malignancies involving bone or Tumour-induced hypercalcaemia** For intravenous infusion, infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line. If using 4 mg/5 mL concentrate for solution for infusion or preparing a reduced dose of 4 mg/100 mL solution for infusion for patients with renal impairment, dilute requisite dose according to product literature.

- **When used for Paget's disease of bone or Osteoporosis (including corticosteroid-induced osteoporosis) in men and postmenopausal women** For intravenous infusion, give via a vented infusion line over at least 15 minutes.

**PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw).

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**
  - Bisphosphonates for treating osteoporosis (updated February 2018) NICE TA464

This technology appraisal guidance should be applied clinically in conjunction with:

- NICE guideline on assessing the risk of fragility fractures (CG146), which defines who is eligible for osteoporotic fracture risk assessment.

- NICE quality standard on osteoporosis (QS149), which defines the clinical intervention thresholds for the 10-year fracture probability of a major osteoporotic fracture, in those patients who have undergone fracture risk assessment.

www.getintopharma.com
Disorders of bone metabolism 733

Zoledronic acid is recommended as an option for treating osteoporosis in patients, only if:
- the person is eligible for risk assessment as defined in the full NICE guideline on osteoporosis, and
- the 10-year probability of osteoporotic fragility fracture is at least 10%, or
- the 10-year probability of osteoporotic fragility fracture is at least 1% and the person has difficulty taking oral bisphosphonates (alendronic acid, ibandronic acid or risedronate sodium) or these drugs are contra-indicated or not tolerated.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta464

Scottish Medicines Consortium (SMC) decisions

SMC No. 29/02
The Scottish Medicines Consortium has advised (May 2003) that zoledronic acid (Zometa®) is accepted for restricted use within NHS Scotland for the prevention of skeletal related events in patients with breast cancer and multiple myeloma if prescribed by an oncologist.

SMC No. 317/06
The Scottish Medicines Consortium has advised (October 2006) that zoledronic acid (Aclasta®) is accepted for use within NHS Scotland for the treatment of Paget’s disease of bone in patients for whom the use of a bisphosphonate is appropriate.

SMC No. 447/08
The Scottish Medicines Consortium has advised (March 2008) that zoledronic acid (Aclasta®) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women in those for whom oral treatment options for osteoporosis are inappropriate, when initiated by a specialist.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Infusion**
- **Zoledronic acid (Non-proprietary)**
  - Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml Zoledronic acid 4mg/100ml infusion bags | 1 vial £174.14
  - Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 ml Zoledronic acid 5mg/100ml infusion bags | 1 vial £217.68

- **Aclasta** (Novartis Pharmaceuticals UK Ltd)
  - Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 ml Aclasta 5mg/100ml infusion bottles | 1 bottle £253.38

- **Zerlinda** (Actavis UK Ltd)
  - Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml Zerlinda 4mg/100ml infusion bags | 1 bag £150.00

- **Zometa** (Novartis Pharmaceuticals UK Ltd)
  - Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml Zometa 4mg/100ml infusion bottles | 1 bottle £174.14

**Solution for infusion**
- **Zoledronic acid (Non-proprietary)**
  - Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml Zoledronic acid 4mg/100ml solution for infusion vials | 1 vial £174.14
  - Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 ml Zoledronic acid 5mg/100ml solution for infusion vials | 1 vial £180.00
  - Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 ml Zoledronic acid 5mg/100ml solution for infusion vials | 1 vial £253.38
  - Zoledronic acid (as Zoledronic acid monohydrate) 800 microgram per 1 ml Zoledronic acid 4mg/5ml concentrate for solution for infusion vials | 1 vial £174.14
  - Zoledronic acid (as Zoledronic acid monohydrate) 800 microgram per 1 ml Zoledronic acid 4mg/5ml solution for infusion vials | 1 vial £184.04

**Calcitonin (salmon)** (Salcatonin)

**INDICATIONS AND DOSE**

- Hypercalcaemia of malignancy
  - BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - Adult: 100 units every 6–8 hours (max. per dose 400 units every 6–8 hours), adjusted according to response
  - BY INTRAVENOUS INFUSION
  - Adult: Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

- Paget’s disease of bone
  - BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - Adult: 100 units daily, adjusted according to response for maximum 3 months (6 months in exceptional circumstances), a minimum dosage regimen of 50 units three times a week has been shown to achieve clinical and biochemical improvement

**Prevention of acute bone loss due to sudden immobility**
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - Adult: Initially 100 units daily in 1–2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks

**CONTRA-INDICATIONS** Hypocalcaemia

**CAUTIONS** Heart failure; history of allergy (skin test advised); risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)

**INTERACTIONS** Appendix 1: calcitonin (salmon)

**SIDE-EFFECTS**
- Common or very common Abdominal pain - arthralgia - diarrhoea - dizziness - fatigue - flushing - headache - musculoskeletal pain - nausea - secondary malignancy (long term use) - taste altered - vomiting
- Uncommon Hypersensitivity - hypertension - influenza like illness - oedema - polyuria - skin reactions - visual impairment
- Rare or very rare Bronchospasm - throat swelling - tongue swelling
- Frequency not known Hypocalcaemia - tremor

**PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING** Avoid; inhibits lactation in animals.

**RENAI IMPAIRMENT** Use with caution.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion, give intermittently in Sodium chloride 0.9%. Diluted solution given without delay. Dilute in 500 mL give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration.
Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Calcitonin (salmon) (Non-proprietary)
  Calcitonin (salmon) 50 unit per 1 ml [Calcitonin (salmon) 50 units/ml solution for injection ampoules | 5 ampoules (POM)]
  £167.50 DT = £167.50
- Calcitonin (salmon) 100 unit per 1 ml [Calcitonin (salmon) 100 units/ml solution for injection ampoules | 5 ampoules (POM)]
  £220.00 DT = £220.00
- Calcitonin (salmon) 200 unit per 1 ml [Calcitonin (salmon) 200 units/ml solution for injection vials | 1 vial (POM)]
  £352.00 DT = £352.00

Calcium regulating drugs

Teriparatide

Indications and dose
Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis
- By subcutaneous injection
- Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)

Contra-indications
Bone metastases - hyperparathyroidism - metabolic bone diseases - Paget’s disease - pre-existing hypercalcaemia - previous radiation therapy to the skeleton - skeletal malignancies - unexplained raised alkaline phosphatase

Side-effects
- Common or very common: Anaemia - asthenia - chest pain - gastrointestinal disorders - headache - hypercalcaemia - hyperhidrosis - hypotension - muscle complaints - palpitations - sciatica - skin reactions - syncope - vomiting
- Uncommon: Arthralgia - back pain - emphysema - hypercalcaemia - hyperuricaemia - nephrolithiasis - tachycardia - urinary disorders - weight increased
- Rare or very rare: Oedema - renal impairment

Pregnancy
Avoid.

Breast feeding
Avoid.

Renal impairment
Caution in moderate impairment; avoid if severe.

Prescribing and dispensing information
Teriparatide is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1

National funding/access decisions

NICE decisions
- Raloxifene and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018) NICE TA161
Teriparatide is recommended as an alternative treatment option for the secondary prevention of osteoporotic fragility fractures in postmenopausal women:
  - who are unable to take alendronate and risedronate, or have a contra-indication to or are intolerant of alendronate and risedronate, or have had an unsatisfactory response to treatment with alendronate or risedronate, and
  - who are 65 years or older and have a T-score of -4 standard deviations (SD) or below, or a T-score of -3.5 SD or below plus more than two fractures, or who are aged 55-64 years and have a T-score of -4 SD or below plus more than two fractures.
Women who are currently receiving treatment, but for whom treatment would not have been recommended, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta161

Mhra/Chm advice: denosumab: atypical femoral fractures (February 2013)
Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.
Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.
Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

Drug action
Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.
Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

Osteonecrosis of the jaw Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, antiangiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

- Denosumab 120 mg (cancer indication)
  - A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients
  - Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have unhealed lesions from dental or oral surgery
- Denosumab 60 mg (ostoporosis indication)
  - Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors
- All patients should be given a patient reminder card and informed of the risk of ONJ. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, if they wear dentures they should make sure their dentures fit properly before starting treatment, to maintain good oral hygiene, receive routine dental check-ups during treatment, and immediately report any oral symptoms such as dental mobility, pain, swelling, non-healing sores or discharge to a doctor and dentist. Patients should tell their doctor and dentist that they are receiving denosumab if they need dental treatment or dental surgery.

Hypocalcaemia Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment. Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

- before the first dose
- within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):

- before each dose
- within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)
- if suspected symptoms of hypocalcaemia occur
All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitching, cramps, numbness or tingling in the fingers, toes, or around the mouth).

Osteonecrosis of the external auditory canal has been reported with denosumab and this should be considered in patients who present with ear symptoms including chronic ear infections or in those with suspected cholesteatomas. Possible risk factors include steroid use and chemotherapy, with or without local risk factors such as infection or trauma. The MHRA recommends advising patients to report any ear pain, discharge from the ear, or an ear infection during denosumab treatment.

MHRA/CHM ADVISE: DENOSUMAB (XGEVA®) FOR GIANT CELL TUMOUR OF BONE: RISK OF CLINICALLY SIGNIFICANT HYPERCALCAEMIA FOLLOWING DISCONTINUATION (JUNE 2018)

Cases of clinically significant hypercalcaemia (rebound hypercalcaemia) have been reported up to 9 months after discontinuation of denosumab treatment for giant cell tumour of bone. The MHRA recommends that prescribers should monitor patients for signs and symptoms of hypercalcaemia after discontinuation, consider periodic assessment of serum calcium, re-evaluate the patient’s calcium and vitamin D supplementation requirements, and advise patients to report symptoms of hypercalcaemia.

Denosumab is not recommended in patients with growing skeletons.

MHRA/CHM ADVISE: DENOSUMAB (XGEVA®) FOR ADVANCED MALIGNANCIES INVOLVING BONE: STUDY DATA SHOW NEW PRIMARY MALIGNANCIES REPORTED MORE FREQUENTLY COMPARED TO ZOLEDRONIC ACID (ZOLEDRONATE) (JUNE 2018)

A pooled analysis has shown an increased rate of new primary malignancies in patients given Xgeva® (1-year cumulative incidence 1.1%) compared with those given zoledronic acid (0.6%), when used for the prevention of skeletal-related events with advanced malignancies involving bone. No treatment-related pattern in individual cancers or cancer groupings was apparent.

- CONTRA-INDICATIONS Hypocalcaemia
  - XGEVA® Unhealed lesions from dental or oral surgery
- CAUTIONS Atypical femoral fractures - hypocalcaemia - osteonecrosis of the jaw—consider temporary interruption of treatment if occurs
- SIDE-EFFECTS
  --common or very common Abdominal discomfort - cataract - constipation - hypocalcaemia (including fatal cases) - increased risk of infection - pain - sciatica - second primary malignancy - skin reactions
  - uncommon Cellulitis (seek prompt medical attention) - hypercalcaemia (on discontinuation)
  - rare or very rare Atypical femur fracture - osteonecrosis
- CONCEPTION AND CONCEPTION: Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies; risk of toxicity increases with each trimester.
- BREAST FEEDING Manufacturer advises avoid.
- RENAL IMPAIRMENT Increased risk of hypocalcaemia if creatinine clearance less than 30 mL/minute.
- MONITORING REQUIREMENTS Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasma-calcium concentration during therapy.
- PATIENT AND CARER ADVICE Atypical femoral fractures Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab. Osteonecrosis of the jaw All patients should be informed to maintain good oral hygiene, receive routine dental check-
las, and immediately report any oral symptoms such as
dental mobility, pain, or swelling to a doctor and dentist.
Hypocalcaemia All patients should be advised to report
symptoms of hypocalcaemia to their doctor (e.g. muscle
spasms, twitches, cramps, numbness or tingling in
the fingers, toes, or around the mouth).
Patient reminder card A patient reminder card should be
provided (risk of osteonecrosis of the jaw).

- NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions
Denosumab for the prevention of osteoporotic fractures in
postmenopausal women (October 2010) NICE TA204
Denosumab (Prolia ®) is recommended as a treatment
option for the primary prevention of osteoporotic fragility
fractures in postmenopausal women at increased risk of
fractures:
- who are unable to comply with the special instructions
  for administering alendronate and risedronate, or have
  an intolerance of, or a contra-indication to, those
  treatments and
- who comply with particular combinations of bone
  mineral density measurement, age, and independent
  risk factors for fracture, as indicated in the full NICE
guidance.
Denosumab (Prolia ®) is recommended as a treatment
option for the secondary prevention of osteoporotic fragility
fractures only in postmenopausal women at increased risk
of fractures who are unable to comply with the special
instructions for administering alendronate and
risedronate, or have an intolerance of, or a contra-
indication to, those treatments.

Patients whose treatment was started within the NHS
before this guidance was published should have the option
to continue treatment, without change to their funding
arrangements, until they and their NHS clinician consider
it appropriate to stop.

www.nice.org.uk/guidance/ta204

Denosumab for the prevention of skeletal-related events in
adults with bone metastases from solid tumours (October
2012) NICE TA265
Denosumab (Xgeva ®) is recommended for the prevention
of skeletal-related events in adults with bone metastases
from breast cancer and from solid tumours other than
prostate if:
- bisphosphonates would otherwise be prescribed, and
- the manufacturer provides denosumab with the discount
  agreed in the patient access scheme.
Denosumab is not recommended for preventing skeletal-
related events in adults with bone metastases from
prostate cancer.

Patients with bone metastases from solid tumours
currently receiving denosumab whose disease does not
meet the above criteria can continue treatment until they
and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta265

Scottish Medicines Consortium (SMC) decisions
SMC No. 651/10
The Scottish Medicines Consortium has advised (December
2010) that denosumab (Prolia ®) is accepted for restricted
use within NHS Scotland for the treatment of osteoporosis
in postmenopausal women at increased risk of fractures
who have a bone mineral density T-score < −2.5 and > −4.0
and for whom oral bisphosphonates are unsuitable.

- MEDICINAL FORMS There can be variation in the licensing of
different medicines containing the same drug.

Solution for injection

- Denosumab 60 mg per 1 ml

  Prolia (Amgen Ltd)

  Denosumab 60 mg/1ml solution for injection
  pre-filled disposable injection (Pack) £183.00
  DT = £183.00

- Xgeva (Amgen Ltd)

  Denosumab 70 mg per 1 ml Xgeva 120mg/1.7ml solution for
  injection vials | 1 vial (Pack) £309.86 DT = £309.86

5 Dopamine responsive conditions

DOPAMINERGIC DRUGS >> DOPAMINE RECEPTOR AGONISTS

Dopamine-receptor agonists

Overview
Bromocriptine p. 419 is used for the treatment of
galactorrhoea, and for the treatment of prolactinomas (when
it reduces both plasma prolactin concentration and tumour
size). Bromocriptine also inhibits the release of growth
hormone and is sometimes used in the treatment of
acromegaly, but somatostatin analogues (such as octreotide
p. 950) are more effective.

Cabergoline p. 421 has similar side-effects to
bromocriptine, however patients intolerant of bromocriptine
may be able to tolerate cabergoline (and vice versa).

Quinagolide below has actions and uses similar to those of
ergot-derived dopamine agonists, but its side-effects differ
slightly.

Suppression of lactation

Although bromocriptine and cabergoline are licensed to
suppress lactation, they are not recommended for routine
suppression (or for the relief of symptoms of postpartum
pain and engorgement) that can be adequately treated with
simple analgesics and breast support. If a dopamine-receptor
agonist is required, cabergoline is preferred. Quinagolide is
not licensed for the suppression of lactation.

Quinagolide

- DRUG ACTION Quinagolide is a non-ergot dopamine D₂
  agonist.

- INDICATIONS AND DOSE

Hyperprolactinaemia

- BY MOUTH

  Adult: Initially 25 micrograms once daily for 3 days,
  dose to be taken at bedtime, increased in steps of
  25 micrograms every 3 days; usual dose
  75–150 micrograms daily, for doses higher than
  300 micrograms daily increase in steps of
  75–150 micrograms at intervals of not less than
  4 weeks

- UNLICENSED USE Not licensed for the suppression of
  lactation.

- CAUTIONS Acute porphyrias p. 1058 - history of psychotic
  illness - history of serious mental disorders

- FURTHER INFORMATION

  - Hyperprolactinemic patients In hyperprolactinaemic patients,
    the source of the hyperprolactinaemia should be
    established (i.e. exclude pituitary tumour before
    treatment).

- INTERACTIONS >> Appendix 1: dopamine receptor agonists

- SIDE-EFFECTS

  - Common or very common Abdominal pain - appetite
decreased - constipation - diarrhoea - dizziness - fatigue
  - flushing - headache - hypotension - insomnia - nasal
  congestion - nausea - oedema - syncope - vomiting

  - Rare or very rare Acute psychosis - drowsiness

www.getintopharma.com
**Gonadotrophin responsive conditions**

**Cetrorelix** below and ganirelix p. 738 are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques. **Gonadorelin analogues**

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementation), breast cancer, prostate cancer and before intra-uterine surgery. Use of leuprorelin acetate and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding.

**Breast pain (mastalgia)**

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics; moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen p. 953 may be a useful adjunct in the treatment of mastalgia (unlicensed indication) especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES**

**ANTI-GONADOTROPHIN-RELEASING HORMONES**

---

**Gonadotrophins**

**Gonadotrophin-affecting drugs**

Danazol p. 742 is licensed for the treatment of *endometriosis* and for the relief of severe pain and tenderness in *benign fibrocystic breast disease* where other measures have proved unsatisfactory. It may also be effective in the long-term management of *hereditary angioedema* (unlicensed indication).

---

**6**

**Gonadotrophin responsive conditions**

---

**Gonadotrophins**

---

**ALLERGY AND CROSS-SENSITIVITY**

Quinagolide should not be used in patients with hypersensitivity to quinagolide (does not apply to hypersensitivity to ergot alkaloids).

**CONCEPTION AND CONTRACEPTION**

Advise non-hormonal contraception if pregnancy not desired.

**PREGNANCY**

Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).

**BREAST FEEDING**

Suppresses lactation.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid (no information available).

**RENAL IMPAIRMENT**

Avoid—no information available.

**MONITORING REQUIREMENTS**

Monitor blood pressure for a few days after starting treatment and following dosage increase.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

**Sudden onset of sleep**

Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can be disturbing in some patients during the first few days of treatment with dopamine-receptor agonists, particular care should be exercised when driving or operating machinery.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**INDICATIONS AND DOSE**
- **Adjunct in the treatment of female infertility (initiated under specialist supervision)**
  - **BY SUBCUTANEOUS INJECTION**
    - **Adult:** 500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and busuvelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)
  - **BY INTRANASAL ADMINISTRATION**
    - **Adult:** 150–300 micrograms 4 times a day, (150 micrograms equivalent to one spray), to be administered during waking hours. Start in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and busuvelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

**SIDE-EFFECTS**
- **Common or very common**  Skin reactions
- **Uncommon**  Headache - malaise - nausea
- **Rare or very rare**  Dyspnoea - facial swelling - hypersensitivity
- **Frequency not known**  Abdominal distension - ovarian hyperstimulation syndrome - pelvic pain

**PREGNANCY**  Avoid in confirmed pregnancy—toxicity in animal studies.

**BREAST FEEDING**  Avoid — no information available.

**HEPATIC IMPAIRMENT**  Manufacturer advises avoid in moderate to severe impairment (no information available).

**RENAI IMPAIRMENT**  Avoid in moderate to severe renal impairment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Fyremadel** (Ferring Pharmaceuticals Ltd)
  - Ganirelix 500 microgram per 1 ml
  - Fyremadel 250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (£5)

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPIN-RELEASING HORMONES**

**Buserelin**

**DRUG ACTION**  Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle-stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE**
- **Endometriosis**
  - **BY INTRANASAL ADMINISTRATION**
    - **Adult:** 300 micrograms 3 times a day maximum duration of treatment 6 months (do not repeat), to be started on days 1 or 2 of menstruation; administer one 150 microgram spray into each nostril

**SIDE-EFFECTS**
- **Common or very common**  Skin reactions
- **Uncommon**  Headache - malaise - nausea
- **Rare or very rare**  Dyspnoea - facial swelling - hypersensitivity
- **Frequency not known**  Abdominal distension - ovarian hyperstimulation syndrome - pelvic pain

**PITUITARY DESENSITISATION BEFORE INDUCTION OF OVULATION BY GONADOTROPHINS FOR IN VITRO FERTILISATION (UNDER EXPERT SUPERVISION)**
- **BY SUBCUTANEOUS INJECTION**
  - **Adult:** 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and busuvelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

**CONTRA-INDICATIONS**
- When used for endometriosis  Hormone dependent tumours - undiagnosed vaginal bleeding - use longer than 6 months (do not repeat)
- When used for pituitary desensitisation  Hormone dependent tumours - undiagnosed vaginal bleeding

**CAUTIONS**
- **Depression - diabetes - hypertension - patients with metabolic bone disease (decrease in bone mineral density can occur) - polycystic ovarian disease**

**SIDE-EFFECTS**
- **Common or very common**  Depression - mood altered
- **Rare or very rare**  Auditory disorder - hypotension - leucopenia - pituitary tumour benign - thrombocytopenia - tinnitus

**SPECIFIC SIDE-EFFECTS**
- With intranasal use  Altered smell sensation - epistaxis - hoarseness - nasal irritation - taste altered

**SIDE-EFFECTS, FURTHER INFORMATION**
- During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer.

www.getintopharma.com
susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **DIRECTIONS FOR ADMINISTRATION**
  - With subcutaneous use
  - With intranasal use

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buserelin nasal spray.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - **Suprecur** (Sanofi)
    - Buserelin (as Buserelin acetate) 1 mg per 1 ml
      - 5.5mg/5.5ml solution for injection vials | 2 vial POM £33.02
  - **Suprefact** (Sanofi)
    - Buserelin (as Buserelin acetate) 1 mg per 1 ml
      - 5.5mg/5.5ml solution for injection vials | 2 vial POM £34.37

- **Spray**
  - **Suprecur** (Sanofi)
    - Buserelin (as Buserelin acetate) 150 microgram per
      - 1 dose Suprecur 150micrograms/dose nasal spray | 168 dose POM £105.16
  - **Suprefact** (Sanofi)
    - Buserelin (as Buserelin acetate) 100 microgram per
      - 1 dose Suprefact 100micrograms/dose nasal spray | 336 dose POM £122.24

**Goserelin**

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

- **INDICATIONS AND DOSE**

  - **ZOLADEX LA**
    - Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer | Advanced breast cancer | Oestrogen-receptor-positive early breast cancer
      - **BY SUBCUTANEOUS INJECTION**
        - Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

  - **Endometriosis**
      - **BY SUBCUTANEOUS INJECTION**
        - Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

  - **Endometrial thinning before intra-uterine surgery**
      - **BY SUBCUTANEOUS INJECTION**
        - Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

  - **Before surgery in women who have anaemia due to uterine fibroids**
      - **BY SUBCUTANEOUS INJECTION**
        - Adult: 3.6 mg, dose given to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development), to be administered into the anterior abdominal wall

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding - use longer than 6 months in endometriosis (do not repeat)

- **CAUTIONS**
  - Depression - diabetes - hypertension - patients with metabolic bone disease (decrease in bone mineral density can occur) - polycystic ovarian disease - risk of spinal cord compression in men - risk of ureteric obstruction in men

- **SIDE-EFFECTS**
  - **Common or very common** Alopecia - arthralgia - bone pain - breast abnormalities - depression - glucose tolerance impaired - gynaecomastia - headache - heart failure - hot flush - hyperhidrosis - mood altered - myocardial infarction - neoplasm complications - paraesthesia - sexual dysfunction - skin reactions - spinal cord compression - vulvovaginal disorders - weight increased
  - **Uncommon** Hypercalcaemia (in women) - urethral obstruction
  - **Rare or very rare** Ovarian and fallopian tube disorders - pituitary haemorrhage - pituitary tumour - psychotic disorder

- **Frequency not known** Abdominal cramps - body hair change - constipation - diarrhoea - fatigue - hepatic function abnormal - interstitial pneumonia - muscle complaints - nausea - nervousness - peripheral oedema (when used for gynaecological conditions) - premature menopause - pulmonary embolism - QT interval prolongation - sleep disorder - uterine leiomyoma degeneration - voice alteration - vomiting - vulvovaginal infection - withdrawal bleed

**SIDE-EFFECTS, FURTHER INFORMATION** Tumour flare can occur when androgen deprivation therapy is initiated.
Leuprolerin acetate

**DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE**

### PROSTAP 3 DCS

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 11.25 mg every 3 months

Endometriosis

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 11.25 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 11.25 mg every 3 months for maximum 6 months (course not to be repeated)

### PROSTAP SR DCS

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 3.75 mg every month

Endometriosis

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 3.75 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 3.75 mg every month for maximum 6 months (course not to be repeated)

**CONTRA-INDICATIONS**

- **GENERAL CONTRA-INDICATIONS**
  - Undiagnosed vaginal bleeding

- **SPECIFIC CONTRA-INDICATIONS**
  - When used for endometriosis use longer than 6 months (do not repeat)

- **CAUTIONS**
  - Diabetes - family history of osteoporosis - patients with metabolic bone disease (decrease in bone mineral density can occur) - risk of spinal cord compression in men with prostate cancer - risk of ureteric obstruction in men with prostate cancer

**SIDE-EFFECTS**

- **Common or very common**

- **Uncommon**
  - Alopecia - diarrhoea - fever - myalgia - palpitations - visual impairment - vomiting

- **Rare or very rare**
  - Haemorrhage

- **Frequency not known**
  - Anaemia - glucose tolerance impaired - hypertension - hypotension - leucopenia - paralytic ileus - pulmonary embolism - QT interval prolongation - seizure - spinal fracture - thrombocytopenia - urinary tract obstruction

**SIDE-EFFECTS, FURTHER INFORMATION** In prostate cancer, during the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.

**CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

**PREGNANCY** Avoid—teratogenic in animal studies.

**BREAST FEEDING** Avoid.

**MONITORING REQUIREMENTS**

- Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.

**DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Zoladex (AstraZeneca UK Ltd)**
  - Goserelin (as Goserelin acetate) 3.6 mg Zoladex 3.6mg implant Safesystem pre-filled syringes | 1 pre-filled disposable injection
  - £10.00 DT = £70.00

- **Zoladex LA (AstraZeneca UK Ltd)**
  - Goserelin (as Goserelin acetate) 10.8 mg Zoladex LA 10.8mg implant Safesystem pre-filled syringes | 1 pre-filled disposable injection
  - £235.00 DT = £235.00

- **Goserelin (as Goserelin acetate) 7.2 mg** (AstraZeneca UK Ltd)
  - Zoladex LA 7.2mg implant Safesystem pre-filled disposable injection
  - £235.00 DT = £235.00

- **Goserelin (as Goserelin acetate) 3.6 mg** (AstraZeneca UK Ltd)
  - ZOLADEX 3.6 mg implant Safesystem pre-filled syringes | 1 pre-filled disposable injection
  - £235.00 DT = £235.00

Nafarelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

- **INDICATIONS AND DOSE**
  
  **Endometriosis**
  
  - **BY INTRANASAL ADMINISTRATION**
    - Adult (female): 200 micrograms twice daily for maximum 6 months (do not repeat), one spray in one nostril in the morning, and one spray in the other nostril in the evening (starting on days 2–4 of menstruation).

  Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)
  
  - **BY INTRANASAL ADMINISTRATION**
    - Adult: 400 micrograms twice daily, one spray in each nostril, to be started in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of choric gonadotrophin at follicular maturity), discontinue if down-regulation not achieved within 12 weeks.

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding • use longer than 6 months in the treatment of endometriosis (do not repeat)

- **CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)

- **SIDE-EFFECTS**
  - **Common or very common** Artificial menopause • breast abnormalities • chest pain • depression • dysphoria • emotional lability • headaches • hirsutism • hot flush • hypersensitivity • hypertension • hypotension • insomnia • myalgia • oedema • oestrogen deficiency • paraesthesia • rash • seborrhoea • sexual dysfunction • skin reactions • uterine haemorrhage • vulvovaginal dryness • weight changes
  - **Uncommon** Alopecia • arthralgia • ovarian cyst (may require discontinuation)
  - **Frequency not known** Ovarian hyperstimulation syndrome • palpitations • vision blurred

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first dose should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **DIRECTIONS FOR ADMINISTRATION** Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer nafarelin nasal spray.

---

Triptorelin

**DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.
Reduction in size of uterine fibroids

▶ BY INTRAMUSCULAR INJECTION
- Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**GONAPEPTYL DEPOT®**

**Advanced prostate cancer**

▶ BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 3.75 mg every 4 weeks

**Endometriosis | Reduction in size of uterine fibroids**

▶ BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 3.75 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**SALVACYL®**

**Male hypersexuality with severe sexual deviation**

▶ BY INTRAMUSCULAR INJECTION
- Adult: 11.25 mg every 12 weeks

**CONTRA-INDICATIONS** In endometriosis do not use for longer than 6 months (do not repeat) - undiagnosed vaginal bleeding

**SALVACYL®** Severe osteoporosis

**CAUTIONS**

**GENERAL CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)

**SPECIFIC CAUTIONS**

- When used for prostate cancer Risk factors for osteoporosis - risk of spinal cord compression in men - risk of ureteric obstruction in men

**SALVACYL®** Increased risk of sensitivity to restored testosterone if treatment interrupted—consider administration of an antiandrogen before stopping treatment - transient increase in serum testosterone occurs on initiation—consider administration of an antiandrogen

**SIDE-EFFECTS**

▶ Common or very common Asthenia · depression · dizziness · dysuria · gastrointestinal discomfort · gynaecomastia · haemorrhage · headache · hot flush · hyperhidrosis · hypersensitivity · joint disorders · menstrual cycle irregularities · mood altered · muscle complaints · nausea · oedema · ovarian and fallopian tube disorders · pain · painful sexual intercourse · paraesthesia · pelvic pain · sexual dysfunction · sleep disorders · vulvovaginal dryness

▶ Uncommon Alopecia · appetite abnormal · asthma exacerbatet · breast pain · chills · constipation · diarrhoea · drowsiness · dry mouth · dyspnoea · embolism · gout · hypertension · muscle weakness · skin reactions · testicular disorders · tinnitus · vision disorders · vomiting · weight changes

▶ Rare or very rare Abnormal sensation in eye · chest pain · confusion · diabetes mellitus · difficulty standing · fever · flatulence · hypotension · influenza like illness · memory loss · musculoskeletal stiffness · nasopharyngitis · orthopnoea · osteoarthropathy · taste altered · vertigo

▶ Frequency not known Angioedema · anxiety · bone disorder · malaise · QT interval prolongation

**SIDE-EFFECTS, FURTHER INFORMATION** During the initial stage increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased pain.

**CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid.

**MONITORING REQUIREMENTS**

- When used for Prostate cancer Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.

**DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

**PRESCRIBING AND DISPENSING INFORMATION**

**DECAPETYL® SR 22.5MG** Each vial includes an overage to allow accurate administration of a 22.5 mg dose.

**DECAPETYL® SR 3MG** Each vial includes an overage to allow accurate administration of 3 mg dose.

**DECAPETYL® SR 11.25MG** Each vial includes an overage to allow accurate administration of an 11.25 mg dose.

**NATIONAL FUNDING/ACCESS DECISIONS**

**All Wales Medicines Strategy Group (AWMSG) decisions** The All Wales Medicines Strategy Group has advised (March 2017) that triptorelin (Decapeptyl® SR) is recommended as an option for use within NHS Wales as an adjuvant treatment to radiotherapy and as a neoadjuvant treatment prior to radiotherapy, in patients with high-risk localised or locally advanced prostate cancer.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

▶ Decapetyl SR (Ipsen Ltd)

Triptorelin (as Triptorelin acetate) 3 mg Decapetyl SR 3mg powder and solvent for suspension for injection vials | 1 vial £69.00 DT = £69.00

Triptorelin 11.25 mg Decapetyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial £207.00 DT = £207.00

Triptorelin (as Triptorelin embonate) 22.5 mg Decapetyl SR 22.5mg powder and solvent for suspension for injection vials | 1 vial £414.00 DT = £414.00

▶ Gonapeptyl Depot (Ferring Pharmaceuticals Ltd)

Triptorelin (as Triptorelin acetate) 3.75 mg Gonapeptyl Depot 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection £81.69 DT = £81.69

▶ Salvacyl (Ipsen Ltd)

Triptorelin 11.25mg Salvacyl 11.25mg powder and solvent for suspension for injection vials | 1 vial £248.00 DT = £207.00

### 6.1 Hereditary angioedema

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES**

**ANTI-GONADOTROPIN-RELEASING HORMONES**

**Danazol**

**DRUG ACTION** Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and antiprogestogenic activity.

**INDICATIONS AND DOSE**

**Endometriosis**

▶ BY MOUTH
- Adult: 200–800 mg daily in up to 4 divided doses usually for 3–6 months, dose to be adjusted to achieve amenorrhoea, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

---

**BNF 78**

---
Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment

- **BY MOUTH**
  - Adult: 300 mg daily in divided doses usually for 3–6 months, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

### Hereditary angioedema

- **BY MOUTH**
  - Adult: Initially 100–200 mg daily, dose to be reduced according to response, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

### UNLICENSED USE

- **Not licensed for use in hereditary angioedema.**

### CONTRA-INDICATIONS

- Acute porphyrias p. 1058
- androgen-dependent tumours
- thromboembolic disease
- undiagnosed genital bleeding

### CAUTIONS

- Cardiac impairment (avoid if severe)
- diabetes mellitus
- elderly
- epilepsy
- history of thrombosis or thromboembolic disease
- hypertension
- lipoprotein disorder
- migraine
- polycythaemia

### INTERACTIONS

→ Appendix 1: danazol

### SIDE-EFFECTS

- Alopecia
- aminoolevulinic acid synthetase induction
- anxiety
- appetite increased
- breast atrophy
- carpal tunnel syndrome
- clitoris enlarged
- contact lens intolerance
- cutaneous lupus erythematosus
- depressed mood
- dizziness
- embolism and thrombosis
- emotional lability
- eosinophilia
- epigastric pain
- epilepsy exacerbated
- face oedema
- fatigue
- fever
- fluid retention
- flushing
- glucose tolerance impaired
- haematuria
- headaches
- hepatic disorders
- hirsutism
- hypertension
- idiopathic intracranial hypertension
- insulin resistance
- joint disorders
- leucopenia
- libido disorder
- menstrual cycle irregularities
- muscle contractions involuntary
- muscle cramps
- myocardial infarction
- nausea
- neoplasms
- pain
- palpatations
- pancreatitis
- photosensitivity reaction
- polycythaemia
- respiratory disorders
- seborrhoea
- skin reactions
- speech pitch disorder
- spermatogenesis reduced
- splenic peliosis
- tachycardia
- throbbing pain
- thrombocytopenia
- tremor
- vertigo
- vision disorders
- voice alteration
- vulvovaginal disorders
- weight increased

**SIDE-EFFECTS, FURTHER INFORMATION**

Withdraw if virilisation effects occur—may be irreversible on continued use.

### CONCEPTION AND CONTRACEPTION

Ensure patients with amenorrhoea are not pregnant. Non-hormonal contraceptive methods should be used, if appropriate.

### PREGNANCY

Avoid; has weak androgenic effects and virilisation of female fetus reported.

### BREAST FEEDING

No data available but avoid because of possible androgenic effects in infant.

### HEPATIC IMPAIRMENT

Manufacturer advises caution; avoid in marked impairment.

### RENAL IMPAIRMENT

Caution in renal impairment (avoid if severe).

### MONITORING REQUIREMENTS

Manufacturer advises periodic monitoring of hepatic function and haematological state (including biannual hepatic ultrasonography for treatment exceeding 6 months or repeated courses of treatment).

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

#### Capsule

- **Danazol (Non-proprietary)**
  - **Danazol 100 mg** Danazol 100 mg capsules | 28 capsule £18.40
  - **Danazol 200 mg** Danazol 200 mg capsules | 56 capsule £30.27

- **Danol (Sanofi)**
  - **Danazol 100 mg** Danol 100 mg capsules | 60 capsule £16.38
  - **Danazol 200 mg** Danol 200 mg capsules | 60 capsule £32.41

### 7 Hypothalamic and anterior pituitary hormone related disorders

#### Hypothalamic and anterior pituitary hormones

### Anterior pituitary hormones

#### Corticotrophins

Tetracosactide p. 744 (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn’s disease; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

#### Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, or follicle-stimulating hormone alone (as in follitropin), are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 766, or in superovulation treatment for assisted conception (such as in vitro fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotropic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

#### Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 748, produced using recombinant DNA technology. Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

#### Hypothalamic hormones

Gonadorelin p. 744 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful,
however, in distinguishing hypothalamic from pituitary lesions. Gonadorelin analogues are indicated in endometriosis and infertility and in breast and prostate cancer.

### 7.1 Adrenocortical function testing

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES ▶ CORTICOTROPINS**

#### Tetracosactide (Tetracosactrin)

- **INDICATIONS AND DOSE**
  - Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test)
    - By intravenous injection, or by intramuscular injection
    - Adult: 250 micrograms for 1 dose
  - Diagnosis of adrenocortical insufficiency (diagnostic 5-hour test)
    - By intramuscular injection using depot injection
    - Adult: 1 mg for 1 dose
  - Alternative to corticosteroids in conditions such as Crohn’s disease or rheumatoid arthritis (formerly used but value was limited by the variable and unpredictable therapeutic response and by the waning of effect with time)
    - By intramuscular injection using depot injection
    - Adult: Initially 1 mg daily, alternatively initially 1 mg every 12 hours, (in acute cases), then reduced to 1 mg every 2–3 days, followed by 1 mg once weekly, alternatively 500 micrograms every 2–3 days

- **CONTRA-INDICATIONS** Acute psychosis - adrenogenital syndrome - allergic diseases - asthma - avoid injections containing benzyl alcohol in neonates - Cushings syndrome - infectious diseases - peptic ulcer - primary adrenocortical insufficiency - refractory heart failure

- **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) - active systemic diseases (should not be used unless adequate disease-specific therapy is being given) - diabetes mellitus - diverticulitis - history of asthma - history of atopic allergy - history of eczema - history of hayfever - history of hypersensitivity - hypertension - latent amoebiasis (may become activated) - latent tuberculosis (may become activated) - myasthenia gravis - ocular herpes simplex - osteoporosis - predisposition to thromboembolic - psychological disturbances may be triggered - recent intestinal anastomosis - reduced immune response (should not be used unless adequate disease-specific therapy is being given) - ulcerative colitis

**CAUTIONS, FURTHER INFORMATION**

- Risk of anaphylaxis. Should only be administered under medical supervision. Consult product literature.
- Hypertension. Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
- Diabetes mellitus. Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.

- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** For depot injection, manufacturer advises caution in cirrhosis (may enhance effect of tetracosactide therapy).
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.
  - Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Synacthen (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)
  - Tetracosactide acetate 250 microgram per 1 ml
  - Synacthen 250micrograms/1ml solution for injection ampoules
  - 1 ampoule (£38.00) + £38.00

**Suspension for injection**

- EXCIPIENTS: May contain benzyl alcohol
- Synacthen Depot (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)
  - Tetracosactide acetate 1 mg per 1 ml
  - Synacthen Depot 1mg/1ml suspension for injection ampoules
  - 1 ampoule (£346.28) + £346.28

### 7.2 Assessment of pituitary function

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES ▶ GONADOTROPIN-RELEASING HORMONES**

#### Gonadorelin

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

- **INDICATIONS AND DOSE**
  - Assessment of pituitary function
    - By subcutaneous injection, or by intravenous injection
    - Adult: 100 micrograms for 1 dose

- **CAUTIONS** Pituitary adenoma

Follitropin delta

- **DRUG ACTION**
  - Follitropin delta is a recombinant human follicle stimulating hormone, which causes development of multiple mature follicles.

- **INDICATIONS AND DOSE**
  - Superovaluation treatment for assisted conception (such as in vitro fertilisation) (initiated under specialist supervision)
  - **BY SUBCUTANEOUS INJECTION**

- **CONTRA-INDICATIONS**
  - Ovarian cysts (not caused by polycystic ovarian syndrome) - ovarian enlargement (not caused by polycystic ovarian syndrome) - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of uterus - vaginal bleeding of unknown cause

- **CAUTIONS**
  - Acute porphyrias p. 1058 - history of tubal disease (increased risk of ectopic pregnancy)

- **SIDE-EFFECTS**
  - **Common or very common**
    - Fatigue - headache - nausea - ovarian and fallopian tube disorders - pelvic disorders - uterine pain
  - **Uncommon**
    - Abdominal discomfort - breast abnormalities - constipation - diarrhoea - dizziness - drowsiness - mood swings - vaginal haemorrhage - vomiting
  - **Rare or very rare**
    - Thromboembolism

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - If ovarian hyperstimulation syndrome occurs, the patient should be advised to withhold hCG and avoid intercourse or use barrier contraceptive methods for at least 4 days.

- **PREGNANCY**
  - Manufacturer advises avoid—not indicated during pregnancy.

- **BREAST FEEDING**
  - Manufacturer advises avoid—not indicated during breastfeeding.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises regular monitoring of ovarian response with ultrasound alone, or in combination with serum estradiol levels.
  - Frequent monitoring of follicular development is required to reduce the risk of ovarian hyperstimulation syndrome during treatment, and for at least 2 weeks after triggering of final follicular maturation—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION**
  - Manufacturer recommends the cartridge should be used with the Rekovelle® injection pen. The first injection should be performed under direct medical supervision; self-administration should only be performed by patients who are well motivated, adequately trained and have access to expert advice.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Follitropin delta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

- **HANDLING AND STORAGE**
  - Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator.

- **PATIENT AND CARER ADVICE**
  - Conception and contraception
  - Manufacturer advises that patients planning to conceive should be warned that there is a risk of multiple pregnancy.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - **Rekovelle** (Ferring Pharmaceuticals Ltd)
    - Follitropin delta 33.33 microgram per ml
      - **Rekovelle**
        - 12 micrograms/0.33 ml solution for injection cartridges | 1 cartridge | £118.31
      - **Rekovelle**
        - 36 micrograms/0.8 ml solution for injection cartridges | 1 cartridge | £354.94
      - **Rekovelle**
        - 72 micrograms/2.16 ml solution for injection cartridges | 1 cartridge | £709.89

Other drugs used for Growth hormone disorders
Pasireotide, p. 951

PITUITARY AND HYPOthalamic HORMONES AND ANALOGUES

GROWTH HORMONE RECEPTOR ANTAGONISTS

Pegvisomant

- **DRUG ACTION**
  - Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist.

- **INDICATIONS AND DOSE**
  - Treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues (initiated by a specialist)
    - By subcutaneous injection
    - Adult: Initially 80 mg for 1 dose, followed by 10 mg daily, then increased in steps of 5 mg daily, adjusted according to response; maximum 30 mg per day

- **CAUTIONS**
  - Abnormal liver function tests and/or signs or symptoms of liver injury (further investigations may be
required before treatment initiation—consult product literature) - diabetes mellitus (adjustment of antidiabetic therapy may be necessary).

### SIDE-EFFECTS

- **Common or very common** Arthralgia - arthritis - asthenia - constipation - diarrhoea - dizziness - dyspnoea - dyspepsia - eye pain - fever - gastrointestinal discomfort - gastrointestinal disorders - haemorrhage - headaches - hyperglycaemia - hypertension - hypoglycaemia - influenza like illness - lipohypertrophy - myalgia - nausea - numbness - oedema - skin reactions - sleep disorders - sweat changes - tremor - vomiting - weight increased

- **Frequency not known** Anger - angioedema - hepatic function abnormal - laryngospasm

### SIDE-EFFECTS, FURTHER INFORMATION

**Injection-site reactions** Rotate injection sites to avoid lipohypertrophy.

**Abnormal hepatic function** Manufacturer advises interrupt treatment if liver function tests at least 5 times the upper limit of normal or transaminase levels at least 3 times the upper limit of normal and bilirubin increased—consult product literature. Discontinue if liver injury is confirmed.

**CONCEPTION AND CONTRACEPTION** Possible increase in female fertility.

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available); temporary or permanent withdrawal may be needed—consult product literature.

### MONITORING REQUIREMENTS

- Manufacturer advises assess liver function tests before treatment initiation and monitor liver function tests during treatment—consult product literature.
- Manufacturer advises monitor serum IGF-1 concentrations.

### NATIONAL FUNDING/ACCESS DECISIONS

**Scottish Medicines Consortium (SMC) decisions**

The Scottish Medicines Consortium has advised (November 2017) that pegvisomant (Somavert®) is accepted for use within NHS Scotland for the treatment of patients with acromegaly who have had an inadequate response to surgery and/or radiation therapy and in whom an appropriate medical treatment with somatostatin analogues did not normalise IGF-1 [insulin-like growth factor-1] concentrations or was not tolerated. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**All Wales Medicines Strategy Group (AWMSG) decisions**

The All Wales Medicines Strategy Group has advised (November 2017) that pegvisomant (Somavert®) is recommended as an option for use within NHS Wales for the treatment of patients with acromegaly who have had an inadequate response to surgery and/or radiation therapy and in whom an appropriate medical treatment with somatostatin analogues did not normalise insulin-like growth factor-1 (IGF-1) concentrations or was not tolerated. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower than the WPAS price.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

- **Somavert (Pfizer Ltd)**
  - **Pegvisomant 10 mg** Somavert 10mg powder and solvent for solution for injection vials | 30 vial (£3,500.00 (Hospital only)) | £1,500.00 (Hospital only)
  - **Pegvisomant 15 mg** Somavert 15mg powder and solvent for solution for injection vials | 30 vial (£3,250.00 (Hospital only)) | £2,500.00 (Hospital only)
  - **Pegvisomant 20 mg** Somavert 20mg powder and solvent for solution for injection vials | 1 vial (£3,000.00 (Hospital only)) | £1,500.00 (Hospital only)
  - **Pegvisomant 25 mg** Somavert 25mg powder and solvent for solution for injection vials | 30 vial (£3,750.00 (Hospital only)) | £3,000.00 (Hospital only)
  - **Pegvisomant 30 mg** Somavert 30mg powder and solvent for solution for injection vials | 30 vial (£4,500.00 (Hospital only)) | £3,750.00 (Hospital only)

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES

#### Somatropin (Recombinant Human Growth Hormone)

- **INDICATIONS AND DOSE**
  - **Gonadal dysgenesis (Turner syndrome)**
    - By subcutaneous injection
    - Adult: 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily
  - **Deficiency of growth hormone**
    - By subcutaneous injection
    - Adult: Initially 150–300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age).
    - Dose equivalences and conversion
    - Dose formerly expressed in units; somatropin 1 mg = 3 units.
  - **CONTRA-INDICATIONS**
    - Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) - not to be used after renal transplantation - severe obesity in Prader-Willi syndrome - severe respiratory impairment in Prader-Willi syndrome
  - **CAUTIONS**
    - Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) - disorders of the epiphysis of the hip (monitor for limping) - history of malignant disease - hypoaldrenism (initiation or adjustment of glucocorticoid replacement therapy may be necessary) - hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value - initiation of treatment close to puberty not recommended in child born small for corrected gestational age - papilloedema - relative deficiencies of other pituitary hormones - resolved intracranial hypertension (monitor closely) - Silver-Russell syndrome

#### SIDE-EFFECTS

- **Common or very common** Carpal tunnel syndrome - fluid retention - headache - joint disorders - lipoatrophy - myalgia - oedema - parasthesia
  - **Uncommon** Gynaecomastia - idiopathic intracranial hypertension
  - **Rare or very rare** Hyperglycaemia - hyperinsulinism - hypothyroidism - osteonecrosis of femur - pancreatitis - slipped capital femoral epiphysis
  - **Frequency not known** Leukaemia - musculoskeletal stiffness

### SIDE-EFFECTS, FURTHER INFORMATION

Fundscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).
Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

> Somatropin for adults with growth hormone deficiency (August 2003) NICE TA64

Somatropin is recommended in adults only if the following 3 criteria are fulfilled:

- Severe growth hormone deficiency, established by an appropriate method,
- Impaired quality of life, measured by means of a specific questionnaire,
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.

Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient’s physician consider it appropriate.

Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

www.nice.org.uk/TA64

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
### Sex hormone responsive conditions

#### Sex hormones

**Oestrogens and HRT**

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity, natural oestrogens (estradiol p. 756 (oestradiol), estrone (oestrone), and estriol p. 832 (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than synthetic oestrogens (ethinylestradiol p. 759 (ethinylöstradiol) and mestranol). Tibolone p. 760 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

#### Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis but other drugs are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern.

Clonidine hydrochloride p. 145 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.
For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

For the treatment of menopausal symptoms in women with breast cancer see Breast cancer p. 942.

Risk of breast cancer
It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

Risk of endometrial cancer
The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer
Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

Risk of venous thromboembolism
Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke
Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment.

Risk of coronary heart disease
HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Choice
The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone are not suitable for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances. An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

Surgery
Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

Reasons to stop HRT
Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment

Ethinylestradiol
Ethinylestradiol p. 759 (ethinyl-oestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders. Ethinylestradiol is occasionally used under specialist supervision for the management of hereditary anaemorrhagic telangiectasia (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

Raloxifene
Raloxifene hydrochloride p. 754 is licensed for the treatment and prevention of postmenopausal osteoporosis; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

Progestogens and progesterone receptor modulators
There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 810) and testosterone analogues (norethisterone p. 764 and norgestrel). The newer progestogens (desogestrel p. 805, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 806 is the active isomer of norgestrel and has twice its potency. Progesterone p. 765 and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol p. 742 and gonadorelin analogues are also available. Although oral progestogens have been used widely for menorrhagia (see Heavy menstrual bleeding p. 753) they are

</table>

Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference. Taken from MHRA/CHM (Drug Safety Update) and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only). See also MHRA/CHM (Drug Safety Update) and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

1. Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
2. Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
3. The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progestogen eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
4. Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
5. Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
6. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
7. Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
8. There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

Cancer

Progestogens also have a role in neoplastic disease.

**Progestosterone receptor modulators**

Ulipristal acetate p. 804 is a progestosterone receptor modulator with a partial progestosterone antagonist effect. Ulipristal acetate is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids (see important safety information in ulipristal acetate). Ulipristal acetate is also used as an hormonal emergency contraceptive.

**Endometriosis**

**Description of condition**

Endometriosis is the growth of endometrial-like tissue outside the uterus. Endometriosis is a condition affecting women mainly of reproductive age and, although its exact cause is unknown, it is an oestrogen-dependent condition and is associated with menstruation. Endometriosis is typically associated with symptoms such as pelvic pain, painful periods and subfertility. Women with endometriosis report pain, which can be frequent, chronic and severe, as well as tiredness, more sick days, and a significant physical, sexual, psychological and social impact. Endometriosis is an important cause of subfertility and this can also have a significant effect on quality of life.

Women may also have endometriosis without symptoms, so it is difficult to know how common the disease is in the population. It is also unclear whether endometriosis is...
always progressive or can remain stable or improve with time.

**Aims of treatment**

The aim of treatment is to reduce the severity of symptoms, improve the quality of life, and to improve fertility if this is affected.

**Drug treatment**

Management options for endometriosis include drug treatment and surgery. Most drug treatments for endometriosis work by suppressing ovarian function and are contraceptive. Surgical treatment aims to remove or destroy endometriotic lesions. The choice of treatment depends on the woman’s preferences and priorities in terms of pain management and fertility. A short trial (such as 3 months) of paracetamol or an NSAID alone or in combination should be considered for first-line management of endometriosis-related pain. If pain relief is inadequate, consider other forms of pain management and referral for further assessment.

Hormonal treatment (with a combined oral contraceptive or a progestogen) should be offered to women with suspected, confirmed or recurrent endometriosis. The patient should be informed that hormonal treatment for endometriosis can reduce pain and has no permanent negative effect on subsequent fertility. If initial hormonal treatment for endometriosis is not effective, not tolerated or is contra-indicated, the woman should be referred to a gynaecologist or specialist endometriosis service for possible further treatment, which could include other hormonal treatments or surgery. For use of drugs to treat neuropathic pain, see Neuropathic pain.

**Surgery**

Women with suspected or confirmed endometriosis should be asked about their symptoms, preferences and priorities with respect to pain and fertility, to guide surgical decision-making. For deep endometriosis involving the bowel, bladder or ureter, gonadotrophin-releasing hormones given for 3 months before surgery should be considered. Excision rather than ablation should be considered to treat endometriomas, taking into account the woman’s desire for fertility and her ovarian reserve. After laparoscopic excision or ablation of endometriosis, consider hormonal treatment (with, for example, a combined hormonal contraceptive), to prolong the benefits of surgery and manage symptoms. A hysterectomy may be indicated if, for example, the woman has adenomyosis or heavy menstrual bleeding that has not responded to other treatments. For use of drugs to treat neuropathic pain, see Neuropathic pain.

**Surgical management if fertility is a priority**

If fertility is a priority, the management of endometriosis-related subfertility should have multidisciplinary involvement with input from a fertility specialist. Women with endometriosis who are trying to conceive should not be offered hormonal treatment, because it does not improve spontaneous pregnancy rates.

---

**Heavy menstrual bleeding**

**Description of condition**

Heavy menstrual bleeding, also known as menorrhagia, is excessive menstrual blood loss of 80 mL or more, or for a duration of more than 7 days, which results in the need to change menstrual products every 1–2 hours. Heavy menstrual bleeding occurs regularly, every 24–35 days.

**Drug treatment**

The choice of treatment should be guided by the presence or absence of fibroids (including size, number and location), polyps, endometrial pathology or adenomyosis, other symptoms (such as pressure or pain), co-morbidities, and patient preference.

In females with heavy menstrual bleeding and unidentified pathology, fibroids less than 3 cm in diameter causing no distortion of the uterine cavity, or suspected or diagnosed adenomyosis, a levonorgestrel-releasing intra-uterine system p. 806 is the first-line treatment option. Patients should be advised that irregular menstrual bleeding can occur particularly during the first months of use and that the full benefit of treatment may take at least 6 months.

If a levonorgestrel-releasing intra-uterine system p. 806 is unsuitable, either tranexamic acid p. 110, an NSAID, a combined hormonal contraceptive, or a cyclical oral progestogen should be considered. Progestogen-only contraceptives may suppress menstruation and be beneficial to females with heavy menstrual bleeding. A non-hormonal treatment is recommended in patients actively trying to conceive.

If drug treatment is unsuccessful or declined by the patient, or if symptoms are severe, referral to a specialist for alternative drug treatment or surgery should be considered.

In females with fibroids of 3 cm or more in diameter, referral to a specialist should be considered. Treatment options include tranexamic acid, an NSAID, ulipristal acetate p. 804, a levonorgestrel-releasing intra-uterine system p. 806, a combined hormonal contraceptive, a cyclical oral progestogen, uterine artery embolisation, or surgery. Treatment choice depends on the size, number and location of the fibroids, and severity of symptoms. If drug treatment is required while investigations and definitive treatment is being organised, either tranexamic acid, or an NSAID, or both, can be given.

Intermittent ulipristal acetate can be offered to females who are not eligible for surgery and have a haemoglobin concentration of 10.2 g/100 mL (102 g/litre) or less. If the haemoglobin concentration is more than 10.2 g/100 mL (102 g/litre), ulipristal acetate may be considered. The use of ulipristal acetate is associated with a risk of rare but serious liver injury; liver function should be monitored during treatment, see Important safety information, and Monitoring requirements in ulipristal acetate.

The effectiveness of drug treatment (excluding ulipristal acetate) for heavy menstrual bleeding may be limited in females with fibroids that are substantially greater than 3 cm in diameter. Treatment with a gonadotrophin-releasing hormone analogue or ulipristal acetate before hysterectomy and myomectomy should be considered if uterine fibroids are causing an enlarged or distorted uterus.

### CALCULIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

**Raloxifene hydrochloride**

- **INDICATIONS AND DOSE**
  - **Treatment and prevention of postmenopausal osteoporosis**
    - **BY MOUTH**
      - Adult: 60 mg once daily
  - **Breast cancer [chemoprevention in postmenopausal women at moderate to high risk] (initiated under specialist supervision)**
    - **BY MOUTH**
      - Adult: 60 mg once daily for 5 years
  - **UNLICENSED USE** Not licensed for chemoprevention of breast cancer in the UK. Licensed for this indication in USA.
  - **CONTRA-INDICATIONS** Cholestasis - endometrial cancer - history of venous thromboembolism - undiagnosed uterine bleeding
  - **CAUTIONS** Avoid in Acute porphyrias p. 1058 - breast cancer (manufacturer advises avoid during treatment for breast cancer) - history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides) - risk factors for stroke - risk factors for venous thromboembolism (discontinue if prolonged immobilisation)
  - **INTERACTIONS** → Appendix 1: raloxifene
  - **SIDE-EFFECTS**
    - Common or very common: Influenza - leg cramps - peripheral oedema - vasodilatation
    - Uncommon: Embolism and thrombosis
    - Rare or very rare: Breast abnormalities - gastrointestinal discomfort - gastrointestinal disorder - headaches - nausea - rash - thrombocytopaenia - vomiting
  - **HEPATIC IMPAIRMENT** Manufacturer advises avoid (risk of increased exposure).
  - **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - **NICE decisions**
      - Raloxifene for the primary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018) NICE TA160
        - Raloxifene is not recommended as a treatment option for the primary prevention of osteoporotic fragility fractures in postmenopausal women.
        - Women who are currently receiving treatment, but for whom treatment would not have been recommended, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/ta160
      - Raloxifene and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (updated February 2018) NICE TA161
        - Raloxifene is recommended as an alternative treatment option for the secondary prevention of osteoporotic fragility fractures in postmenopausal women:
          - who are unable to comply with the special instructions for the administration of alendronate and risedronate, or have a contra-indication to or are intolerant of alendronate and risedronate, and
          - have a combination of T-score, age and number of independent clinical risk factors for fracture, as indicated in the full NICE guidance.
        - Women who are currently receiving treatment, but for whom treatment would not have been recommended, should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop. www.nice.org.uk/guidance/ta161
  - **MEDICINAL FORMS**
    - **Tablet**
      - Raloxifene hydrochloride (Non-proprietary)
        - Raloxifene hydrochloride 60 mg | 28 tablet (P) £17.06 DT = £3.49 | 84 tablet (P) £10.47–£13.50
      - Evirex (Somex Pharma)
        - Raloxifene hydrochloride 60 mg | 28 tablet (P) £5.10 DT = £3.49
      - Evista (Daiichi Sankyo UK Ltd)
        - Raloxifene hydrochloride 60 mg | Evista 60mg tablets | 28 tablet (P) £17.06 DT = £3.49
      - Razylan (Aspire Pharma Ltd)
        - Raloxifene hydrochloride 60 mg | Razylan 60mg tablets | 28 tablet (P) £17.06 DT = £3.49

### OESTROGENS

**Conjugated oestrogens (equine)**

- **INDICATIONS AND DOSE**
  - **PREMARIN® TABLETS**
    - **Menopausal symptoms**
      - **BY MOUTH**
        - Adult: 0.3–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus
    - **Postmenopausal osteoporosis prophylaxis**
      - **BY MOUTH**
        - Adult: 0.625–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus
  - **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - acute thrombophlebitis - Dubin–Johnson syndromes (or monitor closely) - history of breast cancer - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - liver disease (where liver function tests have failed to return to normal) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - Rotor syndromes (or monitor closely) - thrombophilic disorder - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism
  - **CAUTIONS** Acute porphyrias p. 1058 - diabetes (increased risk of heart disease) - factors predisposing to thromboembolism - history of breast nodules (closely monitor breast status—risk of breast cancer) - history of endometrial hyperplasia - history of fibrocystic disease (closely monitor breast status—risk of breast cancer) - hypophysyal tumours - increased risk of gall-bladder disease reported - migraine - migraine-like headaches - presence of antiphospholipid antibodies (increased risk of thrombotic events) - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - risk of breast cancer
  - **CAUTIONS, FURTHER INFORMATION**
    - **Risk of breast cancer** It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.
    - Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

www.getintopharma.com
Risk of endometrial cancer. The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer. Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

Risk of venous thromboembolism. Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke. Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke.

Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

Risk of coronary heart disease. HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Other conditions. The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

**INTERACTIONS** → Appendix 1: hormone replacement therapy

**SIDE-EFFECTS**

**Common or very common** Alopecia · arthralgia · breast abnormalities · depression · leg cramps · menstrual cycle irregularities · vaginal discharge · weight changes

**Uncommon** Anxiety · cervical abnormalities · contact lens intolerance · dizziness · embolism and thrombosis · gallbladder disorder · gastrointestinal discomfort · headaches · hirsutism · libido disorder · mood altered · nausea · oedema · skin reactions · vulvovaginal candidiasis

**Rare or very rare** Angioedema · asthma exacerbated · cerebrovascular insufficiency · chorea exacerbated · colitis ischaemic · epilepsy exacerbated · galactorrhoea · glucose tolerance impaired · hypocalcaemia · jaundice cholestatic · myocardial infarction · neoplasms · pancreatitis · pelvic pain · vomiting

**Frequency not known** Endometrial hyperplasia · erythema nodosum

**SIDE-EFFECTS, FURTHER INFORMATION**

Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

**CONCEPTION AND CONTRACEPTION** HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

**PREGNANCY** Manufacturer advises avoid—not indicated during pregnancy.

**BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).

**HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Premarin** (Pfizer Ltd)  
  Conjugated oestrogens 300 microgram Premarin 0.3mg tablets  
  84 tablet (P 06 ) £6.07 DT + £6.07
  Conjugated oestrogens 625 microgram Premarin 0.625mg tablets  
  84 tablet (P 04 ) £4.02 DT + £4.02
  Conjugated oestrogens 1.25 mg Premarin 1.25mg tablets  
  84 tablet (P 03 ) £3.58 DT + £3.58

Combinations available: Conjugated oestrogens with medroxyprogesterone, p. 761

**Conjugated oestrogens with bazedoxifene acetate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, conjugated oestrogens (equine) p. 754.

**INDICATIONS AND DOSE**

Menopausal symptoms (in women with at least 12 months since last menses for whom treatment with progestogen-containing therapy is not appropriate)

- **BY MOUTH**
  - Adult: 0.45/20 mg daily continuously

**DOSE EQUIVALENCE AND CONVERSION**

- Dose expressed as x/y mg conjugated oestrogens/bazedoxifene.

**INTERACTIONS** → Appendix 1: hormone replacement therapy

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · constipation · diarrhea · drowsiness · dry mouth · hot flush · muscle complaints · nausea · peripheral oedema · skin reactions · vulvovaginal candidiasis
- **Uncommon** Cholecytitis
- **Rare or very rare** Embolism and thrombosis
- **Frequency not known** Dry eye · eye disorders · eye inflammation · eye pain · palpatations · vision disorders
Estradiol

**INDICATIONS AND DOSE**

**BEDOL®**

**Menopausal symptoms | Osteoporosis prophylaxis**
- **BY MOUTH**
  - Adult: 2 mg daily, started on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**ELLESTE SOLO® MX**

**Menopausal symptoms**
- **BY TRANSDERMAL APPLICATION**
  - Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 40, subsequently adjust according to response

**Osteoporosis prophylaxis**
- **BY TRANSDERMAL APPLICATION**
  - Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 80, subsequently adjust according to response

**ELLESTE-SOLO® 1-MG**

**Menopausal symptoms**
- **BY MOUTH**
  - Adult: 1 mg daily, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**ELLESTE-SOLO® 2-MG**

**Menopausal symptoms not controlled with lower strength | Osteoporosis prophylaxis**
- **BY MOUTH**
  - Adult: 2 mg daily, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be given with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**ESTRADERM MX®**

**Menopausal symptoms**
- **BY TRANSDERMAL APPLICATION**
  - Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, therapy should be initiated with Evorel 50 patch; subsequently adjust according to response; dose may be reduced to Evorel 25 patch after first month if necessary for menopausal symptoms only

**FEMSEVEN®**

**Menopausal symptoms | Osteoporosis prophylaxis**
- **BY TRANSDERMAL APPLICATION**
  - Adult: Apply 1 patch once weekly continuously, to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with FemSeven 50 patches for the first few months, subsequently adjust according to response

**OESTROGEL®**

**Menopausal symptoms**
- **TO THE SKIN**
  - Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

**Dose equivalence and conversion**
- With topical use
  - For Oestrogel®, 2 measures is equivalent to estradiol 1.5 mg.

**PROGYNOVA®**

**Menopausal symptoms**
- **BY MOUTH**
  - Adult: 1–2 mg daily continuously, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Each cycle in women with a uterus, initiate therapy with MX50; subsequently adjust according to response.
Female sex hormone responsive conditions

Osteoporosis prophylaxis

- **BY MOUTH**
  - Adult: 2 mg daily continuously, to be taken with cyclical progesterogen for 12–14 days of each cycle in women with a uterus

**PROGYNONA® TS**

Menopausal symptoms | Osteoporosis prophylaxis
- **BY TRANSDermal APPLICATION**
  - Adult: Apply 1 patch once weekly continuously, alternatively apply 1 patch once weekly for 3 weeks, followed by a 7-day patch-free interval (cyclical), to be used with cyclical progesterogen for 12–14 days of each cycle in women with a uterus, initiate therapy with Progynova TS 50, subsequently adjust according to response, women receiving Progynova TS 100 patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis

**SANDRENA®**

Menopausal symptoms
- **TO THE SKIN**
  - Adult: Apply 1 mg daily, to be applied over area 1–2 times size of hand; with cyclical progesterogen for 12–14 days of each cycle in women with a uterus, dose may be adjusted after 2–3 cycles to lowest effective dose; usual dose 0.5–1.5 mg daily

**ZUMENON®**

Menopausal symptoms
- **BY MOUTH**
  - Adult: Initially 1 mg daily, to be started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), increased if necessary to 2 mg daily, to be taken with a cyclical progesterogen for 12–14 days of each cycle in women with a uterus

Osteoporosis prophylaxis
- **BY MOUTH**
  - Adult: 2 mg daily, to be taken with a cyclical progesterogen for 12–14 days of each cycle in women with a uterus

- **CONTRA-INDICATIONS**
  - Active arterial thromboembolic disease (e.g. angina or myocardial infarction) – active thrombophlebitis – Dubin-Johnson syndrome (or monitor closely) – history of breast cancer – history of recurrent venous thromboembolism (unless already on anticoagulant treatment) – oestrogen-dependent cancer – recent or active thromboembolic disease (e.g. angina or myocardial infarction) – Rotor syndrome (or monitor closely) – thrombophilic disorder – undiagnosed vaginal bleeding – untreated endometrial hyperplasia – venous thromboembolism

- **CAUTIONS**
  - Acute porphyrias p. 1058 – diabetes (increased risk of heart disease) – history of breast nodules (closely monitor breast status (risk of breast cancer) – history of endometrial hyperplasia; factors predisposing to thromboembolism – history of fibrocystic disease (closely monitor breast status (risk of breast cancer) – hypophyseal tumours – increased risk of gall-bladder disease – migraine (or migraine-like headaches) – presence of antiphospholipid antibodies (increased risk of thrombotic events) – prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer – risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) – symptoms of endometriosis may be exacerbated – uterine fibroids may increase in size

- **CAUTIONS, FURTHER INFORMATION**
  - Risk of breast cancer: It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.
  - Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- **Risk of endometrial cancer**: The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

  In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously.

  However, this should be weighed against the increased risk of breast cancer.

- **Risk of ovarian cancer**: Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

- **Risk of venous thromboembolism**: Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

  In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

  Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

  **Risk of stroke**: Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

  **Risk of coronary heart disease**: HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

  **Other conditions**: The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

- **SIDE-EFFECTS**

  **GENERAL SIDE-EFFECTS**
  - **Common or very common**
    - Headaches
    - Nausea
    - Skin reactions
  - **Uncommon**
    - Hypertension

  **SPECIFIC SIDE-EFFECTS**
  - **Common or very common**
    - With transdermal use: Abdominal pain – breast abnormalities – menstrual cycle irregularities – uterine disorders – vaginal discharge – weight changes
  - **Uncommon**

www.getintopharma.com
vascular disease • tumour growth • visual impairment • vulvovaginal candidiasis

▶ With transdermal use Anemia • breast neoplasm benign • depression • flatulence • increased risk of infection • leucopenia • mood swings • venous thromboembolism • vertigo • vomiting

▶ Rare or very rare

▶ With oral use Angioedema • cerebrovascular insufficiency • chorea • contact lens intolerance • haemolytic anaemia • hepatic disorders • hirsutism • malaise • myocardial infarction • sexual dysfunction • steepening of corneal curvature • vaginal discharge • vomiting

▶ With transdermal use Epilepsy exacerbated • galactorrhoea • glucose tolerance impaired • libido disorder

▶ Frequency not known

▶ With oral use Carbohydrate metabolism change • epilepsy exacerbated • hyperglycaemia • increased risk of coronary artery disease • neoplasms • pancreatitis • systemic lupus erythematosus (SLE)

SIDE-EFFECTS, FURTHER INFORMATION Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces regular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

CONCEPTION AND CONTRAETUTION HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

PREGNANCY Not known to be harmful.

BREAST FEEDING Avoid; adverse effects on lactation.

HEPATIC IMPAIRMENT Avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until determination of fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

PREGNANCY Not known to be harmful.

BREAST FEEDING Avoid; adverse effects on lactation.

HEPATIC IMPAIRMENT Avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

MONITORING REQUIREMENTS

▶ History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).

▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

DIRECTIONS FOR ADMINISTRATION

▶ With transdermal use Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch.

PATIENT AND CARER ADVICE

▶ With transdermal use Patient counselling is advised for estradiol patches (administration).

▶ With topical use Patient counselling is advised for estradiol gels (administration).

OSTROGEL® With topical use Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application.

SANDRENA® With topical use Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

Bedol (ReSource Medical UK Ltd)

www.getintopharma.com
**CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis. Acute porphyrias p. 1035 - Dubin-Johnson and Rotor syndromes (or monitor closely). Gallstones - heart disease associated with pulmonary hypertension - heart disease associated with risk of embolus - history during pregnancy of cholestatic jaundice - history during pregnancy of chorea - history during pregnancy of pemphigoid gestationis - history during pregnancy of purpura - history of breast cancer - history of haemolytic uraemic syndrome - liver disease (where liver function tests have failed to return to normal). Migraine with aura - oestrogen-dependent cancer - sclerosing treatment for varicose veins - severe or multiple risk factors for arterial disease - severe or multiple risk factors for venous thromboembolism - systemic lupus erythematosus with (or unknown) antiphospholipid antibodies - thrombophilic disorder - transient cerebral ischaemic attacks without headaches - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment).

**CAUTIONS** Active trophoblastic disease (until return to normal). Risk factors for arterial disease - plasma-gonadotrophin concentration) - seek specialist advice - cardiovascular disease (sodium retention with oedema, thromboembolism) - Crohn’s disease - diabetes (increased risk of heart disease) - gene mutations associated with breast cancer (e.g. BRCA 1) - history of breast nodules or fibrocystic disease - closely monitor breast status (risk of breast cancer) - history of endometrial hyperplasia - history of severe depression (especially if induced by hormonal contraceptive) - antiphospholipid antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for arterial disease - risk factors for venous thromboembolism - anglophobic disorder (including lupus anticoagulant); (in adolescents, avoid for age and gender). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from treatment.

- Risk of venous thromboembolism Use with caution if any of the following factors present but avoid if two or more factors present:
  - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - obesity—body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative); long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast); history of superficial thrombophlebitis;
  - age over 35 years (avoid if over 50 years); smoking.

- Risk factors for arterial disease Use with caution if any one of the following factors present but avoid if two or more factors present:
  - family history of arterial disease in first degree relative aged under 45 years (avoid if other heart disease present);
  - diabetes mellitus (avoid if diabetes complications present);
  - hypertension—blood pressure above 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (In adolescents, avoid if blood pressure very high); smoking (avoid if smoking 40 or more cigarettes daily);
  - age over 35 years (avoid if over 50 years);
  - obesity (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over
760 Sex hormone responsive conditions

**Tibolone**

**INDICATIONS AND DOSE**
Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues)

Osteoporosis prophylaxis in women at high risk of fractures when other fractures contra-indicated or not tolerated

- **BY MOUTH**
  - Adult: 2.5 mg daily

**CONTRA-INDICATIONS**
Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thromboprophylaxis - acute porphyrias p. 1058 - Dubin-Johnson and Rotor syndrome (or monitor closely) - history of breast cancer - history of cardiovascular disease - history of cerebrovascular disease - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - history of thromboembolism - history of thromboprophylaxis - hormone-dependent tumours - liver disease (where liver function tests have failed to return to normal) - oestrogen-dependent cancer - thrombophilic disorder - uninvestigated or undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism

**CAUTIONS**
- Diabetes (increased risk of heart disease)
- epilepsy - factors predisposing to thromboembolism - history of breast nodules - closely monitor breast status (risk of breast cancer) - history of endometrial hyperplasia - history of fibrocystic disease - closely monitor breast status (risk of breast cancer) - history of liver disease - hypertriglyceridaemia - hyperphysical tumours - migraine (or migraine-like headaches) - presence of antiphospholipid antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - risk of stroke

**SIDE-EFFECTS**

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

**Tablet**
- Ethinylestradiol (Non-proprietary)
  - Ethinylestradiol 2 microgram tablets | 100 tablet [P] £200.00
  - Ethinylestradiol 10 microgram tablets | 21 tablet [P] £200.00
  - Ethinylestradiol 50 microgram tablets | 21 tablet [P] £200.00

- Ethinylestradiol 1 mg tablets | 28 tablet [P] £200.00

**PREGNANCY**
- Not known to be harmful.
- Avoid until weaning or for 6 months after birth (adverse effects on lactation).

**HEPATIC IMPAIRMENT**
- Avoid.

**INTERACTIONS**
- Appendix 1: hormone replacement therapy

**SIDE-EFFECTS, FURTHER INFORMATION**
Cyclical HRT (where a progestogen is taken for 6–12 days of each 28–day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. Continuous combined HRT commonly produces irregular breakthrough bleeding in the first 4–6 months of treatment. Bleeding beyond 6 months or after a spell of amenorrhoea requires further investigation to exclude serious gynaecological pathology.

**SIDE-EFFECTS**
- Frequency not known Arthralgia - dementia - depression - diziness - erythema nodosum - gallbladder disorder - headaches - increased risk of ischaemic stroke - myalgia - neoplasms - vision disorders

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

**Tablet**
- Ethinylestradiol (Non-proprietary)
  - Ethinylestradiol 2 microgram tablets | 100 tablet [P] £200.00
  - Ethinylestradiol 10 microgram tablets | 21 tablet [P] £200.00
  - Ethinylestradiol 50 microgram tablets | 21 tablet [P] £200.00

- Ethinylestradiol 1 mg tablets | 28 tablet [P] £200.00

**PREGNANCY**
- Avoid; toxicity in animal studies.

**BREAST FEEDING**
- Avoid.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution; avoid in acute disease.

**RENAIL IMPAIRMENT**
- Monitoring Patients with renal impairment should be closely monitored (risk of fluid retention).

**PRESCRIBING AND DISPENSING INFORMATION**
Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogues) and as (or with) an oral contraceptive. Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding). If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**NOVOFEM®**

Menopausal symptoms in women with a uterus

Osteoporosis prophylaxis in women with a uterus

- BY MOUTH
  - Adult: 1 tablet daily for 16 days, red tablets to be taken, then 1 tablet daily for 12 days, white tablets to be taken, subsequent courses are repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

**TRISEQUENS®**

Menopausal symptoms in women with a uterus

Osteoporosis prophylaxis in women with a uterus

- BY MOUTH
  - Adult: 1 tablet daily for 12 days, blue tablets to be taken, followed by 1 tablet daily for 10 days, white tablet to be taken, then 1 tablet daily for 6 days, red tablet to be taken, subsequent courses are repeated without interval

**INTERACTIONS**

- Appendix 1: hormone replacement therapy

---

**EVOREL® SEQUI**

Patients and carers should be advised on the application of Evorel® Sequi patches.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - Clinorette (ReSource Medical UK Ltd)
    - Clinorette tablets | 84 tablet (£23)
  - Elleste Duet (Meda Pharmaceuticals Ltd)
    - Elleste Duet 1mg tablets | 84 tablet (£20)
    - Elleste Duet 2mg tablets | 84 tablet (£20)
  - Norethisterone acetate 1mg, Estradiol 2mg tablets | 84 tablet (£20 DT = £17.02
  - Kliovance (Novo Nordisk Ltd)
    - Norethisterone acetate 1mg, Estradiol 2mg Kliovance tablets | 84 tablet (£20 DT = £17.02
  - Novofem (Novo Nordisk Ltd)
    - Novofem tablets | 84 tablet (£20 DT = £17.02
  - Trisequens (Novo Nordisk Ltd)
    - Trisequens tablets | 84 tablet (£20 DT = £17.02

**Transdermal patch**

- Evorel Conti (Janssen-Cilag Ltd)
  - Estradiol 50 microgram per 24 hour, Norethisterone acetate 170 microgram per 24 hour Evorel Conti patches | 8 patch (£37.22 DT = £37.22
- Evorel Sequi (Janssen-Cilag Ltd)
  - Evorel Sequi patches | 8 patch (£20 DT = £11.09

---

**Estradiol with norgestrel**

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 756.

**INDICATIONS AND DOSE**

**CYCLO-PROGYNOLA® 2MG TABLETS**

Menopausal symptoms in women with a uterus

Osteoporosis prophylaxis in women with a uterus

- BY MOUTH
  - Adult: 1 tablet daily for 11 days, white tablet to be taken; start on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 10 days, brown tablet to be taken, followed by a 7-day tablet free interval

**INTERACTIONS**

- Appendix 1: hormone replacement therapy

**SIDE-EFFECTS**

- Common or very common Gastrointestinal discomfort - haemorrhage - headaches - menstrual cycle irregularities - nausea - skin reactions - weight changes
- Uncommon Breast abnormalities - depressed mood - dizziness - erythema nodosum - oedema - palpitations - visual impairment
- Rare or very rare Anxiety - contact lens intolerance - fatigue - hirsutism - muscle cramps - sexual dysfunction - vaginal discharge - vomiting
- Frequency not known Angioedema - dementia - gallbladder disorder - myocardial infarction - neoplasms - stroke - venous thromboembolism

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Form unstated

- Cyclo-Progynola (Meda Pharmaceuticals Ltd)
  - Cyclo-Progynola 2mg tablets | 2 tablet (£30)

---

www.getintopharma.com
**PROGESTOGENS**

### Norethisterone

#### Indications and dose

**Endometriosis**
- **By mouth**
  - Adult: 10–15 mg daily for 4–6 months or longer, to be started on day 5 of cycle; increased to 20–25 mg daily if required, dose only increased if spotting occurs and reduced once bleeding has stopped

**Dysfunctional uterine bleeding (to arrest bleeding)**
- **By mouth**
  - Adult: 5 mg 3 times a day for 10 days

**Dysfunctional uterine bleeding (to prevent bleeding)**
- **By mouth**
  - Adult: 5 mg twice daily, to be taken from day 19 to day 26 of cycle

**Dysmenorrhoea**
- **By mouth**
  - Adult: 5 mg 3 times a day for 3–4 cycles, to be taken from day 5–24 of cycle

**Premenstrual syndrome (but not recommended)**
- **By mouth**
  - Adult: 5 mg 2–3 times a day for several cycles, to be taken from day 19–26 of cycle

**Postponement of menstruation**
- **By mouth**
  - Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

**Breast cancer**
- **By mouth**
  - Adult: 40 mg daily, increased if necessary to 60 mg daily

**Short-term contraception**
- **By deep intramuscular injection**
  - Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

**Contraception**
- **By mouth**
  - Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

#### Contraindications

**General Contraindications**
- Avoid in patients with a history of liver tumours - breast cancer (unless progestogens are being used in the management of this condition) - genital cancer (unless progestogens are being used in the management of this condition) - history during pregnancy of idiopathic jaundice - history during pregnancy of pemphigoid gestationis (non-contraceptive indications) - history during pregnancy of severe pruritus (non-contraceptive indications) - when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

**Specific Contraindications**
- With oral use Acute porphyrias p. 1058 - severe arterial disease - undiagnosed vaginal bleeding

#### Cautions

**General Cautions**
- Asthma - cardiac dysfunction - conditions that may worsen with fluid retention - diabetes (progestogens can decrease glucose tolerance - monitor patient closely) - epilepsy - history of depression - hypertension - migraines - susceptibility to thromboembolism (particular caution with high dose)

**Specific Cautions**
- When used for contraception active throphoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) - seek specialist advice - arterial disease - functional ovarian cysts - history of jaundice in pregnancy - malabsorption syndromes - past ectopic pregnancy - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies

- With intramuscular use for contraception disturbances of lipid metabolism - history during pregnancy of deterioration of osteosclerosis - history during pregnancy of pruritus - possible risk of breast cancer

#### Interactions

- Use as a contraceptive in comorbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

- Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

#### Side-effects

**General Side-effects**
- Common or very common Menstrual cycle irregularities
- Uncommon Breast tenderness
- Frequency not known Hepatic cancer - thromboembolism

**Specific Side-effects**
- Common or very common
  - With intramuscular use Dizziness - haemorrhage - headache - hypersensitivity - nausea - skin reactions - weight increased

- Uncommon
  - With intramuscular use Abdominal distension - depressed mood

- Frequency not known
  - With oral use Appetite change - depression - fatigue - gastrointestinal disorder - headaches - hypertension - libido disorder - nervousness - rash - weight change

#### Pregnancy

- With oral use Masculinisation of female fetuses and other defects reported with non-contraceptive use.

**Breast Feeding**
- Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.

- With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

#### Hepatic Impairment

- When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Avoid in non-contraceptive indications.

#### Renal Impairment

- Use with caution in non-contraceptive indications.
PATIENT AND CARER ADVICE
Diarrhoea and vomiting with oral contraceptives. Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine for oral contraceptives. One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special order manufacturers include: oral suspension

Solution for injection
- Noristerat (Bayer Plc) Norethisterone enantate 200 mg per 1 ml Noristerat 200mg/1ml solution for injection ampoules | 1 ampoule | £4.05
- Norethisterone (Non-proprietary) Norethisterone 5 mg Norethisterone 5mg tablets | 30 tablet | £2.40 DT = £2.35
- Noriday (Pfizer Ltd) Norethisterone 350 microgram Noriday 350microgram tablets | 84 tablet | £2.10 DT = £2.10
- Primolut N (Bayer Plc) Norethisterone 5 mg Primolut N 5mg tablets | 30 tablet | £2.26 DT = £2.35
- Utovan (Pfizer Ltd) Norethisterone 5 mg Utovan 5mg tablets | 30 tablet | £1.40 DT = £2.35 | 90 tablet | £4.21

Combinations available: Estradiol with norethisterone, p. 762

INDICATIONS AND DOSE
CRINONE® VAGINAL GEL
Infertility due to inadequate luteal phase
- BY VAGINA
  - Adult: 1 applicatorful daily, to be started either after documented ovulation or on day 18–21 of cycle, in vitro fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

CYCLOGEST® PESSARIES
Premenstrual syndrome | Post-natal depression
- BY VAGINA, OR BY RECTUM
  - Adult: 200–800 mg daily, doses above 200 mg to be given in 2 divided doses, for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

GESTONE® SOLUTION FOR INJECTION
Dysfunctional uterine bleeding
- BY DEEP INTRAMUSCULAR INJECTION
  - Adult: 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation, to be administered into buttocks

Recurrent miscarriage due to inadequate luteal phase (but not recommended) or following in vitro fertilisation or gamete intra-fallopian transfer
- BY DEEP INTRAMUSCULAR INJECTION
  - Adult: 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of pregnancy, to be administered into buttocks; maximum 200 mg per day

LUBION®
Supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - Adult: 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

LUTIGEST®
Luteal support as part of an Assisted Reproductive Technology (ART) treatment programme
- BY VAGINA
  - Adult: 100 mg 3 times a day, to be started the day after oocyte retrieval, and continued for 30 days once pregnancy is confirmed

UTROGESTAN® CAPSULES
Progestogen opposition of oestrogen HRT
- BY MOUTH
  - Adult: 200 mg once daily on days 15–26 of each 28-day oestrogen HRT cycle, alternatively 100 mg once daily on days 1–25 of each 28-day oestrogen HRT cycle

SUPPLEMENTATION OF LUTEAL PHASE DURING ASSISTED REPRODUCTIVE TECHNOLOGY (ART) CYCLES
- BY VAGINA
  - Adult: 1 capsule 3 times a day from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

CONTRA-INDICATIONS Acute porphyrias p. 1058 - avoid in patients with a history of liver tumours - breast cancer (unless progestogens are being used in the management of this condition) - genital cancer (unless progestogens are being used in the management of this condition) - history

- **CAUTIONS**
  
  Asthma. Cardiac dysfunction. Conditions that may worsen with fluid retention. Diabetes. Progestogens can decrease glucose tolerance—monitor patient closely.

  - Epilepsy. History of depression. Hypertension. Migraine. Susceptibility to thromboembolism (particular caution with high dose)

- **SIDE-EFFECTS**
  
  - Common or very common
  
  With oral use: Headache. Menstrual cycle irregularities.
  

  - Uncommon
  

  - Rare or very rare
  
  With oral use: Depression. Nausea.

  - Frequency not known
  

  With rectal use: Diarrhoea. Flatulence.

- **PREGNANCY**
  
  Not known to be harmful.

- **BREAST FEEDING**
  
  Avoid—present in milk.

- **HEPATIC IMPAIRMENT**
  
  Avoid in hepatic impairment. Avoid in active liver disease including disorders of hepatic excretion (e.g., Dublin-Johnson or Rotor Syndromes), infective hepatitis (until liver function returns to normal) and liver tumours.

- **RENAL IMPAIRMENT**
  
  Use with caution.

- **DIRECTIONS FOR ADMINISTRATION**
  
  With oral use: Capsules should be taken at bedtime on an empty stomach.

- **PATIENT AND CARER ADVICE**
  
  With oral use: Patient counselling is advised for progesterone capsules (administration).

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **LUTIGEST®**

  **Scottish Medicines Consortium (SMC) decisions**

  The Scottish Medicines Consortium has advised (October 2016) that progesterone (Lutigest®) is accepted for use within NHS Scotland for luteal support as part of an assisted reproductive technology (ART) treatment program for infertile women. This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

  **LUBION®**

  **Scottish Medicines Consortium (SMC) decisions**

  SMC No. SMC2017

  The Scottish Medicines Consortium has advised (July 2018) that progesterone (Lubion®) is accepted for use within NHS Scotland for luteal support as part of an Assisted Reproductive Technology (ART) treatment program in infertile women who are unable to use or tolerate vaginal preparations.
Male sex hormone responsive conditions

8.2 Male sex hormone responsive conditions

**Androgens, anti-androgens and anabolic steroids**

**Androgens**

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively Sustanon®, which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

**Anti-androgens**

**Cyproterone acetate**

Cyproterone acetate p. 770 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in animal studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

**Dutasteride and finasteride**

Dutasteride p. 787 and finasteride p. 787 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin p. 783 in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men.

**Anabolic steroids**

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some aplastic anaemias. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

**Androgens**

**CONTRA-INDICATIONS**

- Breast cancer in males
- History of liver tumours
- Hypercalcaemia
- Prostate cancer

**CAUTIONS**

- Cardiac impairment
- Diabetes mellitus
- Elderly
- Epilepsy
- Hypertension
- Ischaemic heart disease
- Migraine
- Pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored—skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)—sleep apnoea—step treatment or reduce dose if severe polycythaemia occurs—tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)

**8.2 Male sex hormone responsive conditions**

**Androgens, anti-androgens and anabolic steroids**

**Androgens**

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

Dutasteride p. 787 and finasteride p. 787 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin p. 783 in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men.

**Anabolic steroids**

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some aplastic anaemias. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

**ANDROGENS**

**Androgens**

**CONTRA-INDICATIONS**

- Breast cancer in males
- History of liver tumours
- Hypercalcaemia
- Prostate cancer

**CAUTIONS**

- Cardiac impairment
- Diabetes mellitus
- Elderly
- Epilepsy
- Hypertension
- Ischaemic heart disease
- Migraine
- Pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored—skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)—sleep apnoea—step treatment or reduce dose if severe polycythaemia occurs—tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
SIDE-EFFECTS
- Common or very common: Headache, hot flush, hypertension, polycythaemia, prostate abnormalities, skin reactions, weight increased
- Uncommon: Alopecia, asthenia, behaviour abnormal, depression, dizziness, dyspnoea, dysuria, gynaecomastia, hyperhidrosis, insomnia, nausea, sexual dysfunction
- Rare or very rare: Pulmonary oedema, microembolism, sperm abnormalities
- Frequency not known: Anxiety, epiphyses premature fusion, fluid retention, jaundice, oedema, paraesthesia, precocious puberty, prostate cancer, seborrhoea, sleep apnoea, urinary tract obstruction

SIDE-EFFECTS, FURTHER INFORMATION
Stop treatment or reduce dose if severe polycythaemia occurs.

PREGNANCY
Avoid—causes masculinisation of female fetus.

BREAST FEEDING
Avoid.

HEPATIC IMPAIRMENT
Avoid if possible—fluid retention and dose-related toxicity.

RENAL IMPAIRMENT
Caution—potential for fluid retention.

MONITORING REQUIREMENTS
- Monitor haematocrit and haemoglobulin before treatment, every three months for the first year, and yearly thereafter.
- Monitor prostate and PSA in men over 45 years.

PATIENT AND CARER ADVICE
Androgenic effects in women: Women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism.

Testosterone

INDICATIONS AND DOSE
TESTAVAN®

Hypogonadism due to androgen deficiency in men
- BY TRANSDERMAL APPLICATION
  - Adult: Apply 23 mg once daily; increased in steps of 23 mg, adjusted according to response; maximum 69 mg per day

DOSE EQUIVALENCE AND CONVERSION
- For Testavan®: One pump actuation delivers 1.15 g of gel containing 23 mg of testosterone.

TESTIM®

Hypogonadism due to testosterone deficiency in men
- BY TRANSDERMAL APPLICATION
  - Adult: Apply 50 mg once daily, subsequent application adjusted according to response; maximum 100 mg per day

DOSE EQUIVALENCE AND CONVERSION
- For Testim®: One tube of 5 g contains 50 mg testosterone.

TESTOGEL® 50MG/5G

Hypogonadism due to androgen deficiency in men
- BY TRANSDERMAL APPLICATION
  - Adult: Apply 50 mg once daily; increased in steps of 25 mg, adjusted according to response; maximum 100 mg per day

DOSE EQUIVALENCE AND CONVERSION
- For Testogel® 50mg/5g: One sachet of 5 g contains 50 mg of testosterone.

TOSTRAN®

Hypogonadism due to testosterone deficiency in men
- BY TRANSDERMAL APPLICATION
  - Adult: Apply 60 mg once daily, subsequent application adjusted according to response; maximum 80 mg per day

DOSE EQUIVALENCE AND CONVERSION
- For Tostran®: 1 g of gel contains 20 mg testosterone.

CAUTIONS
- Thrombophilia—increased risk of thrombosis

SIDE-EFFECTS
- Common or very common: Hypertriglyceridaemia
- Uncommon: Flushing
- Frequency not known: Anaemia, deep vein thrombosis, electrolyte imbalance, emotional lability, hair changes, malaise, muscle cramps, musculoskeletal pain, testicular disorder.

DIRECTIONS FOR ADMINISTRATION
Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature.

TOSTRAN®: Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.

TESTOGEL® 50MG/5G: Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel; avoid shower or bath for at least 6 hours.

TESTIM®: Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours.

TESTOGEL® 16.2MG/G: Apply thin layer of gel on clean, dry, healthy skin over right and left upper arms and shoulders. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, and cover the site with clothing once gel dried; avoid shower or bath for at least 2 hours.

TESTAVAN®: Manufacturer advises apply one pump actuation of gel evenly onto clean, dry, intact skin over upper arm and shoulder using the applicator, without getting any gel on the hands—repeat on opposite upper arm and shoulder if two pump actuations are required, and repeat again on initial upper arm and shoulder if three pump actuations are required. Allow to dry completely before dressing and cover application site with clothing. Wash hands with soap and water immediately if gel was touched during application; avoid shower or bath for at least 2 hours.
Testosterone propionate

**INDICATIONS AND DOSE**

- **Androgen deficiency**
  - **By intramuscular injection**
  - Adult: 50 mg 2–3 times a week
  - **Delayed puberty in males**
  - **By intramuscular injection**
  - Adult: 50 mg once weekly
  - **Breast cancer in women**
  - **By intramuscular injection**
  - Adult: 100 mg 2–3 times a week

**SIDE-EFFECTS**

- Increased risk of thrombosis

**MEDICINAL FORMS**

- Forms available from special-order manufacturers include: solution for injection

---

Testosterone undecanoate

**INDICATIONS AND DOSE**

- **Androgen deficiency**
  - Adult: 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily
  - **Hypogonadism**
    - **By deep intramuscular injection**
    - Adult (male): 1 g every 10–14 weeks, to be given over 2 minutes, if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks.

**SIDE-EFFECTS**

- Increased risk of thrombosis

**MEDICINAL FORMS**

- Not licensed for use in breast cancer.
- **Thrombophilia** — increased risk of thrombosis

---

Testosterone enantate

**INDICATIONS AND DOSE**

- **Hypogonadism**
  - **By slow intramuscular injection**
  - Adult: Initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks
  - **Breast cancer**
  - **By slow intramuscular injection**
  - Adult: 250 mg every 2–3 weeks

**SIDE-EFFECTS**

- Increased risk of thrombosis

**Caution**

- **With intramuscular use**
  - Hair growth increased
  - **With oral use**
  - Fluid imbalance, gastrointestinal discomfort, hepatic function abnormal, lipid metabolism change, myalgia

---

Testosterone decanoate, isocaproate, phenylpropionate and propionate

The properties listed below are those particular to the combination only. For the properties of the components please consider, testosterone propionate below.

**INDICATIONS AND DOSE**

- **Androgen deficiency**
  - **By deep intramuscular injection**
  - Adult: 1 mL every 3 weeks, adjusted according to response

**DOSE EQUIVALENCE AND CONVERSION**

- Each 1 mL dose of Sustanon 250 solution for injection contains 100 mg testosterone decanoate, 60 mg testosterone isocaproate, 60 mg testosterone phenylpropionate and 30 mg testosterone propionate.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Excipients:** May contain Butylated hydroxytoluene, propylene glycol
  - Testovan (Ferring Pharmaceuticals Ltd)
  - Testim (Ferring Pharmaceuticals Ltd)
  - Testogel (Besins Healthcare (UK) Ltd)
  - Testogen 50 mg Testim 50 mg/g gel | 30 tube POM £32.00 DT = £32.00 (C4-2)
  - Testogen 16.2 mg per 1 gram Testogel 16.2 mg/g gel | 88 gram POM £31.11 DT + £31.11 (C4-2)
  - Tostran (Kyowa Kirin Ltd)
  - Testosterone 20 mg per 1 gram Tostran 2% gel | 60 gram POM £28.63 DT = £28.67 (C4-2)

---

Testosterone propionate

**INDICATIONS AND DOSE**

- **Androgen deficiency**
  - **By intramuscular injection**
  - Adult: 50 mg 2–3 times a week

**SIDE-EFFECTS**

- Bone formation increased, circulatory system disorder, gastrointestinal disorder, gastrointestinal haemorrhage, hepatomegaly, hypercalcaemia, neoplasms

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Testosterone enantate (Non-proprietary)**
  - Testosterone enantate 250 mg per 1 ml Testosterone enantate 250 mg/1 ml solution for injection ampoules | 3 ampoule POM £83.74–£87.73 DT + £85.74 (C4-2)

---

Testosterone undecanoate

**INDICATIONS AND DOSE**

- **Androgen deficiency**
  - Adult: 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

**SIDE-EFFECTS**

- Increased risk of thrombosis

**Caution**

- **With intramuscular use**
  - Hair growth increased
  - **With oral use**
  - Fluid imbalance, gastrointestinal discomfort, hepatic function abnormal, lipid metabolism change, myalgia

www.getintopharma.com
8.2a Male sex hormone antagonism

ANTI-ANDROGENS

Cyproterone acetate

- **INDICATIONS AND DOSE**
  - Hyper-sexuality in males
  - Sexual deviation in males
    - BY MOUTH
    - Adult: 50 mg twice daily, to be taken after food
  - Prevention of tumour flare with initial gonadorelin analogue therapy
    - BY MOUTH
    - Adult (male): 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; maximum 300 mg per day.
  - Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred
    - BY MOUTH
    - Adult (male): 200–300 mg daily in 2–3 divided doses.
  - Hot flushes with gonadorelin analogue therapy or after orchidectomy
    - BY MOUTH
    - Adult (male): Initially 50 mg daily, then adjusted according to response to 50–150 mg daily in 1–3 divided doses.

- **CONTRA-INDICATIONS**
  - GENERAL CONTRA-INDICATIONS
    - Meningioma or history of meningioma
  - SPECIFIC CONTRA-INDICATIONS
    - When used for when used for hypersexuality
      - Dubin–Johnson syndrome
      - history of thromboembolic disorders
      - liver disease
      - malignant diseases
      - previous or existing liver tumours
      - Rotor syndrome
      - severe depression
      - severe diabetes (with vascular changes)
      - sickle-cell anaemia
      - wasting diseases
  - **CAUTIONS**
    - Diabetes mellitus
    - in prostate cancer
    - severe depression
    - in prostate cancer
    - sickle-cell anaemia
    - ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)
  - **SIDE-EFFECTS**
    - Common or very common
      - Depressed mood
      - dyspnoea
      - fatigue
      - gynaecomastia
      - hepatic disorders
      - hot flush
      - hyperhidrosis
      - nipple pain
      - restlessness
      - weight change
    - Uncommon
      - Skin reactions
    - Rare or very rare
      - Gallerhorrhea
      - neoplasms
    - Frequency not known
      - Adrenocortical suppression
      - anaemia
      - azoospermia
      - hair changes
      - hypotrichosis
      - osteoporosis
      - sebaceous gland underactivity (may clear acne)
      - thromboembolism

**SIDE-EFFECTS, FURTHER INFORMATION**

- Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).
- **HEPATIC IMPAIRMENT**
  - Avoid (unless used for prostate cancer)—dose-related toxicity.
- **MONITORING REQUIREMENTS**
  - Monitor blood counts initially and throughout treatment.
  - Monitor adrenocortical function regularly.
  - Liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Nebido (Bayer Plc)
  - Testosterone undecanoate 250 mg per 1 ml
  - Nebido 1000 mg/4 ml solution for injection vials | 1 vial [48](https://www.getintopharma.com) £17.11 DT = £17.11 [48](https://www.getintopharma.com)

Capsule

CAUTIONARY AND ADVISORY LABELS

21, 25

- Restandol (Merck Sharp & Dohme Ltd)
  - Testosterone undecanoate 40 mg
  - Restandol 40 mg Testocaps | 30 capsule [48](https://www.getintopharma.com) £8.55 [48](https://www.getintopharma.com) | 60 capsule [48](https://www.getintopharma.com) £17.10 DT = £17.10 [48](https://www.getintopharma.com)

9 Thyroid disorders

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES

Thyrotropin alfa

(Recombinant human thyroid stimulating hormone; rhTSH)

**DRUG ACTION**

- Thyrotropin alfa is a recombinant form of thyrotropin (thyroid stimulating hormone).

**INDICATIONS AND DOSE**

Detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients, together with serum thyroglobulin testing (with or without radiiodine imaging) to increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 900 micrograms every 24 hours for 2 doses, dose to be administered into the gluteal muscle, consult product literature for further information on indications and dose

**CAUTIONS**

- Presence of thyroglobulin autoantibodies may give false negative results

www.getintopharma.com
9.1 Hyperthyroidism

Antithyroid drugs

Overview

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole below is the most commonly used drug. Propylthiouracil p. 772 should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole with levothyroxine sodium p. 773 daily, may be used in a blocking-replacement regimen; therapy is usually given for 18 months. The blocking-replacement regimen is not suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (¹³¹I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 150 is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol hydrochloride but nadolol p. 149 is also used.

Thyrotoxic crisis (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 676 (as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Antithyroid drugs in pregnancy

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is not suitable. Carbimazole is associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy). See also Important safety information in the carbimazole below drug monograph.

Advanced Pharmacy Services

Patients with thyroid disorders may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Other drugs used for Hyperthyroidism Metoprolol tartrate, p. 154

ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

Carbimazole

INDICATIONS AND DOSE

Hyperthyroidism

> BY MOUTH

Adult: 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

> BY MOUTH

Adult: 40–60 mg daily, therapy usually given for 18 months

DOSE EQUIVALENCES AND CONVERSION

When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

IMPORTANT SAFETY INFORMATION

NEUTROPENIA AND AGRANULOCYTOSIS

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

> Patient should be advised to report symptoms and signs suggestive of infection, especially sore throat.

A white cell count should be performed if there is any clinical evidence of infection.

Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.
Carbimazole is associated with an increased risk of congenital malformations when used during pregnancy, especially in the first trimester and at high doses (daily dose of 15 mg or more).

Women of childbearing potential should use effective contraception during treatment with carbimazole. It should only be considered in pregnancy after a thorough benefit-risk assessment, and at the lowest effective dose without additional administration of thyroid hormones—close maternal, fetal, and neonatal monitoring is recommended.

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

Carbimazole should not be used in patients with a history of acute pancreatitis associated with previous treatment—re-exposure may result in life-threatening acute pancreatitis with a decreased time to onset.

MHRA/CHM ADVICE: CARBIMAZOLE: RISK OF ACUTE PANCREATITIS (FEBRUARY 2019)

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

MHRA/CHM ADVICE: CARBIMAZOLE: INCREASED RISK OF CONGENITAL MALFORMATIONS; STRENGTHENED ADVICE ON CONTRACEPTION (FEBRUARY 2019)

Carbimazole is associated with an increased risk of congenital malformations when used during pregnancy, especially in the first trimester and at high doses (daily dose of 15 mg or more).

Propylthiouracil can be given but the dose may need adjusting according to response. The dose may require adjustment in cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

Breast feeding

Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

CONTRA-INDICATIONS

Severe blood disorders

SIDE-EFFECTS

Rare or very rare Bone marrow disorders · haemolytic anaemia · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

Frequency not known Agranulocytosis · aplasia · angiodema · dyspepsia · eosinophilia · fever · gastrointestinal disorder · generalised lymphadenopathy · haemorrhage · headache · hepatic disorders · insulin autoimmune syndrome · leucopenia · malaise · myopathy · nausea · nerve disorders · neutropenia · pancreatitis acute (discontinue permanently) · salivary gland enlargement · skin reactions · taste loss

CONCEPTION AND CONTRACEPTION

The MHRA advises that females of childbearing potential should use effective contraception during treatment.

PREGNANCY

The MHRA advises consider use only after a thorough benefit-risk assessment. See Important Safety Information and Antithyroid drugs p. 771 for further information.

BREAST FEEDING

Present in breast milk and this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

BREAST FEEDING

Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function.

MHRA/CHM ADVICE: CARBIMAZOLE: INCREASED RISK OF CONGENITAL MALFORMATIONS; STRENGTHENED ADVICE ON CONTRACEPTION (FEBRUARY 2019)

Carbimazole is associated with an increased risk of congenital malformations when used during pregnancy, especially in the first trimester and at high doses (daily dose of 15 mg or more).

Women of childbearing potential should use effective contraception during treatment with carbimazole. It should only be considered in pregnancy after a thorough benefit-risk assessment, and at the lowest effective dose without additional administration of thyroid hormones—close maternal, fetal, and neonatal monitoring is recommended.

MHRA/CHM ADVICE: CARBIMAZOLE: RISK OF ACUTE PANCREATITIS (FEBRUARY 2019)

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

Carbimazole should not be used in patients with a history of acute pancreatitis associated with previous treatment—re-exposure may result in life-threatening acute pancreatitis with a decreased time to onset.

MHRA/CHM ADVICE: CARBIMAZOLE: INCREASED RISK OF CONGENITAL MALFORMATIONS; STRENGTHENED ADVICE ON CONTRACEPTION (FEBRUARY 2019)

Carbimazole is associated with an increased risk of congenital malformations when used during pregnancy, especially in the first trimester and at high doses (daily dose of 15 mg or more).

Women of childbearing potential should use effective contraception during treatment with carbimazole. It should only be considered in pregnancy after a thorough benefit-risk assessment, and at the lowest effective dose without additional administration of thyroid hormones—close maternal, fetal, and neonatal monitoring is recommended.

MHRA/CHM ADVICE: CARBIMAZOLE: RISK OF ACUTE PANCREATITIS (FEBRUARY 2019)

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

Carbimazole should not be used in patients with a history of acute pancreatitis associated with previous treatment—re-exposure may result in life-threatening acute pancreatitis with a decreased time to onset.

MHRA/CHM ADVICE: CARBIMAZOLE: INCREASED RISK OF CONGENITAL MALFORMATIONS; STRENGTHENED ADVICE ON CONTRACEPTION (FEBRUARY 2019)

Carbimazole is associated with an increased risk of congenital malformations when used during pregnancy, especially in the first trimester and at high doses (daily dose of 15 mg or more).

Women of childbearing potential should use effective contraception during treatment with carbimazole. It should only be considered in pregnancy after a thorough benefit-risk assessment, and at the lowest effective dose without additional administration of thyroid hormones—close maternal, fetal, and neonatal monitoring is recommended.

MHRA/CHM ADVICE: CARBIMAZOLE: RISK OF ACUTE PANCREATITIS (FEBRUARY 2019)

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

Carbimazole should not be used in patients with a history of acute pancreatitis associated with previous treatment—re-exposure may result in life-threatening acute pancreatitis with a decreased time to onset.

MHRA/CHM ADVICE: CARBIMAZOLE: INCREASED RISK OF CONGENITAL MALFORMATIONS; STRENGTHENED ADVICE ON CONTRACEPTION (FEBRUARY 2019)

Carbimazole is associated with an increased risk of congenital malformations when used during pregnancy, especially in the first trimester and at high doses (daily dose of 15 mg or more).

Women of childbearing potential should use effective contraception during treatment with carbimazole. It should only be considered in pregnancy after a thorough benefit-risk assessment, and at the lowest effective dose without additional administration of thyroid hormones—close maternal, fetal, and neonatal monitoring is recommended.

MHRA/CHM ADVICE: CARBIMAZOLE: RISK OF ACUTE PANCREATITIS (FEBRUARY 2019)

Cases of acute pancreatitis have been reported during treatment with carbimazole. It should be stopped immediately and permanently if acute pancreatitis occurs.

Carbimazole should not be used in patients with a history of acute pancreatitis associated with previous treatment—re-exposure may result in life-threatening acute pancreatitis with a decreased time to onset.
VITAMINS AND TRACE ELEMENTS

Iodide with iodine
(Lugol’s Solution; Aqueous Iodine Oral Solution)

- **INDICATIONS AND DOSE**
  - **Thyrotoxicosis (pre-operative)**
    - BY MOUTH USING ORAL SOLUTION
    - Adult: 0.1–0.3 mL 3 times a day
  - **DOSE EQUIVALENCE AND CONVERSION**
    - Doses based on the use of an aqueous oral solution containing iodine 50 mg/mL and potassium iodide 100 mg/mL.

- **CAUTIONS** Not for long-term treatment
- **SIDE-EFFECTS** Conjunctivitis • depression (long term use) • erectile dysfunction (long term use) • excessive tearing • headache • hypersensitivity • increased risk of infection • influenza like illness • insomnia (long term use) • rash • salivary gland pain
- **PREGNANCY** Neonatal goitre and hypothyroidism.
- **BREAST FEEDING** Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.
- **DIRECTIONS FOR ADMINISTRATION** For oral solution, dilute well with milk or water.
- **MEDICINAL FORMS** Forms available from special-order manufacturers include: oral solution

9.2 Hypothyroidism

**Thyroid hormones**

**Overview**
Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto’s thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. Levothyroxine sodium below (thyroxine sodium) is the treatment of choice for maintenance therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine sodium should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone.

Liothyronine sodium p. 774 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in severe hypothyroid states when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 676, and treatment of infection; assisted ventilation is often required.

**Advanced Pharmacy Services**
Patients with thyroid disorders may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

**THYROID HORMONES**

Levothyroxine sodium
(Thyroxine sodium)

- **INDICATIONS AND DOSE**
  - **Hypothyroidism**
    - BY MOUTH
      - Adult 18–49 years: Initially 50–100 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks, adjusted according to response; maintenance 100–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication
      - Adult 50 years and over: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication
  - **Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole**
    - BY MOUTH
      - Adult: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 2 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

**CONTRA-INDICATIONS** Thyrotoxicosis

**CAUTIONS** Cardiovascular disorders • diabetes insipidus • diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) • elderly • hypertension • long-standing hypothyroidism • myocardial infarction • myocardial insufficiency • panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) • predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

**SIDE-EFFECTS**

- **INFECTIONS**
  - **Long-term use**
    - Fever • malaise • myalgia • rash • skin reactions • weight decreased

**INTERACTIONS** → Appendix 1: thyroid hormones

**SIDE-EFFECTS**

- **Angina pectoris**
  - **Long-term use**
    - Angina

**DIABETES MELLITUS**

- **Initiation of antidiabetic medication**
  - **Long-term use**
    - Insulin may need to be increased

**PREGNANCY** Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

**Dose adjustments** Levothyroxine requirement may increase during pregnancy.
Monitoring Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**
- **Levothyroxine sodium (Non-proprietary)**
  - Levothyroxine sodium anhydrous 22.5 microgram: Levothyroxine sodium 12.5-microgram tablets | 28 tablet (PPO) £1.20–£2.80 DT = £2.56
  - Levothyroxine sodium anhydrous 25 microgram: Levothyroxine sodium 25-microgram tablets | 28 tablet (PPO) £3.05 DT = £1.63 | 500 tablet (PPO) £41.61–£56.25
  - Levothyroxine sodium 25-microgram tablets lactose free | 100 tablet (PPO) £
  - Levothyroxine sodium anhydrous 50 microgram: Levothyroxine sodium 50-microgram tablets lactose free | 100 tablet (PPO) £
  - Levothyroxine sodium 50-microgram tablets | 28 tablet (PPO) £1.50 DT = £1.03 | 1000 tablet (PPO) £36.79–£55.71
  - Levothyroxine sodium anhydrous 75 microgram: Levothyroxine sodium 75-microgram tablets | 28 tablet (PPO) £2.10–£4.00 DT = £2.73
  - Levothyroxine sodium anhydrous 100 microgram: Levothyroxine sodium 100-microgram tablets lactose free | 100 tablet (PPO) £
  - Levothyroxine sodium 100-microgram tablets | 28 tablet (PPO) £1.50 DT = £1.03 | 1000 tablet (PPO) £36.79–£56.07
- **Eltroxin (Advanz Pharma)**
  - Levothyroxine sodium anhydrous 25 microgram: Eltroxin 25-microgram tablets | 28 tablet (PPO) £2.54 DT = £1.63
  - Levothyroxine sodium anhydrous 50 microgram: Eltroxin 50-microgram tablets | 28 tablet (PPO) £1.77 DT = £1.03
  - Levothyroxine sodium anhydrous 100 microgram: Eltroxin 100-microgram tablets | 28 tablet (PPO) £1.78 DT = £1.03

**Oral solution**
- **Levothyroxine sodium (Non-proprietary)**
  - Levothyroxine sodium anhydrous 5 microgram per 1 ml: Levothyroxine sodium 25micrograms/5ml oral solution sugar free | 100 ml (PPO) £118.63 DT = £94.98
  - Levothyroxine sodium anhydrous 10 microgram per 1 ml: Levothyroxine sodium 50micrograms/5ml oral solution sugar free sugar-free | 100 ml (PPO) £91.22 DT = £89.12
  - Levothyroxine sodium anhydrous 20 microgram per 1 ml: Levothyroxine sodium 100micrograms/5ml oral solution sugar free sugar-free | 100 ml (PPO) £165.00 DT = £164.98
  - Levothyroxine sodium anhydrous 25 microgram per 1 ml: Levothyroxine sodium 125micrograms/5ml oral solution sugar free sugar-free | 100 ml (PPO) £185.00

**Liothyronine sodium** (L-Tri-iodothyronine sodium)

- **INDICATIONS AND DOSE**

  **Hypothyroidism**
  - **BY MOUTH**
    - Adult: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should be increased gradually, smaller initial doses given for the elderly.

  **Hypothyroid coma**
  - **BY SLOW INTRAVENOUS INJECTION**
    - Adult: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

**DOSE EQUIVALENCE AND CONVERSION**
- 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

- **CONTRA-INDICATIONS**
  - Thyrotoxicosis

- **CAUTIONS**
  - Cardiovascular disorders - diabetes insipidus - diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) - elderly - hypertension - long-standing hypothyroidism - myocardial infarction - myocardial insufficiency - panhypopituitarism (initiate corticosteroid therapy before starting liothyronine) - predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting liothyronine)

**CAUTIONS, FURTHER INFORMATION**
- Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

- **INTERACTIONS** → Appendix 1: thyroid hormones

- **SIDE EFFECTS**

  **GENERAL SIDE-EFFECTS**
  - Rare or very rare
    - Alopecia - angina pectoris (more common at excessive dosage) - arrhythmia (more common at excessive dosage) - diarrhoea (more common at excessive dosage) - heat intolerance - muscle cramps - muscle weakness - palpitations (more common at excessive dosage) - tachycardia (more common at excessive dosage) - vomiting (more common at excessive dosage)

    - Frequency not known
      - Agitation - fever - flushing - headache - hyperhidrosis - insomnia (more common at excessive dosage) - oedema - restlessness (more common at excessive dosage) - skin reactions - tremor (more common at excessive dosage) - weight decreased

  **SPECIFIC SIDE-EFFECTS**
  - With intravenous use Menstruation irregular

  **SIDE-EFFECTS, FURTHER INFORMATION**

  **Initial dosage in patients with cardiovascular disorders**

  If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY** Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

**Dose adjustments**
- Levothyroxine requirement may increase during pregnancy.

**Monitoring** Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.
MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

**Tablet**

- Liothyronine sodium (Non-proprietary)
  - Liothyronine sodium 20 microgram tablets | 28 tablet £245.29 DT = £206.71

- Cytomel (imported (United States))
  - Liothyronine sodium 5 microgram tablets | 100 tablet
  - Liothyronine sodium 25 microgram tablets | 100 tablet

**Powder for solution for injection**

- Liothyronine sodium (Non-proprietary)
  - Liothyronine sodium 20 microgram powder for solution for injection vials | 5 vial £1,567.50
Chapter 7
Genito-urinary system

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary frequency and incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine p. 367 can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin hydrochloride p. 778 also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin hydrochloride is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine tartrate p. 780 are comparable to those of modified-release oxybutynin hydrochloride. Flavoxate hydrochloride p. 778 has less marked side-effects but it is also less effective. Darifenacin p. 777, fesoterodine fumarate p. 777, propiverine hydrochloride p. 779, solifenacin succinate p. 779, and trospium chloride p. 781 are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

Propantheline bromide p. 86 and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine hydrochloride p. 376 is limited by its potential to cause cardiac side-effects.

Mirabegron p. 781, a selective beta_3 agonist, is licensed for the treatment of urinary frequency, urgency, and urge incontinence associated with overactive bladder syndrome. Purified bovine collagen implant (Contigen®, Bard) is indicated for urinary incontinence caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

Nocturnal enuresis in children

23-May-2017

Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

Treatment

Children under 5 years

For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families.

Non Drug Treatment

Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in children under 7 years should be considered depending on the child’s maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

www.getintopharma.com
Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks’ uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 867, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable.

Drug Treatment
Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn gradually at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 778 or tolterodine tartrate p. 780 [unlicensed indication]). Treatment should be continued for 3 months; the course can be repeated if necessary. The tricyclic antidepressant imipramine hydrochloride p. 376 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually.

Useful Resources

ANTIMUSCARINICS

Antimuscarinics (systemic)

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · prostatic enlargement (in adults) · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention

- **CAUTIONS** Acute myocardial infarction (in adults) · arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia) · cardiac surgery (due to association with tachycardia) · children (increased risk of side-effects) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · elderly (especially if frail) · gastrointestinal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to angle-closure glaucoma · prostatic hyperplasia (in adults) · pyrexia · ulcerative colitis

- **SIDE-EFFECTS**
  - Common or very common Constipation · dizziness · drowsiness · dry mouth · dyspepsia · flushing · headache · nausea · palpitations · skin reactions · tachycardia · urinary disorders · vision disorders · vomiting
  - Rare or very rare Angioedema · confusion (more common in elderly)

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

**ANTIMUSCARINICS | URINARY**

**Darifenacin**

08-Mar-2017

- **INDICATIONS AND DOSE**
  - Urinary frequency | Urinary urgency | Incontinence
    - **BY MOUTH**
      - Adult: Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks

- **INTERACTIONS** → Appendix 1: darifenacin

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain · dry eye · nasal dryness
  - Uncommon Asthenia · bladder pain · cough · diarrhoea · dysphagia · erectile dysfunction · flatulence · hyperhidrosis · hypertension · increased risk of infection · injury · insomnia · oedema · oral ulceration · taste altered · thinking abnormal · urinary tract disorder

- **PREGNANCY** Manufacturer advises avoid—tobacco in animal studies.

- **BREAST FEEDING** Present in milk in animal studies—manufacturer advises caution.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment (risk of increased exposure).

- **Dose adjustments** Manufacturer advises maximum 7.5 mg daily in moderate impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

**Fesoterodine fumarate**

08-Feb-2019

- **INDICATIONS AND DOSE**
  - Urinary frequency | Urinary urgency | Urge incontinence
    - **BY MOUTH**
      - Adult: 4 mg once daily, increased if necessary up to 8 mg once daily

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises max. 4 mg daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have hepatic or renal impairment.
  - For dose adjustments with concurrent use of moderate inhibitors of CYP3A4 in patients with hepatic or renal impairment, consult product literature.

- **INTERACTIONS** → Appendix 1: fesoterodine
Oxybutynin hydrochloride

**INDICATIONS AND DOSE**

**Urinary frequency** | **Urinary urgency** | **Urinary incontinence** | **Neurogenic bladder instability**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Child 5-11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
- Child 12-17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4–5 times a day
- Adult: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4–5 times a day
- Elderly: Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response

**BY MOUTH USING MODIFIED-RELEASE TABLETS**

- Child 5-17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day
- Adult: Initially 5 mg once daily, increased in steps of 5 mg every week, adjusted according to response; maximum 20 mg per day

**Dose equivalence and conversion**

- Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of Lyrinel® XL

**SIDE-EFFECTS**

- Common or very common: Diarrhoea, dry eye, gastrointestinal discomfort, insomnia, throat complaints
- Uncommon: Cough, fatigue, gastrointestinal disorders, nasal dryness, taste altered, urinary tract infection, vertigo
- Pregnancy: Manufacturer advises caution—no information available
- Breast feeding: Manufacturer advises caution—no information available

---

**Flavoxate hydrochloride**

**INDICATIONS AND DOSE**

**Urinary frequency** | **Urinary incontinence** | **Dysuria** | **Urinary urgency** | **Bladder spasm due to catheterisation, cystoscopy, or surgery**

**BY MOUTH**

- Adult: 200 mg 3 times a day

---

**SIDE-EFFECTS**

- Diarrhoea, dysphagia, eosinophilia, fatigue, hyperpyrexia, hypersensitivity, leucopenia, nervousness, vertigo
- Pregnancy: Manufacturer advises caution—no information available
- Breast feeding: Manufacturer advises caution—no information available

- **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in animal studies.
- **BREAST FEEDING** Manufacturers advise avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENA L IMPAIRMENT** Manufacturer advises caution.

- **DIRECTIONS FOR ADMINISTRATION**
  - With transdermal use in adults Apply patches to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days).

- **PRESCRIBING AND DISPENSING INFORMATION**
  - In adults: The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
  - In children: The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

- **PATIENT AND CARER ADVICE**
  - With transdermal use in adults: Patients or carers should be given advice on how to administer oxybutynin transdermal patches.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions:
    - With transdermal use in adults: The Scottish Medicines Consortium has advised (July 2005) that Kentera® should be reserved for use in patients who benefit from oral oxybutynin but cannot tolerate its side-effects.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solifenacin succinate**

- **INDICATIONS AND DOSE**
  - Urinary frequency | Urinary urgency | Urinary incontinence
    - By mouth
      - Adult: 5 mg once daily, increased if necessary to 10 mg once daily

---

www.getintopharma.com
DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises max. dose 5 mg daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have moderate hepatic impairment or severe renal impairment.

CONTRA-INDICATIONS

- Narrow-angle glaucoma

CAUTIONS

- Neurogenic bladder disorder - susceptibility to QT-interval prolongation

INTERACTIONS

- Appendix 1: solifenacin

SIDE-EFFECTS

- QT-interval prolongation

RENAL IMPAIRMENT

- The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

PREGNANCY

- Manufacturer advises caution - no information available.

BREAST FEEDING

- Manufacturer advises avoid — no information available.

HEPATIC IMPAIRMENT

- Manufacturer advises caution (risk of increased exposure).

Dose adjustments

- For immediate-release medicines, manufacturer advises dose reduction to 1 mg twice daily. For modified-release capsules, manufacturer advises dose reduction to 2 mg once daily.

RENAL IMPAIRMENT

- Avoid modified-release preparations if eGFR less than 30 mL/minute/1.73m². Dose adjustments: Reduce dose to 1 mg twice daily if eGFR less than 30 mL/minute/1.73m².

PRESCRIBING AND DISPENSING INFORMATION

- The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder.

Tablet

- 30 mg:
  - Tolterodine tartrate 4 mg (Astellas Pharma Ltd) £25.03 DT = £2.21
  - Tolterodine tartrate 2 mg (Astellas Pharma Ltd) £30.56 DT = £2.34

- 1 mg:
  - Detrusitol (Pfizer Ltd) £25.03 DT = £2.21
  - Tolterodine tartrate 2 mg Detrusitol 2 mg tablets £30.56 DT = £2.34

Modified-release capsule

- Blerone XL (Zentiva)
  - Tolterodine tartrate 4 mg Blerone XL 4 mg capsules £25.78 DT = £25.78

- Detrusitol XL (Pfizer Ltd)
  - Tolterodine tartrate 4 mg Detrusitol XL 4 mg capsules £25.78 DT = £25.78

- Efflomosyl XL (Mylan)
  - Tolterodine tartrate 4 mg Efflomosyl XL 4 mg capsules £25.78 DT = £25.78

- Inconex XL (Sandoz Ltd)
  - Tolterodine tartrate 4 mg Inconex XL 4 mg capsules £25.78 DT = £25.78

- Marisoea XL (Teva UK Ltd)
  - Tolterodine tartrate 4 mg Marisoea XL 2 mg capsules £25.78 DT = £25.78

- Neditol XL (Aspire Pharma Ltd)
  - Tolterodine tartrate 2 mg Neditol XL 2 mg capsules £25.78 DT = £25.78

- Preblacon XL (Actavis UK Ltd)
  - Tolterodine tartrate 4 mg Preblacon XL 4 mg capsules £25.78 DT = £25.78

- Santizor XL (Pfizer Ltd)
  - Tolterodine tartrate 4 mg Santizor XL 4 mg capsules £25.78 DT = £25.78

Tolterodine tartrate

- Indications and dose

  - Urinary frequency / Urinary urgency / Urinary incontinence
    - By mouth using immediate-release medicines
    - Adult: 2 mg twice daily, reduced if not tolerated to 1 mg twice daily
    - By mouth using modified-release capsules
    - Adult: 4 mg once daily

  - Dose equivalence and conversion

  - Children stabilised on immediate-release tolterodine tartrate 2 mg twice daily may be transferred to modified-release tolterodine tartrate 4 mg once daily.

- Cautions

  - History of QT-interval prolongation

- Interactions

  - Appendix 1: tolterodine

SIDE-EFFECTS

- Common or very common Abdominal pain - bronchitis - chest pain - diarrhoea - dry eye - fatigue - gastrointestinal disorders - paraesthesia - peripheral oedema - vertigo - weight increased

- Uncommon Arrhythmia - heart failure - memory loss - nervousness

- Frequency not known Hallucination

- Pregnancy

  - Manufacturer advises avoid — toxicity in animal studies.

- Breast feeding

  - Manufacturer advises avoid — no information available.

- Hepatic impairment

  - Manufacturer advises caution (risk of increased exposure).

  - Dose adjustments

    - For immediate-release medicines, manufacturer advises dose reduction to 1 mg twice daily.
